Credit Hours: 3.00. This is a course in Front-End Web Development that emphasizes the importance of JavaScript, its libraries, and other front-end technologies in crafting engaging and interactive user interfaces. The JavaScript programming language has been the backbone of modern front-end web development. It enables developers to create dynamic content that enriches the user experience and interaction on websites. This course will cover the fundamental ideas of JavaScript. Students will learn to use the Document Object Model (DOM) in JavaScript to make web pages that can update and change in real-time. Students will also explore various JavaScript libraries or other front-end technologies that help streamline the development process and allow for the creation of complex user interfaces with less code.

Learning Outcomes: 1. Develop skills and proficiency in creating professional interactive components using HTML, JavaScript, JavaScript libraries, and CSS. 2. Demonstrate understanding of front-end programming. 3. Create interactive front-end user interfaces for websites. 4. Systematically develop content for the Web, from concept to implementation. 5. Further enhance cognitive skills in problem-solving, debugging, and programming. Credits: 3.00

CGT 25500 - Game Development II: Design And Psychology

Credit Hours: 3.00. (CNIT 30800) This course examines video game design, theory, and development from aesthetic, psychological, and technical perspectives. Students will gain experience with a commercial game development platform. Advanced game development techniques will be taught in this course.

Learning Outcomes: 1. Deconstruct and analyze an existing game and define its essential elements as per various theories of game design. 2. Identify major psychological paradigms and how they are applied in video game experiences. 3. Demonstrate proficiency in applying behavior modification principles in video games. 4. Demonstrate individual technical proficiency with a commercial game engine. 5. Complete a market-ready video game in a team-based production environment. 6. Implement agile production techniques. Credits: 3.00

CGT 25600 - Principles Of User Experience Design

Credit Hours: 3.00. This course introduces students to the process of user-centered design of computer systems humans interact with. Students learn how to draw upon principles of usability and user interface design rooted in human psychology and user research in order to conceptualize, prototype, and evaluate computer systems. Topics include processes such as user research, conceptual design, prototyping, and evaluation and concepts such as visual hierarchy, usability, information architecture, navigation, and more. The course is platform-independent and encourages students to experiment with new and emerging technologies.

Learning Outcomes: 1. Apply the user-centered design process (UCDP) to create visual digital interfaces. 2. Demonstrate the user-centered design approach. 3. Apply the design process to create computer interfaces. 4. Apply visual

principles to interface design. 5. Apply usability principles to interface design. 6. Conduct usability research. Credits: 3.00

CGT 26505 - Video Game Level, Mission, And World Design

Credit Hours: 3.00. This course teaches the techniques required to make game environments and levels from a game level design perspective. Students learn the process of designing play spaces through a structured process of paper design, blockout, and iteration. Architectural principles are discussed, in addition to case studies from published games. Environment art and lighting techniques are discussed and implemented, all with the goal of enhancing the interactivity of the given play space.

Learning Outcomes: 1. Analyze game levels and environments using concepts from architecture. 2. Plan game levels by using design documentation. 3. Construct a complete game level or environment. 4. Assemble compelling action-gameplay experiences using industry best practices. 5. Apply principles from cinematography to video game environments. Credits: 3.00

CGT 27000 - Introduction To Data Visualization

Credit Hours: 3.00. This course is designed for students with little or no background in Data Visualization. It provides an introductory examination of data visualization through lecture, readings and hands-on experience with current visualization tools. Students will obtain an overview of the various types of data, the fundamentals of the visualization process for information and scientific visualization, and examine detail visualizations workflows that aim to answer "when" (temporal data), "where" (geospatial data), "what" (topical data), and "with whom" (trees and networks) questions when visualizing data. After taking the course students will have both the theoretical foundation and practical skills needed to create insightful visualizations for a wide range of data types.

Learning Outcomes: 1. Differentiate between information and scientific visualization. 2. Appreciate the visualization process. 3. Identify five major information visualization types: charts, tables, graphs, geospatial maps and network maps. 4. Articulate which visualization tool to use for specific data formats. 5. Compare and evaluate different techniques of data representation. Credits: 3.00

CGT 27001 - Topics In Data Visualization

Credit Hours: 1.00. This course provides students with first-hand knowledge about the field of data visualization and explore a collection of competencies that will help students think through, think about, and think with visual representation of data. Students will explore and examine current careers in data visualization and learn what skills they should work to refine in preparation for future internships and jobs. This course will provide insight into current data visualization literacy requirements in today's data driven world.

Learning Outcomes: 1. Articulate the skills needed to pursue a career in data visualization. 2. Understand the need for visualization skills and identify area in data visualization that interests them for future study. 3. Demonstrate the ability to interpret, recognize, appreciate, and understand information presented through visible actions, objects, and symbols. 4. Demonstrate their ability to work in a team environment, articulate and co-presenting results. Credits: 1.00

CGT 27108 - User Experience Design Studio II: Screen

Credit Hours: 3.00. Intermediate exploration of various approaches to human-centered design. Students learn intermediate research and design methods and create high-fidelity prototypes. The course is platform-independent and encourages students to experiment with new and emerging technologies.

Learning Outcomes: 1. Conduct intermediate analysis of situations, clients, and problems using multiple approaches to problem framing. 2. Create a variety of concepts that address the issues in the problem statement. 3. Use intermediate data gathering and analysis techniques to inform design decisions. 4. Demonstrate intermediate application of principles of visual and interaction design to create high-fidelity prototypes. 5. Distinguish among major approaches to user-centered design. 6. Compare and contrast the core values of various approaches to user-centered design. Credits: 3.00

CGT 27207 - User Experience Design Experience Studio II

Credit Hours: 3.00. This course allows students to practice as a UX designer in a company-like environment. Students continue to develop their abilities and contribute significantly to projects.

Projects utilize a human-centered design approach to provide a rich user experience.

Learning Outcomes: 1. Articulate the skills needed to pursue a career in data visualization. 2. Understand the need for visualization skills and identify area in data visualization that interests them for future study. 3. Demonstrate the ability to interpret, recognize, appreciate, and understand information presented through visible actions, objects, and symbols. 4. Demonstrate their ability to work in a team environment, articulate and co-presenting results. Credits: 3.00

CGT 27208 - User Experience Design Studio III: Cross-Channel

Credit Hours: 3.00. Advanced exploration of cross-channel approaches to human-centered design such as service design that span digital and physical experiences. Students utilize principles of usability and user experience to create and evaluate physical prototypes. The course is platform-independent and encourages students to experiment with new and emerging technologies.

Learning Outcomes: 1. Conduct advanced analysis. 2. Create a variety of concepts that address the issues of situations, clients, and problems that demonstrate an awareness of multiple user touchpoints. 3. Use physically-based techniques for data gathering and analysis to inform design decisions. 4. Demonstrate application of human factors principles to create physical prototypes. 5. Distinguish among popular processes and methodologies for UX. 6. Explain how design philosophy impacts design practice. Credits: 3.00

CGT 27500 - Data Visualization II

Credit Hours: 3.00. This course provides a practical introduction to exploratory data analysis and data mining to better inform data visualization applications. The course introduces a practical approach for making sense out of data. Students are introduced to issues inherent to the data analysis process or data mining projects. The course covers: (1) how to ***prepare*** data prior to analysis, (2) how to ***generate*** summaries of the data, (3) how to ***identify*** non-trivial facts, patterns and relationships in the data and (4) how to ***create*** models from the data to better understand the data and make predictions. After data is analyzed students will use the data visualization process and techniques to ***visually represent*** the data. The course will also introduce the use of high-level programming languages for data analysis and data visualization.

Learning Outcomes: 1. Prepare data prior to analysis. 2. Identify patterns and relationships in the data. 3. Use programming languages for visualizing data at an introductory level. Credits: 3.00

CGT 28500 - Cross Cultural Game Development

Credit Hours: 3.00. This course presents current methods of design and development of digital games for extra-cultural audiences. Students are instructed using an experiential learning model in which multi-cultural student teams lead independent game development projects targeted at a non-native cultural audience. Topics include: dimensions of cultural, game engine scripting, art asset utilization, ethnographic data collection methods, cross-cultural team building, cultural observation, and project management. This course is taught in the US but is co-taught as a distance learning course with a foreign partner institution. Students who take 28500 may not also take 28510 (the study abroad version of the course).

Learning Outcomes: 1. Create an engaging game for culturally non-native audience using a 3D game engine. 2. Identify cultural dimensions using ethnographic methods. 3. Collaborate effectively within a multi-cultural team. 4. Present a finished game and supporting research to a non-native culture. 5. Synthesize cultural experiences into a set of functional guidelines. Credits: 3.00

CGT 29000 - Computer Graphics

Credit Hours: 1.00 to 3.00. Course topics will be determined by the CGT faculty. Hours and subject matter shall be arranged by the instructor and approved by the CGT curriculum committee. This course will not be used for independent study.

Learning Outcomes: 1. Vary by course offering. Credits: 1.00 to 3.00

CGT 29900 - Selected Topics In Computer Graphics

Credit Hours: 1.00 to 3.00. Hours and subject matter to be arranged by staff.

Credits: 1.00 to 3.00

CGT 30505 - Portfolio II

Credit Hours: 0.00. Students present online portfolios, and the course instructors review and give feedback to help direct students' online presence in efforts to meet industry standards.

Learning Outcomes: 1. Create a portfolio approaching industry standards in content.

Credits: 0.00

CGT 30800 - Prepress Production And Design

Credit Hours: 3.00. This course focuses on the process of designing, creating, and preparing documents for commercial printing. Students will develop proficiency with publishing software. Topics include page layout, font and image management, color, printing processes, papers, bindings and proofing methods. Projects emphasize designing single and multi-page documents for business and advertising such as identities, flyers, brochures, forms, catalogs, newsletters and booklets.

Learning Outcomes: 1. Create sketches and roughs for conception and planning of print documents. 2. Apply design principles to the creation of original print documents and content elements. 3. Manage all content elements and prepare documents for printing. 4. Demonstrate proficiency laying out documents and applying effects using a prevailing computer based page layout package. 5. Discuss the different types of print documents as well as their components and purposes. 6. Discuss the issues related to color processes and color printing. 7. Demonstrate knowledge of papers, inks, and bindings. 8. Create print products that show an understanding of the principles of page design and organization. Credits: 3.00

CGT 30900 - Internship In Computer Graphics Technology

Credit Hours: 2.00 or 3.00. Internship course in computer graphics technology. Practical experience totaling at least 240 hours in computer graphics technology. Permission of department required.

Learning Outcomes: 1. Vary by course offering. Credits: 2.00 or 3.00

CGT 31300 - Digital Painting I For Computer Graphics

Credit Hours: 3.00. This course introduces students to digital painting techniques for graphical visualization and communication. Topics include industry standard practices and instruction in digital brush creation, digital mark making, value under painting, color palettes, and lighting and rendering to produce various computer graphics.

Credits: 3.00

CGT 31400 - Advanced Motion Design

Credit Hours: 3.00. This course builds on the basic principles of motion design. Students will learn advanced techniques in visual storytelling, puppetry/rigging and integration of 3D elements into the design environment. Advanced design principles will also be discussed as sell as post-production techniques for animators with a focus on commercial production.

Credits: 3.00

CGT 31500 - Computer Graphics Programming II

Credit Hours: 3.00. A continuation of the study of computer graphics programming concepts with an emphasis on interactive graphics and application development. Topics include polygon tessellation, vector imaging, interactive programming techniques, application development, and game development.

Learning Outcomes: 1. Demonstrate proficiency in using Modern C++ (14/17) relative to Classic C++. 2. Demonstrate working knowledge of the shader-based programmable graphics pipeline. 3. Demonstrate ability to extend the functionality of a game engine using C++. 4. Work on a team to research an advanced topic related to computer graphics. 5. Deliver a content lesson based on team research that includes a presentation with learning exercises. Credits: 3.00

CGT 31700 - Planning And Communicating Themed Attraction Design

Credit Hours: 3.00. Building on students knowledge of narrative creation and design, students will learn about the fundamentals of operations, graphics, engineering, technology and design to create theme-based immersive attractions. This course will focus on design concepts, technical design, management and creation of immersive experiences.

Credits: 3.00

CGT 31800 - Animation Preproduction

Credit Hours: 3.00. This course introduces students to industry standard practices of preproduction for animation, and demonstrates how these processes relate to the creation of large-scale graphics productions.

Learning Outcomes: 1. Identify, evaluate, and solve written problems using visual techniques. 2. Demonstrate an understanding of the different animation preproduction processes. 3. Demonstrate the ability to perform animation preproduction research and development. 4. Develop the successful conceptualization and design of background environments. 5. Develop the successful conceptualization and design of story characters. 6. Identify, evaluate, and

understand the impact of storytelling through cameras and cinematography principles. 7. Develop a completed storyboard sequence. 8. Develop a completed color script. 9. Identify, evaluate, and utilize industry standard graphics software. Credits: 3.00

CGT 31901 - Experience Lab

Credit Hours: 3.00. This course provides students with hands-on experience in a student-run design studio environment. Students will work on real-world projects, including paid project work from corporate sponsors, collaborating with clients and peers to develop professional design solutions as well as have the opportunity to apply for internship credit. The course emphasizes project management, client communication, and the application of design principles in a practical setting. Additionally, students will have the opportunity to enter their work in design competitions when possible/available.

Learning Outcomes: 1. Analyze client needs and project requirements to develop comprehensive project briefs and timelines. 2. Create innovative design solutions that effectively address client objectives and constraints. 3. Evaluate design concepts through peer reviews and feedback sessions to refine and improve final deliverables. 4. Apply project management tools and techniques to successfully execute and deliver design projects on time. Credits: 3.00

CGT 32101 - Digital Illustration

Credit Hours: 3.00. This course applies fundamental computer graphics concepts of visualization, communication and creativity using a painting metaphor. Exercises and projects in graphic theory, problem solving and painting skill development provides students with projects that focus on further development within the digital illustration discipline. A variety of traditional digital drawing and painting techniques are used to transform concepts into communicative visual artifacts.

Learning Outcomes: 1. Design a workflow for creative project research. 2. Identify visual styles and techniques of illustration 3. Exhibit advanced conceptual and technical imaging skills. 4. Create concept art for environments. 5. Apply concepts of perspective, anatomy and lighting to create realistic digital paintings. 6. Create evocative illustrations for physical and digital outputs. 7. Analyze entrepreneurial aspects of digital art marketing and promotion through public exhibits and other venues. Credits: 3.00

CGT 32500 - Animation For Games

Credit Hours: 3.00. In game industry, computer animation is the foundation giving life to human-like virtual characters. A thorough understanding of the motion capture and interactive computer animation is a requisite element of the game development process. This course introduces students to the fundamental techniques and skills required to develop animations for video games using a modern motion capture device and software packages. Students are taught using lectures and lab sessions. The focus of this course is primarily on the technical, artistic, and functional dimensions of animation for games, prioritizing the required technical skills. Production of user controller interactive virtual characters is required.

Learning Outcomes: 1. Demonstrate a moderate level of motion capture animation and animation programming with a commercial game engine. 2. Demonstrate the ability to develop character animations and multi-character interaction for games. 3. Acquire competency in each of the following domains: motion capture, motion retargeting, motion cleaning, footskate removal, character controller implementation. 4. Demonstrate the ability to complete an interactive multi-character story. 5. Demonstrate the ability to develop highly realistic animation for video game using a motion capture system. Credits: 3.00

CGT 32505 - Player-Centered Approaches To Designing Games

Credit Hours: 3.00. This course is designed for students interested in games user research to deepen their understanding of designing engaging games, through feedback from real players and evaluation of design decisions. The course is divided into two sections: The first half of the semester focuses on the fundamentals of player-centered research approaches, that explain the role of games user research and play testing in the game development process, mental models for player-centered design approaches and designing experiments to measure behavioral and experiential metrics for design impact. The second half of the course is dedicated to case studies of design failures in games. Students will be involved in design exercises that use an iterative data-driven approach to enhance game design elements.

Learning Outcomes: 1. Describe the core concepts of games user research and explain

how it can improve player experiences. 2. Identify the appropriate research method based on different design needs, plan and execute games user research studies on live game development projects. 3. Identify design problems and effectively communicate research results to game development team. 4. Demonstrate data-driven approaches to iteratively enhance design elements for better player experience. 5. Apply cross-cultural design approaches in game design process for enhancing end-user experience. Credits: 3.00

CGT 32600 - Graphics Standards For Product Definition

Credit Hours: 3.00. Introduction to product data exchange and interoperability standards, ANSI and NIST product documentation standards, product modeling standards, methodologies for technology selection, implementation, and evaluation. This course supports the product archival and communication processes in a PLM environment.

Credits: 3.00

CGT 32800 - Business Of Themed Entertainment

Credit Hours: 3.00. This course provides an insider's look at the skills needed to succeed in themed entertainment industry as well as provide an overview of the experience economy. Students will get an insider understanding of the project process, working with outside vendors, team communication, common constraints and budgeting.

Credits: 3.00

CGT 33300 - Modeling For Entertainment Graphics

Credit Hours: 3.00. This course offers students a chance to comprehensively explore Polygon Modeling, with consideration of how choices made in modeling can affect all other aspects of the animation pipeline.

Learning Outcomes: 1. Evaluate polygon models based on topology and polygon budget. 2. Build polygon models appropriate for level of detail sculpting and detailing. 3. Unwrap polygon models with minimal UV shells, maximizing texture space. 4. Texture and detail polygon models with appropriate shaders, achieving a desired result. 5. Render polygon models in a format appropriate for demo reel review. 6. Correct topological errors in conversion from NURBS to Polygons. 7. Identify challenges in conversion of two-dimensional drawings to three-dimensional models. Credits: 3.00

CGT 33500 - Game Scripting

Credit Hours: 3.00. Students gain a deeper understanding into video game scripting. Utilizing a common project, students use scripted objects to customize and enhance a small existing game. While the projects are individualized for the student, they are trained to utilize best practices for team based, industry applications of their work. Permission of department required.

Learning Outcomes: 1. Create reusable game objects that perform useful functions in standard video game genres. 2. Reinforce proper techniques in scripting. 3. Achieve mastery of Unreal blueprint scripting and visual scripting generally. 4. Learn how to drive gameplay with imported data. 5. Achieve a rudimentary baseline of C++ scripting. 6. Become familiar with Visual Studio. Credits: 3.00

CGT 34000 - Digital Lighting And Rendering For Computer Animation

Credit Hours: 3.00. The development of a working knowledge of perspective display of three-dimensional models and the resulting effects of projected light sources on shade, shadow, color, texture, and atmospheric effects in architecture, product illustration, and animation. Emphasis will be placed on lighting design, analysis, and photorealistic simulation for commercial graphic applications.

Learning Outcomes: 1. Complete guided exercises to learn the basic concepts of lighting & compositing. 2. Observe, photograph and paint reference imagery of real-world lighting scenarios. 3. Analyze professional examples of lighting to understand the desired outcomes. 4. Understand how to use state-of-the-art Shading, Lighting, Compositing and Animation packages. 5. Assemble and texture scenes for lighting. 6. Plan and execute a creative vision by art directing an original lighting sequence. Credits: 3.00

CGT 34100 - Motion For Computer Animation

Credit Hours: 3.00. An applied course covering three-dimensional computer graphic animation for graphics specialists and professionals involved in the use of technical design, time and motion study, surface texture mapping, digital lighting, color, and the technology required to produce computer

animations for commercial applications in manufacturing design, marketing, and training.

Learning Outcomes: 1. Complete all the assigned readings, assignments, and any other quizzes or tests associated with this course and earned a passing grade. 2. Review all lectures online, attended all meeting sessions, and have participated in class discussions on a weekly basis. 3. Able to demonstrate their knowledge in all the area listed within the General Goals of the course. Credits: 3.00

CGT 34505 - Environment Modeling For Games

Credit Hours: 3.00. This course teaches the techniques and principles needed to create realistic three-dimensional virtual environments rendered in game engines. This course will examine design, modeling, material creation and lighting of environments displayed in a real-time game engine environment. Amongst the topics that will be covered is: Direct input modeling, procedural modeling, digital sculpting, material authoring and real-time lighting using current 3D tools.

Learning Outcomes: 1. Explore and practice methods for environment creation by means of 3D modeling. 2. Develop fine motor skills: Refining the digital artisan's skillset in modeling. 3. Explore Aesthetics as it pertains to environment design. 4. Learn and practice professional methods. 5. Practice creating and curating a portfolio/online body of work. Credits: 3.00

CGT 34600 - Digital Video And Audio

Credit Hours: 3.00. Covers the use of digital technologies for video and audio in multimedia, hypermedia, and animation products. Students examine the methods for creating, sampling, and storing digital video and digital audio and the constraints placed on these media assets when used for media-based products. Emphasis is placed upon the technology of digital video and audio, including formats, data rates, compressors, and the advantages and disadvantages of the different technologies.

Learning Outcomes: 1. Demonstrate understanding of the principles editing. 2. Solve video compositing problem by using masking, tracking, color correcting, and animation. 3. Properly compress a digital video when given a set of constraints. 4. Author interactive video disks (Blue-ray) using standard authoring tools. 5. Set up a solution to stream video. Credits: 3.00

CGT 34800 - Photorealistic Shaders

Credit Hours: 3.00. This course focuses on the creation and application of photorealistic custom shaders to visual effect problems. Students learn to tender common material photorealistically using common industry tools and techniques. Emphasis is placed on meeting specified aesthetic and photorealistic requirements within computationally constrained environments.

Learning Outcomes: 1. Create custom shaders for common platforms. 2. Create photorealistic shaders when given photographic references. 3. Optimize shaders within the constraints of available resources. 4. Create shaders to meet aesthetic requirements. Credits: 3.00

CGT 35000 - Experiential Branding And Storytelling

Credit Hours: 3.00. This course explores the role of branding and storytelling in creating memorable user experiences. Students will learn how to develop brand narratives and design cohesive brand experiences across multiple touchpoints, including advertising, social media, and emerging technologies. The course will also cover storytelling techniques, empathy, and measuring campaign effectiveness using key performance indicators.

Learning Outcomes: 1. Develop compelling brand narratives that resonate with target audiences. 2. Design cohesive brand experiences across digital and physical spaces, including spatial computing and immersive technology. 3. Apply storytelling frameworks to create engaging and immersive user experiences. 4. Measure the effectiveness of campaigns using key performance indicators. 5. Create prototypes of branded experiences for evaluation, incorporating empathy and emotional journey mapping, while maximizing accessibility and universal design. Credits: 3.00

CGT 35100 - Interactive Multimedia Design

Credit Hours: 3.00. This course introduces the many facets of interactive multimedia design and production. Students are introduced to authoring programs used for information delivery, with special attention focused on the integration of various media assets for communication. There is also concentration on the storage, management, and retrieval of media assets in a production environment. Considerable time is spent on the

systematic design of interactive media products to meet specified goals of communication.

Credits: 3.00

CGT 35300 - Principles Of Interactive And Dynamic Media

Credit Hours: 3.00. This course explores the development of interactive and dynamic media components for web and interactive media products. The course examines the design, creation and integration of 2D animation, 2D games, text, sound, video, programming, and databases for use in web and other interactive media.

Learning Outcomes: 1. Develop skills and proficiency in creating interactive components using HTML5, JavaScript libraries, and CSS. 2. Demonstrate understanding of JavaScript programming. 3. Develop beginning to moderately complex front-end designs. 4. Understand the emerging capabilities of delivering Web content. 5. Extend the ability to systematically develop content for the Web, from concept to implementation. Credits: 3.00

CGT 35400 - Design Management

Credit Hours: 3.00. This course focuses on the development and management of design systems, project management, and collaboration within design teams. Students will learn how to create and implement effective design systems, manage projects, and lead design teams. The course will cover techniques for collaboration, communication, and the use of AI tools in prototyping and project management. Through the creation of high-fidelity prototypes, students will gain practical experience in applying these management and design system skills.

Learning Outcomes: 1. Understand the principles of design systems and their implementation. 2. Apply project management techniques to design projects. 3. Collaborate effectively within design teams. 4. Utilize modern tools for prototyping and project management. 5. Evaluate to refine design systems based on user feedback and testing. Credits: 3.00

CGT 35500 - Character Creation For Photorealism And Stylism

Credit Hours: 3.00. This course explores both the artistic and technical aspects of 3D character modeling and texturing, providing a comprehensive foundation in digital character creation. Students will begin with an in-depth study of anatomy and proportion, critical for the accurate construction of characters in a digital environment. Emphasis will be placed on developing strong anatomical knowledge and topology skills, which are essential for producing high-quality characters that achieve both photorealism and stylization for various entertainment and practical applications. Mastery of these traditional concepts and techniques will enable students to create portfolio quality character models that align with industry standards.

Learning Outcomes: 1. Analyze the principles of correct anatomical proportions essential for the creation of both bipedal and quadrupedal characters, maintaining anatomical accuracy in digital character design. 2. Apply optimal topology techniques in character construction, optimizing the model for efficient rigging and animation processes. 3. Utilize reference photographs and concept sketches to create accurate photorealistic and stylistic character models, preserving accuracy to visual references and artistic intent. 4. Create stylized characters by strategically exaggerating realistic caricatured body features, achieving consistency with the character's visual style and environment. Credits: 3.00

CGT 35600 - Web Programming, Development And Data Integration

Credit Hours: 3.00. A course focusing on the development of dynamic content and applications to facilitate information distribution. The course stresses development strategies for managing the rapidly changing information of corporations and organizations for just-in-time distribution, using authoring programs to create interactive multimedia products that utilize database management systems, file systems, and XML to provide a method for visualizing and manipulating that data. Significant time is spent on intermediate to advanced programming and scripting.

Learning Outcomes: 1. Demonstrate an understanding of how to use server-side technology to develop dynamic database-driven websites and personalize content for users. 2. Integrate server-side and client-side technology in developing web applications. 3. Demonstrate an understanding of the logic behind web applications. 4. Create projects using server-side technologies to be used in a database-

driven Web project. 5. Show understanding of basic database design, theory, and application. Credits: 3.00

CGT 36500 - Game Development Practicum

Credit Hours: 3.00. This course provides an opportunity for teams of game developers to focus on a project without distraction by competing course deliverables. Students propose a game project and spend the entire semester working only on that project. Course instructors will function as facilitators, producers, and supervisors, helping each student team scaffold their work such that all course goals are met.

Learning Outcomes: 1. Decompose a large term game development project into an actionable sequence of smaller development tasks. 2. Face emergent open-ended development challenges and either solve them or adapt to them as project goals require. 3. Set short-term game production goals and consistently meet them. 4. Self-evaluate completed work and iterate as necessary to ensure it meets the project's quality goals. 5. Accept and incorporate criticism regarding one's work and use it to improve one's craft. 6. Deliver criticism constructively that is in service to meeting project quality goals. 7. Maintain group cohesion and morale across a physically separated accordance with industry best productions practices. 8. Internalize and structure individual work habits in accordance with industry best production practices. Credits: 3.00

CGT 36700 - Previsualization In Themed Entertainment

Credit Hours: 3.00. This course provides an overview of themed entertainment development from concept to previsualization and communication. Students will have the opportunity to take initial concepts for themed experiences and visualize them to communicate to multiple external audiences.

Credits: 3.00

CGT 37000 - Interactive Data Visualization

Credit Hours: 3.00. Data visualization is the art and science of putting quantitative numbers into pictorial or graphical format that are easy for users to understand, use, and take action upon the data. In this course, we will learn basic data visualization design principles, theories, data management skills, and fundamental web technologies to design and develop web based interactive date visualizations. The students will be able to design the proper visual representations of the data based on the data's characteristics, business needs, and prospective users.

Learning Outcomes: 1. Demonstrate understating of different types of data, their characteristics, relations, and business purpose. 2. Compare and choose proper visualization methods to represent the data based on the characteristic and purpose. 3. Apply perception theories and design principles in visualization design. 4. Utilize web toolkits and technologies to develop simple data visualization. 5. Develop an interaction information visualization system to represent data from different aspects. Credits: 3.00

CGT 37108 - User Experience Design Studio IV: Strategy

Credit Hours: 3.00. Advanced exploration of strategic human-centered design that aligns user experience with organizational strategy and business goals, using approaches such as agile, waterfall, and lean UX. Students utilize visual, information, and usability principles as well as various approaches and methods of human-centered design to create interactive digital prototypes. The course is platform-independent and encourages students to experiment with new and emerging technologies.

Learning Outcomes: 1. Conduct expert analysis using advanced data gathering and analysis techniques to inform design decisions. 2. Create a variety of concepts for situations, clients, and problems that aligns with the client organizational strategy and business goals. 3. Demonstrate fluent application and evaluation of visual and interaction design principles by using advanced prototyping techniques to create interactive prototypes. 4. Demonstrate the ability to make recommendations for appropriate major design approaches and methodologies that fit a particular design situation and team. 5. Articulate their design identity and personal design philosophy. Credits: 3.00

CGT 37207 - User Experience Design Experience Studio III

Credit Hours: 3.00. This course provides students with opportunities to explore opportunities in a company-like environment. Students are knowledgeable project members and beginning to transition into subject matter experts and managers. Projects utilize human-centered design principles to provide a rich user experience.

Learning Outcomes: 1. Create and manage teams, resources, and activities. 2. Create and manage project strategy. 3. Demonstrate depth in one or more UX specializations. 4. Champion UX approaches to diverse stakeholders in a professional manner. Credits: 3.00

CGT 37208 - User Experience Design Studio V: Specialization

Credit Hours: 3.00. This course prepares students to lead complex and strategic design projects. Students become proficient in the most advanced approaches, methods and techniques of human-centered design. The course is platform-independent and encourages students to experiment with new and emerging technologies.

Learning Outcomes: 1. Conduct expert analysis using expert data gathering and analysis techniques to inform design decisions. 2. Create a variety of concepts for situations, clients, and problems to advance stakeholder strategies and goals. 3. Demonstrate advanced application and evaluation of visual and interaction design principles by using advanced prototyping techniques to create working interactive digital prototypes. 4. Demonstrate the ability to lead UX teams through the user-centered design processes, employing appropriate approaches, processes and methodologies. 5. Practice human-centered design in concordance with their personal design philosophy. Credits: 3.00

CGT 37500 - Game Audio

Credit Hours: 3.00. Students learn the basics of audio production as it relates to game development. Students edit and create audio effects using off-the-shelf tools and implement these sounds in a game engine. Microphones, digital audio workstations, and sound effect libraries are utilized in a framework that focuses on direct implementation into interactive media.

Learning Outcomes: 1. Analyze existing audio library sounds effects and edit them according to a project's requirements. 2. Identify game audio scripting techniques and translate these into their own work. 3. Analyze and explain the theory of implementing music into games and interactive media. 4. Develop techniques for using software and equipment for the creation of game audio effects. 5. Implement audio effects and music into a commercial game engine. Credits: 3.00

CGT 37700 - Scientific Visualization

Credit Hours: 3.00. This course is an introduction to the use of computer graphics to help user gain insight into scientific datasets. Applications from atmospheric science, medicine and physics will be explored. Topics will include the fundamental approaches to scalar-valued data (volume rendering, iso-surface extraction), vector-valued data (glyphs, streamlines), and tenors-valued data (ellipsoidal, quadric and super quadric glyphs).

Learning Outcomes: 1. Describe sources of scalar-, vector-, and tensor-valued data and the properties of the data. 2. Assess the effectiveness of given visualization techniques. 3. Explain the differences between multiple approaches to visualization. 4. Create effective scientific visualizations using the vTk library, or tools based on vTk. Credits: 3.00

CGT 38500 - Game Production

Credit Hours: 3.00. This course uses intensive project-based, student-led learning in game development to cultivate skills in quality assurance, leadership, communication, time management, contingency planning, technology integration, autonomy and accountability. Students act in an executive role with students in other project-oriented classes and in so doing cultivate supervisory production experience. Each student must engage with instructors and students to hone real-world hard and soft skills through situated experiences and student-led teaching opportunities. Student producers must develop a functioning development pipeline, meet regularly with their teams, and maintain industry-standard documentation and project management processes. Permission of Instructor required.

Learning Outcomes: 1. Lead a team of novice developers to achieve all production goals for their semester project. 2. Build a functional asset pipeline that accommodates team needs while maintaining steady output. 3. Implement and document game development processes according to industry-accepted standards. 4.

Maintain group cohesion and morale while motivating all team members to produce their best work. 5. Implement agile production techniques in a small-group game development project. Credits: 3.00

CGT 39000 - Computer Graphics

Credit Hours: 1.00 to 3.00. Course topics will be determined by the CGT faculty. Hours and subject matter will be arranged by the instructor and approved by the CGT curriculum committee.

Learning Outcomes: 1. Vary by course offering. Credits: 1.00 to 3.00

CGT 40100 - Immersive Virtual Realities

Credit Hours: 3.00. This practical production course serves as the culmination of the knowledge and skills acquired throughout the degree program. Students will apply their expertise in immersive media by developing a comprehensive production project that demonstrates proficiency in virtual world building, prop creation, and animation. Projects may be undertaken individually or collaboratively and can range from photorealistic to stylistic in design. The final deliverable may take various forms, including virtual reality experiences, online social environments, or other innovative mediums. This course emphasizes creativity, technical execution, and conceptual depth, allowing students to showcase their unique artistic and technical vision.

Learning Outcomes: 1. Produce an immersive reality project that exemplifies both artistic creativity and technical proficiency, incorporating advanced principles of design, animation, and interactive media. 2. Implement concepts and techniques acquired throughout the degree program into a fully developed project, demonstrating expertise in an individual and collaborative production. 3. Analyze instructor feedback and implement revisions to enhance the quality, effectiveness, and coherence of the project. 4. Design immersive worlds, assets, characters, and animations, integrating all essential components to craft a unified and engaging experience customized to a target audience. Credits: 3.00

CGT 40200 - Motion And Video II

Credit Hours: 3.00. This course builds on the principles of motion design and video production. Students will learn advanced techniques in effects and integration of video and motion elements with the goal of creating realistic production and animation to be used in commercial production.

Learning Outcomes: 1. Identify two ways that video and motion graphics can be utilized within the same project. 2. Demonstrate a working knowledge of motion paths within a project. 3. Demonstrate effective techniques for working with a client. 4. Provide examples of professional and non-professional motion and video productions. 5. Develop a video reel for professional use. Credits: 3.00

CGT 40400 - Self Promotion For Computer Graphics

Credit Hours: 3.00. This course has been designed to introduce students to the professional practice of branding oneself as commonly used in industry. Students will learn how to critique their own work, and the work being done by peers in the industry.

Credits: 3.00

CGT 40500 - Senior Portfolio Review

Credit Hours: 0.00. Portfolio review for seniors in Computer Graphics Technology.

Learning Outcomes: 1. Create a portfolio approaching industry standards in content. Credits: 0.00

CGT 40700 - Current And Future Trends In Themed Attraction Design

Credit Hours: 3.00. Students will learn about current trends in immersive attractions. Current technologies will be explored that can be used to enhance the narrative in a themed immersive space. Students will explore technologies, narrative techniques and integration of engineering.

Credits: 3.00

CGT 41100 - Contemporary Problems In Applied Computer Graphics

Credit Hours: 3.00. Groups will identify, design, qualify, manage, create, and present a final project relative to existing or emerging issues within applied computer graphics. Activities and experiences will explore related topics such as project planning and management, user expectations, interpersonal communications skills, and quality management. The course concludes with faculty, peers, and practicing professionals evaluating oral, written, and media presentations of final projects.

Credits: 3.00

CGT 41101 - Contemporary Problems In Applied Computer Graphics I

Credit Hours: 2.00. Groups will identify, design, qualify, and plan a final project relative to existing or emerging issues within applied computer graphics. This project will be done in

conjunction with industry and faculty engagement. Activities and experiences will explore related topics such as project planning and management, user expectations, interpersonal communications skills, and quality management. This course is followed by CGT 41201 which includes the execution and evaluation of the capstone project planned in CGT 41101.

Learning Outcomes: 1. Utilize a provided project specification to develop a project completion plan. 2. Develop an appropriate project evaluation plan using accepted techniques. 3. Implement basic project management principles to assign team member tasks, required resources, and time allocations. Credits: 2.00

CGT 41201 - Contemporary Problems In Applied Computer Graphics II

Credit Hours: 2.00. CGT 41201 is the second course in the CGT applied computer graphics capstone sequence with a focus on execution and evaluation of the senior capstone project. Emphasis will be placed on industry engagement for the execution of the project plan that was developed in CGT 41101. Students will work in teams to execute the project plan; develop and execute a project evaluation plan, and make a professional final presentation to industry members, faculty, and peers. Students will execute a project refinement process based on feedback received and incorporate that into a final presentation and project report. CGT 41201 will be taught in a seminar format with one meeting per week focused on project status checks, evaluation plan development and execution, and project presentations.

Learning Outcomes: 1. Execute a project plan to produce a substantial graphics product. 2. Develop and execute an evaluation plan of their capstone project. 3. Develop professional presentations incorporating external feedback and project results. 4. Produce a major project report for their capstone project, including project management, rationale, and substantial findings. Credits: 2.00

CGT 41600 - Senior Design Project

Credit Hours: 3.00. This capstone course requires students to engage in a substantive endeavor directed at solving problems related to computer graphics. Activities include the creation and management of graphic systems and media assets per the requirements of the senior design proposal. Students are required to demonstrate professional attitudes and attributes in the timely completion and presentation of their project.

Credits: 3.00

CGT 42500 - Game Design

Credit Hours: 3.00. This course is about the discovery, summarization, application, analysis, and synthesis of novel game design techniques. Discovery and summarization are done through research and in-class presentations. These presentations are then used to create prototypes in the game engine of the student's choice. Students are expected to collect data on these prototypes. This data is then used to iterate on the prototypes throughout the semester. The course culminates in a polished prototype that is published on any valid public gaming platform or student portfolio. This is an advanced course that assumes the student has existing skills in game creation (particularly game scripting, game art, and game design). Permission of instructor required.

Learning Outcomes: 1. Discover novel game design techniques. 2. Demonstrate new game design ideas by creating functional prototypes in a game engine. 3. Discover and apply current game design theory. 4. Recognize current game design trends in modern games. 5. Communicate complex game design ideas to an audience. 6. Synthesize new ideas from concepts learned from research and collaborative work in class. 7. Collect and evaluate playtesting data. 8. Publish a small game prototype on a gaming platform. Credits: 3.00

CGT 42600 - Industry Applications Of Simulation And Visualization

Credit Hours: 3.00. This course focuses on developing mathematically accurate physical-visual simulations of mechanisms, systems, and assemblies. Topics include physical system analysis; coordinate systems; inverse kinematics; linear, rotational, and reciprocating motion. Simulations will be created using modeling technology, programmed scripting, and diverse software.

Credits: 3.00

CGT 43500 - Virtual Reality And 3D User Interfaces

Credit Hours: 3.00. The purpose of this course is twofold: (a) to provide students with a deep understanding of the fundamentals of virtual reality environments and 3D user interfaces and (b) to offer students practical experience with consumer-grade virtual reality systems. Students will explore the challenges of developing and analyzing virtual reality systems and 3D user interfaces that are effective and comfortable, motivated by design goals and constrained by the real world. We will also explore the relationship of virtual reality to entertainment, medical, and manufacturing domains.

Learning Outcomes: 1. Discover novel virtual reality interaction techniques. This is

accomplished via student research, instructor presentations, and student presentations. 2. Demonstrate new virtual reality design ideas by creating functional prototypes in a game engine. 3. Apply theory to create virtual reality experiences that will generate intuitive interactions and believable experiences for the user. 4. Apply programming knowledge to create interactive experiences in virtual reality environments. 5. Communicate complex virtual reality design ideas to an audience. 6. Synthesize new ideas from concepts learned from research and collaborative work in class. 7. Collect and analyze user experience data. Credits: 3.00

CGT 44200 - Production For Computer Animation

Credit Hours: 3.00. An applied course covering advanced spline modeling techniques, lighting techniques, applied shading, motion dynamics and controllers, particle systems, application customization programming, and pre-production development and planning. Study of emerging advancements in computer animation and spatial graphic technologies will be included.

Learning Outcomes: 1. Identify career opportunities in computer graphics and related industries. 2. Assess, classify and critique peer and professional-level portfolios in relation to industry roles 3. Define major project outcomes that align with specific career pathways. 4. Develop and manage production plans for a major entertainment graphics project. 5. Manage teams or individual tasks to execute defined goals within entertainment graphics projects. 6. Create professional portfolio or showreel pieces that demonstrate industry relevant skills. Credits: 3.00

CGT 44201 - Advanced Portfolio Development For Digital Media Careers

Credit Hours: 3.00. This course is designed to provide students the opportunity to complete self-driven projects to enhance and showcase their skills to potential employers. Students will learn about professional expectations of a variety of jobs in computer graphics and digital media, including but not limited to Animation, Games, Visual Effects, and Interactive Design. They will develop the skills to receive and provide feedback, refine expertise in their chosen area of specialization by proposing and executing relevant projects, culminating in the creation of job application materials and an online portfolio which displays the completed works.

Learning Outcomes: 1. Explore Digital Media career opportunities and determine a path that best fits one's goals. 2. Create new materials and curate a strong portfolio showcasing individual skills and interests. 3. Evaluate peer projects to train one's critical eye. 4. Develop a plan and vision for pursuing one's desired career path. 5. Understand the recruiting process and the expectations of the industry to prepare strong, tailored application materials. Credits: 3.00

CGT 44400 - The History And Technique Of Visual Effects In Film

Credit Hours: 3.00. This lecture-based course presents the history and technique of special or visual effects in film from the 19th Century (George Me'lie's) to the current digital age of visual effects. Emphasis is placed on the use of effects in fantasy, science fiction, and horror genres. These effects can range from the recreation of historical venues, to fictional characters and to worlds not yet seen. This course serves not only to address this facet of the history of film and cinema, but also the techniques and technology of visual effects including practical effects, miniatures, stop-motion, makeup, mechanical effects, optical effects, motion control, and the digital realm.

Credits: 3.00

CGT 44500 - Procedural Methods For Game Development

Credit Hours: 3.00. This course teaches a procedural approach to game development ranging from geometric modeling techniques, crowd simulation, particle systems, fluid simulation and flame simulation. The course will examine procedural nondestructive workflows that can be translated into real-time assets for game development. Students will learn how to set up nodal and parameter based graphs that carry the ability to be interactively updated and changed, thus having the flexibility expected in an industry pipeline.

Learning Outcomes: 1. Implement non-destructive procedurally modeled and aesthetically pleasing assets while demonstrating an understanding of scalable UVs. 2. Implement assets within game engine environment, harnessing the advanced procedural production in an optimized real-time

setting. 3. Create asset movement through implementation of simple expressions to drive procedural animations. 4. Create finished and refined renders for use in visualization and sequenced flipbook animations. 5. Demonstrate knowledge of pre-rendered particle systems and an understanding of transference to real-time applications. 6. Demonstrate mastery of rigid body dynamics to create in-game destruction sequence. Credits: 3.00

CGT 44600 - Post-Production And Special Effects For Computer Animation

Credit Hours: 3.00. A variety of commercial applications of technical animation and spatial graphics are analyzed and produced, with special emphasis upon client development, design, organization, scripting, storyboarding, technical production, management, and evaluation.

Learning Outcomes: 1. Describe the business model of film and animation production. 2. Understand script development and analysis as they relate to production. 3. Demonstrate image acquisition in the production environment. 4. Demonstrate an understanding of final finishing and distribution processes. Credits: 3.00

CGT 45000 - Professional Practices

Credit Hours: 3.00. This course prepares students for professional employment in Computer Graphics related professions. Topics include ethical and legal issues, contracts, copyright, and freelancing as well as portfolio planning, design, preparation, and presentation.

Learning Outcomes: 1. Develop and implement technical writing skills. 2. Practice professional correspondence. 3. Create a technical resume. 4. Develop interviewing skills. Credits: 3.00

CGT 45001 - Computer Graphics Professional Practices II

Credit Hours: 1.00. Preparation for professional employment in computer graphics professions. Topics covered include professional and technical writing, correspondence, corporate and freelance employment considerations; portfolio planning; and interviewing. Students will arrange interviews and portfolio reviews.

Learning Outcomes: 1. Develop and implement technical writing skills. 2. Practice professional correspondence. 3. Create a technical resume. 4. Develop interviewing skills. Credits: 1.00

CGT 45100 - Multimedia Application Development

Credit Hours: 3.00. This course focuses on the development of applications that manipulate media assets. Significant time is spent on intermediate to advanced programming and scripting as well as the synchronization of aural and graphical components. Students are required to plan, design, and implement a major project, and a final presentation is required.

Credits: 3.00

CGT 45300 - Multisensory Experience Design

Credit Hours: 3.00. This course examines the design of experiences that engage multiple senses. Students will explore how to create immersive environments that utilize sound, touch, and other sensory inputs to enhance user interaction. The course will also cover the integration of physical technology, such as microcontroller-driven physical computing, with digital screens.

Learning Outcomes: 1. Understand the principles of multisensory experience design. 2. Design environments that engage multiple senses. 3. Incorporate sound, touch, and other sensory inputs into designs. 4. Evaluate the impact of multisensory elements on user experience. 5. Create prototypes of multisensory experiences for testing, blending physical technology with digital screens. 6. Ensure accessibility by designing UX experiences that accommodate users with disabilities, incorporating assistive features and inclusive design principles. Credits: 3.00

CGT 45400 - Innovative Experience Design

Credit Hours: 3.00. This course explores advanced design techniques for creating impactful experiences studying various fields such as sports, gaming, social media, charitable causes, fintech, and healthcare. Students will learn to incorporate empathy, accessibility, and AI into their designs to address human-centered challenges. The course will also focus on collaboration, engaging with clients, improving communication skills and confidence, and evaluation of created work.

Learning Outcomes: 1. Apply innovative design techniques to create impactful experience through design efficiency and effectiveness. 2. Integrate empathy and accessibility into design processes. 3. Study and develop solutions for human-centered challenges in a variety of emerging fields. 4. Collaborate with clients, engage effectively, and improve communication

skills. 5. Evaluate and test user experiences to gather feedback and improve designs. Credits: 3.00

CGT 45600 - Advanced Web Programming, Development And Data Integration

Credit Hours: 3.00. This course presents the advanced technologies available for use on the World Wide Web and within corporate intranet environments. Emphasis and discussion is focused on the advantages and disadvantages of these technologies as well as on implementation to create unique solutions for business and industry. Strategies for planning, development, and implementation will be discussed and demonstrated. Significant time is spent on advanced programming and scripting as well as manipulation and visualization of data from various sources, including robust database management systems. Students are required to plan, design and implement a major project.

Learning Outcomes: 1. Demonstrate understanding of ASP.NET, C#, and the .NET Framework. 2. Create and compile advanced dynamic web projects using ASP.NET technology. 3. Demonstrate understanding of advanced database applications and SQL. 4. Show understanding of the logic behind advanced web applications. 5. Integrate front-end and back-end technologies in developing professional web applications. Credits: 3.00

CGT 47000 - Data Visualization Studio

Credit Hours: 3.00. This course will teach students design and develop interactive data visualization systems to communicate and analyze complicated datasets. Students will learn interaction and visual design principles, draw from human perception and cognition theories, and focus on hands-on practice of developing interactive data visualization systems that enable users to see, understand, and analyze complex data and relations. At the end of the class, students will apply the design principles and use proper technologies to create a comprehensive interactive visualization system for data analysis.

Learning Outcomes: 1. Demonstrate understanding of design principles from perspectives of human perception, cognition, and design. 2. Choose the correct visual format based on the data, relations, and data usage. 3. Recognize the common problems in information visualization dashboard design. 4. Demonstrate the ability to process, filter, and transform data for visualization. 5. Utilize proper visual forms, visual analysis techniques, and practices for analyzing basic types of data and data relationships. 6. Develop complex interactive information visualizations system with multiple visualizations for communication and data analysis. Credits: 3.00

CGT 47407 - UXD Experience Studio VI Management

Credit Hours: 3.00. This is an advanced-level course where students are project managers in a company-like environment within the Purdue Experience Studios. Students learn about management expectations within a UX design company as they work with multi-level teams on corporate-sponsored projects. Projects utilize a human-centered design approach with an emphasis on designing for the user experience. Students learn how to manage team leadership, including training project owners by planning, organizing, and running training and mentoring workshops. Permission of instructor required.

Learning Outcomes: 1. Participate in setting up multiple teams with the goal of creating balanced and successful teams. 2. Conduct effective 1on1 meetings to manage junior student's personal growth plan. 3. Implement team-building skills with structured activities and workshops. 4. Solve teamworking conflicts in a fair and effective manner. 5. Demonstrate depth in UX management by documenting your skill development and growth throughout the semester in a written reflection document. 6. Create an activity log of the process, goals, and outcomes to train new student managers. 7. Train junior students how to communicate UX approaches to diverse stakeholders in a professional manner. 8. Teach successful meeting etiquette, including agendas, action items, and follow-ups to junior students. Credits: 3.00

CGT 47500 - Applied Games Research

Credit Hours: 3.00. This course teaches fundamental concepts in scientific methodology, such as hypothesis formation, experimental design, methodology, data collection and analysis, reporting of findings, quantitative and qualitative methods, sampling, ethical research practices, and regulatory compliance. It also teaches practical skills such as manuscript preparation, publication, and funding strategies. Though the course is

oriented toward applying these concepts and skills in a Games context, the lessons are broadly applicable, and students from other areas within the department are welcome to enroll with instructor permission.

Learning Outcomes: 1. Construct original manuscripts and research proposals that integrate quantitative and qualitative methodologies, applying the scientific method to investigate complex topics. 2. Assess peer manuscripts and published scientific papers for clarity, logic, writing quality, and the validity of conclusions, providing constructive critiques. 3. Implement research, writing, and analytical techniques to address problem scenarios, recommend appropriate methodologies, and complete exercises, quizzes, and exams. 4. Design a collaborative research study by integrating course concepts, planning, and preparing for an independent team project. Credits: 3.00

CGT 48500 - Honors Game Production

Credit Hours: 3.00. This course provides an opportunity for students to acquire real-world experience working as a game studio producer for one or more student Career Project (capstone) teams. Students may enroll in this course via invitation only. As this is an Honors course, students are expected to bear greater individual responsibility and produce very high quality results. Students should be capable of working with a high degree of autonomy and be prepared to adapt to open-ended problems and deliverables expectations that may shift according to project needs. Student producers will coordinate development efforts and logistics between Career Project teams (CGT 365) and the various Outsourcer courses that the Career Project teams depend upon. Students must function as leaders and accept responsibility for their team's results. This course fulfills the requirement for work experience as defined by the CGT department. Permission of instructor required.

Learning Outcomes: 1. Negotiate and manage relationships between multiple clients and providers. 2. Create actionable, sustainable development plans with their teams. 3. Master industry-standard project management groupware to track and assign work items to their teams. 4. Solve or adapt to emergent open-ended production challenges. 5. Identify production blockages and proactively foresee future blocks. 6. Accept and incorporate criticism regarding one's work and use it to improve their craft. 7. Deliver criticism constructively toward meeting project quality goals. 8. Reflect on one's own work and evaluate how their experience contributed to the overall project and articulate how the experience helped them grow in their discipline. 9. Maintain group cohesion and morale while motivating all team members to produce their best work. 10. Implement agile production techniques in multiple small-group game development projects. Credits: 3.00

CGT 49000 - Computer Graphics

Credit Hours: 1.00 to 3.00. Senior-level course topics will be determined by the CGT faculty. Hours and subject matter shall be arranged by the instructor and approved by the CGT curriculum committee. This course will not be used for independent study.

Learning Outcomes: 1. Vary by course offering. Credits: 1.00 to 3.00

CGT 49100 - Special Topics In Computer Graphics

Credit Hours: 1.00 to 6.00. A variable title, variable content course pertaining to problems and research in graphical methods and representation. Permission of instructor required.

Learning Outcomes: 1. Vary by course offering. Credits: 1.00 to 6.00

CGT 49800 - Undergraduate Research In Computer Graphics Technology

Credit Hours: 1.00 to 3.00. Students will conduct research in the area of computer graphics technology with a primary investigator. The primary focus of the course is to contribute to ongoing research, while learning current research techniques. Contributing to research design, analyzing data, determining courses of action, developing critical thinking, and presenting results are emphasized. Requires prior approval of, and arrangement with, a faculty research advisor. Permission of instructor required.

Learning Outcomes: 1. Demonstrate subject-matter competency, integrating appropriate theoretical and conceptual frameworks. 2. Conduct research using generally accepted methods appropriate for the research question. 3. Demonstrate critical thinking skills. 4. Evaluate, synthesize, and apply ethical issues

facing researchers. Credits: 1.00 to 3.00

CGT 49900 - Selected Tropics in Computer Graphics

Credit Hours: 1.00 to 3.00. Hours and subject matter to be arranged by staff.

Credits: 1.00 to 3.00

CGT 50100 - Seminar In Computer Graphics Technology

Credit Hours: 0.00 to 3.00. A variable topics course that addresses contemporary problems and issues related to M.S. students in Computer Graphics Technology. Permission of instructor required.

Learning Outcomes: 1. Understand the transition from undergraduate to graduate study (course approaches, studying, research, assistantship responsibilities). 2. Understand and apply ethics in research and writing. 3. Understand the grant process and agencies that offer grants. 4. Understand the publishing process relative to articles and proceedings. 5. Understand the various publishing formats and methods of citations (APA, Chicago, and MLA versus organizational approaches). 6. Understand the IRB process and method of research approval. 7. Develop a plan of study. 8. Establish a graduate committee. 9. Understand the process for obtaining the MS. 10. Accept grand challenges in Computer Graphics Technology. Credits: 0.00 to 3.00

CGT 51100 - The Development Of Graphics In Technology

Credit Hours: 3.00. An introduction to the historical development of visual science in western civilization and its effect on computer graphics techniques and practices. Topics include the historical, contemporary, and future developments in computer graphics. Emphasizes the study of visual science and the significance of computer graphics as a communications medium.

Learning Outcomes: 1. Apply the principles attained from course material. Lectures, readings and discussions will be structured around developments and shifts in the selected computer graphics topics. 2. Provide an understanding in research methodologies that are related to different areas in computer graphics. 3. Understand key concepts and techniques of computer graphics. 4. Design and conduct academic research in computer graphics. Credits: 3.00

CGT 51200 - Foundational Readings Of User Experience Design

Credit Hours: 3.00. This course provides an overview of the field of human-computer interaction (HCI) and user experience (UX) design. Students will explore the main themes, paradigms, and theories of HCI and UX from its inception to the present. The course takes a broad, chronological approach, examining the history and evolution of HCI and UX, including its major intellectual shifts, successes and failures, and its dynamic relationship to other fields. Students will read seminal works from leading researchers. This course is intended to provide a solid foundation for further research. No specific technical or programming experience is required.

Learning Outcomes: 1. Engage with major theories, paradigms, and themes throughout the history of HCI and UX. 2. Identify, describe, and assess strengths and limitations of various methods and approaches with HCI and UX. 3. Critically evaluate existing research in the field and develop their scholarly and intellectual skills in preparation for future research. Credits: 3.00

CGT 51300 - Interactive Multimedia Development And Research

Credit Hours: 3.00. A survey of the interactive multimedia development process, knowledge base, and applications in business and industry. Particular attention is paid to research issues surrounding theoretical, technological, and interactive techniques, and validating those approaches through applied research. Emphasis is placed on the interdisciplinary nature of the development of new media tools.

Learning Outcomes: 1. Become familiar with a range of projects that consider data as a primary material and learn to contextualize recent creative data visualization projects within the history of electronic media, the interactive arts, and visual design. 2. Develop proficiency at programming using the main contemporary software frameworks for data visualization and interactive content creation. 3. Gain experience working on a larger project, including collaborating with others on interactive software, authoring a conference-style write-up to

describe the project, and documenting project code in an open-source repo. Credits: 3.00

CGT 51500 - Virtual Environments

Credit Hours: 3.00. This course provides deep exposure to the most prominent and important research within the fields of virtual reality, games, and any application area where virtual environments are constructed or inhabited. Students will study experiential, cultural, and phenomenological aspects of habitation within virtual environments as well as become familiar with technical aspects involved in virtual environment creation. Students will generate original research data and analysis, prepare a publishable manuscript, and build their own virtual worlds as applicable.

Learning Outcomes: 1. Conduct a thorough literature review of a chosen topic related to virtual environments and/or their development. 2. Analyze scientific research and present the results of the analysis. 3. Conduct a sound, logical study in the area of virtual environments. 4. Create a virtual environment using a game or virtual reality engine. 5. Prepare a human subjects research application (IRB) that meets all regulatory regulations required to conduct ethical human research. 6. Write a publishable research manuscript using the LaTeX scripting language. Credits: 3.00

CGT 51600 - Collaborative Virtual And Augmented Environments

Credit Hours: 3.00. A study of the field of collaborative virtual and augmented environments in shared, multi-user, same-site and multi-site immersive environments. Students will gain knowledge in the following research areas: multi-user interaction, collaborative virtual and augmented environments, and latest software and hardware tools. In this collaborative environment, students not only interact within the same virtual environment but collaborate between physically different environments through distributed environments. Knowledge of 3D computer graphics fundamentals, openGL, and C/C++, or consent of instructor.

Learning Outcomes: 1. Understand the principles and theory of collaborative shared virtual and augmented environments. 2. Apply the principals of graphics programming in designing virtual and collaborative space. 3. Describe and explain the use of, and advantages and disadvantages of, current VR and AR collaborative technologies. 4. Describe human interaction issues in 3D collaborative virtual and augmented environments. Credits: 3.00

CGT 51800 - Augmented Reality

Credit Hours: 3.00. Augmented Reality, a form of presenting virtual information within a perspective of the real world. This course instructs students in the foundations, practice and use of AR (Augmented Reality) as well as the technology required to produce an AR visualization. The concepts covered in this class include: physical tracking systems, computer vision, image processing techniques, 3D virtual environment visualization and calibration, display systems for AR and usage of AR in multimedia & tech culture. Some experience in Unity 3D preferred.

Learning Outcomes: 1. Comprehend the fundamentals of Augmented Reality and the technologies required to produce an AR context. 2. Harness the power of image processing to implement tracking with and without fiducial markers. 3. Produce an AR application for use in entertainment, instruction, research or training as a final project (requiring instructor approval). 4. Present concepts of AR and how they are used in research and industry as it relates to their class final project. 5. Demonstrate knowledge of the history of AR and its social-cultural impact as well as the evolution of the technology used in advancing AR display and tracking techniques. Credits: 3.00

CGT 51900 - Projects In Graphics

Credit Hours: 3.00. This course instructs students in current methods of conducting research on computer graphics and the content development process. Topics covered in the course include biofeedback, user experience, measurement and analysis, development pipelines, publication strategies and methodologies. LaTeX document preparation, simulation, and qualitative approaches to conducting research in the field of computer graphics.

Learning Outcomes: 1. Conduct a thorough literature review of a chosen topic related to computer graphics and/or the content development process. 2. Present to the class an analysis of an academic paper or set of papers. 3. Conduct a sound, logical study in the area of computer graphics. 4. Prepare a human

subjects research application (IRB) that meets all regulatory regulations required to conduct ethical human research. 5. Conduct a research study. 6. Analyze the results of a completed research study. 7. Write a complete publishable manuscript using the LaTeX scripting language. Credits: 3.00

CGT 52000 - Computer Graphics Programming

Credit Hours: 3.00. This course provides a working knowledge of computer graphics fundamentals, such as using transformation matrices, writing programmable shaders, implementing a lighting model and texture mapping using a modern graphics API. Coursework focuses on creating real-time interactive applications using a low-level programming language.

Learning Outcomes: 1. Understand the graphics pipeline exposed by modern graphics APIs. 2. Understand and use transformation matrices and coordinate frames. 3. Implement the Phong lighting model using programmable shaders. 4. Understand and use texture mapping and texture state such as filtering and wrapping modes. 5. Understand and implement interaction techniques using mouse, keyboard and user interface. Credits: 3.00

CGT 52100 - Advanced Real-Time Computer Graphics

Credit Hours: 3.00. This course focuses on a working knowledge of real-time rendering and shaders using a modern graphics API. Students will learn the performance implications of program design choices with respect to the highly parallelized nature of the GPU and the characteristics of the GPU memory hierarchy. Students will learn about optional specialized programmable shader stages, as well as advanced techniques such as physically-based lighting and shadowing techniques.

Learning Outcomes: 1. Understand the graphics pipeline exposed by modern graphics APIs. 2. Understand and apply modern GPU features. 3. Understand and use buffers efficiently for data access in shaders 4. Understand and use techniques such as tangent-space bumpmapping or shadow mapping which require the use of additional coordinate frames and transformation matrices. 5. Implement a physically-based lighting model using programmable shaders. Credits: 3.00

CGT 52200 - UX Design Graduate Studio I: Fundamentals

Credit Hours: 3.00. This course is an introduction to the fundamental components of human-centered design, focusing on interactive computing systems. Students learn basic tenets and methods of user-centered design, including usability and visual design principles, user research, low-fidelity prototyping, and high-fidelity prototyping. The course is platform-independent and encourages students to experiment with new and emerging technologies.

Learning Outcomes: 1. Conduct analysis of situations, clients and problems, articulate problem statements, and create concepts that address issues in the problem statement. 2. Identify and use data gathering and analysis techniques to inform design decisions. 3. Demonstrate application of principles of visual and interaction design to create prototypes. 4. Explain and apply the fundamental components of user-centered design. 5. Synthesize and articulate the core values of user-centered design. Credits: 3.00

CGT 52300 - Intelligent Virtual Agents

Credit Hours: 3.00. Intelligent Virtual Agents (IVAs) are interactive virtual characters that exhibit human-like qualities, including communicating using natural human modalities such as facial expressions, speech, and gesture. They are capable of real-time perception, cognition, emotion, and action that allow them to participate in dynamic social environments. This course introduces students to the interdisciplinary research on the design, application, and evaluation of IVAs. Students will be taught theory, methodologies, and algorithms, which they will then apply to individual projects. These individual projects will provide students with a common base for authoring IVAs for various application domains, including virtual assistants, pedagogical agents, human-agent task/problem co-solving, human-agent collaboration, and more. Prior background in virtual reality or technical animation is assumed, as the course will provide students the opportunity to further develop these competencies through hands-on assignments within a commercial game engine. The focus of this course is primarily on the computational and functional dimensions of IVAs; however, design and creativity are also important aspects of all projects. This course uses an active learning approach that involves lab assignments, presentations, independent research, and group ideation and collaboration.

Learning Outcomes: 1. Define notions of expressiveness of intelligent virtual agents. 2.

Create domain-specific IVAs using artificial intelligence techniques. 3. Identify application domains and simulate IVAs' behaviors. 4. Develop communication strategies that enable human-IVA interaction based on artificial intelligence techniques. 5. Apply the theory and programming knowledge covered in class to concrete exercises using a commercial game engine. 6. Compare and contrast the constraints and affordances for expressiveness in physical vs. virtual intelligent agents and human-like vs. non-humanoid agents. Credits: 3.00

CGT 52500 - Virtual Reality

Credit Hours: 3.00. This course introduces students to the hardware, software, and cognitive underpinnings necessary for creating cutting-edge virtual reality (VR) applications with a strong emphasis on immersive and interactive experiences, allowing students to explore and innovate within the realm of VR. Students will engage with various topics throughout the course, including computer graphics, human-computer interaction, applied perception, optics, and display technologies. Practical experience with consumer-grade virtual reality systems will empower students to design, develop, and analyze VR applications that are effective and comfortable for the user. This course aims to explore the vast potential of VR beyond traditional applications, highlighting its impact on entertainment, healthcare, education, and various other industrial domains. Through a combination of lectures, hands-on projects, and assignments, students will tackle the challenges of VR development, guided by design principles and real-world constraints. By the end of this course, students will be equipped with both knowledge and practical skills needed to design and develop VR experiences that push the boundaries of immersion and interactivity.

Learning Outcomes: 1. Discover novel virtual reality interaction techniques. This is accomplished via student research, instructor presentations, and student presentations. 2. Demonstrate new virtual reality design ideas by creating functional prototypes in a game engine. 3. Apply theory to create virtual reality experiences that will generate intuitive interactions and believable experiences for the user. 4. Develop interactive experiences in virtual reality environments. 5. Communicate complex virtual reality design ideas to an audience. 6. Synthesize new ideas from concepts learned from research and collaborative work in-class. 7. Collect and analyze user experience data. Credits: 3.00

CGT 53200 - UX Design Graduate Studio II: Cross-Channel

Credit Hours: 3.00. This course is an advanced exploration of cross-channel approaches to human-centered design, such as service design, that span digital and physical experiences. Students utilize principles of usability and user experience to create and evaluate physical prototypes. The course is platform-independent and encourages students to experiment with new and emerging technologies.

Learning Outcomes: 1. Conduct advanced analysis of various situations using appropriate processes and methodologies for UX. 2. Select and apply appropriate user research methods. 3. Prioritize design requirements based on user research. 4. Identify and frame perceived and real problems. 5. Distinguish among popular processes and methodologies for UX. 6. Create design concepts that address the issues of situations, clients, and problems that demonstrate an awareness of multiple user touchpoints. 8. Distinguish among methods for representing design ideas and processes. 9. Apply contextually appropriate methods for representing design ideas and processes. 10. Justify appropriateness of chosen methods. 11. Prototype multi-channel experiences that incorporate physical computing systems and other advanced technologies. 12. Apply human factors principles in the creation of physical prototypes. 13. Apply appropriate methods to evaluate multi-channel experiences. 14. Demonstrate technical competence with physical computing systems and other advanced technologies. 15. Design holistic experiences that integrate multiple channels cohesively. 16. Explain how design philosophy impacts design practice. 17. escribe how underlying assumptions and perspectives influence practice. 18. Identify key components of a design philosophy. 19. Articulate personal

design philosophy. 20. Apply advanced UX theory in the design and evaluation of interactive experiences. 21. Distinguish among relevant theoretical frameworks and constructs. 22. Utilize theoretical frameworks in the design of interactive experiences. 23. Analyze existing experiences using appropriate theoretical frameworks. Credits: 3.00

CGT 53700 - Applied Artificial Intelligence For Computer Graphics

Credit Hours: 3.00. This graduate-level survey course offers a comprehensive exploration of how AI technologies are revolutionizing computer graphics and applications, including animation, augmented reality (AR), virtual reality (VR), digital media, and interaction techniques. With a focus on both the theoretical foundations and practical applications of AI, the curriculum delves into machine learning, deep learning, neural networks, and their specific uses in creating visual content and interactive digital media applications. Students will engage in hands-on projects, ranging from individual experiments to collaborative efforts, designed to demonstrate AI's transformative potential in enhancing both the visual and interactive dimensions of computational media. By the end of this course, students will not only understand the current landscape of AI in computational media but also possess the technical, analytical, and creative skills needed to contribute meaningfully to this rapidly evolving field.

Learning Outcomes: 1. Design conceptually and prototype computer graphics applications that effectively incorporate AI technologies, demonstrating an understanding of how AI can enrich the content, enhance interaction, and increase realism within these applications. 2. Apply appropriate AI techniques and machine learning algorithms for tasks like object recognition, content generation, and natural user interfaces across a variety of computer graphics applications, including animation, virtual reality (VR), and augmented reality (AR). 3. Assess critically the ethical, societal, and technical implications of using AI in computational media, including considerations around data privacy, bias in AI models, and the broader impact of AI-generated graphics on industry and society. Credits: 3.00

CGT 54000 - Current Topics In 3D Animation

Credit Hours: 3.00. This course addresses recent research and development in 3D animation. Permission of instructor required.

Learning Outcomes: 1. Demonstrate an understanding of the latest research contributions in the field of 3D animation. 2. Discuss advanced/emerging 3D animation technologies and suggest improvements and alternatives. 3. Develop research, presentation, and writing skills related to technical content. 4. Effectively set up for animation (rig) realistic/fantasy creatures and objects. 5. Animate realistic/fantasy creatures and objects in a believable way. 6. Create physically accurate animations using rigid body and soft body dynamics, particle systems, cloth and hair. 7. Apply advanced/emerging animation methods and techniques to development of original animation-based productions. Credits: 3.00

CGT 54300 - Experimental Animation

Credit Hours: 3.00. This course introduces key theoretical and applied concepts of experimental animation. Evolving technology consistently provides new opportunities for experimental practices in animation production. In this course, students will engage with experimental creative practices including abductive reasoning, abstraction, generative animation, motion graphics, simulations, glitch and mixed digital media. These experimental animations are suitable for a wide range of outputs including experimental short film, installation, projection mapping and a range of online platforms.

Learning Outcomes: 1. Identify key examples of experimental digital animation and explain the relationship between experimental practices and technology. 2. Evaluate process and outcomes of experiments with digital graphics technology used to produce images and animation. 3. Appraise aesthetic or communication opportunities arising from new experimental production, linking these to contemporary image culture. 4. Create new experimental animated works for public display, screening or installation or for online dissemination. Credits: 3.00

CGT 54400 - Animation History, Technology And

Technique

Credit Hours: 3.00. This course traces the history of animation by reviewing the evolution of animation technology and the nexus between these technologies, production practices and crafts and the resulting styles, movements and genres of animation. The course reviews major technological developments of the 20th century that have impacted commercial animation production, as well as lesser known independent studios and artists, fringe technologies and sub genres. The course culminates with a consideration of current animation technology and the limits and opportunities it creates.

Learning Outcomes: 1. Identify important developments in animation production technology throughout the history of the medium. 2. Analyze examples of animation from the 20th and 21st century and assess correlations between technology, cultural history and animation production. 3. Evaluate and recommend animation tools based on aesthetic goals and project parameters. 4. Create animation projects utilizing a range of techniques and technologies that explore the limits and potentials of historical and contemporary animation methods. Credits: 3.00

CGT 54500 - Game Development I

Credit Hours: 3.00. In both research and industry game engines are the foundation for nearly all graphics-intensive interactive applications. A thorough understanding of how game engines work is therefore a requisite element of the game development process and lever for research in most domains involving interactive simulations and games. As game engine development, research, and application is a large and complex topic, the course is split into two semesters of study. The two courses are structured similarly but cover different aspects of development on and within game engines. This course introduces students to the fundamental technologies and skills required to develop video games using a modern game engine. Students are taught using a student-led, active-learning pedagogy in which students co-develop and present lectures, demonstrations, and assignments for their peers, with facilitation by the course instructor. The focus of this course is primarily on the technical, functional, and theoretical dimensions of game development, prioritizing technical soundness over design and creativity (which are covered more explicitly in a separate course). As research in this field continues to rapidly iterate, the latest findings are incorporated into each new offering of the course, refreshing its content as the technology evolves in its implementation and theoretical underpinnings. Production of original research focused upon an aspect of game development or game engine design is required.

Learning Outcomes: 1. Reproduce game mechanics observed in an existing game. 2. Present to a classroom the theory and implementation within a scientific paper or set of papers that relate to an aspect of game development and lead a subsequent discussion surrounding said implementation. 3. Extract practicable production information from papers, books, vendor documentation and ad hoc sources to solve open-ended technical problems. 4. Create a technically sound video game prototype within a team-based production environment. 5. Generate and test a research hypotheses related to games, game technology, or game development processes. Credits: 3.00

CGT 55400 - Configuration Management In The Digital Enterprise

Credit Hours: 3.00. This course will cover Configuration Management (CM) in the context of the digital enterprise and Product Lifecycle Management (PLM). Configuration Management applies processes, resources and controls to establish and maintain consistency between product configuration information and the product. Configuration information includes product requirements and changes to the product. This course provides preparation for IpX CM2 Certification at the Application Specialist level.

Learning Outcomes: 1. Learn how an organization is driven by requirements and why configuration management is essentially requirements management. 2. Learn how to use physical item hierarchies as a framework to subdivide complex configurations into manageable increments. 3. Learn how to use a similar administrative hierarchy to manage the requirements for the business enterprise. 4. Learn the difference between corrective action and real improvements and how to eliminate the need for intervention resources. Credits: 3.00

CGT 55500 - Game Development II

Credit Hours: 3.00. This course introduces students to the advanced concepts, technologies, skills that enable the creation of sophisticated video games, simulations, and game systems. Students are taught using student-led, active-learning pedagogy in which students co-develop and present lectures, demonstrations, and assignments for their peers, with the

facilitation of the course instructor. A thorough understanding of how game engines work is therefore a requisite element of the game development process and lever for research in most domains involving interactive simulations and games. As game engine development, research, and application is a large and complex topic, the course material is distributed across two semesters. In addition to the continuation of technical topics this course also emphasizes the experiential, conceptual, and aesthetic dimensions of game development, prioritizing implementation completeness with creative, aesthetically-pleasing implementations that are informed by current research. As research in this field continues to rapidly iterate, the latest findings are incorporated into each new offering of the course, refreshing its content as the technology evolves in its implementation and theoretical underpinnings. Production of original research focused upon an aspect of game development or game engine design is required. Permission of instructor required.

Learning Outcomes: 1. Interpret, describe, and present the theory and implementation of an advanced game development topic via student-led in-class lecture. 2. Present to a classroom the theory and implementation within a scientific paper or set of papers that relate to an aspect of game development and lead a subsequent discussion surrounding said implementation. 3. Extract practicable production/development information from papers, books, vendor documentation and ad hoc sources to solve open-ended technical problems. 4. Create (or extend from the previous course) a technically sound video game prototype within a team-based production environment. 5. Generate and test a research hypotheses related to games, game technology, or game development processes. Credits: 3.00

CGT 56200 - Cognition And Human-Computer Interaction

Credit Hours: 3.00. This course provides an overview of the role of human cognition in the use of interactive digital technologies. Students will learn fundamental theories and concepts of cognitive science that are relevant to interactive technology. The course takes a broad chronological approach, examining the history and development of cognitive theories and models in the field of human computer-interaction (HCI). Students will read seminal works from leading researchers in cognitive science and HCI. The course covers older well-established theories and models as well as newer speculative ones. Students will develop a sound understanding of the origins, development, and future directions of cognition research in HCI. Topics covered include: classical cognition; the cognitive revolution; mediated cognition; activity theory; situated action; embodied cognition; distributed, external, and extended cognition; enactive cognition; thinking and epistemic coping; make-believe and imagination; scaffolding and cognitive offloading; internal and external representations. Students are encouraged to make appropriate connections to their own research areas. No specific technical or programming experiences is required.

Learning Outcomes: 1. Critically assess the role of cognition in the use of interactive digital technologies. 2. Explain the history and development of cognition research in the field of human computer-interaction, including major theories and seminal works. 3. Apply concepts from the course in their own personal research. Credits: 3.00

CGT 57000 - Information Visualization

Credit Hours: 3.00. This course provides a systematic, comprehensive framework to study principles, design choices, and development toolkits on information visualization design and development. It focuses on creating innovative and intuitive visualization solutions to provide users with peripheral awareness of meaningful information from a complex data set. Employing a user-centric approach, this course studies and analyzes visualization design and development from data, tasks, and visualization and interactions. The students will learn perception theories on visualization and use visual elements such as space and color to encode data, compare, evaluate, choose among different visualization forms and interaction methods. Through a project-based learning approach, students will conduct case studies on various visualization designs, analyze the user, data, tasks, and design choices in the visualizations, and finally design and develop information visualization solutions as course projects. Students should have finished their undergraduate study in domains that are closely related to one or more of the following: business analysis, statistics, knowledge management, computer science, software engineering, interaction design, human-centered computing, scientific visualization or information visualization. Permission of department required.

Learning Outcomes: 1. Describe the purposes of visualization and the process of design and developing visualizations. 2. Explain visual encoding channels, visualization design rules, and design principles using scientific theories on visual perception. 3. Apply popular visualization forms to represent different types of data. 4. Analyze visualization designs to

differentiate the functions and purposes of visual elements and channels 5. Evaluate different visualization forms, arrangements, and interactions about their pro and cons, purposes, and suitable contexts. 6. Design, develop, and evaluate an innovative visualization system with interlinked multiple views to represent a large complex dataset. Credits: 3.00

CGT 57200 - Special Topics In Human-Centered Design And Development

Credit Hours: 3.00. This course offers students the opportunity to explore current topics in human-centered design and development of systems with graphical user interfaces in-depth through readings, discussions, design projects and design critiques. Topics vary by semester. Possible offerings include Critical Design, Design for Behavior Change, Participatory Design, Design for Social Good, Service Design, Social Interaction Design.

Learning Outcomes: 1. Describe, explain, and compare processes, methods and techniques of human-centered data. 2. Create deliverables such as, but not limited to: interactive prototypes, research reports, usability evaluation reports, scholarly research papers using HCDD processes, methods and techniques. 3. Critique HCDD processes, methods and techniques. 4. Evaluate HCDD deliverables using HCDD methods such as cognitive walkthrough, usability testing, focus groups, etc. 5. Lead teams through HCDD iterative processes used for creating. 6. Solve specific design problems using the appropriate HCDD processes, methods and techniques. Credits: 3.00

CGT 57207 - UX Design Graduate Experience Studio

Credit Hours: 3.00. This course immerses students in a company-like environment where they work on semester-long design projects that are sponsored by industry partners. Students learn about the various roles within a UX environment as they build collaboration and project management skills. Projects utilize a human-centered design approach with an emphasis on designing for the user experience. Students will engage in substantial research and evaluation activities, informed by seminal literature in the field, along with their design work. Students are expected to take responsibility for project deliverables and mentor junior students. Permission of department required.

Learning Outcomes: 1. Implement team-building skills and manage collaboration between teammates. Solve conflicts in a fair and effective manner that is a "lead by example" process. Organize and lead team retrospectives. Measure your UX role and your teammates, then determine growth plans (e.g., create team member growth plans; retrospective reflections; peer team evaluations; ...). 2. Develop a project strategy with tasks and deliverables based on project goals and team dynamics. Execute project management plan with milestones, and team member tasks. Champion the development of a UX project proposal that will clearly explain the project vision, direction, goals, stakeholders, deliverables, timeline, and tasks (e.g., identification, planning, and completion of project milestones; ...). 3. Demonstrate depth in one or more UX specializations and critique strengths and weaknesses. Teach UXD specialization tasks and process to team members. Educate team members about the roles and careers of UX designers. Document your educational path of UXD skill development in a written reflection (e.g., activity log of specialization goals and outcomes; guide to job searching; ...). 4. Communicate UX approaches to diverse stakeholders in a professional manner. Champion the final project written design documentation, including the executive summary. Enhance portfolio, conduct job search, and mentor junior students (e.g., sponsor-facing reports; executive summaries; lead presentation and documentation; ...). 5. Conduct advanced primary and secondary research in tandem with ongoing client communication and team design work. Write up research and evaluation findings in a formal paper. Credits: 3.00

CGT 57500 - Data Visualization Tools And Applications

Credit Hours: 3.00. This course provides hands-on experience in data visualization tools and applications. The course is designed for students with little or no background in Data Visualization. It introduces students to design principles for creating meaningful displays of quantitative and qualitative data to facilitate insight and decision-making. The goal is to introduce visualization as a tool, explore and identify which visualization tools are better suited to visualize different types of data, and understand the role visualization plays in understanding what the data represent. This course gives students an in-depth view of the various branches of visualization and the visualization tools in each area. After taking the course students will be able to evaluate data visualization tools and determine which tool to use for different types of data. This course is targeted towards students interested in using visualization in their own work and future academic courses.

Learning Outcomes: 1. Assess the visualization process. 2. Assess the applicability of various visualization tools. 3. Evaluate different techniques of visual representation. Credits: 3.00

CGT 58100 - Workshop In Computer Graphics Technology

Credit Hours: 0.00 to 8.00. Advanced study of technical and professional topics. Emphasis is on new developments relating to technical, operational, and training aspects of industry and technology education.

Learning Outcomes: 1. Vary by course offering. Credits: 0.00 to 8.00

CGT 59000 - Special Problems In Computer Graphics Technology

Credit Hours: 1.00 to 6.00. Independent study of a special problem under the guidance of a member of the staff. Does not substitute for either M.S. thesis or M.S. project credit. Permission of instructor required.

Learning Outcomes: 1. Vary by course offering. Credits: 1.00 to 6.00

CGT 59700 - Directed MS Capstone

Credit Hours: 3.00 to 6.00. An original investigation of a particular problem under the guidance of the instructor(s). The resulting product is a substantial project report with an evaluation or research component. Not applicable to a thesis option plan of study. Enrollment for a total of six credits is required. Permission of department required.

Learning Outcomes: 1. Independently identify a problem or opportunity and conduct a substantial project relevant to the student's focus area. 2. Iteratively evaluate project outcomes using appropriate research methods. 3. Communicate project process, outcomes, and relevant forms of evaluation through written and oral outputs. Credits: 3.00 to 6.00

CGT 59800 - Directed MS Project

Credit Hours: 1.00 to 3.00. A formal investigation of a particular problem under the guidance of the advisory committee. Not applicable to a thesis option plan of study. Enrollment during at least two consecutive terms for a total of three credits is required. Permission of instructor required.

Learning Outcomes: 1. Vary by course offering. Credits: 1.00 to 3.00

CGT 61000 - Visual Intelligence And Perception

Credit Hours: 3.00. This course focuses on the fundamentals of perception and cognition relative to vision and its implications to the field of computer graphics technology and the creation of graphics. Students will examine the foundations of human perception of form, shape, color, and motion, developing an understanding of why and how humans perceive visual information. Permission of instructor required.

Learning Outcomes: 1. Discover the history of investigations into visual perception. 2. Understand how the human vision system constructs an understanding of the 3D world. 3. Know the visual rules that govern the interpretation of form, shape, color and motion. 4. Understand the clinical aspects relative to vision and perception. 5. Learn to apply visual rules in the planning, creation and evaluation of all graphics. Credits: 3.00

CGT 62000 - Graphics Processing Unit Computing

Credit Hours: 3.00. This course provides a working knowledge of general-purpose graphics processing unit computing (GPGPU) using CUDA, OpenCL, and C++. OpenCL and CUDA are the platform independent industrial standard API and leading edge technology for GPGPU. The course focuses on utilizing, GPU for advanced tasks of scientific computing on parallelization of creating real-time and interactive applications and is structured into several blocks; parallel programming and synchronization tasks, GPU architecture, CUDA programming model, the OpenCL programming model. Permission of instructor required.

Learning Outcomes: 1. Understand the Graphics Processing Unit Computing models. 2. Understand the modern Graphic Processing

Units. 3. Parallelize sequential tasks and apply them to the Graphics Processing Unit Computing model. Credits: 3.00

CGT 62100 - Compute Shader Programming

Credit Hours: 3.00. Compute shaders allow graphics programmers to leverage the parallel processing power of the GPU for tasks besides rendering. Kinematics and other simulations, collision detection and image processing are common applications. In this class we will use several different shading languages to implement a variety of algorithms in both stand-alone applications and in game engines. Pre-Requisite: CGT 52000 (Concurrent Pre-Requisite) or CGT 52100 (Concurrent Pre-Requisite) or instructor permission.

Learning Outcomes: 1. Describe the capabilities and limitations of compute shaders. 2. Decompose problems into sequences of common parallel programming patterns (e.g., map, reduce, scan). 3. Implement efficient compute shaders with respect to computational and memory constraints. 4. Assess the efficiency of compute shaders. Credits: 3.00

CGT 63700 - Creative AI: Machine Learning For Creativity And Design

Credit Hours: 3.00. This graduate seminar offers an in-depth exploration into the creative and innovative intersections of artificial intelligence (AI) and machine learning with arts and design. As we witness a surge of breakthroughs in AI, this course aims to uncover the creative potential of new interaction techniques and art forms within these technological advances. Students will delve into how machine learning reshapes disciplines such as computational design, media arts, music, gaming, human-computer interaction, virtual reality, and graphics. The seminar has a dual focus: firstly, surveying the landscape of contemporary creative applications of deep learning across various fields; and secondly, empowering students to conceive and execute their own creative projects that leverage AI technologies. Coursework will be organized around the development of creative AI projects, to be completed either individually or collaboratively in small groups. Prerequisite: CGT 53700 or by permission of instructor.

Learning Outcomes: 1. Apply AI and machine learning techniques for creative purposes in fields such as animation, art, graphic design, digital media, and visual effects. 2. Contextualize and categorize creative AI projects within the history of electronic media, interactive arts, and visual design. 3. Devise and develop a series of creative projects using generative AI/ML programming techniques within contemporary software frameworks. 4. Evaluate the creativity, ethical considerations, and societal impacts of creative AI projects, as well as the creative potential of AI techniques and tools. Credits: 3.00

CGT 64500 - Games Research

Credit Hours: 3.00. This course instructs students in current methods of conducting research on digital games, ludology, and the game development process. The most current or impactful research in the field is presented, analyzed, and extrapolated upon. The course surveys a wide variety of specific topics that shift as new research findings are published. Previous topics have included: biofeedback, user experience evaluation in games, gameplay measurement and analysis, development pipelines, mathematical modeling of game design, publication strategies and methodologies, scientific document preparation, and simulation. Quantitative and qualitative approaches to conducting research in the field of digital and traditional games. Production of original research focused upon an aspect of games, ludology, game development, or simulation is required.

Learning Outcomes: 1. Conduct a thorough literature review of a chosen topic related to digital games and/or their development. 2. Present to a classroom a critical analysis of a scientific paper or set of papers and lead a discussion surrounding said research. 3. Prepare a human subjects research application (IRB) that meets all regulatory regulations required to conduct ethical human research. 4. Design and conduct a sound, logical study in the area of games. 5. Complete a publishable-quality scientific manuscript and submit it for publication. Credits: 3.00

CGT 67000 - Applications In Visual Analytics

Credit Hours: 3.00. Visual Analytics (VA) provides a fast way for people to make sense of large number of data, and has applications in many sectors. This course will introduce Visual Analytics through foundational theories and a broad range of techniques and tools, focusing on using visualization methods to reason and solve complex problems in a wide variety of applications. Visual analytics is the science of analytical reasoning facilitated by interactive visual interfaces that synthesize human and computational ability to attack large complex problems. It is concerned with analytical reasoning, interaction, data transformations, data visualization, analytic reporting, and technology transition. While the different visual

analytics applications share common theories and strategies, each of them has its unique data composition, visual representations, and analytical needs and strategies. Through survey and study a broad range of visual analytics applications, students will be able to apply visual analytics on their own applications, analyze and break down a complex analytical problem into proper components and steps, evaluate different visual analytic techniques and strategies, and finally design and develop an effective visual analytics solution toward the problem.

Learning Outcomes: 1. Describe the purposes, foundational theories, research components, and process of visual analytics. 2. Select proper visualization forms from visual analytics tools to answer specific reasoning questions. 3. Apply information visualization and visual analytics approaches to analyze complex problems from data processing, transformation, to visualization, and analysis. 4. Compare, analyze and assess different visual analytics approaches from various aspects such as effectiveness, efficiency, scalability, learnability, and user experience. 5. Develop a visual analytics solution and evaluate its efficacy in solving a complex domain problem. Credits: 3.00

CGT 69400 - CGT Graduate Seminar

Credit Hours: 0.00. The CGT Graduate Seminar is designed to provide opportunities for students to experience the breadth and depth of academic inquiry, raising their awareness of key challenges and opportunities for graduate research within the field of the department. Through participation in a series of interactive sessions and presentations, students will gain valuable insights into the diverse research areas within the department, discover potential research avenues, and become aware of critical issues in the fields.

Learning Outcomes: 1. Describe the range of research topics covered by CGT faculty. 2. Distinguish the various research methods and approaches used in CGT-related disciplines. 3. Identify research opportunities in CGT-related disciplines. Credits: 0.00

CGT 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required.

Learning Outcomes: 1. Vary by course offering. Credits: 1.00 to 18.00

Computer Sciences

CS 10100 - Digital Literacy (UCC: STS)

Credit Hours: 3.00. Survey of the digital world, computers as multi-purpose machines, digital information, definition of programming, computers everywhere (the Internet of things), computers that perform simultaneous computations, how apps work, data storage and searching, databases, digital audio, graphics, video, computer networks and the Internet, the World Wide Web and Internet sharing services, network and Internet performance, real-time services, artificial intelligence, cloud computing, security, and privacy. CS students may take course for elective credit only.

University Core Curriculum (UCC): (UCC: STS)

Learning Outcomes: 1. Understand how to decide the disk size needed when purchasing a computer or smart phone. 2. Understand why smart phones, desktop, and laptop computers have more than one processor (such as dual-core and quad-core devices). 3. Understand why computers are embedded in appliances and automobiles. 4. Understand why saving a document is required after changes are made and what a computer does when one saves a document. 5. Understand why music is available in a variety of digital formats, such as m4a, mp3, and wav. 6. Understand why someone acquires an Internet service that is 10 times faster than their current service, it is unlikely that web pages will load 10 times faster. 7. Understand when someone uses the Internet to communicate with a person who is halfway around the world, how the information travels between the two computers. 8. Understand why when someone streams a movie, they have to wait before the movie starts playing. 9. Understand why a computer may be able to fool you into thinking a human is really answering your questions. 10. Understand whether it is possible for a computer to control a car and navigate it through traffic on an actual highway. 11. Understand how, if you receive an email message that appears to come from a friend asking you to click on a link to see a Facebook page, you can tell whether it is safe to click the

link or not. 12. Understand where, when you upload a video to a cloud service (e.g., YouTube), the video is stored 13. Understand whether if a new virus appears, the virus protection software on your computer will prevent the virus from infecting your computer. 14. Understand whether or not if your bank's URL begins with "https", a criminal who wiretaps your Internet connection can see each keystroke you send to the bank. Credits: 3.00

CS 15900 - C Programming

Credit Hours: 3.00. Fundamental principles, concepts, and methods of programming in C, with emphasis on applications in the physical sciences and engineering. Basic problem solving and programming techniques; fundamental algorithms and data structures; and use of programming logic in solving engineering problems. Students are expected to complete assignments in a collaborative learning environment. Credit cannot be obtained for both CS 15900 and any of CS 15600, CS 15800 and CS 18000.

Learning Outcomes: 1. Understand the fundamental principles, concepts and methods of computer programming. 2. Use the C programming language to developing solutions in the domains of physical sciences, mathematics, and engineering. 3. Demonstrate the ability to function as part of a technical team to generate a solution to a programming problem. 4. Analyze alternative algorithm designs to implement solutions that make efficient use of limited resources of the computer. Credits: 3.00

CS 17600 - Data Engineering In Python

Credit Hours: 3.00. The course introduces students to programming fundamentals in Python, including loops, functions and different data types, and provides an introduction to data engineering including working with common data formats and learning the basics of data wrangling. Students will format, extract, clean, filter, transform, search, combine, summarize, aggregate, and visualize a diverse range of data sets. Python libraries including Matplotlib and Pandas are used.

Learning Outcomes: 1. Write Python code using loops, decision statements, and functions. 2. Explain how arguments are passed in Python functions and how the scope of variables impacts execution. 3. Use the operations on lists, tuples, and dictionaries to perform appropriate data manipulations. 4. Using Matplotlib, create informative plots and other data visualizations. Explain the key qualities of good visualizations. 5. Creating and manipulating DataFrames using Pandas. 6. Create Python code as well as methods in Pandas to select, search, change, and summarize data in tables. 7. Explain how to identify and fill in missing values in data. 8. Apply Pandas functions combine and merge datasets, perform a range of data aggregations, groupings and cross tabulations. 9. Given multiple data sets, demonstrate how to summarize, transform, combine the data sets, and aggregate and visualize the resulting data set. Credits: 3.00

CS 17700 - Programming With Multimedia Objects

Credit Hours: 4.00. Introduction to computers and programming: number representations, primitive data types and operations, basic control structures, programming applets and applications using graphical user interfaces, programming for detecting events and performing actions, processing multimedia objects such as images and sounds. Throughout the course, examples are drawn from a variety of fields in the natural sciences. Not open to CS majors with a grade of C or better in CS 18000 . Not open to non-CS majors with a grade of C or better in any course in computer programming.

Credits: 4.00

CS 18000 - Problem Solving And Object-Oriented Programming

Credit Hours: 4.00. Problem solving and algorithms, implementation of algorithms in a high level programming language, conditionals, the iterative approach and debugging, collections of data, searching and sorting, solving problems by decomposition, the object-oriented approach, subclasses of existing classes, handling exceptions that occur when the program is running, graphical user interfaces (GUIs), data stored in files, abstract data types, a glimpse at topics from other CS courses. Intended primarily for students majoring in computer sciences. Credit cannot be obtained for both CS 18000 and any of 15600, 15800 and 15900. Not open to students with credit in CS 24000.

Learning Outcomes: 1. Understand solving problems by analyzing the problem, designing an algorithm, and programming the solution.

Credits: 4.00

CS 18200 - Foundations Of Computer Science

Credit Hours: 3.00. Logic and proofs; sets, functions, relations, sequences and summations; number representations; counting; fundamentals of the analysis of algorithms; graphs and trees; proof techniques; recursion; Boolean logic; finite state machines; pushdown automata; computability and undecidability.

Learning Outcomes: 1. Understand discrete mathematical tools, facts, and reasoning relevant to computer science. Credits: 3.00

CS 18300 - Professional Practice I

Credit Hours: 0.00. Professional Practice. Permission of instructor required.

Credits: 0.00

CS 18400 - Professional Practice II

Credit Hours: 0.00. Professional Practice. Permission of instructor required.

Credits: 0.00

CS 19000 - Topics In Computer Sciences

Credit Hours: 1.00 to 5.00. Topics vary. Permission of instructor required.

Credits: 1.00 to 5.00

CS 19100 - Freshman Resources Seminar

Credit Hours: 1.00. This course is intended to integrate freshman majors in computer sciences into the department, help them adjust to university life, and assist them in developing academic and intellectual survival skills. Weekly recitation sections enable the students to work in teams. Strongly recommended for freshmen. The credit may be used only toward free electives.

Credits: 1.00

CS 19300 - Tools

Credit Hours: 1.00. This course is designed to introduce new Computer Science students to various programming tools which will aid them in their Computer Science classes, personal projects, and software development job experiences.

Learning Outcomes: 1. Understand Unix/Linux commands for navigating directories and files and manipulating files and folders. 2. Understand terminal commands for searching and input/output redirection. 3. Understand shells such as sh, csh, ksh, tcsh, bash, zsh. 4. Understand debugging via print statements and general debugger concepts. 5. Understand version control via Git and Github, source control, workflow, commit, collaboration, pull, push, create and pushing a new repository, cloning, branches, merging, and conflicts. 6. Understand vim including mouseless navigation, normal/insert mode, copy/paste, search/replace, and saving/quitting. Credits: 1.00

CS 19700 - Freshman Honors Seminar

Credit Hours: 1.00. A seminar dealing with the history, context, and future of computer science. Open only to students in the Computer Sciences Honors Program. The credit may be used only toward free electives.

Credits: 1.00

CS 21100 - Competitive Programming I

Credit Hours: 2.00. CP1 teaches applied algorithmic ideas and problem solving techniques to solve programming interview and competitive programming questions including usage of basic data structures such as [array, set, map, stack, queue, deque, priority queue], the four main algorithm paradigms: [complete search, greedy, divide and conquer, dynamic programming], other algorithmic ideas including [binary search the answer/bisection, meet-in-the-middle, prefix sum and difference arrays, two pointers, sliding window], and basic graph algorithms covering [strongly/connected components, floodfill, topological sort, shortest paths].

Learning Outcomes: 1. Differentiate between categories of problems in computer science including complete search, greedy, divide and conquer, dynamic programming, and various types of graph problems, as well as subcategories in each of these categories. 2. Implement well-known solutions (as discussed in class) to all major categories of problems in computer science (listed in LO1). 3. Use new/novel algorithms to solve problems. 4. Recognize key characteristics of certain problem types listed in LO1. 5. Classify a problem by those key characteristics. 6. Deconstruct a problem into subproblems that can be solved individually. 7. Assemble those subproblems into a complete solution. 8. Determine runtime and space usage of a potential solution using big-O notation to judge if the potential solution will work. 9. Create an efficient solution to a problem based on analysis of the problem type, the deconstructed problem parts, and the time and space constraints of the

problem. 10. Reflect on how one came up with a solution to a problem to better recognize patterns in problem types. 11. Debug programs by generating custom test cases based on problem constraints. Credits: 2.00

CS 23500 - Introduction To Organizational Computing

Credit Hours: 3.00. People and organizations, decision-making, information systems, telecommunications, desktop systems, integration tools, collaboration and groupware, multimedia, authoring multimedia documents, emerging technologies. May not be taken for credit by Computer Science majors.

Credits: 3.00

CS 24000 - Programming In C

Credit Hours: 3.00. The UNIX environment, C development cycle, data representation, operators, program structure, recursion, macros, C preprocessor, pointers and addresses, dynamic memory allocation, structures, unions, typedef, bit-fields, pointer/structure applications, UNIX file abstraction, file access, low-level I/O, concurrency.

Learning Outcomes: 1. Understand programming principles and techniques for problem solving in the C programming language. Credits: 3.00

CS 24200 - Introduction To Data Science

Credit Hours: 3.00. (STAT 24200) This course provides a broad introduction to the field of data science. The course focuses on using computational methods and statistical techniques to analyze massive amounts of data and to extract knowledge. It provides an overview of foundational computational and statistical tools for data acquisition and cleaning, data management and big data systems. The course surveys the complete data science process from data to knowledge and gives students hands-on experience with tools and methods. Basic knowledge of Python required. Computer Science majors cannot count this course as a degree requirement but can take it for credit as a free elective if taken before CS 37300, 34800, 47100, 47300, 44800.

Learning Outcomes: 1. Use Python, R, and selected tools to scrape, clean, process, and visualize data. 2. Apply data management techniques to prepare, parse, manipulate, and store data. 3. Use statistical methods to summarize data and identify relationships. 4. Explain how to formulate new hypotheses and draw accurate conclusions from data. 5. Apply statistics and computational analysis to make predictions based on data. 6. Apply basic computer science concepts such as modularity, abstraction, and encapsulation to data analysis problems. 7. Effectively communicate the outcome of data analysis using descriptive statistics and visualizations. Credits: 3.00

CS 24300 - Artificial Intelligence Basics

Credit Hours: 3.00. This course provides an introduction to foundational areas of artificial intelligence and current techniques for building intelligent systems. As an entry-level course for Artificial Intelligence, the primary goals of this course are: Teach fundamental building blocks of an intelligent system, namely, knowledge representation; learning; model validation, diagnosis, and visualization; reasoning and decision-making; probabilities and uncertainty in AI. Provide students with first-hand experiences in building a working machine learning and an automated reasoning system. Provide an overview of current state-of-the-art technologies in multiple domains of artificial intelligence. Broaden the students' horizon and spark their interests via learning about exciting applications of artificial intelligence in many aspects of human society.

Learning Outcomes: 1. Use data processing and implement learning and reasoning algorithms using Python. 2. Determine how to represent knowledge in an AI system. 3. Build a first-hand machine learning system. Know and be able to build all basic components of the entire machine learning pipeline, including data collection, wrangling, cleaning, model selection, training, cross-validation, and diagnosis. 4. Master the mathematical theory behind linear regressors and classifiers. 5. Build a first-hand automated reasoning system, learn how to formulate real-world problems as constraint programs, solve reasoning problems and make complex decisions using AI. 6. Produce a reasoning system using depth-first search. 7. Demonstrate basic knowledge of the full landscape of AI: game playing, causality, fairness/bias/ethics, uncertainty handling, reinforcement learning. Credits: 3.00

CS 25000 - Computer Architecture

Credit Hours: 4.00. Digital logic: transistors, gates, and combinatorial circuits; clocks; registers and register banks; arithmetic-logic units; data representation: big-endian and little-endian integers; ones and twos complement arithmetic; signed and unsigned values; Von-Neumann architecture and

bottleneck; instruction sets; RISC and CISC designs; instruction pipelines and stalls; rearranging code; memory and address spaces; physical and virtual memory; interleaving; page tables; memory caches; bus architecture; polling and interrupts; DMA; device programming; assembly language; optimizations; parallelism; data pipelining.

Learning Outcomes: 1. Students understand the function of basic hardware, including fundamentals of digital logic, processors, memory, and I/O. Credits: 4.00

CS 25100 - Data Structures And Algorithms

Credit Hours: 3.00. Running time analysis of algorithms and their implementations, one-dimensional data structures, trees, heaps, additional sorting algorithms, binary search trees, hash tables, graphs, directed graphs, weighted graph algorithms, additional topics.

Learning Outcomes: 1. Understand fundamental data structures, fundamental algorithms, and their implementation. Credits: 3.00

CS 25200 - Systems Programming

Credit Hours: 4.00. Low-level programming; review of addresses, pointers, memory layout, and data representation; text, data, and bss segments; debugging and hex dumps; concurrent execution with threads and processes; address spaces; file names; descriptors and file pointers; inheritance; system calls and library functions; standard I/O and string libraries; simplified socket programming; building tools to help programmers; make and make files; shell scripts and quoting; Unix tools including sed, echo, test, and find; scripting languages such as awk; version control; object and executable files (.o and a.out); symbol tables; pointers to functions; hierarchical directories; and DNS hierarchy; programming embedded systems.

Learning Outcomes: 1. Have an appreciation and ability for low-level (systems) programming and debugging. Credits: 4.00

CS 25300 - Data Structures And Algorithms For DS/AI

Credit Hours: 3.00. This course gives a broad introduction to the most important data structures and algorithms in computer science. The emphasis is on data structures and their use in algorithms relevant for data science and AI and their applications. The course focuses on developing and comparing efficient implementations, assessing suitability of data structures for massive data sets, and understanding effective use, modifications, and extensions. This course will not fulfill CS 25100 requirement for any Computer Science major or minor.

Learning Outcomes: 1. Apply an asymptotic analysis to given code and explain its significance. 2. Analyze asymptotic performance of data structures and algorithms with respect to time and space. 3. Describe different implementations of a data structure and explain when what implementation is most efficient. 4. Demonstrate how to add functionality to a data structure to efficiently handle new operations and queries. 5. Assess how the choice of data structures and algorithm design methods impacts the performance of programs. 6. Make effective and appropriate use of data structures such as stacks, queues, linked lists, hash tables, Bloom filters, priority queues, dictionaries, search trees, tries, and graphs. Credits: 3.00

CS 28400 - Professional Practice III

Credit Hours: 0.00. Professional Practice. Permission of instruction required.

Credits: 0.00

CS 28401 - Professional Practice Part-Time

Credit Hours: 0.00. Professional Practice Part-Time. The instructor determines the adequacy of the student's preparation for the work assignment proposed by the prospective employer for the student. Permission of Instructor required.

Credits: 0.00

CS 29000 - Topics In Computer Sciences

Credit Hours: 1.00 to 5.00. Topics vary. Permission of instructor required.

Credits: 1.00 to 5.00

CS 29100 - Sophomore Development Seminar

Credit Hours: 1.00. Presentations by corporate partners about careers in computer science. Presentations by faculty about careers in academia and research. Students learn about upper-division courses, tour research laboratories, and attend job fairs.

Credits: 1.00

CS 29199 - Cooperative Experience I

Credit Hours: 0.00. Professional experience in computer science. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.

Learning Outcomes: 1. Apply knowledge to identifying and solving problems in the professional context. 2. Advance skills related to professional preparation, critical thinking, problem solving, communication, and

teamwork. 3. Increase understanding of the profession and practice, basic industry principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

CS 29299 - Cooperative Experience II

Credit Hours: 0.00. Professional experience in computer science. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.

Learning Outcomes: 1. Apply knowledge to identifying and solving problems in the professional context. 2. Advance skills related to professional preparation, critical thinking, problem solving, communication, and teamwork. 3. Increase understanding of the profession and practice, basic industry principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

CS 30700 - Software Engineering I

Credit Hours: 3.00. An introduction to the methods and tools of software engineering; software life cycle; specification and design of software, software testing, cost and effort estimation; laboratory exercises with design, testing, and other tools.

Learning Outcomes: 1. Architect and design quality software. 2. Contrast and critique software lifecycle models. 3. Create software using current software engineering tools, methods, and concepts. 4. Work together on a team in a productive and professional manner. 5. Inspect and test software and documentation. Credits: 3.00

CS 31100 - Competitive Programming II

Credit Hours: 2.00. CP2 teaches experienced programmers additional techniques to solve interview and competitive programming problems and builds on material learned in CP1. This includes specific algorithmic techniques such as [shortest paths, topological sort, MST, union find, range queries], advanced algorithms surrounding trees and DAGs, advanced problem types in [dynamic programming, backtracking/simulation, mathematics, string processing], and more. It can be viewed as a programming complement to CS 38100, with some overlap in content.

Learning Outcomes: 1. Differentiate between advanced categories of problems in computer science including backtracking/simulation, advanced dynamic programming, advanced graphs (including trees and DAGs), mathematics, string processing, and range queries, as well as subcategories in each of these categories. 2. Implement well-known solutions (as discussed in class) to advanced categories of problems in computer science (listed in LO1). 3. Identify when a problem spans multiple categories of problems (as listed in LO1) 4. Design algorithms to solve problems that span multiple categories of problems. 5. Use new/novel algorithms to solve advanced problems. 6. Recognize key characteristics of certain problem types listed in LO1. 7. Classify an advanced problem by those key characteristics. 8. Deconstruct an advanced problem into subproblems that can be solved individually. 9. Determine runtime and space usage of a potential solution using big-O notation to judge if the potential solution will work. 10. Create an efficient solution to a problem based on analysis of the problem type, the deconstructed problem parts, and the time and space constraints of the problem. 11. Reflect on how one came up with a solution to a problem in order to better recognize patterns in problem types. Credits: 2.00

CS 31400 - Numerical Methods

Credit Hours: 3.00. Iterative methods for solving nonlinear equations; direct and iterative methods for solving linear systems; approximations of functions, derivatives, and integrals; error analysis.

Credits: 3.00

CS 33400 - Fundamentals Of Computer Graphics

Credit Hours: 3.00. Fundamental principles and techniques of computer graphics. The course covers the basics of going from a scene representation to a raster image using OpenGL. Specific topics include coordinate manipulations, perspective, basics of illumination and shading, color models, texture maps, clipping and basic raster algorithms, fundamentals of scene constructions. CS 31400 is recommended.

Credits: 3.00

CS 34800 - Information Systems

Credit Hours: 3.00. File organization and index structures; object-oriented database languages; the relational database

model with introductions to SQL and DBMS; hierarchical models and network models with introductions to HDDL, HDML, and DBTG Codasyl; data mining; data warehousing; database connectivity; distributed databases; the client/server paradigm; middleware, including ODBC, JDBC, CORBA, and MOM.

Learning Outcomes: 1. Learn about different data models (relational, graph, and document) used in different database systems. 2. Learn how to pose complex database queries in SQL and NoSQL languages as well as theoretical query languages. 3. Gain an introductory background in indexing. 4. Learn about transactions and concurrency control. 5. Differentiate between OLTP and OLAP applications. Credits: 3.00

CS 35100 - Cloud Computing

Credit Hours: 3.00. Introduction to cloud computing. Cloud data center infrastructure, public and private clouds, servers and virtualized servers, data center networks and virtualized networks, virtualized disk, file, and object storage, the concept of scale-out, algorithms and programming systems used in the design and implementation of cloud-native software, especially using containers and orchestration systems, microservices, serverless designs, controller-based designs, edge and fog computing, security in a cloud environment, programming models.

Learning Outcomes: 1. Describe physical facilities and virtualized technologies used in a cloud data center. 2. Understand major algorithms and programming paradigms used to build cloud-native software. 3. Design and deploy containerized software in a cloud environment. 4. Demonstrate orchestration of container software. Credits: 3.00

CS 35200 - Compilers: Principles And Practice

Credit Hours: 3.00. Should not be taken concurrently with CS 35400. The theory and practice of programming language translation, compilation, and run-time systems, organized around a significant programming project to build a compiler for a simple but nontrivial programming language. Modules, interfaces, tools. Data structures for tree languages. Lexical analysis, syntax analysis, abstract syntax. Symbol tables, semantic analysis. Translation, intermediate code, basic blocks, traces. Instruction selection, CISC and RISC machines. Liveness analysis, graph coloring register allocation. Supplemental material drawn from garbage collection, object-oriented languages, higher-order languages, dataflow analysis, optimization, polymorphism, scheduling and pipelining, memory hierarchies.

Learning Outcomes: 1. Provides students with an understanding of how a computer program is converted into elementary code that causes the computer to produce the output intended by the programmer. Credits: 3.00

CS 35300 - Principles Of Concurrency And Parallelism

Credit Hours: 3.00. Important concepts, models, algorithms, abstractions, and implementation aspects of concurrent and parallel programs. Topics include: techniques used to describe concurrent programs (e.g., threads, events, co-routines, continuations), abstractions for shared-memory and message-passing programs, relaxed memory models, livelock and deadlock detection, lock-free algorithms, data races and atomicity, scheduling techniques, process calculi, and software transactions.

Learning Outcomes: 1. This course provides students the vocabulary and concepts to better understand how to design and program scalable multicore processors. Credits: 3.00

CS 35400 - Operating Systems

Credit Hours: 3.00. Should not be taken concurrently with CS 35200. Introduction to operating systems. Computer system and operating system architectures, processes, inter-process communication, inter-process synchronization, mutual exclusion, deadlocks, memory hierarchy, virtual memory, CPU scheduling, file systems, I/O device management, security.

Learning Outcomes: 1. Provides students with an understanding of the fundamentals of computer operating systems. Credits: 3.00

CS 35500 - Introduction To Cryptography

Credit Hours: 3.00. An introduction to cryptography basics: Classic historical ciphers including Caesar, Vigenere, and Vernam ciphers; modern ciphers including DES, AES, Pohlig-Hellman, and RSA; signatures and digests; key exchange; simple protocols; block and stream ciphers; network-centric protocols.

Learning Outcomes: 1. Understand the basic concepts and proof techniques in cryptography. 2. Develop skills to define and evaluate the security of existing schemes. 3. Construct provably secure schemes for common cryptographic tasks. Credits: 3.00

CS 36100 - Great Issues In Computer Science

Credit Hours: 3.00. This course provides an overview of current and essential professional and ethical issues in computing and their impact on society. Topics specialize in the impact of computing, including algorithmic bias, motives behind design

decisions, data ethics, privacy and security, and legal issues. The goal of this course is to equip students with the framework and context necessary to think critically about the impact of computing. Discussions and readings will include current events.

Learning Outcomes: 1. Identify the causes behind some contemporary ethical concerns in computing. 2. Apply critical thinking and analytical abilities to a conversation around the impact of computing on society. 3. Apply reasoning to real-world case studies to analyze the ramifications of unethical practices. 4. Appreciate the importance of diverse experiences, thoughts, and backgrounds in Computer Science, both in academia and industry. 5. Understand some legal issues, privacy impacts, social issues, and other topics as they apply to computing. Credits: 3.00

CS 37300 - Data Mining And Machine Learning

Credit Hours: 3.00. This course will introduce students to the field of data mining and machine learning, which sits at the interface between statistics and computer science. Data mining and machine learning focuses on developing algorithms to automatically discover patterns and learn models of large datasets. This course introduces students to the process and main techniques in data mining and machine learning, including exploratory data analysis, predictive modeling, descriptive modeling, and evaluation.

Learning Outcomes: 1. Identify key elements of data mining and machine learning algorithms. 2. Understand how algorithmic elements interact to impact performance. 3. Understand how to choose algorithms for different analysis tasks. 4. Analyze data in both an exploratory and targeted manner. 5. Implement and apply basic algorithms for supervised and unsupervised learning. 6. Accurately evaluate the performance of algorithms, as well as formulate and test hypotheses. Credits: 3.00

CS 38001 - C++ Programming

Credit Hours: 1.00. This course builds on the CS 24000 (Programming In C) course to teach C++ extensions. This 5-week one-credit course teaches C++ programming and helps students improve their understanding of object-oriented programming. It also teaches how to use an Integrated Development Environment (IDE) when programming in C++.

Learning Outcomes: 1. Understand how to program in C++. 2. Understand how to program in object-oriented languages in general. 3. Understand how to implement some basic Software Patterns in C++. 4. Understand how to use an IDE when programming in C++. Credits: 1.00

CS 38002 - Advanced Java Programming

Credit Hours: 1.00. This course builds on the Java course CS 18000 (Problem Solving And Object Oriented Programming) to teach advanced topics in Java. This 5-week one-credit course will teach advanced topics such as Network Programming in Java, JDBC, JNI, and J2EE to write web applications in Java. You will also improve your understanding of Object Oriented Programming.

Learning Outcomes: 1. Understand advanced features such as Network Programming in Java, J2EE, JDBC, Java Swing, and JNI. 2. Understand how to improve programming skills in object-oriented languages. Credits: 1.00

CS 38003 - Python Programming

Credit Hours: 1.00. This course teaches the Python programming language assuming that students have already taken a course in computer programming. This 5-week one-credit course teaches the Python language, the most common modules used in Python, as well as how to write Python web applications.

Learning Outcomes: 1. Understand how to write applications in Python. 2. Understand how to improve programming skills in object-oriented languages. Credits: 1.00

CS 38100 - Introduction To The Analysis Of Algorithms

Credit Hours: 3.00. Techniques for analyzing the time and space requirements of algorithms. Application of these techniques to sorting, searching, pattern-matching, graph problems, and other selected problems. Brief introduction to the intractable (NP-hard) problems.

Learning Outcomes: 1. Use big O-notation to give asymptotic time and space bounds of algorithms. 2. Explain the use of big-Omega, big-Theta, and little-o notations. 3. Use recurrence relations to determine the time complexity of recursive algorithms. 4. Solve recurrence relations commonly arising in algorithm design. 5. Give examples that

illustrate time-space trade-offs of algorithms.

Credits: 3.00

CS 38600 - Professional Practice IV

Credit Hours: 0.00. Professional Practice. Permission of instructor required.

Credits: 0.00

CS 39000 - Topics In Computer Sciences

Credit Hours: 1.00 to 5.00. Topics vary. Permission of instructor required.

Credits: 1.00 to 5.00

CS 39100 - Junior Resources Seminar

Credit Hours: 1.00. This seminar course engages a number of outside speakers who typically present information on the role of research in computer science, how the research components of computer science relate to each other, approaches to software development in industry, different types of application development paradigms, technological trends, and societal, ethical, and legal issues. The credit may be used only toward free electives.

Credits: 1.00

CS 39399 - Cooperative Experience III

Credit Hours: 0.00. Professional experience in computer science. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.

Learning Outcomes: 1. Apply knowledge to identifying and solving problems in the professional context. 2. Advance skills related to professional preparation, critical thinking, problem solving, communication, and teamwork. 3. Increase understanding of the profession and practice, basic industry principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

CS 39499 - Extensive Cooperative Experience IV

Credit Hours: 0.00. Professional experience in computer science. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.

Learning Outcomes: 1. Apply knowledge to identifying and solving problems in the professional context. 2. Advance skills related to professional preparation, critical thinking, problem solving, communication, and teamwork. 3. Increase understanding of the profession and practice, basic industry principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

CS 39599 - Extensive Cooperative Experience V

Credit Hours: 0.00. Professional experience in computer science. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.

Learning Outcomes: 1. Apply knowledge to identifying and solving problems in the professional context. 2. Advance skills related to professional preparation, critical thinking, problem solving, communication, and teamwork. 3. Increase understanding of the profession and practice, basic industry principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

CS 39699 - Professional Practice Internship

Credit Hours: 0.00. To obtain professional practice with qualified employers within industry, government, or small business. Permission of department required.

Learning Outcomes: 1. Identify the practices, protocols, and key skills used for various positions of a particular organization and/or industry in which they are working. 2. Reflect on their professional growth, personal development, and the practical application of theoretical knowledge within their chosen field. 3. Refine and reassess their own career goals as a result of the experience. Credits: 0.00

CS 39700 - Honors Seminar

Credit Hours: 0.00. A seminar for all sophomores, juniors, and seniors in the Computer Sciences Honors Program. Meets eight times each semester under the supervision of the Honors coordinator. The meetings focus on honors research projects, helping students to identify appropriate projects and form groups, and providing a forum for juniors and seniors to report on their projects as required in the honors program.

Credits: 0.00

CS 40700 - Software Engineering Senior Project

Credit Hours: 3.00. A capstone course combining all the concepts students have learned in the Software Engineering Track: software and software engineering, working as a team leader and as a team member, Agile Software Development, Scrum Software Development, Version Control, basing software development on reusable technology, developing requirements

(User Stories and Use Cases), modelling with classes, design patterns, focusing on users, modelling interactions and behavior, architecting and designing software, testing and inspecting, managing the software development process. This is a project course. Students are organized into 4-6 student teams. Each team completes a full-semester software engineering project. Each team creates a Project Charter, Product Backlog, Design, and for 3 Sprints -- Planning Document, Demo, Retrospective Document. The final demo is a formal presentation.

Learning Outcomes: 1. Understand the software development process. 2. Understand the best methods to plan, analyze, design, test, measure, and manage software projects. 3. Understand agile methodologies in general and specifically Scrum. 4. Understand how to use version control systems in a team software engineering project. 5. Understand that good people are one of, if not the most important, requirements for successful projects. 6. Understand how to work on a team project as a team leader and/or team member. Credits: 3.00

CS 40800 - Software Testing

Credit Hours: 3.00. Preliminaries: errors and testing; software quality, requirements, behavior, and correctness; testing, debugging, verification; control flow graphs, dominators; types of testing; Test selection: from requirements, finite state models, and combinatorial designs; regression testing and test minimization; Test adequacy assessment: control and data flow; mutation based; testing tools.

Learning Outcomes: 1. Understand the basic technology related to software testing and debugging. 2. Differentiate between reliability and correctness. 3. Understand the impact of the saturation effect on the test process and its cost. 4. Understand the relationship between software development and test processes. 5. Apply a variety of black box test generation methods manually and using tools. 6. Use test adequacy criteria and understand their respective cost and effectiveness. 7. Select appropriate software test tools for a given testing task. Credits: 3.00

CS 41100 - Competitive Programming III

Credit Hours: 2.00. CP3 teaches experienced programmers additional techniques to solve competitive programming problems and builds on material learned in CP1 and CP2. This includes algorithmic techniques in topics such as [network flow, computational geometry, graph matching, NP-hard problems]. Primarily, CP3 prepares students to compete in programming contests, which means most class time is focused on simulating contest environments and teaching teamwork and communication alongside problem practice.

Learning Outcomes: 1. Differentiate between advanced categories of problems in computer science including network flow, computational geometry, graph matching, and NP-hard problems, as well as subcategories in each of these categories. 2. Extrapolate generalized solutions and problem-solving strategies across advanced categories listed in LO1 as well as in general competitive programming categories. 3. Design algorithms to solve problems that span multiple advanced categories of problems, combining categorical solutions in complex ways. 4. Use new/novel algorithms to solve advanced problems. 5. Deconstruct an advanced problem into subproblems that can be solved individually. 6. Quickly determine runtime and space usage of a potential solution using big-O notation to judge if the potential solution will work. 7. Create an efficient solution to a problem based on analysis of the problem type, the deconstructed problem parts, and the time and space constraints of the problem. 8. Communicate ideas quickly and concisely to other competitive programmers to create efficient solutions. Credits: 2.00

CS 42200 - Computer Networks

Credit Hours: 3.00. Undergraduate-level introduction to computer networks and data communication. Low-level details of media, signals, and bits: time division and frequency division multiplexing; encoding; modulation; bandwidth, throughput, and noise. Packet transmission: Local Area Network (Ethernet, FDDI) and Wide Area Network technologies (ATM); wireless networks; network interconnection with repeaters, bridges, and switches; DSU/CSU; xDSL and cable modems. Internetworking: router-based architecture; IP addressing; address binding with ARP; datagram encapsulation and fragmentation; UDP and TCP, retransmission; protocol ports; ICMP and error handling. Network applications: client/server concept; port demultiplexing; program interface to protocols (API); use by clients and servers; domain name system; TELNET; Web technologies including

HTTP, CGI, Java; RPC and middleware; network management.

Credits: 3.00

CS 42600 - Computer Security

Credit Hours: 3.00. A survey of the fundamentals of information security. Risks and vulnerabilities, policy formation, controls and protection methods, database security, encryption, authentication technologies, host-based and network-based security issues, personnel and physical security issues, issues of law and privacy.

Learning Outcomes: 1. Apply the notions of threat, vulnerability, attack, countermeasure, security objectives, and adversarial models when analyzing security of computer and information systems. 2. Explain the main authorization mechanisms and access control models, and their applicability in different situations. 3. Explain security issues related to password and other authentication mechanisms. 4. Explain the different types of malware, the mechanisms of their propagation, and the strengths and limitations of different defense mechanisms. 5. Identify the threats and vulnerabilities for a networked environment, and explain different countermeasures, and their effectiveness. 6. Explain the vulnerabilities brought about by modern web-based application and services, different countermeasures, and their effectiveness. Credits: 3.00

CS 43400 - Advanced Computer Graphics

Credit Hours: 3.00. Advanced concepts and techniques of computer graphics. The course covers, in complete detail, going from a scene representation to a raster image without using OpenGL or other graphics packages. The course develops a complete graphics implementation in which the students implement every aspect of the graphics pipeline. This involves a substantial software project in C/C++.

Credits: 3.00

CS 43900 - Introduction To Data Visualization

Credit Hours: 3.00. The course offers an introduction to the fundamentals principles, design strategies, and techniques needed to visually communicate, explore, and analyze data. The course focuses primarily on the visual representation of inherently non-spatial data (e.g., tables and spreadsheets, graphs and networks, trees, text, and time series), but also considers the visualization of maps and of data in geospatial context.

Learning Outcomes: 1. Describe the main visualization techniques and explain their strengths and limitations. 2. Select the most perceptually effective visual encoding for a given data attribute. 3. Perform a principled critique of an existing data visualization. 4. Design an effective data visualization solution for a given data set to address a specific data analysis objective. 5. Create interactive web-based visualizations using open-source software libraries. Credits: 3.00

CS 44000 - Large Scale Data Analytics

Credit Hours: 3.00. This course provides an integrated view of the key concepts of modern algorithmic data analytics. It focuses on teaching principles and methods needed to analyze large datasets in
order to extract novel, transformative insights for the underlying application. The course emphasizes the duality between formulating questions that can be answered by statistical data analysis tools (the statistical perspective) and the algorithmic challenge of actually extracting such answers using available parallel and distributed computational resources from massive datasets. The topics cover three areas: (1) algorithmic concepts necessary for big data analytics, (2) big data systems, including data management and programming, and (3) advanced analytic methods to address characteristics of real-world big data problems.

Learning Outcomes: 1. Identify techniques appropriate for solving a data analytics challenge. 2. Load and manipulate data in distributed computing environments. 3. Apply computing paradigms to effectively write efficient and scalable algorithms for data analysis pipelines. Know limitations, design details and design decisions of these algorithms. 4. Apply mixed-precision optimization and parallel learning algorithms to modern machine learning algorithms. 5. Present results in methods appropriate for domain experts. Credits: 3.00

CS 44100 - Data Science Capstone

Credit Hours: 3.00. The Capstone course aims at providing students with an opportunity to integrate their accumulated knowledge and technical and social skills in order to identify and solve realistic or real-world data science problem, with an emphasis on the application domain. Capstone projects are

often sponsored by corporate partners or by academic or non-academic research groups. The Capstone course serves as preparation for students entering into the profession of Data Science. Students will conduct a team-based project through the entire data science pipeline, by following the six phases of the CRISP-DM (Cross-Industry Standard Process for Data Mining) methodology. Students get experience in working as teams, participating in project planning, writing reports, and giving presentations.

Learning Outcomes: 1. Identify the business objectives in a complex problem. 2. Develop appropriate data science goals and project plan. 3. Implement the appropriate data pre-processing and analysis models. 4. Evaluate the above models and interpret results with respect to the "business" objectives. 5. Present the project outcomes through written reports and digital/oral presentations. Credits: 3.00

CS 44800 - Introduction To Relational Database Systems

Credit Hours: 3.00. An in-depth examination of relational database systems including theory and concepts as well as practical issues in relational databases. Modern database technologies such as object-relational and Web-based access to relational databases. Conceptual design and entity relationship modeling, relational algebra and calculus, data definition and manipulation languages using SQL, schema and view management, query processing and optimization, transaction management, security, privacy, integrity management.

Learning Outcomes: 1. Learn data modeling: physical, logical and conceptual data models, the entity-relationship model. 2. Study logical and Physical Design and interaction with operating systems, disk Storage, Basic File Structures, Hashing, Indexing. 3. Learn the relational database model and implementation and performance issues. 4. Understand transaction Processing, concurrency control, atomicity control and recovery control. 5. Understand database privacy, integrity, and security. 6. Understand data mining, data warehousing, online analytical processing, and information retrieval. 7. Understand Cloud computing and Distributed Database Systems architectures, Big Data, Hadoop, MapReduce, and NoSQL. 8. Recognize performance issues. Credits: 3.00

CS 45600 - Programming Languages

Credit Hours: 3.00. Concepts for structuring data, computation, and whole programs. Object-oriented languages, functional languages, logic- and rule-based languages. Data types, type checking, exception handling, concurrent processes, synchronization, modularity, encapsulation, interfaces, separate compilation, inheritance, polymorphism, dynamic binding, subtyping, overloading, beta-reduction, unification.

Credits: 3.00

CS 45800 - Introduction To Robotics

Credit Hours: 3.00. Any intelligent robot system interacting with our environment needs to have perception, planning, and control methods in its cognition process. The perception module outlines the robot's procedures to gather and interpret sensory observations into world models. The underlying planning and control modules use those world models to plan robot behaviors and their interaction with our natural environments. Therefore, this course will cover the fundamental topics in robot perception, planning, and control to design general-purpose robot cognition algorithms. Overall, this course is divided into four modules: Robot perception: This covers fundamental techniques needed for robot localization and mapping from raw 3D sensory data. Robot planning: This module will discuss robot behavior planning techniques such as A*, RRT*, and trajectory optimization. Robot Control: This introduces basic control techniques such as PID controller to execute the robot's planned behaviors in the real world. Robot Learning: This part will briefly introduce machine learning techniques for robot decision-making and control.

Learning Outcomes: 1. Formulate and solve the robot perception problems. 2. Identify the robot constraints, define their degree of freedom, and formulate their planning and control problems. 3. Apply classical and modern robot planning and control techniques to complex robot systems like manipulators, autonomous cars, etc. 4. Identify limitations in existing classical robot algorithms and understand their formal guarantees. 5. Evaluate and assess current best practices and mechanisms for robot programming. 6. Develop a skill for robot programming from perception to low-level control using standard methods. Credits: 3.00

CS 47100 - Introduction To Artificial Intelligence

Credit Hours: 3.00. Students are expected to spend at least three hours per week gaining experience with artificial intelligence systems and developing software. Basic problem-

solving strategies, heuristic search, problem reduction and AND/OR graphs, knowledge representation, expert systems, generating explanations, uncertainty reasoning, game playing, planning, machine learning, computer vision, and programming systems such as Lisp or Prolog.

Learning Outcomes: 1. Develop understandings of various applications of AI. 2. Recognize problems where AI techniques are applicable. 3. Implement and apply basic principles of AI in solutions that require problem-solving, inference, learning, and planning. 4. Understand how to evaluate various AI techniques and make appropriate selections. Credits: 3.00

CS 47300 - Web Information Search And Management

Credit Hours: 3.00. This course teaches important concepts and knowledge of information retrieval for managing unstructured data such as text data on Web or in emails. At the same time, students will be exposed to a large number of important applications. Students in the course will get hands on experience from homework and a course project. The first part of the course focuses on general concepts/techniques such as stemming, indexing, vector space model, and feedback procedure. The second part of the course shows how to apply the set of techniques on different applications such as Web search, text categorization, and information recommendation.

Learning Outcomes: 1. Understand the important concepts and techniques of information retrieval and how to apply these techniques to a set of important or real world applications. Credits: 3.00

CS 47500 - Human-Computer Interaction

Credit Hours: 3.00. The goal of this course is to teach students how to design useful and usable interactive systems that address important needs of people. Students will experience the entire user-centered design life cycle, from need finding to usability evaluation. Topics covered in the course include user-centered design principles, usability heuristics, need-finding methods such as semi-structured interviews and contextual inquiry, quick prototyping techniques, usability evaluation methods such as hallway testing and human-subjects user study, and theories about user interaction and decision making. As we are entering a new era of AI, the course will also include a brief introduction on how to apply the HCI principles and techniques to AI-powered systems. This course is project-based. Students will form project teams among themselves to work on a semester-long project and apply the user-centered design principles, theories, and techniques that they have learned in class to build a useful and usable interactive system such as a mobile application. This course is also highly interactive, including a series of design studios and in-class activities that require active participation, communication, and discussion with other students.

Learning Outcomes: 1. Apply HCI methods such as semi-structured interviews and contextual inquiries to uncover user needs and realistic problems that can be solved by computational methods. 2. Apply user-centered design principles to iteratively develop interface designs to address those needs. 3. Develop prototypes to concretize a design idea in different levels of fidelity. 4. Critique a design idea or prototype and pinpoint design flaws and usability issues based on commonly agreed upon design principles and usability heuristics. 5. Iteratively evaluate and improve upon the prototypes based on feedback from potential users. 6. Communicate design ideas and findings to target users, other designers, funders, etc. 7. Work in a team and succeed. Credits: 3.00

CS 47800 - Introduction To Bioinformatics

Credit Hours: 3.00. (BIOL 47800) Bioinformatics is broadly defined as the study of molecular biological information, targeting particularly the enormous volume of DNA sequence and functional complexity embedded in entire genomes. Topics will include understanding the evolutionary organization of genes (genomics), the structure and function of gene products (proteomics), and the dynamics of gene expression in biological processes (transcriptomics). Inherently, bioinformatics is interdisciplinary, melding various applications of computational science with biology. This jointly taught course introduces analytical methods from biology, statistics and computer science that are necessary for bioinformatics investigations. The course is intended for junior and senior undergraduates from various science backgrounds. Our objective is to develop the skills of both tool users and tool designers in this important new field of research.

Learning Outcomes: 1. Demonstrate proficiency with professional skills needed by practicing biologists, including experimental design and execution, biological techniques, data collection and documentation, communication of results, and responsible conduct of science. 2. Demonstrate the ability to discuss ethical issues

in the application of biological sciences, and the impact of science on society. 3. Demonstrate skills in critical thinking. These skills include understanding scientific methods, solving biology-related problems, interpreting and analyzing primary literature in biology, and interpreting data in a meaningful way. 4. Demonstrate knowledge of the path leading to specific careers in biology. 5. Understand the role of evolution of creating and modifying the macromolecular components of the cell, and in creating biological complexity and variability. 6. Use and understand the scientific method, including how to generate hypotheses and predictions, develop an experimental design, collect data, statistically analyze data, and interpret results. 7. Demonstrate an understanding of laboratory skills used in genetics. 8. Demonstrate knowledge of how evolutionary forces impact and shape microbial function and activity. 9. Demonstrate an understanding of the scientific method including hypothesis generation and testing, data collection, analysis, and interpretation. Credits: 3.00

CS 48300 - Introduction To The Theory Of Computation

Credit Hours: 3.00. Turing machines and the Church-Turing thesis; decidability; halting problem; reducibility; undecidable problems; decidability of logical theories; Kolmogorov complexity; time classes; P, NP, NP-complete; space classes; Savitch's theorem, PSPACE-completeness, NL-completeness; hierarchy theorems; approximation theorems; probabilistic algorithms; applications of complexity to parallel computation and cryptography.

Credits: 3.00

CS 48700 - Professional Practice V

Credit Hours: 0.00. Professional Practice. Permission of instructor required.

Credits: 0.00

CS 48900 - Embedded Systems

Credit Hours: 3.00. Software for embedded systems; programming with extreme constraints on memory, storage, and processing power; programming models, including synchronous, asynchronous, and concurrent; programming systems that run forever; use of Finite State Machines (FSMs); review of embedded hardware and available boards; asynchronous and synchronous serial connections (e.g., RS232 and SPI); General Purpose I/O (GPIO) pins; relays, servos, and other peripherals; design for low power; battery characteristics; systems that communicate over computer networks and the Internet; current industry practices; design of embedded projects; working in teams. CS 35200 (Compilers) and CS 35400 (Operating Systems) are recommended, but not required.

Learning Outcomes: 1. Understand basics of embedded systems. 2. Understand how and why many Internet of Things (IoT) devices use the cloud. 3. Understand how embedded systems are employed in a variety of situations, including smart homes and buildings, security systems, cars, and planes. 4. Understand the three basic programming models, and when each is appropriate. 5. Understand how synchronous and asynchronous serial devices operate. 6. General characteristics of batteries and which type of battery is appropriate for various embedded designs. 7. Understand the use of relays and how embedded logic that operates on low voltage can control high voltage peripherals. 8. Understand why systems that use sensors and actuators must be calibrated. 9. Understand how to build and demonstrate a working embedded system.

Credits: 3.00

CS 49000 - Topics In Computer Sciences For Undergraduates

Credit Hours: 1.00 to 5.00. Supervised reading and reports in various fields. Permission of instructor required.

Credits: 1.00 to 5.00

CS 49700 - Honors Research Project

Credit Hours: 3.00. One semester of the project may be counted as one of the seven computer science courses at or above the 300 level required for the bachelor's degree. One more semester, if approved by the honors coordinator, can be used as a free elective. A group research project directed by Computer Sciences faculty members. Each group must submit a technical report describing its work and the results obtained.

Credits: 3.00

CS 50010 - Foundational Principles Of Information Security

Credit Hours: 3.00. This course covers foundational principles relevant to information security including data structures,

algorithm design, computational complexity, probability theory, number theory, and basics of cryptography. This course is restricted to CS graduate students. This course is required for students in the Master of Science in Computer Science Concentration in Information Security for Professionals Program. The course may not be used on the Plan of Study for any CS graduate students other than those in the Concentration in Information Security for Professionals program. Programming experience and computer science knowledge equivalent to that of a minor in CS. Incoming students are expected to have programming skills in at least one procedural programming languages, e.g., C,C++,Java, or Python.

Learning Outcomes: 1. Identify and explain the basic data structures. 2. Identify and explain algorithm design techniques. 3. Explain computational complexity and decidability concepts and their relevance to information security. 4. Apply basic probability tools to analyze problems involving uncertainty and randomness. 5. Explain basic concepts of modular arithmetic and their application to cryptography. Credits: 3.00

CS 50011 - Introduction To Systems For Information Security

Credit Hours: 3.00. The course covers computer systems principles relevant to information security and it serves as a prerequisite for the later courses in the MS in IS program. The material includes features in the C/C++ programming languages for understanding security-critical software vulnerabilities, basic knowledge in computer architecture and assembly languages, knowledge of the compiling process, operating systems, networking, databases, and web applications relevant to information security. This course is restricted to CS graduate students. This course is required for students in the Master of Science in Computer Science Concentration in Information Security for Professionals Program. The course may not be used on the Plan of Study for any CS graduate students other than those in the Concentration in Information Security for Processionals program. Programming experience and computer science knowledge equivalent to that of a minor in CS. Incoming students are expected to have programming skills in at least one procedural programming languages, e.g., C,C++,Java, or Python.

Learning Outcomes: 1. Understand C/C++ code with security-relevant features such as pointers, string operations, function pointers, dynamic memory allocation, etc., laying the foundations for understanding software vulnerabilities in C/C++. 2. Explain common programming errors in C/C++ programs. 3. Explain how C/C++ programs are compiled into assembly and how call stack works in function calls, laying the foundation for understanding stack based buffer overflow. 4. Explain basic concepts in computer architecture, such as instruction set, assembly code, CPU modes, registers, MMU, paging. 5. Explain basic concepts in operating systems, such as processes, system calls, virtual memory, file system structure. 6. Explain basic concepts in networking, databases, and web applications. Credits: 3.00

CS 50023 - Data Engineering I

Credit Hours: 1.00. The course introduces students to the fundamentals of Data Engineering with a focus on tools and computational techniques to gather, construct, manipulate, summarize, and visualize data sets as a means to extract knowledge from the underlying data. Python and Python libraries are used. Completion of the course will allow learners to perform basic data analysis on data sets. Experience in Python Programming and Linear Algebra is required. The course also prepares learners for additional instruction in the courses Data Engineering II and Foundations of Decision Making.

Learning Outcomes: 1. Identify key file types (TXT, CSV, HTML) and their characteristics. Using Python, read data in these formats. 2. Create and execute Python scripts to parse, select, transform, summarize, and visualize data. 3. Explain how to identify and fill in missing values in data values. 4. Create informative visualizations from given data and recognize the key qualities of good visualizations. 5. Apply Pandas functions to slice, dice, and summarize datasets. 6. Apply the process of sampling data and sample probabilistically. 7. Demonstrate how to transform and construct features (e.g., standardization, distances). 8. Compute summary statistics from data (e.g., covariance, correlation). 9. Explain how to solve simple data analysis problems. Credits: 1.00

CS 50024 - Data Engineering II

Credit Hours: 1.00. This course introduces students to the fundamentals of database management systems (DBMS) from

a user's perspective. The principles of modeling an enterprise using Entity-Relationship diagrams and transforming the model into a relational or NoSQL database are illustrated through a range of examples. The SQL language is used to create, query, aggregate, and update a relational database. NOSQL databases and the related data models (column, graph, and document-based) are introduced. Experience in Python Programming is required.

Learning Outcomes: 1. Carry out database design steps from conceptual to logical to physical design. 2. Use SQL commands to define the structure of a relational database, populate, update and delete data in the database, retrieve data having specified characteristics, and specify access control. 3. Explain the differences, advantages, and disadvantages of relational and NOSQL databases. 4. Describe features of relational databases not needed in big data applications. 5. Create a document-based, NOSQL database like mongoDB and movie data from an SQL to a NOSQL database. 6. Understand the benefits and downsides of creating index structures on query performance for relational, and NOSQL databases. 7. Explain the difference between hash indices and B-tree indices. 8. Analyze large data sets created from piecing together multiple data files through the application of SQL queries. Credits: 1.00

CS 50025 - Foundations Of Decision Making

Credit Hours: 1.00. This course provides an overview of data science methods used for data-driven discovery, extraction of knowledge, and informed decision making. The course covers fundamental computational methods and statistical techniques used to correctly reason about uncertainty, conduct hypothesis tests, infer causal relationships, and apply and evaluate predictive models. The course highlights how sampling biases can impact fairness in decision making. Throughout, students get hands-on experience on how to make correct and explainable inferences from data. Experience in Python Progamming, Probability, Statistics and Linear Algebra is required.

Learning Outcomes: 1. Support and justify claims with evidence from data and discuss how human biases can impact interpretations. 2. Recognize the basic approach to formulating statistical hypothesis tests and apply parametric hypothesis tests for both discrete and continuous data. 3. Interpret p-values and apply them effectively to support claims about data. 4. Formulate and test conjectures with controlled experiments, including A/B testing. 5. Recognize the types of errors encountered when conducting multiple hypothesis tests. 6. Use computational approaches based on randomization for hypothesis testing and uncertainty quantification. 7. Discuss ethical issues such as privacy and fairness that can be associated with automating decisions based on machine learning methods. 8. Apply the basic components of classification methods using Python libraries. 9. Evaluate the performance of learned models with learning curves and k-fold cross validation and assess significance with hypothesis tests. Credits: 1.00

CS 50100 - Computing For Science And Engineering

Credit Hours: 3.00. Credit in this course may not be used toward a graduate degree in Computer Sciences. Computational concepts, tools, and skills for computational science and engineering scripting for numerical computing, scripting for file processing, high performance computing, and software development. Project may be required.

Learning Outcomes: 1. To prepare graduate students outside Computer Science to write computer programs in support of their studies and research. Credits: 3.00

CS 50200 - Compiling And Programming Systems

Credit Hours: 3.00. Basic principles of compilers and compiler design; control of translation, loading, and execution; symbolic coding systems; lexical and syntactic analysis, design and operation of assemblers and macroprocessors; design of interpretive systems. Students are expected to complete a large programming project as part of the course.

Learning Outcomes: 1. Deeper understanding of the syntactic rules and the functionality of modern programming languages, as well as the use of the compiler for enhancing program quality. 2. Opportunity to practice the implementation of certain key components in

the compiler front-end and back-end. Credits: 3.00

CS 50300 - Operating Systems

Credit Hours: 3.00. Basic principles of operating systems: addressing modes, indexing, relative addressing, indirect addressing, stack maintenance; implementation of multitask systems; control and coordination of tasks, deadlocks, synchronization, mutual exclusion; storage management, segmentation, paging, virtual memory; protection, sharing, access control; file systems; resource management; evaluation and prediction of performance. Students are expected to spend at least three hours per week gaining hands-on experience in using and modifying a small operating system.

Credits: 3.00

CS 50500 - Distributed Systems

Credit Hours: 3.00. Foundations for building reliable distributed systems, including failure and system models, and basic communication and agreement problems; crash failures, recovery, partition, Byzantine failures; asynchronous systems, failure detectors, communication channels, wireless and sensor networks; software clocks, causality, and cuts. Examples of problems include reliable broadcast consensus, leader election, group communication, and replication. Permission of department required.

Credits: 3.00

CS 51000 - Software Engineering

Credit Hours: 3.00. Software life cycles, requirements engineering, software design, design of distributed systems, verification and validation, software architecture, process metrics and models, and research methods in software engineering.

Credits: 3.00

CS 51400 - Numerical Analysis

Credit Hours: 3.00. (MA 51400) Alternative methods for solving nonlinear equations; linear difference equations, applications to solution of polynomial equations; differentiation and integration formulas; numerical solution of ordinary differential equations; roundoff error bounds.

Credits: 3.00

CS 51500 - Numerical Linear Algebra

Credit Hours: 3.00. Direct and iterative solvers of dense and sparse linear systems of equations, numerical schemes for handling symmetric algebraic eigenvalue problems, and the singular-value decomposition and its applications in linear least squares problems.

Learning Outcomes: 1. Become knowledgeable about major kernels and algorithms underlying matrix computations for dense and sparse matrices including linear systems of equation, symmetric eigenvalue problems, and the singular-value decomposition. 2. Be able to implement basic versions of these kernels and algorithms. 3. Learn about the difference between direct and iterative methods for linear systems. 4. Gain expertise in the design of iterative methods and preconditioning techniques for large-scale sparse linear systems. 5. Be able to implement eigenvalue and singular-value problem solvers. Credits: 3.00

CS 51501 - Parallelism In Numerical Linear Algebra

Credit Hours: 3.00. This course examines both theoretical and practical aspects of numerical algorithm design and implementation on parallel computing platforms. In particular, it provides an understanding of the tradeoff between arithmetic complexity and management of hierarchical memory structures, roundoff characteristics if different from the sequential schemes, and performance evaluation and enhancement. Applications are derived from a variety of computational science and engineering areas.

Learning Outcomes: 1. Become quite knowledgeable in handling these parallel numerical linear algebra algorithms that arise in computational science and engineering. 2. Acquire problem-solving skills in this field. 3. Communicate their solution strategies and the performance realized on parallel computing platforms. Credits: 3.00

CS 52000 - Computational Methods In Optimization

Credit Hours: 3.00. A treatment of numerical algorithms and software for optimization problems with a secondary emphasis on linear and nonlinear systems of equations: unconstrained and constrained optimization; line search methods; trust region methods; Quasi-Newton methods; linear programming; calculating derivatives; quadratic programming; global optimization, including simulated annealing.

Credits: 3.00

CS 52300 - Social, Economic, And Legal Aspects Of Security

Credit Hours: 3.00. This course focuses on social, legal, and economic aspects of information security and privacy, also including ethics, policies, and human behavioral issues. The course covers the interactions between non-technological aspects of information security as well as relevant technological aspects. It focuses on how non-technological facets can inform and guide technological choices, and how technological choices

can enhance or detract from the broader organizational and societal goals.

Learning Outcomes: 1. Identify and describe the legal, organizational, and financial ramifications of security-related design and management decisions. 2. Explain how to respond to a security incident, including recovery and cleanup, damage assessment, forensics and the handling of digital evidence so that it is admissible in court, and satisfying government requirements on the reporting of the incident. 3. Identify, evaluate and assess the risks faced by an organization, and their impact and consequences should they materialize (including liability, reputational damage, disruption to operations, loss of customers). Recommend effective and appropriate measures to mitigate those risks. 4. Explain the role of incentives in information security, and be capable of evaluating and modifying an organizational and reward structure so that it better aligns the interests of employees with those of the organization. 5. Ensure compliance with privacy and data protection laws. Detect and remedy practices that have potential to give rise to violations of these laws. 6. Identify major national laws that affect the practice of information security and explain potential interactions. 7. Evaluate and improve an e-policy's in security and privacy aspects. Credits: 3.00

CS 52500 - Parallel Computing

Credit Hours: 3.00. Parallel computing for science and engineering applications: parallel programming and performance evaluation, parallel libraries and problem-solving environments, models of parallel computing and run-time support systems, and selected applications.

Credits: 3.00

CS 52600 - Information Security

Credit Hours: 3.00. (CSCI 52600) Basic notions of confidentiality, integrity, availability; authentication models; protection models; security kernels; secure programming; audit; intrusion detection and response; operational security issues; physical security issues; personnel security; policy formation and enforcement; access controls; information flow; legal and social issues; identification and authentication in local and distributed systems; classification and trust modeling; and risk assessment.

Credits: 3.00

CS 52700 - Software Security

Credit Hours: 3.00. This course focuses on software security fundamentals, secure coding guidelines and principles, and advanced software security concepts. Students will learn to assess and understand threats, learn how to design and implement secure software systems, and get hands-on experience with common security pitfalls. Restricted to CS MS and CS PHD students. Significant programming experience and skills are required to complete the labs and projects.

Learning Outcomes: 1. Explain the top 20 most common weaknesses in software security (CWE top 20) and understand how such problems can be avoided in software. 2. Know limitations of existing defense mechanisms and how to overcome them. 3. Explain and identify common security threats, risks, and attack vectors for software systems. 4. Evaluate and assess current security best practices and defense mechanisms for current software systems. 5. Identify security problems in source code and binaries, assess the associated risks, and reason about their severity and exploitability. 6. Assess the security of given source code or applications. Credits: 3.00

CS 52800 - Network Security

Credit Hours: 3.00. The course focuses on the principles and foundations of building secure network systems and on security and privacy challenges in existing and emerging networks. The course compares and analyzes network architectures and network protocols from the physical layer to the access control, network, transport and application layer from an adversarial standpoint to understand how to build more secure protocols that can withstand attacks. Restricted to CS MS and CS PHD students. Significant programming experience and skills are required to complete the projects.

Learning Outcomes: 1. Describe the different categories of network threats and attacks. 2. Examine the strengths and weaknesses of security technologies at each layer of the network protocol stack. 3. Identify the appropriate defense mechanism(s) and its (their) limitations, given a network threat. 4. Demonstrate the ability to discuss security

properties, limitations, and threats in wireless networks and emerging technologies. 5. Demonstrate the ability to summarize defenses against network censorship, and network anonymity and privacy protocols. Credits: 3.00

CS 52900 - Security Analytics

Credit Hours: 3.00. This course focuses on applied data mining, machine learning, data analytics techniques, and their application and relevance in information security. The course covers basic concepts of data mining and machine learning, computation platforms in support of big data analytics including Map-Reduce and Spark, machine learning algorithms such as classification trees, logistic regression, naive Bayes, k Nearest Neighbors, Support Vector Machines, Artificial Neural Networks (including Feed Forward, Convolutional, and Recurrence), the application of these algorithms to security tasks such as Spam/Phishing detection, malware detection, intrusion detection, and situational awareness. The future and potential role of applying machine learning techniques in information and data security is explored.

Learning Outcomes: 1. Explain commonly used machine learning algorithms relevant to information security; identity their strengths and weaknesses, and illustrate their relevance through examples. 2. Identify security problems that can be solved by using machine learning (including deep learning) techniques. 3. Explain the concepts of artificial neural networks, including feed forward networks, convolutional neural networks, and recurrent neural networks. 4. Deploy machine learning algorithms (including artificial neural networks) using software such as NumPy, SciPy, and TensorFlow. 5. Apply Spark and HDFS to perform data analysis. 6. Apply machine learning algorithms to security problems. 7. Assess the effectiveness of applying data analytics techniques to different security problems and explain existing shortcomings of ML techniques. 8. Explain what type of data visualization can be effective for security problems (e.g., in fraud detection). 9. Explain the concept of adversarial machine learning and the common attacks/defenses. Credits: 3.00

CS 53000 - Introduction To Scientific Visualization

Credit Hours: 3.00. Teaches the fundamentals of scientific visualization and prepares students to apply these techniques in fields such as astronomy, biology, chemistry, engineering, and physics. Emphasis is on the representation of scalar, vector, and tensor fields; data sampling and resampling; and reconstruction using multivariate finite elements (surfaces, volumes, and surfaces on surfaces).

Learning Outcomes: 1. Learn basic notions of human vision and color perception that inform the design of effective visual representations. 2. Know different models of color perception and understand their connection to the anatomy of the visual system. 3. Be familiar with several color spaces and know their perceptual properties. 4. Know how to devise effective color scales suitable for different data mapping needs. 5. Learn the data structures and data reconstruction techniques that are needed to create continuous visual representations of discrete simulation or experimental datasets. 6. Be familiar with the main grid types used in numerical simulations, know what data structures can be used to represent them in memory, and the associated footprint. 7. Know various data interpolation methods and understand their relationship with grid topology. 8. Know how to efficiently solve the point location problem, whereby the cell must be determined that encloses an arbitrary spatial location. 9. Learn the main visualization techniques for scalar, vector, and tensor datasets. Credits: 3.00

CS 53100 - Computational Geometry

Credit Hours: 3.00. Computational geometry studies how to compute with and reason about geometric objects. The subject is playing an increasingly important role in computer graphics, game software, geometric modeling, geographic information systems, and many other applications. Course topics include convex hull, segment manipulations, triangulations, range searching, Voronoi diagrams, window queries, Delaunay triangulation, and duality. Some key algorithms are implemented. Questions of floating-point accuracy and robust algorithm design are considered throughout the course.

Credits: 3.00

CS 53200 - Geometric Modeling Algorithms

Credit Hours: 3.00. The geometric modeling course will first introduce computational and mathematical concepts needed for 3D shapes, such as points, vectors, linear combinations, metrics, continuity, differentiability, and transformations. Then, it will describe mathematical descriptions of shapes and their implementations, starting from curves to free-form and subdivision surfaces, meshes and their simplifications, volumetric structures such as meshes, and constructive solid geometry. It will also provide knowledge of the fundamentals of procedural modeling (fractals, L-systems, terrain, and vegetation modeling). This course will also discuss modern AI-oriented methods for 3D shape generation.

Learning Outcomes: 1. Learn foundations of geometric modeling including geometry and topology. 2. Learn basic geometric objects, their representations, and operations including line, plane, and volume. 3. Learn algorithms and Data Structures for Geometric Modeling. 4. Learn curves including derivative, curvature, osculating circle, and continuity. 5. Learn surfaces including differential properties and special surfaces. 6. Learn volumes including space enumeration and constructive solid geometry. 7. Learn advanced shape representations including meshes. 8. Learn procedural models including fractals, chaos, and noise. 9. Learn AI-based generative models. Credits: 3.00

CS 53400 - Motion Planning

Credit Hours: 3.00. This course introduces the fundamental concepts of motion planning in robotics and autonomous systems. It will cover classical algorithms, basic kinematics, sampling-based approaches, and an introduction to multi-agent planning. The course is designed for graduate students with little or no prior background in motion planning. Practical applications and hands-on projects will be used to solidify the concepts learned.

Learning Outcomes: 1. Comprehend the essential problems in motion planning for autonomous systems, including pathfinding, navigation, and collision avoidance. 2. Articulate the challenges faced by robots in different environments, such as static, dynamic, and complex terrains. 3. Implement and apply classical graph-based search algorithms (e.g., A*, Dijkstra's) to solve planning problems in robotic systems. 4. Analyze the trade-offs between different algorithms with respect to computational complexity, optimality, and real-time performance in grid-based and continuous environments. 5. Grasp the concepts behind sampling-based planning methods such as Probabilistic Roadmaps (PRM) and Rapidly-exploring Random Trees (RRT). 6. Design and implement basic versions of these algorithms in simulation environments, understanding their practical application in high-dimensional configuration spaces. 7. Implement collision detection algorithms and integrate them into planning frameworks to ensure safe navigation in complex and cluttered environments. 8. Develop an understanding of geometric representations used in collision detection and their limitations in real-world applications. 9. Understand kinodynamic constraints (e.g., velocity, acceleration) and incorporate them into motion planning to ensure feasible trajectories for robots. 10. Apply basic control and trajectory optimization techniques to produce smooth and dynamic motions in robotics systems. 11. Understand the challenges and strategies in multi-agent motion planning, focusing on collision avoidance, path coordination, and reciprocal interactions. 12. Implement simple multi-agent planning algorithms, such as Reciprocal Velocity Obstacles (RVO), in a dynamic multi-agent scenario. 13. Gain hands-on experience using Robot Operating System (ROS) and other standard robotics frameworks to apply motion planning algorithms in simulation and real-world settings. 14. Demonstrate the ability to prototype, test, and debug planning algorithms in simulated robotic systems. 15. Understand the role of optimization in motion planning and apply basic optimization-based techniques for trajectory generation and path smoothing. 16. Analyze

how optimization techniques improve the efficiency and feasibility of motion planning in constrained environments. Credits: 3.00

CS 53500 - Interactive Computer Graphics

Credit Hours: 3.00. The principles of computer graphics and interactive graphical methods for problem solving. Emphasis placed on both development and use of graphical tools for various display devices. Several classes of graphics hardware considered in detail. Topics include pen plotting, storage tubes, refresh, dynamic techniques, three dimensions, color, modeling of geometry, and hidden surface removal. Part of the laboratory involves use of an interactive minicomputer graphics system. Knowledge of programming required.

Learning Outcomes: 1. Learn the algorithms underlying the interactive graphics pipeline, including algorithms for geometric modeling, projection, rasterization, shading, lighting, texture mapping, projective texture mapping, shadow mapping, and environment mapping. 2. Gain experience implementing the interactive graphics pipeline through projects. 3. Gain initial experience programming Graphics Processing units through shaders. 4. Learn and implement algorithms for advanced rendering techniques. Credits: 3.00

CS 53600 - Data Communication And Computer Networks

Credit Hours: 3.00. Data communications: communication hardware technologies including local area and longhaul network hardware, circuit and packet switching, interfaces between computer and network hardware, and performance issues. Network architecture: protocol software and conceptual layering, reliable delivery over an unreliable channel, transport protocols, virtual circuits, datagrams, internetworking as a fundamental design concept, the client-server paradigm, naming and name binding, name servers, addressing and address resolution, routing and routing algorithms, congestion and flow control techniques, network file systems, distribution of computation, and DARPA internet protocols (TCP/IP) as examples of protocol organization.

Learning Outcomes: 1. Network services and applications, including DNS and HTTP . 2. The socket API . 3. Network transport architectures, TCP, UDP and TCP congestion control. 4. Routing and forwarding, intra-domain and inter-domain routing algorithms. Credits: 3.00

CS 53900 - Extended Reality: Principles And Applications

Credit Hours: 3.00. The course covers the computer science foundations of XR in geometric modeling, computer graphics, computer vision, computer animation, human-computer interaction, virtual reality, mixed reality, and augmented reality, as well as applications of XR in education, healthcare. The course will cover principles, design, implementation, and evaluation of XR applications.

Learning Outcomes: 1. Apply computer science, computer graphics, computer visualization, computer vision, and human-computer interaction concepts and principles to implement an extended reality (XR) application. 2. Apply statistics and human-computer interaction concepts and principles to design, implement, and analyze a user study to evaluate an XR application. 3. Demonstrate knowledge of the potential implications of XR technologies in the real-world context. 4. Demonstrate knowledge of the capabilities and limitations of the state of the art in XR. Credits: 3.00

CS 54100 - Database Systems

Credit Hours: 3.00. Fundamentals for the logical design of database systems. The entity-relationship model, semantic model, relational model, hierarchical model, network model. Implementations of the models. Design theory for relational databases. Design of query languages and the use of semantics for query optimization. Design and verification of integrity assertions, and security. Introduction to intelligent query processing and database machines.

Credits: 3.00

CS 54200 - Distributed Database Systems

Credit Hours: 3.00. Fundamental issues in distributed database systems that are motivated by the computer networking and distribution of processors and databases. The theory, design, specification, implementation, and performance of distributed database systems.

Credits: 3.00

CS 54300 - Introduction To Simulation And Modeling Of Computer Systems

Credit Hours: 3.00. Simulation: discrete event simulation, process oriented simulation, generating random numbers, simulation languages, simulation examples of complex systems. Nondeterministic models: random variables, Poisson process, moment generating functions, statistical inference and data analysis. Modeling: elementary queuing models, networks of queues, applications to performance evaluation of computer systems.

Credits: 3.00

CS 54701 - Information Retrieval

Credit Hours: 3.00. Basic principles and practical algorithms used for information retrieval and text mining: statistical characteristics of text, several important retrieval models, text categorization, recommendation system, clustering, federated text search, link analysis, etc.

Learning Outcomes: 1. Learn the theories and techniques behind Web search engines, E-commerce recommendation systems, etc. 2. Get hands on project experience by developing real-world applications, such as intelligent tools for improving search accuracy from user feedback, email spam detection, recommendation system, or scientific literature organization and mining. 3. Learn tools and techniques to do cutting-edge research in the area of information retrieval or text mining. Credits: 3.00

CS 55100 - Cloud Computing Fundamentals

Credit Hours: 3.00. A comprehensive course that investigates all aspects of cloud computing, including: cloud data centers and infrastructure (equipment for processing, storage, communication, and special-purpose facilities); the use of virtualized servers (virtual machines and containers), virtualized storage (Storage Area Networks, Network Attached Storage, object storage), and virtual networks; automation; orchestration systems, such as Kubernetes; programming paradigms used to construct cloud-native software, such as MapReduce, microservices, controllerbased computing, and serverless computing; edge computing; security and privacy in cloud systems; software models. The course emphasizes researching new ways to use cloud computing and research into new ways to design and build cloud systems. The course includes a project. Students should have completed coursework in or have equivalent familiarity with operating systems and computer networks.

Learning Outcomes: 1. Identify underlying cloud facilities and infrastructure features. 2. Assess and compare algorithms and architectures used to design cloud-native software systems. 3. Plan, implement, and deploy cloud-native software systems that use available technologies. 4. Articulate the scientific and technical principles that led to cloud computing. 5. Devise measurements and evaluate the performance of cloud systems. Credits: 3.00

CS 55500 - Cryptography

Credit Hours: 3.00. (CSCI 55500) Concepts and principles of cryptography and data security. Cryptography (secret codes): principles of secrecy systems; classical cryptographic systems, including Vigenere and Vernam ciphers; the Data Encryption Standard (DES); public-key encryption; privacy-enhanced email; digital signatures. Proprietary software protection; information theory and number theory; complexity bounds on encryption; key escrow; traffic analysis; attacks against encryption; basic legal issues; e-commerce; and the role of protocols.

Credits: 3.00

CS 55600 - Data Security And Privacy

Credit Hours: 3.00. Data security and privacy is an important part of information security. This course provides an introduction to the fundamental principles and techniques for data security and privacy. The course covers fundamental theories of access control, discretionary access control, mandatory access control, and role-based access control, database access control approaches including grant revoke, virtual private databases and labelled databases, database encryption. On privacy, it covers data anonymization, re-identification attacks, definition, primitives, and applications of differential privacy.

Learning Outcomes: 1. Explain the limitation of discretionary access control and the impacts to security. (E,Q,W) 2. Explain the definition, enforcement, and challenges for multi-level security, including the Bell LaPadula model, non-interference, and covert channels. (E,Q,W) 3. Articulate integrity models (Biba and Clark-Wilson), and the difference between integrity and confidentiality. (E,Q,W) 4. Explain the main database security mechanism, including grant revoke model, content-based and context-based access control, virtual private databases, labelled databases, and data encryption. (E,Q,W) 5. Articulate the limitations of data anonymization for achieving privacy, and the strengths and limitations of privacy notions including differential privacy. (EQW) 6. Identify, implement, and deploy differential privacy mechanisms for problem settings. (P) Credits: 3.00

CS 55800 - Introduction To Robot Learning

Credit Hours: 3.00. Introduction To Robot Learning

Learning Outcomes: 1. Formulate the robot motion planning and control problems and solve them using standard tools. (W, P, E) 2. Identify

the robot constraints, define their degree of freedom, and formulate their dynamical models for control. (W, P, E) 3. Apply classical and modern robot planning and control techniques to complex robot systems like manipulators, autonomous cars, etc. (W, P, E) 4. Identify limitations in existing classical robot algorithms and understand how to avoid the musing Machine Learning. (W, P) 5. Understand and apply Deep Reinforcement Learning approaches to complex robot systems. (W, P, E) 6. Evaluate and assess current best practices and mechanisms for robot programming. (W, P) 7. Develop a skill for robot programming from perception to low-level control using state-of-the art methods. (W, P) Credits: 3.00

CS 56000 - Reasoning About Programs

Credit Hours: 3.00. The course focuses on the logical foundations and algorithmic techniques used to ensure program correctness. With an emphasis on automated program verification and synthesis, the course covers classical concepts and techniques such as Hoare logic, abstract interpretation, abstraction-refinement and bounded model checking. The course also exposes students to approaches for program synthesis, a new frontier for program reasoning, such as inductive synthesis, synthesis using version space algebras, constraint-based synthesis and synthesis based on machine-learning techniques. The courses emphasizes both theoretical foundations as well as hands-on experience with verification/synthesis tools and SAT/SMT solvers. Students are expected to have completed undergraduate coursework in Foundations of Computer Science (CS 18200) or equivalent, Systems Programming (CS 25200) or equivalent, and Introduction to the Analysis of Algorithms (CS 38100) or equivalent. Mathematical maturity is expected.

Learning Outcomes: 1. Express the expected behavior of programs in logic. 2. Able to manually reason about satisfiability and validity of formulas in first-order logic (modulo theories). 3. Use SAT/SMT solvers to check satisfiability and validity of formulas in first-order logic (modulo theories). 4. Specify properties of programs using pre/postconditions, safety properties and assertions in first-order logic (modulo theories). 5. Describe and apply core approaches for program verification. 6. Explain and apply Hoare logic, invariant generation, abstract interpretation, abstraction-refinement, and bounded model checking. 7. Ability to verify programs using tools such as Dafny and the Z3 SMT solver. 8. Conduct original research in program synthesis. 9. Explain and apply inductive synthesis and functional synthesis, different search techniques (enumerative, explicit, constraint-based), and some recent approaches based on machine learning. 10. Choose and apply appropriate synthesis techniques to a problem domain of their choice. 11. Ability to critically review and present current research in program synthesis. Credits: 3.00

CS 56500 - Programming Languages

Credit Hours: 3.00. An exploration of modern or unconventional concepts of programming languages, their semantics, and their implementations; abstract data types; axiomatic semantics using Hoare's logic and Dijkstra's predicate transformers; denotational semantics; functional, object-oriented, and logic programming; concurrency and Owicki-Gries theory. Example languages include ML, Ada, Oberon, LISP, PROLOG, and CSP.

Credits: 3.00

CS 57100 - Artificial Intelligence

Credit Hours: 3.00. Artificial Intelligence (AI) systems are increasingly being deployed in many real-world tasks. This course provides an introduction to the fundamental principles and applications of AI. The course covers classic material including search-based methods, probabilistic reasoning, game playing, decision making, exact and approximate inference, causal learning, and reinforcement learning as well as selected advanced topics. The focus of the course is on foundational methods and current techniques for building AI systems that exhibit 'intelligent' behavior and can 'learn' from experience. The course assumes students are familiar with basic concepts in analysis, linear algebra, optimization, discrete mathematics, elementary probability, statistics, data structures, and algorithms. Students are expected to have good programming and software development skills and have a working knowledge of Python and Java.

Learning Outcomes: 1. Assess and explain the applicability, strengths, and weaknesses of the basic knowledge representation, problem-solving, and learning methods in solving a particular problem. (E,W) 2. Predict the

behavior and estimate the cost (in time and space) of different heuristic and optimal search methods, and choose the appropriate method for particular problems. (W,P) 3. Develop small logic-based, rule-based, and search-based systems; be able to predict performance characteristics. (P) 4. Predict the behavior of basic machine-learning methods, and choose the appropriate method for particular problems. (W,P) 5. Communicate critical key issues in AI-related to knowledge representation, problem-solving, and learning for a specific problem. (W) 6. Propose, evaluate, and implement effective solutions to problems requiring AI techniques. (P) 7. Articulate key problems, both technical and philosophical, in the development of artificial intelligence systems. (E,W) Credits: 3.00

CS 57300 - Data Mining

Credit Hours: 3.00. (CSCI 57300) Data Mining has emerged at the confluence of artificial intelligence, statistics, and databases as a technique for automatically discovering summary knowledge in large datasets. This course introduces students to the process and main techniques in data mining, including classification, clustering, and pattern mining approaches. Data mining systems and applications are also covered, along with selected topics in current research. Offered in alternate years.

Learning Outcomes: 1. Learn Data mining techniques. 2. Learn how to summarize large data sets. 3. Learn current research topics. Credits: 3.00

CS 57700 - Natural Language Processing

Credit Hours: 3.00. This course will cover the key concepts and methods used in modern Natural Language Processing (NLP). Throughout the course several core NLP tasks, such as sentiment analysis, information extraction, syntactic and semantic analysis, will be discussed. The course will emphasize machine-learning and data-driven algorithms and techniques, and will compare several different approaches to these problems in terms of their performance, supervision effort and computational complexity. Prerequisites: A background in linear algebra, calculus, statistics and probability, and completion of CS 57800 or equivalent are highly recommended. Strong programming skills in any modem language (Python, Java, C++) are required.

Learning Outcomes: 1. Describe and analyze the key challenges in dealing with natural language data and other fundamental areas of NLP. 2. Analyze and implement the key algorithms and techniques used in NLP. 3. Identify algorithmic techniques that can be applied to new problems and evaluate other possible solutions. 4. Conduct experiments using proper methodology for training and testing NLP systems using data. 5. Critically review current research work in the NLP field. Credits: 3.00

CS 57800 - Statistical Machine Learning

Credit Hours: 3.00. This introductory course will cover many concepts, models, and algorithms in machine learning. Topics include classical supervised learning (e.g., regression and classification), unsupervised learning (e.g., principle component analysis and K-means), and recent development in the machine learning field such as variational Bayes, expectation propagation, and Gaussian processes. While this course will give students the basic ideas and intuition behind modern machine learning methods, the underlying theme in the course is probabilistic inference.

Learning Outcomes: 1. Learn the theory and key algorithms used in machine learning. 2. Get hands-on machine learning experience by implementing several algorithms, applying them to datasets and analyzing their performance. 3. Understand how to use machine learning methods to their research projects, formulate the learning tasks and match them with appropriate solutions. Credits: 3.00

CS 57900 - Bioinformatics Algorithms

Credit Hours: 3.00. Review of Genomes, DNA, RNA, proteins, proteomes. Biological Sequences: dynamic programming; pairwise global, local, and semi-global alignments of genes and proteins; constant, affine, and general gap penalties; RNA alignments; BLOSUM and PAM scoring matrices. Multiple alignment of proteins: approximation algorithms; iterative and progressive alignment methods. Database search for sequences: BLAST and variants. Phylogenetic Trees: distance-based methods, ultrametric and additive distance functions; parsimony, and maximum likelihood methods. Whole Genome Alignment: suffix trees and suffix arrays. Systems Biology: Module discovery in biological networks, spectral algorithms for graph clustering. Network alignment: quadratic programming formulations and graph matching. Genetic Variation: haplotype inference, the perfect phylogeny problem and chordal graphs. Additional topics such as next-generation sequencing, analysis of multidimensional data from flow cytometry, and gene

expression data, if time permits.

Learning Outcomes: 1. Students will learn how to design algorithms. 2. Students will learn how to solve computational problems from the new biology, the data-rich field that biological sciences is becoming. Credits: 3.00

CS 58000 - Algorithm Design, Analysis, And Implementation

Credit Hours: 3.00. Basic techniques for designing and analyzing algorithms: dynamic programming, divide and conquer, balancing. Upper and lower bounds on time and space costs, worst case and expected cost measures. A selection of applications such as disjoint set union/find, graph algorithms, search trees, pattern matching. The polynomial complexity classes P, NP, and co-NP; intractable problems.

Credits: 3.00

CS 58100 - Algorithmic Game Theory

Credit Hours: 3.00. The field of algorithmic game theory (also known as economics and computation) has been expanding at a rapid pace in recent years, with computational reasoning playing a crucial role in transforming classical economics. An increasing number of real-world systems require careful design of algorithms where the inputs are provided by agents with different preferences. Applications include Google's ad auctions, spectrum auctions, Bitcoin, matching markets, and allocation of vaccines. This has inspired new models and algorithms and led to deep connections with machine learning through multi-agent learning and computational complexity. This course will introduce the area of Algorithmic Game Theory by studying games, solution concepts, complexity of equilibria, mechanism design, auction theory, fair division, social choice, learning dynamics, and markets. It will include both classical results and recent developments.

Learning Outcomes: 1. Analyze and solve games (zero-sum, general-sum, potential games), identify stable solutions, and design algorithms for computing them where applicable. 2. Design and analyze mechanisms that work well when the participants are strategic, for various problems including selling goods (auctions). 3. Design and analyze algorithms with provable fairness guarantees. 4. Explain concepts of social choice used in specific domains, e.g., elections. 5. Analyze markets and design algorithms that market participants can use to achieve desirable outcomes in both static and repeated settings. 6. Analyze multi-agent learning settings, where agents learn together in some environment but have different incentives, which influence their interactions. Credits: 3.00

CS 58400 - Theory Of Computation And Computational Complexity

Credit Hours: 3.00. The theory of general purpose programming systems. Recursive and partial-recursive functions; recursive and recursively enumerable sets. The Church-Turing thesis. The recursion theorem, Rogers' translation theorem, Rice's undecidability theorem. The general theory of computational complexity: there are no general solutions to natural optimization problems. Complexity for specific models of computation: the polynomial complexity classes P, NP, and PSPACE; NP-hard and PSPACE-hard problems, inherently exponential problems.

Credits: 3.00

CS 58500 - Theoretical Computer Science Toolkit

Credit Hours: 3.00. This course covers fundamental techniques and a range of mathematical tools that underlie today's research in theoretical computer science. The course material is essential for research in theoretical computer science as well as machine learning theory. The course is targeted at students who plan to pursue research in these areas. Topics will be chosen from four core areas: Convex Analysis and Optimization, Spectral Methods, Concentration Inequalities, and Discrete Fourier Analysis. Depending on student and instructor interest, additional topics will be chosen and may include applied analysis, coding theory, probabilistic proofs, and more advanced topics in discrete Fourier analysis. Students will read papers in theoretical computer science and machine learning theory using, exploring and extending the covered techniques and tools. Students are expected to be proficient in probability theory, have the maturity to follow and carry out basic analysis proofs, and have completed courses in calculus, linear algebra, discrete mathematics, and analysis of algorithms. More specifically, the course expects mastery of the material covered in Calculus III, Linear Algebra, Probability, Foundations of CS, and Analysis of Algorithms.

Learning Outcomes: 1. Explain and justify the merits and limitations of convex optimization algorithms. 2. Describe the characteristics and the role of convexity in optimization. 3. Formulate mathematically problems that have solutions based on convex optimization or matric analysis tools and analyze them effectively. 4. Predict typicality of the outcome in experiments. 5. Explain how to use and apply concentration bounds, including Chernoff-Hoeffding Bound, Martingales and Azuma's

Inequality, and applications of the Talagrand inequality. 6. Develop precise mathematical formulation of problems and analyze using frameworks related to concentration of measure. 7. Apply Discrete Fourier Transform to determine properties of functions. 8. Explain why Fourier Analysis of Boolean Functions is a major tool in theoretical CS and describe application scenarios including property testing, cryptography, complexity, learning theory, pseudorandomness, hardness of approximation, and random graph theory. 9. Identify properties of functions based on the properties of their spectrum. 10. Explain the basic ideas underlying the tradeoff between the amount of redundancy used and the number of errors that can be corrected by a code. 11. Describe achieving the optimal tradeoff between redundancy and error correction for codes that come equipped with efficient encoding and decoding. 12. Illustrate how and why concatenated codes support the construction of asymptotically good codes. Credits: 3.00

CS 58700 - Foundations Of Deep Learning

Credit Hours: 3.00. This course provides an integrated view of the key concepts of deep learning (representation learning) methods. This course focuses on teaching principles and methods needed to design and deploy novel deep learning models, emphasizing the relationship between traditional statistical models, causality, invariant theory, and the algorithmic challenges of designing and deploying deep learning models in real-world applications. This course has both a theoretical and coding component. The course assumes familiarity with coding in the language used for state-of-the-art deep learning libraries, linear algebra, probability theory, and statistical machine learning. Credit Hours: 3.00. This course provides an integrated view of the key concepts of deep learning (representation learning) methods. This course has both a theoretical and coding component. The course assumes familiarity with coding in the language used for state-of-the-art deep learning libraries, linear algebra, probability theory, and statistical machine learning.

Learning Outcomes: 1. Understand statistical Foundations of Deep Learning. 2. Understand feedforward Networks. 3. Understand stochastic optimization of neural network models. 4. Understand Bayesian Neural Networks. 5. Understand invariant & Equivariant Representation Learning. 6. Understand task-invariant representations. 7. Understand meta Learning. 8. Understand multi-task Learning. 9. Understand transfer Learning. 10. Understand implicit generative models (probabilistic models without explicit likelihoods). 11. Understand variational Auto-Encoders. 12. Understand generative Adversarial Networks. 13. Understand stable Diffusion Generative models. 14. Understand how to evaluate the performance of neural networks, as well as

formulate and test hypotheses. 15. Understand how theory and algorithmic elements interact to impact performance. Credits: 3.00

CS 58800 - Randomized Algorithms

Credit Hours: 3.00. The area of randomized algorithms has grown from being a tool in computational number theory to finding widespread application in algorithms in all areas of computer science. Two practical benefits of randomization are its simplicity and speed. Deep and important computational complexity connections have been developed, from bridging the gap between discrete and continuous optimization, bypassing deterministic barriers in online settings, summarizing massive data in polylogarithmic space, probabilistically checkable proofs, privacy enhancing techniques, modeling the web and other large networks, and sparsifying and compressing complicated combinatorial structures such as graphs. Randomization is an essential key ingredient in the algorithmic breakthroughs today and in the future. This course presents the basic concepts in the design and analysis of randomized algorithms and shows how to apply them to algorithms for a wide range of problems. The course covers a broad range of problems benefitting from randomized computation including data structures, graph algorithms, online algorithms, geometric algorithms, streaming algorithms, derandomization techniques, and tools for probabilistic analysis of algorithms.

Learning Outcomes: 1. Describe the main principles underlying the design and analysis of a randomized algorithm. 2. Explain concepts of randomized algorithms used in specific domains; e.g., graph-theory, number theory, and linear algebra problems. 3. Apply measure concentration results from probability theory to analyze a given randomized algorithm. 4. Determine the running times, failure probabilities, and accuracy guarantees of a randomized algorithm. 5. Apply learned design techniques and analysis tools to design and analyze new randomized algorithms. 6. Explain material from published research in the area of randomized algorithms using field-specific language. Credits: 3.00

CS 59000 - Topics In Computer Sciences

Credit Hours: 1.00 to 5.00. Directed study for students who wish to undertake individual reading and study on approved topics. Permission of instructor required.

Credits: 1.00 to 5.00

CS 59100 - Seminar

Credit Hours: 1.00. A weekly seminar presented by faculty and invited speakers, normally in a specific area.

Credits: 1.00

CS 59200 - Computer Science Seminar

Credit Hours: 3.00. A seminar course for in-depth exploration of a specific topic. Topics vary. Classes consist of both instructor and student presentations. Students read, present and discuss research papers, and may complete and present a research project in the area. For each offering, inclusion on a plan of study is determined by the CS Graduate Study Committee. If approved, may be included on a CS MS or PhD plan of study according to relevant ruleset.

Learning Outcomes: 1. Vary due to nature of course. Credits: 3.00

CS 59300 - New Topics In CS

Credit Hours: 3.00. A variable title course for topics not currently covered in the CS graduate curriculum. Each offering follows a traditional course structure with textbook(s), assignments, exams, and week-by-week content synopsis described in a syllabus. A CS 59300 offering does not imply that a course is intended to become, or will become, a regular course in the CS graduate curriculum. May be included on a CS MS or PhD plan of study according to the relevant ruleset.

Learning Outcomes: 1. Vary due to nature of course. Credits: 3.00

CS 59799 - Graduate Professional Practice

Credit Hours: 0.00. Internship experience to complement the student's academic coursework and help prepare the student for employment in computer science. The student must present a letter from the proposed employer describing to a reasonable extent the work to be undertaken and find a member of the Computer Science Graduate Faculty to be the instructor. The student must have completed at least one semester as a computer science graduate student at Purdue, West Lafayette. May not be taken in successive semesters. Permission of instructor required.

Learning Outcomes: 1. Experience applying knowledge and skills learned in courses. Credits: 0.00

CS 61500 - Numerical Methods For Partial Differential Equations I

Credit Hours: 3.00. (MA 61500) Finite element method for elliptic partial differential equations; weak formulation; finite-dimensional approximations; error bounds; algorithmic issues; solving sparse linear systems; finite element method for parabolic partial differential equations; backward difference and Crank-Nicolson time-stepping; introduction to finite difference methods for elliptic, parabolic, and hyperbolic equations; stability, consistency, and convergence; discrete maximum principles. Prerequisite: CS 51400, MA 52300.

Credits: 3.00

CS 62600 - Advanced Information Assurance

Credit Hours: 3.00. Advanced topics in information assurance, including selections from the following: penetration testing, formal verification of systems, formal models of information flow and protection, distributed system authentication, protocol design and attack, computer viruses and malware, intrusion and anomaly detection models, multi-level security, active defenses, investigation and forensics, network firewalls, anonymity and identity, e-commerce support, and database security models and mechanisms. Offered every third semester. Prerequisite: CS 52600 , CS 55500 .

Credits: 3.00

CS 63500 - Capturing And Rendering Real-World Scenes

Credit Hours: 3.00. Advanced techniques for automated modeling and visualization of complex environments, such as rooms, buildings, urban scenes, and landscapes. Topics covered are at the confluence of computer graphics, computer vision and engineering, and include: capture technologies, acquisition device calibration, view registration, panoramic images, 3D reconstruction from images, view morphing, 3D image warping, lightfield modeling and rendering, visual hulls, point-based modeling and rendering, view dependent texture mapping, and application development issues and examples. Prerequisite: CS 58000 , CS 53500 or a solid foundation in computer graphics, programming proficiency in C or C++ and basic linear algebra.

Credits: 3.00

CS 63600 - Internetworking

Credit Hours: 3.00. Principles of Internetwork architecture and communication protocols underlying interoperable systems. Topics include universal interconnection, Internet addressing and routing, address binding, control of Internet congestion and flow, examples of Internet protocol suites (TCP/IP and XNS), round trip time estimation, naming and name resolution, Internet applications programs, and the ISO/OSI model. Prerequisite: CS 50300 .

Credits: 3.00

CS 63800 - Multimedia Networking And Operating Systems

Credit Hours: 3.00. For graduate students in computer sciences who have a background in networking and operating systems and are interested in research in networked multimedia systems. The course consists of a selection of networking and operating system topics for realizing high performance, predictable, scalable, flexible, and secure multimedia systems. Topics may vary to reflect timely research issues and the current interests of the instructor(s). Students are expected to complete a term project. Presentations also may be required. Undergraduate background in computer science required. Prerequisite: CS 53600 or CS 50300 .

Credits: 3.00

CS 64100 - Multimedia Database Systems

Credit Hours: 3.00. Prepares students for research in multimedia database systems. Students are exposed to a variety of emerging innovative techniques to store, manipulate, communicate, visualize, and reason with multimedia systems. Prerequisite: CS 54100 or CS 54200 .

Credits: 3.00

CS 65500 - Advanced Cryptology

Credit Hours: 3.00. Advanced topics in cryptography and cryptanalysis, including selections from the following: Steganographic methods, Cryptanalytic techniques, including differential cryptanalysis, and chosen plaintext attacks. Message digest algorithm construction. Digital cash. Quantum cryptography. N-key systems. Minimal and zero-knowledge systems. Protocol design and failure. Verification of algorithms. Key generation and management. Traffic analysis. VPN construction and operation. Politics, espionage, and law enforcement concerns. Offered every third semester. Prerequisite: CS 52600 , CS 55500 .

Credits: 3.00

CS 66200 - Pattern Recognition And Decision-Making Processes

Credit Hours: 3.00. (ECE 66200) Introduction to the basic concepts and various approaches of pattern recognition and decision-making processes. Topics include various classifier designs, evaluation of classifiability, learning machines, feature extraction, and modeling. Prerequisite: ECE 30200 .

Credits: 3.00

CS 69000 - Seminar On Topics In Computer Sciences

Credit Hours: 0.00 to 5.00. Topics vary. Permission of instructor required.

Credits: 0.00 to 5.00

CS 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. The student is expected to follow safe research practices, to follow ethical research practices, to maintain communication with the instructor, to formulate a set of reasonable semester research progress milestones with instructor, optionally in writing. Permission of instructor required.

Credits: 1.00 to 18.00

CS 69900 - Research PhD Thesis

Credit Hours: 1.00 to 18.00. Research PhD Thesis. The student is expected to follow safe research practices, to follow ethical research practices, to maintain communication with the instructor, to formulate a set of reasonable semester research progress milestones with instructor, optionally in writing. Permission of instructor required.

Credits: 1.00 to 18.00

CSCI 23000 - Computing I

Credit Hours: 4.00. The context of computing in history and society, information representation in digital computers, introduction to programming in a modern high-level language,

introduction to algorithms and data structures, their implementation as programs.

Credits: 4.00

CSCI 24000 - Computing II

Credit Hours: 4.00. Continues the introduction of programming begun in CSCI 23000, with a particular focus on the ideas of data abstraction and object oriented programming. Topics include programming paradigms, principles of language design, object-oriented programming, programming and debugging tools, documentation, recursion, linked data structures, and an introduction to language translation.

Credits: 4.00

CSCI 24100 - Introduction To Web Design

Credit Hours: 3.00. Introduction to writing content for the Internet and World Wide Web. Emphasis on servers, hand-coded HTML, Cascading Style Sheets and extending HTML with other Web technologies.

Credits: 3.00

CSCI 31100 - Advanced Database Programming, Oracle

Credit Hours: 3.00. Focus on the concepts and skills required for database programming and client server development. Concepts will apply to any modern distributed database management system. Emphasis on developing Oracle SQLPlus scripts, PL/SQL server side programming, and Oracle database architecture. Students with programming experience in ODBC compliant languages will be able to practice connecting such languages to an Oracle database. Lecture and laboratory.

Credits: 3.00

CSCI 34000 - Discrete Computational Structures

Credit Hours: 3.00. Theory and application of discrete mathematics structures and their relationship to computer science. Topics include mathematical logic, sets, relations, functions, permutations, combinatorics, graphs, Boolean algebra, digital logic, recurrence relations, and finite-state automata.

Credits: 3.00

CSCI 36200 - Data Structures

Credit Hours: 3.00. A study of the design and analysis of data structures and algorithms. Abstract data types: arrays, stacks, queues, lists, trees, graphs, etc. Algorithms: sorting, searching, hashing. File structures: organization and access methods.

Credits: 3.00

CSCI 36300 - Principles Of Software Design

Credit Hours: 3.00. (ECE 37200) This course is designed to teach students best practices in designing and implementing object-oriented systems of high quality. To accomplish this task, we start with an overview of software design patterns and their role in developing high-quality software. We then begin surveying different design-level software design patterns, such as the Bridge, Strategy, Wrapper Facade, and Visitor software design patterns. Next, we touch on software design patterns for building distributed systems. Finally, we finish the course by surveying software anti-patterns, which are common design mistakes that negatively impact system quality, such as degrading performance as the system scales in size and complexity. Students will have the opportunity to apply learned techniques on several programming projects throughout the semester.

Learning Outcomes: 1. Understand and define the purpose of software design patterns. 2. Identify and describe the design goal and intent of different design patterns. 3. Know what software design pattern to apply to a particular problem. 4. Apply techniques for implementing and debugging object-oriented software systems. 5. Apply techniques for identifying design flaws that negatively impact system quality. Credits: 3.00

CSCI 40300 - Introduction To Operating Systems

Credit Hours: 3.00. Operating system concepts; history, evolution and philosophy of operating systems. Concurrent processes, process coordination and synchronization, CPU scheduling, deadlocks, memory management, virtual memory, secondary storage and file management, device management, security and protection, networking, distributed and real-time systems.

Learning Outcomes: 1. Learn computer systems structures. 2. Learn operating systems structures. 3. Study processes & threads. 4. Perform CPU scheduling. Credits: 3.00

CSCI 41400 - Numerical Methods

Credit Hours: 3.00. Error analysis, solution of nonlinear equations, direct and iterative methods for solving linear systems, approximation of functions, numerical differentiation and integration, numerical solution of ordinary differential equations. Not open to students with credit in CSCI 512.

Credits: 3.00

CSCI 43200 - Security In Computing

Credit Hours: 3.00. An introduction to computing security to include Cryptography; Identity and authentication; Software security; Operating system security; Trusted operating system design and evaluation; Network threats and defenses; Security management; legal aspects of security; Privacy and ethics.

Learning Outcomes: 1. Learn about cryptography, identity, and authentication. 2. Identify different types of software security, operating system security, trusted operating system design. 3. Discuss the legal aspects of security, privacy, and ethics. Credits: 3.00

CSCI 44300 - Database Systems

Credit Hours: 3.00. Relational database systems: architecture, theory, and application. Relational data structure, integrity rules, mathematical description, data manipulation. Standard SQL and its data manipulation language, engineering aspects of database design in industry, introduction to non-relational database systems.

Credits: 3.00

CSCI 44800 - Biometric Computing

Credit Hours: 3.00. Biometrics is capturing and using physiological or behavioral characteristics for personal identification. It is set to become the successor to the PIN. This course will introduce computational methods for the implementation of various biometric technologies including face and voice recognition, finger print and iris identification, and DNA matching.

Learning Outcomes: 1. Learn behavioral characteristics for biometric identification. 2. Discuss biometric traits and theories. 3. Implement real-world biometric technologies.

Credits: 3.00

CSCI 45000 - Principles Of Software Engineering

Credit Hours: 3.00. Tools and techniques used in software development. Lifecycle concepts applied to program specification, development, and maintenance. Topics include overall design principles in software development; the use of structured programming techniques in writing large programs; formal methods of program verification; techniques and software tools for program testing, maintenance, and documentation.

Credits: 3.00

CSCI 48400 - Theory Of Computation

Credit Hours: 3.00. Introduction to formal languages and automata theory; finite automata, regular expressions, regular languages, context-free languages and pushdown automata, context sensitive languages, Turing machines, undecidability, P and NP. Design and analysis techniques for divide-and-conquer algorithms, greedy algorithms, dynamic programing, amortized analysis.

Credits: 3.00

CSCI 48900 - Data Science

Credit Hours: 3.00. The course will cover data manipulation, analysis, and visualization. Statistical modeling, dimension reduction and techniques of supervised and unsupervised learning. Introduction to software technologies used in data science and applications in science, government and industry.

Learning Outcomes: 1. Understand and describe various aspects of machine learning, statistics and soft engineering skills used in industrial and academic data science. 2. Demonstrate and apply knowledge through class competitions, blog assignment and a final project. 3. Communicate data analyses effectively through written reporting and oral presentations. Credits: 3.00

CSCI 49000 - Topics In Computer Sciences For Undergraduates

Credit Hours: 1.00 to 5.00. Supervised reading and reports in various fields.

Credits: 1.00 to 5.00

CSCI 49500 - Explorations In Applied Computing

Credit Hours: 1.00 to 6.00. Explorations in Applied Computing is an undergraduate capstone experience. Students will work in teams, advised by faculty and external liaisons, to solve real-world computing problems. This hands-on experience will cultivate technical expertise, utilization of analytical thinking, quantitative reasoning, project management skills, and communication skills.

Credits: 1.00 to 6.00

CSCI 49600 - Computer Science Internship Capstone

Credit Hours: 3.00. A professional experience providing students the opportunity to incorporate material learned in CSCI coursework in a supervised internship position. The approved internship position will cultivate technical expertise, utilization of analytical thinking, quantitative reasoning, project management skills, and communication skills.

Credits: 3.00

Construction Engineering and Management

CEM 18000 - Construction Engineering Pre-Professional Development

Credit Hours: 1.00. Online course consisting of 8 sessions and 1 module (10 hour OSHA training) is intended to be completed before the student's first work session (internship) in order to prepare the student in the form of oral and written communication that will assist them in being successful in their experiential learning opportunities within industry. This course will also introduce the students to the construction industry relative to office and field requirements and introduce the student to professional skills that will be needed for their experiential learning opportunities including but not limited to: verbiage and acronyms, tools, software platforms, and general business etiquette and ethics.

Learning Outcomes: 1. Demonstrate an ability to apply knowledge of mathematics, science and engineering. 2. Demonstrate an understanding of professional and ethical responsibility. 3. Demonstrate ability to

communicate effectively. 4. Demonstrate the broad education necessary to understand the impact of engineering solutions in a global, economic, environmental, and societal context. 5. Demonstrate recognition of the need for, and an ability to engage in life-long learning. 6. Demonstrate knowledge of contemporary issues. Credits: 1.00

CEM 20100 - Life Cycle Engineering And Management Of Constructed Facilities

Credit Hours: 3.00. This course introduces concepts relating to the engineering and construction of facilities throughout their life cycle. Topics that will be explored include the nature of the construction industry, construction contracts, legal and management organization of construction companies, basics of the design and construction process, as well as an introduction to the role of estimating and project scheduling. Cost, time, safety and quality concepts of construction management relationships will also be discussed. Prerequisite: First Year Engineering Curriculum must be completed.

Learning Outcomes: 1. Work with construction schedules and determine which activities are critical to the timely completion of the project. 2. Identify different types of construction contracts and specifications. 3. Calculate the productivity and the costs associated with construction equipment labor. 4. Calculate the peak financial requirement for a given project based on project revenues and expenses. 5. Understand the importance of safety on the construction site. 6. Understand the principles involved in estimating and controlling costs on a construction project. Credits: 3.00

CEM 28000 - Construction Engineering Professional Development I

Credit Hours: 1.00. This course will prepare the student for professional practice in construction engineering including information on careers and issues in construction industries; History and Culture of the U.S. Construction Industry; Engineering Ethics and Preparation for Leadership. Information and assistance is also provided related to minors and selections associated with the plan of study; student's organizations; opportunities for construction research and community outreach at Purdue. Guest speakers with be utilized to enhance the experience. The guest speakers include industry partners as well as faculty and staff. There will be an emphasis on written and oral communication.

Learning Outcomes: 1. Demonstrate an ability to apply knowledge of mathematics, science and engineering. 2. Demonstrate an ability to design a system, component, or process to meet desired needs within realistic constraints such as economic, environmental, social, political, ethical, health and safety, manufacturability, and sustainability. 3. Demonstrate an ability to function on multidisciplinary teams. 4. Demonstrate an ability to identify, formulate, and solve engineering problems. 5. Demonstrate an understanding of professional and ethical responsibility. 6. Demonstrate ability to communicate effectively. 7. Demonstrate the broad education necessary to understand the impact of engineering solutions in a global, economic, environmental, and societal context. 8. Demonstrate recognition of the need for, and an ability to engage in life-long learning. 9. Demonstrate knowledge of contemporary issues. 10. Demonstrate an ability to use the techniques, skills, and modern engineering tools necessary for engineering practice. Credits: 1.00

CEM 29100 - Construction Internship II

Credit Hours: 0.00. Second of three internship periods and a continuation of that described. Typically, experience emphasizes the office-based activities of the sponsor.

Credits: 0.00

CEM 29199 - Experiential Learning Session I

Credit Hours: 0.00. The Construction Engineering and Management (CEM) curriculum-based experiential learning courses allow students to bridge the gap between classroom theory and real-world practice through intentional partnerships with industry leaders. Students are systematically and deliberately aligned with industry partners to immerse themselves in authentic, real-world scenarios within the construction engineering and management field. Student experiences will be captured in the assigned courses (listed below) to document the learning outcomes based on carefully crafted learning objectives encompassing a range of essential skills and competencies necessary for success in the industry. The courses represent experiential learning work sessions with industry partners as a full-time employee charged with responsible work activities/tasks. Our primary goal is cultivating

a holistic understanding of key concepts while fostering critical thinking, problem-solving abilities, and professional development. For additional information and best practices, please refer to the Experiential Learning Handbook A Guide for Students and Supervisors in Purdue's Construction Engineering and Management Program Fifth Edition 2022.

Learning Outcomes: 1. Communicate ideas, information, and progress updates professionally, both verbally and in written form, with colleagues, supervisors, and external stakeholders. 2. Demonstrate the ability to pay attention to detail and ensure thoroughness in completing assigned tasks, projects, and reports within specified timelines and quality standards; utilizing codes, standards, and standard operating procedures. 3. Understand and apply safety protocols, regulations, and best practices in the construction industry to ensure a safe working environment for themselves and their colleagues. They will make informed decisions regarding safety in their work and when overseeing the work of others. 4. Gain a comprehensive understanding of field operations within the construction industry, including hands-on experience with equipment, tools, materials, and procedures commonly used in the field. 5. Acquire fundamental knowledge and skills related to estimating, including cost estimation, quantity take-offs, bidding processes, and interpreting project specifications and drawings. 6. Develop a foundational understanding of project management principles and practices, including project planning, scheduling, budgeting, resource allocation, risk management, and client communication. 7. Demonstrate the ability to adapt to changing project requirements, solve problems creatively, identify potential issues, and propose practical solutions to overcome challenges encountered during the internship experience. 8. Participate in team-based projects, collaborate with diverse teams, contribute ideas, respect diverse perspectives, and demonstrate effective interpersonal skills to achieve common goals. 9. Uphold professional ethics, integrity, and accountability in all aspects of their work, including respecting confidentiality, adhering to company policies and procedures, and conducting themselves honestly and fairly. 10. Use reflective practices to evaluate their internship experiences, identify areas for improvement, set personal and professional goals, seek feedback from mentors and supervisors, and demonstrate a commitment to lifelong learning and professional development. Credits: 0.00

CEM 29299 - Experiential Learning Session II

Credit Hours: 0.00. The Construction Engineering and Management (CEM) curriculum-based experiential learning courses allow students to bridge the gap between classroom theory and real-world practice through intentional partnerships with industry leaders. Students are systematically and deliberately aligned with industry partners to immerse themselves in authentic, real-world scenarios within the construction engineering and management field. Student experiences will be captured in the assigned courses (listed below) to document the learning outcomes based on carefully crafted learning objectives encompassing a range of essential skills and competencies necessary for success in the industry. The courses represent experiential learning work sessions with industry partners as a full-time employee charged with responsible work activities/tasks. Our primary goal is cultivating a holistic understanding of key concepts while fostering critical thinking, problem-solving abilities, and professional development. For additional information and best practices, please refer to the Experiential Learning Handbook A Guide for Students and Supervisors in Purdue's Construction Engineering and Management Program Fifth Edition 2022.

Learning Outcomes: 1. Communicate ideas, information, and progress updates professionally, both verbally and in written form, with colleagues, supervisors, and external stakeholders. 2. Demonstrate the ability to pay attention to detail and ensure thoroughness in completing assigned tasks, projects, and reports within specified timelines and quality standards; utilizing codes, standards, and standard operating procedures. 3. Understand and apply safety protocols, regulations, and best practices in the construction industry to

ensure a safe working environment for themselves and their colleagues. They will make informed decisions regarding safety in their work and when overseeing the work of others. 4. Gain a comprehensive understanding of field operations within the construction industry, including hands-on experience with equipment, tools, materials, and procedures commonly used in the field. 5. Acquire fundamental knowledge and skills related to estimating, including cost estimation, quantity take-offs, bidding processes, and interpreting project specifications and drawings. 6. Develop a foundational understanding of project management principles and practices, including project planning, scheduling, budgeting, resource allocation, risk management, and client communication. 7. Demonstrate the ability to adapt to changing project requirements, solve problems creatively, identify potential issues, and propose practical solutions to overcome challenges encountered during the internship experience. 8. Participate in team-based projects, collaborate with diverse teams, contribute ideas, respect diverse perspectives, and demonstrate effective interpersonal skills to achieve common goals. 9. Uphold professional ethics, integrity, and accountability in all aspects of their work, including respecting confidentiality, adhering to company policies and procedures, and conducting themselves honestly and fairly. 10. Use reflective practices to evaluate their internship experiences, identify areas for improvement, set personal and professional goals, seek feedback from mentors and supervisors, and demonstrate a commitment to lifelong learning and professional development. Credits: 0.00

CEM 29700 - Experimental Course

Credit Hours: 1.00 to 6.00. This course is required to assist in the development and testing of new courses for either residential or online delivery. Initially, there may be more residential courses than online due to faculty availability and/or workload.

Learning Outcomes: 1. Introduce students to essential elements of engineering theories, practices, and applications in the field of construction engineering. Courses may address two or more ABET outcomes. 2. Able to identify, formulate, and solve complex engineering problems by applying principles of engineering, science, and mathematics. 3. Able to apply engineering design to produce solutions that meet specified needs with consideration of public health, safety, and welfare, as well as global, cultural, social, environmental, and economic factors. 4. Able to communicate effectively with a range of audiences. 5. Able to recognize ethical and professional responsibilities in engineering situations and make informed judgments, which must consider the impact of engineering solutions in global, economic, environmental, and societal contexts. 6. Able to function effectively on a team whose members together provide leadership, create a collaborative and inclusive environment, establish goals, plan tasks, and meet objectives. 7. Able to develop and conduct appropriate experimentation, analyze and interpret data, and use engineering judgment to draw conclusions. 8. Able to acquire and apply new knowledge as needed, using appropriate learning strategies. Credits: 1.00 to 6.00

CEM 30100 - Project Control And Life Cycle Execution Of Constructed Facilities

Credit Hours: 3.00. This course continues an introduction to construction management and engineering concepts for future engineers, contractors and owner representatives involved at different stages in the life-cycle of constructed facilities. Specifically, this course focuses on the principles, tools, and procedures used in the construction industry for project selection and financing, advanced planning and scheduling techniques, resource management, and project monitoring.

Learning Outcomes: 1. Able to use the techniques, skills, and modern engineering tools necessary for engineering practice. 2. Able to

design a process to meet desired needs within realistic constraints. Credits: 3.00

CEM 32100 - Construction Engineering Materials Lab

Credit Hours: 1.00. The nature and performance of materials under load stress. Important engineering materials for evaluation of physical and mechanical properties include ferrous and nonferrous metals, plastics, bituminous materials, Portland cement, aggregates, concrete, timber, and particulate systems.

Learning Outcomes: 1. Evaluate the behavior and properties of engineering materials. 2. Assess the nature and performance of materials under load: Theory vs. Reality. 3. Facilitate the understanding of the strength and weakness of major construction engineering materials and their application. 4. Design and conduct experiments, and analyze and interpret data. Credits: 1.00

CEM 32400 - Human Resource Management In Construction

Credit Hours: 3.00. Introduce a broad set of fundamental topics regarding management of people in engineering and construction organizations in the U.S. Subjects include labor-management relations (laws, regulations and practices affecting construction workers and organizations); worker motivation, productivity, and training; roles and practices of managers; construction safety; management of quality.

Learning Outcomes: 1. Understand managerial aspects of the engineering and construction industry. 2. Know the background and the principal laws and practices concerning labor-management relations for the union and nonunion jobs. 3. Know current management practices involving worker supply and demand, workforce training, EEO and workforce diversity, professional ethics and construction safety. 4. Gain basic knowledge to help you become an effective manager in engineering and construction organizations. 5. Enhance communication skills. Credits: 3.00

CEM 35100 - Foundations Of Architectural Design (UCC: HUM)

Credit Hours: 3.00. Contemporary humans spend most of our time directly engaging with architecture; it is the context in which we live our lives. This course introduces the demands ('tasks') and methods ('tools') inherent to the practice of architectural design. In other words, the problems architects address through design and the ways in which they do so. These two sets of topics are presented in tandem through historical and contemporary examples, along with selected case-studies and readings. Success in the course will provide a foundation for richly experiencing, critically assessing, and productively engaging the development of our built environment.

University Core Curriculum (UCC): (UCC: HUM)

Learning Outcomes: 1. Identify features exhibiting distinct qualities (historical, cultural, technical, etc.) in built examples. 2. Explain how an architectural design may have developed as it did. 3. Demonstrate how ideas from one source can be applied to the analysis of another. 4. Distinguish how a case study example exhibits specific traits. Credits: 3.00

CEM 38000 - Construction Engineering Professional Development II

Credit Hours: 1.00. This course will build upon the topics discussed in CEM 28000 to further prepare students for their work in the construction industry. A focus of this class will be on presentation skills. By utilizing the first or last hour of CEM 42500 - Construction Practice Project, the students of CEM 38000 will have the opportunity to present and also participate as an audience and active participant in CEM 42500 Construction Practice Project. The presentations of CEM 38000 will consist of their required Summer Internship Reports, which are a compilation of the work they have completed and skills they have learned in their first two internships (CEM 19100 and CEM 29100).

Learning Outcomes: 1. Demonstrate an ability to apply knowledge of mathematics, science and engineering. 2. Demonstrate an ability to design a system, component, or process to meet desired needs within realistic constraints such as economic, environmental, social, political, ethical, health and safety, manufacturability, and sustainability. 3. Demonstrate an ability to identify, formulate, and solve engineering problems. 4. Demonstrate an understanding of professional and ethical responsibility. 5. Demonstrate an ability to communicate effectively. 6. Demonstrate the broad education necessary to understand the impact of engineering solutions in a global, economic, environmental, and

societal context. 7. Demonstrate recognition of the need for, and an ability to engage in life-long learning. 8. Demonstrate knowledge of contemporary issues. Credits: 1.00

CEM 39100 - Construction Internship III

Credit Hours: 0.00. Third, and last, of required internships. It typically emphasizes the project management activities of the sponsor. Actual assignments to a student may vary from sponsor to sponsor.

Credits: 0.00

CEM 39399 - Experiential Learning Session III

Credit Hours: 0.00. The Construction Engineering and Management (CEM) curriculum-based experiential learning courses allow students to bridge the gap between classroom theory and real-world practice through intentional partnerships with industry leaders. Students are systematically and deliberately aligned with industry partners to immerse themselves in authentic, real-world scenarios within the construction engineering and management field. Student experiences will be captured in the assigned courses (listed below) to document the learning outcomes based on carefully crafted learning objectives encompassing a range of essential skills and competencies necessary for success in the industry. The courses represent experiential learning work sessions with industry partners as a full-time employee charged with responsible work activities/tasks. Our primary goal is cultivating a holistic understanding of key concepts while fostering critical thinking, problem-solving abilities, and professional development. For additional information and best practices, please refer to the Experiential Learning Handbook A Guide for Students and Supervisors in Purdue's Construction Engineering and Management Program Fifth Edition 2022.

Learning Outcomes: 1. Communicate ideas, information, and progress updates professionally, both verbally and in written form, with colleagues, supervisors, and external stakeholders. 2. Demonstrate the ability to pay attention to detail and ensure thoroughness in completing assigned tasks, projects, and reports within specified timelines and quality standards; utilizing codes, standards, and standard operating procedures. 3. Understand and apply safety protocols, regulations, and best practices in the construction industry to ensure a safe working environment for themselves and their colleagues. They will make informed decisions regarding safety in their work and when overseeing the work of others. 4. Gain a comprehensive understanding of field operations within the construction industry, including hands-on experience with equipment, tools, materials, and procedures commonly used in the field. 5. Acquire fundamental knowledge and skills related to estimating, including cost estimation, quantity take-offs, bidding processes, and interpreting project specifications and drawings. 6. Develop a foundational understanding of project management principles and practices, including project planning, scheduling, budgeting, resource allocation, risk management, and client communication. 7. Demonstrate the ability to adapt to changing project requirements, solve problems creatively, identify potential issues, and propose practical solutions to overcome challenges encountered during the internship experience. 8. Participate in team-based projects, collaborate with diverse teams, contribute ideas, respect diverse perspectives, and demonstrate effective interpersonal skills to achieve common goals. 9. Uphold professional ethics, integrity, and accountability in all aspects of their work, including respecting confidentiality, adhering to company policies and procedures, and conducting themselves honestly and fairly. 10. Use reflective practices to evaluate their internship experiences, identify areas for improvement, set personal and professional goals, seek feedback from mentors and supervisors, and demonstrate a commitment to lifelong learning and professional development. Credits: 0.00

CEM 39499 - Extensive Cooperative Experience IV

Credit Hours: 0.00. Professional experience in Construction Engineering and Management. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.

Learning Outcomes: 1. Apply knowledge to identifying and solving problems in the

professional context. 2. Advance skills related to professional preparation, critical thinking, problem solving, communication, and teamwork. 3. Increase understanding of the profession and practice, basic industry principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

CEM 39599 - Extensive Cooperative Experience V

Credit Hours: 0.00. Professional experience in Construction Engineering and Management. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.

Learning Outcomes: 1. Apply knowledge to identifying and solving problems in the professional context. 2. Advance skills related to professional preparation, critical thinking, problem solving, communication, and teamwork. 3. Increase understanding of the profession and practice, basic industry principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

CEM 39700 - Experimental Course

Credit Hours: 1.00 to 6.00. This course is required to assist in the development and testing of new courses for either residential or online delivery. Initially, there may be more residential courses than online due to faculty availability and/or workload.

Learning Outcomes: 1. Introduce students to essential elements of engineering theories, practices, and applications in the field of construction engineering. Courses may address two or more ABET outcomes. 2. Able to identify, formulate, and solve complex engineering problems by applying principles of engineering, science and mathematics. 3. Able to apply engineering design to produce solutions that meet specified needs with consideration of public health, safety, and welfare, as well as global, cultural, social, environmental, and economic factors. 4. Able to communicate effectively with a range of audiences. 5. Able to recognize ethical and professional responsibilities in engineering situations and make informed judgments, which must consider the impact of engineering solutions in global, economic, environmental, and societal contexts. 6. Able to function effectively on a team whose members together provide leadership, create a collaborative and inclusive environment, establish goals, plan tasks, and meet objectives. 7. Able to develop and conduct appropriate experimentation, analyze and interpret data, and use engineering judgment to draw conclusions. 8. Able to acquire and apply knowledge as needed using appropriate learning strategies. Credits: 1.00 to 6.00

CEM 40100 - Critical Thinking In Construction Engineering

Credit Hours: 3.00. This course introduces the concepts of critical thinking and why acting in our 'comfort zone' can result in discomfort. Students will explore a number of simulated and actual problems that challenge understanding of the situation and require additional investigation or analysis. Problems will cover the entire building life-cycle from development of a project plan, through design, project risk analysis for bidding, controlling the project, project recovery, and project handover. Guest speakers will present examples of projects where critical thinking was applied to resolve project issues or avoid a significant error.

Learning Outcomes: 1. Understand the complex nature of construction through the schematic nature of design and the physical realities of construction sequences and processes. 2. Explore different approaches to accomplishing the same goal. 3. Learn from several case studies where solutions may appear obvious but where the better solution is less obvious. Professional writing and presentation skills are required. 4. Evaluate a specific construction case in depth and report on their findings and recommended approach. Credits: 3.00

CEM 42501 - Construction Engineering Capstone I

Credit Hours: 2.00. The capstone senior design course for construction engineering and management majors. Working in teams in a realistic engineering practice environment, students

use an actual construction project to accomplish open-ended project planning and systems design. Course covers construction project strategy, cost estimating and bidding, constructability analysis, project scheduling, contract conditions, project organization, site analysis and development, safety and quality management, and information systems design. Comprehensive written submittals and oral presentations require integration of knowledge gained in previous courses and in construction internships.

Learning Outcomes: 1. Know phases and aspects of construction project planning, engineering, and management at the project level. 2. Know complexities and uncertainties of planning and decision-making in a realistic environment. 3. Know how construction activities by the constructor are influenced by owner needs and project design basis and features. 4. Demonstrate methods and skills of oral and written communication. 5. Demonstrate methods, techniques and experience of working in teams. Credits: 2.00

CEM 42502 - Construction Engineering Capstone II

Credit Hours: 2.00. The capstone senior design course for construction engineering and management majors. Working in teams in a realistic engineering practice environment, students use an actual construction project to accomplish open-ended project planning and systems design. Course covers construction project strategy, cost estimating and bidding, constructability analysis, project scheduling, contract conditions, project organization, site analysis and development, safety and quality management, and information systems design. Comprehensive written submittals and oral presentations require integration of knowledge gained in previous courses and in construction internships.

Learning Outcomes: 1. Able to read a contract and determine the scope of work to be provided and under what terms. 2. Able to assemble a schematic design and design development set of plans & specifications representative of the schedule and budget. 3. Able to create appropriate types of schedules based on work composition using various scheduling programs. 4. Able to select the appropriate equipment, labor resources, and materials including temporary structure to perform the work. 5. Able to develop an estimate and budget based on plans and specifications. Credits: 2.00

CEM 43100 - Introduction To Facility Engineering And Management

Credit Hours: 3.00. This course introduces students to the field of facility engineering and management, the operation of constructed facilities to ensure efficient operation, meet stakeholder needs, and preserve the facility for its intended life. The course is a technical elective for Construction Engineering and Management students who are familiar with the delivery of capital construction projects and provides an owner/operator perspective of capital construction and ongoing operations. The course focuses on the different capital construction types (buildings, roads, bridges, tunnels, water treatment facilities, and industrial facilities). Guest speakers will be used to present the challenges specific to individual facility types. Methods and tools to develop the needed management and annual operational plans for facilities will be used. Case studies will be used to demonstrate the application of methods and tools.

Learning Outcomes: 1. Understand what is required to operate and manage a constructed facility. 2. Describe what resources are needed to operate and manage facilities of different types. 3. Examine the needs of individual facility types to ensure successful operation. 4. Analyze a facility to determine what is required for planning purposes. Credits: 3.00

CEM 45100 - Integrative Building Design

Credit Hours: 3.00. This course introduces the architectural and constructive challenges of comprehensive, integrated building design. In lectures, the range of constituent systems (active and passive) that combine to produce contemporary buildings will be presented with particular attention to the specific parameters and metrics that drive their functionality and performance. The central project is an extended exercise in design modeling: applying iterative refinements to introduce additional layers of systemic complexity and to respond to specific analytical measures of building performance. Success in this course will support the ability to productively contribute to building and construction projects from a variety of specific roles.

Learning Outcomes: 1. Understand building systems fundamentals. 2. Apply knowledge of building systems to a model case. 3. Compare the outcomes of different design/system application choices. 4. Develop a design solution based on a range of input parameters. 5. Communicate project outcomes clearly and effectively. Credits: 3.00

CEM 45500 - Temporary Structures In

Construction

Credit Hours: 3.00. This course will cover the design and construction of various temporary structures and systems used in building and transportation construction. The course describes not only design issues of temporary structures such as formwork, falsework, bracing, earth retention systems, scaffolding, cofferdams, and so forth by providing lectures and design examples, but it also covers business aspects associated with the design and construction of temporary structures in the real world such as business practice, legal aspects, and design philosophy.

Learning Outcomes: 1. Develop an understanding of design and performance of various systems. 2. Develop an understanding of the importance and value of these systems and the responsibilities that will be carried into a professional career. Credits: 3.00

CEM 45600 - Design-Build Project Delivery Method For Engineers

Credit Hours: 3.00. This course presents traditional project delivery methods and contrasts them with design-build project delivery. The course focuses on the principles, tools, and procedures used in the design-build project delivery method. It provides students with sufficient education to become certified (following additional examination) by the Design Build Institute of America as an Associate Member and dependent on employment experience, a full Member. Traditional project delivery methods, Design-Bid-Build, Construction Manager as Agent, 'Fast Track', and other 'rip and read' methods are losing popularity to project delivery methods that take a more collaborative approach. Collaboration requires a different way of thinking about a capital construction project and working with others in project delivery. Constructors must move from a transactional, arms-length relationship where the project is viewed as a low-price commodity to a full-suite delivery of services resulting in a high-value product. This requires collaboration with the Owner and other members of the project delivery process, something that has been missing from traditional project delivery methods. Active student participation is required. Student participation will be facilitated through assigned presentations, in-class projects, field trips to local projects, and guest lectures. Students who complete the course and achieve DBIA's minimum requirements (Fundamentals of Project Delivery, Principles of Design-Building Project Delivery, Post Award, and Contracts & Risk Management) will be eligible for recognition by DBIA.

Credits: 3.00

CEM 45700 - Inland Navigation Engineering

Credit Hours: 3.00. This course teaches detailed elements of Inland Navigation Structures, primarily in the United States. Students will become familiar with how waterways are conceived, planned, designed and constructed. Engineering Design Manuals for Locks and Dams will be reviewed. A primary focus will be on a new Corps of Engineers Lock and Dam currently under construction. The students will thoroughly review the Plans and Specifications as well as Construction Photos and Videos taken during construction. Various marine construction equipment and techniques will be presented.

Learning Outcomes: 1. Describe the attributes of all major project delivery methods, procurement methodologies, and contracting approaches. 2. Identify the appropriate project delivery method based on owner requirements. 3. Evaluate the attributes of design-build project delivery. 4. Assess the critical elements of the request for qualifications/request for proposals (RFQ/RFP) process and overall project management for design-build projects. 5. Understand the risk management and contract implications of a design-build project versus other project delivery methods. 6. Apply the attributes learned in this course to case studies. 7. Be prepared to be a meaningful participant on a real design-build project. Credits: 3.00

CEM 48500 - Legal Aspects Of Construction Engineering

Credit Hours: 3.00. This course will cover legal principles and landmark cases relevant to civil and construction engineering. Specific subjects covered include contracts, torts, agency, professional liability, labor laws, insurance, expert testimony, arbitration, patents and copyrights, sureties and ethics.

Learning Outcomes: 1. Read, comprehend and interpret construction contract plans and specifications for lock and dam facilities and other inland navigation structures. Through detailed study of project plans and specs as well as construction photos, students will be taken through the process of building these facilities from planning through construction. 2. Understand how a lock and dam facility functions. 3. Identify various components of lock and dam structures. 4. Understand various types of marine equipment necessary to construct a navigation facility in the dry or wet. Credits: 3.00

CEM 49700 - Construction Engineering Projects

Credit Hours: 0.00 to 4.00. Topics vary. Permission of

department required.

Credits: 0.00 to 4.00

CEM 50100 - Leadership And Advanced Project Management

Credit Hours: 3.00. This course will focus on the first ten years of the student's professional career. It will introduce concepts relating to development of the leader-manager, advanced project management techniques that will assist the student towards success in the construction industry, and developing a business plan on starting a small engineering or construction company. Guest speakers provide learning from entrepreneurs who got their start utilizing the systems taught in the course.

Learning Outcomes: 1. Recognize the importance of their personal values, attitudes, and communication skills in developing the leader-manager within. 2. Understand that modern leadership is "Taking people from where they are to where they have never been" and that "Leaders build leaders". 3. Work within a team atmosphere and understand conflict management. 4. Develop their planning skills with specific focus on Lean Construction and story boarding & resource leveling techniques. 5. Understand the importance and impact that marketing and relationship development can have on the individual construction company's success and survival. 6. Expand their financial and cash management skills, including real estate development. 7. Develop business plans for an emerging engineering or construction business. Credits: 3.00

CEM 53100 - Facilities Engineering And Management

Credit Hours: 3.00. This course provides the student with an understanding of the issues related to facilities management for owner organizations. The course is oriented toward upper class and graduate students familiar with the delivery of capital construction projects and provides an owner's perspective of capital construction and ongoing operation. The course will focus on the total life-cycle cost of a capital construction project beginning with planning, business rationale, economic analysis, and programmatic specifications. The owner's perspective on annual operating costs will be examined including calculation of daily, weekly, monthly, and annual operating costs. The implications of stewardship and customer service will be reviewed and analyzed including the implications on total life-cycle costs. The human resources implications of operating a facility will be reviewed including determination of staffing requirements to meet various levels of service as well as tools and techniques to determine and manage contracted services. Numerous case studies will be described and discussed which will demonstrate the importance of careful planning and budgeting of annual and periodic maintenance. Issues of sustainability, regulations, and other legal factors will be discussed and examined.

Learning Outcomes: 1. Gain an understanding of the cost implications associated with the decision to construct a new facility via a total cost of ownership perspective as well as understanding the service delivery expectations. 2. Learn methods for formulating and analyzing costs of operations including capital renewal. 3. Learn concepts of management of facilities (institutional, commercial, residential, and manufacturing). 4. Learn external factors related to owning and/or operating facilities of various sizes. 5. Learn prioritization, stewardship, management and decision making for capital projects. Credits: 3.00

CEM 53200 - Infrastructure Planning

Credit Hours: 3.00. This course provides the student with an in depth understanding of the issues related to infrastructure planning, engineering, and economics. The focus will be on the prioritization, stewardship, management and decision-making roles within the engineering division of a large public works agency. Various infrastructure planning concepts will be reviewed and discussed. Numerous case studies will be described and discussed, which will demonstrate that in order to plan and implement a successful public works project, many controversial issues must be faced and difficult problems must be solved. Decision-making at agency and other levels of government will be discussed with respect to reports prepared by planners covering engineering feasibility, environmental and social impact assessments, and financial and economic analyses. Evolving modern planning issues will be introduced and discussed, including sustainability; environmental economics; environmental justice; uncertainty and risk-benefit analysis; partnerships with private entities versus total privatization; and the optimum staff-mix utilization in-house versus outsourcing.

Learning Outcomes: 1. Learn methods for formulating and analyzing infrastructure projects. 2. Learn concepts of management of public works planning and implementation. 3. Learn principal methodologies of the interdisciplinary analyses of infrastructure

projects. 4. Learn prioritization, stewardship, management and decision making for public works projects. Credits: 3.00

CEM 53300 - Infrastructure Analytics

Credit Hours: 3.00. This course investigates the data sources and numerical tools required to assess the status of constructed facilities and to make informed decisions from the data. The course is oriented toward upper class and graduate students familiar with the delivery of capital construction projects (buildings, roads, bridges, earthworks, utilities, rail/transit, ports, and canals) and includes numerical analysis techniques. The course will focus on data sources, either direct or indirect, and analysis methods to identify the current condition or project future conditions of built infrastructure. Course format will be highly interactive with discussion about recent infrastructure projects in both instructor, guest speaker, and student-led discussions. Issues of sustainability, regulations, and other factors will be discussed and examined.

Learning Outcomes: 1. Learn Identification of metrics for analysis. 2. Learn data gathering techniques and tools. 3. Learn management of infrastructure data. 4. Learn techniques to resolve missing or non-existent data. 5. Learn numerical methods, limitations and accuracy. Credits: 3.00

CEM 58500 - Temporary Structures

Credit Hours: 1.00. This class will provide construction and design professionals the skills to understand construction loads and their combinations, wind loads and their impacts, timber design, bracing and guying design, designing vertical forming systems, and shoring analysis for vertical construction.

Learning Outcomes: 1. Know the possible types and magnitudes of loads experienced by temporary structures. 2. Design bracing and guying systems needed and used in vertical construction. 3. Design vertical forming systems. 4. Design vertical shoring systems. 5. Coordinate construction interfaces with design. Credits: 1.00

CEM 58600 - Development Of Underground Space

Credit Hours: 3.00. This course has been designed to support students with civil engineering and construction engineering and management background. New underground construction projects are planned all over the world, and the course equips students to contribute to these exciting developments. This course includes an overview of the application for tunneling and underground space as well as construction methods. The course will cover various sizes of underground opening from small diameters built by micro-tunneling to common tunnels used in civil and mining applications to large caverns, often found in different end uses such as storage or hydropower construction.

Learning Outcomes: 1. Critique concepts for the future use of underground space and innovative methods of construction. 2. Describe and classify underground works according to type, use and construction methods. 3. Recognize the diversity and complexity of underground excavations and associated works. 4. Improve oral and written communication skills, including effective presentation. Credits: 3.00

CEM 58700 - Underground Infrastructure Asset Management

Credit Hours: 3.00. Most of the U.S. water and wastewater conveyance infrastructure was installed during the first half of the 20th century and is coming to an end of its useful life. "Out of sight, out of mind" describes the awareness and significance that has been placed on these underground lifeline systems which support societies' quality of life, public health, economic development and living standard. Historically, management of these systems has been described as "crises management." They only get attention when there is a failure. It has been determined that a reactive management approach is not sustainable. The Environmental Protection Agency (EPA) has been instrumental in assisting utilities transition from reactive management practices to proactive practices. This approach involves the principles and practices of Asset Management (AM). AM is a comprehensive approach which involves every aspect of the organization to develop and implement best business practices to address: (a) the current state of the assets, (b) levels of service, (c) critical assets, (d) life-cycle costing, and (e) funding. This course prepares students to utilize sound engineering judgment and principles for managing the construction, repair, rehabilitation, and maintenance of buried infrastructure systems including pipes, tunnels, chambers, etc.

Learning Outcomes: 1. Understand how utilities (owners of underground infrastructure) are organized and operate. 2. Understand rates of deterioration, failure mechanisms, evaluation/inspection technologies, rehabilitation and repair methods of the buried infrastructure systems including pipes, tunnels, and chambers. 3. Develop strategic, tactical and operational plans to achieve the mission and objectives for developing and implementing

asset management programs for buried infrastructure. 4. Improve oral and written communication skills, including effective presentation. Credits: 3.00

CEM 59700 - Experimental Masters Course

Credit Hours: 1.00 to 3.00. This course will allow CEM to develop and test new courses for graduate level delivery. Possible courses include: Robotics in Construction; Tunneling; Process Plant Construction; Waterway Engineering; Construction Visualization; Remote Monitoring and Inspection; Cost/Benefits of Planning Details; Heavy Construction Innovation; Site Pollutant Reduction & Control; Statistical Methods in Construction; Infrastructure Decay Mechanisms; Time Buffers and Task Durations; BIM Tools and Applications; Sustainable Construction Methods; Construction Operations & Productivity; Construction Accounting; and Construction Leadership.

Learning Outcomes: 1. Varies with each course however, the goal will be to provide either high-demand subject matter or to tailor courses to a manageable size. Credits: 1.00 to 3.00

Construction Management

CM 10000 - Introduction To Construction Management (UCC: STS)

Credit Hours: 3.00. This course is a survey of the construction industry. Topics include the overall construction process, career opportunities in the construction industry, an introduction to construction materials as well as management and technology tools used in the industry. There will be an emphasis on construction specific vocabulary.

University Core Curriculum (UCC): (UCC: STS)

Learning Outcomes: 1. Recognize the evolution of the construction management role, the future of the construction industry, and prepare for a career in the industry. 2. Describe the basic sequence of work as well as a broad overview of basic materials and methods for a general construction project. 3. Know the evolution and growing demand for technology in construction. 4. Identify resources for student success at Purdue and life-long learning. 5. Convey professionalism by practicing proper communication, team work, rules and regulations, and level of detail required within a construction company and on a construction jobsite. Credits: 3.00

CM 15000 - Construction Management Fundamentals

Credit Hours: 6.00. This introductory course focuses on construction materials, methods, and contracts for basic commercial and residential projects. Students will develop essential skills in quantity estimating, construction plan reading, and project documentation. Students will participate in hands-on lab exercises that aim to connect theory with practice. The course includes OSHA 10-hour instruction, with students earning OSHA 10-hour certification cards upon completion, further emphasizing the importance of safety in construction practices.

Learning Outcomes: 1. Identify materials, means, and methods for a construction project throughout the entire project lifecycle. 2. Recognize project controls required during the pre-construction and construction phases of a construction project. 3. Explain project planning tasks relevant to a construction project. 4. Comprehend project administration on a construction project and the required documentation and technology available within the current construction industry. 5. Convey professionalism by practicing proper communication, team work, rules and regulations, and level of detail required within a construction company and on a construction jobsite. Credits: 6.00

CM 16000 - Surveying

Credit Hours: 3.00. Fundamental concepts and practical applications related to measurement of vertical and horizontal distances and angles using the tape, level, and total station. Computations of grades, traverses, areas, and curves. Basic concepts and applied use of topography, contours, and topographical maps.

Learning Outcomes: 1. Understand fundamentals of surveying including the theory and practice of surveying. 2. Perform surveying computations of grade, direction, traverse adjustment, area, and horizontal and vertical curve geometry. 3. Perform field measurements using basic and modern surveying equipment. 4. Perform tasks within a group effectively and efficiently. Credits: 3.00

CM 16400 - Graphics For Civil Engineering And Construction

Credit Hours: 2.00. This course introduces the fundamentals of construction engineering graphics and computer-aided documentation, focusing on their application in civil engineering and construction-related professions. Emphasizing the future of digital communication in the industry, students will explore advanced visualization and analysis techniques through the integration of sketching, computer-aided design (CAD), and emerging technologies. The course covers industry-standard graphic conventions, database management strategies, and methods for generating, interpreting, and sharing precise geometric models. Students will develop skills in creating, manipulating, and analyzing 2D and 3D visualizations to effectively communicate and solve complex construction problems in a dynamic, technology-driven environment.

Learning Outcomes: 1. Understand the Role of Construction Graphics: Demonstrate knowledge of the history, theories, and importance of engineering design processes and graphics in construction, including their role in real-world problem-solving and communication. 2. Apply Geometric and Graphic Standards: Develop proficiency in creating and solving 2D and 3D geometric forms and applying construction graphic standards and codes to engineering problems. 3. Utilize Computer Graphics and Visualization: Effectively use computer-aided design (CAD) tools and 3D visualization skills to analyze, solve, and communicate construction challenges. 4. Enhance Communication Through Graphic Conventions: Present solutions clearly and accurately using appropriate 2D and 3D graphical communication standards and conventions. Credits: 2.00

CM 20002 - Intermediate Pre-Construction Management

Credit Hours: 4.00. A project course covering intermediate level commercial, residential, heavy/civil, and industrial construction projects. Students will expand their understanding of construction company management, design, cost, project controls, and safety.

Learning Outcomes: 1. Calculate design components of a construction project during the pre-construction phase. 2. Produce project controls required during the pre-construction phase of a construction project. 3. Construct pre-planning documents relevant to beginning a construction project. 4. Apply project administration to a construction project utilizing the required documentation and technology available within the current construction industry. Credits: 4.00

CM 21500 - Mechanical Construction

Credit Hours: 3.00. Principles of code, design, methods, and materials are applied to plumbing, heating, ventilation, and air conditioning systems for buildings. The comprehension of mechanical construction plans and specifications is emphasized through exercises in mechanical estimating.

Learning Outcomes: 1. Relate materials, means, & methods for the MEP scope to a construction project throughout the project lifecycle. Prepare a list of CSI Divisions for the MEP scope and outline the MEP scope of work for a construction project; Propose sustainability concepts to the materials, means, and methods for the MEP scope of a construction project; Schedule work sequence for the MEP scope of construction phases of a project; Apply QA/QC documents and procedures required for the MEP scope during the construction phase. 2. Apply company management concepts to the MEP scope of a construction project during the construction phase. Create financial management plan required to complete the MEP scope of a construction project; Demonstrate interpersonal relations related to the MEP scope on a construction project; Integrating technology use on the MEP scope of a construction project during the construction phase. 3. Show professionalism by applying proper communication, team work, rules & regulations, and level of detail required within a construction company and on a construction jobsite. Demonstrate leadership skills within a team-based project; Utilize management skills required to complete tasks within a construction project; Practice teamwork utilizing the strengths of the individuals within the team; Apply oral and written communication skill

required within a construction project; Use ethics in all decision making and daily activities in a construction project. Credits: 3.00

CM 21601 - Electrical Construction

Credit Hours: 2.00. Principles of code and basic concepts in electrical theory, materials, methods, design and estimating are applied to electrical systems for buildings. Comprehension of electrical construction plans and specifications as well as installation exercises are emphasized through lab experiences.

Learning Outcomes: 1. Demonstrate thorough knowledge of all documents normally used in the electrical construction process including plans and specifications. 2. Recognize the applications of commonly used types of electrical materials required in building construction. 3. Interpret and evaluate materials selection, installation methods, and proper sizing and installation techniques using the National Electrical Code. 4. Illustrate the ability to effectively interact with building construction professionals regarding electrical construction. 5. Recall the names, nicknames, applications and rules for commonly used materials in the electrical contracting industry. 6. Construct proper electrical systems schematics. 7. Assemble the correct components and arrange them correctly to demonstrate basic electrical circuit knowledge. 8. Inspect electrical installations and identify rudimentary National Electrical Code violations. Credits: 2.00

CM 23301 - Mechanical, Electrical And Piping Systems In The Built Environment

Credit Hours: 3.00. An introductory course dealing with construction materials and methods related to building systems, focusing on mechanical, electrical, and piping (MEP) systems. Students will acquire fundamental skills in MEP construction plan reading, quantity estimating, basic systems' design and construction execution through lectures, laboratories and integrated project team exercises.

Learning Outcomes: 1. Recognize the basic principles and components of mechanical, electrical and piping (MEP) systems. 2. Explain the components of a given MEP system based on reading plan and specifications information. 3. Demonstrate the ability to understand conceptual cost and schedule of MEP systems. 4. Trace basic MEP systems lines, such as piping, lighting, and mechanical ducts. 5. Show an understanding of professionalism by applying proper communication, teamwork, rules & regulations, and level of detail required within a built environment business and on a construction jobsite. Credits: 3.00

CM 26000 - BIM I: Arch Modeling & Presentation Development

Credit Hours: 3.00. This course prepares future Integrated Virtual Construction Managers (IVCM) with essential skills in Building Information Modeling (BIM) for architectural design and marketing. Students will learn to create detailed, accurate 3D models and immersive visualizations that enhance construction workflows and serve as powerful marketing tools. By integrating BIM with project management, students will gain the technical and creative skills needed to transform complex construction data into persuasive visual content for clients and stakeholders.

Learning Outcomes: 1. Create accurate and detailed architectural Building Information Models, integrating design intent and construction data, while coordinating with other disciplines. 2. Demonstrate proficiency in creating high-quality visualizations, including renderings, animations, and walkthroughs, to develop professional presentations that clearly and persuasively communicate design concepts, project details, and potential construction impacts to stakeholders and clients. 3. Incorporate project management data, such as material quantities, cost estimates, and timelines, into models, preparing students for decision-making roles in construction management. 4. Develop the ability to manage BIM models throughout the project lifecycle, ensuring accuracy, version control, and alignment with evolving project objectives, while preparing professional-grade presentations tailored to client needs. Credits: 3.00

CM 26200 - Introduction To Construction Graphics

Credit Hours: 3.00. Study of graphic solutions to problems

conditioned by traditional and emerging construction document standards. Construction document creation is based on current architectural engineering and construction (AEC) standards with a focus on residential settings. Introductory 2D documentation will progress into 3D modeling techniques.

Learning Outcomes: 1. Employ graphic strategies in typical construction communication environments. 2. Relate construction graphics theories to real-world practices. 3. Produce graphic solutions to appropriate problems. 4. Show functional literacy in a variety of construction types. 5. Demonstrate construction print reading skills. 6. Identify and utilize construction graphic standards. Credits: 3.00

CM 27000 - Statics

Credit Hours: 3.00. Forces acting on bodies at rest, including coplanar, concurrent, and non-concurring systems; equivalent force systems and distributed forces. Use of free body diagrams and equations of equilibrium in solving problems for array of determinate structural systems: trusses, pin frames, arches, cables, retaining walls, and beams. Load tracing to examine the overall structural conditions with regards to lateral and gravity loads.

Learning Outcomes: 1. Analyze force systems acting at a single point. 2. Analyze force systems that are non-concurrent. 3. Analyze/design cable systems. 4. Analyze/design trusses by graphical and numerical methods. 5. Analyze/design pinned frames. 6. Analyze/design 3-hinged arches. 7. Trace the live and dead loads throughout a building structure. Credits: 3.00

CM 30002 - Advanced Pre-Construction Management

Credit Hours: 4.00. A project course covering advanced level commercial, residential, heavy/civil, and industrial construction projects. Students will further develop their understanding of construction company management, design, cost, project controls, and safety.

Learning Outcomes: 1. Select design systems for a construction project during the pre-construction phase. 2. Illustrate project controls required during the pre-construction phase of a construction project. 3. Analyze pre-planning tasks relevant to beginning a construction project. 4. Differentiate project administration on a construction project utilizing the required documentation and technology available within the current construction industry. 5. Demonstrate professionalism by analyzing proper communication, teamwork, rules and regulations, and level of detail required within a construction company and on a construction jobsite. Credits: 4.00

CM 30101 - Introduction To Construction Company Financial Management

Credit Hours: 2.00. An introduction to methods for recognizing revenue for long-term construction contracts and each method's impact on financial statements. Includes introduction to analysis of financial statements and their use in developing company budgets, projecting cash needs, pricing construction projects, and forecasting the impact of business decisions on construction company profit.

Learning Outcomes: 1. Identify and explain the use of various revenue recognition methods available to the construction contractor. 2. Identify the unique accounts required for percentage of completion revenue recognition, describe what the account represents, and indicate on which statement the account is found. 3. Interpret the outcomes of line-item analysis, vertical analysis, horizontal analysis, and cost-volume-profit analysis utilizing construction company financial statement data. 4. Perform a profit center analysis of an income statement. 5. Prepare an annual budget for a construction company given source documents. 6. Analyze the impact of various decisions on company profits by applying the cost-volume-profit financial analysis technique. 7. Select the appropriate overhead and profit allocation technique given example company cost structures and compute minimum company overhead and profit mark-up rates. 8. Prepare a monthly company budget given the annual budget and other appropriate information. 9. Compare the monthly budget prepared to actual data. 10. Compare and contrast profit and cash flow for the construction company. 11. Prepare

a cash flow projection by applying the company monthly budget. Credits: 2.00

CM 31000 - Equipment And Field Operations

Credit Hours: 3.00. Study of heavy equipment used in construction operations with an emphasis on equipment selection, application, cost, productivity, safety, and economics.

Learning Outcomes: 1. Understand each of the construction equipment functions and applications for construction operations. 2. Use the technique and method presented in class to: analyze ownership and operating costs; analyze earthwork volume, mass diagram, and hauling distance; analyze compaction operations; analyze power requirements; analyze dozer operation; analyze scraper operation; analyze excavator operation; analyze hauling operation; understand asphalt mix production and placement; understand concrete and concrete equipment operation; understand crane operation. Credits: 3.00

CM 31500 - Applied Construction Practice I

Credit Hours: 3.00. This course provides a supervised pre-professional learning experience, enabling students to apply their skills and knowledge while gaining practical, on-the-job training. It's designed to offer students an exciting hands-on progressive learning experience while helping employers shape and prepare their future workforce. Students are required to maintain full-time documented employment with an approved employer for the duration of the course. Permission of instructor required.

Learning Outcomes: 1. Demonstrate proficient use of construction management skills and concepts to successfully perform duties as assigned by direct supervisor. 2. Work cooperatively as a team member on construction projects. 3. Demonstrate oral and written communication skills to facilitate project delivery. 4. Demonstrate professionalism. 5. Develop independent planning and organizational skills. Credits: 3.00

CM 32500 - Applied Construction Practice II

Credit Hours: 3.00. This course provides a supervised pre-professional learning experience, enabling students to apply their skills and knowledge while gaining practical, on-the-job training. It's designed to offer students an exciting hands-on progressive learning experience while helping employers shape and prepare their future workforce. Students are required to maintain full-time documented employment with an approved employer for the duration of the course.

Learning Outcomes: 1. Demonstrate proficient use of construction management skills and concepts to successfully perform duties as assigned by direct supervisor. 2. Work cooperatively as a team member on construction projects. 3. Demonstrate oral and written communication skills to facilitate project delivery. 4. Demonstrate professionalism. 5. Develop independent planning and organizational skills. Credits: 3.00

CM 33000 - Design And Construction I

Credit Hours: 6.00. A course which introduces students to projects and the design information of the built environment as communication tools representing space and proportion. Through a blend of lectures and studio work, students obtain working knowledge of the traditions, documents and standards utilized in the planning for a built structure. Students will also experience how design decisions and programing are influenced by a multitude of outside influences.

Learning Outcomes: 1. Develop basic projects, sketches and pre-projects related to the built environment using appropriate design conventions. 2. Exercise criticism in relation to built environment design disciplines by taking user needs, aesthetics and technical demands into consideration at the same time. 3. Analyze relevant precedents in order to make informed design choices. 4. Explain the feasibility analysis, supervision and coordination of integrated projects. 5. Demonstrate professionalism by analyzing proper communication, team work, rules & regulations, and level of detail required within an integrated approach to the design and construction of the built environment. Credits: 6.00

CM 33100 - Design And Construction II

Credit Hours: 6.00. A course where students exert criticism and evaluation of existing design through a blend of lectures and studio work. Students will be exposed to typical impediments to the design of the built environment as they demonstrate integrative decision making in creating an aesthetic and functional design program that meet the needs of society in a resource efficient and sustainable manner. Students will

regularly critique the work of others and have their work critiqued as they seek to shape and implement informed design decisions.

Learning Outcomes: 1. Exercise criticism in relation to built environment design disciplines by taking user needs, aesthetics, cost, schedule, safety and technical demands into consideration at the same time. 2. Identify sustainability, efficiencies and resource conservation principles to be applied in the built environment. 3. Elaborate sketches, two-dimension drawings or three-dimension models using standard design conventions to aid in the design and construction coordination. 4. Demonstrate the skills associated with making integrated decisions across multiple systems and variables in the completion of a design project. 5. Demonstrate professionalism by analyzing proper communication, team work, rules & regulations, and level of detail required within an integrated approach to the design and construction of the built environment. Credits: 6.00

CM 33200 - Architectural Design, Construction Techniques And Society

Credit Hours: 3.00. A course in which students will be exposed to the evolution of architecture and building techniques that influenced the western built environment. Emphasis will be given to the use of appropriate vocabulary and also how social and cultural factors have influenced the design of the built environment throughout the centuries. The course will survey topics from XVII century to recent times.

Learning Outcomes: 1. Recognize architectural and technical traditions of the Western culture. 2. Identify relationships between cultural patterns and social responsibilities of designers. 3. Recognize ways that history or related arts, humanities and technologies influence the built environment. 4. Use appropriate architectural and technical vocabulary. Credits: 3.00

CM 36000 - BIM II: Modeling & Advanced Techniques

Credit Hours: 3.00. This course prepares future Integrated Virtual Construction Managers to master advanced Architectural Building Information Modeling (BIM) while also focusing on Structural and MEPF (Mechanical, Electrical, Plumbing, and Fire Protection) systems. Through hands-on projects, students will gain expertise in multi-disciplinary BIM coordination, clash detection, spatial coordination, and simulation techniques, essential for avoiding design and construction conflicts. Emphasizing interdisciplinary collaboration, the course equips students with the technical and managerial skills to efficiently manage complex building projects from design through construction.

Learning Outcomes: 1. Master creating detailed 3D models for architectural, structural, and MEPF components using industry standards, ensuring design accuracy and compliance with building codes and standards. 2. Demonstrate the ability to coordinate architectural, structural, and MEPF models, using clash detection tools to identify and resolve conflicts and ensure seamless integration across disciplines. 3. Apply collaborative BIM practices to facilitate communication and coordination among project stakeholders, ensuring alignment of design and construction elements throughout the project. 4. Use models to visualize building systems and project phases, supporting design reviews, construction planning, and informed decision-making throughout the project lifecycle. Credits: 3.00

CM 36200 - Construction Competition

Credit Hours: 2.00. This is a multi-disciplinary course where students from several majors work together as a team, developing a proposal for a construction of development project, which is presented at a student competition. Topics include a variety of project types, including land development, design/build, residential, commercial and heavy highway. Permission of instructor required.

Learning Outcomes: 1. Write competition required documents and/or presentation. 2. Collaborate successfully in groups. 3. Demonstrate professional communication towards stakeholders involved in the competition they participate (team mates, competition organizers and/or instructors). Credits: 2.00

CM 36400 - Jobsite Management

Credit Hours: 3.00. Examination of construction project management on the jobsite. Topics include, submittals, record

keeping, jobsite layout, meetings, negotiations, dispute resolution, labor relations, safety, subcontracting, quality, cost control, waste management, changes, claims, progress payments, and project closeout.

Learning Outcomes: 1. Understand and explain the fundamentals of project management. 2. Understand and explain the project team. 3. Understand and explain the use of construction documents on the jobsite. 4. Understand and explain submittals, samples, and shop drawings. 5. Understand and explain documentation and record keeping at the jobsite. 6. Understand and explain meetings, negotiations, and dispute resolution. 7. Understand and explain jobsite labor relations and control. 8. Understand and explain personnel and safety management. 9. Understand and explain subcontracting and purchasing. 10. Understand and explain project quality management. 11. Understand and explain time and cost controls. 12. Understand and explain waste and environmental management and sustainable construction practices. 13. Understand and explain computerized project administration. 14. Understand and explain building information modeling (BIM). 15. Understand and explain changes and claims. 16. Understand and explain progress payments. 17. Understand and explain project closeout. Credits: 3.00

CM 36500 - BIM For Project Managers And Field Supervision

Credit Hours: 2.00. One of the most important components of the construction industry is to visualize the project during its design, construction and over entire life cycle of structure, enabling invested parties to change/adjust the project. A construction project manager' job description is a person who can plan and oversee a construction project from initiation to close with the help of software, technology, resources and a reasonable budget. BIM has delivered a significant impact all aspects and types of AEC projects in terms of economic as well as technical viability. BIM plays a vital role in the management of the project. A project manager can leverage the capability of BIM to deliver a successful construction project and BIM reduces the burden on the project manager of manually calculating and managing tasks. It seems clear that for a construction project to be successful today, project managers would do well to adopt BIM technology. This course is the start that seeks to better understand & address student needs as a on job-site project manager utilizing advanced technologies coupled with Building Information Modeling to produce a form of Building Information Management. It will be given across the multiple disciplines/curricula in anticipation of integrating said new technologies extracted from BIM. Permission of instructor required.

Learning Outcomes: 1. Identify key components of BIM used in Field office. 2. Identify key aspects of LOD (and what trades are most beneficial) needed in BIM for field office operations. 3. Improve Field and Office processes (and communication) utilizing BIM. 4. Facilitate and improve Coordination of discipline models. 5. Introducing the engineering design process in a quick, easy, and visible way. 6. Bridging the physical and digital model within field office. 7. Integrating hands-on experience with technology utilized in field. Credits: 2.00

CM 36800 - Reinforced Concrete And Steel Construction And Design

Credit Hours: 3.00. This course examines the design and behavior of reinforced concrete and steel structures, with a focus on analyzing concrete members under moments, shear, and axial forces. Students will explore the influence of material properties on structural performance and study the design of reinforced concrete components (beams, columns, slabs) and steel members, applying industry codes and standards. The course integrates theoretical, experimental, and practical aspects of structural design, equipping students with the skills to proportion and understand concrete and steel elements for real-world construction management applications.

Learning Outcomes: 1. Explain the influence of material properties (e.g., concrete strength, steel yield stress) on the structural performance and behavior of reinforced concrete and steel elements under different loading conditions. 2. Analyze reinforced concrete and steel structural elements subjected to different types of loads (moment, shear, axial forces) and determine their strength, stability, and serviceability. 3. Assess the effectiveness of design solutions for reinforced concrete and steel structures critically considering factors such as cost,

material selection, and long-term performance. 4. Develop comprehensive structural designs for reinforced concrete and steel members, integrating theoretical principles with practical design constraints to ensure safety, economy, and efficiency. 5. Communicate complex structural design concepts and calculations effectively through technical drawings, reports, and presentations to clients, contractors, and other stakeholders. Credits: 3.00

CM 37000 - Heavy Civil Construction Management

Credit Hours: 3.00. This course will focus on the construction of roads, bridges, and other major transportation-related infrastructure. Topics include construction of concrete pavements, asphalt pavements, deep foundations, and underground utilities. Management of traffic, road construction safety, quality and master planning will also be covered.

Learning Outcomes: 1. Explain terminology and construction requirements for embankments and aggregate bases. 2. Develop a plan for highway construction equipment. 3. Compare the procedures and techniques for construction, rehabilitation, and maintenance of asphalt and concrete pavements. 4. Apply quality control techniques in highway construction. Credits: 3.00

CM 37100 - Industrial Construction Management

Credit Hours: 3.00. This course will focus on the design and construction of industrial systems and processes including Infrastructure for energy, chemical, and water/wastewater systems. Topics studied include piping, welding, heavy lift cranes, and high voltage systems.

Learning Outcomes: 1. Explain the construction procedures for large industrial processes and contracting methods. 2. Calculate forces from heavy crane lifts and multi-crane lifts. 3. Analyze work procedures related to piping, welding, and high voltage electrical installation. Credits: 3.00

CM 37200 - Planning, Design, And Construction Process For The Healthcare Built Environment

Credit Hours: 3.00. This course will focus on the construction of healthcare facilities including hospitals, clinics, nursing homes and laboratories. The course will emphasize the interrelationship of planning, design, and construction.

Learning Outcomes: 1. Identify the key market segments of the healthcare built environment. 2. Classify the unique requirements for healthcare planning, design, and construction. 3. Analyze job opportunities within healthcare for construction management students. Credits: 3.00

CM 37300 - Healthcare Construction Management - Systems, Occupied Space Work, And Related Industries

Credit Hours: 3.00. This course will focus on the construction of healthcare facilities and include topics related to infectious materials control, disruption avoidance, rapid technology changes, emergency routes, and advanced mechanical and electrical systems.

Learning Outcomes: 1. Analyze building systems in healthcare construction. 2. Define the processes required to work within occupied spaces. 3. Identify the related industries in healthcare other than traditional hospitals. Credits: 3.00

CM 37400 - Mechanical And Electrical Construction Management I

Credit Hours: 3.00. This course will focus on the process of analyzing the elements of mechanical, electrical, and plumbing (MEP) construction inherent in producing a MEP construction estimate. Topics include using work product documentation to present and shape the proposal, establishing a conceptual framework of the estimating process, examining commercial/industrial methods and materials, symbol identification, equipment application, and studying the estimating process sequence from project overview to final pricing.

Learning Outcomes: 1. Interpret MEP construction drawings, specifications and bid documents. 2. Describe the estimating process, including the concepts of labor, material, profit, and overhead. 3. Prepare a final bid summary, including quantity takeoff and required pricing. Credits: 3.00

CM 37500 - Mechanical And Electrical Construction Management II

Credit Hours: 3.00. This course will focus on an in-depth investigation of the elements of mechanical, electrical, and plumbing (MEP) construction on real-world projects. The student will be involved in investigating the equipment and

components for the MEP systems and selecting the optimum project delivery method. Estimating will include topics such as solar arrays, EV charging, electrical vehicle charging station projects, smart grids, and energy conservative strategies and equipment. Cost saving strategies will also be examined for MEP system installations utilizing Building Information Modeling (BIM), pre-fabrication, and value engineering.

Learning Outcomes: 1. Interpret MEP construction drawings and specifications at an MEP contractor level of competency. 2. Evaluate the design and provide value engineering options. 3. Explore value engineering methods to reduce labor and material costs and increase profit. 4. Research technology projects to review the latest technology trends in MEP installations. Credits: 3.00

CM 37600 - Residential Construction Management-Green Construction And Sustainability

Credit Hours: 3.00. A study of the best building practices in residential construction, based upon the National Green Building Standard and other national green/sustainable building practices.

Learning Outcomes: 1. Explain the goals of green and sustainable construction guidelines as it pertains to residential structures. 2. Describe the potential benefit of building green for both building professionals and their customers. 3. Explain the relationship between building science and the disciplines of green building and remodeling. 4. Describe different green building programs and incentives for different states. 5. Apply green buildings practices and principles to existing residential construction. Credits: 3.00

CM 37700 - Residential Construction Management Design-Build

Credit Hours: 3.00. A study of the design-build project delivery system for residential construction, including home design fundamentals, construction methods, disability code requirements, building code requirements, and aging-in-place design coupled with best practices of universal design.

Learning Outcomes: 1. Describe concepts relating to universal design-build and aging in place when designing residential construction. 2. Describe specific design solutions for various client requirements including but not limited to ADA, Aging in Place, etc. 3. Identify special considerations for estimating and scheduling a design-build project. 4. Identify considerations and recommendations for executing the job while the client is in residence. 5. Discuss common design-build business challenges and practical tips and tools to overcome them. Credits: 3.00

CM 37800 - Wood And Timber Construction And Design

Credit Hours: 3.00. This course focuses on designing and constructing wood and timber structures, combining historical techniques and modern innovations. Students will study traditional timber framing methods alongside contemporary practices such as cross-laminated timber, glulam beams, and other engineered wood products. The course emphasizes analyzing, designing, and constructing safe, efficient, and sustainable timber structures, preparing students to integrate classic craftsmanship and cutting-edge technologies in construction projects. Practical design assignments and case studies will provide real-world timber construction exposure.

Learning Outcomes: 1. Evaluate the load-bearing capacities of different types of timber materials and structures using appropriate engineering calculations and software tools. 2. Apply principles of timber construction design to determine the most appropriate materials and techniques for specific construction projects based on structural requirements, cost-efficiency, aesthetics, and environmental impact such as resource sustainability, energy use, and lifecycle carbon footprints in timber materials and designs. 3. Analyze case studies of successful timber structures to identify key design principles, safety considerations, and sustainability practices used in their construction. 4. Design innovative timber structures that integrate traditional craftsmanship with modern technologies, ensuring both functionality and aesthetic appeal. 5. Communicate timber construction ideas and designs effectively through clear

technical drawings, reports, and presentations to peers, instructors, and industry professionals. Credits: 3.00

CM 38000 - Soils And Foundations

Credit Hours: 3.00. Study of soils and foundations in the construction projects. Topics include, fundamental soil engineering theories, properties of soils, soil classification, compaction, permeability, stress, shear strength, consolidation, and bearing capacity.

Learning Outcomes: 1. Understand, apply, and analyze fundamentals of geotechnical engineering and construction techniques associated with various types of soil conditions. 2. Conduct various soil lab testing and create lab reports. 3. Use the knowledge of soils and foundation engineering and applications to: create lab reports as written communication; analyze engineering properties of soils; analyze different soil types and field exploration; analyze soil compaction; analyze permeability of water in soils; analyze subsurface stress, consolidation, and shear strength of soil; analyze shallow and deep foundation load, design, and construction; analyze lateral earth pressure and retaining wall structure. Credits: 3.00

CM 38800 - Temporary Structures In Construction

Credit Hours: 3.00. This course provides an in-depth exploration of temporary structures used to support construction operations. Topics include the design, application, and removal or integration of systems such as concrete formwork, scaffolding, shoring, cofferdams, underpinning, slurry walls, and construction dewatering systems. Students will study the technical aspects of these structures, which are either dismantled once permanent works are self-supporting or are incorporated into the finished project. The course emphasizes practical knowledge and safety considerations for the use of temporary structures in the construction industry.

Learning Outcomes: 1. Analyze the potential risks associated with the use of temporary structures and evaluate the effectiveness of safety measures for mitigating these risks. 2. Evaluate different methods for designing and constructing temporary structures, considering factors like material properties, load-bearing capacity, and site conditions. 3. Design a temporary structure for a construction project, incorporating technical specifications, safety considerations, and cost-effectiveness. 4. Demonstrate the ability to integrate temporary structures into a larger construction project, ensuring minimal disruption and maximum safety during the build process. 5. Propose an integrated solution for managing temporary structures throughout a construction project, from design and installation to removal or incorporation into the finished project. Credits: 3.00

CM 40000 - Construction Capstone I

Credit Hours: 6.00. A project course covering specialized construction projects related to a student's area of concentration within the construction management program. Students will synthesize their previous knowledge of pre-construction management into a capstone project.

Learning Outcomes: 1. Design systems for a construction project during the pre-construction phase. 2. Create project controls required during the pre-construction phase of a construction project. 3. Evaluate pre-planning tasks relevant to be beginning a construction project. 4. Generate project administration for a construction project utilizing the required documentation and technology available within the current construction industry. 5. Display professionalism by creating proper communication, team work, rules and regulations, and level of detail required within a construction company and on a construction jobsite. Credits: 6.00

CM 43300 - Risk Management And Legal Issues In Design And Construction Integration

Credit Hours: 2.00. An advanced course dealing with risk management and legal issues as they pertain to the interaction of designers, contractors, and owners. Students will learn to identify and mitigate potential risks that may affect the multiple stakeholders and the business organizations they represent during design and construction activity. The course will also deal with trust and teamwork issues within collaborative processes in the built environment.

Learning Outcomes: 1. Identify potential risks

for designers, contractors, and owners in a collaborative construction industry environment. 2. Understand potential trust issues that inhibit collaboration within the architecture, engineering, and construction (AEC) industry. 3. Develop mitigation measures to reduce risk and increase collaboration within architecture, engineering, and construction interactions. 4. Use clear and precise questions and consider diverse points of views when reasoning. 5. Demonstrate ability to gather, assess, record, and compare relevant information in order to support conclusions and related consequences. Credits: 2.00

CM 45000 - Construction Capstone II

Credit Hours: 6.00. A project course covering specialized construction projects related to a student's area of concentration within the construction management program. Students will synthesize their previous knowledge of construction management into a capstone project.

Learning Outcomes: 1. Evaluate materials, means, and methods required for a construction project throughout the project lifecycle. 2. Interpret company management concepts for a construction project during the construction phase. 3. Create project controls required during the construction phase of a construction project. 4. Design site planning for a construction project throughout the construction lifecycle. 5. Display professionalism by creating proper communication, team work, rules and regulations, and level of detail required within a construction company and on a construction jobsite. Credits: 6.00

CM 45001 - Construction Capstone II

Credit Hours: 3.00. A project course covering specialized construction projects related to a student's area of concentration within the construction management program. Students will synthesize their previous knowledge of construction management into a capstone project.

Learning Outcomes: 1. Evaluate materials, means, and methods required for a construction project throughout the project lifecycle. 2. Interpret company management concepts for a construction project during the construction phase. 3. Create project controls required during the construction phase of a construction project. Credits: 3.00

CM 45701 - Construction Safety

Credit Hours: 3.00. This course will examine the impact of safety on the construction industry, including in-depth discussions on the application of the Occupational Safety & Health Administration (OSHA) Safety and Health Standards for the construction industry. The emphasis of this course is to provide training for job sited supervisory personnel. This course will also fulfill the requirements for the OSHA 30-Hour Card.

Learning Outcomes: 1. Identify the role of OSHA in the construction industry and examine current issues related to safety. 2. Acquire knowledge of jobsite safety management and company safety risk management. 3. Identify and evaluate jobsite hazards, including abatement strategies and procedures. 4. Complete the requirements for an OSHA 30-hour card in Construction Safety & Health Administration. Credits: 3.00

CM 46000 - BIM IV: Model Creation & Management Utilizing Cloud

Credit Hours: 3.00. This course explores the impact of cloud-based technologies on managing construction projects with Building Information Modeling (BIM), emphasizing remote collaboration and real-time data access. Students will gain hands-on experience with industry-leading platforms like Autodesk Construction Cloud, learning to manage 3D discipline-specific models, coordinate teams, and oversee project workflows from any location. By integrating cloud-based management with BIM, the course prepares students to lead modern, digitally connected construction projects.

Learning Outcomes: 1. Manage construction projects using cloud-based BIM tools, enabling real-time collaboration, data sharing, and communication among group members as well as sponsors. 2. Coordinate multidisciplinary teams remotely, integrating project data from design to construction while ensuring seamless collaboration. 3. Master cloud-based technology to leverage data analytics that optimize construction workflows, which allow them to make informed decisions, and automate project processes for improved efficiency and

reduced risk generating automated reports, and track key metrics such as timelines, budgets, and safety. 4. Apply best practices in data management within cloud-based BIM platforms, ensuring secure storage, version control, and efficient risk management through clash detection and issue resolution. Credits: 3.00

CM 46200 - Applications Of Construction Documentation II

Credit Hours: 3.00. Creating, archiving, integrating, qualifying and utilizing computer-generated, three-dimensional architectural models in a light commercial construction enterprise. Topics include components of MEP, fire protection, blueprint reading and 4D BIM scheduling. Credit cannot be obtained for both CM 36000 and CM 46200.

Learning Outcomes: 1. Learn, decipher, and apply parametric and geometric technologies to AEC problems. 2. Explain where new and emerging software technologies can be applied in the industry. 3. Program database-driven parametric objects for use in various projects. 4. Explain how parametric technologies can benefit the production homebuilder. 5. Develop leadership and life-long learning skills applicable to the construction industry. 6. Incorporate renderings and 3D models into drawing sets for effective communication. 7. Prepare effective marketing materials for residential and commercial industry. Credits: 3.00

CM 46500 - BIM V-Capstone

Credit Hours: 3.00. This capstone course offers an immersive, hands-on experience in integrating emerging technologies with Building Information Modeling (BIM) to transform construction project management into Integrated Virtual Construction Management. Students will use and manipulate tools like drones, IoT, 3D scanning, robotics, AR/VR, and AI-driven analytics to develop innovative solutions, enhancing project planning, monitoring, and execution through real-world simulations. By the end, students will demonstrate mastery in leveraging these technologies, culminating in a capstone project that showcases their ability to solve complex construction challenges.

Learning Outcomes: 1. Integrate emerging technologies such as IoT, drones, 3D scanning, AR/VR, and robotics into BIM workflows to enhance project planning, monitoring, and execution. 2. Develop end-to-end BIM models incorporating cost estimation, scheduling, site management, and real-time data integration using advanced tools and technologies. 3. Manage construction projects using cloud-based BIM tools for collaboration, coordination, and communication among multi-disciplinary teams. 4. Apply data analytics, AI, machine learning, and sustainability practices within BIM to optimize project performance, predict risks, and enhance safety and operational efficiency throughout the construction lifecycle. 5. Experiment with cutting-edge construction technologies, gaining hands-on experience in real-world research and development (R&D) practices as they explore innovative solutions to complex construction management challenges. Credits: 3.00

CM 47500 - Construction Costs

Credit Hours: 2.00. A study of construction costs, including analysis of field records, job cost accounting, job cost control, and determination of unit prices.

Learning Outcomes: 1. Define the underlying concepts of construction cost control. 2. Prepare a construction project cash flow forecast using the project budget and time schedule. 3. Calculate construction project cost performance by measuring costs to-date, projecting remaining costs, and calculating variances at completion in terms of materials, subcontracts, general conditions, and project equipment. 4. Analyze construction labor cost performance using earned value, trending, and variance analysis. 5. Make capital acquisition decisions using time value of money concepts. Credits: 2.00

CM 49000 - Construction Work Experience II

Credit Hours: 1.00. This course completes a student's required 800 hours of work experience within the construction industry. Students will be required to share their experiences with faculty and other construction management students. Permission of department required.

Learning Outcomes: 1. Create an oral presentation sharing experience(s) acquired within the construction industry. 2. Write a formal paper summarizing knowledge gained through the requirement of work experience. 3. Critique fellow students on their written and oral communications of experiences. Credits: 1.00

CM 49900 - Special Topics In Construction

Credit Hours: 0.00 to 4.00. Variable title, variable credit course (Independent Study). Hours, subject matter, and credit to be arranged by staff. Permission of Instructor required.

Learning Outcomes: 1. Develop an increased knowledge in select topics related design and/or construction management. Credits: 0.00 to 4.00

CM 50500 - Construction Finance And Company Management

Credit Hours: 3.00. This course provides students with knowledge and research training to construction finance and company management.

Learning Outcomes: 1. Learn about concepts, principles, and practices of construction finance. 2. Learn about company marketing, customer relationship and trust development. 3. Learn about the methods, technologies and statistical approaches used for construction finance and company management. 4. Apply the accounting knowledge to prepare and analyze financial statements. 5. Become a critical thinker of current company management practices and apply what they have learnt to identify and solve challenges of construction management. Credits: 3.00

CM 50800 - Human Factors In Construction And Transportation

Credit Hours: 3.00. This course provides students with knowledge and research training to identify and solve design problems and safety issues of human factors specifically in construction and transportation.

Learning Outcomes: 1. Learn the concepts, theories, methods and technologies of human factors (HF), human information processing, and cognitive psychology. 2. Apply the HF knowledge to study and discuss HF issues in the design and safety of construction and transportation. 3. Develop critical thinking ability to identify HF issues and factors in research and real world. 4. Apply HF knowledge to explore, research and solve the problems in the areas of their interests in construction and transportation. 5. Communicate the design and safety from HF perspective. Credits: 3.00

CM 51000 - Topics In Environmentally Sustainable Construction, Design And Development

Credit Hours: 3.00. This course explores environmental sustainability in all its forms, starting with the historical and theoretical basis and continuing through an understanding of sustainable building construction, design, development, and renewable energy strategies/management tools and how these can be applied in practice.

Learning Outcomes: 1. Recognize human population trends and their effects on associated resource demands. 2. Identify and evaluate energy use trends, including status quo, business-as-usual (BAU) and alternative production and delivery approaches. 3. Interpret and analyze regional and global climate trends and implications, including policy alternatives. 4. Illustrate economic and social drivers, including triple bottom line business practices. 5. Discuss trends and management alternatives in land and ocean ecosystems. 6. Examine food and water security issues including production, management, and distribution alternatives. 7. Distinguish behavior psychology including examination of constraints and opportunities for sustainable practices. 8. Compare market and other incentives designed to stimulate best practices for building design and community planning. 9. Demonstrate knowledge of the conceptual history and controversies involving sustainability. 10. Apply current sustainability principles. 11. Debate common sustainability issues from multiple perspectives. 12. Recognize uncertainty envelopes and constraints on predictive knowledge. 13. Apply best practices in sustainability to their specific

field of interest. 14. Employ interdisciplinary approaches to sustainability outside of their own field. 15. Recognize the challenges and opportunities of applying science and technology to governance. 16. Formulate messaging skills needed to deliver scientific information to popular audiences. 17. Practice abstract theoretical evaluation of sustainability challenges and solutions. 18. Employ critical reading and writing skills within scientific, policy and popular media. 19. Prepare action research projects to transform sector-specific practices for sustainability. 20. Construct a broad range of delivery and assessment strategies to support change for sustainability. Credits: 3.00

CM 51100 - Energy Conserving Building Retrofit

Credit Hours: 3.00. This course introduces energy related reconstruction of buildings with an emphasis on light commercial buildings. Retrofit topics include: Basic thermodynamics, Energy conserving technologies, Impact of site characteristics, Indoor air quality, Water conservation measures, Measuring and benchmarking energy performance, Cost/Benefit Analysis, Financing energy improvements, as well as Building operation and management to reduce energy and water use.

Learning Outcomes: 1. Identify and describe opportunities for energy conservation in existing light commercial buildings through energy related reconstruction activities, commissioning, onsite power generation, as well as building operation and management strategies. 2. Apply basic thermodynamics to energy related retrofit strategies. 3. Identify, classify, and describe techniques and technologies that can be utilized in building envelop, building site, or HVAC systems for energy or water conservation. 4. Apply problem solving and decision making for cost vs. benefit analysis of retrofit strategies. 5. Apply basic energy measurement and benchmarking simulation models. 6. Identify the ways indoor air quality is impacted by vent. Credits: 3.00

CM 51800 - Building Information Modeling And Sustainability

Credit Hours: 3.00. This course explores environmental sustainability in all its forms, starting with the historical and theoretical basis and continuing through an understanding of sustainable building construction, design, development, and renewable energy strategies/management tools. In this course students explore Building Information modeling technology to assess and compare the design impact on the environment.

Learning Outcomes: 1. Explain and apply LEED Principles. 2. Explain and apply Life Cycle Analysis principles. 3. Compare design alternatives. 4. Solve a real construction problem. Credits: 3.00

CM 52000 - Preconstruction Project Management

Credit Hours: 3.00. Management and control of projects from authorization to start of construction. Project success factors, conceptual and parametric estimating, design planning and management constructability review techniques and value engineering methods. Real estate transactions. Land zoning, platting, development and pro forma calculations.

Learning Outcomes: 1. Appreciate the real estate site selection process. 2. Understand the zoning and platting process. 3. Develop an understanding of the real estate transaction process. 4. Compare and contrast project delivery systems. 5. Understand the design process. 6. Identify project success factors. 7. Utilize value engineering and constructability concepts. 8. Understand the role of preconstruction in the project life cycle. 9. Employ early estimating techniques. 10. Analyze projects from a time-value of money perspective. 11. Evaluate the viability of a construction project before authorization. 12. Appreciate roles played by the various participants in the preconstruction process. 13. Ensure adequate risk management measures have been employed. 14. Apply real estate development rules and consider regulatory issues. Credits: 3.00

CM 52500 - Managing Construction Quality And Production

Credit Hours: 3.00. Advanced techniques for assessing the success of construction project management including schedule cost, safety and quality measurements. Impacts of pre planning, human factors, and communication systems on quality and productivity. Statistical methods for analysis of construction

operations.

Learning Outcomes: 1. Define construction productivity and quality. 2. Understand the project owner's role, the designer's role, and the construction firm's role in construction, productivity and quality. 3. Demonstrate the ability to manage productivity at the following enterprise levels - company, project, and construction site. 4. Demonstrate the ability to manage construction labor productivity, equipment productivity, and subcontractor productivity. 5. Measure construction labor productivity. 6. Understand the impact that changes have on productivity. 7. Quantify lost productivity. 8. Implement a Total Quality Management (TQM) system. Credits: 3.00

CM 52600 - Value Engineering - Functional Analysis Of Systems And Techniques

Credit Hours: 3.00. This course applies value engineering principles and life cycle costs to the built environment with particular focus on the effect of the decisions made in the design, construction, operation and maintenance of the built environment on the quality and cost.

Learning Outcomes: 1. Synthesize and articulate the core principles of life cycle cost and apply engineering economics principles to calculate costs. 2. Synthesize and articulate the core principles of functional analysis of systems and techniques (FAST) methodology. 3. Conduct analysis of systems, articulate client needs and problems, define problem statements, compare design alternatives, and suggest solutions that address the issues in the problem statement. 4. Develop weighting criteria for decision making to meet problem statement and demonstrate advantages of proposed solution in comparison with initial design. Credits: 3.00

CM 53000 - Construction Operations And Strategic Management

Credit Hours: 3.00. Principles of construction company business management for U.S. companies. Executive-level construction functions including strategic planning, organizational structure, and ownership structure including succession planning.

Learning Outcomes: 1. Undertake company strategic planning. 2. Prepare a company business plan. 3. Create organizational structure. 4. Develop policies and procedures. 5. Manage change. 6. Manage equipment utilization. 7. Ensure contract profitability. 8. Identify and manage other operational concerns. 9. Develop succession plans. 10. Implement succession plans. Credits: 3.00

CM 53100 - Facilities Contract Management

Credit Hours: 3.00. This course will teach you the basics of contracts for use in management of facilities. The purpose of the course is not to teach you how to write contracts. Instead, you will learn key principles of contract law so that you can better understand how an agreement is made and what terms become part of that agreement. Knowledge from this course will help the facility manager navigate the contractual process, from negotiating terms to dealing with potential disputes. Areas of focus will include real estate contracts, negotiations, managing risks and disputes, and the uniform commercial code. An emphasis will also be placed on contracts related to construction projects.

Learning Outcomes: 1. Interpret the phases of facility management from design/acquisition to final disposition using principles of acquisition, installation, operations, maintenance, outsourcing, renovation and disposition of building systems, structure, interiors, exterior and grounds. 2. Identify the skills needed to strategically lead process, the organization, stakeholders and technologies in an ethically responsible way. 3. Interpret corporate real estate finance, management and transactional execution. 4. Integrate written, oral, aural, and graphic communication skills through repetitive assessment and evaluation of industry appropriate genre. Credits: 3.00

CM 53400 - Quality And Productivity In Industry And Technology

Credit Hours: 3.00. Examines the contemporary issues of continuous improvement in quality and productivity in manufacturing and service industries. Includes a close examination of the evolving philosophies bearing on the scope, improvement, and costs of quality assurance programs in industry and technology. Permission of instructor required.

Learning Outcomes: 1. Understand the history of quality and apply those concepts to contemporary quality issues. 2. Analyze internal and external organization customer needs in terms of contemporary quality concepts. 3. Synthesize the balance between cultural and technological organizational transformation. 4. Analyze the role of Lean, Six Sigma and TPS in modern process design and optimization and contemporary quality management. 5. Synthesize Lean and Six-Sigma roles and responsibilities. 6. Utilize Lean and Six Sigma philosophies, methodologies and tools; statistical analysis tools; quality assurance auditing techniques; and quality training concepts. 7. Design materials for present basic Lean Six Sigma training aids. Credits: 3.00

CM 53500 - Construction Accounting And Financial Management

Credit Hours: 3.00. Accounting techniques, financial methods, and financial management for construction firm management. Analysis techniques for contemporary construction company accounting and finance practice with an emphasis on cash flow analysis and cash management.

Learning Outcomes: 1. Identify and explain the use of various revenue recognition methods available to the construction company. 2. Explain the progress billing terms retainage and front loading and discuss the reasons for and against such practice. 3. Identify the accounts applied and their use when the percentage of completion method of accounting is applied. 4. Explain the difference between underbilling and overbilling, discuss why they occur and their impact on cash flow. 5. Apply the following financial analysis techniques to financial statements: line-item analysis, horizontal analysis, vertical analysis, use-source analysis, ratio analysis, cost-volume-profit analysis, and profit center analysis. 6. Prepare the budgeted income statement and develop rates for overhead and profit mark-up, exercise control over company cost, and prepare a cash plan. 7. Apply time value of money principles to various decision making tools when seeking company and project financing and the acquisition of capital assets. Credits: 3.00

CM 53600 - Highway Construction And Quality Control

Credit Hours: 3.00. This course provides students with knowledge of methods, materials, equipment, and procedures in construction of highways. Students will acquire the concepts and applications of quality control and quality assurance in construction of highways. Students will learn to design appropriate work zones to improve efficiency and safety of highway construction. This course will provide graduate students with a much-needed venue to gain the theory, technology, and practice of highway construction, rehabilitation, maintenance, and quality control.

Learning Outcomes: 1. Acquire the characteristics of various types of highway materials and highway designs and highway construction specifications. 2. Acquire the quality control and assurance principles, and techniques, and methods. 3. Determine the optimal strategy for pavement preservation. 4. Apply quality control and safety improvement techniques in highway construction. 5. Design work zones to improve efficiency and safety of highway construction. Credits: 3.00

CM 53800 - Roadway Infrastructure Management

Credit Hours: 3.00. This course provides students with theories and practices of managing roadways to achieve maximum benefit in the system and network level with limited available funds and resources. Students will learn the concepts of roadway performance measures in terms of physical conditions, service levels, and safety. As a graduate level course, this course will introduce basic methods to find optimal solutions for real-world problems and provide graduate students analytical and mathematical tools for effectively conducting research related to problem formulation, optimal decision-making, and maximizing benefits/effectiveness and minimizing costs.

Learning Outcomes: 1. Acquire roadway systems and performance measures. 2. Acquire the frameworks and principles of management systems. 3. Conduct data analysis and establish condition prediction models. 4. Perform life cycle benefit/cost analysis of infrastructure projects. 5. Create decision-making models to maximize benefit of infrastructure systems with

limited resources. Credits: 3.00

CM 54000 - Law For Construction Managers

Credit Hours: 3.00. A study of the legal system and its impact on the construction process. The focus is on the legal obligations, rights and remedies pertaining to the construction company. Topics include bidding, contracts, and construction changes.

Learning Outcomes: 1. Describe agency relationships, contracts, torts, professional liability, risk management, indemnification, risk sharing and surety bonds. 2. Explain the concept of the design professional as judge. 3. Recognize the procedures for legally terminating a construction contract. 4. Plan the project with a contract law viewpoint. 5. Comply with the legal requirements for competitive bidding. 6. Create as well as to comply with the rights & duties of the construction contract. 7. Demonstrate the ability to apply construction law concepts to subcontracting, changes, payments, performance problems, defects, subsurface problems, time and claims. Credits: 3.00

CM 54500 - Construction Management Training And Development

Credit Hours: 3.00. Identification, training and development of future company leaders. Mentorship as a required, managerial activity, effective delegation of responsibility, and empowerment of subordinates to take initiative.

Learning Outcomes: 1. Interpret the role of the training department in meeting an organization's strategic goals. 2. Analyze the broader organizational context and business environment in order to ensure that training meets business needs and achieves stakeholder support. 3. Use effective investigative and analytical methods to advise and assist clients in identifying needs, at organizational levels, to which training is the most appropriate response. 4. Work with stakeholders to design training events (including formal programs) that are grounded in the principles of learning, are accessible, effective and make timely use of available resources. 5. Incorporate new technology as appropriate into both training and learning processes, and the effective management of the training and development function. 6. Carry out appropriate monitoring and evaluation of training programs, and coordinate with stakeholders on any necessary changes to training provision and practice. 7. Explore models and research relating to the core competencies and behavioral characteristics of effective trainers. Credits: 3.00

CM 54700 - Collaborative Project Delivery Models And Practices

Credit Hours: 3.00. A project-focused course covering advanced topics on collaborative project delivery models such as Integrated Project Delivery (IPD), Design-Build (DB), and Partnering. Collaborative project delivery methodologies aim to integrate project teams, stakeholders, systems, business structures, and practices to facilitate collaboration at all levels within a project and to produce the most optimal project outcomes. Students will develop and expand their interdisciplinary collaborative team working skills, communication, and understanding of essential elements underlying collaborative project delivery models.

Learning Outcomes: 1. Describe, analyze, and select the most appropriate delivery method for a project. 2. Engage in team-building processes and analyses that are intended to establish collaborative working environments. 3. Analyze case study documents including RFP's, RFQ's, contracts, and other managerial documents used in collaborative project delivery practices. 4. Research and analyze construction management processes to develop collaborative project teams and collaborative work environments. Credits: 3.00

CM 54900 - Advanced Topics In Mechanical And Electrical Construction

Credit Hours: 3.00. A project-focused course covering advanced topics on mechanical and electrical construction installation practices and processes. This course teaches the student how to plan, organize, and execute mechanical and electrical construction operations. Students will develop and expand their knowledge about mechanical and electrical work sequencing, coordination, commissioning, and relationship to facility operations and management.

Learning Outcomes: 1. Describe and analyze mechanical and electrical scopes of work. 2. Engage in team-building processes and analyses that involve developing work sequencing and coordination. 3. Analyze case study documents including construction schedules to determine best practices and recommendations for improvement. 4. Research and analyze commissioning programs to develop key performance indicators and implementation strategies. Credits: 3.00

CM 55000 - Risk Management In Construction

Credit Hours: 3.00. Analysis of the depth and breadth of risk in construction. Defining key terms and concepts used in various risk management arenas - legal statutes, precedent and case studies relevant to construction risk management, insurance, and surety bonding. Subjects include: contracts, torts, insurance, surety, safety laws, quality, and risk management models. Analysis of case studies to utilize risk management tools and identify issues and possible approaches. Project risk control including management of foreseeable hazards as well as unforeseen conditions.

Learning Outcomes: 1. Overview of risk fundamentals - and how liability drives outcomes. 2. Understand the relationships between insurance, sureties, contractual risk transfer and risk financing. 3. Understand how safety covers direct employees, other parties, and member of the public. 4. Understand the role of incident investigation, and management of claims of various types. 5. Understand quality and how to deliver acceptable project results. 6. Understand the value of Business Continuity Planning and other Crisis Management methods and tools. 7. Understand the value of corporate compliance programs for satisfaction of regulatory and other legal requirements. 8. Understand standards of care, and their evolutionary nature, compelling "compliance as you go." 9. Ability to critically evaluate existing risk management approaches, and apply risk management models to promote successful project outcomes. Credits: 3.00

CM 55500 - Construction Leadership And Marketing

Credit Hours: 3.00. Analysis of organizational leadership at the executive level. The goals of this course are to introduce and stimulate thought and discussion of leadership theories, characteristics and behaviors of successful leaders, contextual factors affecting leader effectiveness, dynamics of leader-follower relationships, communication, decision-making and contemporary challenges confronting organizational leaders as well as marketing theory, marketing vs. business development, the marketing process, and an introduction to a construction marketing dashboard.

Learning Outcomes: 1. Understand the essential principles of leadership theories and apply the theories in construction management. 2. Comprehend the characteristics and behaviors of successful leaders in the field of construction. 3. Grasp the main contextual factors affecting leader effectiveness. 4. Apply the dynamics of leader-follower relationships in daily operations. 5. Acquire communication, decision-making and other key leadership skills. 6. Recognize the contemporary challenges confronting organizational leaders. 7. Understand the marketing theory, the market process, and marketing vs. business development. 8. Understand and utilize construction marketing dashboard. Credits: 3.00

CM 55800 - Advanced Construction Management For Disaster Recovery

Credit Hours: 3.00. Prepares construction project professionals to better plan and deliver post-disaster built environment and infrastructure restoration and reconstruction services. Emphasizes differences between conventional construction and disaster recovery work, considering projects of larger scope and including international concerns. Technical facets of restoration processes introduced to advise comprehensive management. Includes executive-level management case study with team solution. Permission from department required.

Learning Outcomes: 1. Explain the special environmental and personal conditions and concerns that often confront construction project professionals performing disaster recovery. 2. Improve planning for major disaster recovery projects. 3. Explain how to execute major disaster recovery projects. 4. Select appropriate restorative, demolition, and waste disposal

techniques for common recovery projects. Credits: 3.00

CM 56000 - Academic Writing Seminar I

Credit Hours: 1.00. Analysis of the requirements of research reports. Emphasis on research methods and concepts, identifying major issues, academic literature reviews, data collection and presentation methods, and selecting a research topic.

Learning Outcomes: "1. Increase the student's skills related to research and academic writing through the introduction of resources available through the Purdue Library System and the Purdue Online Writing Lab (OWL). 2. Demonstrate appropriate samples of academic writing through sample reports on the Purdue College of Technology EPubs. 3. Develop the student's knowledge and application of PAP version 6 formatting. 4. Advance the student's expectations of academic writing. Credits: 1.00

CM 56500 - Academic Writing Seminar II

Credit Hours: 1.00. Provides a higher level understanding of scholarly writing as it is applied to the individual student's research. Students also learn to present his or her technical work to an audience in a clear, easily understandable form.

Learning Outcomes: 1. Demonstrate develop of the student's skills related to academic writing through individual and group exercises related to their individual research. 2. Demonstrate appropriate samples of academic writing through sample reports on the Purdue College of Technology Epubs. 3. Appropriate student knowledge and application of APA version 6 formatting. 4. Advance the student's expectations of academic writing. 5. Increase the rate of successful completion of the masters program scholarly writing requirements. Credits: 1.00

CM 57000 - Analysis Of Research In Construction

Credit Hours: 4.00. Analysis of research and evaluation of research reports. Emphasis on understanding the application of business research procedures including fundamental statistical methods in the solution of a construction industry relevant problem.

Learning Outcomes: 1. Acquire research knowledge and skills required to produce scholarly work for the construction industry. 2. Adapt the scientific research model to solve problems in a construction company. 3. Demonstrate proficiency at library usage, EndNote, and citing references using APA format. 4. Demonstrate related academic writing through individual and group exercises suitable to their individual research. 5. Demonstrate appropriate samples of academic writing though sample reports on the Purdue College of Technology Epubs. 6. Advance expectations of academic writing. Credits: 4.00

CM 58100 - Workshop In Building Construction Management Technology

Credit Hours: 0.00 to 8.00. Advanced study of technical and professional topics. Emphasis is on new developments relating to technical, operational, and training aspects of industry and technology education.

Learning Outcomes: 1. Vary due to nature of course. Credits: 0.00 to 8.00

CM 59000 - Special Problems In Building Construction Management Technology

Credit Hours: 1.00 to 6.00. Independent study of a special problem under the guidance of a member of the staff. Does not substitute for either M.S. thesis or M.S. project credit. Permission of instructor required

Learning Outcomes: 1. Develop an increased knowledge in select topics related design and/or construction management. Credits: 1.00 to 6.00

CM 59800 - Directed MS Project

Credit Hours: 1.00 to 3.00. A formal investigation of a particular problem under the guidance of the advisory committee. Not applicable to a thesis option plan of study. Enrollment during at least two consecutive terms for a total of three credits is required. Permission of instructor required.

Learning Outcomes: 1. Vary due to nature of course. Credits: 1.00 to 3.00

CM 59900 - Facilities Management Directed Project

Credit Hours: 1.00 to 3.00. The Directed Project is defined as an applied research project that is more extensive and sophisticated than a graduate-level independent study and less formal than a master's thesis. The overall objective of the requirement is to engage in a facilities management related study focused in industry, business or education. The focus is to be placed on a topic with practical implications rather than

original research.

Learning Outcomes: 1. Identify a business or industry relevant solution to a technology related problem. 2. Define and/or validate a business or industry relevant problem. 3. Address a technological problem in a systematic and replicable manner. 4. Use technical/professional research and/or development procedures effectively. 5. Identify criteria for success/solution of the problem. 6. Gather information appropriate to the problem by employing business research procedures. 7. Document the research and development activity in a manner that permits replication and assessment of key decisions and alternatives. 8. Write effectively in a form customary to business and industry, using APA format. 9. Prepare and deliver a presentation in a form customary to business and industry. Credits: 1.00 to 3.00

CM 61000 - Urban Built Environment

Credit Hours: 3.00. This provides students with advanced theories and applications of analyzing multiple performance indicators in urban built environments. Students will learn the concepts of energy, environment, human comfort, and mobility performance in urban built environments. This course will offer an overview of various analysis techniques using Geographic Information System, Building Energy Modeling and Simulation, and Spatial Analytics using a programming language. Graduate students will learn problem-solving skills through project-based learning, and how to apply the skills to effectively conduct research related to urban built environment planning, design, and development. Prerequisite: CM 51000.

Learning Outcomes: 1. Apply GIS techniques to understand geographical patterns and spatial variables. 2. Apply building energy modeling and analyze environmental, design, and construction parameters affecting energy demand. 3. Evaluate spatial networks in urban built environments in various measures. 4. Evaluate multiple performance of urban built form. 5. Create a decision-support framework to better inform the performance of urban built forms and optimize urban built. Credits: 3.00

CM 62500 - Smart Infrastructure System

Credit Hours: 3.00. Applying advanced cutting-edge technologies to the civil and construction industry to address traditional infrastructure problems is becoming more popular. One of the very hot areas is developing smart infrastructure. How to make our civil infrastructures smarter and more resilient plays a vital role for our society. The first half of this course will cover the fundamental knowledge of some cutting-edge technologies and smart infrastructure including sensing, signal processing, data collection and transmission, and closed-loop control. The second half of this course will focus on smart infrastructure applications including smart bridges, smart grid, smart building and smart railways. This advanced-level course will provide advanced knowledge of cutting-edge technologies to develop smart infrastructure systems. Through this course, student will polish their research skills in different aspects including: conducting literature review, developing their own research idea, implementing their ideas, presenting their work and publishing their results. In addition, at the end of this course, students will be able to implement various types of systems, create smart infrastructure systems and check their performance. Prerequisite: CM 58100.

Learning Outcomes: 1. Differentiate design and performance of smart infrastructure system over traditional infrastructure system. 2. Organize and identify major components of smart infrastructure systems for practical application. 3. Plan the operation and maintenance of smart infrastructure systems for long-term operation. 4. Create and design smart infrastructure systems based on different purposes. 5. Implement smart infrastructure system to address the critical needs and evaluate smart infrastructure system performance. Credits: 3.00

CM 63500 - Advanced Facilities Management

Credit Hours: 3.00. This course provides advanced facilities management (FM) practices in the life cycle of the built environment, including core competencies, compliance and standards, operations & maintenance, risk management, sustainability, health & safety, real estate and financial management, human resources management, and workplace and utility management. In addition, FM practices include emergency preparedness, business continuity, leadership, contracts, capital and maintenance planning, outsourcing, procurement, space planning, occupant comfort and productivity, and energy management. The role of the facilities manager in hard (space and infrastructure) and soft services (grounds, custodial, waste management, pest control, parking, workspace management, catering) will be analyzed with case studies emphasizing the need for their integration in the design and construction process. The students will be able to interpret

and analyze critical management principles in the operations phase of the built environment by identifying the fundamentals of facilities management theory and practice. Prerequisite: CM 52600.

Learning Outcomes: 1. Differentiate the essential services in facilities management (FM). 2. Analyze the hard and soft services in FM with short business cases. 3. Organize the critical components of FM in architecture, engineering, and construction processes. 4. Evaluate the current research trends in FM from an applied and practical perspective. 5. Implement the fundamentals of FM from a managerial perspective in a business case. 6. Describe the role of the facility manager in various organizational settings. Credits: 3.00

CM 63600 - Future-Proof Construction And Infrastructure

Credit Hours: 3.00. The course provides advanced tools and methods to optimize the maintainability, resilience, flexibility and responsiveness of infrastructure and construction so to ensure that these provide an adequate level of service under uncertain future conditions. This includes methods to rigorously quantify the level of service, model the uncertainty over variable parameters, identify maintainable, resilience flexible and responsive design solutions, run simulations to estimate their impact (i.e., costs of interventions and risk on the service) and identify the optimal balance with the costs of construction. Prerequisite: CM 51000.

Learning Outcomes: 1. Explain the concept of future-proof design. 2. Measure rigorously and orthogonally the service provided by an infrastructure. 3. Optimize the intervention strategies based on the predicted deterioration of objects. 4. Evaluate resilience of construction and infrastructure to ensure that the extra cost invested in resiliency are justified by the risk saved in the phase of operation and management. 5. Evaluate flexibility of construction and infrastructure to ensure that the extra cost invested in flexibility are justified by the risk saved in the phase of operation and management. 6. Develop team-building skills. Credits: 3.00

CM 63700 - Computer Vision Application For Smart Infrastructure Management

Credit Hours: 3.00. This graduate-level course is for students who major in Construction Management Technology, Construction Engineering and Management, Civil Engineering, and other related majors in the architecture, engineering, and construction domain. Computer vision (CV) technology can play a critical role in constructing and managing built environments (infrastructure systems and facilities). It promises to become even more critical in the next few decades as technologies are more efficient and effective for infrastructure inspection and maintenance. The CV technologies include the principles and utilization of object detection, action recognition, and 3D reconstruction technologies. This course will offer the students the advanced knowledge and ability to come up with a solution for infrastructure and facility management challenges by evaluating current computer vision technologies. After this course, the students can evaluate appropriate computer vision algorithms and develop frameworks for various infrastructure management problems by creating their own training data sets and models.

Learning Outcomes: 1. Master theories and methods of computer vision by critically reviewing and assessing scientific literature. 2. Identify and formulate computer vision and 3D modeling-related problems in the smart construction and infrastructure management field. 3. Apply, evaluate, and examine various computer vision algorithms, tools, equipment, and methods to support the construction and facility management research domains. 4. Communicate effectively and work in teams to develop working computer vision systems for smart construction and infrastructure management. 5. Design and develop practical and innovative computer vision applications or systems applicable to construction and infrastructure management. Credits: 3.00

CM 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required.

Learning Outcomes: 1. Vary due to nature of course. Credits: 1.00 to 18.00

CMGT 12000 - Materials And Methods

Credit Hours: 3.00. Introduction to common construction terminology, materials, methodologies, building codes, structural fundamentals, and contract documents related to buildings, industrial facilities, and infrastructure. Field trips to production / fabrication facilities for each type of material (wood, steel,

concrete, and masonry).

Credits: 3.00

CMGT 15000 - Surveying

Credit Hours: 3.00. Fundamental concepts and practical applications related to measurement of vertical and horizontal distances and angles using the tape, level, and total station. Computations of grades, traverses, areas, and curves. Basic concepts and applied use of topography, contours, and topographical maps.

Credits: 3.00

CMGT 21000 - Quantity Take-Off

Credit Hours: 3.00. Study of methods to estimate material quantities for construction projects. Topics include, interpreting construction drawings, fundamental construction technology, quantity take-offs. Excel and take-off software are used.

Credits: 3.00

CMGT 25000 - Mechanical And Electrical Systems

Credit Hours: 3.00. Methods for design, construction and inspection of mechanical and electrical systems for buildings. Emphasis on heating and cooling loads, equipment selection, duct and pipe sizing, codes, safety installation, inspection, commissioning, and estimating. Responsibilities of the general contractor for HVAC (heating, ventilating, and air-conditioning), electrical and plumbing work.

Credits: 3.00

CMGT 26000 - Statics

Credit Hours: 3.00. Forces acting on bodies at rest, including coplanar, concurrent, and non-concurring systems; equivalent force systems and distributed forces. Use of free body diagrams and equations of equilibrium in solving problems for array of determinate structural systems: trusses, pin frames, arches, cables, retaining walls, and beams. Load tracing to examine the overall structural conditions with regards to lateral and gravity loads.

Credits: 3.00

CMGT 31000 - Cost Estimating

Credit Hours: 3.00. Study of methods to estimate quantities and costs for material, labor and equipment; establishing direct overhead and markups including indirect overhead and profit for a construction project; software applications for estimating; conceptual estimating procedures; and subcontractor qualifications and scope of work.

Credits: 3.00

CMGT 32000 - Scheduling And Project Control

Credit Hours: 3.00. A study of the planning and control of construction schedules. Topics include Gantt charts, critical path method (CPM) network scheduling, and monitoring and controlling the schedule. Lab work includes the application of MS Project for creating, presenting, revising, updating and controlling construction schedules.

Credits: 3.00

CMGT 33000 - Contract Administration And Specifications

Credit Hours: 3.00. Study of the contractual organization and administration of a construction project. Topics include, analysis of delivery systems, working with contracts, general and special conditions of the contract, specifications, project communication, payment applications, change orders and close out. Project management software is used.

Credits: 3.00

CMGT 35000 - Materials Testing

Credit Hours: 2.00. Laboratory and field testing of structural materials to determine their mechanical properties and behavior under load. Materials included are steel, aluminum, concrete, wood, and asphalt.

Credits: 2.00

CMGT 36000 - Strength Of Materials

Credit Hours: 3.00. Stress-strain relationships of construction materials. Consideration of strength issues related to major classes of engineering materials including steel, concrete, and wood. Composite analysis; shear forces and bending moments in beams. Introduction to analysis and design of steel and wood beams and columns, beam deflections.

Credits: 3.00

CMGT 38000 - Infrastructure Planning, Engineering, And Economics

Credit Hours: 3.00. Introduction to the planning and analysis of infrastructure projects. The focus will be on the prioritization, stewardship, management and decision-making roles within the division of a large public works agency. This course will cover municipal infrastructure system, infrastructure alternatives, financial and economic analyses, environmental and social impact assessment, uncertainty and risk-benefit analysis, sustainability, and public-private partnerships including numerous case studies.

Credits: 3.00

CMGT 39000 - Construction Experience III

Credit Hours: 1.00. Supervised pre-professional learning experience that allows students to apply their skills and knowledge in a professional setting. This experience is designed to enhance the student's preparedness for an intended career in the construction profession. A minimum of 400 work-hours is required.

Credits: 1.00

CMGT 41000 - Equipment And Field Operations

Credit Hours: 3.00. Study of heavy equipment used in construction operations with an emphasis on equipment selection, application, cost, productivity, safety, and economics.

Credits: 3.00

CMGT 42000 - Safety And Inspection

Credit Hours: 3.00. Study of safety regulations, practices,

policies, and procedures required for construction projects. Topics include, accident investigation, record keeping, OSHA reporting requirements, inspections, and hazards. Included is an OSHA safety card.

Credits: 3.00

CMGT 43000 - Jobsite Management

Credit Hours: 3.00. Examination of construction project management on the jobsite. Topics include, submittals, record keeping, jobsite layout, meetings, negotiations, dispute resolution, labor relations, safety, subcontracting, quality, cost control, waste management, changes, claims, progress payments, and project closeout.

Credits: 3.00

CMGT 44000 - Project Management Capstone

Credit Hours: 3.00. Students apply the knowledge and skills, acquired during their construction management program of study, to simulate the construction management process on an actual construction project. Includes role playing and a formal oral presentation.

Credits: 3.00

CMGT 45000 - Structural Systems And Analysis

Credit Hours: 3.00. Analysis of the structural characteristics of common construction materials, including: wood, steel, concrete, masonry, and light gauge metal in order to integrate structural elements into complete structural systems in the construction of modern buildings and structures to withstand gravity, wind, earthquake, and other environmental forces.

Credits: 3.00

CMGT 46000 - Soils And Foundations

Credit Hours: 3.00. Study of soils and foundations in the construction projects. Topics include, fundamental soil engineering theories, properties of soils, soil classification, compaction, permeability, stress, shear strength, consolidation, and bearing capacity.

Credits: 3.00

Consumer Science

CSCI 31700 - Computation For Scientific Applications

Credit Hours: 3.00. Prerequisite: N207 or equivalent. This course gives a survey and overview of popular computational software used in multiple scientific domains to support data processing and scientific research. This class focuses on teaching how to use software to efficiently process data in terms of modeling, simulating, visualizing and data-mining. Fundamental concepts related to scientific computing are introduced briefly.

Credits: 3.00

CSCI 36100 - Fundamentals Of Software Project Management

Credit Hours: 3.00. Tools and techniques used to manage software projects to successful completion. Problem solving focus to learn specification development and management, program success metrics, UML modeling techniques, code design and review principles, testing procedures, usability measures, release and revision processes, and project archival.

Credits: 3.00

CSR 10000 - Introduction To CSR

Credit Hours: 1.00. A workshop to familiarize students with the CSR department, department majors, advising resources, and major requirements. Special emphasis on basic freshman survival skills.

Credits: 1.00

CSR 10300 - Introduction To Personal Finance

Credit Hours: 3.00. This course will provide knowledge and skills for young adults to be active, informed, and rational managers of their financial life. The course will particularly address the following 4 areas of personal finance. Managing money: Why it's useful to plan ones financial affairs, budgeting, being an informed manager of ones money and consumer of financial products. Financing large items using savings and credit: Know how credit works, how to use it wisely, and how to avoid over indebtedness. Learn savings strategies to maximize the growth of your money. Using financial markets: What are the different ways to invest, and how to make them work for you and your objectives (such as retirement). Managing risk: How to use financial tools (such as insurance) to protect yourself against risk. The course will emphasize age-relevant knowledge and practical advice, with the objective to help students make better financial decisions and adopt better financial behaviors for the long term.

Learning Outcomes: 1. Estimate their budget, according to basic general principles of accounting, and use it to improve their financial situation by matching expenses to income and smartly planning for the long-term. 2. Decide whether to use savings and/or credit to finance large purchases, which implies being able to save in the most appropriate and rewarding way, and distinguishing between the benefits and drawback of various sources and types of loans. 3. Invest in financial markets wisely using appropriate financial instruments, based on their personal situation at any point in time (including planning for retirement). 4. Identify and implement the best financial products to protect themselves against risk (e.g. different types of insurance). 5. Make financial decisions in an informed and carefully thought-out manner, including reaching out to appropriate resources

and advice when necessary. Credits: 3.00

CSR 12800 - Introduction To Apparel Design

Credit Hours: 3.00. This course introduces the fundamentals of the Apparel industry, design, and assembly through lectures, discussions, readings and application in an Apparel laboratory. The student will learn the proper operation of industrial garment production equipment. Further, the course will introduce the manufacturing standards of apparel assembly through garment construction, principles of fit and fiber, and fabric performance.

Learning Outcomes: 1. Explain the basics of the nature, materials, producers, and markets of and for fashion and the apparel industry. 2. Identify basic apparel assembly and design techniques, principles of fit, and fiber and fabric performance characteristics within specific types of garments. 3. Operate garment production equipment in a safe and appropriate manner. Credits: 3.00

CSR 20000 - Professional Development In Consumer Science

Credit Hours: 1.00. Professional Development in Consumer Sciences & Retailing is a required course that will provide the necessary techniques to manage job search skills and career development for both current and future professional needs. The covered topics will expose students to on-campus resources, opportunities to gain key networking skills, and establish their professional identity to better prepare students for the current job market.

Learning Outcomes: 1. Provide life-long job search skills. 2. Enable students to effectively navigate career fairs & networking events. 3. Educate students about Purdue's resources regarding career and academic development. 4. Develop student's professional documents. 5. Assist students in creating their personal professional brand. 6. Perpare students on the transition from college to the professional world. Credits: 1.00

CSR 20100 - Introduction To Professional Sales

Credit Hours: 3.00. Introduction to sales process, business to business communication strategies, and expectations of a sales professional.

Learning Outcomes: 1. Describe the operationalization of sales and the purchasing function within a business. 2. Define the variety of sales roles and determine best fit. 3. Demonstrate the skills necessary to succeed in a sales role. 4. Apply sales process to a role play sales call. Credits: 3.00

CSR 20900 - Introduction To Retail Management

Credit Hours: 3.00. Retail career paths, management training, merchandise control, organization and service structure, and a comparison of store types.

Credits: 3.00

CSR 21500 - Textile Industry

Credit Hours: 3.00. Fundamentals of the textile industry addressing the lifecycle of textile products beginning with the source and properties of textile fibers to the steps in the production of textile products and their impact on product performance and consumer satisfaction. Generate an awareness of the global textile industry as it relates to the impact on the environmental and social communities. Emphasis on retail, apparel, and interior design applications.

Learning Outcomes: 1. Predict fabric performance and end-use based on knowledge of fibers, yarns, fabric constructions, and finishes. 2. Possess a working knowledge of the many facets of processing textiles from raw materials to the finished product, including laws and requirements that regulate textile labeling. 3. Generate awareness of the scope and complexity of the global textile industry as well as the challenges it faces, environmentally and socially. 4. Assess the impact of consumer buying behavior, use, care and disposal decisions on textiles and related industries. Credits: 3.00

CSR 22000 - Apparel Design I

Credit Hours: 3.00. Introductory course that deals with the evolution of apparel design through the principles of flat pattern design, three-dimensional draping, and computer-aided design (CAD for pattern design). Fundamentals for apparel design. Students create designs for a basic, sleeveless, collarless top.

Learning Outcomes: 1. Recognize and apply the creative process: inspiration, designer's resources, visual consumer, garment engineering, and fashion sketching. 2. Recognize, name, and use pattern making tools, equipment, and terminology. 3. Produce and apply the use of a croquis (sketch/design/inspiration) book. 4. Create and continuously add personal designs and

inspirations of design to a croquis book. 5. Understand and apply proper use of fabric grain in pattern making and draping. 6. Drape a set of basic block patterns to properly fit an industrial model form: bodices, skirts and sleeves. 7. Understand and apply the use of design principles #1 dart manipulation, and other patternmaking design details. 8. Create and sketch an original design, complete the patterns, and complete the assembly of: a sleeveless/collarless garment to fit the upper torso only or both upper and lower torso.

Credits: 3.00

CSR 22100 - Apparel Design II

Credit Hours: 3.00. Continued development of apparel design from concept to finished product through the application of flat pattern design, draping, and computer-aided design. Building on the introductory course to create apparel wear design that includes sleeves, collars, blouses/shirts, dresses, pants, and skirts. Introduction to pattern grading manually and through CAD, and marker for apparel production.

Learning Outcomes: 1. List, define, and apply sewn products industry and patternmaking terminology as related to apparel design. 2. Measure the human figure and industrial model form for the development and drafting of patterns for apparel. 3. Identify and appropriately make sure of various patternmaking / drafting tools. 4. Apply principles of flat pattern drafting to the production of patterns for original design apparel items of pants, collars, sleeves, and skirts. 5. Apply the principles of draping to the production of patterns for original design apparel items of skirt, pants, collars, sleeves, and torso. 6. Render presentation boards for color story, design inspirations / sketches, target customer profile, item selection of line or collection, fabric trim selection, and technical sketches (flats or production drawings). 7. Create, render, and continuously add personal designs and inspirations of design to a croquis book. 8. Create original design garments from conception of design through rendering to drafted patterns to assembled garment. Credits: 3.00

CSR 28200 - Customer Relations Management

Credit Hours: 3.00. A course that provides insight into the structure and working of customer relations management and its role in business and government agency. Analysis of how consumer needs, complaints, and education are handled. Customer relations' management in the real world and techniques used in managing customer relations toward the goal of maximizing customer satisfaction. This course has a real-world focus and is more applied than the usual introductory course.

Credits: 3.00

CSR 30000 - Field Experience In Retail Management

Credit Hours: 1.00. Approved in-service training, a total of 140 hours; development of activities plan; and report of activities. Recommended for semesters 3,4,5, or 6. Advance approval of director and employer and attendance at pre- and post-organizational meeting is required. Permission of instructor required.

Credits: 1.00

CSR 30700 - Field Experience In Selling And Sales Management

Credit Hours: 1.00. Approved in-service training and supervised work experience in selling and sales management. Total of 140 hours required with in-depth report and analysis of activities. Permission of department required.

Learning Outcomes: 1. Provide exposure to career options in a real world setting through direct practice or by observation and interaction with colleague at the internship site. 2. Apply theory and relevant coursework in a professional setting, where the student will combine academic and work site assignments. 3. Advance skills and professional experience to enhance the student's career development.

Credits: 1.00

CSR 30900 - Leadership Strategies

Credit Hours: 3.00. Provides knowledge of humanistic processes that contribute to development of effective leadership.

Learning Outcomes: 1. Identify leadership principles and skills for the 21st-century organization. 2. Understand and apply ethical leadership. 3. Connect theory to applied

solutions. 4. Apply critical thinking to leadership principles through in-class discussion and written assignments. Credits: 3.00

CSR 31000 - Buying Of Merchandise

Credit Hours: 3.00. Principles of volume buying applicable to department, chain, specialty, and independent stores.

Learning Outcomes: 1. Demonstrate knowledge of the buying and merchandising functions, and their role in a retail organization. 2. Describe definitions and concepts of terminology related to merchandising math. 3. Apply basic mathematical concepts to solve typical merchandising problems and make decisions. 4. Use data to analyze and evaluate the performance of merchandising strategies. Credits: 3.00

CSR 31500 - Relationship Selling

Credit Hours: 3.00. This course focuses on long-term relationship selling. The course is organized around a seven-step selling process which has proven to be effective. The course adds to this process some principles of marketing and business strategy. The elements are necessary for the success of professional salesperson both in successful prospecting and making strategic choices as to how to allocate their time within the territory. Important to the learning process is actually practice of principles. Students will do various exercises of principles such as prospecting and negotiation. At the end of the semester, students will hone the skills learned through the semester with a series of role plays designed to put them in position of both seller and buyer.

Learning Outcomes: 1. Recognize that selling is a process which can be taught versus an innate trait. 2. Have an organized approach to the process of selling which can be applied to any industry. 3. Know principles of marketing and strategy which students can apply to the selling process. 4. Know principles of negotiation and handling objections both through class assignments and role playing. 5. Know how to do effective product presentation and frame benefits to the clients through a series of role play scenarios. Credits: 3.00

CSR 32300 - Visual Merchandising

Credit Hours: 3.00. Creative experimentation, production, and analysis of promotional formats for merchandising of product in a retail setting. Study of the elements and principles of design and their application for promotion of retail merchandise and/or services.

Credits: 3.00

CSR 32800 - Apparel Art And Design

Credit Hours: 3.00. Exploration and experimentation of creative rendering of apparel design through the use of various media. Opportunity for the students to develop their own unique style of illustrating fashion.

Credits: 3.00

CSR 33100 - Consumer Behavior

Credit Hours: 3.00. An interdisciplinary survey of consumer behavior theory focused on psychological, sociological, and cultural influences on consumer choice and use of products and services. Credit will not be given for both CSR 33100.

Credits: 3.00

CSR 33200 - Cross-Cultural Marketing And International Retailing

Credit Hours: 3.00. Examination of marketing/retail practices used to target domestic and global consumer market segments. Development of successful retail and marketing strategies is stressed.

Credits: 3.00

CSR 34100 - Luxury Brand Management

Credit Hours: 3.00. Students examine the innovation and creativity that foster the development of luxury brands in the current business environment. A key facet of this course is the opportunity to develop unique brand strategies that generate social, aesthetic, quality, and emotional value for luxury consumers. Students learn the ways brands tailor services, products, and experiences to achieve these goals.

Learning Outcomes: 1. Define the psychological and cultural elements of luxury brand experiences. 2. Explain the connections between service excellence, craftsmanship, and creative direction within the management of luxury brands. 3. Analyze social, economic, and technological trends within the luxury market. 4. Describe the ethical and social challenges of managing luxury brands. 5. Develop strategies that create brand prestige and generate value for luxury consumers. Credits: 3.00

CSR 34200 - Personal Finance

Credit Hours: 3.00. The class covers a comprehensive discussion of investments, consumer credit, insurance and retirement issues. The goal is to show how these components are interconnected in order to create a complete picture of financial health of an individual. CTL:IPO 1811 Personal Finance

Credits: 3.00

CSR 34400 - Fundamentals Of Negotiations

Credit Hours: 3.00. This course is designed to be relevant to the broad spectrum of bargaining "problems" that are traditionally faced by the manager, sales personnel and financial advisors. The course explores the processes of bargaining and negotiation as social and managerial activities. Special emphasis will be given to the areas of interpersonal and interpersonal and intergroup conflict, in addition to the interpersonal influence techniques and the tactics and strategies involved with improved bargaining and negotiation. The major purpose of the course is for each student to gain insight into his or her own negotiating style and to become a more effective negotiator, as well as a more astute observer of social process. The course will involve extensive use of cases, role-plays, and related participative activities, enhanced by rigorous self-review and introspection.

Learning Outcomes: 1. Explore the major concepts and theories of the psychology of bargaining and negotiation. 2. Understand the dynamics of interpersonal and intergroup conflict and its resolution. 3. Help develop the sophistication to analyze bargaining and conflict relationships. 4. Learn about your own individual "bargaining" style. 5. Development appropriate negotiation strategies and tactics for specific situations. Credits: 3.00

CSR 35700 - Retail Technology: Merchandise Planning And Allocation

Credit Hours: 3.00. The application of software technology in retail merchandising, planning and allocation systems. Builds on basic knowledge of buying functions utilizing industry software, to develop skills needed in higher-order planning and allocation of merchandise. Students apply knowledge and skills through simulations with real-world data.

Learning Outcomes: 1. Explain the relationship between planning and buying merchandise. 2. Explain the relationship between allocation and supply chain. 3. Evaluate the effects of planning/allocation on revenue & profit. 4. Demonstrate analytical skills through the application of industry software, to make effective merchandising decisions. Credits: 3.00

CSR 36300 - Retail Technology: Category Management

Credit Hours: 3.00. Category management is used by retailers and consumer products companies to reduce costs and increase revenue, based on consumer behavior. Technology to implement category management is used at all levels of the value chain, from producer to procurement to the retail store. Students in this course learn about the theory behind category management from both sales and retail perspectives, then apply that knowledge using industry software to create and analyze visual and data sales plans.

Learning Outcomes: 1. Demonstrate via discussion and examination, concepts of space planning and category management. 2. Create planograms using space planning knowledge and skills. 3. Develop a sales plan utilizing category management process and sales data. 4. Analyze effects on profit and revenue based on category management applications and planogram sales data. 5. Design a retail space that includes: consumer purchasing decisions, coordinates product selection and supply, shelf merchandising, promotion and pricing. Credits: 3.00

CSR 38600 - Risk Management

Credit Hours: 3.00. The course includes principles of insurance, analysis and evaluation of risk exposures, legal aspects of insurance, insurance needs and analysis, policy selection, and insurance company selection and due diligence. Types of insurance that are studied include: property and casualty, health, life, long-term care, disability and general business liability.

Credits: 3.00

CSR 39000 - Undergraduate Special Problems

Credit Hours: 1.00 to 6.00. Individual participation, supervised reading, laboratory or field experiments, or research in special areas of the field. Permission of instructor required.

Credits: 1.00 to 6.00

CSR 39500 - Special Projects

Credit Hours: 1.00 to 6.00. Individual participation in supervised undergraduate project. Open to qualified upperclassmen. Permission of department required.

Credits: 1.00 to 6.00

CSR 39700 - Directed Honors Research

Credit Hours: 1.00 to 3.00. Directed independent honors research for CFS Honors Program students. Students must select a faculty advisor for the course. Permission of instructor required.

Credits: 1.00 to 3.00

CSR 39800 - International Special Topics

Credit Hours: 1.00 to 6.00. Course taken during an International experience that is recognized by the University. Permission of department required.

Credits: 1.00 to 6.00

CSR 39900 - Undergraduate Special Topics In CSR

Credit Hours: 1.00 to 6.00. Various topics that may change from semester to semester are presented by CSR faculty. Permission of department required.

Credits: 1.00 to 6.00

CSR 40300 - Retail Management Internship

Credit Hours: 3.00. A supervised full-time internship in retail and related industries. This experience will enable students to further develop their professional interests and skills. Prior field experience and completion of application and pre-approval of internship by internship director and attendance at pre- and post-organization meetings is required. Permission of department required.

Credits: 3.00

CSR 40400 - Strategic Management For Service Industries

Credit Hours: 3.00. Effective management of organizational resources in a coherent and seamless manner is necessary to realize a competitive advantage. Through the analysis of internal and external forces, students develop strategies to help an organization realize its goals and objectives. Through the application of concepts, tools, and principles of strategy and competitive advantage, this course emphasizes strategy formulation, implementation, and evaluation to ensure the long-term success of an organization. The course is structured to enhance students' analytical, critical thinking, and verbal skills by integrating academic and experiential knowledge from previous functional courses such as accounting, finance, marketing, operations, human resources, etc.

Learning Outcomes: 1. Demonstrate through effective written and oral communication, the ability to conduct a strategic situational analysis of a service organization. 2. Develop a business strategy for a service organization. 3. Integrate and apply prior knowledge areas from your major to propose a functional strategy that aligns with the strategic vision of your service organization. Credits: 3.00

CSR 40600 - E-Retailing

Credit Hours: 3.00. To provide understanding of the technological and retail infrastructure that underlines doing retailing over the internet. Build an understanding of business strategies over the net. To identify management issues and consumer issues in e-retailing.

Learning Outcomes: 1. Understand the technological and retail infrastructure that underlies doing retailing over the Internet. 2. Learn the vocabulary to discuss e-retailing. 3. Build and understand business strategies over the Internet. 4. Acquire power to exploit any business opportunities that jump out your way. 5. Provide the ability to get your hands dirty and use some of the most important net marketing tools. 6. Understand the "business case" for Internet commerce in retailing (or other business). 7. Identify management issues in e-retailing. 8. Understand the consumer issues in e-retailing. 9. Acquire skill sets that allow a competitive market advantage in interviews, jobs and careers. Credits: 3.00

CSR 41500 - Sales Force Management

Credit Hours: 3.00. An introduction to sales force management. An examination of the sales force management process, including principles of recruiting and selecting, training, compensation, motivation, supervision, and evaluation. Planning skills, including sales force deployment and the role of the sales force in sales forecasting, are also covered.

Learning Outcomes: 1. Identify the appropriate balance between the theoretical, analytical, and pragmatic dimensions of professional sales management through discussions and examples of the diverse sales concepts, issues and activities. Credits: 3.00

CSR 41600 - Retail Supply Chain Management

Credit Hours: 3.00. Supply chain management is a set of approaches utilized to efficiently integrate all parties of the supply chain to fulfill a request from a customer. Companies like Amazon, Zara, Walmart, Toyota, Dell, and Procter & Gamble are proof that excellence in supply chain management is a must to achieve industry leadership. With increasing competition around the globe, supply chain management is both a challenge and an opportunity for companies. The main goal of this course is to introduce you to the key concepts and techniques that will allow you to analyze, manage and improve supply chain processes for different industries. The course is a combination of lectures, case studies, in-class exercises, and games with the goal of defining key tradeoffs that managers need to understand and evaluate to successfully manage complex supply chains. Quantitative tools designed to evaluate these tradeoffs will be studied and used extensively throughout the course. Topics that will be covered in this course include: Managing inventory, forecasting in supply chains, the optimal design of the supply chain, transportation and distribution, bullwhip effects and dealing with uncertainty, sourcing and supply contracts.

Learning Outcomes: 1. Develop an

understanding of how supply chain management can improve operations efficiency and market responsiveness under uncertainty. 2. Utilize and apply theories, concepts, and optimization techniques in analyzing, managing and improving supply chain processes for various industries. 3. Obtain skills to assess supply chain performance and make recommendations to enhance supply chain competitiveness in today's business environment. 4. Identify current issues and trends in global supply chain management such as sustainability, consumer health, and national security. Credits: 3.00

CSR 41800 - Selling And Sales Management Capstone

Credit Hours: 3.00. A capstone course in advanced professional selling taught in a seminar format and designed to prepare students for the transition from student to professional. Students are introduced to practitioner-focused issues involved in long-term, major B2B account sales and an emphasis is placed on professional presentation skills. Students will complete a senior group research project and a major account sales project. Professional dress code from business-casual to full-business attire required based on the scheduled day-to-day activity.

Learning Outcomes: 1. Construct a complete selling and sales management program (term project). 2. Demonstrate the ability to analyze selling and sales management situations, and apply skills to solving selling and sales management problems and developing effective selling strategies (exams; quizzes; class exercises). 3. Identify how diversity, ethical, global, and multicultural considerations affect the selling and sales management decision-making processes (exams; class exercises). 4. Demonstrate effectively communication skills by the presentation of a research project in an oral presentation and in a written paper (term project presentations and project updates). Credits: 3.00

CSR 42100 - Apparel Design III

Credit Hours: 3.00. Creation of apparel product line or collection from concept to consumer. Application of principles of apparel design from rendering, technical sketches, pattern design, pattern grading, marker making, and construction of several apparel garments from the line or collection.

Credits: 3.00

CSR 48000 - Financial Counseling And Planning Internship

Credit Hours: 1.00. Supervised internship in the financial services industry. The experience will enable students to develop their professional interest and skills. Attendance at a pre-planning meeting required. Permission of department required.

Credits: 1.00

CSR 48100 - Ethics And Behaviors In Financial Planning

Credit Hours: 3.00. As research in behavioral finance makes increasingly clear, understanding the psychology of financial behaviors is a critical skill for financial planners. Simultaneously, understanding ethical challenges to financial planners' own behaviors, and complying with new and ever more complex regulations, is a key requirement of successful and relevant financial planning and advice-giving. The course will enable students to be better financial planners by reviewing rules of behaviors for financial planners, improving students' capacity to provide fiduciary advice, and enhance their ability to integrate psychological insights into customers' financial behavior throughout the financial planning process.

Learning Outcomes: 1. Identify ethical issues and compliance matters in the field of financial counseling and planning. 2. Evaluate client and planner attitudes, values, biases, behaviors, and their impact on the financial planning relationship. 3. Demonstrate understanding of The CFP Board's Code of Ethics and Professional Responsibility and Rules of Conduct; Disciplinary Rules and Procedures, and Financial Planning Practice Standards. 4. Apply basic knowledge of behavioral finance and its impacts on clients' financial needs (including in times of crisis). Credits: 3.00

CSR 48400 - Consumer Investment And Savings Decisions

Credit Hours: 3.00. A survey of consumer investment alternatives, with emphasis on financial assets.

Learning Outcomes: 1. Analyze investment decisions and investment risk management through portfolio management, capital market equilibrium and asset pricing theories. Credits:

3.00

CSR 48500 - Case Studies In Financial Planning

Credit Hours: 3.00. Financial planning principles and practice. Course utilizes a case study approach toward financial planning for upper- and middle-income households. Business calculator required.

Learning Outcomes: 1. Demonstrate a comprehensive understanding of the content found within the Financial Planning curriculum and effectively apply and integrate this information in the formulation of a financial plan. 2. Effectively communicate the financial plan, both orally and in writing, including information based on research, peer, colleague or simulated client interaction and/or results emanating from synthesis of material. 3. Collect all necessary and relevant qualitative and quantitative information required to develop a financial plan. 4. Analyze personal financial situations, evaluating clients' objectives, needs, and values to develop an appropriate strategy within the financial plan. 5. Demonstrate logic and reasoning to identify the strengths and weaknesses of various approaches to a specific problem. 6. Evaluate the impact of economic, political, and regulatory issues with regard to the financial plan. 7. Apply the CFP Board Financial Planning Practice Standards to the financial planning process. Credits: 3.00

CSR 48600 - Retirement Planning And Employee Benefits

Credit Hours: 3.00. Analysis of employee benefit plans, retirement needs analysis, and types of retirement plans including employer-sponsored plans and participant-directed plans.

Learning Outcomes: 1. Evaluate a client's retirement income and savings need. 2. Explain important provisions of Social Security, The Affordable Care Act and Medicare. 3. Differentiate between individual Retirement Arrangements including those used by individuals and small businesses. 4. Know the rules relating to qualified retirement plans. 5. Conduct an in-depth analysis of qualified plans (e.g. defined benefit, profit sharing, 401(k) plans, stock bonus plans, and ESOPs). 6. Employ rules and strategies for appropriate retirement decumulation. 7. Understand deferred compensation plans, stock option plans, and planning for executive compensation. Credits: 3.00

CSR 49000 - Independent Study

Credit Hours: 1.00 to 4.00. Independent study. Permission of instructor required.

Credits: 1.00 to 4.00

CSR 49700 - Honors Research Project

Credit Hours: 1.00 to 4.00. The completion of the independent honors research project for CFS Honors Program students. Must have an approved Honors Project Proposal. Permission of instructor required.

Credits: 1.00 to 4.00

CSR 50300 - EXPIRED - Transitional Health Disparities: Research, Practice, And Policy

Credit Hours: 3.00. This course will provide an overview of quantitative and qualitative research methods, measurement models, and research skills relevant to translational health science and the transfer/translation of knowledge from the research setting to applied practice settings. Course material will place special emphasis on research skills for developing health disparities translational researchers and strategies for being culturally competent, and career-minded in the mediation, cultivation, and development of translational research skills, and the implementation of evidence-based practices. Emphasis is placed on service needs of marginalized populations.

Learning Outcomes: 1. Identify and describe quantitative and qualitative research methods relevant to translational research in health disparities; be able to discuss measurement models and demonstrate skills of research relevant to translational research in health disparities. 2. Distinguish between core principles of implementation science and the transfer/translation of knowledge from the research setting to clinical practice settings in health disparities. 3. Discuss definitions and terms related to evidence-based practice (EBP), the history and progression of EBP, and the importance of empirically supported knowledge transfer from research settings to clinical settings and policy initiatives in health

disparities. 4. Evaluate the importance of and need for culturally competent clinical and services research and the development of culturally adapted EBP's in health disparities. 5. Summarize ethical principles in clinical and services research in health disparities. Credits: 3.00

CSR 59000 - Special Problems In Consumer Sciences And Retailing

Credit Hours: 1.00 to 4.00. Credit variable. Permission of instructor required.

Learning Outcomes: 1. Vary due to nature of the course. Credits: 1.00 to 4.00

CSR 62300 - Design And Analysis Of Public Health Interventions

Credit Hours: 3.00. (HK 67500) Professional competencies in design, implementation, evaluation and diffusion of health interventions in community settings. Program planning paradigms, determinants of health behavior, and behavior change strategies serve as a basis for analyzing health interventions.

Learning Outcomes: 1. Understand how to identify and/or select evidence-based interventions appropriate for defined populations, setting, and health issues. 2. Choose an evidence-based intervention and adapt it for a new population and/or setting. 3. Understand key ethical considerations when implementing interventions for defined public health problems, populations and settings. 4. Create a model to guide the evaluation of a health disparities program and/or intervention. 5. Establish evaluation questions and select an appropriate evaluation design to answer health disparities questions. 6. Identify strengths, limitations, and quality control issues associated with measure selection, data collection, data analysis, and data management of a health disparities intervention. 7. Understand the ethical and political implications of evaluation work regarding health disparities. 8. Identify grant proposals to secure funds to conduct an evaluation of an evidence-based health disparities intervention. Credits: 3.00

CSR 63100 - Consumer Behavior Theories

Credit Hours: 3.00. An examination of research methods, principles, and theories of social science as they apply to the study of consumer behavior and marketing sciences. Prerequisite: STAT 50100 , STAT 50200 , or PSY 60000 , PSY 60100 .

Credits: 3.00

CSR 68100 - Consumption Theories

Credit Hours: 3.00. Analysis of theories of consumption with emphasis on their relation to current practices and to the history of economic thought. Permission of instructor required.

Credits: 3.00

CSR 69000 - Independent Study In Consumer Sciences And Retailing

Credit Hours: 1.00 to 6.00. Topic and credit to be arranged. Permission of instructor required.

Learning Outcomes: 1. Vary due to nature of the course. Credits: 1.00 to 6.00

CSR 69700 - Final Non-Thesis Paper

Credit Hours: 1.00 to 3.00. The curriculum of consumer behavior and family and consumer economics has evolved in the past decades with the changing market trend to currently encompassing specializations for meeting the diverse and integrated needs of individual consumers, their families, and communities. The non-thesis option is called to respond to the increasing market demand for professionals who are able to solve practical issues in the field in addition to mere epistemological pursuits. This proposed new course is designed for the students from this option to organize their learnings in the option in a way that provides propositions and strategies for addressing their topics of interest. Hence, this course should be taken during the last semester of the student's Master's program. The students will work with their major advisors for the topic and design of the study. Prerequisites: The students should take this course during the last semester of their non-thesis master's program. It is preferably taken after the students have completed the recommended core courses. Permission of Instructor required.

Learning Outcomes: 1. Be prepared for the workforce in business, nonprofit organizations, and public services. 2. Cultivate critical and analytical thinking, written communication, problem solving, and technology. Credits: 1.00 to 3.00

CSR 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required.

Learning Outcomes: 1. Vary due to nature of the course. Credits: 1.00 to 18.00

CSR 69900 - Research PhD Thesis

Credit Hours: 1.00 to 18.00. Research PhD Thesis. Permission of instructor required.

Learning Outcomes: 1. Vary due to nature of the course. Credits: 1.00 to 18.00

Critical Disability Studies

CDIS 23900 - Introduction To Disability Studies

Credit Hours: 3.00. Introduces students to the principles of and debates within disability studies. Topics explored include ideas of normalcy; the social model of disability; history of eugenics and its current manifestations; relations between disability and other identity categories; issues of social and physical access; cultural representations of disabled people.

Learning Outcomes: 1. Identify different models of understanding disability. 2. Understand the ways normalcy is socially constructed. 3. Distinguish between impairment and disability. 4. Offer informed opinions on current eugenic practices. 5. Compare and contrast disability to other identity categories such as race, gender, and sexuality. 6. Identify exclusionary practices that marginalize disabled people. Credits: 3.00

CDIS 29000 - Special Topics In Critical Disability Studies

Credit Hours: 3.00. Various topics in critical disability studies, changing from semester to semester as presented by different instructors.

Learning Outcomes: 1. Vary due to variable nature of course. Credits: 3.00

Dance

DANC 10100 - Modern Dance Technique I

Credit Hours: 2.00. An introduction to the techniques and principles of modern dance.

Learning Outcomes: 1. Demonstrate elementary level performance of skills and principles of Modern Dance technique. 2. Perform basic dance movement with personal expression. 3. Demonstrate fundamental bodily and spatial awareness, mobility, and strength. Credits: 2.00

DANC 10200 - Ballet I

Credit Hours: 2.00. An introduction to the techniques and principles of classical ballet.

Learning Outcomes: 1. Demonstrate essential ballet skills, principles and techniques used in ballet. 2. Demonstrate correct use of ballet terminology. 3. Recognize and define ballet as a historical classical art form. 4. Perform for an audience all three parts of ballet class: barre, center and across the floor. Credits: 2.00

DANC 10300 - Jazz Dance I

Credit Hours: 2.00. An introduction to the principles of jazz dance techniques: alignment, isolations, rhythmic patterns, and basic locomotion.

Learning Outcomes: 1. Perform basic skills of the body including coordination, proper alignment, and musicality through movement phrases and exercises aligned with Jazz Dance Techniques. 2. Demonstrate an elementary understanding of core principles, techniques and histories under the broad umbrella of Jazz Dance Technique. 3. Demonstrate a fundamental understanding of Jazz Dance vocabulary and basic body anatomy. Credits: 2.00

DANC 10400 - Hip Hop I

Credit Hours: 2.00. This is an introductory-level course where students will explore the different styles, vocabularies, and grooves of dance styles under the Hip Hop umbrella. Students will learn elements of choreography, freestyling (also known as improvisation), and grooves of varying Hip Hop dance genres.

Learning Outcomes: 1. Identify the pioneers and "Five Elements of Hip Hop" dance and culture. 2. Integrate the movement vocabulary from class into freestyle and choreography. 3. Develop bodily and spatial awareness, mobility, and strength. 4. Demonstrate understanding of foundational movements through freestyle practices, choreography, and movement vocabulary. Credits: 2.00

DANC 20100 - Modern Dance Technique II

Credit Hours: 2.00. A continuation and refinement of the modern dance techniques and principles addressed in DANC 10100.

Learning Outcomes: 1. Demonstrate confident performance of skills and principles of Modern Dance technique. 2. Perform dance movement with personal expression and artistry. 3. Demonstrate increased bodily and spatial awareness, mobility, and strength. Credits: 2.00

DANC 20200 - Ballet II

Credit Hours: 2.00. A continuation of the principles and techniques of classical ballet addressed in DANC 10200.

Learning Outcomes: 1. Demonstrate advanced ballet skills, principles and techniques used in ballet, with focus on increased strength and coordination. 2. Demonstrate correct use of ballet terminology. 3. Define ballet as a historical classical art form. 4. Perform for an audience all three parts of ballet class: barre, center and across the floor, as well as various ballet variations. Credits: 2.00

DANC 20300 - Jazz Dance II

Credit Hours: 2.00. A continuation and refinement of the jazz dance concepts and movement vocabulary addressed in DANC 10300.

Credits: 2.00

DANC 23000 - Biomechanics Of Dance, Movement And Strength

Credit Hours: 2.00. This course will provide conceptual and experiential understanding of biomechanical approaches to dance technique. Through studio, lecture, movement exercises and assignments, the students will learn to perform all types of dance and movement with ease, strength and economy of motion.

Learning Outcomes: 1. Integrate movement patterns that are efficient, stable and mobile. 2. Develop the ability to identify problem areas in dance and movement technique. 3. Know tools for developing successful skills. Credits: 2.00

DANC 24000 - Dance Composition

Credit Hours: 3.00. An introduction to the theory and practice of the principles and utilization of choreographic tools; movement exploration, manipulation of basic dance elements, development of movement themes, and application of compositional dance forms.

Learning Outcomes: 1. Learn the systematic application of choreographic tools which will allow them to create a coherent dance composition. 2. Increase awareness for dance composition and understand its value and meaning as both a creator and observer. 3. Learn to discuss and critique dance choreography. Credits: 3.00

DANC 24500 - Practicum In Dance Performance And Production

Credit Hours: 1.00 to 2.00. Open through audition. The study and practice of dance rehearsal, performance and basic concert production techniques, culminating in a main-stage dance concert. Permission of instructor required.

Learning Outcomes: 1. Demonstrate understanding of professional dance company member responsibilities and processes by learning choreography as assigned and performing at the highest standard. 2. Demonstrate personal artistry as a dancer and dependability as an ensemble member through rehearsals, technical preparations and performances. 3. Demonstrate interpersonal collaboration skills in creative process. Credits: 1.00 to 2.00

DANC 26000 - Dance Improvisation

Credit Hours: 3.00. In this course students explore a variety of techniques for creating movement. While physically researching concepts from a broad spectrum of improvisational artists, students expand their boundaries and definitions of dance, art and creativity. Important concepts include choice making, moving from internal motivations, and ensemble collaboration. All backgrounds in dance and movement are welcome, and will benefit from this course.

Learning Outcomes: 1. Demonstrate multiple approaches to create unique dance movement spontaneously. 2. Formulate and participate in improvised solo and group dance performances. 3. Generate qualities of movement and elements of dance composition through improvisation. 4. Evaluate the many critical roles of improvisation in the art of dance. Credits: 3.00

DANC 26100 - Contact Improvisation

Credit Hours: 3.00. This course is both a physical practice and philosophical exploration of the techniques and underlying premise of this contemporary partner dance form. CI training involves a practice of movement improvisation while developing the body's ability to attend to the effects of gravity, muscle tone, and anatomical structures on dancing solo and in partnership. While increasing their body awareness, respect, sensitivity and connection, students learn about collaborative community creativity, which can be applied in other settings including design, performance, and social activism. DANC 26000 is a good preparation for this course, but not required. Course may be repeated for credit.

Learning Outcomes: 1. Demonstrate basic skills

of solo movement in group dance setting. 2. Demonstrate basic skills of partnering using weight sharing and touch. 3. Model nonverbal communication with a partner. 4. Improve awareness and perception of the body. Credits: 3.00

DANC 30000 - Performance Production

Credit Hours: 3.00. This course teaches many aspects of producing a performance, from backstage to onstage. Students will learn the technical aspects of creating a professional performance by both observing performance production and developing an actual performance, which this semester is the Xperimental 2024 Concert. Students may participate in the production in a variety of active roles; however, they will be exposed to all aspects through observation, participation, and discussion. Production roles include: director and assistant director, choreographer, performer, lighting design and staging, sound design and technical support, and stage crew (stage manager, house manager, ticket manager, setup and strike support). Occasional class sessions cover skills to enhance your knowledge of some areas of production such as sound design, and lighting technology. For many students who are at the university level, the art of performance is defined almost totally by the act of being on stage performing, in studios or on stages. This course is designed to invite students to learn about all the activities that are done behind the scenes in order for live performances to be presented to an audience. We will discuss what is involved in both large institutional performance spaces, and compare this to our university performance. Then we will discuss what this scenario looks like for performance professionals after college. This course will greatly enhance students' ability to produce their own events in the future, and develop greater appreciation for the collaborative nature of live performance as art form.

Learning Outcomes: 1. Plan and create a small live performance production. 2. Identify the necessary components of a production of a professional performance and explain the key collaborative interactions among them. 3. Practice basic skills for working performers and producers including those relating to technology and business. Credits: 3.00

DANC 30100 - Modern Dance Techniques III

Credit Hours: 2.00. A continuation and refinement of the modern dance techniques and principles addressed in DANC 20100. Emphasis placed on expressive qualities of movement.

Learning Outcomes: 1. Demonstrate strong performance of skills and principles of Modern Dance technique. 2. Perform complex movement with personal expression and artistry. 3. Evaluate the art of Modern Dance and examine its value and meaning as both a creator and observer. Credits: 2.00

DANC 34500 - Choreography

Credit Hours: 3.00. This course focuses on methods and practices of choreographing contemporary dance works. It teaches the choreographic process: how to create original movement and expand and build both solo and group dance works. Basic compositional elements of exploring and manipulating movement and structuring choreographed material are utilized. The development of production elements are taught to support choreographic intent. Highly recommended before enrolling in this course: DANC 24500 and DANC 30100.

Learning Outcomes: 1. Identify and apply choreographic tools to create a coherent dance composition. 2. Analyze dance composition and understand its value and meaning as both a creator and observer. 3. Express individual artistry through dance composition. Credits: 3.00

DANC 34600 - Intermediate Choreography

Credit Hours: 1.00 or 2.00. A study of selected principles underlying the design of group performance in modern dance. Permission of instructor required.

Learning Outcomes: 1. Analyze and research methods for constructing and choreographing a group dance work. 2. Demonstrate ability to craft, edit and stage a piece of choreography for a professional-level dance performance. 3. Demonstrate growth in interpersonal and leadership skills while working with the group of dancers cast in their dance work. Credits: 1.00 or 2.00

DANC 35000 - Dance For The Camera

Credit Hours: 3.00. An introduction to technical and aesthetic techniques to create screendance or dance film, with an emphasis on camera use, editing techniques, development and production of choreographic projects designed specifically for film format.

Learning Outcomes: 1. Demonstrate how to use a camera and capture dance footage. 2. Demonstrate basic skills in non-linear digital video editing with attention to motion and action editing in dance. 3. Analyze the art of screendance and examine its value and

meaning as both a creator and observer. 4. Create a sense of personal expression and artistry through crafting dance film projects. Credits: 3.00

DANC 35100 - Intermedia Dance Technology

Credit Hours: 3.00. An introduction to dance and intermedia within the choreographic process. Integration of movement and various forms of technology which might involve digital images, film, animation, programming, sensors, sound, lighting and/or robotics.

Learning Outcomes: 1. Demonstrate new approaches to choreography by integrating intermedia technology into the dance-making process. 2. Apply basic skills for creating or implementing film, digital media, sound editing, and/or programming. 3. Analyze intermedia dance technology works. 4. Develop awareness of dance intermedia technology art and examine its value and meaning as both a creator and observer. 5. Build a sense of personal expression and artistry through the composition of intermedia dance technology works. Credits: 3.00

DANC 36800 - Dance Sound Design

Credit Hours: 1.00. The study and application of sound design for dance, with emphasis on creation of sound scores for Modern Dance concerts. Instructor permission required.

Learning Outcomes: 1. Feel comfortable researching sound and music. 2. Feel more comfortable using an audio sequencer and other associated software to create a dance sound design. 3. Gain valuable experience integrating the finished design into the dance performance. 4. Add an important credential to the resume and portfolio. Credits: 1.00

DANC 37800 - Survey Of Concert Dance History (UCC: HUM)

Credit Hours: 3.00. This course is a broad survey of concert dance history predominately in the 20th and 21st century in Western cultures. The direct relationship and influence of the culture, training, choreographic, and performative records of dance practices, to socio-political ideologies of gender, race, sexuality, and national identities will be the area of investigation. Students will read, watch, research and actively participate in discussion regarding important dance figures, movements, eras, and their social and cultural reverberations. Dance's relationship to other art practices throughout history will also be a subject of lecture and discussion.

University Core Curriculum (UCC): (UCC: HUM)

Learning Outcomes: 1. Demonstrate understanding of the foundational underpinnings of concert dance history. 2. Identify specific choreographers and their works of art in oral and written communication. 3. Recognize concert dance contexts in order to speak and write clearly about them. 4. Demonstrate an awareness of the relationships and interactions between dance and culture. Credits: 3.00

DANC 37900 - The Art Of Protest: An Examination Of The Role Of Arts, Artists, Activism, & Social Transformation

Credit Hours: 3.00. Throughout history, art has been used to advocate for political movements and provoke social action and transformation. This course examines the role of the arts and the artist and their relationship to activism throughout history and beyond. We will investigate how art has been used as a tool to transform cultural perspectives, alter policies, and promote social change. We will explore a range of artists whose methodologies, materials and approach challenge the cultural norms. From printmakers to musicians, to choreographers, to performance artists, students will engage and evaluate the act of art-making as a tactic of resistance and the responses to those acts. We will investigate readings that argue for and against the need for artists to make work that politically challenge their society. Once a foundation of knowledge has been laid, we will turn to the creative process through an investigation of materials and practices - performance, mixed media, and photography. Students will research, watch, discuss, create, and perform their own projects that promote social transformation.

Learning Outcomes: 1. Demonstrate effective oral and written communication in formal assignments, critical analysis, and class presentations. 2. Demonstrate through creative projects how art, culture, and activism have a direct and interactive relationship. 3. Investigate and critically engage with artists whose work transform cultural perspectives, alter policies, provide socio-political commentary, and promote social change. 4. Analyze seminal art and historical and philosophical texts that articulate the role and

importance of political art. Credits: 3.00

DANC 49000 - Special Problems In Dance

Credit Hours: 1.00 to 3.00. Individual readings, topics, or projects in dance. Permission of instructor required.

Learning Outcomes: 1. Vary due to nature of the topic. Credits: 1.00 to 3.00

Earth Atmospheric and Planetary Sciences

EAPS 10000 - Planet Earth (UCC: STS)

Credit Hours: 3.00. An introduction to the Geosciences-Earth science, oceanography, atmospheric science and astronomy. The course emphasizes topics (earthquakes, volcanoes, ocean pollution, climate change, severe weather, etc.) that are of general interest and relevance, and the interconnections between various Earth processes. CTL:IPS 1730 Earth Science

University Core Curriculum (UCC): (UCC: STS)

Credits: 3.00

EAPS 10400 - Oceanography (UCC: STS)

Credit Hours: 3.00. Origin of the oceans and marine life. Seafloor spreading and marine geology; currents, waves, and tides; marine organisms and ecology; beaches and nearshore life. Man's use and abuse of the sea, including contemporary problems and future opportunities. The role of oceans in climate and evolution of the biosphere.

University Core Curriculum (UCC): (UCC: STS)

Learning Outcomes: 1. Understand ocean and coastal processes. 2. Understand potential future impacts of ocean and other environmental changes. Credits: 3.00

EAPS 10500 - The Planets (UCC: SCI)

Credit Hours: 3.00. This course is designed for science and non-science majors alike to learn about the origin and characteristics of the bodies in our Solar System, including planets, moons, asteroids, comets, exoplanets beyond, and the search for extraterrestrial life. We'll discuss how solar systems form and die, the origin of the terrestrial versus giant planets and their orbits, the evolution of planetary surfaces due to asteroid impacts and volcanism, the development of atmospheres, the formation of planetary rings, the origin of moons, the hazards of space travel, and why Pluto IS a planet.

University Core Curriculum (UCC): (UCC: SCI)

Learning Outcomes: 1. Place your home in context with the Universe (cosmic geography). 2. Understand how the solar system came to be. 3. Understand the basic structure of the solar system and Earth's place in it. 4. Understand the processes that shape the surfaces of the planets. 5. Learn about past, current, and future exploration of space.

Credits: 3.00

EAPS 10600 - Geosciences In The Cinema (UCC: STS)

Credit Hours: 3.00. This course is designed for science and non-science majors alike to learn about natural hazards based on the depictions of such hazards in movies. Topics include earthquakes, tsunamis, volcanoes, tornadoes, hurricanes, climate change, asteroid impacts, space exploration, and wildfires. The course focuses on the accuracy of the depiction of natural hazards in the movies, the underlying processes that control their formation and the dangers they represent, how they influence society, and how students can prepare for them and keep themselves safe.

University Core Curriculum (UCC): (UCC: STS)

Learning Outcomes: 1. Understand how scientists explore natural hazards, make observations, and develop theories. 2. Explain the processes that control natural hazards and where and when they are likely to occur. 3. Know the natural hazards inherent to a student's location and be able to plan how to keep themselves safe in the event of such an occurrence. 4. Critically assess the reasonableness of depictions of natural hazards in the media. Credits: 3.00

EAPS 10900 - The Dynamic Earth

Credit Hours: 3.00. This course covers the formation and development of the solid earth, atmosphere, hydrosphere, and bio-sphere. The course studies the whole earth as a system of many interacting parts and focuses on the changes within and between these parts. This course is intended for all majors in earth and atmospheric sciences.

Credits: 3.00

EAPS 11100 - Physical Geology (UCC: SCI)

Credit Hours: 3.00. Geologic processes and the development of land forms. Laboratory covers the study of minerals and rocks, the interpretations of topographic and geologic maps, and field investigations. CTL: Physical Geology

University Core Curriculum (UCC): (UCC: SCI)

Credits: 3.00

EAPS 11200 - Earth Through Time (UCC: SCI)

Credit Hours: 3.00. The history of the planet Earth from its beginnings to the present. This course will explore the causes and effects of processes that have changed the Earth's surface and subsurface through time, the impacts of these changes on the evolution of life, and how scientist interpret Earth history

from the geologic record. The laboratory will provide hands-on experience in interpreting various geologic and fossil records. This course may be taken on its own, or as a year-long lab series with EAPS 11100 . EAPS 11100 and EAPS 11200 will fulfill the two course sequence laboratory experience outside the major department.

University Core Curriculum (UCC): (UCC: SCI)

Credits: 3.00

EAPS 11600 - Earthquakes And Volcanoes (UCC: SCI)

Credit Hours: 3.00. A survey class on earthquakes and volcanoes. Topics include earthquake hazards and forecasting, the use of seismic waves to investigate the earth's interior, volcanoes and tectonics, volcanic hazards, and the influence of volcanoes on climate. Examples of recent and historic earthquakes and volcanic eruptions are presented.

University Core Curriculum (UCC): (UCC: SCI)

Credits: 3.00

EAPS 11700 - Introduction To Atmospheric Science (UCC: SCI)

Credit Hours: 3.00. The weather/climate system. Solar variability and Milankovitch Theory. Atmospheric scales of motion. Chemistry of greenhouse gases and aerosols. Fundamental laws of meteorological dynamics and radiation. Weather systems, air masses and fronts. Severe storms, hurricanes and tornadoes. (Required for atmospheric sciences majors.).

University Core Curriculum (UCC): (UCC: SCI)

Learning Outcomes: 1. Appreciate the temporal and spatial scales of climate change, from Milankovitch Theory and glacial/interglacial regions, to the anthropogenic effects of greenhouse gases (GHG's). 2. Appreciation of how weather events collectively and cumulatively, lead to the establishment of climate. 3. Understand the basic scales of atmospheric motion (space and time) and the classification of weather events into these scales (planetary, synoptic, mesoscale and microscale). 4. Understand the definition of aerosols and GHG's and their relation to weather and climate. 5. Understand the four basic laws of radiation (beginning with Planck's Law). 6. Understand the fundamental laws of atmospheric motion, and some general principles of weather prediction. 7. Understand the basic principles of cloud physics, from CCN to cloud formation and precipitation. 8. Understand the First Law of Thermodynamics, and the general concepts of thermal convection, including lapse rates and the concept of latent heat release. 9. Understand the behavior, including simulation and differences, of geophysical columnar vortices, from dust devils to tornadoes to hurricanes. 10. Understand the broad context of atmospheric science, from solar physics and space weather, to meteorology and lower atmosphere weather phenomena. 11. Understand how the planetary atmospheric circulation establishes a jet stream and the semi-permanent pattern of wind and pressure belts (e.g., the trade winds and the westerlies). 12. Understand the formation and movement of air masses and fronts, including the formation of Extratropical Cyclones. 13. Understand the formation of thunderstorms, including severs thunderstorms, hail and tornadoes. 14. Understand tornado climatology in the USA, the tornado intensity scale, taxonomy and climate considerations such as ENSO pattern of El Nino and La Nina. 15. Understand weather hazards in the field of aviation, particularly thunderstorm phenomena (such as hail and downburst winds). 16. Understand a basic review of weather/climate and energy (from wind farms to climate changes). Credits: 3.00

EAPS 11800 - Introduction To Earth Sciences

Credit Hours: 3.00. Introduction to a range of topics in Earth Science, including: Origin and geological history of Earth, including geological records of climate and evolution; Earth materials (minerals and rocks); Chemical and physical composition and structure of the Earth; Rock weathering, erosion, and sedimentary processes; Geological timescale; Geologic structures including their map and field expression; Tectonic processes; The hydrological cycle with emphasis on groundwater and physical and chemical oceanography; Energy and mineral resources; Astrobiology. (Required for Geology and Geophysics and Earth and Space Science Teaching majors.)

Credits: 3.00

EAPS 12000 - Introduction To Geography (UCC: STS)

Credit Hours: 3.00. Introduction to the major themes of modern geography, designed to enhance your spatial thinking skills, geographic literacy, and to help you understand the relevance of geographic concepts and how they relate to our changing world. This course will expand your awareness of global issues and provide you with tools to understand how the world around you changes at local, regional, and global scales.

University Core Curriculum (UCC): (UCC: STS) Learning Outcomes: 1. Interpret geographic data and identify and understand spatial relationships linking humans and the environment. 2. Use geographic tools introduced in the course (e.g. Google Earth, MapMaster). 3. Understand how and why people organize themselves and move as a function of economic, social, historical and cultural forces. 4. Understand how weather and climate are linked to natural and human induced climate change, and links between the atmosphere and biosphere through water and nutrient cycles. 5. Understand how processes within and on the Earth are reflected in the landscape and how erosions, transport and deposition re-shape landscapes. 6. Understand the resource concept and be able to make connections between distribution of resources and balancing competing interests. Credits: 3.00

EAPS 12500 - Environmental Science And Conservation (UCC: STS)

Credit Hours: 3.00. (AGRY 12500, FNR 12500, NRES 12500) Introduction to environmental science and conservation includes topics in ecological principles, conservation and natural resource management, human impacts on the environment, toxic waste disposal, climate change, energy, air and water pollution, environmental geology and geologic hazards.

University Core Curriculum (UCC): (UCC: STS) Learning Outcomes: 1. Describe the issues, facts and concepts central to a broad range of environmental and conservation topics. 2. Form opinions on controversial topics, explaining what they think we should do regarding topics in the news. 3. Describe the work done in five scientific disciplines, ecology, environmental science, resource management, conservation biology, and environmental geology. Credits: 3.00

EAPS 12900 - Earth System Dynamics (UCC: SCI/STS)

Credit Hours: 3.00. Provides foundational knowledge and critical thinking skills to discuss the Earth's changing climate and environment and their impacts. Introduces how the components of the Earth system - atmosphere, hydrosphere, lithosphere, and biota -- interact with each other in response to various forcings. Course is designed to enhance learners' geospatial-temporal thinking skills and geoscience literacy, as well as analyze some of the 'what if' scenarios using a 'systems approach'.

University Core Curriculum (UCC): (UCC: SCI/STS) Learning Outcomes: 1. Describe the various sub-systems inside the Earth system and conceptualize how they interact. 2. Apply facts and concepts about geospatial-temporal phenomena when relevant events arise in real life. 3. Develop the ability to analyze the Earth system from personal, community to global scales. 4. Connect available evidence in real life to climate change impacts for decision- and policy-making. Credits: 3.00

EAPS 13700 - Freshman Seminar In Earth, Atmospheric, And Planetary Sciences

Credit Hours: 1.00. Seminar presented by guests in different fields of the Earth and Atmospheric Sciences to expose students to the range of topics included in the department and in possible career paths.

Learning Outcomes: 1. Demonstrate the ability to form high performing teams. 2. Demonstrate the ability to locate and use academic success resources. 3. Demonstrate understanding of time management and study skills. 4. Demonstrate knowledge in the utilization of Purdue degree planning tools. 5. Demonstrate understanding of the academic requirements and career paths in the EAPS program. Credits: 1.00

EAPS 13800 - Thunderstorms And Tornadoes (UCC: SCI)

Credit Hours: 3.00. Not open to juniors and seniors majoring in atmospheric science. An elementary treatment of the physical

structure of the atmosphere and the dynamical conditions that lead to the development of convective clouds, thunderstorms, and severe weather (including tornadoes, hail, wind, rain, lightning, and flash floods). This course will also focus on storm climatology, the socioeconomic impact of severe weather, as well as prediction, detection, warnings, and safety procedures. Analysis of severe weather events will include tornado movies and case studies of ground/aerial surveys of storm damage.

University Core Curriculum (UCC): (UCC: SCI)

Credits: 3.00

EAPS 19100 - Introductory Topics In Earth And Atmospheric Science

Credit Hours: 1.00 to 3.00. Introductory special topics in earth and atmospheric sciences. Permission of instructor required.

Credits: 1.00 to 3.00

EAPS 20000 - Water World: Processes And Challenges In Global Hydrology (UCC: STS)

Credit Hours: 3.00. Introduction to the Hydrological Sciences designed for undergraduate students. Course uses an Earth-systems approach to emphasize the interconnections and feedback between the hydrosphere, geosphere, biosphere, and atmosphere. Course topics will include: global water-balance, techniques for measuring components of the water-balance, hydrological uncertainties, groundwater, surface-water, vadose zone, forest and watershed hydrology, global change hydrology, human and climate impacts on water resource, and water on the worlds.

University Core Curriculum (UCC): (UCC: STS)

Learning Outcomes: 1. Create, analyze, and evaluate water-balances. 2. Define and recognize the importance of the groundwater, surface-water, and vadose zone water systems, and explain interactions and interconnections between these three systems. 3. Evaluate human and climate impacts on water resources and explain how hydrological processes impact biodiversity and ecological functioning. 4. Create conceptual models for how these systems may change with growing human populations, land development and deforestation, and climate change. Credits: 3.00

EAPS 20500 - Fundamentals Of Planetary Science

Credit Hours: 3.00. This course provides a quantitative understanding of the fundamental principles that govern the behavior of planetary systems, including their atmospheres, surfaces, interiors, and orbital dynamics. This course is intended to be a quantitative follow-on to EAPS 10500, and aims to provide students with hands-on experience with physics-based problem solving, scientific programming, and developing research projects. Lecture periods will include lectures as well as group work on problems, and lab periods will focus on programming projects in Python. By the end of the course, students will have a strong foundation in the principles and techniques of planetary science and be well-prepared to engage in upper-year courses and conduct planetary science research. It is recommended that students have completed EAPS 10500 The Planets, PHYS 17200 Modern Mechanics or equivalent, and have some previous programming experience (preferably in Python).

Learning Outcomes: 1. Apply principles of classical physics to investigations of planetary orbital dynamics, surfaces, interiors, and atmospheres. 2. Write and debug basic data analysis, graphical display, and numeric computation code in Python. 3. Come up with a science question, conduct a literature review, test hypotheses using real data or models, and present an informed assessment. Credits: 3.00

EAPS 22100 - Survey Of Atmospheric Science (UCC: SCI)

Credit Hours: 3.00. (NRES 23000) An introductory course for both science and nonscience students. A general study of the atmosphere, basic meteorological principles, and weather systems. Relationships of the changing atmosphere to climate ozone depletion, and other contemporary issues.

University Core Curriculum (UCC): (UCC: SCI)

Learning Outcomes: 1. Understand and describe a wide range of meteorological phenomena using fundamental principles of physics and chemistry. 2. Learn a unified approach that relates the behavior of air parcels acting under forces to the observed weather and climate. 3. Represent weather parameters quantitatively on maps and charts. 4. Identify the principal threat to the stratospheric ozone shield and the gases responsible for the greenhouse effect. 5. Understand the Coriolis effect and how it determines wind direction and circulation in cyclones and anticyclones in the Northern and Southern Hemispheres. 6. Identify conditions that lead to the formation of hazardous weather. Credits: 3.00

EAPS 22500 - Science Of The Atmosphere (UCC:

SCI)

Credit Hours: 3.00. This course provides a quantitative introduction to how to use the laws of physics to understand the behavior of the Earth's atmosphere. Emphasizes key processes that govern the climate system and the weather phenomena that arise within it. Topics covered may include the Earth's energy balance, heat transfer, the greenhouse effect, atmospheric convection, precipitation, the general circulation, the Coriolis effect, atmospheric chemistry, weather systems, weather forecasting, and climate change.

University Core Curriculum (UCC): (UCC: SCI) Learning Outcomes: 1. Solve simple quantitative problems by manipulating equations, plugging in numbers, and checking units. 2. Visualize how our atmosphere varies in space and time by interpreting graphs and maps of atmospheric data as a function of latitude, longitude, and/or height/pressure. 3. Use key physical laws to explain (mathematically and in words)...Physical properties (composition, density, temperature, pressure, specific humidity, relative humidity) of our atmosphere; How energy transfer between the Sun, Earth, and outer space affect the properties of our atmosphere; How horizontal variability in air properties gives rise to circulations, such as the jet stream. Credits: 3.00

EAPS 22700 - Introduction To Atmospheric Observation And Measurements

Credit Hours: 3.00. Survey of principal techniques, tool, and instruments used in atmospheric science research. Students work on research projects designed in coordination with EAPS faculty. Topics are complimentary to those covered in EAPS 22500 and may include either observational analysis, numerical modeling, or both. Topics to be covered include hypothesis formulation, literature search, training on the necessary instruments and numerical modeling tools, experiment design and execution, statistical analysis, student-designed experiment revision, scientific writing, and presentation of findings to the class and interested EAPS faculty.

Learning Outcomes: 1. Formulate testable scientific hypotheses. 2. Survey published scientific literature. 3. Identify commonly used atmospheric measuring systems and their principles of operation. 4. Operate basic meteorological instruments and analyze their data. 5. Design and execute an experiment to test a hypothesis. 6. Present their findings both orally and in writing. Credits: 3.00

EAPS 23000 - Laboratory In Atmospheric Science

Credit Hours: 2.00. A laboratory course that introduces the fundamentals of atmospheric science through quantitative exercises. The theoretical exercises include the vertical structure of the atmosphere, the Earth's energy budget, atmospheric moisture, saturation and stability, clouds and precipitation and atmospheric motion. Data and map analysis exercises include mid-latitude cyclones, thunderstorms and tornadoes, hurricanes and controls of climate. Prior or current course work in introductory atmospheric science is required. This course may not be taken for credit by students in the atmospheric science option of the Department of Earth and Atmospheric Sciences.

Credits: 2.00

EAPS 23001 - Laboratory In Atmospheric Science: Introduction To Weather And Climate Datasets

Credit Hours: 2.00. This course is a Python-based introduction to the array of weather and climate datasets freely available on the internet in an online computational laboratory setting. The course will emphasize the importance of having data be freely available and "FAIR" (Findable, Accessible, Interoperable, Reusable) from the point of view of the philosophy of science, from a data science perspective, and from a practical "how to do it" perspective.

Learning Outcomes: 1. Write Python code to read in, plot, and perform simple analyses using a wide range of weather and climate datasets (observations, numerical weather forecasts, reanalysis, climate models) in different formats that are publicly available on the internet. 2. Visualize weather and climate data in maps and graphs. 3. Communicate weather and climate information clearly and concisely to non-experts using weather and climate data visualizations. Credits: 2.00

EAPS 24300 - Mineralogy

Credit Hours: 4.00. Elements of crystallography, physical and chemical properties of rock-forming minerals, and minerals of economic importance. Origin and occurrence of minerals. Prior course work in dynamic earth or physical geology is required.

Learning Outcomes: 1. Know the major element geochemistry of common rock forming minerals that occur in earth, the terrestrial planets, and in

meteorites. 2. Understand that minerals form the geochemical reservoirs from which rock materials are derived. 3. Have competence in the rules of crystallography, be able to determine symmetry elements in 1-, 2-, and 3-demensions, and understand how to index different parts of crystals using common notations. 4. Identify rock forming minerals and selected accessory and ore minerals in hand sample. 5. Learn the theory and methods of optical mineralogy, spectroscopy, X-ray diffraction, and electron microbeam analysis. 6. Learn the thermodynamics phase equilibria in rock and mineral systems, and the basic petrology of igneous, metamorphic and sedimentary rocks. Credits: 4.00

EAPS 24400 - Earth Materials II

Credit Hours: 4.00. The study of common igneous, sedimentary, and metamorphic rocks. The origin and occurrence of rocks, weathering, and alteration processes. Prior course work in earth materials or mineralogy is required.

Credits: 4.00

EAPS 30100 - Oil!

Credit Hours: 3.00. Petroleum is a common thread that interweaves Geoscience with the Political-Economic history of the 20th century. Its dominance in current society has major repercussions on our current and future society and environment. The unequal distribution of petroleum and natural gas, coupled with innovative geologists and engineers, has set the stage for the modern geo-political world. This course is a unique survey into the multitude of aspects of petroleum -- from its formation to "resource wars".

Learning Outcomes: 1. Enlighten and enable self-discovery of this major past, present and future issue in human civilization. 2. Understand the selected major oil-gas basins. 3. Learn Technical writing. 4. Examine case examples of past unethical corporate or private behaviors and how these were eventually resolved or remain a concern (e.g., monopoly building and later bread-up of Standard Oil; Ecuador pollution cases;; CIA involvement with Iranian government overthrow in 1950s to restore oil company monopoly; corruption in African and other ""oil-cursed"" nations; atmospheric pollution of cities; major oil spills; etc.). 5. Learn exactly how a hydrogen-fuel car would function, including engineering costs; or exactly how ozone is produced in car-dominated cities in the summer. This multidisciplinary course also includes aspect of social change, role of oil-gas in national politics, climate effects, and the petrochemical industry products. 6. Understand petroleum basins and the importance of hydrocarbons in history/society/climate is essential. This OIL! Course is unique in placing the geological aspects into the broader context of social, international and environmental concerns. Credits: 3.00

EAPS 30900 - Computer-Aided Analysis For Geosciences

Credit Hours: 3.00. Application of computer analysis techniques including error analysis, line and surface fitting, spatial and temporal correlations, contouring, interpolation, and map projections. These methods are discussed in terms of specific geologic applications. All exercises and examples are developed using commercial mathematical software package. A three-hour-per-week computer laboratory tutorial provides hands-on experience with the techniques discussed in class. Prior course work in computer programming is required.

Learning Outcomes: 1. Carry out computational solutions to a given range of data analysis problems. 2. Select the appropriate analysis and visualization approaches when given a set of data. 3. Appraise and conclude the analysis results professionally. Credits: 3.00

EAPS 31000 - Introductory Statistics For Geosciences

Credit Hours: 3.00. Introductory course in statistics and quantitative reasoning for students in geosciences. Topics covered include probability distributions of discrete and continuous random variables, simulation, confidence intervals and hypothesis tests for one and two samples, inference for regression and correlation.

Learning Outcomes: 1. Understand basic concepts of probability and statistics, and gain a solid basis for practical application of statistical methods in geosciences. 2. Obtain hands-on experience in resampling methods to handle data without having to rely on strong

assumptions common in classical statistics but rarely met in geosciences. 3. Use statistical software to analyze data and interpret results. Credits: 3.00

EAPS 31201 - Earth Systems Science For Elementary Teachers (UCC: SCI)

Credit Hours: 3.00. An Earth Systems Science perspective draws upon the wealth of Earth systems science research in both content and pedagogy. This approach has served as a guiding framework for how students learn, engage in, and develop deep understandings of the interconnections among Earth's many different systems of geosphere, hydrosphere, atmosphere, and biosphere and the important role that human civilization plays in affecting Earth's other systems. This course takes an Earth Systems Science approach - an emerging transdisciplinary endeavor - to build students' understanding of the structure and functioning of the Earth as a complex, adaptive system.

University Core Curriculum (UCC): (UCC: SCI) Learning Outcomes: 1. View the Earth as a component of an interconnected system. 2. Investigate the accretion of the solar system and Earth and their respective histories. 3. Scale and model the solar system. 4. Model tectonic plates and different plate boundaries. 5. Analyze atmospheric conditions and make short-term weather predictions. 6. Recognize and evaluate Earth's resources. 7. Create a plan to address multiple interrelated challenges. 8. Evaluate the natural environment for anthropomorphic affects. 9. Develop critical thinking and problem-solving skills. 10. Apply guided-inquiry methods to learning. Credits: 3.00

EAPS 31500 - Biogeochemistry

Credit Hours: 3.00. The course examines the main element cycles of Earth: carbon, oxygen/hydrogen, nitrogen, sulfur, phosphorous, and trace metals, and how they are interconnected from terrestrial, aquatic/ocean, and atmospheric perspectives. General chemistry concepts such as equilibrium, free energy, electrochemistry are used to understand the energetics of the cycles. Connection between the cycles and environmental problems, such as climate change and air pollution will be emphasized.

Learning Outcomes: 1. Construct a mental model of the Earth system and the flow of elements among different parts of the system. 2. Examine modern problems caused by human perturbation of the main biogeochemical cycles. 3. Perform basic research tasks and present scientific findings. Credits: 3.00

EAPS 31900 - Exploring Earth Through Time

Credit Hours: 3.00. The course will explore the history of the Earth from its beginning 4.5 billion years ago to the present. Our understanding and insight into the history of the Earth has greatly expanded during the last several decades. Emphasis will be placed on the relationships of tectonic processes that shaped the surface of the Earth and the evolution of the Earth's biosphere. The course will also examine how the role of evolution of life has played in the history of the atmosphere and oceans.

Credits: 3.00

EAPS 32500 - Aviation Meteorology

Credit Hours: 3.00. This course is designed for students who have an interest in topics in meteorology applied to aviation operations with emphasis on meteorological hazards for instrument flight. Topics covered include obtaining and evaluating weather data, review of synoptic meteorology, map analysis, the ICAO standard atmosphere, pressure and altimetry, atmospheric thermodynamics, moisture and stability, low-IFR operations, aircraft icing, turbulence, thunderstorms and associated hazards, and interpretation and use of radar and satellite imagery. Prior course work in introductory atmospheric science and pre-calculus is required.

Credits: 3.00

EAPS 32700 - Climate, Science And Society

Credit Hours: 3.00. This course will examine the broad problems of climate change by examining the relationship between science, politics, and society by using climate change as a lens through which to examine larger issues. Students will be encouraged to identify similar themes in their own experiences as emerging scientists, engineers and global leaders. Adequate preparation to write essays and perform basic arithmetic calculations needed. Prior knowledge of climate change science is not necessary.

Learning Outcomes: 1. Able to think logically and creatively. 2. Able to apply knowledge to practical situations. 3. Able to respond flexibly as situation changes. 4. Understand ethical issues, particularly in Science. 5. Appreciate diverse experiences, thoughts, backgrounds. 6. Understand and appreciate Science in the world environment. Credits: 3.00

EAPS 34400 - Igneous And Metamorphic Petrology

Credit Hours: 4.00. This course provides an overview of igneous

and metamorphic petrology including, but not limited to, the following topics: experimental petrology and phase diagrams, melting of the Earth's interior, understanding the relationship between mineralogy, chemical composition, and physical conditions, relating magmatism and metamorphism to different tectonic environments, and exploring the similarities, and differences, between magmatism on Earth and other planetary bodies. The lectures and labs emphasize developing a basic understanding of petrology and petrologic processes, rather than the simple memorization of terms, definition, and facts.

Learning Outcomes: 1. Understand how petrologists determine the origin of common igneous and metamorphic rocks and the data that supports current interpretations. 2. Describe the types of igneous and metamorphic rocks that would be found in different tectonic settings. 3. Interpret and understand phase diagrams and how they are constructed. 4. Link mineralogy to chemical compositions and understand how compositions can change during melting, fractional crystallization, or open-system metamorphism. 5. Understand how metamorphic rocks can be utilized to quantitatively constrain the physical conditions that a rock experienced. 6. Gain confidence in understanding and using scientific methods and information to interpret igneous and metamorphic rocks. Credits: 4.00

EAPS 35200 - Structural Geology

Credit Hours: 3.00. This course deals with the nature and evolution of structures in rock deformed naturally by flow and fracture, as deduced from experimental, theoretical and field studies. Specific topics include: structures in three dimensions using descriptive geometry and stereonets, field measurements of rock geometry, tensors, strain and stress, the theory of brittle and plastic rock behavior, theory and field observation of folds and faults, structural analysis of an outcrop, the structure and mechanics of mountain belts. Students will be expected to show competency with using a general set skills, techniques, and tools commonly used by professional geoscientists.

Learning Outcomes: 1. Interpret geologic structures in three dimensions using descriptive geometry, stereonets, and field measurements of rock geometry. 2. Evaluate quantitatively observations of the deformation in the crust using basic stress and strain theory, the theory of brittle and plastic rock behavior, theory and field observation of folds and faults, structural analysis of an outcrop. 3. Recognize the structures and give a mechanical explanation for the development of mountain belts. 4. Apply these skills in the field. Credits: 3.00

EAPS 35300 - Earth And Planetary Surface Processes

Credit Hours: 3.00. Introduction to a variety of topics in sediment transport and deposition, emphasizing linkages between active processes, landscape evolution, and the rock record. Comparisons will be made between surface processes occurring on Earth and other planetary bodies in the Solar System. Topics include: introductory fluid mechanics; sediment transport by water, ice, and wind, and the development of fluvial bed forms, glacial landscapes, and sand dunes; groundwater geochemistry and the development of karst and caves; impact cratering; comparative planetology. Each major topic is accompanied by field projects that emphasize local geologic history.

Learning Outcomes: 1. Apply fluid dynamics to sediment transport and rock dissolution using physics, chemistry, and calculus. 2. Use dimensionless variables (e.g., Reynolds number, Froude number, Shields number, Drag coefficient) to solve problems in diverse fluid flows (e.g., water, ice, wind, soil, and debris flows). 3. Identify and quantify processes responsible for shaping Indiana's landscape, including mega flooding, glaciation, wind, and karst. 4. Interpret landscape form in terms of geologic processes occurring in the Solar System. 5. Identify sedimentary structures and relate them to active surface processes. 6. Observe and measure active processes in the field. 7. Organize and write a formal scientific paper. Credits: 3.00

EAPS 35400 - Earth And Planetary Geophysics

Credit Hours: 3.00. This course will explore geophysical processes from the scales of individual stresses that deform rocks, to plate motions, to planetary-scale interiors and phenomena. Emphasis will be focused on sources of stress and how this stress is manifested, heat transfer, and fluid processes. Seismic waves, gravity data, planetary shape, and what information they provide about the interior of solid planets will be discussed. The course material will be applied to Earth, other rocky worlds like the Moon and Mars, and icy moons like Europa and Enceladus. This course is an introduction to

geophysical processes and serves as a stepping-stone to upper level geophysics courses such as EAPS 35200, EAPS 45000, and EAPS 55700.

Learning Outcomes: 1. Describe the interior structures of Earth and other planets and large moons, and how we know them. 2. Describe how heat and fluids are transferred within the Earth and other planets and large moons. 3. Describe how interior processes in the Earth are ma09nifested in plate tectonics, and how they result in other tectonic regimes on other planets and large moons. 4. Apply quantitative skills to geophysical problems. 5. Critically evaluate a scientific study and orally communicate your evaluation. Credits: 3.00

EAPS 36000 - Great Issues In Climate Change And Society

Credit Hours: 3.00. This course develops basic skills and knowledge critical to analyze issues of energy use, climate change, and sustainability that incorporate both societal and scientific perspectives. The goal of this course is not to arrive at particular consensus solutions to the problems associated with these issues but instead to foster an informed (through information literacy) debate that will ultimately be waged as solutions are sought. Working in teams the students work throughout the semester to complete a capstone teamwork project and a group presentation. Counts for Great Issues course in College of Science.

Learning Outcomes: 1. Understand/interpret the complex issues related to energy (production and use) policy and climate change. 2. Recognize the basic ethical, technological, political, and economic issues influencing the production of renewable and fossil energy. 3. Identify, distinguish, and use credible/factual information sources to establish a defensible viewpoint on these issues. Credits: 3.00

EAPS 36400 - Natural Hazards: Science And Society

Credit Hours: 3.00. This course will investigate the role of data and science in policy and decision-making as it relates to natural hazard resiliency. The scientific fundamentals of specific hazards will be introduced along with an explanation of how available data, various policies, programs, and real-time decisions can impact a community's response and recovery from disasters. Guest speakers describe their role in specific disasters, and in framing the policies and decisions made in the aftermath of the natural hazards. This course counts as a Great Issues course in the College of Science for Juniors and Seniors.

Learning Outcomes: 1. Demonstrate the ability to write knowledgeably and persuasively about the issues examined. 2. Use statistics and data ethically in the discussion of great issues. 3. Work as an active and contributing member of a team. 4. Transmit accumulated knowledge in effective written and oral presentations. Credits: 3.00

EAPS 36700 - Survey Of Planetary Atmospheres

Credit Hours: 3.00. This course is intended to serve as an introduction to the diversity of planetary atmospheres in our solar system and beyond for those without an atmospheric science background. Topics to be covered in this class include: The basic structure and properties of an atmosphere, how planetary atmospheres form / are eroded, the balance of radiation and its effect on atmospheric motions, the presence and formation of hazes, clouds, and aerosols, fundamental atmospheric compositions and chemistry, the connections between planetary interiors, surfaces, and atmospheres, and how we measure and interpret observations of exoplanet atmospheres. To achieve this, we will learn about Earth's atmosphere and us our terrestrial template to compare, contrast, and explore the atmospheres of other astronomical bodies.

Learning Outcomes: 1. Gain familiarity with the different types of planetary bodies and the atmospheres that are present on them. 2. Recall the main properties of planetary atmospheres in our solar system. 3. Identify and apply the general properties of the atmospheres. 4. Understand the effect of radiation and distribution of energy in an atmosphere. 5. Recognize the importance of chemical reactions and pathways. 6. Identify the ways in which atmospheres are formed, lost, and evolved. 7. Make simple predictions about the atmospheres of exoplanets based on an assessment of our understanding of the solar system. Credits: 3.00

EAPS 37500 - Great Issues - Fossil Fuels, Energy And Society

Credit Hours: 3.00. Prosperity of the 20th century was based on abundant and cheap energy; during the 21st century we will be faced with difficult challenges. Our society will face higher energy prices, decline of petroleum based fuels supplies,

increased environmental effects of fossil fuels usage, and the challenge of solving the technological problems of developing alternative fuels. This course will review the structure, economics, and geopolitical issues faced by fossil fuel industries and the mitigation strategies that will be needed to change to low fossil fuel use society based on low polluting renewable energy sources. Counts for Great Issues course in College of Science for Juniors and Seniors.

Credits: 3.00

EAPS 38500 - Principles Of Engineering Geology

Credit Hours: 3.00. Application of geology to evaluation of design and construction problems relating to dams, highways, tunnels, and reservoirs; review of construction material sources and their utilization. A field investigation is required. Prior course work in mineralogy, petrology or geology for engineers is required.

Credits: 3.00

EAPS 39000 - Geologic Field Methods

Credit Hours: 3.00. Introduction to geologic mapping principles on quadrangle (7 1/2 min., 15 min., 1:250,000 scales) maps. Application of aerial photography, GPS, and GIS techniques. Emphasis on construction of cross sections, measurement of stratigraphic sections, and preparation of geologic reports. Several weekend field exercises will be required.

Credits: 3.00

EAPS 39100 - Topics In Earth And Atmospheric Sciences

Credit Hours: 1.00 to 4.00. Intermediate special topics in the earth and atmospheric sciences. Permission of instructor required.

Credits: 1.00 to 4.00

EAPS 39500 - Astrobiology

Credit Hours: 3.00. Course explores current ideas on how life originated on Earth and may have originated elsewhere in the universe. Lectures will cover zones of habitability in stellar systems, planetary surface and atmosphere evolution and the environment of the early Earth. Topics include how life on Earth functions and its earliest evolution, SETI, planetary quarantine, panspermia, mass extinctions and the potential for life elsewhere in our own solar system.

Learning Outcomes: 1. Know the outlines of how life developed on the Earth, the principal requirements for life to originate and persist, what features makes a planet (in our system or around other stars) habitable for life. 2. Understand how extrasolar planets are found and what limitations exist in our knowledge of those planets. 3. Understand how NASA is seeking for life on Mars and elsewhere in the solar system, why we are concerned about quarantining spacecraft and returned samples. 4. Acquainted with the rationale and methods of the SETI search for intelligent life in the universe. Credits: 3.00

EAPS 40000 - Planetary Sciences Senior Capstone

Credit Hours: 3.00. In this course, students will use the knowledge they have gained as part of their education at Purdue to develop a comprehensive science-driven planetary exploration strategy. First, students will review the history of planetary exploration. Next, students will understand the current landscape for planetary exploration including missions and instruments which will soon fly. Throughout the course, student-led research and presentation exercises will build to the development of a mission concept for planetary exploration.

Learning Outcomes: 1. Understand of the history of planetary exploration and the major science questions that influenced the designs of historical, ongoing, and proposed spacecraft missions. 2. Make effective and engaging scientific presentations and posters using the Assertion-Evidence model. 3. Understand how the grant proposal writing and evaluation process works within the NASA ROSES grant proposal system, including knowing how to: 4. Write proposals for competitive grant programs, such as NASA ROSES. 5. Evaluate grant proposals to determine their scientific merit. 6. Participate in a proposal peer review panel discussion. 7. Learn to write proposal evaluation peer review reports in a style consistent with NASA ROSES proposal peer review panel guidelines. 8. Become an effective team member in a science-driven spacecraft mission proposal design study. Credits: 3.00

EAPS 40700 - Earth And Planetary System Science

Credit Hours: 3.00. This class will explore the major components of the Earth System-the atmosphere, the hydrosphere (ocean + cryosphere), the biosphere, and the solid Earth-and their interactions, both today and through time. Topics include (1) the evolution of earth's climate system, from global glaciation to ice-free states in the past to future anthropogenic climate change scenarios; (2) how the circulation of the atmosphere, ocean, and solid earth shape the distribution

of chemicals and life through time; (3) how life has transformed Earth's surface environments; and (4) the interplay between atmospheres, oceans, geology, and life on other worlds.

Learning Outcomes: 1. Describe the components of the Earth System and their interactions. 2. Discuss how the Earth system has evolved from its formation to present-day. 3. Understand the role of humans in the Earth System and scenarios for future Earth System evolution. 4. Consider how other planetary systems may resemble or differ from the Earth System. Credits: 3.00

EAPS 41900 - Internship In Environmental Geosciences

Credit Hours: 1.00 to 6.00. This course provides students with an opportunity to gain practical work experience in environmental geoscience. The student works with a faculty advisor to set up an internship consisting of the equivalent of at least six weeks of full-time employment with a government agency, business, or consulting company. Internships typically involve field, laboratory, and office work. A portion of the internship may be part-time work during a regular semester, but at least three consecutive weeks must be full-time work. One credit hour per week of unpaid internship. Six week internship. Prior course work in upper level EAPS courses is required. Permission of department required.

Credits: 1.00 to 6.00

EAPS 42000 - Global Change Modeling

Credit Hours: 3.00. Understanding, monitoring, and modeling global environmental change. Each session examines the response of the interrelated earth systems to different geological, ecological, atmospheric, oceanic, or societal impacts. Topics include global warming, major biogeochemical cycles, atmospheric ozone, coevolution of life and climate, asteroid impacts, and ecological disruptions. The laboratory uses object-oriented modeling software and current NASA satellite data. No prior knowledge of computer programming is required.

Credits: 3.00

EAPS 42100 - Atmospheric Thermodynamics

Credit Hours: 3.00. (AGRY 43100) Structure and composition of the atmosphere. Thermodynamics of dry and moist air, including adiabatic and pseudo-adiabatic processes, hydrostatic stability, and air mass determination. Prior course work in introductory atmospheric science, second semester physics or thermodynamics is required.

Credits: 3.00

EAPS 42200 - Atmospheric Dynamics I

Credit Hours: 3.00. (AGRY 43200) A study of the general system of equations governing mass and momentum changes in the atmosphere; special horizontal wind representations, thermal wind relationships; circulation, vorticity, divergence, and vertical motion. Prior course work in atmospheric thermodynamics and differential equations is required.

Credits: 3.00

EAPS 42300 - Atmospheric Dynamics II

Credit Hours: 3.00. (AGRY 43300) An extension of EAPS 42200, with emphasis on perturbation theory and hydrodynamics stability, air mass and frontal theory, barotropic and baroclinic models, wave cyclone theory, and numerical weather prediction.

Credits: 3.00

EAPS 42501 - Physics Of Climate

Credit Hours: 3.00. To understand climate we describe and synthesize physical processes in the atmosphere and their coupling to the ocean, ice, and land. We quantitatively explore climatology with an equal balance of physical principles and scrutiny of available modern data. Topics include: visualization of atmospheric/land surface/oceanographic climatological data sets; theories of climate dynamics; and climate change. Beginning with radiative balance and simple energy balance models, the course progresses toward understanding the effects of radiative-convective forcing and rotation on the fluid envelopes. Analysis of data in an interactive computer-enabled environment is an important part of the course. By the end of this course, the student should know how the Earth System behaves at large scales and grasp the physical understandings of why.

Learning Outcomes: 1. Quantitatively describe climatology, climate variability, and climate change through physical principles and modern climate data. 2. Use radiative equilibrium, radiative-convective equilibrium, and energy balance models to make predictions of climate change and compare with observations. 3. Describe and synthesize atmosphere and ocean dynamics, large-scale circulation patterns, and interactions with ice and land surfaces. 4. Analyze major contemporary atmospheric science problems and phenomena, such as global warming, ozone hole, El Nino, etc., and the information provided by past climates on Earth. Credits: 3.00

EAPS 43100 - Synoptic Laboratory I

Credit Hours: 1.00. (AGRY 44100) Analysis of vertical distributions of temperature and moisture with applications to adiabatic and pseudo-adiabatic processes, hydrostatic stability, and air mass determination. Prior course work in atmospheric thermodynamics is required.

Credits: 1.00

EAPS 43200 - Synoptic Laboratory II

Credit Hours: 1.00. Analysis of horizontal distributions of pressure, temperature, wind, vorticity, and vertical motions. Applications to synoptic-scale wave propagation. Prior course work in atmospheric thermodynamics and synoptic lab I is required.

Credits: 1.00

EAPS 43300 - Synoptic Lab III

Credit Hours: 1.00. (AGRY 44300) Diagnoses of midtropospheric wave propagation and growth. Analysis of surface pressure fields and fronts and their relationships to upper air features. Extensive use is made of teletype and facsimile weather information. Prior course work in atmospheric dynamics and synoptic lab II is required.

Credits: 1.00

EAPS 43400 - Weather Analysis And Forecasting

Credit Hours: 3.00. (AGRY 44400) In-depth study of contemporary weather analysis and forecasting techniques and problems. Extensive use is made of teletype and facsimile data and numerical weather prediction guidance provided by the National Meteorological Center.

Credits: 3.00

EAPS 43500 - Severe Storms Field Work

Credit Hours: 3.00. This four-week summer course will focus on prediction, instrumented field observations, and case study analysis of severe storms. Students will receive instruction in severe storm forecasting, real-time radar interpretation, safe observation of severe storms, teamwork, and careers in research meteorology. During a field trip, students will deploy meteorological instrumentation in support of the instructors' research efforts. Students are required to deliver weather briefings and evaluate their forecasts. Permission of instructor required.

Learning Outcomes: 1. Lead the group (in pairs) in a complete day of atmospheric science field program activities. 2. Evaluate the quality of your severe weather forecast. 3. Expand your knowledge of paths and skills necessary for a successful career in meteorology. Credits: 3.00

EAPS 44500 - Spacecraft Design

Credit Hours: 3.00. Senior students perform a team-based spacecraft design, requiring application of the education and skills developed in the planetary sciences curriculum. Components include analysis methods for preliminary design, development of an initial spacecraft and mission concept, and development of a complete numerical model of the mission, culminating in oral and written reports by the teams.

Learning Outcomes: 1. Understand and implement the design process for aerospace systems. 2. Solve problems as part of a team. 3. Conduct open-ended, iterative tasks associated with science operation, science objectives, and mission design and system integration. 4. Properly integrate a variety of systems and sub-systems within a spacecraft, rocket and mission to demonstrate design feasibility. 5. Learn how to generate a Science Traceability Matrix. 6. Prioritize design requirements and organize work schedules. 7. Use formal, structured design methods to develop superior products that meet or surpass customer expectations. 8. Give oral presentations and write technical reports required of design engineers. Credits: 3.00

EAPS 44600 - Geochemistry

Credit Hours: 3.00. This course provides an overview of the processes controlling the distribution of elements within the solid Earth as well as the hydrosphere and atmosphere.

Learning Outcomes: 1. Describe the distribution of elements in our Solar System and throughout the Earth. 2. Explain the distribution of elements as a function of their physical properties and chemical affinities. 3. Use principles of thermodynamics to explain why particular reactions or phase assemblages are expected at different equilibrium conditions. 4. Develop simple models to explain the exchange of elements between different Earth reservoirs and the chemical evolution of these reservoirs through time. 5. Describe applications of geochemistry to big picture research questions in Earth, atmospheric, and planetary science. Credits: 3.00

EAPS 45000 - Physics And Chemistry Of Solid Earth

Credit Hours: 4.00. Physics of the earth's interior, including seismic velocity and density structure, seismic wave propagation, and gravitational and magnetic fields. Thermal history of the earth. Chemical and mineralogical composition of the earth, radioactivity, isotopes, and geochronology. Magma generation, crustal evolution, and tectonic models. Prior course work in chemistry, physics, calculus, earth materials, and plate

tectonics is required.

Credits: 4.00

EAPS 47400 - Sedimentary Geology

Credit Hours: 4.00. Systematic study of continental and marine depositional environments. Interpretation of sedimentary facies, structures, and microfacies. Principles and applications of stratigraphy, including applications of paleontology, field relations, paleomagnetism, well logs, seismic reflections, and chemistry. Field investigations may be required. Prior course work in earth materials, mineralogy and petrology is required.

Learning Outcomes: 1. Understand core areas of sedimentary geology, and interpret a wide range of earth processes on different temporal and spatial scales. 2. Develop proficiency interpreting depositional processes and environments of ancient sedimentary strata through bedrock exposures, well logs, and drill cores. 3. Demonstrate skills of interpretive analysis and critical thinking with respect to geological problems involving temporal and spatial relationships. 4. Develop writing abilities through scientific reports that will be written individually, revised based on instructor and peer feedback, and subsequently integrated into a comprehensive basin analysis report. 5. Demonstrate competence in collecting scientific data, including field observations and field and analytical measurements. Specifically, demonstrate competency in collecting the following field datasets from outcrops: paleocurrent indicators, lithofacies associations, stratigraphic sections, and facies architectures. 6. Conduct effective independent and collaborative investigations. Specifically, develop your ability to work both independently and collaboratively during acquisition, analysis, and dissemination of scientific datasets as part of basin analysis project. Credits: 4.00

EAPS 47500 - Geology And Geophysics Field Camp - Wasatch-Uinta Field Camp

Credit Hours: 6.00. The Wasatch-Uinta Field Camp is a six-week capstone course designed to prepare students for successful careers in the geosciences. This course emphasizes scientific methodology and traditional techniques that provide a strong foundation for the broad range of modern technologies used by today's industry, academic, government and private workforces. Students learn to develop research strategies, collect field observations and measurements, compile detailed rock descriptions, measure stratigraphic sections, and construct geologic maps and cross sections. Field exercises are located in geologically ideal locations in the Wasatch and Uinta mountains of Utah, the San Rafael Swell of southeastern Utah, Grand Teton National Park in Wyoming, and the Carlin-type gold deposits of Nevada. The Wasatch-Uinta Field Camp was established in 1967 by the University of Minnesota. The camp is operated by a consortium that currently includes Purdue University, the University of Minnesota-Duluth, University of Wisconsin-Madison, the University of Nebraska, and the University of Illinois.

Learning Outcomes: 1. Learn how to make systematic geological observations and also collect relevant data using a Brunton compass. This includes the ability to identify rock types and minerals and primary and secondary geological structures and require skills and information learned in mineralogy, petrology (igneous, metamorphic, and sedimentary), structural geology, and stratigraphy. 2. Collect field observations and measurements, compile detailed rock descriptions, measure stratigraphic sections, which will be used to construct geologic maps and cross sections. 3. Navigate in the field using topographic maps, and compasses. Proficiency in field navigation is crucial for locating and completing field studies. 4. Develop skills in interpreting geological history, including the sequence of events and the geological evolution of an area based on field observations. 5. Deal with incomplete or ambiguous data and will be required to formulate hypotheses, make educated inferences, and solve geological problems based on limited information. 6. Enhance their ability to work effectively in a team, collaborating with peers on field projects, and communicating geological findings through clear and concise field notes, maps, and reports. 7. Learn to conduct geological fieldwork safely is paramount. Students should be able to

identify potential hazards in the field, adhere to ethical and legal guidelines for collecting samples, and understand the importance of preserving natural landscapes. Learn best practices for safely conducting a field study. Credits: 6.00

EAPS 47700 - Earth And Planetary GIS

Credit Hours: 3.00. In this course, students will learn to display and analyze Earth and planetary data using geographic information systems (GIS). Students will learn how to find and work with data from various sources, including satellites and spacecraft missions. Using a variety of spatial data, students will make maps and visualizations of data, perform analyses using a range of toolboxes, and implement workflows in geoprocessing.

Learning Outcomes: 1. Communicate applications of GIS in the real world. 2. Locate geospatially relevant datasets in online repositories. 3. Organize and manage files (and their appropriate formats) used within GIS software. 4. Identify limitations and gaps in remote sensing datasets. 5. Design and implement a workflow to analyze remote sensing data. 6. Create maps and figures that visualize products within a geospatial analysis workflow. 7. Describe a goal (i.e., hypothesis being tested) that geospatial analysis can address, as well as the data inputs, steps in the workflow, and outcome (i.e., results) of the analysis in the form of a webpost that can be shared with employers and other GIS users. Credits: 3.00

EAPS 49000 - Field Geology In Rocky Mountains

Credit Hours: 6.00. Field studies in sedimentary, igneous, and metamorphic terrains. Studies may involve geologic mapping, stratigraphic section measuring, structural analysis and interpretation, geomorphic interpretation, and interpretation of geologic history. Field excursions include visits to several classical geologic localities in the Colorado Plateau, Great Basin, and Rocky Mountains with discussions and interpretations of features observed. Transportation fee plus room and board at field station required. Rigorous field work requires physical conditioning. Six-week session, including field excursion. Prior course work in earth materials, surface processes, and plate tectonics is required. Permission of instructor required.

Learning Outcomes: 1. Maintain a professional notebook where observations are recorded as primary data such as rock descriptions and sketches. 2. Write well-structured, professional unit descriptions from provided rock description data sheets, or from virtual images, virtual microscope. 3. Plan an efficient field check for a mapping area, address areas of uncertainty and plan pathways through field. 4. Record and organize observations into interpretations through geologic sketches from outcrop-to field-area-scale. 5. Use unit descriptions to interpret geologic history. 6. Extrapolate from discrete observations to fully mapped terrains, using geologic principles to guide decision making. 7. Interpret and project geologic data mapped on the surface into the subsurface through cross-sectional development. 8. Synthesize notes and sketches, mapped geologic data and cross-cutting relationships to determine relative chronology and geologic history. 9. Synthesize observations and interpretations in notes, maps, and cross-sections into a written geologic report. 10. Work more effectively in a team. Credits: 6.00

EAPS 49700 - Earth And Atmospheric Sciences Undergraduate Readings And Research

Credit Hours: 1.00 to 6.00. Supervised reading and/or research in various fields. Permission of instructor required.

Credits: 1.00 to 6.00

EAPS 50300 - Mars Seminar

Credit Hours: 3.00. This seminar course will introduce students to the origin and evolution of Mars through reading classic papers on the geology, atmosphere, and Interior of Mars, as well as in-class lectures, discussions, and a final paper.

Learning Outcomes: 1. Understand Mars as a planet. 2. Understand the limits of human knowledge about the Red Planet, its potential for life, and its potential for sustaining humans in the future. 3. Gain a basic understanding of the process of Mars exploration including landing site selection. 4. Gain proficiency in reading scientific papers and in presenting scientific ideas in oral and written format.

Credits: 3.00

EAPS 50400 - Geologic Dating Methods

Credit Hours: 3.00. This course covers general theory and applications of geochronology and thermochronology to questions in Earth and planetary science.

Learning Outcomes: 1. Explain the basic physical processes underlying the most commonly used dating methods. 2. Calculate geochronological dates from raw geochemical datasets or other kinds of observations for the most commonly used dating methods. 3. Use physical and numerical models to interpret the significance of geochronological dates. 4. Evaluate which geochronological method, if any, is most appropriate for answering a particular scientific question in Earth and planetary science. 5. Discuss the contribution of geo/thermochronology to big questions in Earth and planetary science. Credits: 3.00

EAPS 50600 - Cosmochemistry And Geochemistry

Credit Hours: 3.00. The course focuses on the chemical processes involved in the formation and evolution of our solar system and our planet. The course includes discussion of nucleosynthesis and chemical abundances, the origin and composition of various planetary objects and their constituent materials, and the distribution and cycling of elements within and between different Earth systems, including the solid Earth, atmosphere, and oceans.

Learning Outcomes: 1. Understand the cosmochemical model for solar system formation. 2. Become familiar with the inventory of planetary materials in our solar system and understand their characteristics. 3. Understand what causes the first order distribution of elements in different parts of the Earth and other planetary bodies. 4. Apply principles of thermodynamics and reaction kinetics to predict the physical and chemical characteristics of Earth and planetary materials. 5. Understand how chemical exchange between the solid earth, biosphere, and ocean-atmosphere affect the evolution of the Earth system. 6. Analyze laboratory data to gain insight geochemical and cosmochemical processes. 7. Identify outstanding questions in the primary cosmochemistry and geochemistry literature and propose what new observations, data, and/or models could be used to address these questions. Credits: 3.00

EAPS 50700 - Introduction To Analysis And Computing With Geoscience Data

Credit Hours: 3.00. Course teaches computing techniques including error analysis, line and surface fitting, interpolation, map projections, geospatial and temporal correlations, signal processing, and visualization with discussions on specific and practical geoscience applications. Lectures with computer exercises and team project reporting using open-source computer software. Cannot get credit for both EAPS 50900 and EAPS 50700.

Learning Outcomes: 1. Carry out computational solutions to a given range of geoscience data analysis problems. 2. Select the appropriate analysis approaches when given a set of data. 3. Appraise and conclude the analysis results professionally. Credits: 3.00

EAPS 50701 - Geospatial Data Analytics

Credit Hours: 3.00. The course will introduce fundamental theories, analytical methods and programming skills that are needed to work with geospatial data. Students will learn the theories, methods, and techniques to visualize, analyze and model various geospatial data through hands-on computer programming practice based on various open-source geospatial libraries. To be specific, the course will use R and its related packages as the basic tool for implementation. The goal is to enable the learners to develop their own geospatial analytical applications.

Learning Outcomes: 1. Interpret and evaluate the theories and methods of geospatial data analytics. 2. Design and implement typical geospatial methods through programming. 3. Visualize and interpret the outcome of geospatial data analytics effectively. Credits: 3.00

EAPS 50801 - Geographic Information Systems

Credit Hours: 3.00. This course covers a range of fundamentals in geographic information science and technology. Students will learn the use of current popular geographic information system (GIS) tools to handle various geographic data. Through working on real-world geospatial problems, students shall gain extensive and hands-on experience in geographic data manipulation, visualization, and analysis. Course assignments are focused on

both GIS theoretical basics and practical skills for students to achieve expected proficiency. The course will work with geospatial data in geography, topography, environmental science, hydrology, transportation, and geosocial science. It is targeted to students with interest in civil and environmental engineering, agriculture, geography, earth science, natural resources, smart cities or other related subjects.

Learning Outcomes: 1. Demonstrate a comprehensive and in-depth understanding of GIS fundamentals. 2. Effectively collect and handle various geographic data. 3. Exhibit a proficient command of popular GIS software tools. 4. Conduct GIS mapping, database design, analysis and visualization tasks independently. Credits: 3.00

EAPS 50900 - Data Analysis Techniques In Earth And Atmospheric Sciences

Credit Hours: 3.00. Application of statistical techniques to analyze and interpret data containing substantial information about the dynamics of our planet Earth. Emphasis on fundamentals with elements of atmospheric/climate time series analysis and weather and climate extremes (necessary for understanding current research) interwoven with computer-intensive bootstrap methods (which work for complex data sets typical in geosciences). Offered Spring.

Learning Outcomes: 1. Gain a solid basis for practical application of statistical methods to data analysis in geosciences. 2. Gain exposure to atmospheric and climate time series analysis including weather and climate extremes, necessary for understanding current topics in weather and climate research. 3. Experience computer-intensive methods to handle complex data sets without having to rely on strong assumptions common in classical statistics but rarely met in geosciences. Credits: 3.00

EAPS 51000 - Climate Time Series Analysis

Credit Hours: 3.00. This course in time series analysis combines traditionally taught basics with topics of central importance in current weather and climate research, including long memory, extremes, nonlinear time series, chaos and complexity.

Learning Outcomes: 1. Understand concepts and methods of classical time series analysis. 2. Get hands on experience in resampling methods for time series analysis, which work for complex data sets without having to rely on strong assumptions common in classical time series analysis but rarely met in geosciences. 3. Learn how to match a time series methods to a particular geosciences data set or question. 4. Develop skills in writing programs in R to analyze geosciences data and interpret results. 5. Learn basics of advanced topics instrumental in geosciences: long memory, extremes, nonlinear time series, chaos and complexity. 6. Improve their critical thinking and oral communication skills via giving presentations on their research projects involving topics covered in the course. Credits: 3.00

EAPS 51201 - Planetary Origins

Credit Hours: 3.00. The goal of this course is to introduce students to our current understanding of how planetary systems form and evolve. We will focus on the physical theories describing how the structures of planetary systems develop and how planets, moons, and other heavenly bodies form. We will also consider the relationship between these theories and observations (astronomical, geophysical, cosmochemical) of the Solar System and extrasolar planetary systems. This will include some discussion how the Solar System fits into our understanding of the veritable menagerie of planetary systems.

Learning Outcomes: 1. Understand the physical processes that produce and sculpt planetary systems. 2. Develop ability to read and critically examine scientific papers. 3. Provide and receive constructive criticism to and from colleagues. 3. Learn how to formulate a research question and conduct a literature review or design and conduct some original research on that topic. 4. Learn how to present scientific ideas in oral and written format. Credits: 3.00

EAPS 51400 - Glacial And Quaternary Geology

Credit Hours: 3.00. Formation, dynamics, and regimen of glaciers. Erosional and depositional processes and landforms developed by alpine and continental glaciation. Glaciation of North America during the Ice Age, with emphasis on stratigraphy, soils, climates, biology, and physical changes resulting from glacial processes and environments. Application of glacial studies to agronomy, life sciences, climatology, oceanographic studies, and engineering problems. A one-day field investigation is required.

Credits: 3.00

EAPS 51500 - Geodata Science

Credit Hours: 3.00. Course covers a range of topics with applications of mathematical, statistical, numerical, and distributed parallel computing methods for modeling and understanding complex and large spatio-temporal geoscience datasets in the formats common to in-situ observations, asynoptic remote sensing data, volumetric gridded analysis, etc.

Learning Outcomes: 1. Identify and load into R the relevant data to solve a specific geoscience problem. 2. Design effective data import, tidying, and transformation procedures using geoscience knowledge. 3. Determine what and how to plot large geoscience datasets to guide each step in the workflow. 4. Judge whether model assumptions are reasonable and if the chosen models fit the data using geoscience domain knowledge. 5. Appraise and conclude the results of a geodata-science project professionally. Credits: 3.00

EAPS 51600 - Stable Isotope Applications In Earth Science And Ecology

Credit Hours: 3.00. This course examines stable isotopes as tools to study biogeochemical cycles, hydrological processes, carbon cycle, ecology, geology, and anthropology. Primary systems studied will include H, C, N, O, and S. The goal is to explore both theoretical and applied aspects of stable light isotope biogeochemistry so that students can: 1) understand and critically evaluate research articles containing stable isotopic data, and 2) see how isotopes might be used as primary tools or to enhance their own research. Every effort will be made to cover the isotopic systems of each student's research field. Theoretical principles, isotope fractionation, mixing models, and variation of isotopes in the natural world, and uncertainty quantification in applications will be presented and discussed. Course assignments will include homework sets, exams, a journal-club style discussion of relevant literature, and a final paper in the form of a review article or scientific proposal.

Learning Outcomes: 1. Apply a theoretical understanding of light stable isotopes to research applications in biogeochemistry, hydrology, ecology, geology, and/or anthropology. 2. Read and evaluate research articles containing stable isotopic data. 3. Demonstrate an understanding of how isotopic measurement techniques work, sampling preparation considerations, and data workup. 4. Analyze, plot, and interpret stable isotope data to answer a research question of the student's choosing. Credits: 3.00

EAPS 51700 - Lunar Exploration

Credit Hours: 3.00. In this course we will review the history of the scientific exploration of the Moon since the dawn of the space age. Our focus will be on the science problems that motivated researchers in their scientific investigations of the Moon and the results that they obtained. The course will then transition to modern theory and the fringes of our understanding related to Moon formation and evolution. Here the course will make extensive use of primary peer-reviewed literature, and facilitate open discussion intended to cultivate original thought or new testable hypotheses aimed at advancing outstanding issues in lunar science. Part of this course will also be devoted to understanding the technical language and terminology used in lunar science, as well as general strategies for reading and understanding scientific literature.

Learning Outcomes: 1. Appreciate the immense body of scientific knowledge enabled by the exploration of the Moon. 2. Identify scientifically important lunar geographical features through daily readings, in-class discussions, and quizzes. 3. Understand the constraints on our current models for the origin and evolution of the Moon. 4. Identify the knowledge gaps in our current models for the origin and evolution of the Moon and how future missions could be designed to close those gaps. 5. Apply learned skills and strategies for reading, comprehending, and assessing primary scientific literature. Credits: 3.00

EAPS 51800 - Soil Biogeochemistry

Credit Hours: 3.00. This course will provide an introduction to the physical and microbial processes governing the cycling of photosynthetically-produced organic matter on land and in streams and rivers. Organic geochemical transformations in the soil and litter will be highlighted along with methods of characterization of the organic constituents. Biogeochemical concepts of stabilization and destabilization of soil organic matter and stress response of terrestrial ecosystems will be reinforced through manipulation of actual data sets.

Learning Outcomes: 1. Understand the basic mineral and organic chemistry of soils. 2. Understand the range of soil types and capacities to store organic matter. 3. Understand the natural and man-made stressors of soil organic matter and the range of

impacts. 4. Understand the common analytical tools used to assess chemistry and health state of soils. 5. Understand how to structure and write and NSF-style proposal. 6. Understand the need for hypothesis generation in developing a research proposal. 7. Be able to work in teams to analyze large data sets and develop and hone hypotheses. 8. Understand the mechanisms of soil stabilization and destabilization. 9. Understand the comparative role of different groups of microbes in the decay of plant-derived litter. Credits: 3.00

EAPS 52000 - Theory Of Climate

Credit Hours: 3.00. A general introduction to the theory of climate at an intermediate level. A brief survey of physical climatology and paleoclimates. Theoretical development of climate models. Theories of climatic stability and climatic change.

Learning Outcomes: 1. Describe in a quantitative fashion the processes that determine past and present climates, as well the qualitative patterns associated with those changes. Apply this fundamental theoretical knowledge using the tools of modeling to understand and predict climate changes and changes in modes of climatic variability. 2. Identify, calculate, and explain the various thresholds, non-linearities, and 'tipping point' mechanisms in the climate system as a complex dynamical system both from the theoretical and observational points of view. 3. Define the appropriate type of model or quantitative framework for answering a climate, paleoclimate, or future climate question and know how to utilize this model through comparison with appropriate data or theoretical predictions. Credits: 3.00

EAPS 52100 - Atmospheric Chemistry

Credit Hours: 3.00. An introduction to the chemistry of the earth's atmosphere. Covers evolution of the earth's atmosphere, its physical and chemical structure, its natural chemical composition and oxidative properties, and human impacts, including increasing tropospheric ozone, decreasing stratospheric ozone, climate change, and acidic deposition.

Credits: 3.00

EAPS 52300 - Radar Meteorology

Credit Hours: 3.00. Origin and evolution of radar. Modern weather radar systems and their component parts. Propagation of microwave energy in the atmosphere. Rayleigh and Mie scattering theory, with application to scattering by precipitation. Utilization of radar systems in forecasting quantitative analyses and cloud physics research. Recent refinement and future potential. Prior coursework in synoptic meteorology labs and atmospheric physics is required.

Credits: 3.00

EAPS 52400 - Laboratory Analysis

Credit Hours: 3.00. This course focuses on becoming familiar with various laboratory techniques used in the analysis of earth and planetary materials and understanding what questions data products from these techniques can answer. This course will include discussion of the instruments and how they operate, as well as provide hands-on experience working in the lab and processing data.

Learning Outcomes: 1. Become familiar with common laboratory analytical techniques used in earth and planetary science. 2. Gain experience working with analytical instruments and the associated laboratory data. 3. Propose a research topic, conduct a literature review, and design an original research project requiring use of coordinated analytical techniques. Credits: 3.00

EAPS 52500 - Boundary Layer Meteorology

Credit Hours: 3.00. (AGRY 53500) A study of the physical nature of the lowest layers of the atmosphere. The energy balance concept and the turbulent transfer of heat, momentum, and water vapor are discussed in detail. Some specific microclimates are studied in this context.

Credits: 3.00

EAPS 52600 - Introductory Geofluid Dynamics

Credit Hours: 3.00. Provides a fluid dynamics background for graduate students interested in atmospheric sciences, oceanography, mantle convection, hydrology, turbulence, or pollution. Topics covered include: basic assumptions and deviations of Navier Stokes equations, conservation laws, vorticity, divergence, waves, and applications in atmosphere, ocean, and geophysics.

Learning Outcomes: 1. Provide students a rigorous foundation in geofluid dynamics as well as the connections among math, physics, and real natural phenomena. 2. Students will become accustomed to applying the physical

equations to real phenomena, and to presenting them in a concise way. 3. Understand the basic equations and physics in existing models which provides a broader and deeper understanding of the earth sciences. Credits: 3.00

EAPS 52700 - Principles Of Terrestrial Ecosystem Ecology

Credit Hours: 3.00. The objective of this course is to build a conceptual model of terrestrial ecosystems and to provide students with the state-of-the-art mechanisms by which terrestrial ecosystems work. Topics include ecosystem concept, Earth's climate system, geology and soils, terrestrial water and energy balance, terrestrial production processes, terrestrial decomposition, terrestrial plant nutrient use and cycling, biogeochemical pathways, and ecosystem temporal and spatial dynamics. Permission of instructor required.

Learning Outcomes: 1. Learn what key variables to be observed for ecosystem studies. 2. Understand the feedbacks between the atmosphere and terrestrial biosphere. Credits: 3.00

EAPS 52900 - Modeling Ecosystems And Biogeochemical Cycles

Credit Hours: 3.00. Process-based models are powerful tools for studying ecosystem dynamics and geochemical cycles in Earth System Sciences. In this course, we will explore how various components of ecosystems can be modeled following principles of biology, physics, and chemistry. We will also examine techniques for using modeling to study: 1) responses of the structure and functioning of ecosystems to changing climate, atmospheric composition, environmental conditions, and human activities; and 2) exchanges of major greenhouse gases (e.g., CO2, CH4, and N2O) between the atmosphere and the biosphere. During the course, we will go through the whole cycle of system modeling approach including model conceptualization, formulation, parameterization, sensitivity and uncertainty analysis, verification, and application.

Learning Outcomes: 1. Learn the whole cycle of system modeling approach including model conceptualization, formulation, parameterization, sensitivity and uncertainty analysis, verification, and application. 2. Learn how to model the key element cycles (e.g., C and N) between the atmosphere and terrestrial biosphere. Credits: 3.00

EAPS 53000 - Extreme Weather And Climate: Science And Risk

Credit Hours: 3.00. This project-oriented course introduces students to the real-world analysis of weather and climate risk, including under climate change. Course will provide a risk-relevant introduction to different types of impactful weather (e.g., hurricanes, drought) and how the climate system can cause them to vary on monthly (e.g., Madden-Julian Oscillation), seasonal (e.g., El Nino and La Nina), and longer timescales (e.g., climate change). The course will further connect this intrinsic uncertainty in weather outcomes to uncertainties in real-world applications (e.g., crop yields) across a variety of economic sectors - "risk". Students will be introduced to basic methods in probability and statistics for analyzing data required to help someone make real-world decisions that depend on weather/climate. The principal course outcome is a semester-long "start-to-finish" project where students define a hypothetical real-world decision that is weather-dependent, find and analyze data to guide that decision-maker, write a concise report on their findings, and concisely present their results orally to the class.

Learning Outcomes: 1. Explain the meaning of "risk" in weather/climate and impacts. 2. Describe the basics of various types of impactful weather. 3. Describe how modes of climate variability cause weather to vary on monthly, seasonal, and longer time scales. 4. Explain how weather and climate variability translates to risk in a wide range of applications and economic sectors. 5. Analyze weather/climate data to find real-world solutions to weather risk problems. 6. Gain experience working as a hypothetical weather/climate science consultant in a team setting. 7. Summarize research in a succinct and compelling technical report. 8. Summarize research in a succinct and compelling oral presentation. 9. Use data to help someone find a solution to a real-world problem that depends on the weather/climate. Credits: 3.00

EAPS 53200 - Atmospheric Physics I

Credit Hours: 3.00. Cloud and precipitation physics and basic atmospheric radiative transfer. Introduction to computer-aided problem solving.

Learning Outcomes: 1. Understand the basic physics of cloud and precipitation formation and evolution in the atmosphere and their connections to atmospheric thermodynamics and dynamics. 2. Describe these processes qualitatively and solve associated problems

quantitatively. 3. Describe and explain the observed microphysical structure of various precipitation systems (such as squall lines, hailstorms, supercells, frontal rainbands, and others). 4. Understand the basics of how cloud and precipitation processes are represented in numerical models. 5. Demonstrate a basic knowledge of various remote sensing methods. Credits: 3.00

EAPS 53300 - Atmospheric Physics II

Credit Hours: 3.00. A continuation of EAPS 53200 , covering the following selected advanced topics in atmospheric physics: gaseous absorption, Mie scattering, the equation of transfer, and radiative transfer in cloudy and hazy atmospheres. The application of radiative transfer in active and passive remote sensing. Advanced topics in atmospheric thermodynamics, such as heterogeneous systems, kinetic theory of gases, and planetary atmospheres. Basic ozone photochemistry applied to stratospheric and tropospheric pollution.

Credits: 3.00

EAPS 53400 - Tropical Meteorology

Credit Hours: 3.00. This course tackles the observed structure of the Earth's tropical atmosphere and the core theories that explain this structure and its variability. Topics include the 3D annual and seasonal mean state, the energy budget, the Hadley cell, monsoons, the Walker cell, equatorial waves, ENSO, convective aggregation, easterly waves, and tropical cyclones.

Learning Outcomes: 1. Visualize and identify the most important features of the tropical atmosphere and describe them in terms that can be understood by a non-expert. 2. Explain how the Sun shining on a rotating rock with an overlying water ocean provides the necessary ingredients for the many different forms of variability in the tropical atmosphere. 3. Develop testable hypotheses about any aspect of the tropical atmosphere of interest. 4. Perform experiments using simple physical computational models to test hypotheses. 5. Use real-world historical data (e.g., reanalysis) to test hypotheses. Credits: 3.00

EAPS 53500 - Atmospheric Observations And Measurements

Credit Hours: 3.00. A course that introduces students to direct and remotely sensed observations of the atmosphere. Directly measured quantities discussed include temperature, pressure, moisture, wind, solar radiation, chemical properties of the atmosphere, etc. Remote sensing of cloud, precipitation, and air motion by weather radars, satellites, profilers, lidars, and other emerging technologies is reviewed. Students will gain experience in observation techniques and data interpretation, and will learn uncertainty and error assessment. Prior course work in atmospheric science and statistics is required.

Credits: 3.00

EAPS 53600 - Introduction To General Circulation

Credit Hours: 3.00. This course provides an overview of the general circulation of the atmosphere and oceans. Topics include: global energy balance, hydrological cycle, atmospheric general circulation and climate, ocean general circulation and climate, history and evolution of Earth's climate, climate sensitivity and feedback mechanisms, global climate models, natural climate change and anthropogenic climate change.

Learning Outcomes: 1. Understand the energy balance of the Earth and the atmosphere. 2. Grasp the general circulation of the atmosphere and ocean and their energy. 3. Gain a scientific understanding of the climate's natural variability and human-induced change. 4. Learn about global climate models. Credits: 3.00

EAPS 53900 - Mesoscale Meteorology

Credit Hours: 3.00. Review of the theories applied in mesoscale meteorology, including semi-geostrophic systems and frontogenesis, symmetric instability, rainbands and inertia-gravity waves, sea-breeze, terrain effects, mountain waves, lee-vortices and cyclogenesis, convection, convective instability, low-level jets, drylines, and squall lines. Prior course work in synoptic labs and vector calculus is required.

Credits: 3.00

EAPS 54000 - Introduction To Geodesy

Credit Hours: 3.00. Course offers an introduction and overview of theory, techniques, data sources, and applications of geodesy. Provides understanding of how various geodetic techniques work and how they can be used to investigate a number of geological, atmospheric, and related problems. Evaluation of the robustness and quality of data as well as assessment of models and conclusions derived from geodetic methods.

Learning Outcomes: 1. Explain essential theory behind various geodetic techniques. 2. Describe how geodetic techniques and datasets can be used to investigate geological problems. 3. Identify and break down contributing sources to complex data signals. 4. Assess which data and model types are most appropriate for a

particular problem. 5. Devise an original research project topic and develop hypothesis and a methodology for its evaluation. 6. Analyze and critique scientific journal articles. 7. Summarize main research results in a clear, concise manner in both written and oral form.

Credits: 3.00

EAPS 54100 - Geodetic Data And Applications

Credit Hours: 3.00. This course will provide students with hands-on experience in the selection, processing, and analysis of geodetic data sets, particularly InSAR and GPS. Students will learn how to select data, evaluate its strengths and weaknesses, process and analyze the data, and apply it to the investigation of geological problems.

Learning Outcomes: 1. Explain essential theory behind processing geodetic data. 2. Describe various processing parameters and how they influence data analysis. 3. Evaluate quality of various datasets and determine most appropriate analysis strategies for desired application. 4. Interpret analyzed datasets in the context of geological problems. 5. Judge whether models fit data and if model parameters are compatible with available non-geodetic data sources. 6. Devise an original research project topic and develop hypothesis and a methodology for its evaluation. 7. Summarize main research results in a clear, concise manner in both written and oral form.

Credits: 3.00

EAPS 54200 - Economic Geology: Petroleum

Credit Hours: 3.00. Fundamental principles of the origin, migration, accumulation, exploration, and development of petroleum. Study of reservoir fluids, reservoir mechanics, and primary and secondary production techniques. Methods of prospect and leasehold evaluation and economic appraisal. Offered in alternate years.

Credits: 3.00

EAPS 54500 - Planetary Spacecraft Instrumentation

Credit Hours: 3.00. This course will educate students on the basic design and operation of planetary science instruments in space. Instrumentation covers many different techniques over many different portions of the optical spectrum, detection of particles and fields, and sample handling techniques on planetary bodies. Topics for defining instruments and their capabilities within a given mission, such as traceability matrices and proposal techniques, will also be discussed. In-class lectures and discussion will be important components of this course. All students will be expected to read several papers per week and respond to discussion or quiz questions. Each student will participate in giving a lecture and lead a discussion on two to three topics, based on assigned papers. Based on the information presented in class, there will be an individual project to define an instrument, with an option to learn one of several software tools for designing a scientific instrument for space.

Learning Outcomes: 1. Be exposed to the various types of instrumentation used in planetary exploration. 2. Gain a basic understanding of how various types of planetary instruments work. 3. Learn and experience how instrument parameters are defined and selected based on scientific objectives of the mission. 4. Learn about design optimization packages for photon and ion optics, and neutron and charged particle trajectories. 5. Gain proficiency in reading instrumentation papers and in presenting instrument and spacecraft details.

Credits: 3.00

EAPS 55000 - Advanced Geophysical Field Studies.

Credit Hours: 1.00 to 3.00. Individual geophysical field investigations including organizing, conducting and reducing, and interpreting data under the guidance of a staff member. Permission of instructor required.

Credits: 1.00 to 3.00

EAPS 55501 - Numerical Modeling Of Planetary Orbits

Credit Hours: 3.00. The goal of the course is twofold. First, you will develop quantitative skills to understand the orbital motions of planets and minor bodies in planetary systems, both in our solar system and in exosolar systems. Second, you will develop practical skills and techniques for using computers to solve scientific problems. We will begin with classical analyses of the two-body and N-body problems. We will then learn about modern, powerful, analytical and numerical techniques. We will then see how these techniques are applied to solving real problems in understanding the origin and evolution of planetary systems. These problems will include understanding planet formation, planet migration, resonance dynamics and resonance capture, tidal evolution of planets and natural satellites, and the collisional evolution of small body populations. Permission from instructor required.

Learning Outcomes: 1. Demonstrate proficiency with modern numerical methods and tools. 2.

Demonstrate proficiency with methods of analysis and theory related to the dynamics of solar system bodies. Credits: 3.00

EAPS 55600 - Planetary Surface Processes

Credit Hours: 3.00. The application of petrology and structural geology to other planets. Topics include: theories of star and solar system formation, orbital dynamics and Kepler's laws, petrology and geochemistry of meteorites, age dating techniques, structure and composition of the terrestrial, giant, and icy planets, planetary surfaces, planetary atmospheres, and theories of the formation of the moon. Offered in alternate years. Prior course work in earth materials is required.

Learning Outcomes: 1. Understand the physical and chemical principles behind processes that modify planetary surfaces. 2. Identify planetary surface features in orbital imagery and use observational evidence to postulate their origin and modification histories. 3. Gain field experience with planetary surface processes and landforms at local planetary analog sites. 4. Propose a research topic (all students) and conduct a literature review (undergrads), or design and complete an original research project (grads) on that topic. Credits: 3.00

EAPS 55700 - Introduction To Seismology

Credit Hours: 3.00. Theory of propagation to seismic waves in elastic media. Solution of wave equations for compressional, shear, and surface waves. Analysis of travel-times, amplitudes, and attenuation of seismic waves in terms of ray and wave theory. Principles of the seismograph. Structure of the earth as determined by seismological studies. Investigation of the causes, effects, distribution, and characteristics of earthquakes. Earthquake prediction.

Credits: 3.00

EAPS 55800 - Physical Properties Of Earth And Planetary Materials

Credit Hours: 3.00. This course includes a survey of the physical properties of earth materials: solids, liquids, and porous materials relevant to a range of geophysical and engineering concerns broadly within the domain of the growing field of Rock Physics. The variety of rock materials with particular emphasis on the aspects of composition, texture, and pore structure is first overviewed. Standard petrophysical characteristics such as mineralogic composition, density, and porosity are defined and the methods used to determine them both directly in the laboratory and indirectly from borehole measurements studied. With this background, students then explore how the intrinsic characteristics of pore structure, fluid content, and composition together with conditions of in situ temperature and pressure control the bulk material's electrical conductivity, dielectric permittivity, elasticity, and strength. These properties are viewed from perspectives of many scales of observation from the laboratory through geophysical logging from boreholes to larger scale geophysical surface measurements and high pressure and temperature laboratory measurements. More advanced issues related to frequency dependence, anisotropy, and stress measurement are discussed. Depending on their level, students will complete assignments or carry out literature reviews and a final research project. The research project may be designed to complement the student's own research needs.

Learning Outcomes: 1. Be aware of the various physical properties of rocks and particularly link these to geophysical observations. 2. Gain an appreciation of various methods to model these various physical properties and what the practical limitations of these various models are. Credits: 3.00

EAPS 55900 - Topics In Seismology

Credit Hours: 1.00 to 3.00. This course covers current topics in seismology. Recent topics have included seismic structure of the crust and mantle, seismic anisotropy, and earthquake sources. Professor Nowack. Permission of instructor required.

Credits: 1.00 to 3.00

EAPS 56700 - Planetary Atmospheres

Credit Hours: 3.00. This course is intended to for upper-level undergraduates and graduate students and will provide an in-depth look into the to the diversity of planetary atmospheres in our solar system and beyond. Topics to be covered in this class include: The processes by which atmospheres are constructed and eroded over plants lifetime, radiative balance, general circulation, the formation of hazes, clouds, and aerosols, atmospheric compositions and chemistry, the link between planetary interiors, surfaces, and atmospheres, how we measure and interpret observations of exoplanet atmospheres, and much more. To achieve this, we will briefly introduce the properties and components of an atmosphere, visit the planetary atmospheres in our solar system to learn more, and finally explore exoplanetary atmospheres.

Learning Outcomes: 1. Differentiate between different types of planetary bodies and the atmospheres that are present on them. 2. Recall the main properties of planetary atmospheres in our solar system. 3. Derive underlying physical properties for an atmosphere. 4. Understand and evaluate how atmospheric composition and planet type affect these physical properties. 5. Compare the effect of radiation and the subsequent dynamical

motions with the distribution of energy in an atmosphere as a function of stellar type and atmospheric composition. 6. Distinguish the importance of different chemical reactions and pathways (such as those for an oxidizing vs. reducing atmosphere). 7. Examine the ways in which atmospheres are formed, lost, and evolved, and how this results in the atmospheres we see today. 8. Make detailed predictions about the atmospheres of exoplanets based on an assessment of our understanding of the solar system. 9. Summarize and differentiate between techniques for observing and sampling the planetary atmospheres of our solar system and beyond. Credits: 3.00

EAPS 57300 - Basin Analysis

Credit Hours: 3.00. Advanced study of tectonic evolution and stratigraphic history of sedimentary basins. Topics include formative mechanisms of different sedimentary basins; tectonic, eustatic, and climatic controls on basin stratigraphy; relationship of depositional systems to basin types; subsidence and thermal histories; and application of basin analysis to petroleum reservoir and ground water aquifer assessment. Required field trips. Offered in alternate years. Prior course work in sedimentology and stratigraphy is required.

Credits: 3.00

EAPS 57700 - Remote Sensing Of The Planets

Credit Hours: 3.00. Introduction to key planetary and Earth science satellite remote sensing datasets, including visible and thermal imagery, visible through mid-infrared spectroscopy, radar, gamma ray and neutron spectroscopy, and laser altimetry. Students will receive hands-on-experience with data acquisition, image processing in IDL, spectral analysis in ENVI and Davinci, crater counting, and geologic mapping in GIS programs. Includes 1-2 full-day field trips. Junior, Senior, or Graduate status required. Recommended minimum background for undergraduates: Introductory knowledge of Earth or planetary surface processes and basic programming skills.

Learning Outcomes: 1. Understand the underlying physical principles behind the interpretation of remote sensing data. 2. Gain proficiency in the acquisition, processing, and analysis of remote sensing data. 3. Gain field experience with using and ground truthing remote sensing data at planetary analog sites. 4. Propose a research topic, conduct a literature review, and design and complete an original research project. Credits: 3.00

EAPS 58000 - Geodynamics

Credit Hours: 3.00. This course will provide students with a first order understanding of geophysical processes by developing analytical solutions to a variety of geophysical and planetary thermo-mechanical problems. Topics will include stress and strain, rheology, elasticity and flexure, faulting, and conductive heat transfer, and fluid mechanics. We will develop governing analytical equations based on first order principles, such as the conservation of mass, energy, and momentum, and solve these equations for a number of boundary conditions.

Learning Outcomes: 1. Solve first-order analytical thermo-mechanical problems in geophysics and planetary science. 2. Understand the basis for more complex numerical solutions of thermo-mechanical problems in geophysics and planetary science. 3. Investigate the factors that control a variety of thermo-mechanical geophysical and planetary processes. Credits: 3.00

EAPS 58300 - Geology Of Landfills

Credit Hours: 3.00. This course consists of the application of the geological sciences to the siting, exploration and site evaluation for solid waste disposal landfills, plus the evaluation of existing landfill facilities as they pertain to soils, bedrock, stratigraphy, landforms, geologic processes, and hydrogeology. Included are soil and rock exploration, laboratory testing, installation of ground water monitoring devices, and evaluation of contaminant transport. Both attenuation and confinement landfill systems are considered. Geological aspects of solid waste disposal regulations are reviewed and compared to those for hazardous waste disposal. Classroom discussions include evaluation of specific landfill examples and a semester project on a landfill evaluation. A one-day field investigation is required.

Credits: 3.00

EAPS 58400 - Hydrogeology

Credit Hours: 3.00. Investigates the qualitative and quantitative aspects of ground water location, occurrence, movement, evaluation, and development, and the influence of man upon this resource. Geologic and engineering aspects of ground water systems are discussed. Classroom teaching is complemented by problem sets and field trips.

Credits: 3.00

EAPS 58801 - Impact Cratering

Credit Hours: 3.00. Impact cratering is arguably the most pervasive geologic process in the solar system. In this course, we will study the physical process of impact cratering and its place in planetary science. The course will take a process-

oriented approach to understanding impact cratering with firm foundations in geologic observation and impact experiments. To explore the extreme process of impact cratering, we will use continuum/rock mechanics, thermodynamics, numerical modeling, experiments, and observations. Principal topics will include the formation of craters from contact of the projectile to final crater morphology; shock metamorphism; impact ejecta and products; cratered terrains; impacts and planetary evolution; and impact hazards.

Learning Outcomes: 1. Understand the physical principles of impact cratering. 2. Understand how impacts affect target materials. 3. Calculate the effects of the impact (size of crater, volume of melt, etc.). 4. Propose a research topic (all students) and conduct a literature review (undergrads), or design and complete an original research project (grads) on that topic.

Credits: 3.00

EAPS 59000 - Field Geology North America

Credit Hours: 2.00. Advanced study of tectonic evolution and stratigraphic history of specific geologic provinces. Particular emphasis on the relationship between tectonics, basin development, and sedimentation. Field component deals with application of field techniques used in basin analysis and structural studies. A 10-day field trip is required. Permission of instructor required.

Credits: 2.00

EAPS 59100 - Advanced Topics In Earth And Atmospheric Sciences

Credit Hours: 0.00 to 18.00. Specialized study offered on an individual basis or through specially arranged courses. Permission of instructor required.

Credits: 0.00 to 18.00

EAPS 59500 - Planetary Habitability

Credit Hours: 3.00. This class will explore the origin and evolution of habitable environments on Earth, habitable environments in our Solar System (e.g., early Mars, Europa's ocean), and the diversity of potentially habitable environments on exoplanets. Topics include consideration of how stellar properties, orbital dynamics, and geological phenomena influence habitability. We will additionally consider how we can remotely characterize habitable environments beyond the solar system from the comfort of Earth.

Learning Outcomes: 1. Synthesize information from several scientific disciplines to construct a holistic view of the most promising environments for the origin and long-term survival of life in the Universe. 2. Read primary literature critically and distinguish between facts, assumptions, and speculations relating to habitability. 3. Present and defend arguments for whether a particular world may or may not host habitable environments. 4. Pose well-formulated questions and testable hypotheses relating to habitability. Credits: 3.00

EAPS 60000 - Writing Successful Science Proposals

Credit Hours: 3.00. This course is designed to teach graduate students the skills necessary to successfully garner extramural graduate, postdoctoral, and project funding. Topics will include identification of funding sources and development of research objectives and strategies. Emphasis will be on writing concise fellowships and full NSF-type research proposals. Class meetings will be interactive with an emphasis on peer review. Each student will complete a quality research proposal based upon their own research. Any graduate student with a nascent idea for a science or engineering project is encouraged to enroll. We have found that this course works especially well to help newer MS or PhD graduate students develop a research project, improve communication with their advisor, and organize their research priorities regardless of whether they use this course to submit a proposal.

Learning Outcomes: 1. Develop an understanding of their own research significance, novelty, and plan, be able to communicate these concepts both in the written from (proposal) and be able to orally communicate these ideas to their peers.

Credits: 3.00

EAPS 60200 - New Graduate Student Seminar

Credit Hours: 3.00. This course will provide students with the tools to succeed as a graduate student in the Department of Earth, Atmospheric, and Planetary Sciences, which include good communication with their advisors, graduate fellowship proposal writing, giving good talks and posters, giving and receiving critical reviews, an understanding of regulations and graduate timelines, formulating a plan of study, and resources available to help graduate students succeed. Permission of instructor required.

Learning Outcomes: 1. Communicate effectively with their adviser. 2. Understand how to develop a compelling research question. 3. Organize their planned research into a graduate fellowship proposal. 4. Provide and receive constructive criticism to and from colleagues, including understanding peer review. 5. Understand how to give well-organized talks

and eye-catching posters for department seminars and national meetings. 6. Assemble an advisory committee, formulate a plan of study, and know the department regulations and what is required to graduate in a timely manner. Credits: 3.00

EAPS 62000 - Aerosols, Clouds And Climate

Credit Hours: 3.00. An exploration of the complex relationships between aerosols, clouds and climate, including the so-called "direct effect" of aerosol on the radiation balance and their numerous influences upon relevant cloud properties called "indirect effects", the impact of different cloud types upon incoming solar radiation and outgoing longwave radiation, the effects of anthropogenic aerosol and climate change on precipitation efficiency, and the representation of aerosol, clouds and cloud processes in climate models.

Learning Outcomes: 1. Students will add to their base knowledge regarding the interaction of aerosols, clouds and climate. 2. Students will also develop their critical thinking skills and written communication skills. 3. Students will also improve their oral communication skills. Credits: 3.00

EAPS 65000 - Advanced Topics In Geophysics

Credit Hours: 3.00. Specialized topics in geophysics such as heat flow, rock magnetism, and marine geophysics; varied depending on interest. Permission of instructor required.

Credits: 3.00

EAPS 65200 - Folding Of Rocks

Credit Hours: 3.00. Theory and application of finite strain to the study of folded rocks, with numerous illustrations from literature. Presentation of modern theories of folding and density instability of single- and multi-layered rocks, with special emphasis on basic folding mechanisms. Treatment of linear viscous and power-law fluids. Second- and third-order analysis of causes of basic fold forms, such as concentric, chevron and kink folds, and mullion structure. Causes of drag folds and reverse drag folds. Offered in alternate years.

Credits: 3.00

EAPS 65300 - Fracturing Of Rocks

Credit Hours: 3.00. Description and analysis of joints and faults from the point of view of field geology and fracture mechanics. Three basic modes of fracture and their analogs in the Earth's crust. Also examined are structures, such as folds, pressure solution surfaces, basins, and mountain ranges associated with faults. Offered in alternate years. Prerequisite: differential equations.

Credits: 3.00

EAPS 65700 - Geophysical Inverse Theory

Credit Hours: 3.00. Investigates problems of determining physical parameters of the earth from remote observations of wave and potential fields. The theoretical topics include spectral and singular value decompositions, maximum likelihood and stochastic inversion, Backus and Gilbert theory, Green's function and linear operators, and the physics of layered media. Geophysical applications include seismic tomography, deconvolution, gravity and magnetics, earthquake sources, geodetics, and remote sensing. Offered in alternate years. Prior course work in advanced differential equations, physics, and chemistry of the earth is required.

Credits: 3.00

EAPS 68000 - Contaminant Hydrogeology

Credit Hours: 3.00. Covers the basic theory and applications of problem-solving exercises in hydrogeology, fluid mechanics, and chemistry of contaminated sites; flow and transport equations and models; investigational methods; remediation methods; case studies; and pertinent environmental laws. Prior course work in chemistry, computer programming, differential equations, and hydrogeology is required.

Credits: 3.00

EAPS 69100 - Colloquium In Earth, Atmospheric, And Planetary Sciences

Credit Hours: 1.00. This course is intended to expose students to the wide range of topics studied throughout the Department of Earth, Atmospheric, and Planetary Sciences, allows for interactions with outside experts and networking, and provides the opportunity for students to synthesize high level topics that may not be directly related to their scientific endeavors.

Learning Outcomes: 1. Gain exposure to new scientific topics. 2. Summarize and discuss potentially new and unfamiliar scientific topics. 3. Identify relevant information from scientific talks and presentations. 4. Engage with the important questions that stimulate discussion and debate in EAPS fields. 5. Listen attentively and actively. 6. Use critical thinking and questioning. Credits: 1.00

EAPS 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required.

Credits: 1.00 to 18.00

EAPS 69900 - Research PhD Thesis

Credit Hours: 1.00 to 18.00. Research PhD Thesis. Permission of instructor required.

Credits: 1.00 to 18.00

Economics

ECON 10500 - Exploring Careers In Business Economics And Consulting

Credit Hours: 1.00. Careers in economics are far more diverse than you might expect. This course introduces students to a wide range of career opportunities within the field of economics, while also emphasizing its value for those pursuing other majors. Through interactive sessions featuring guest speakers and alumni networking opportunities, students will explore various career paths and identify the skills and experiences necessary for a successful career in economics. Each session delves into essential themes, including critical skills for business economics and consulting, insights into economics-related career opportunities, and real-world advice from industry professionals.

Learning Outcomes: 1. Distinguish the wide range of career opportunities within economics and related fields, recognizing the profession's versatility and applicability to various industries. 2. Identify the key skills and competencies essential for success in business economics, consulting, and other economics-related career paths. 3. Recognize how economics principles apply to different roles and industries, including consulting, business strategy, and policy-making. 4. Engage effectively with alumni and professionals, leveraging networking opportunities to gain insights into real-world applications of economics and potential career trajectories. 5. Formulate a personalized strategy to build their academic and professional experiences, preparing for a successful transition into economics-related careers. Credits: 1.00

ECON 21000 - Principles Of Economics (UCC: BSS)

Credit Hours: 3.00. This course presents the principles upon which the social science of economics is based. Specifically, it examines how individuals, firms, and the government interact through markets. It also examines several important macroeconomic issues including unemployment, inflation, international trade, and economic growth. Students are expected to be able to apply these economic principles to analyze current events, work decisions, and personal choices. CTL:ISH 1040 Introduction To Economics

University Core Curriculum (UCC): (UCC: BSS)

Learning Outcomes: 1. Identify costs and benefits involved in economic decision making. 2. Predict market equilibrium and changes in equilibrium. 3. Evaluate the efficiency of market equilibrium. 4. Express and interpret economic theories and data using various visual representations (e.g., graphs, tables, charts). 5. Calculate basic measures of macroeconomic performance and the forces that influence those measures. Credits: 3.00

ECON 21900 - Economics For Future Elementary Teachers

Credit Hours: 3.00. A principles of economics course designed for future elementary and social studies teachers. The purpose of this course is to: 1) introduce the future teacher to basic economic concepts required by the Indiana Academic Standards for Social Studies, K-6, 2) learn methods for teaching these concepts in the K-6 curriculum, and 3) develop a catalog of curriculum materials appropriate for teaching economics in grades K-6. No credit for management students.

Learning Outcomes: 1. Identify and understand the basic concepts and principles of economics in order to teach at the elementary school level. 2. Develop an `Economic Way of Thinking? that can be utilized to make more efficient choices as consumers, and as voters. 3. Identify supplementary materials (DVDs, online and app-based resources, simulations, curriculum materials, etc.) that can be used in K-6 teaching or as a supplement in K-6 classrooms. 4. Apply this 'Economic Way of Thinking' in the analysis existing curriculum in K-6 economics, and of everyday current events. 5. Utilize the basic concepts and principles of economics to design and develop new K-6 curriculum. Credits: 3.00

ECON 21910 - Economics For Future Secondary Teachers

Credit Hours: 3.00. Upon completion of this course students will be able to analyze economic events in order to make more intelligent choices as consumers, workers, and voting citizens; identify and understand the basic concepts and principles of economics in order to meet standards at the secondary school level; identify supplemental materials and programs from variety of sources used in your teaching major, minor or as supplements in your classrooms; and review and organize lessons that teach economic concepts. No credit for management students. The course content is principles-level economics and is designed for social studies education students who are beginning their sequence of required economics courses. The course is designed to be taken before upper-division economic content courses.

Learning Outcomes: 1. Analyze economic events so that you will be able to make more intelligent choices as a consumer, worker, and voting citizen 2. Identify and understand the basic concepts and principles of economics in order to teach at the secondary school level. 3. Identify supplementary materials and programs (CD's, video tapes, simulations, curriculum materials, etc.) from a variety of sources that can be used in your teaching major, minor or as supplements in your classroom. 4. Review and organize lessons that teach economic concepts in your chosen Social Studies area. 5. Assist course instructor in improving the course to better fit your needs. Credits: 3.00

ECON 25100 - Microeconomics (UCC: BSS)

Credit Hours: 3.00. Microeconomics studies the choices individuals make and the incentives that influence those choices. Emphasis is on the incentives that determine market prices and resource allocation. The role of public policy in influencing incentives and efficiency is also addressed. CTL:ISH 1042 Microeconomics

University Core Curriculum (UCC): (UCC: BSS)

Learning Outcomes: 1. Calculate economic costs and benefits relevant for making rational decisions. 2. Identify factors that influence demand, supply, and market equilibrium. 3. Evaluate efficiency and equity of market equilibrium and the role of government in achieving efficiency and equity. Credits: 3.00

ECON 25200 - Macroeconomics (UCC: BSS)

Credit Hours: 3.00. This course examines how the US economy functions and provides an overview of important macroeconomic issues including: unemployment, inflation, social security, national debt, international trade, the sub-prime crisis, and business cycles. Emphasis is placed upon the role and limits of government fiscal and monetary policy in promoting economic growth and stable prices. CTL: ISH 1041 Macroeconomics

University Core Curriculum (UCC): (UCC: BSS)

Learning Outcomes: 1. Understand the causes of economic prosperity. 2. Recognize the causes and effects of unemployment, inflation, and business cycles. 3. Demonstrate an understanding of monetary and fiscal policy options as they relate to economic stabilization. 4. Critically assess economic information contained in news reports, policymakers' statements, and specialized publications. Credits: 3.00

ECON 26000 - Data Visualization And Inference

1. Describe and analyze statistical data in an economics context.
2. Build probability models of continuous and discrete random variables to analyze economic and business situations.
3. Estimate the value of an unknown population parameter and assess the reliability of the estimate using confidence intervals as well as hypothesis testing.
4. Identify the advantages as well as the limitations of statistics in the process of making real-world business and economic decisions.
5. Use STATA to compute probability models and interpret the results of the statistical analysis to draw conclusions from economic and business data.

Learning Outcomes: 1. Develop a working knowledge of data production and interpretation in an economics context. 2. Illustrate the fundamental interconnectedness of economics and data. 3. Introduce the basic concepts in statistics needed for further study of econometrics. Credits: 3.00

ECON 28600 - Economics Scholars

Credit Hours: 1.00. This course explores the concept of human capital investment in higher education. For each course meeting you will be assigned readings. You must complete the assigned readings before the scheduled discussion and come prepared to discuss them. Class will consist of a discussion of the ideas in the readings, not a lecture, with grades based on your participation in addition to one writing assignment at the end of the semester. The instructor will suggest questions to get the discussion started and will maintain the queue that determines speaking order. Permission of instructor required.

Learning Outcomes: 1. Read essays on higher education investment and be able to explain and evaluate their arguments. 2. Discuss and write about how the concept human capital investment theory applies to higher education policy today. Credits: 1.00

ECON 29000 - Sophomore Level Problems In Economics

Credit Hours: 1.00 to 4.00. Arrange with instructor before enrolling. Investigation in a specific economics field. Permission of instructor required.

Learning Outcomes: 1. Vary by course topic. Credits: 1.00 to 4.00

ECON 29199 - Cooperative Experience I

Credit Hours: 0.00. Professional experience in economics. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.

Learning Outcomes: 1. Apply knowledge to identifying and solving problems in the professional context. 2. Advance skills related to professional preparation, critical thinking, problem solving, communication, and team work. 3. Increase understanding of the profession and practice, basic industry principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

ECON 29299 - Cooperative Experience II

Credit Hours: 0.00. Professional experience in economics. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.

Learning Outcomes: 1. Apply knowledge to identifying and solving problems in the professional context. 2. Advance skills related to professional preparation, critical thinking, problem solving, communication, and team work. 3. Increase understanding of the profession and practice, basic industry principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

ECON 30100 - Managerial Economics

Credit Hours: 3.00. This course provides students with essential tools from intermediate microeconomic theory to support effective decision-making in business and institutional settings. By exploring fundamental economic concepts such as marginal analysis, profit maximization, cost minimization, and pricing strategies, students will enhance their strategic thinking and managerial capabilities. The course addresses key topics including consumer behavior, demand, production and costs, factor demand, market structure, and strategic behavior, equipping students to tackle complex business challenges and make sound economic decisions. By the end of the course, students will have developed the skills to determine optimal strategies in various market conditions, preparing them to succeed as informed business managers.

Learning Outcomes: 1. Learn how to identify goals and constraints, and use inductive and deductive reasoning to draw logical conclusions. 2. Recognize the nature and importance of profits in directing resources to their highest value in use. 3. Understand how incentives shape individual and institutional decisions. 4. Understand the functioning of markets in managing individual and social allocation of scarce resources. 5. Recognize the importance of time value of money in making sound managerial decisions. 6. Learn the value of "thinking at the margin" when we seek to reach optimal outcomes. Credits: 3.00

ECON 32200 - Economics Of Public Policy

Credit Hours: 3.00. The examination and analysis of public finance practices and problems in the federal fiscal system. Government activities that involve spending and taxation are analyzed applying basic principles of economics. Topics include public education, social security, healthcare, environment and tax systems. State and local government issues are also addressed.

Learning Outcomes: 1. Explain how the provision of government goods and services through political institutions differs from market provision of goods and services. 2. Examine and analyze taxes and subsidies with and without market failure. 3. Examine and analyze various types of government expenditures on public education, health care, social security, income assistance, unemployment compensation, etc. 4. Explain how cost-benefit analysis can be used to help government choose among alternative investment projects. 5. Examine and analyze the impact of various types of taxes on the economy. Credits: 3.00

ECON 32500 - Economics Of Sports

Credit Hours: 3.00. This class applies economic principles to the professional sports entertainment industry and its derivative input markets. The class begins by examining the microeconomics of demand for (by fans) and supply of (by teams) sports entertainment. The labor markets for the primary input, athletic talent, receive significant attention. Coordination among economic agents, taking the forms of leagues, players' unions, and government, is considered at the end of the class, with an emphasis on how they affect the efficiency of the markets related to sports entertainment. Quantitative empirical

analysis is emphasized throughout the class. This is not a sports trivia or fantasy sports strategy class.

Learning Outcomes: 1. Solve models of how fans, teams, and players behave. 2. Describe and evaluate the structures of the markets for sports outputs and inputs, e.g., players. 3. Explain information presented in quantitative forms, e.g., equations, graphs, tables. 4. Analyze the effects of leagues' or governmental polices on market efficiency. 5. Communicate conclusions about sports output and input markets in numerical, graphical, tabular, and written forms. Credits: 3.00

ECON 34000 - Intermediate Microeconomic Theory

Credit Hours: 3.00. This course provides students with the techniques needed to model and analyze the behavior of individual economic agents. It introduces a variety of techniques that will allow students to solve business problems and make informed personal economic decisions. The course covers topics from consumer behavior and demand, decisions under uncertainty, production and cost, factor demand, market structure, pricing strategies, and strategic behavior. This is an upper-division economics course required for all economics majors and it serves as a foundation for higher level elective courses in economics.

Learning Outcomes: 1. Analyze the means by which individuals and firms make rational choices when demanding and supplying goods and services. 2. Describe the equilibrium outcomes of individuals and firms interacting in markets. 3. Evaluate market outcomes in terms of economic efficiency. 4. Practice analytical and quantitative reasoning skills. 5. Identify and describe the management and pricing strategies of competitive, monopolistic, monopsonistic, and oligopolistic firms. Credits: 3.00

ECON 35200 - Intermediate Macroeconomics

Credit Hours: 3.00. This course offers a rigorous introduction to macroeconomic theory and empirics with real-world applications. We examine longstanding stylized facts about long-run economic growth, short-run economic fluctuations (booms and recessions), and the aggregate effects of government policy. We study determinants of equilibrium in labor, consumption, investment, and money markets as well as the role of fiscal and monetary policies in closed and open economies.

Learning Outcomes: 1. Provide students with a framework for analyzing different macroeconomic questions related to the determination of income, consumption, employment, inflation, interest rates, and exchange rates. 2. Develop analytical skills to understand and apply macroeconomic concepts and theories to real world phenomena and policies. Credits: 3.00

ECON 36000 - Econometrics

Credit Hours: 3.00. This course examines the statistical techniques economists use to analyze data, estimate causal effects, make predictions, and test economic theory. It emphasizes estimating multiple regression models including models of firm output, product prices, and wages. Students learn to make statistical and practical inferences about the true causal relationships. The course covers the data analysis skills required for careers as a consultant, financial analyst, researcher, or economist in the private and public sectors. The skills practiced in the course include using statistical software to analyze data.

Learning Outcomes: 1. Model economic relationships in a regression framework. 2. Estimate economic models using the assigned statistical software. 3. Perform statistical and practical inference based on the results of empirical analysis. 4. Communicate empirical results clearly and concisely, in graphs, tables and writing. 5. Derive properties of estimators (unbiasedness, consistency, efficiency) and evaluate the characteristics of specific empirical models. Credits: 3.00

ECON 36100 - Antitrust And Regulation

Credit Hours: 3.00. This course studies the influence of laws and regulations on market performance and on the functioning of a free-enterprise system. The focus is on two types of government policies: antitrust law and economic regulation. Antitrust laws define the rules by which firms are supposed to compete. Regulations may require that firms obtain approval to set prices, change prices, or enter new markets. They may require firms to adhere to environmental or safety standards. The focus is on current topics in both areas, including comparison of U.S. practice with that of European Union and elsewhere.

Learning Outcomes: 1. Demonstrate a basic understanding of economics as applied to antitrust and government regulation of firms,

including comparisons of U.S. practice with that of the European Union and elsewhere. 2. Understand the perspective provided by economic analysis regarding the interplay between government regulation and firms' decisions regarding such factors as pricing, market entry, and the extent/form of competition. 3. Identify insights economic analysis provides concerning the creation and implementation of optimal regulation of business. Credits: 3.00

ECON 36200 - Health Economics

Credit Hours: 3.00. This course is designed to introduce upper level undergraduate students in economics to the field of health economics. We will analyze health and health care theories, institutions, and key policy issues using tools from intermediate microeconomic theory. The course begins with an analysis of health care as a commodity and why health is different from other consumer goods. The course then examines the demand for and the production of health and health care, and the behavior and organization of health care providers. The discussion then switches to information asymmetries and the functioning of health insurance markets. Afterwards, the course turns to the analysis of government involvement in the health care system. The class concludes with an examination of medical care systems around the world, paying particular attention to the U.S. health care system.

Learning Outcomes: 1. Describe the main economic theories relating to health and health care markets. 2. Apply economic theory to the analysis of health care policy and institutions. 3. Construct a detailed demand and supply model of the health insurance market. 4. Critically evaluate key policy issues in health and health care from an economic perspective. Credits: 3.00

ECON 36500 - History Of Economic Thought

Credit Hours: 3.00. The course traces the development of theories of value and economic growth from the seventeenth century to Karl Marx. Among the authors studied are the mercantilists, Hume, Smith, Ricardo, and Marx. Excerpts from the original works are read and evaluated in light of modern theory.

Credits: 3.00

ECON 36700 - Law And Economics

Credit Hours: 3.00. It has become increasingly clear to economists, legal scholars and political scientists that it is impossible to understand economic institutions without first having an understanding of the legal framework within which they operate. Similarly, it is impossible to understand the impact of law on society without first having an understanding of economic principles. This problem is further complicated by the fact that there are often ambiguities in the written law that lead to significant differences between what the law appears to say and how the law is interpreted in the courts. This course is designed to give the student an understanding of both legal and economic principles and the relationship between them. Finally, through the use of economic analysis, the student will acquire the tools to predict the likely outcomes of particular laws and how they will affect their family and business decisions.

Learning Outcomes: 1. Understand better the relationship of Law and Economics, two different disciplines that both directly impact the business climate. 2. Learn how the concepts taught in this class apply in a real world setting. Credits: 3.00

ECON 37000 - International Trade

Credit Hours: 3.00. Develops an understanding of the economics of globalization, including the movement of goods, people, capital, and ideas across countries. Using the tools of intermediate economic theory, we discuss the benefits and costs of globalization, the implications of globalization for wages, earnings, and national welfare, and their intersection with government policies.

Learning Outcomes: 1. Demonstrate a basic understanding of Economics as applied to international trade, including the movement of goods, people, capital, and ideas across countries. 2. Understand the perspective provided by economic analysis regarding globalization of economies, including the implications for wages, earnings and national welfare. 3. Identify insights economics analysis provides concerning the benefits and costs of globalization and the implications for government policies. Credits: 3.00

ECON 37200 - Experimental Economics

Credit Hours: 3.00. This course will explore how experiments are used in economics to test economic theory, understand behavior, and evaluate new policies. Focusing on recent research, we read research papers on a variety of policy topics including labor market discrimination, payday lending, organ transplantation, media censorship, and voting. Applying the concepts from class, students will identify their own original research questions and design new experiments.

Learning Outcomes: 1. Understand why

experiments are the gold standard for causal inference. 2. Identify the key elements of any economic experiment and evaluate design choices. 3. Generate original research questions that can be answered with an experiment. 4. Design novel experiments to test hypotheses. Credits: 3.00

ECON 37300 - Computational Economics

Credit Hours: 3.00. The main goal of this course is to introduce economics students to the computation, programming, and data analysis in Python. In the first part of the course, we will cover basic programming techniques and the use of popular Python packages for data analysis. In the second part of the course, we will consider more advanced programming techniques including numerical methods, dynamic programming, and simulation-based methods. Throughout the course we will consider a number applications related to microeconomics, macroeconomics, and econometrics covered in the Economics program curriculum.

Learning Outcomes: 1. Have a working knowledge of programming techniques in Python. 2. Use scientific computing packages to analyze economic data. 3. Possess an understanding of numerical methods used to solve economic models. 4. Use visualization tools to communicate computational results. Credits: 3.00

ECON 37600 - Economics Of The European Union

Credit Hours: 3.00. Current economic structure of the European Union, and the economic challenges it is now facing.

Learning Outcomes: 1. Understand the background and current economic structure of the European Union, as well as the economic challenges it is now facing. Credits: 3.00

ECON 38000 - Money And Banking

Credit Hours: 3.00. The course analyzes the economics of money, monetary systems, investments, and financial intermediaries in modern industrial economies. Topics considered include the origin of money and the banking industry, financial asset markets, the role of central banks, and the effects of various monetary policies. The theory will be presented side by side with current economic and financial news, and the students will learn how to track financial and economic data via The Wall Street Journal.

Learning Outcomes: 1. Understand economic analysis, through developing the economic intuition necessary to organize concepts and facts, and draw conclusions through use of inductive and deductive logic. 2. Evaluate current developments and financial news, using economic analysis to think critically about how to interpret current events. 3. Use economic analysis to predict likely changes in the economy and financial system. Credits: 3.00

ECON 38500 - Labor Economics

Credit Hours: 3.00. The purpose of this course is to introduce important topics, theories, institutions, and policy issues relating to the functioning of labor markets. Topics to be considered include labor supply decisions, investments in human capital, compensating wage differentials, labor contract theory, unions, compensation programs, signaling in labor markets, the economics of unemployment, and government employment, retirement, and workplace safety.

Learning Outcomes: 1. Distinguish the major determinants of labor market participation and hours worked. 2. Analyze how welfare programs and business cycles affect labor supply. 3. Derive the short and long term demand for labor. 4. Construct a detailed demand and supply model of the labor market. 5. Find the equilibrium labor market outcomes in the context of the neoclassical model 6. Analyze the role played by jobs' and workers' characteristics in generating wage differentials. 7. Develop a schooling model that explains human capital investment. 8. Distinguish factors that affect earnings inequality and labor market discrimination. Credits: 3.00

ECON 39000 - Junior Level Problems In Economics

Credit Hours: 1.00 to 4.00. Investigation into a specific topic area of economics. Permission of instructor required.

Credits: 1.00 to 4.00

ECON 39040 - Economics Internship

Credit Hours: 1.00. An Economics-related work experience. This internship experience is intended to complement the student's academic plan-of-study and help prepare him/her for his/her future role in Economics. A letter from the prospective employer stating the period of employment, hours per week, job title, job qualifications, and job description may be requested before registration will be permitted. Permission of instructor required.

Learning Outcomes: 1. Internship experience. Credits: 1.00

ECON 39399 - Cooperative Experience III

Credit Hours: 0.00. Professional experience in economics. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.

Learning Outcomes: 1. Apply knowledge to identifying and solving problems in the professional context. 2. Advance skills related to professional preparation, critical thinking, problem solving, communication, and team work. 3. Increase understanding of the profession and practice, basic industry principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

ECON 39499 - Extensive Cooperative Experience IV

Credit Hours: 0.00. Professional experience in economics. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.

Learning Outcomes: 1. Apply knowledge to identifying and solving problems in the professional context. 2. Advance skills related to professional preparation, critical thinking, problem solving, communication, and team work. 3. Increase understanding of the profession and practice, basic industry principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

ECON 39599 - Extensive Cooperative Experience V

Credit Hours: 0.00. Professional experience in economics. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.

Learning Outcomes: 1. Apply knowledge to identifying and solving problems in the professional context. 2. Advance skills related to professional preparation, critical thinking, problem solving, communication, and team work. 3. Increase understanding of the profession and practice, basic industry principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

ECON 43200 - Economics Of Growth & Innovation

Credit Hours: 3.00. Part one: we focus on this fact: the richest countries in the world have incomes nearly 200 times greater than the poorest, with profound consequences for the lives (and deaths) of their citizens. Why nations are poor and how they can become rich is one of the most important questions in Economics. We will look at the role of investment, schooling, population growth and technology. Part two: we explore how globalization affects productivity and innovation. This includes how international trade and domestic policies affect allocative efficiency, accelerate structural change, and discipline competitive behaviors by domestic firms. We explore how firms grow on global markets, how technology is embodied in traded inputs, and how international markets for ideas and the possibility of imitation can lead to explosive growth. Part three: we explore a rapidly growing literature on the economics of innovation. We'll wrestle with the questions of: where new ideas come from, and whether it is becoming more difficult to innovate; how cities become hotbeds of innovation and how this will be affected by remote work; and how innovation can be shaped by choices of firms and by government policies.

Learning Outcomes: 1. Analyze income levels and growth rates across countries using economic models to understand and assess the underlying factors driving disparities in economic development, including investment, population growth, schooling, and technology; quantitatively assess these factors and make cross-country comparisons to build capabilities for engaging in economic reasoning through data; use economic models and research evidence to evaluate the causal drivers of, and impact of policy decisions on, innovation at the level of individuals, institutions, and places. Credits: 3.00

ECON 45100 - Game Theory

Credit Hours: 3.00. In the course, economic, political, and social interactions are represented as games, in which strategies and resulting outcomes can be analyzed. The analysis of these interactions is then used to demonstrate how one can make optimal decisions under uncertainty. This course uses Calculus.

Learning Outcomes: 1. Model strategic

interactions as a game. 2. Describe behavior in games using strategies. 3. Calculate the Nash equilibrium of a game. 4. Predict behavior in different games. 5. Explain the role of uncertainty in strategic interactions. Credits: 3.00

ECON 45600 - Urban Economics

Credit Hours: 3.00. Examines the market forces that lead to the development, growth, and size of cities. In addition, this course covers the theory of location and land use, principles of local public finance, policy problems in the areas of urban housing, transportation, crime, and pollution.

Credits: 3.00

ECON 46100 - Industrial Organization

Credit Hours: 3.00. This course examines the determinants of firm and market structure and the resulting market performance in imperfectly-competitive markets. Advanced topics include advertising, research and development, imperfectly competitive international markets, and market integration. Emphasis is placed on using theoretical models of firm and industry behavior to explain and analyze real-world examples of firm behavior.

Learning Outcomes: 1. Use basic versions of the models economists use to analyze imperfectly competitive markets. 2. Recognize the results of empirical tests of those models, in the laboratory and using real-world data. 3. Recognize the implications of these models for public policy toward business competition. Credits: 3.00

ECON 46300 - Advanced Data Analysis And Machine Learning

Credit Hours: 3.00. This is an advanced applied econometrics course that introduces students to a variety of techniques and methods for the empirical study of economic data. This course focuses on the practical aspects of economic data analysis, including data organization (such as merging and appending datasets) and the implementation of econometric models. This course will cover multivaraite linear regression, non-linear least squares, models for binary and categorical outcomes, model selection using machine learning, and panel data models. As part of the course, students will learn to conduct empirical analysis of economic data using Stata, a statistical software package.

Learning Outcomes: 1. Explore and organize economic data. 2. Apply a variety of econometric techniques including: multivariate linear regression, non-linear least squares, models for binary outcomes (including logit and probit models), and models for panel data (including linear random effects and fixed effects models). 3. Understand the fundamentals of machine learning and use machine learning for model selection. 4. Interpret and critique the results from econometric estimations. Credits: 3.00

ECON 46600 - International Economics

Credit Hours: 3.00. Analyzes topics in international economics, using more advantage techniques and more detailed treatment than in ECON 37000 or 37100. While coverage varies somewhat with instructor, some topics could include: economic growth, innovation and technology transfer, and the role of multinational corporations.

Learning Outcomes: 1. Demonstrate a basic understanding of Economics as applied to international trade and finances. 2. Understand the perspective provided by economic analysis regarding the interaction between economic growth and international trade. 3. Identify insights economics analysis provides concerning the benefits and costs of technology transfer and the role of multinational corporations. Credits: 3.00

ECON 47100 - Behavioral Economics

Credit Hours: 3.00. Students learn about human behavior in economic environments, with a strong emphasis on classroom laboratory exercises. Topics considered include behavior in a variety of markets - for example, markets with price controls, markets for financial assets and auction markets -- and behavior in social dilemmas that arise when people try to provide public goods voluntarily or when sellers try to conspire to fix prices. Students will also learn how people bargain with, trust each other, and show social preferences towards others. Decision-making and anomalies for risky and uncertain choices will also be covered.

Learning Outcomes: 1. Demonstrate a basic understanding of Economics as applied to human behavior in various economic environments based on classroom laboratory exercises. 2. Understand the perspective provided by economic analysis in social exchanges that involve bargaining, trust, and uncertainty. 3. Identify insights experimental economics provides concerning individuals' behavior in markets. Credits: 3.00

ECON 48500 - Economics Of Racial And Gender Discrimination

Credit Hours: 3.00. This course focuses on quantifying the extent of, and determining the underlying causes of racial and gender disparities in the labor market. Topics include the impact of prejudice on labor market outcomes, statistical discrimination, early childhood factors and differences in environment, and fertility and reproductive technology.

Learning Outcomes: 1. Quantify racial and gender disparities in economic outcomes. 2. Recognize the differences and importance of disparities that control and do not control for observable factors. 3. Understand the difference between prejudice and discrimination, and the extent to which prejudice can cause discrimination. 4. Assess how discrimination can occur even in the absence of prejudice. 5. Evaluate the impact of policies designed to reduce disparities, such as affirmative action. Credits: 3.00

ECON 49000 - Problems In Economics

Credit Hours: 1.00 to 4.00. Arrange with instructor before enrolling. Supervised reading and reports in various subjects. Open only to a limited number of seniors with superior records in previous courses. Permission of instructor required.

Learning Outcomes: 1. Vary by course topic. Credits: 1.00 to 4.00

ECON 49900 - Economics Capstone Research

Credit Hours: 3.00. The course combines experiential learning with a hands-on research project that unfolds over the course of a semester, serving as a culminating experience at the end of their degree program. The overarching objective of the capstone project is for students to understand how business problems can be addressed with empirical methods. This course is designed to help students develop a more comprehensive and integrative understanding of the major, apply their knowledge to develop and execute a methodologically rigorous research a project, and demonstrate their mastery of critical thinking and research skills they have acquired throughout their time in the major. In addition to a paper, completion of the research project may involve the presentation of the findings in a seminar or workshop setting.

Learning Outcomes: 1. Complete a high quality research paper that applies Economic analysis to a topic of particular interest to the student. 2. Develop a deep understanding of the roles that Economic theory and/or empirical analysis (Econometrics) play in creating high-quality economic analysis. 3. Identify the economics literature (journals, books, monographs, etc.) that relates to the research topic considered. Credits: 3.00

ECON 50000 - Mathematics For Economists

Credit Hours: 2.00 or 3.00. This is a Master's level course in mathematics and its application to economics. Students in this class will review and practice the mathematical methods required to solve micro and macroeconomic theoretical models, especially constrained optimization problems. Content covers algebra, univariate and multivariate calculus and constrained optimization methods

Learning Outcomes: 1. Solve problems requiring algebra and (uni-) multivariate calculus. 2. Apply algebra and calculus to solving (un)constrained optimization problems required by economic theoretical models. 3. Analyze assumptions embedded in economic theoretical models, e.g., functional forms and parameter values, using algebra and calculus. Credits: 2.00 or 3.00

ECON 50100 - Statistical Analysis For Economists

Credit Hours: 1.00 to 3.00. A master's level course in statistics and its application to economics. Course will familiarize students with the elements of statistics needed to perform econometrics.

Learning Outcomes: 1. Apply algebra and basic calculus to econom(etr)ic models. 2. Calculate and interpret univariate and multivariate statistics. 3. Describe and identify properties of random variables. 4. Select methods of and perform statistical inference. Credits: 1.00 to 3.00

ECON 51000 - Applied Game Theory

Credit Hours: 2.00. Game theory is a powerful tool that facilitates a decision making process of individuals. Games are characterized usually by two or more players where any player's action has an impact on other player's payoff. Players are decision making units, e.g. individuals, firms, workers, managers, countries etc. Game theory analyzes situations in which people (or other animals) interact by breaking these situations down into basic descriptions of the set of players, the strategies available to these players, and the payoffs that the players receive for different combinations of strategy choices. Permission of department required.

Learning Outcomes: 1. Understanding of the logical mechanics, provide good intuition and to

apply tools to explain events. Credits: 2.00

ECON 51100 - Intermediate Economics I

Credit Hours: 3.00. Consumer behavior and demand, production and cost, factor demand, market structure, general equilibrium and welfare. Emphasis on the tools used to analyze the behavior of individual economic units. Not open to students with credit in ECON 34000 .

Credits: 3.00

ECON 51200 - Intermediate Economics II

Credit Hours: 3.00. Course content includes money and banking, national income and aggregative economics; the analysis of the determination of national income, employment, the price level, and the balance of payments. Consideration of both theory and economic policy. Not open to students with credit in ECON 35200 .

Credits: 3.00

ECON 51302 - Fundamentals Of Macroeconomics

Credit Hours: 2.00. This course examines how the US economy functions and develops a theoretical framework permitting an analysis of the forces affecting national income, employment, unemployment, interest rates, and the rate of inflation. Throughout the semester we will discuss both the theory and the empirical evidence on aggregate macroeconomic measures; consumption, savings, and investment; labor supply and demand; employment and unemployment; economic growth; money and banking; and macroeconomic stabilization techniques.

Learning Outcomes: 1. Describe the macroeconomy using aggregate measures. 2. Identify and describe the drivers of households' consumption and savings decisions. 3. Demonstrate an understanding of the factors that affect business investment decisions. 4. Derive the short-run demand for labor. 5. Distinguish the major determinants of labor market participation and hours worked. 6. Recognize the different measures, causes and effects of unemployment. 7. Identify and describe the causes of long-run economic growth. 8. Recognize the causes and effects of inflation. 9. Assess economic information contained in news reports, policymakers' statements, and specialized publications. Credits: 2.00

ECON 51400 - Microeconomics (UCC: BSS)

Credit Hours: 2.00. An introduction to microeconomic theory. Analysis of consumer demand, output and input decisions of firms, price determination, economic efficiency, market structures, and market failure.

University Core Curriculum (UCC): (UCC: BSS) Learning Outcomes: 1. Calculate economic costs and benefits relevant for making rational decisions. 2. Identify factors that influence demand, supply, and market equilibrium. 3. Evaluate the efficiency and equity of market equilibrium and the role of government in achieving efficiency and equity. Credits: 2.00

ECON 51500 - Macroeconomics

Credit Hours: 1.00 to 3.00. Investigation of the causes of macroeconomic fluctuations in the economy. Looks at changes in inflation, unemployment, real output, interest rates, and exchange rates, and explores why they occur, what their effects are, and what, if any, role government should play in dealing with these problems. A mixture of theory and case studies with reference to historical case studies. Current macroeconomic problems will be discussed with a focus on the international aspects of macroeconomic problems.

Learning Outcomes: 1. Predict the macroeconomic impact of fiscal and monetary policies using the mathematical IS/LM models. 2. Demonstrate an understanding of the interdependencies and complexities with respect to international trade of goods and services as well as capital flows. 3. Analyze the possible economic/social impacts of various policy proposals from a historic perspective. Credits: 1.00 to 3.00

ECON 51600 - Introduction To Mathematics For Economics

Credit Hours: 2.00. This is a Master's level course in mathematics and its application to economics. Students in this class will review and practice the mathematical methods required to solve micro and macroeconomic theoretical models, especially constrained optimization problems. The content covers a review of algebra, univariate and multivariate calculus, and constrained optimization methods, e.g., LaGrange multipliers. Mastering these methods is instrumental to preparing for ECON 51100 & 51200 (micro and macro theory).

Learning Outcomes: 1. Solve problems requiring algebra and (uni-) multivariate calculus. 2. Apply algebra and calculus to solving (un)constrained optimization problems required by economic theoretical models. 3.

Analyze assumptions embedded in economic theoretical models, e.g., functional forms and parameter values, using algebra and calculus. Credits: 2.00

ECON 52000 - Industrial Economics

Credit Hours: 2.00. This course will explore the division of economic activity among industries in developed and less-developed countries. It will examine patterns of private and public ownership in different countries. It will discuss the determinants of market and firm structure, firm conduct, and market performance in imperfectly competitive markets, and different approaches to regulating such markets. Emphasis is placed on using basic economic models of firm and industry behavior to explain and analyze real-world markets. Permission of department required.

Learning Outcomes: 1. Students will be able to apply economic analysis and model to explain real-world firm and industry behavior. Credits: 2.00

ECON 52100 - Consumer & Producer Theory

Credit Hours: 2.00. In this course, we will develop and apply some of the basic theories of consumer and producer choices. You will learn how to approach issues from an economic perspective and gain an understanding of the microeconomic models and tools that will be used in subsequent courses.

Learning Outcomes: 1. Analyze key aspects of consumer and producer choices. 2. Understand how markets allocate resources. 3. Apply insights from microeconomic theory to public and economic policy. Credits: 2.00

ECON 53300 - Econometrics

Credit Hours: 2.00. This masters-level course in econometrics covers the tools that will enable students to conduct empirical analysis using economic data. The course examines the statistical techniques used in testing economic theories, estimating causal effects, and making predictions. Emphasis is placed on estimating a single equation and the problems associated with such estimation. In addition to multivariate OLS regression, students will be introduced to other regression methods including: instrumental variables estimation, time series estimation, and panel data methods. As part of the course, students will use Stata, a statistical software package.

Learning Outcomes: 1. Understand the theoretical foundations of linear regression methods. 2. Estimate linear regression model parameters and perform basic tests using Stata. 3. Interpret regression results and identify the sources of estimation bias. Credits: 2.00

ECON 53600 - Public Economics

Credit Hours: 2.00. This course is designed to introduce masters' students in economics to the field of health economics. We will analyze health and health care theories, institutions, and key policy issues. The course covers how the markets for health and health services are different from other goods, with a particular emphasis on the role of government and market failure. We will examine the demand for and the production of health and health care, and the behavior and organization of health care providers. We will also explore information asymmetries and the functioning of health insurance markets. We will consider health and healthcare systems around the world, paying particular attention to the U.S. health care system and recent reforms to it.

Learning Outcomes: 1. Know key details relating to the structure of the U.S. health care system, and be able to describe key institutions and programs involved in U.S. health care and health insurance. 2. Discuss the special features of health and health care that present challenges for economic analysis and policy development, including in terms of health care reform. 3. Apply economic concepts and approaches to understanding key health economics issues. 4. Explain, in broad terms, what health care systems look like in other countries and how they differ from the U.S. 5. Apply economic concepts and insights from public health to the current Covid-19 pandemic. Credits: 2.00

ECON 53700 - Health Economics

Credit Hours: 2.00 or 3.00. This course is designed to introduce masters' students in economics to the field of health economics. We will analyze health and health care theories, institutions, and key policy issues. The course covers how the markets for health and health services are different from other goods, with a particular emphasis on the role of government and market failure. We will examine the demand for and the production of health and health care, and the behavior and organization of health care providers. We will also explore information asymmetries and the functioning of health insurance markets. We will consider health and healthcare systems around the world, paying particular attention to the U.S. health care system and recent reforms to it.

Learning Outcomes: 1. Know key details relating to the structure of the U.S. health care system, and be able to describe key institutions and programs involved in U.S. health care and

health insurance. 2. Discuss the special features of health and health care that present challenges for economic analysis and policy development, including in terms of health care reform. 3. Apply economic concepts and approaches to understanding key health economics issues. 4. Explain, in broad terms, what health care systems look like in other countries and how they differ from the U.S. 5. Apply economic concepts and insights from public health to the current Covid-19 pandemic. Credits: 2.00 or 3.00

ECON 53800 - International Economics

Credit Hours: 2.00 or 3.00. The course covers selected topics in international trade with a focus on real world applications.

Learning Outcomes: 1. Identify the effects of international trade on wages, prices or products and welfare of nations. 2. Develop models as well as a diverse set of academic papers to discuss current policy debates. Credits: 2.00 or 3.00

ECON 53900 - Wage Discrimination

Credit Hours: 1.00. This course is an applied economics course that focuses on racial discrimination in the labor market. We will use the tools you have developed so far in the MA program to study the extent, causes and consequences of disparities in wages and employment by race.

Learning Outcomes: 1. Quantify racial and gender disparities in economic outcomes. 2. Recognize leading theories for those disparities. 3. Evaluate empirical evidence for these theories. 4. Assess policy responses to alleviate disparities. Credits: 1.00

ECON 54100 - Managerial Economics & Business Strategy

Credit Hours: 1.00. The course covers topics such as monopolies (price discrimination, optimal pricing strategies), advanced strategic decision-making and imperfect competition (optimal pricing and production), new product introductions, product variety offered on the market, and entry deterrence strategies. The main goal of this course is to provide a basis for a good understanding of the logical mechanics, and to provide a good intuition in managerial economics and business decision-making processes that facilitate the understanding of daily business problems.

Learning Outcomes: 1. Identify and explain logical mechanics that determine individuals' choices and decisions. 2. Evaluate managerial economic problems to better identify daily business problems. 3. Apply key aspects such as marginal concepts and countervailing effects when proposing solutions. 4. Illustrate main mechanisms using graphs and apply basic knowledge of algebra and calculus to business problems. Credits: 1.00

ECON 55000 - Personnel Economics

Credit Hours: 2.00. Personnel Economics applies micro- and macroeconomic theory to the workings of the labor market while maintaining a focus on incentives in the workplace. The course will investigate the determination of wages and compensation (based on a study of labor demand and supply) and the differences in these forms of payment for labor services across workers within an occupation, across occupations, and across cultures. Other topics to be considered include the connection between investments in education and training and labor market outcomes and estimates of the costs and benefits of immigration and employee turnover and discuss the impact of unions, as well as discrimination in the labor market issues. Permission of department required.

Learning Outcomes: 1. Students will have the tools of economic logic that allow them to evaluate proposals for labor policies on a firm-specific level and on a national level. Credits: 2.00

ECON 55400 - Business Cycles & Macroeconomic Policy

Credit Hours: 1.00. This course examines how the US economy functions and develops a theoretical framework permitting an analysis of the forces behind short-term fluctuations in the level of economic activity and the corresponding macroeconomic stabilization techniques. Topics covered include comprehending the origins and characteristics of business cycles, assessing the impact of government fiscal and monetary policies in fostering stable economic growth and prices, and evaluating the causes and consequences of unemployment.

Learning Outcomes: 1. Categorize and describe the causes and properties of business cycles. 2. Demonstrate an understanding of monetary and fiscal policy options as they relate to economic stabilization. 3. Use theoretical and empirical models to predict and evaluate the effects of economic policies on macroeconomic variables. 4. Assess economic information contained in

news reports, policymakers' statements, and specialized publications. Credits: 1.00

ECON 55500 - Economic Forecasting

Credit Hours: 2.00. This course provides an introduction to forecasting methods of current interest in economics. The goal is to equip students with a working knowledge of state-of-the-art techniques that are useful for forecasting macroeconomic variables. The strengths and weaknesses of the techniques will be analyzed and their empirical relevance will be demonstrated through a variety of applications to real data sets. The topics will include univariate prediction models, vector autoregressions, forecasting with large data sets, forecast combinations and forecast evaluation. Particular emphasis will be placed on applications and the issues involved with implementation of the various methods in practice.

Learning Outcomes: 1. Identify the statistical issues involved in forecasting economic data. 2. Analyze the strengths and weaknesses of a variety of forecasting techniques commonly used in economics. 3. Demonstrate the empirical relevance of each forecasting approach through applications to real-world data sets. Credits: 2.00

ECON 56200 - Econometrics I

Credit Hours: 3.00. This masters-level course in econometrics covers the tools that will enable students to conduct empirical analysis using economics data. The course examines the statistical techniques used in testing economic theories, estimating casual effects, and making predictions. Emphasis is placed on estimating a single equation (e.g., a demand function) and the problems associated with such estimation. As part of the course, students will estimate equations using STATA, a statistical software package. Permission of department required.

Learning Outcomes: 1. Students will have the tools to perform simple econometric analysis of Economic problems. Credits: 3.00

ECON 56400 - Advanced Quantitative Economics With Python

Credit Hours: 1.00. The main goal of this course is to extend the computational and programming toolkit developed in Quantitative Economics with Python. In particular, we will cover advanced methods for working with, visualizing and analyzing data in Python. In addition, we will consider more advanced programming techniques including stochastic optimization and infinite-horizon dynamic programming. Throughout the course we will consider a number of applications related to microeconomics, macroeconomics, and econometrics covered in the MS Econ program curriculum.

Learning Outcomes: 1. Have working knowledge of programming techniques in Python. 2. Have the ability to use scientific computing packages to analyze economic data. 3. Have an understanding of numerical methods used to solve economic models. 4. Use visualization tools to communicate computational results. Credits: 1.00

ECON 56500 - Law And Economics

Credit Hours: 2.00. This course is designed to give the student an understanding of both legal and economic principles and the relationship between them. It will also show the student how to access various data bases, Lexis/Nexis, to get a formal statement of the law and how the laws have actually been interpreted and enforced. Finally, through the use of economic analysis, the student will acquire the tools to predict the likely outcomes of particular laws and how they will affect their family and business decisions. Permission of department required.

Learning Outcomes: 1. The student is expected to understand the interplay between Economics and Law. Credits: 2.00

ECON 56700 - Managerial Economics And Business Strategy

Credit Hours: 1.00 to 4.00. This course studies optimal decision-making processes made by managers and policymakers within firms and other organizations. The course is based on microeconomics and applies advanced microeconomics-related concepts with an emphasis on pricing strategies. The course covers topics such as monopolies (price discrimination, optimal pricing strategies), advanced strategic decision-making and imperfect competition (optimal pricing and production), new product introductions, product variety offered on the market, and entry deterrence strategies. We use a variety of examples and applications, and operate with modern tools (Game Theory) that facilitate the decision-making process for individuals, policymakers and managers. The main goal of this course is to provide a basis for a good understanding of the logical mechanics, and to provide a good intuition in managerial economics and business decision-making processes that facilitate the understanding of daily business problems. Permission of instructor required.

Learning Outcomes: 1. Identify and explain logical mechanics that determine individuals' choices and decisions. 2. Evaluate managerial economic problems to better identify daily business problems. 3. Apply key aspects such as marginal concepts and countervailing effects when proposing solutions. 4. Illustrate main mechanisms using graphs and apply basic

knowledge of algebra and calculus to business problems. Credits: 1.00 to 4.00

ECON 57200 - Econometrics II

Credit Hours: 2.00. This course reviews basic concepts in probability, mathematical statistics and linear algebra in order to obtain a more rigorous understanding of the linear regression model, its representation and assumptions, procedures for estimation and properties associated with the OLS estimator. We move on and apply what we have learned to the linear regression model. We discuss estimation and prediction, establish properties such as efficiency, unbiasedness, consistency and convergence in mean square. We conclude by considering a few nonlinear models appropriate for modeling binary outcomes. Permission of department required.

Learning Outcomes: 1. A student will be able to apply Econometric analysis to specific economic questions using MATLAB. Credits: 2.00

ECON 57300 - Financial Econometrics

Credit Hours: 2.00. This course offers an introduction of basic principles of econometric analysis that will help students understand finance theories and their empirical applications. It will also equip students with appropriate statistical techniques for doing applied financial research. The statistical techniques are particularly well suited for analyzing financial time-series data. Permission of department required.

Learning Outcomes: 1. The student will be able to apply Econometric time series methods to analysis financial data. Credits: 2.00

ECON 57600 - Statistical & Machine Learning

Credit Hours: 2.00 or 3.00. This is an introductory course in statistical and machine learning. It will cover fundamental concepts and essential tools that are critical in understanding cutting-edge machine learning techniques. Students will develop skills in applying a wide
variety of modeling and prediction methods. Topics include linear regression, classification, regularization and shrinkage methods, tree-based methods, and support vector machines. An integral part of this course is the extensive use of the open source statistical software R. Students will gain hands-on experience in analyzing datasets commonly used in business and economics.

Learning Outcomes: 1. Develop skills in applying a wide variety of modeling and prediction methods. Topics include linear regression, classification, regularization and shrinkage methods, tree-based methods, and support vector machines. An integral part of this course is the extensive use of the open source statistical software R. 2. Gain hands-on experience in analyzing datasets commonly used in business and economics. Credits: 2.00 or 3.00

ECON 57700 - Quantitative Economics With Python

Credit Hours: 2.00 or 3.00. Introduce students to computational and programming in Python.

Learning Outcomes: 1. Learn Python essentials including basic programming techniques and the use of popular packages for data analysis and more advanced programming techniques including numerical methods, dynamic programming, and simulation-based methods. Credits: 2.00 or 3.00

ECON 57800 - Statistical & Machine Learning II

Credit Hours: 2.00. This is a second course in machine learning. After studying the fundamental concepts and essential machine learning tools in Machine Learning I, this follow-up course will go over a range of more advanced topics and learning methods. Topics include support vector machines, deep learning and neural networks, principal components analysis and other unsupervised learning methods. As in the first course, we will be using the statistical software R and its packages extensively to implement various learning methods.

Learning Outcomes: 1. Explain how common learning methods are implemented. 2. Train a range of deep learning models. 3. Perform dimension reduction techniques to summarize high-dimensional data in an efficient manner. 4. Select appropriate models and learning methods for a particular application. Credits: 2.00

ECON 58400 - Experimental Economics

Credit Hours: 2.00 or 3.00. This course introduces you to the experimental methods used by economists to study human behavior. These methods analyze data collected in controlled laboratory experiments. Throughout the course, we will discuss different types of experiments that have been extensively researched by experimental economists. To help introduce and motivate each topic, you will participate in weekly synchronous experiments with your classmates over the internet. You will then complete an assignment analyzing the data generated by your class in the online experiment. The following lecture will provide an overview of the theoretical framework and experimental predictions. We will also discuss commonly observed behavior and any relevant explanations for such behavior.

Learning Outcomes: 1. Demonstrate an understanding of the experimental methodology used by economists to study human behavior. 2. Evaluate economic behavior by analyzing and interpreting experimental data and its relationship to common economic models. 3. Identify and explain common insights that experiments provide regarding people's behavior in strategic situations. Credits: 2.00 or 3.00

ECON 58500 - Behavioral Economics

Credit Hours: 2.00 or 3.00. This course explores human economic behavior, with a strong emphasis on laboratory and field experiment methodology used in behavioral economics research. Topics considered include behavior in markets for financial assets and auction markets, and behavior in social dilemmas that arise when people try to provide public goods voluntarily or increase economic surplus through trust. Students will also study how people bargain with and exhibit social preferences towards others. Decision-making and anomalies for risky uncertain choices will also be covered.

Credits: 2.00 or 3.00

ECON 58700 - Advanced Quantitative Economics With Python

Credit Hours: 3.00. The main goal of this course is to extend the computational and programming toolkit developed in Quantitative Economics with Python course. In particular, we will cover advanced methods for working with, visualizing and analyzing data in Python. In addition, we will consider more advanced programming techniques including stochastic optimization and dynamic programming. Throughout the course, we will consider a number of applications related to microeconomics, macroeconomics, and econometrics covered in the MS Econ program curriculum.

Learning Outcomes: 1. Gain working knowledge of programming techniques in Python. 2. Use scientific computing packages to analyze economic data. 3. Understand numerical methods used to solve economic models. 4. Use visualization tools to communicate computational results. Credits: 3.00

ECON 59000 - Problems In Economics

Credit Hours: 1.00 to 4.00. Open only to a limited number of seniors and graduate students. Arrange with instructor before enrolling. Supervised reading and reports in various subjects. Permission of instructor required.

Credits: 1.00 to 4.00

ECON 59100 - Financial Valuation And Decision Making

Credit Hours: 2.00 or 3.00. A comprehensive introduction to finance. The object of this course is to provide the computational framework necessary to appreciate and understand how to make decisions based on sound financial reasoning.

Learning Outcomes: 1. Develop skills in investment decisions and financing decisions. Credits: 2.00 or 3.00

ECON 60000 - Teaching Economics

Credit Hours: 1.00 to 3.00. This course traces the development of economic theory from the Mercantilist writers through the contributions of J. S. Mill and Karl Marx. Topics covered include the development of value theory (especially labor theories of value), theories of economic growth and business cycles, the classical debate over the meaning and validity of Say's Law, and changing views regarding the appropriate role of government in the marketplace. In each case, the contributions of the authors considered are evaluated in light of our modern understanding of economic theory.

Credits: 1.00 to 3.00

ECON 60600 - Microeconomics I

Credit Hours: 1.00 to 3.00. An introduction to basic consumer and producer theory, competitive markets (including using the continuum to model competition), basic general equilibrium theory, and basic risk/uncertainty. Co-requisite: ECON 61500.

Learning Outcomes: 1. Demonstrate basic knowledge of both basic consumer and producer theory as used in graduate level economics 2. Develop and use a standard toolkit of mathematical methods to set up and solve problems in these area. 3. Assess through a series of homework and exams. Credits: 1.00 to 3.00

ECON 60700 - Microeconomics II

Credit Hours: 1.00 to 3.00. Building on Microeconomics I, more advanced consumer and producer theory using support functions, risk/uncertainty and information, and basic game theory and oligopoly. Prerequisite: ECON 60600 .

Credits: 1.00 to 3.00

ECON 60800 - Macroeconomic Theory I

Credit Hours: 2.00 or 3.00. An introduction to general equilibrium macroeconomic models in both deterministic and stochastic settings. Topics studied include: static neoclassical models, social planner problems, dynamic programming, growth and capital accumulation, stochastic economies, asset pricing, and overlapping generations models.

Credits: 2.00 or 3.00

ECON 60900 - Microeconomics III

Credit Hours: 1.00 to 3.00. An advanced course in game theory and general equilibrium theory. Among the topics covered are: games in strategic form, games in extensive form, games of incomplete information, cooperative games with side payments, mechanism design, consumer choice theory, Pareto optimality, the Arrow-Debreu-McKenzie model, and the existence and stability of competitive equilibria. Prerequisite: ECON 60600 .

Learning Outcomes: 1. Demonstrate an advanced understanding of microeconomic topics, including extensions in game theory, Pareto optimality, the Arrow-Debreu-McKenzie model, and the existence and stability of competitive equilibria. 2. Identify insights game theory provides in translating informal descriptions of multi-person decision situations into formal game-theoretic problems, including the class of games in which the players are tasked to simultaneously distribute limited resources over several objects. 3. Understand the perspective provided by general equilibrium analysis contrasted with particle equilibrium theory. Credits: 1.00 to 3.00

ECON 61000 - Advanced Game Theory

Credit Hours: 1.00 to 3.00. An advanced course in game theory and its applications. Among the topics covered are: extensive form games, normal form games, Nash equilibrium, mixed strategies equilibrium, subgame perfect equilibrium, learning and equilibrium, games with incomplete information, repeated games, cooperative games, noncooperative bargaining, and auctions. Prerequisite: ECON 60600 .

Learning Outcomes: 1. Demonstrate an advanced understanding of game theory and strategic thinking, including concepts such as dominance, backward induction, equilibrium, commitment, extensive form games, and asymmetric information. 2. Understand the perspective provided by game theory for a variety of games played in economic and political settings. 3. Identify insights game theory provides in translating an informal description of a multi-person decision situation into a formal game-theoretic problem. Credits: 1.00 to 3.00

ECON 61100 - Macroeconomic Theory II

Credit Hours: 2.00 or 3.00. An introduction to selected topics in macroeconomics, including theories of business cycles, economic growth, microfoundations of labor markets and some miscellaneous issues. Topics covered include: theories of business cycles (real business cycles, information imperfections, coordination failures), economics of growth (neoclassical model, human capital model, endogenous growth), microfoundations of labor markets (recursive competitive equilibrium models, search and matching models, efficiency wages, implicit contracts, insider-outsider model), miscellaneous issues including monetary economics (cash-in-advance constraint models), the Lucas critique, time inconsistency, and endogenous cycles. Prerequisite: ECON 60800 .

Credits: 2.00 or 3.00

ECON 61200 - Macroeconomic Theory III

Credit Hours: 1.00 to 3.00. Selected topics in contemporary research in macroeconomic theory. Emphasis on the implications of uncertainty in macroeconomic theory, including such topics as search theory, asset selection under uncertainty, stochastic optimal control, and asymmetric information.

Learning Outcomes: 1. Understand and define equilibrium in various models. 2. Identify the sources of inefficiencies in a competitive equilibrium. 3. Develop foundations in macroeconomic models necessary to pursue research in economics. Credits: 1.00 to 3.00

ECON 61400 - Economics Of Information

Credit Hours: 1.00 to 3.00. An introduction to the economics of information. Key topics considered are nonexpected utility theory and the various implications of asymmetric information-either hidden action(s) and/or hidden types, including extensions of the basic principal-agent model as well adverse selection issues, mechanism design, and screening/signaling models. Other topics that may be considered include the value of information/real option theory, herd behavior, capital asset pricing models, stochastic calculus and options pricing models, organizational decision making, search theory and price dispersion models, and herd behavior. Prerequisite: ECON 60600 .

Credits: 1.00 to 3.00

ECON 61500 - Mathematical Analysis For Economists

Credit Hours: 2.00 or 3.00. Topics include constrained optimization, comparative statics, and elementary topics in mathematical analysis. Students should be familiar with calculus, linear algebra, basic probability, and have a grasp of microeconomic theory (such as the material covered in ECON 51100).

Learning Outcomes: 1. Master key mathematical concepts used in advanced (PhD level) Economics courses. 2. Gain the ability to

analyze Economics problems using higher level mathematical tools. Credits: 2.00 or 3.00

ECON 61800 - Advanced Topics In Economics

Credit Hours: 3.00. Macro/international theory workshop. Topics on macroeconomics and international economics are presented by departmental and external speakers.

Learning Outcomes: 1. Gain awareness of the latest research in Economics across a variety of fields in Economics. 2. Identify ways to effectively communicate new research in Economics to others. 3. Understand how the development of new formal theoretic models and/or the execution of rigorous novel empirical research using the latest Econometric methods provide insights for current policy discussion. Credits: 3.00

ECON 62000 - Industrial Organization

Credit Hours: 1.00 to 3.00. A survey of some of the major theoretical issues in the field of industrial organization. Topics include: the welfare economics of competition and monopoly, static and dynamic oligopoly theory, differentiated products models, and entry deterrence.

Credits: 1.00 to 3.00

ECON 62100 - Applied Industrial Organization

Credit Hours: 1.00 to 3.00. A continuation of ECON 62000, with emphasis on empirical analysis and the application of theory to real-world situations. Topics covered include: empirical estimation of market structure, empirical tests of market conduct, the effect of anti-competitive behavior on economic performance, antitrust practice, regulation theory and practice, and experimental industrial economics. The material is selected from current journal articles. Prerequisite: ECON 62000.

Learning Outcomes: 1. Understand methodological developments in the area of empirical Industrial Organization. 2. Establish empirical models and test hypotheses derived from theory. 3. Gain insights in data evaluation and apply statistical software. 4. Derive, estimate, and interpret economic concepts such as market power, economies of scale and scope, price elasticities of demand, etc. Credits: 1.00 to 3.00

ECON 62400 - Estimating Game Theoretic Models

Credit Hours: 2.00 or 3.00. This course examines topics in empirical industrial organization (I.O.), which aims to use data to draw conclusions about how market and firm structure, firm conduct, and market performance interact in imperfectly competitive markets. We will take a "structural" approach, focusing on estimating the parameters of game theoretic models using real industry data, and then simulating those same models to generate predictions under alternative ("counterfactual") scenarios. We will cover theory only to the extent that it provides intuition or testable conclusions. The course is divided into two unequal parts. In the first part, we will learn about static games in the context of mergers, market power, and entry. In the second part, we will focus on the estimation of dynamic games, after first understanding how to solve and estimate dynamic single-agent problems.

Learning Outcomes: 1. Know about several important empirical methods, and you will understand why we use them. 2. Apply some of those methods to real data, generating your own usable code for implementing them. 3. Highlight the advantages and shortcomings of any given method by pointing to scholarly work that applies that method to real industry data. 4. Have the kind of in-depth knowledge (for at least one of these methods) that makes you an expert (and resource) among your peers. 5. Have practiced your presentation skills. 6. Have thought creatively about the challenges facing the forefront of empirical I.O. Credits: 2.00 or 3.00

ECON 63200 - Labor Economics

Credit Hours: 1.00 to 3.00. An area seminar. Theoretical and empirical research on the financial markets.

Credits: 1.00 to 3.00

ECON 63400 - International Trade

Credit Hours: 1.00 to 3.00. Application of microeconomic techniques to international trade. Topics include: classical, neoclassical, and modern theories of international trade; the theory of tariffs and commercial policy, (including aspects of political economy), welfare aspects of trade and tariff theory, and related topics. The material is selected from current journal articles. Prerequisite: ECON 60700.

Learning Outcomes: 1. Acquire the important building blocks for conducting both theoretical and empirical research in international trade. 2. Develop a keen understanding of the state of current research in trade and labor-market outcome. 3. Refine your skills in critical thinking and nourish your ability to initiate and execute

independent inquiries. Credits: 1.00 to 3.00

ECON 63600 - Topics And Research In International Trade

Credit Hours: 1.00 to 3.00. A course in international trade theory and empirics, with emphasis on surveying the recent developments in the field-including empirical applications of material covered in ECON 634. While specific subject matter may vary from year to year, likely topics include: theory and empirics on trade and wages, trade and the environment, trade in the presence of multinational firms and vertical specialization, empirical evaluation of the positive theories of trade (especially factor endowment and variety models), and the identification and measurement of trade barriers and their effects. Material is selected from current journal articles. Prerequisite: ECON 60700.

Learning Outcomes: 1. Identify the evolution & applications of general equilibrium modeling with heterogeneous firms and industries. 2. Outline theory and simulation techniques to modeling frameworks to questions in international trade. 3. Demonstrate knowledge & analysis of New Trade Theory applications through preparation of a 20-30 minute in class presentation. Credits: 1.00 to 3.00

ECON 64100 - Agent-Based Computational Economics

Credit Hours: 2.00 or 3.00. Computational study of economic systems involving interacting agents who do not necessarily possess perfect rationality and information. In addition to equilibrium analysis, agent-based models focus on out-of-equilibrium dynamics that may or may not lead to equilibrium in the long run,

Learning Outcomes: 1. Provide foundation for implementing agent-based simulations in Python. 2. Use agent-based approach to explain and/or complement findings from studies that use human subject experiments. Credits: 2.00 or 3.00

ECON 64200 - Computational Economics

Credit Hours: 2.00 or 3.00. The purpose of this class is to give you a computational toolbox you can apply to economic questions. We will introduce and use numerical methods on computationally tractable problems. The goal of the course is to encourage Ph.D. students to apply these techniques to their own research. Our in-class applications
will primarily be public policy and macro-oriented, by solving and simulating the problems of microeconomic agents and aggregating the results.

Learning Outcomes: 1. Use a computational toolbox that you can apply to economic questions. 2. Solve policy functions of Bellman equations and simulating agent behavior. 3. Solve and simulate the problems of microeconomic agents and aggregating the results. Credits: 2.00 or 3.00

ECON 64300 - Search Theory And Applications In Macroeconomics

Credit Hours: 2.00. This course will employ both self-prepared notes on foundational and current topics in the research area as well as recommended/required texts. Often, students will be required to read, understand and summarize a number of published research papers in this area of study. Methods of assessment will include frequent problem sets that require analysis of data / theoretical analysis of key topics and a capstone course project. Students will develop mastery of frequently used-models and techniques in the literature, including the classic Diamond-Mortensen-Pissarides model of the labor market and Kiyotaki-Wright/Lagos-Wright model of monetary economies. Prerequisite: ECON 61100.

Learning Outcomes: 1. Identify, formulate, and solve general equilibrium search models. 2. Use search models to interpret empirical regularities and assess policy. 3. Discuss and evaluate papers in the literature. 4. Identify topics for future research that can be studied with the tools of search theory. Credits: 2.00

ECON 64500 - International Macroeconomics

Credit Hours: 2.00. One of the challenging and interesting areas of economic research seeks to integrate three intimately related dimensions of economic activity and the choices underlying them: who, when, what, and where? In a nutshell, the main objective of this course is to develop a better understanding of what I will call DS2GE models - Dynamic Stochastic Spatial General Equilibrium models. The strategy will be to take different paths through the research literature while maintaining focus on the who, what, when and where in each reading.

Learning Outcomes: 1. Have a deep understanding of the key theoretical models in use in the field. 2. Understand how the model is both shaped by empirical observation and estimated or tested using real-world data. 3. Solve some small-scale models or sub-parts of models. 4. Use computer algorithms to formulate, calibrate, estimate and simulate a

small-scale Dynamics Stochastic General Equilibrium model of an open economy. 5. Read, understand and assess (i.e., write a professional referee report) peer-reviewed publications in the field of international macroeconomics and trade. 6. Present a research paper clearly and with insight. 7. Develop a preliminary research paper proposal as might fit into a dissertation proposal. Credits: 2.00

ECON 64700 - Urban Economics I

Credit Hours: 2.00. This course explores topics related to current research at the intersection of labor and urban economics. There is significant overlap with industrial organization and trade in topics and methods.

Learning Outcomes: 1. Understand the unique economics of cities and regions. 2. Improve technical knowledge of relevant empirical and structural approaches and their appropriate applications. 3. Evaluate existing research critically. 4. Gain maturity in communicating your own research ideas. Credits: 2.00

ECON 64800 - Urban Economics II

Credit Hours: 2.00. This course is the second part in the sequence Urban Economics. It is aimed at second and third-year PhD students in Economics. This course visits selected topics related to internal migration, regional development and government policies, roles of transportation infrastructure, and urbanization in developing countries. This course aims at familiarizing students with the field's important questions, workhorse models, and key empirical methods. As part of the course, students will start developing their independent research.

Learning Outcomes: 1. Be familiar with recent literature in topics related to urban and regional economics, including regional development policies, residential sorting and its consequences, infrastructure, and the housing market. 2. Use workhorse models and empirical methods in their own original research. 3. Work with spatial data using Python or R. 4. Formulate a research idea, collect data, conduct initial investigation, and present preliminary findings. Credits: 2.00

ECON 64900 - Advanced Topics In Panel Data & Spatial Econometrics

Credit Hours: 2.00. This course covers selected topics in panel data and spatial econometrics with an emphasis on developing a clear understanding of the methodological issues involved as well as identifying a set of substantive issues where such methods can be applied. Familiarity with a matrix-oriented programming language is essential. Considerable emphasis will be placed on the replication of simulation and empirical results from published papers. Prerequisite: ECON 67200.

Learning Outcomes: 1. Understand concepts for characterizing panel and spatial data. 2. Estimate panel and spatial models and conduct inferences. 3. Apply to real economic panel and spatial data. Credits: 2.00

ECON 65000 - Applied Microeconometrics

Credit Hours: 1.00 to 3.00. Topics in labor economics. While the specific subject matter varies from year to year, recent seminars have examined such topics as dynamic labor demand and supply analysis, human capital theory, screening and signaling theories, contract theory, efficiency wages, job matching, search, unions, and internal labor markets. Material is selected from current journal articles.

Learning Outcomes: 1. Understand the background and motivation for various microeconometric model. 2. Recognize the assumptions or conditions that provide identification of the treatment effect in each model. 3. Use Stata to estimate policy-relevant treatment effect using non-experimental data. 4. Demonstrate how to read and understand economic journal articles that use the methods introduced in this course. 5. Perform PhD-level empirical research using microeconometric methods. Credits: 1.00 to 3.00

ECON 65300 - Topics In Early Childhood Development

Credit Hours: 2.00 or 3.00. This course is the second in the Ph.D. Labor Economics sequence. We will focus on the economics of skill formation and its consequences on later outcomes like schooling choices, health, social behaviors and labor market variables. We will do this, by analyzing both static and dynamic settings, in which we recognize that skill formation is a process where early inputs affect the productivity of later ones. This course will be econometrically intense, covering from reduced form techniques to structural ones. We will pay special attention to econometric identification of effects and the analysis of skills as unobserved heterogeneity, its consequences on

empirical estimation and models to address it. This course will emphasize the connection between theory and practice.

Learning Outcomes: 1. Understand the role played by the endogeneity caused by the unobserved heterogeneity in econometric estimation. 2. Understand and use advanced methodologies that allow the correct estimation of econometric models in non-standard settings, like in the presence of self-selection and unobserved heterogeneity. 3. Understand the economic theory and evidence that allow us to claim that early childhood development is one of the most important investment a person can do. 4. Know the relevant literature regarding early childhood development, skill formation and econometric estimation techniques employed in these subareas of labor economics. 5. Understand why and how skills evolve over time. Credits: 2.00 or 3.00

ECON 65400 - Topics In Empirical Labor & Public Economics

Credit Hours: 2.00. Provide an introduction to the baseline models of labor supply, including static and dynamic model of labot supply. Introduce students to several seminal and new papers on labor supply. Provide students with the conceptual understanding and computational tools (Stata and Matlab) required to adapt and apply the models presented in the course to address new research questions in labor and public economics. Provide students with an basic understanding of the Current Population Survey (CPS). Motivate and illustrate simulation-assisted estimation as a method for estimating structural models of labor supply.

Learning Outcomes: 1. Understand baseline models of labor supply, including static and dynamic model of labor supply. 2. Understand concepts and use of computational tools (Stata and Matlab). 3. Basic understanding of the Current Population Survey (CPS). 4. Illustrate simulation-assisted estimation as a method for estimating structural models of labor supply. Credits: 2.00

ECON 65500 - Public Economics

Credit Hours: 2.00 to 3.00. Knowledge of various types of government programs, public policies and program administration. Prerequisite: ECON 65000.

Learning Outcomes: 1. Gain a working knowledge of various types of government programs. 2. Understand the application of reduced form methods for studying public policy. 3. Assemble a portfolio of potential study topics related to public economics. 4. Gain experience in presenting and discussing research. Credits: 2.00 to 3.00

ECON 65600 - Labor Economics II

Credit Hours: 2.00. This course is the third in the PhD Labor Economics sequence. This course is designed to be primarily a "topics" course. Class will focus on some of the most popular open questions in labor economics, however, we will take a long view to these questions in order to understand the progress that has been made over the last half-century.

Learning Outcomes: 1. Cover many of the theoretical underpinnings across topics in labor economics. 2. Understand these tools for quality dissertation writing in labor economics. Credits: 2.00

ECON 65700 - Search Theory & Applications

Credit Hours: 2.00. This course provides an overview to the tools and applications of search theory, which has been a very active area of research. The aim of this course is to provide students with a solid understanding of the search approach and to get started on engaging in research. The first part of the class will cover topics in labor economics, while the second part turns to applications in monetary economics. It is also worth noting that search models have also been successfully applied in other contexts (e.g., housing, marriage and household formation, over-the-counter markets, international trade, industrial organization, just to name a few). Graduate students with broad interests in applied theory, labor economics, macroeconomics, and trade are encouraged to take this class.

Learning Outcomes: 1. Formulate and solve general equilibrium search models. 2. Use search models to interpret empirical regularities and assess policy. 3. Discuss and evaluate papers critically in the literature. 4. Identify topics for future research that can be studied with the tools of search theory. Credits: 2.00

ECON 65800 - Public Economics II

Credit Hours: 2.00. This course explores the operations of government in society and the economy. Using real-world policy examples, motivations for intervention and policy alternatives are explored. A strong emphasis is placed on causal inference and seminal papers in the field of public economics.

Learning Outcomes: 1. Identify and describe the most common types of government programs.

2. Evaluate empirical methods used in public economics literature. 3. Suggest research projects related to public policy. 4. Provide valuable feedback to peers (identify and articulate) on research ideas. 5. Present research in a clear and concise way to an audience. Credits: 2.00

ECON 66200 - Game Theory

Credit Hours: 2.00 or 3.00. In this course, we will examine some of the basic elements of Game Theory. Game Theory studies strategic environments in which each individual's payoff depends upon both their own actions as well as the actions of others. Game Theory attempts to develop an understanding of such situations and to provide a formal framework and solution concepts for making better strategic choices.

Learning Outcomes: 1. Apply game-theoretic reasoning to real-world problems in a range of environments, including: (i) static (normal-form) games with complete or incomplete information, (ii) dynamic (extensive-form) games with complete or incomplete information, and (iii) repeated games. Credits: 2.00 or 3.00

ECON 66800 - Topics In Applied Economics

Credit Hours: 3.00. Applied micro workshop. Topics on applied macroeconomics are presented by departmental and external speakers.

Credits: 3.00

ECON 67000 - Probability And Statistics

Credit Hours: 2.00 or 3.00. An introduction to probability theory and the basic statistical estimation methods. Topics include: axiomatic development of probability theory, counting methods, conditional probability and Bayes' theorem, random variables and distributions, expectation, variance, covariance and correlation, special distributions, statistical inference, maximum likelihood estimators, unbiased estimation, and testing hypotheses. Prerequisite: ECON 61500.

Learning Outcomes: 1. Identify important statistical issues of interest in practical scenarios. 2. Demonstrate the application of state of the art statistical methods to relevant economic questions. 3. Outline a broad picture of the subject by logically connecting the various topics. Credits: 2.00 or 3.00

ECON 67100 - Econometrics I

Credit Hours: 1.00 to 3.00. An introduction to the modern techniques of econometrics and their applications. Topics include: the classical linear regression model (specification, estimation, inference, and prediction), specification analysis, functional form, heteroscedasticity, and autocorrelation. Prerequisite: ECON 67000.

Learning Outcomes: 1. Investigate the properties of econometric estimators under a variety of conditions. 2. Explain econometric techniques for estimating causal effects. 3. Explain the principles and purpose of Monte Carlo simulation methods. 4. Conduct basic empirical analyses of cross sectional data. Credits: 1.00 to 3.00

ECON 67200 - Econometrics II

Credit Hours: 1.00 to 3.00. Topics include generalized method of moments, estimation and inference with weak instruments, panel data models and bootstrap methods. Prerequisite: ECON 67100.

Learning Outcomes: 1. Identify important econometric issues of interest in practical scenarios. 2. Demonstrate the application of state of the art methods to relevant economic questions. 3. Outline a broad picture of the subject by logically connecting the various topics. 4. Criticize the use of inadequate methods through discussion of published work. Credits: 1.00 to 3.00

ECON 67300 - Time Series Econometrics

Credit Hours: 1.00 to 3.00. This advanced course gives an up-to-date and comprehensive treatment of modern time series analysis and empirical macroeconomics. Topics include: ARIMA processes, spectral analysis, forecasting, covariance-stationary vector processes, vector autoregressions, state space representations in the Kalman filter, non-stationary time series and fractional integrated processes, and time series models of heteroscedasticity. Prerequisite: ECON 67200 .

Credits: 1.00 to 3.00

ECON 67400 - Microeconometrics

Credit Hours: 1.00 to 3.00. This advanced course covers the econometrics and statistical methods needed to study data on individual agents in general qualitative response models and models of limited dependent variables. Special emphasis is placed on applying the alternate estimation and inference techniques to actual or simulated datasets. Topics include: univariate binary models, multinomial and multivariate qualitative response models, choice based sampling, distribution-free estimation methods, and Tobit models. Prerequisite: ECON 67200 .

Credits: 1.00 to 3.00

ECON 67800 - Search Theory And Applications

Credit Hours: 2.00 or 3.00. This course provides an overview to the tools and applications of search theory, which has been a very active area of research. The aim of this course is to provide students with a solid understanding of the search approach and to get started on engaging in research.

Learning Outcomes: 1. Formulate and solve general equilibrium search models. 2. Use search models to interpret empirical regularities and assess policy. 3. Critically discuss and evaluate papers in the literature. 4. Identify topics for future research that can be studied with the tools of search theory. Credits: 2.00 or 3.00

ECON 68500 - Experimental Economics I

Credit Hours: 1.00 to 3.00. An overview of seminal and recent developments in experimental economic research. Provides practical training in designing and conducting experiments and the analysis of experimental data. Content varies from year to year. Applications include: industrial organization, game theory, finance, international trade, information economics, and monetary economics. Course readings are primarily from journal articles. Prerequisite: ECON 60700 . ECON 61000 .

Credits: 1.00 to 3.00

ECON 68600 - Experimental Economics II

Credit Hours: 2.00 or 3.00. Covers topics different from ECON 685, and they vary from year to year. May be taken prior to ECON 685. Course readings are primarily from journal articles. Prerequisite: ECON 60700. 61000.

Learning Outcomes: 1. Identify research questions that are suitable for answering using economics experiments. 2. Develop you own experimental designs to address specific research questions and hypotheses. 3. Criticize and evaluate experimental research published in leading economics journals. Credits: 2.00 or 3.00

ECON 68900 - Experimental And Behavioral Economics

Credit Hours: 2.00. The course will cover: (i) experimental methodology; (ii) statistical considerations in experiments; (iii) behavioral game theory (including psychological games and boundedly rational thinking in games); (iv) loss aversion and reference points (including prospect theory, expectations-based reference points, and goal setting); and (v) experiments on gender. We will also discuss how to develop good research ideas in experimental economics, and how to write papers in a way that appeals to top journals in the field.

Learning Outcomes: 1. Develop the skills to design experiments that test cleanly predictions from economic theory. 2. Understand what statistical techniques are appropriate for different types of experimental designs. 3. Become familiar with cutting-edge research in the field of experimental and behavioral economics. 4. Gain experience in how to present research effectively. 5. Learn how to write research papers that will appeal to the top journals in the field. Credits: 2.00

ECON 69000 - Advanced Problems In Economics

Credit Hours: 1.00 to 4.00. Advanced individual reading and investigation in a specific economic field at the graduate level. Open to individual students with superior records. Permission of instructor required.

Credits: 1.00 to 4.00

ECON 69100 - Advanced Topics In Panel Data

Credit Hours: 2.00 or 3.00. This course covers selected topics in the econometrics of panel data with an emphasis on developing a clear understanding of the methodological issues involved as well as identifying a set of substantive empirical issues where such methods can be applied. Prerequisite: ECON 67100 and ECON 67200.

Learning Outcomes: 1. Organize data into an easy to interrupt manner. 2. Understand the role of factor models as a tool for dimension reduction in the analysis of large-dimensional data as well as a device for modeling cross-sectional correlation in panel data analysis when the cross-sectional and time series dimensions are comparable in magnitude. Credits: 2.00 or 3.00

ECON 69200 - Advanced Topics In Time Series

Credit Hours: 2.00 or 3.00. This course covers a set of selected topics of current interest in eco-nomic forecasting. It is designed for students interested in conducting theoretical research related to the development and evaluation of new forecasting techniques as well as those inclined towards the application of state-of-the-art techniques to economic data.

Learning Outcomes: 1. Organize data into an easy to interpret manner. 2. Understand the role of factor models as a tool for dimension reduction in the analysis of large-dimensional data as well as a device for modeling cross-sectional correlation in panel data analysis when the cross-sectional and time series

dimensions are comparable in magnitude. Credits: 2.00 or 3.00

ECON 69300 - Bayesian Econometrics I

Credit Hours: 2.00 or 3.00. This is a first course in Bayesian Econometrics. The overarching goal of the course is to expose students to the Bayesian perspective and get them up-to-speed with modern Bayesian simulation methods.

Learning Outcomes: 1. Explain the Bayesian approach to estimation and inference. 2. Develop posterior simulators to estimate commonly-used models. Credits: 2.00 or 3.00

ECON 69400 - Bayesian Econometrics II

Credit Hours: 2.00 or 3.00. This is a second course in Bayesian Econometrics. After completion student should be able to conduct research in Bayesian econometrics using state-of-the-art models and techniques. Pre-requisite: ECON 69300.

Learning Outcomes: 1. Use state-of-the-art Bayesian models and methods in research. Credits: 2.00 or 3.00

ECON 69700 - Research Methods In Economics

Credit Hours: 2.00 or 3.00. The first steps in doing a thesis research paper, proposal/idea, growing the proposal/idea. Developing a set of critical professional skills. Pre-requisite: ECON 60700 and ECON 60800.

Learning Outcomes: 1. Write a serious term paper, and present it in class in the proposal and final stages. Credits: 2.00 or 3.00

ECON 69900 - Research PhD Thesis

Credit Hours: 1.00 to 18.00. Research PhD Thesis. Permission of instructor required.

Credits: 1.00 to 18.00

Education-Curriculum and Instruction

EDCI 20001 - Special Populations Seminar: Focus On Students With Disabilities And Differentiation Approaches

Credit Hours: 1.00. (EDPS 20001) This seminar is focused on special populations of learners for teacher education majors with an emphasis on exceptional students and approaches to curricular differentiation. Students will engage in mentoring activities and ongoing support in their development as a professional. The goal of the seminar is to connect theory to practice by engaging in an immersive field experience that connects to content and courses taken concurrently. The seminar provides an environment conducive to fostering rich relationships with schools and communities, pursuing common inquiry, thinking critically about theory, content and practice and advocating for equitable schooling. This seminar includes a field experience targeting schools and classrooms including exceptional students. This seminar is intended to be taken concurrently with EDPS 24800 and EDPS 26501.

Learning Outcomes: 1. Identify key educational theories and describe practices for implementation across various education field placements. 2. Discuss and use culturally responsive teaching and communication practices. 3. Reflect on their own learning and the learning of others, gaining insight into themselves, into teaching/learning, and into issues of diversity, equity and social justice. 4. Complete a minimum of 40 hours in the required field experience setting. 5. Demonstrate professional attitudes and conduct that facilitate learning and convey a positive image of the education profession. Credits: 1.00

EDCI 20002 - Special Populations Seminar: English Language Learners And Students With Gifts And Talents

Credit Hours: 1.00. (EDCI 20002) This seminar is focused on special populations of learners for teacher education majors with an emphasis on students who are English learners and students with gifts, talents, and creativity. Students will engage in mentoring activities and ongoing support in their development as a professional. The goal of the seminar is to connect theory to practice by engaging in an immersive field experience that connects to content and courses taken concurrently. The seminar provides an environment conducive to fostering rich relationships with schools and communities, pursuing common inquiry, thinking critically about theory, content and practice and advocating for equitable schooling. This seminar includes a field experience targeting schools and classrooms with ELLs and students with gifts, creativity, and talents. This seminar is intended to be taken concurrently with EDPS 24000 and EDCI 37001.

Learning Outcomes: 1. Identify connections between educational theory to educational practice as related to ELLs and students with GCT. 2. Demonstrate active listening and constructive peer feedback during seminar sessions and in the field. 3. Engage in mentoring activities related to teaching and learning in a community of peers and professionals. 4. Reflect on their own learning, gaining insight into themselves and their interactions with the classroom as teachers of ELLs and students with GCTs. 5. Complete a

minimum of 30 hours in a school-based clinical experience including classroom observations, tutoring, assisting teachers, small and large group instruction and practicing the duties of a teacher who works well with ELLs and students with GCTs. 6. Demonstrate the professional attitudes and conduct that facilitate learning and convey a positive image of the education profession. Credits: 1.00

EDCI 20500 - Exploring Teaching As A Career (UCC: WC)

Credit Hours: 0.00 to 3.00. Students will become familiar with the work of teachers and begin to develop their educational philosophies through examining what it means to teach and to learn and the nature and purpose of schools. Students will critically evaluate teaching as their chosen profession. This course includes a required weekly field-based experience in an elementary, middle, or high school classroom.

University Core Curriculum (UCC): (UCC: WC)

Learning Outcomes: 1. Learn what it means to teach as they reflect on why, whom, and how they will teach. 2. Learn to shift from a student perspective to a teacher perspective through the examination of teaching, learning, and schools. 3. Learn that teaching is affected by socio-political, community and school contexts. Credits: 0.00 to 3.00

EDCI 20700 - Construction And Textile Lab Management

Credit Hours: 3.00. A lecture/lab course which provides clothing construction and textile science content to be applied in the secondary family and consumer sciences classroom.

Learning Outcomes: 1. Demonstrate clothing construction concepts. 2. Apply basic textile science to fabric and clothing selection. 3. Manage a clothing and/or textile lab within a secondary family and consumer sciences classroom. Credits: 3.00

EDCI 21000 - Education Scholars Program I

Credit Hours: 1.00 to 3.00. EDCI 21000 is the first course in a two course, introductory sequence for College of Education students enrolled in the Honors College and/or DeVito Program scholarship recipients. In this course, we will examine key concepts and ideas in educational thought and research, understand what research is, and begin to explore individual students' research interests.

Learning Outcomes: 1. Introduced to key concepts and ideas in educational thought, e.g. democracy; diversity; equity; teaching, learning, and testing; creativity; and technology. 2. Examine how educational researchers conceptualize and conduct research. 3. Explore research interests in education, and how to access resources to further develop those interests. 4. Introduced to campus-based academic resources. 5. Complete multiple writing assignments to develop scholarly writing skills. Credits: 1.00 to 3.00

EDCI 21100 - Education Scholars II

Credit Hours: 1.00 to 3.00. This is the second course in a two course, introductory sequence for College of Education students enrolled in the Honors College and/or DeVito Program scholarship recipients. In this course, students will work on a research project with a faculty mentor, will participate in reflection and discussion of that research experience, will participate in seminars with faculty to read and discuss research, and continue to explore their own research interests and campus resources.

Learning Outcomes: 1. Participate in a semester-long research project with a faculty mentor for 3-4 hours per week. 2. Participate in structured written and oral reflection on their semester-long research experiences. 3. Interact with faculty in the College of Education through 3-4 seminars focused on discussion of their research and scholarship. 4. Explore their research interests, and campus resources. 5. Present their research projects during a public presentation session at the end of the semester. Credits: 1.00 to 3.00

EDCI 21510 - Language & Literacy Foundations For Teachers

Credit Hours: 1.00. The goal of the course is to provide background information in language and literacy necessary for success in literacy methods courses. The course will address basic linguistics and phonetic patterns of English, as well as the structures of literature and literary terms.

Learning Outcomes: 1. Compare and contrast levels of language structure: phoneme, morpheme, root, affix, phrase, sentence. 2. Differentiate graphic from phonological

elements of language (e.g., grapheme vs phoneme). 3. Compare and contrast vocabulary terms (e.g. synonym, homonym, homograph). 4. Define and articulate written elements (e.g. digraphs, consonant clusters, long/short vowels). 5. Identify morpho-syntactic structures and phonological patters in written and spoken language. 6. Compare and contrast literary genres (e.g. narrative, non-narrative, fiction, nonfiction). 7. Distinguish the organizational structures of fictional genres from those of nonfictional genres. 8. Identify literary terms in context (e.g. alliteration, character traits, plot, stanza). Credits: 1.00

EDCI 21610 - Teaching History: Standards And Strategies

Credit Hours: 1.00. Course prepares students for teaching history in powerful, exciting and innovative ways through a topical study (e.g., American Civil Rights Movement) approach. Required for all Social Studies Education majors.

Learning Outcomes: 1. Develop knowledge of appropriate state and national history standards. 2. Use research and theory about how grades 5-12 students learn history. 3. Merge historical content and processes with pedagogy to forge pedagogical content knowledge. 4. Employ appropriate history-specific academic language in history lessons. 5. Utilize new understandings to draw conclusions about what constitutes powerful and purposeful history teaching and learning grades 5-12. Credits: 1.00

EDCI 21710 - Teaching Geography: Standards And Strategies

Credit Hours: 1.00. Course prepares students for teaching geography in powerful, exciting and innovative ways through a study of geographic concepts within the framework of inquiry design model (IDM) and an inquiry-based curriculum. Required for all Social Studies Education majors.

Learning Outcomes: 1. Develop knowledge of appropriate state and national geography standards. 2. Use research and theory about how secondary students learn geography. 3. Merge geographical content and process with pedagogy to forge pedagogical content knowledge. 4. Plan standards-based powerful geography lessons. 5. Utilize new understandings to draw conclusions about what constitutes powerful secondary geography teaching and learning. Credits: 1.00

EDCI 21810 - Teaching Civics And Government: Standards And Strategies

Credit Hours: 1.00. Course prepares students for teaching civics and government in powerful, exciting and innovative ways through a study of civics and political science concepts within the framework of inquiry design model (IDM) and an inquiry-based curriculum Required for all Social Studies Education majors.

Learning Outcomes: 1. Develop knowledge of appropriate state and national civics and government standards. 2. Use research and theory about how secondary students learn civics and government. 3. Merge political science content and processes with pedagogy to forge pedagogical content knowledge. 4. Plan standards-based powerful civics and government-oriented lessons. 5. Utilize new understandings to draw conclusions about what constitutes powerful secondary civics and government teaching and learning. Credits: 1.00

EDCI 21910 - Teaching For Economic Literacy: Developing An Economic Way Of Thinking

Credit Hours: 1.00. Course focuses on preparing students in the social studies education licensure program to teach high school economics and to integrate economics into other middle and/or high school social studies courses. Course addresses issues of economic pedagogy. It will address economic content/concepts specifically and only in a way to illustrate/expand on the teaching ideas, resources, methods, and assessment.

Learning Outcomes: 1. Develop a rationale for teaching high school economics. 2. Identify state and national standards addressing economic content. 3. Explore methods for active teaching/learning in economics. 4. Identify resources appropriate for the active teaching/learning of economics. Credits: 1.00

EDCI 22200 - Knowing The World Through Mathematics (UCC: QR)

Credit Hours: 3.00. In this course, *Knowing the World Through*

Mathematics, students will connect their situated experiences to larger trends in equity and social justice around the globe through mathematical investigations embedded in the context of the United Nations 2030 Agenda (United Nations, 2015). Students in this course will make use of mathematics and global policy documents to critically interpret, model, and represent world phenomena. Students will collaboratively analyze quantitative information gathered through trustworthy, globally representative data sets and individual survey and questionnaire items to investigate local experiences in relation to students' area(s) of interest. Students will learn about and utilize the GAISE Framework for Statistical Problem Solving (Franklin, et al., 2005) and the Four Dimensions of Equity in Mathematics Education (Gutiérrez, 2012) to ground their discussions and deliverables for *Knowing the World Through Mathematics*.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Use a critical mathematics perspective to interpret world patterns, situations, and events. 2. Create mathematical models of world phenomena. 3. Use multiple mathematical representations to present global issues. 4. Identify and implement appropriate mathematical strategies to investigate world phenomena. 5. Express mathematical arguments related to world phenomena. 6. Use mathematics to explore global policy documents. 7. Explore world phenomena through quantitative (and qualitative) methods. Credits: 3.00

EDCI 22222 - Integrated Health And Physical Education For Elementary Teachers

Credit Hours: 3.00. This course provides elementary education majors with a comprehensive understanding of the critical role health and physical education play in the overall development of young learners. Students will explore how physical activity and health education contribute to cognitive, social, emotional, and physical growth. The course emphasizes the importance of integrating movement and health topics such as personal safety, nutrition, and emotional health into the elementary classroom to enhance academic performance, promote wellness, and develop lifelong healthy habits. Through a blend of theory, practical strategies, and hands-on activities, students will learn to design inclusive, developmentally appropriate physical education lessons and comprehensive school health education (CSHE) plans that cater to diverse learners. By the end of the course, students will be equipped to create engaging, safe, and supportive environments that foster both physical well-being and academic success.

Learning Outcomes: 1. Understand health-related fitness concepts and principles related to physical activity and wellness. 2. Promote physical, emotional, and social well-being in elementary students. 3. Understand and teach proper nutrition, including the relationship between healthy eating, physical activity, and overall wellness. 4. Promote mental and emotional health by teaching coping strategies, stress management, and emotional regulation. 5. Teach personal safety and injury prevention, including strategies for safe play, accident prevention, and emergency response. 6. Integrate physical activity into daily classroom activities, promoting active learning and encouraging students to develop positive attitudes toward physical activity. 7. Develop inclusive and developmentally appropriate physical education lessons, ensuring students of all abilities can participate in and benefit from physical education. Credits: 3.00

EDCI 22550 - Mathematics Education Seminar

Credit Hours: 1.00. In this course, students will be introduced to many aspects of mathematics education, including pedagogies, professional organizations, standards, research, lesson planning, technology, etc. In addition, they will have opportunities to get to know others in their major earlier in their program.

Learning Outcomes: 1. Examine critically current pedagogical practices used in secondary mathematics classrooms. 2. Explore alternative pedagogies to enhance student engagement and conceptions of the relevance of mathematics. 3. Become familiar with technologies available for use in mathematics teaching and learning, mathematics education research, and professional organizations and standards. Credits: 1.00

EDCI 25000 - Professional Development In Family And Consumer Sciences Education

Credit Hours: 0.00 to 2.00. This course focuses on students' professional development as family and consumer sciences educators. Characteristics and relationships among middle and high school family and consumer sciences standards, resources, and learning experiences; the Purdue Family and Consumer Sciences Education program; and expectations for

Indiana FCS teacher-licensure are emphasized. Includes participation in professional organizations and meetings.

Learning Outcomes: 1. Formulate and implement plans for building and documenting one's professional identity, competence, and career development as a family and consumer sciences educator. 2. Examine characteristics and relationships among middle and high school family and consumer sciences standards, resources, and learning experiences; coursework and field-based experiences in the Purdue Family and Consumer Sciences Education (FCSE) program; and licensure requirements and standards for teachers of family and consumer sciences. Credits: 0.00 to 2.00

EDCI 27000 - Introduction To Educational Technology And Computing (UCC: IL)

Credit Hours: 1.00 to 3.00. Addresses fundamentals of educational technology, including the integration of instructional design, media, computers and related technologies within the classroom setting.

University Core Curriculum (UCC): (UCC: IL)

Learning Outcomes: 1. Demonstrate the ability to use various forms of technology to access, generate, and manipulate information; as well as to present and communicate results. 2. Given the background information and resources for a potential lesson, identify the instructional activities, methods, and media that should optimally be selected, implemented and evaluated within the lesson. 3. Apply educational technology to plan and deliver instructional lessons that integrate a variety of software, applications, and learning tools. 4. Identify issues (e.g. equity, privacy, security, plagiarism, isolationism) that have been produced or enhanced because of the integration of technology and describe how these issues can be effectively addressed. Credits: 1.00 to 3.00

EDCI 28500 - Multiculturalism And Education (UCC: BSS)

Credit Hours: 2.00 to 3.00. This course integrates an understanding of multiculturalism with principles of democratic education. Historical, sociological, cultural, political, philosophical, and pedagogical foundations of multiculturalism are explored and related to issues of pedagogy in a pluralistic society.

University Core Curriculum (UCC): (UCC: BSS)

Learning Outcomes: 1. Develop awareness of issues and concerns related to multicultural education. 2. Develop knowledge of how multiculturalism impacts teachers, schools, classrooms, and society. 3. Develop skills of critical thinking and reflection that will enable educators to contribute to meeting the needs of students in a multicultural and global world. Credits: 2.00 to 3.00

EDCI 28550 - Foundations Of Multicultural Education And Community (UCC: BSS)

Credit Hours: 3.00. The purpose of this course is to give students an opportunity to explore various facets of multiculturalism within their communities. We will examine the influence of social group identities on teaching, learning, and communities as they relate to contexts both in and out of schools. While this course is broad in scope, the primary aim is to assist you in exploring what it means to be an educator and/or concerned citizen in a society that is multicultural.

University Core Curriculum (UCC): (UCC: BSS)

Learning Outcomes: 1. Understand and describe the impact of diversity on American schools and classrooms. 2. Understand and describe how their own views and perspectives have been shaped by their backgrounds and identities. 3. Understand and describe the challenges of teaching and communicating in diverse and multicultural schools and communities. 4. Demonstrate the awareness, knowledge, skills, and actions needed for teaching in diverse and multicultural schools and communities. 5. Identify strengths as a community volunteer and collaborate with local organizations to identify community needs. 6. Recognize the needs of community stakeholders through formal and informal conversations. Credits: 3.00

EDCI 30101 - Inquiry Into Teaching And Learning

In K-2

Credit Hours: 1.00. The goal of the seminar is to connect theory to practice by engaging in an immersive field experience that connects to content and courses taken concurrently through cycles of inquiry. In particular, this seminar is intended to be an inquiry space for questions and topics related to teaching using pedagogies of care in the K-2 classroom. Admission to Teacher Education required. Cannot be taken concurrently with EDCI 30002.

Learning Outcomes: 1. Engage with teachers and students in connected, educative, and personally rewarding field experiences. 2. Engage in practical experiences with opportunities to observe, plan, teach, assess, and receive feedback. 3. Gain understanding of the professional responsibilities of a teacher. 4. Explore the role of collaboration among colleagues in a school. 5. Draw connections and distinctions among disciplinary practices. 6. Be active participants in an ongoing, supportive lesson inquiry group. 7. Evaluate the outcomes of their teaching practice and constructively respond to feedback. 8. Receive mentoring and engage in peer mentoring. 9. Examine collaboratively and critically, educational needs within the field placement. Credits: 1.00

EDCI 30102 - Inquiry Into Teaching And Learning In 3-6

Credit Hours: 1.00. The goal of the seminar is to connect theory to practice by engaging in an immersive field experience that connects to content and courses taken concurrently through cycles of inquiry. In particular, this seminar is intended to be an inquiry space for questions and topics related to teaching using pedagogies of care in the 3-6 classroom. Admission to Teacher Education is required. Cannot be taken concurrently with EDCI 30101.

Learning Outcomes: 1. Engage with teachers and students in connected, educative, and personally rewarding field experiences. 2. Engage in practical experiences with opportunities to observe, plan, teach assess, and receive feedback. 3. Gain understanding of the professional responsibilities of a teacher. 4. Explore the role of collaboration among colleagues in a school. 5. Draw connections and distinctions among disciplinary practices. 6. Be active participants in an ongoing, supportive lesson inquiry group. 7. Evaluate the outcomes of their teaching practice and constructively respond to feedback. 8. Receive mentoring and engage in peer mentoring. 9. Examine collaboratively and critically, educational needs within the field placement. Credits: 1.00

EDCI 30900 - Reading In Middle And Secondary Schools: Methods And Problems

Credit Hours: 1.00 to 3.00. For prospective teachers at junior and senior high schools. An overview of reading processes, fundamentals of reading instruction, factors that influence the ability to read text materials, strategies and materials for identifying and reducing reading problems, school resources, and programs for normal and deficient readers. Concurrent enrollment with program-specified methods course.

Learning Outcomes: 1. Explore multiple, diverse, research-based instructional strategies and materials to support the teaching of content-area literacy. 2. Support the development of pedagogical competency through continued work with issues of teaching and learning in secondary literacy. Credits: 1.00 to 3.00

EDCI 31100 - Media For Children

Credit Hours: 3.00. Books and other resources designed for children and adolescents are studied and evaluated in terms of literary theory and aesthetic appreciation. Emphasis is placed on literature and its place in the child's world.

Credits: 3.00

EDCI 31101 - Integrating Media In The K-2 Classroom

Credit Hours: 2.00. The goal of the course is for teacher candidates to understand how to choose and evaluate children's literature and media to use in K-2 classroom, develop ways to integrate literature and understanding of literature and media using a variety of methods, select appropriate materials for individual student's needs, and assess student's learning. Admission to Teacher Education is required.

Learning Outcomes: 1. Evaluate both fiction and nonfiction resources for the use in classroom including identifying media which is broadly representative of the world in which we live using a variety of rubrics and evaluation forms. 2. Determine cross-curricular connections, teaching ideas, and assessment methods of

individual titles for use in the K-2 classroom. 3. Develop materials (i.e., graphic organizers, vocabulary activities, comprehension supports) to use with literature which may be differentiated for individual learner's needs. Credits: 2.00

EDCI 31102 - Integrating Media In The 3-6 Classroom

Credit Hours: 1.00. The goal of the course is for teacher candidates to understand how to choose and evaluate children's literature and media to use in the 3-6 classroom, develop ways to integrate literature and media throughout the curriculum, support students' understanding of literature and media using a variety of methods, select appropriate materials for individual student's needs, and assess students' learning.

Learning Outcomes: 1. Evaluate both fiction and nonfiction resources for use in the classroom including identifying media which is broadly representative of the world in which we live. 2. Determine cross-curricular connections, teaching ideas, and assessment methods of individual titles for use in the 3-6 classroom. 3. Develop materials (i.e., graphic organizers, vocabulary activities, comprehension supports) to use with literature which may be differentiated for individual learner's needs. 4. Research and develop a rationale for including social justice topics at part of the 3-6 curriculum. Credits: 1.00

EDCI 31103 - Integrating Media In The K-6 Classroom

Credit Hours: 3.00. This course prepares teacher candidates to select, evaluate, and integrate children's literature and media in K-6 classrooms. Focusing on high-quality, diverse texts and media, candidates will learn to choose materials that are developmentally appropriate and reflect the diversity of the world in which we live. Emphasis will be placed on the critical role literature and media play in fostering vocabulary development, enhancing critical thinking skills, and supporting literacy development across subjects. The course will focus on how K-6 students learn to use comprehension strategies independently and efficiently as they progress through elementary school fostering both their academic growth and their ability to engage with diverse texts.

Learning Outcomes: 1. Integrate literature and media into content area lessons to enhance vocabulary (including academic language skills), critical thinking, and comprehension. 2. Select and evaluate three trade books to read aloud during a math, a social studies, and a science lesson. 3. Identify instructional strategies supported by the Science of Reading that teach k-6 students' academic language skills, vocabulary knowledge, and reading and listening comprehension. Credits: 3.00

EDCI 31950 - Approaches To English Learner Education

Credit Hours: 3.00. This course addresses English language instruction and content instruction for English Learning students in mainstream classrooms. The purpose of this course is to provide information necessary to the design of materials and instructional strategies for English Language Learners in K-12 context. In this course, we will focus on current issues and techniques in instruction for ELL students who are at different stages of English language acquisition in the K-12 school context. The course will also consider the nature of immigrants' experiences of a new country and school context. Practical field experiences integrated into the course will provide students with the opportunity to apply and demonstrate principles and strategies presented in the course.

Learning Outcomes: 1. Use essential techniques for instruction of ELLs across various grade levels. 2. Evaluate the language used in resources for ELL content instruction. 3. Examine the role of visual and verbal language in ELL instruction. 4. Analyze the ways in which students use literacy as writing, drawing, and talk. 5. Describe the language characteristics of important school genres. 6. Apply the teaching and learning cycle in the genre approach to lesson planning. 7. Implement and reflect on a multimodal, content area ELL lesson. 8. Discuss the role of home language and culture in ELL instruction. 9. Apply an understanding of the role of culture and family background in the student's experience of the classroom. Credits: 3.00

EDCI 32250 - Physical Education In The Elementary School

Credit Hours: 2.00. Current conceptions of elementary school physical education, with a particular emphasis on curriculum implementation.

Learning Outcomes: 1. Competence in

instructional and organizational strategies appropriate for effective elementary gymnasium practice. 2. Ability to develop and implement warm-up, concept-based fitness, skill-based, and culminating activity instructional episodes. 3. Ability to provide developmentally appropriate assessment for skill-based physical education lessons. Credits: 2.00

EDCI 32500 - Literacy In The Early Childhood Classroom

Credit Hours: 3.00. Students will study how children's oral language develops, how children learn to read and write in early childhood/K3 settings, and the teacher's role in this process. Students will learn how phonemic awareness, phonics, fluency, vocabulary and comprehension influence children's literacy development. Students will learn how to select appropriate instructional materials; employ teaching strategies to meet the cognitive and affective literacy needs of all children; and collect, interpret, and use data from various types of assessments to inform literacy teaching and learning processes.

Learning Outcomes: 1. Develop a sound background in theory and research about children's language and literacy development and learning in grades K-3. 2. Learn how literacy learning, teaching, and assessment in phonemic awareness, phonics, fluency, vocabulary, comprehension and writing can be effectively and systematically integrated and diversified to meet individual or group needs in grades K-3. 3. Design and implement developmentally appropriate instruction for K-3 grade students. Credits: 3.00

EDCI 32501 - Teaching Literacy In K-2

Credit Hours: 2.00. Students will study how children's oral language develops, how children learn to read and write in primary grade settings, and the teacher's role in this process. Students will learn how phonemic awareness, phonics, fluency, vocabulary and comprehension influence children's literacy development. Students will learn how to select appropriate instructional materials; employ teaching strategies to meet the cognitive and affective literacy needs of all children, and collect, interpret, and use data from various types of assessments to inform literacy teaching and learning processes.

Learning Outcomes: 1. Develop a sound background in theory and research about children's language and literacy development and learning. 2. Learn how literacy learning, teaching, and assessment in phonemic awareness, phonics, fluency, vocabulary, comprehension and writing can be effectively and systematically integrated and diversified to meet individual or group needs. 3. Design and implement developmentally appropriate instruction for primary grade students. Credits: 2.00

EDCI 32600 - Literacy In The Intermediate Classroom

Credit Hours: 3.00. This course includes a field-based component. Students will build on material learned in EDCI 32500 . They will concentrate on increasing student's literacy skills with a focus on fluency, phonics, strategic reading, vocabulary, literary analysis, content area reading, the writing process, and building comprehension skills. They will learn to select appropriate materials, employ strategies to meet the cognitive and affective literacy needs of all children; and create integrate, and use data from various forms of assessment to inform the teaching and learning process.

Learning Outcomes: 1. Develop a sound understanding of student literacy needs in the intermediate grades with a focus on comprehension strategies, strategic reading, vocabulary development, literary analysis, content area reading, and the writing process. 2. Assess student's learning and use this information to design and implement developmentally and culturally appropriate instruction in literacy and social studies. 3. Learn how literacy learning, teaching, and assessment can be effectively and systematically integrated and diversified to meet individual or group needs. Credits: 3.00

EDCI 32602 - Teaching Literacy In 3-6

Credit Hours: 2.00. Students will build on material learned in EDCI 32501. They will concentrate on increasing student's literacy skills with a focus on fluency, phonics, strategic reading, vocabulary, literary analysis, content area reading, the writing process, and building comprehension skills. They will learn to select appropriate materials, employ strategies to meet the cognitive and affective literacy needs of all children, and create integrate, and use data from various forms of assessment to inform the teaching and learning process.

Learning Outcomes: 1. Demonstrate an understanding of theoretical and evidence-

based foundations that guide reading, writing processes, and instruction. 2. Design developmentally appropriate instruction that addresses the needs of all learners. 3. Teach developmentally appropriate lessons/units in the school setting. 4. Assess student learning by designing/using/adjusting formative and summative assessments for your group of students, and pre-assessments. 5. Reflect and analyze your own teaching. Credits: 2.00

EDCI 32650 - Introduction To Linguistics And Language Acquisition In Education

Credit Hours: 3.00. This course addresses foundational knowledge in language and linguistics for pre-service teachers and educational researchers. The purpose of this course is to survey linguistics, the study of the science of language. In this course, we will focus on phonetics, phonology, morphology, syntax, and semantics. These topics will be discussed in terms of theory, as well as in the context of ESL classroom instruction, materials development, and assessment.

Learning Outcomes: 1. Understand and describe core concepts and terminology of descriptive linguistics, including phonetics, phonology, morphology, syntax, semantics, and pragmatics. 2. Apply course concepts to analyze linguistic data and gain a fuller understanding of the systematic nature of language. 3. Apply descriptive linguistic concepts to instruction to support the four domains of speaking, listening, reading, and writing. 4. Research and describe the biological, social, and cultural dimensions of linguistics, including pragmatics, discourse, dialects, bilingualism, and language in education. 5. Discuss the role of home language and culture in ELL instruction. 6. Apply an understanding of the role of culture and family background in the student's experience of the classroom. Credits: 3.00

EDCI 33500 - Reading Instruction For Tier 1 And Tier 2

Credit Hours: 2.00. Given the needs of struggling/striving readers throughout the educational system, this class will focus on effective interventions from the primary grades through high school. Instructors will present a balance of theoretical and practitioner-oriented aspects of reading development and instruction. The course will also examine a number of reading models and instructional approaches designed to ensure all students have access to effective, research-based literacy instruction. The goal is to ensure students complete the semester with a range of essential tools for working with this population.

Learning Outcomes: 1. Develop an understanding of effective Tier 1 and Tier 2 reading instruction. 2. Implement Tier 1 and Tier 2 reading practices in a classroom. 3. Establish an understanding of reading difficulties/disabilities. 4. Extend knowledge of unique needs of struggling readers. Credits: 2.00

EDCI 35000 - Community Issues & Applications For Educators

Credit Hours: 1.00 to 3.00. This course is an examination of diverse individual, family, and community characteristics and issues, and potential impacts on teaching and learning processes. Includes service learning with human service agencies and personnel in the school and community. As part of this course, students complete certification to meet the Indiana Department of Education suicide prevention training requirement for teacher licensure.

Learning Outcomes: 1. Become a more effective teacher by developing greater awareness about, caring and respect for, and ability to relate with people (particularly students and their families) whose backgrounds, life experiences, perspectives, and values are different from one's own. 2. Demonstrate responsiveness to students' diverse backgrounds, life experiences, perspectives, and values through WHAT you teach (curriculum topics, content, and processes), HOW you teach (formal and informal interactions with students, inside and outside of classroom), and WHO you are (personally/professional values and commitments). 3. Examine community human service agencies in terms of (a) ways to contribute as a community volunteer, either individually or with students; (b) ways to interact with agencies on behalf of students; and (c)

future career opportunities. Credits: 1.00 to 3.00

EDCI 35001 - Tanzania Seminar

Credit Hours: 2.00. In this course, we will prepare for the Maymester in Tanzania study abroad program in a variety of ways, including investigating the history and culture of Tanzania, beginning to learn Kiswahili, conceptualizing service learning experiences, and collaborating on a plan for program logistics.

Learning Outcomes: 1. Critically explore common conceptions of Africa. 2. Investigate the history and culture of Tanzania. 3. Describe the educational system of Tanzania. 4. Read, write, and speak basic phrases and sentences in Kiswahili. 5. Conceptualize and engage in service learning experiences. Credits: 2.00

EDCI 35002 - International Comparative Education

Credit Hours: 3.00. In this course, students will explore the education system in an international context and compare particular aspects of the system (e.g., equity, funding, language, accessibility) to their own experiences with, and knowledge of, education in the United States. Students will consider the range of schools and policies in both countries in terms of issues of social justice (e.g., redistribution, recognition, representation).

Learning Outcomes: 1. Experience, first-hand, the educational system of Tanzania and read accounts of this system from a range of perspectives which draw attention to its strengths and challenges. 2. Investigate issues of social justice (e.g., redistribution, recognition, representation) in education systems. Credits: 3.00

EDCI 35003 - Knowing Africa Through Literature

Credit Hours: 3.00. Through a set of texts, this course will offer opportunities to understand, broaden and question a new (to you) and significantly different culture and your experiences in that culture. You will read a variety of African literature, including short stories, novels, and poetry, in order to investigate perspectives on African history, culture, language and education. You will then draw upon your personal encounters and activities while in Tanzania to extend your learning.

Learning Outcomes: 1. Investigate "growing up" cultural, and traveling experiences in Africa from a range of perspectives. 2. Extend understanding of Africa through the study of literature, including short stories, novels, and poetry. Credits: 3.00

EDCI 35004 - History, Culture, And Language In Tanzania

Credit Hours: 3.00. This course is a component of the Maymester in Tanzania study abroad program. In this course, students will study the history, culture, and language of Tanzania through experiences in local schools and the community, supplemented by course readings, assignments, discussions, and service learning projects.

Learning Outcomes: 1. Explore the history of Tanzania, including its identification as the cradle of mankind, colonization, independence, and the impacts of socialism and capitalism. 2. Engage in cultural and linguistic immersion in a rural Tanzanian village and schools. 3. Experience, first-hand, the educational system of Tanzania and read accounts of this system from a range of perspectives which draw attention to its strengths and challenges. 4. Collaborate with Tanzanian residents on developing and implementing service learning projects in the community. Credits: 3.00

EDCI 35600 - Career Education In Family And Consumer Sciences

Credit Hours: 3.00. Examination of middle and high school career education accomplished through family and consumer sciences, including (1) life and career exploration and planning; (2) analysis of career paths and opportunities in family and consumer sciences; and (3) career preparation through laboratory and cooperative education programs. Historical and contemporary foundations for career education in family and consumer sciences is also are addressed. Includes observations and interactions with students and teachers in career-education programs and participation in professional meetings.

Learning Outcomes: 1. Examine purposes, curriculum, and implementation strategies for career education accomplished through family and consumer sciences, including FCS careers, FCS supporting content, and FCS life and career foundations. 2. Examine the structure and delivery of career and technical education in the United States and Indiana, state and federal laws and regulations pertaining to career and technical education, and important events and developments in the history of career and technical education and family and consumer

sciences education. 3. Engage in ethical professional practice professional development, and outreach in family and consumer sciences education, including advocacy and working with local advisory committees. 4. Analyze instructional strategies and procedures for career education in family and consumer sciences, including integration of career and technical student organizations, particularly the Family, Career and Community Leaders of America (FCCLA) and coordination of students' work-based learning experiences through in-school laboratories and community-based placements. Credits: 3.00

EDCI 35950 - Content Area Instruction For English Learners

Credit Hours: 3.00. This course identifies the linguistic challenges faced by English language learners (ELLs) in the content areas of English language arts, mathematics, science, and the social studies. Participants will learn to describe how language varies in the way it presents knowledge in different content areas. The course links these challenges to English language instruction and subject-matter instruction in English for ELLs who are in general education classrooms. The course emphasizes assessment tools designed to assess content knowledge and links these students' English language development. Participants will describe academic tasks that require advanced levels of reading and writing and the expectations for the development of academic literacy as ELLs move from elementary to secondary "literacy" contexts, or the kinds of meaning-making typical of secondary and postsecondary education.

Learning Outcomes: 1. Evaluate the linguistic challenges of academic language in the English language arts, mathematics, science, and the social studies for ELLs. 2. Assess the development of academic literacy as ELLs move from elementary into secondary and postsecondary education. 3. Evaluate how standardized tests pose challenges for ELLs. 4. Analyze how various issues of assessment affect ELL student learning. 5. Create standards-based ESL and content instruction in a supportive learning environment for ELLs with different Limited English Proficiency (LEP) levels. 6. Implement a variety of standards-based teaching strategies, tools, and techniques for developing and integrating the four skills and for assessing the grade-level curriculum. 7. Apply academic tasks that require advanced levels of reading and writing. Credits: 3.00

EDCI 36000 - Curriculum And Instruction In Family And Consumer Sciences: Middle School

Credit Hours: 3.00. Instructional program development for family and consumer sciences. Developmental needs and issues of early adolescents; study of adolescent literacy; and curriculum integration of language arts, math, and other content areas are emphasized. Development of a comprehensive unit of instruction that incorporates standard-based curriculum, assessment, and instruction for family and consumer sciences is a major component of the course. Includes observations and interactions with family and consumer sciences teachers and students and participation in professional meetings.

Learning Outcomes: 1. Utilize middle school philosophy/perspectives, state-level resources, and community assets to guide curriculum development in Family & Consumer Sciences that is challenging, exploratory, integrative, and diverse, and which fosters learning that is active, purposeful, and democratic. (FCS TEd 7) 2. Integrate professional knowledge/behaviors supportive of middle-level education learner development (physical, cognitive, socio-emotional, psychological) into FCS curricula/practices, attentive to the health, wellness, and social-emotional competence of learners. (FCS TEd 8) 3. Employ professional and other resources to develop a "literary" classroom environment that reflects all students. (FCS TEd 11) 4. Identify and collect resources, references, and other materials that support the identity, intellect, skill, and criticality development of students across FCS content. (FCS-Ted) 5. Create student-centered learning experiences in blended and online settings using UDL principles that are culturally responsive (TIBOT competency 3; FCS-Ted 7, 8, 11) 6. Review and critique FCS curriculum

materials and practices for alignment with best practices for inclusion, access, equity, and diversity. (FCS-TEd 7, 8) 7. Relate family and consumer sciences programs to broader educational program goals and to community assets and needs. 8. Integrate foundational FCS perspectives (historical lens, Body of Knowledge, Critical Science approach) into professional schema. (FCS-TEd 12) 9. Develop and reflect on personal/professional characteristics that shape optimal middle school/FCS educator practice. (FCS-TEd 12) Credits: 3.00

EDCI 36100 - Social Studies In The Elementary School

Credit Hours: 3.00. Provides students with an overview of the field of social studies, of selected issues in the field, and of best practice strategies for teaching social studies to elementary school children. Encourages participants to reflect on social studies knowledge, skills and dispositions, how students learn these most effectively, and how best to teach social studies. Includes a field-based experiential component. No undergraduate students may be enrolled in any of these undergraduate courses until they have been admitted to teacher education.

Learning Outcomes: 1. Students will work to identify the most important social studies knowledge, skills and dispositions. 2. Investigate how students learn most effectively. 3. Utilize their new understandings to draw conclusions about what constitutes powerful teaching in the social studies. Credits: 3.00

EDCI 36101 - Teaching Social Studies In K-2

Credit Hours: 2.00. This course provides students with an overview of the field of social studies, of selected issues in the field, and of best practice strategies for teaching social studies to children in the K-2 classroom. Students will work to identify the most important social studies knowledge, skills and dispositions; investigate how K-2 children learn social studies most effectively. Students will then use their new understandings to implement lessons, analyzing the effectiveness of their instruction for children in the K-2 grades. Admission to Teacher Education is required.

Learning Outcomes: 1. Develop compelling questions in order to guide inquiry in the K-2 social studies classroom. 2. Apply social studies disciplinary concepts and tools in developing curriculum and implementing effective teaching strategies for the K-2 children. 3. Use evidence to guide instruction and to evaluate the effectiveness of their instructional practice. 4. Identify critical issues in teaching social studies to the K-2 learner and pose evidence-based solutions. Credits: 2.00

EDCI 36102 - Teaching Social Studies In 3-6

Credit Hours: 2.00. This course provides students with an overview of the field of social studies, of selected issues in the field, and of best practices strategies for teaching social studies to children in the 3-6 classroom. Students will work to identify the most important social studies knowledge, skills and dispositions; investigate how 3-6 children learn social studies most effectively. Students will then use their new understandings to implement lessons, analyzing the effectiveness of their instruction for children in the 3-6 grades.

Learning Outcomes: 1. Develop compelling questions in order to guide inquiry in the 3-6 social studies classroom. 2. Apply social studies disciplinary concepts and tools in developing curriculum and implementing effective teaching strategies for the 3-6 children. 3. Use evidence to guide instruction and to evaluate the effectiveness of their instructional practice. 4. Identify critical issues in teaching social studies to the 3-6 learner and pose evidence-based solutions. Credits: 2.00

EDCI 36300 - Literacy In The Elementary School II

Credit Hours: 3.00. Focuses on teaching children who experience difficulty acquiring literacy. Assessments of children's strengths and needs are used to plan and evaluate instruction. Strategies for helping children develop more mature literacy understandings are applied in weekly small-group instructional sessions. Includes a field-based experiential component. Taken concurrently with EDPS 43000.

Learning Outcomes: 1. Know the literacy processes so that they are able to make decisions about the use of appropriate assessment measures and instructional strategies for children who are experiencing difficulty learning to read and write. Credits: 3.00

EDCI 36303 - Literacy Teaching And Assessment In K-6

Credit Hours: 2.00 to 3.00. This course is an undergraduate, elementary education course designed to provide preservice teachers with classroom and practicum experiences focused on literacy instruction for children experiencing difficulty learning to read and write. Students learn to administer and analyze individual assessments to determine the strengths and needs of a struggling reader/writer and set intervention goals based on these results. Application of appropriate research-based reading instructional strategies for developing (structured literacy instruction) phonological awareness, phonics, comprehension, vocabulary, and fluency is the focus of weekly literacy teaching in local elementary schools.

Learning Outcomes: 1. Demonstrate the importance of providing instruction to meet the needs of all children through their teaching. 2. Implement a framework for assessment and instruction that allows the teacher to evaluate and adjust for an optimal match between the reader/writer, the text and the literacy context. 3. Translate assessment findings into a plan for instructional support that is realistic in view of the child's needs and the available resources. 4. Use assessment as an ongoing guide to instructional decisions. 5. Become skillful in observing, planning, implementing, and evaluating literacy lessons. 6. Demonstrate knowledge of materials, procedures, and strategies for individual and group literacy instruction. 7. Examine a range of assessment and evaluation tools and strategies. 8. Report to others their assessments of students' literacy learning. 9. Work as a team with peers and school personnel. Credits: 2.00 to 3.00

EDCI 36401 - Teaching Mathematics In K-2

Credit Hours: 2.00. This course focuses on teaching mathematics in the elementary school, grades K-2, and encouraging children as mathematical problem posers. Students learn what it means to teach math interactionally using children's ideas, beliefs, and experiences as primary resources. Eliciting and interpreting children's mathematical thinking as well as mathematical reasoning, problem solving, communication, and connections are foci. Admission to Teacher Education required.

Learning Outcomes: 1. Gain skill in assessing, evaluating, and responding to the diverse needs of K-2 learners in mathematics. 2. Identify, practice, and reflect on strategies of teaching mathematics to support K-2 students conceptual and procedural knowledge. 3. Analyze mathematics books and tasks for language demands, conceptual and procedural knowledge, and cross-curricular connections. 4. Reflect on the role of K-2 teachers and children's funds of knowledge in relation to their learning of mathematics. Credits: 2.00

EDCI 36402 - Teaching Mathematics In Grades 3-6

Credit Hours: 2.00. Focuses on teaching mathematics in the elementary school grades 3-6. Students learn what it means to teach mathematics interactionally using children's ideas, beliefs, and experiences as primary resources. Mathematical reasoning, problem solving, communication, and connections are foci.

Learning Outcomes: 1. Develop, apply, analyze, and evaluate strategies of teaching mathematics and their relationships to your beliefs and knowledge about how children learn mathematics. 2. Know and analyze methods of assessing and responding to the needs of mathematics learners labeled in schools. 3. Analyze and apply student's mathematical conceptual understanding and procedural knowledge to the development of problem-solving based mathematics lessons. 4. Create and analyze instructional activities drawing from student's conceptual understanding and procedural knowledge as primary resources. Credits: 2.00

EDCI 36404 - Mathematics In The Elementary School

Credit Hours: 4.00. Focuses on teaching mathematics in the elementary school. Students learn what it means to teach mathematics when reasoning, problem solving, communication, and connections are the foci. Includes a field-based experiential component.

Learning Outcomes: 1. Learn, practice, and reflect on strategies of teaching mathematics and their relationships to your beliefs and knowledge about how children learn mathematics. 2. Gain skill in assessing, evaluating, and responding to the needs of diverse learners in mathematics. 3. Understand

ways to assess students mathematical understanding and learning. 4. Plan and carry out problem-solving mathematics instruction with a focus on students conceptual and procedural understanding. Credits: 4.00

EDCI 36500 - Science In The Elementary School

Credit Hours: 3.00. Investigates ways children learn science as a basis for planning, enacting, and assessing science curriculum and instruction. State and national standards, teaching cases, and science lab experiences are used as tools for reflecting on practice. Includes a field-based experiential component. Taken concurrently with EDCI 36400 and EDCI 37000.

Learning Outcomes: 1. Explore the instruction of elementary science through pedagogically appropriate methods. Lesson design will follow the learning cycle (5 E format) and lessons will be designed in a discovery/inquiry fashion using hands-on instruction. 2. Study in-depth teacher/student and student/student interactions in the classroom and to better understand how knowledge of children can inform the teaching-learning process, especially in science instruction. 3. Explore planning processes in several subject areas to learn to integrate science into other curricular areas, as well as developing both weekly and daily lesson plans. 4. Examine the nature of teaching and teacher growth through reflection. 5. Demonstrate through the planning and teaching of lessons, that you possess the subject matter knowledge necessary to provide quality educational experiences for children in grades K-6. 6. Examine management routines, teacher rationale for those routines, procedures, and management in the classroom. 7. Examine methods of evaluation, including anecdotal records, alternative assessments, performance assessments, general record keeping, and grading. 8. Examine the school as a community of diverse learners. 9. Examine your philosophy of education throughout this field experience. Credits: 3.00

EDCI 36501 - Teaching Science Through Design In Grades K-2

Credit Hours: 2.00. The aim of this lab-based course is to prepare students to teach science, engineering, and computational thinking with grade K-2 learners by building on existing pedagogical and subject matter knowledge in science. Students will engage in science and engineering learning experiences; identify and analyze children's ideas and background experiences; and examine instructional strategies for leveraging students' sense making. Using this knowledge, students will plan for and implement standards-based lessons, reflecting on the strengths and areas of improvement of their instruction for grade K through 2 learners. At least 9 credits of science content required.

Learning Outcomes: 1. List and contrast current models of science teaching and learning. 2. Demonstrate competence in the use of various learner-centered pedagogical strategies for culturally and linguistically diverse students. 3. Develop collaborative, inquiry based, cross-cultural, learner centered unit plans. 4. Demonstrate competence in assessing student learning and in developing plans of action to meet students' needs. 5. Implement pro-active strategies to establish a safe classroom environment in which all students are encouraged to participate and express their views. 6. Demonstrate competence in the use of instructional technologies to enhance student learning. 7. Demonstrate competence in integrating science, technology, engineering practices and mathematics (STEM) across the curriculum to address culturally and socially relevant issues. 8. Demonstrate competence in developing unit plans that engage children in the use of the engineering design process to address culturally and socially relevant issues. 9. Demonstrate competence in developing activities that promote children's computational thinking. 10. Explain how his/her personal philosophy of teaching and learning contrasts with the College of Education mission: "We are committed to social justice and education of all the children of all the people - especially in the

area of P=12 STEM education." 11. Participate actively in discussing regarding curriculum development and implementation designed to address the needs of culturally diverse learners. Credits: 2.00

EDCI 36502 - Teaching Science Through Design In Grades 3-6

Credit Hours: 2.00. The aim of this course is to prepare students to teach science, engineering, and computational thinking with grade 3-6 learners by building on existing pedagogical and subject matter knowledge in science. Students will engage in science and engineering learning experiences; identify and analyze children's ideas and background experiences; and examine instructional strategies for leveraging students' sense making. Using this knowledge, students will plan for and implement standards-based lessons, reflecting on the strengths and areas of improvement of their instruction for grade 3 through 6 learners. At least 9 credits of science content courses are required.

Learning Outcomes: The learning outcomes for this course have more than 2,000 characters. Please see the course catalog for the learning outcomes. Credits: 2.00

EDCI 37001 - Teaching And Learning English As A New Language

Credit Hours: 0.00 to 3.00. This course builds foundational knowledge on the theories and practices related to the English language development of English language learners in the P-12 contexts. Particular attention is given to the current issues as well as on techniques for instructing and assessing students at different stages of English language development in the school context. Students will learn to identify students' strengths and current needs in English, to design classroom experiences across the curriculum, and to assess student performance using current WIDA standards.

Learning Outcomes: 1. Develop understanding of the English language and literacy development process of English language learners. 2. Instruct and assess students who are at different stages of English language development. 3. Identify English Learners' strengths and needs in English. 4. Practice in designing classroom experiences across the curriculum on the basis of these strengths and needs. 5. Learn background in WIDA and practice in designing Model Performance Indicators in connection with teaching experiences in the field for English Learners. 6. Develop understanding of their roles as ELL teachers and professionals in advocating on behalf of their ELLs. Credits: 0.00 to 3.00

EDCI 38100 - Teaching For Social Justice: Culturally And Linguistically Diverse Learners

Credit Hours: 3.00. This course builds on the content of EDCI 28500 (Multicultural Education) with specific attention to issues of social justice related to literacy and linguistic diversity. Within this framework, students will learn strategies for teaching English language learners, deconstruct deficit perspectives of dialectical differences, and consider approaches to classroom management. Additionally, a field experience component with an ELL teacher will be included in the course.

Learning Outcomes: 1. Engage with the following concepts via reading, analysis/critique, and consideration of how they might apply in future classrooms: culturally relevant pedagogy and culturally sustaining pedagogy, code switching and code meshing, restorative justice. 2. Learn pedagogical strategies for working with ELLs in secondary English classrooms. 3. Understand the school-to-prison pipeline phenomenon and develop classroom management principles accordingly. 4. Participate in a field experience that requires interaction with culturally and linguistically diverse students in a local ELL classroom. Credits: 3.00

EDCI 42100 - The Teaching Of Biology In Secondary Schools

Credit Hours: 3.00. The rationale, objectives, methods, and materials of teaching biology and life science in junior and senior high schools. Extensive use of multimedia resources in planning specifically for the student teaching experience. No undergraduate students may be enrolled in any of these undergraduate courses until they have been admitted to teacher education.

Learning Outcomes: 1. Have a conceptual understanding of science, how to develop a learning community within a classroom, and an understanding of and strategies to implement educational equity in a classroom. 2. Learn how to carry out the practical activities of science teaching, develop worksheets, hold class

discussions, develop and grade tests, and use textbooks. 3. Learn about the nature of scientific understanding and classroom communities, and how to use theoretical knowledge of learners & communities to guide their teaching. Credits: 3.00

EDCI 42200 - The Teaching Of English In Secondary Schools

Credit Hours: 3.00. Explores a wide variety of instructional practices suitable for teaching middle and high school English including language, literature, and writing - addressing specific pedagogical issues such as teaching diverse learners and developing cohesive units of instruction.

Learning Outcomes: 1. Explore different philosophical and instructional applications for secondary English teaching. 2. Examine diverse issues affecting teaching and learning in the secondary English classrooms. 3. Develop the reflective and critical thinking skills necessary for secondary English teachers. 4. Increase pedagogical competency in diverse aspects of teaching and learning, including classroom instruction, student interaction, and teacher development. Credits: 3.00

EDCI 42300 - The Teaching Of Social Studies In Secondary Schools

Credit Hours: 3.00. The purpose of this course is the development of a theoretical framework and pedagogical skills necessary to teach social studies to middle and high school students. Students are introduced to the general issues involved in planning and organizing a social studies curriculum.

Learning Outcomes: 1. Develop theoretical understanding and pedagogical skills necessary to teach social studies to middle and high school students. 2. Develop understanding of cross collaboration, communication, and the characteristics of the community, school, and classroom. 3. Develop specific and relevant understanding of student characteristics, approaches to learning, or skills and prior learning. 4. Learn general issues involved in planning and organizing a social studies curriculum. 5. Obtain the knowledge, skills, and attitudes necessary to become a reflective and skilled social studies teacher. Credits: 3.00

EDCI 42400 - The Teaching Of Earth And Physical Science In The Secondary Schools

Credit Hours: 3.00. The methods and materials needed for the teaching of chemistry, earth-space, physics, and general science in the secondary schools, including field experience. No undergraduate students may be enrolled in any of these undergraduate courses until they have been admitted to teacher education. May be taken for two credits (no field experience) by students who are enrolled in another methods course with field experience.

Learning Outcomes: 1. State your goals for secondary science teaching based on an informal position. 2. Use questions, demonstrations, and activities to probe students' concepts. 3. Describe teaching strategies which motivate students and which foster learning. 4. Describe teaching strategies to encourage meaningful problem solving. 5. Plan a science unit using a model of science teaching which takes student conceptual change into account. 6. Teach a lesson, lab, or demonstration employing appropriate strategies. 7. Choose appropriate assessment techniques to evaluate various learning outcomes. 8. Compare and evaluate secondary science curriculum materials, including audio-visual and computer materials. 9. Be able to store and/or dispose of materials properly and select experiments based on appropriate safety guidelines. 10. Describe strategies to provide appropriate learning for a diverse student population. Credits: 3.00

EDCI 42500 - Teaching Of Secondary Mathematics - Methods I

Credit Hours: 3.00. This is the first of two methods courses designed for students who are planning to be secondary mathematics teachers. The course content is organized around principles of equity, curriculum, teaching, learning, assessment and technology. It also focuses on the cycle of effective teaching, which includes justifying planning decisions, analyzing teaching, and using data to inform instruction. The courses addresses NCTM's principles and standards, as well as the content and process standards included in Indiana Academic Standards for Mathematics, and pedagogical strategies for teaching these in ways that serve the diverse population of mathematics learners.

Learning Outcomes: 1. Develop an understanding of students' thinking and the processes by which they come to learn mathematics and think mathematically. 2. Develop an understanding of teaching and learning environments through analyzing classroom interactions and the interplay among mathematics, classroom tasks, teacher moves, and students' ways of thinking and being. 3. Develop an understanding of the scope and significance of school mathematics through an examination of state and national standards and mathematics education research. 4. Develop professional attitudes and work habits and identify professional organizations and resources locally and nationally. 5. Continue learning mathematics, especially in ways that promote inquiry and investigation. Credits: 3.00

EDCI 42600 - Teaching Of Secondary Mathematics - Methods II

Credit Hours: 3.00. This is the second of two methods courses designed for students who are planning to be secondary mathematics teachers. The course content is organized around principles of equity, mathematical task design, classroom discourse, classroom environment assessment and technology. It also focuses on the cycle of effective teaching, which includes justifying planning decisions, analyzing teaching, and using data to inform instruction. The courses addresses NCTM's Professional Standards as well as the content and process standards included in Indiana Academic Standards for Mathematics and pedagogical strategies for teaching in ways that serve the diverse population of mathematics learners.

Learning Outcomes: 1. Develop an understanding of students' thinking and the processes by which they come to learn mathematics and think mathematically. 2. Develop an understanding of teaching and learning environments through analyzing classroom interactions and the interplay among mathematics, classroom tasks, teacher moves, and students' ways of thinking and being. 3. Develop an understanding of the scope and significance of school mathematics through an examination of state and national standards and mathematics education research. 4. Develop professional attitudes and work habits and identify professional organizations and resources locally and nationally. 5. Continue learning mathematics, especially in ways that promote inquiry and investigation. Credits: 3.00

EDCI 42700 - Teaching Of World Languages

Credit Hours: 3.00. This is one of the two methods courses required for World Language Teaching major. While LC 47500 is a theoretical course, this course is a practical course on world language teaching in secondary school.

Learning Outcomes: 1. Design lesson plans that draw on knowledge of content areas. 2. Write language learning assessment documents (diagnostic formative, and summative). 3. Design language assessment rubrics. 4. Evaluate their own and others' teaching effectiveness. 5. Plan lessons that incorporate strategies to monitor student learning. 6. Build collaborative relationships with other language teaching professionals. 7. Identify resources for the developing foreign language teaching, including textbooks, scholarly journals, pedagogy associations and conferences. Credits: 3.00

EDCI 42800 - Teaching Science In The Middle And Junior High School

Credit Hours: 2.00. Designed to prepare preservice teachers to teach science in the middle and junior high school (grades 5-9). No undergraduate students may be enrolled in any of these undergraduate courses until they have been admitted to teacher education.

Learning Outcomes: 1. Gain knowledge about Indiana's middle school science standards. 2. Gain knowledge about curriculum of the courses that they will be student teaching. 3. Gain knowledge about relevant professional organizations and communities. 4. Gain skills to write a high school science lesson plan and teach. 5. Gain skills to write a lab lesson plan. 6. Gain skills to identify and use resources from professional communities. 7. Gain skills to develop project-based learning unit. 8. Gain skills to write a lesson plan to teach NOS. 9.

Gain skills to collaborate in a team of teachers. Credits: 2.00

EDCI 43300 - Advanced Social Studies Methods

Credit Hours: 2.00. Foundations of social studies; methods, techniques, strategies of teaching, and activities - with special attention to skills of planning, questioning, and testing. Includes observation, participation, and microteaching in social studies classrooms. No undergraduate students may be enrolled in any of these undergraduate courses until they have been admitted to teacher education.

Learning Outcomes: 1. Develop knowledge of social studies content, appropriate state and national standards, and social studies specific pedagogy. 2. Develop and apply knowledge of middle level learners' academic needs and interests. 3. Utilize their new understandings to draw conclusions about what constitutes powerful social studies teaching and learning in middle school. Credits: 2.00

EDCI 43400 - Literacy Teaching And Learning In Secondary Schools

Credit Hours: 2.00. Exploration and development of various instructional methods and materials appropriate for supporting adolescent literacy in secondary English (i.e., middle and high school English Language Arts), including the teaching of reading. Content-area literacy methods and materials are also addressed. Includes a field experience of up to 20 hours in a secondary English school setting.

Learning Outcomes: 1. Explore multiple, diverse, research-based instructional strategies and materials to support the teaching of secondary English literacy. 2. Explore multiple, diverse, research-based instructional strategies and materials to support the teaching of content-area literacy. 3. Support the development of pedagogical competency through continued work with issues of teaching and learning in secondary English. Credits: 2.00

EDCI 44400 - Methods For Teaching Family And Consumer Sciences

Credit Hours: 4.00. The culminating on-campus teacher-education course for the Purdue University Family and Consumer Sciences program. The course builds and consolidates teacher-candidates' knowledge and skills for teaching family and consumer sciences. Emphasis placed on standards-based instructional planning and materials; instructional strategies, including laboratories, assessment of student learning, and classroom management. Course includes field experiences. Program content requirements should be completed previous to or concurrent with this course.

Learning Outcomes: 1. Establish a comprehensive knowledge base of standards in a range of family and consumer sciences content areas, with a corresponding knowledge base for integrating standards in other areas such as financial literacy, technology, English Language Arts, and mathematics. 2. Design and implement standards-based curriculum, teaching/learning strategies, and assessment of student learning to meet the needs of diverse learners. 3. Apply knowledge of student behavior, organizational skills, and classroom and laboratory management skills to create a safe, supportive, and productive learning environment. 4. Enable student learning of family and consumer sciences concepts and skills through instructional strategies and laboratory experiences that build student capacities for self-directed learning, critical-thinking, problem-solving, decision-making, leadership, and managent. Credits: 4.00

EDCI 44600 - Directed Observation For Family And Consumer Sciences

Credit Hours: 1.00 to 4.00. Field-based experience in a middle or high school, a Cooperative Extension setting, or other applicable career setting for family and consumer sciences educators. Build professional capacity through focused, participatory experiences that include interactions with family and consumer sciences educators, other school/agency personnel, and students/clients. Thirty-five hours of documented experience in approved setting needed for one credit.

Learning Outcomes: 1. Develop knowledge and awareness of family and consumer sciences education professional setting, including purposes, structures, day-to-day activities, and interactions among participants. 2. Examine professional responsibilities of family and consumer sciences educators, and corresponding knowledge, skills, and capacities for professional effectiveness. 3. Build professional experiences and capacity as a

family and consumer sciences educator. 4. Assess personal competence, goals, and areas for continued professional growth as a family and consumer sciences educator. Credits: 1.00 to 4.00

EDCI 45200 - Global Studies Seminar

Credit Hours: 1.00. (EDPS 45200) The course builds on students' international cross-cultural experiences, particularly Study Abroad. The course is required for those wishing to complete the Global Studies minor in the College of Education.

Learning Outcomes: 1. Discuss economic, social, and cultural diversity within a global context. 2. Describe the cultural, social and historical dynamics that influence individuals and groups. 3. Explain the perspective of the culture of another country through the study of world languages, arts, spiritual traditions, mythology/literature, and/or through study abroad. 4. Identify examples of how social, behavioral, or historical knowledge informs and can shape personal, civic, ethical, or global decisions and responsibilities. 5. Clearly communicate a central message with the supporting materials. Credits: 1.00

EDCI 49000 - Individual Research And Teaching Experience

Credit Hours: 1.00 to 8.00. Primarily for teacher candidates requiring special, individualized experience in research or teaching. Permission of instructor required.

Credits: 1.00 to 8.00

EDCI 49200 - Honors Scholarly Project Capstone

Credit Hours: 1.00 to 6.00. This course is designed to provide students with an introduction to designing and writing a proposal for the Honors Scholarly Project.

Learning Outcomes: 1. Identify a research question for the Honors Scholarly Project. 2. Learn how to review relevant literature, identify a methodology/approach forthe research, design the research study (or equivalent scholarly project) and identify an appropriate mentor. 3. Write, present, and submit a proposal for approval for the Honors Scholarly Project. Credits: 1.00 to 6.00

EDCI 49600 - Student Teaching In The Elementary School (UCC: OC)

Credit Hours: 6.00 to 16.00. Full-time elementary classroom teaching experiences and a student teaching seminar under the mentorship of the classroom teacher and a University supervisor.

University Core Curriculum (UCC): (UCC: OC)

Learning Outcomes: 1. Understand and address each child's development and learning needs. 2. Understand and apply content and curricular knowledge for teaching. 3. Assess, plan, and design contexts for learning. 4. Support each child's learning using effective instruction. 5. Develop as a professional. Credits: 6.00 to 16.00

EDCI 49601 - Elementary Education Expanded Student Teaching

Credit Hours: 1.00 to 8.00. This course is the initial residency experience that precedes a full semester of student teaching. The seminar and field experience focus on induction into the broader elementary school context and building mentoring relationships as both a mentee and mentor. Students will develop their identity as a professional educator who advocates for the profession, themselves, and their students. Includes a field experience. Admission to Teacher Education required.

Learning Outcomes: 1. Integrate their learning from Foundations and Methods courses into their teaching experiences in the classroom. 2. Design and deliver instruction that meets learner needs, continually assess student learning, and use assessment to drive instruction. 3. Develop their skills and professional identity as an educator through self-reflection, analysis of student learning, and analysis of feedback. 4. Use observation, academic and personal engagement, and assessment data to develop an understanding of their students as learners at the individual and group level. Credits: 1.00 to 8.00

EDCI 49800 - Supervised Teaching (UCC: OC)

Credit Hours: 6.00 to 16.00. Teaching full-time in a school classroom under the supervision of the teacher in charge of the class and a University supervisor. Completion of education methods courses and other Gate requirements for the major area and admittance to teacher education required.

University Core Curriculum (UCC): (UCC: OC)

Learning Outcomes: 1. Understand and

address each student's development and learning needs. 2. Understand and apply content and curricular knowledge for teaching. 3. Assess, plan, and design contexts for learning. 4. Support each student's learning using effective instruction. 5. Develop as a professional. Credits: 6.00 to 16.00

EDCI 50000 - Foundations Of Literacy

Credit Hours: 3.00. Survey course in the acquisition of and instruction in reading, writing, and other aspects of language.

Learning Outcomes: 1. Develop a broad background and comprehensive understanding of literacy history, theory, and the socio-cultural influences that have shaped research and practice in the field. 2. Examine the constructs of reading and literacy from multiple theoretical perspectives, and in differing historical contexts. 3. Use new understandings to critically examine current theoretical perspectives and instructional practices. Credits: 3.00

EDCI 50600 - Environmental Education

Credit Hours: 3.00. Synthesis of philosophies, scientific principles and methods for environmental education programs in forests, camps, and schools. Students conduct and summarize literature research on scientific and educational principles. In interdisciplinary teams, they develop, implement, and evaluate curricula for schools, nature centers, interpretive and outdoor education programs.

Learning Outcomes: 1. Become knowledgeable of national environmental educational programs and curriculum. 2. Develop the knowledge and skills to plan, implement, and evaluate environmental education programs, curriculum and materials. 3. Develop an understanding about learners and pedagogical methods for teaching about the environment and assessing learners. Credits: 3.00

EDCI 51000 - Colloquium In Science And Mathematics Education

Credit Hours: 1.00. Weekly colloquia on individual research topics of interest to science and mathematics education faculty and graduate students. Colloquia will describe research programs in education. Course will be required of first-year graduate students.

Credits: 1.00

EDCI 51200 - Mathematics In The Secondary School

Credit Hours: 3.00. Models of mathematics learning, current curriculum trends and practices with emphasis on laboratory and individualized systems; designing instructional materials.

Learning Outcomes: 1. Develop lesson plans promoting students' development of conceptual and procedural understanding of mathematics. 2. Develop understanding of student learning and development in mathematics by engaging in tasks similar to those that might be given to students. 3. Develop understanding of curriculum in context through teaching and working on mathematical problems from a variety of texts. 4. Develop understanding of the scope and significance of secondary school mathematics through examinations of standards and mathematics education research. 5. Develop professionally through the demonstration of professional attitudes and work habits as well as the identification of professional organizations and resources available locally and nationally. Credits: 3.00

EDCI 51300 - Foundations Of Learning Design And Technology

Credit Hours: 3.00. Provides an historical overview of the field and delineates the foundational knowledge, skills, and attitudes needed by professionals in the field of educational technology and instructional design. Students explore the field by engaging in collaborative projects, along with thinking and writing about various aspects of educational technology and the underlying instructional design theories.

Learning Outcomes: 1. Explain/describe the history and foundations of the field. 2. Define learning design and technology and distinguish among its components and related fields. 3. Identify and describe current and emerging issues in the field. 4. Initiate steps toward becoming a professional in the field of learning design and technology. Credits: 3.00

EDCI 51600 - Seminar In Environmental Education

Credit Hours: 3.00. The seminar covers current research and literature in environmental education, focusing on teaching children and adults about the environment. Topics vary by

semester and student interest.

Learning Outcomes: 1. Develop an understanding of the research literature in environmental education pertaining to the topic of study. 2. Develop critical thinking and analysis skills for evaluating environmental education research, programs, and curriculum. 3. Develop an understanding of environmental issues. Credits: 3.00

EDCI 51700 - Survey Of Science Education

Credit Hours: 3.00. Introduction to current issues and research in science education, broadly organized under themes of learning, teaching, and science curriculum.

Credits: 3.00

EDCI 51800 - The Nature Of Science In Science Teaching

Credit Hours: 3.00. Explores philosophical issues related to the scientific enterprise, such as the production and validation of scientific knowledge; the role of the scientific community; and the influence of gender and culture on doing science. Also examines the implications of these issues for science teaching and learning, as well as for research in science education.

Learning Outcomes: 1. Develop an understanding of various philosophical positions on the nature of science. 2. Develop an understanding of your own views of the nature of science. 3. Develop an understanding of the roles of scientists, the greater society, culture, and gender in the creation and validation of scientific knowledge. 4. Develop an understanding of students' and teachers' ideas about the nature of science. 5. Develop an understanding of the implications of various perspectives on the nature of science teaching and learning. Credits: 3.00

EDCI 51900 - Teaching English Language Learners

Credit Hours: 3.00. This course focuses on current issues and techniques in ESL instruction and assessment for students at the beginning or intermediate stages of English language acquisition Pre-K-12. Emphasis is on the design of materials and instruction that foster English language development in the content areas of the curriculum (i.e., Specially Designed Academic Instruction in English or SDAIE). Some familiarity with elementary and/or secondary teaching methods is assumed.

Learning Outcomes: 1. Design materials and instruction that foster English language development in the ENL classroom environment as well as in content areas of the curriculum. Credits: 3.00

EDCI 52001 - Curriculum And Instruction Online MS Seminar I

Credit Hours: 1.00. This boot camp is designed to help you to understand the knowledge and skills necessary for your successful online learning in the Curriculum and Instruction program. In this orientation, you will explore what online learning entails and reflect on how you can best set yourself up to succeed in your studies. You will also learn about various learning strategies and online resources that you can utilize in your courses. In this seminar, you will be responsible for completing all assignments on time over the course of the semester. Read the guidelines for each week and complete the assignments. NOTE: This course is a core course in the C&I online masters program. A grade of B- or better is required (if a lower grade is received, the course must be retaken). Permission of department required.

Learning Outcomes: 1. Exhibit knowledge of academic integrity by completing plagiarism, statement of commitment, and APA tutorials. 2. Effectively explain your professional goals for the program by writing an initial reflection. 3. Identify essential components of the Curriculum and Instruction Handbook, including what is required for the final portfolio. 4. Develop and apply group project skills and management techniques to make you successful in future courses and your career. 5. Demonstrate digital skills and competence with various digital tools (i.e., blogs, screencasting, Google docs, file sharing). 6. Be aware of current trends in the field of distance education and how they relate to your focus. Credits: 1.00

EDCI 52002 - Curriculum And Instruction Online MS Seminar II

Credit Hours: 1.00. This seminar is designed to help you to understand the knowledge and skills necessary for your success throughout the Curriculum and Instruction program. In addition to providing you with information that will help you succeed in the program, you are also asked to think about ways to make yourself more marketable to current and future employers. Permission of department required.

Learning Outcomes: 1. Investigate the skills and knowledge needed to be successful in a

relevant career within the C&I field. 2. Describe program and career goals. 3. Apply research skills required to compose an annotated bibliography. 4. Create the foundation of a C&I portfolio displaying programmatic achievements and course competencies. Credits: 1.00

EDCI 52003 - Theories And Trends In Curriculum And Instruction

Credit Hours: 3.00. This course focuses on current theories and trends influencing curriculum and instruction. A theory is a plausible or scientifically acceptable general principle or body of principles offered to explain phenomena. It is a belief, policy, or procedure proposed or followed as the basis of action. A trend, on the other hand, is a pattern of gradual change in a condition, output, or process. It reflects a general tendency of a series of moves in a certain direction over time. We will focus on understanding sources of current theories and trends and how they may influence work in curriculum and instruction. Permission of department required.

Learning Outcomes: 1. Examine and clarify the educational beliefs, values, and knowledge guiding your curricular and instructional decisions. 2. Utilize and evaluate multiple appropriate sources in researching current curriculum and instruction trends and issues. 3. Interpret, critique, and synthesize relevant research related to current curriculum and instruction trends. 4. Assess the implications of research relative to your curricular and instructional practices. 5. Interpret, critique, and synthesize relevant educational theories related to current curriculum and instruction trends. 6. Assess the implications of educational theories relative to your curricular and instructional practices. 7. Interpret, critique, and synthesize relevant state and national policy decisions related to current curriculum and instruction trends. 8. Assess the implications of state and national policy decisions relative to your curricular and instructional practices. 9. Communicate effectively in oral and written formats. 10. Demonstrate the disposition for life-long learning and continuous professional development. 11. Identify communities of practice within discipline and participate within these communities according to the ethical standards of the discipline. 12. Examine and clarify how your educational beliefs, values, and knowledge guide your curricular and instructional decisions address the diversity of students, schools, and communities. 13. Advocate for values of diversity, inclusivity, and social justice. Credits: 3.00

EDCI 52004 - Teachers As Leaders

Credit Hours: 3.00. This course focuses on teacher leadership in instruction. Participants will examine the history of teacher leadership. Instructional coaching models will be examined and compared. Students will identify the various theories that support each coaching model and examine what is most present in their school contexts. Permission of department required.

Learning Outcomes: 1. Investigate the construct of school leadership. 2. Evaluate potential leadership roles in classrooms, schools, or other organizations. 3. Research teacher leadership praxis to impact future praxis. 4. Synthesize leadership research in conjunction with theories of social justice and equity. 5. Analyze the skills of effective teacher leadership through collaboration and inquiry. 6. Explore the critical role teachers play in creating conditions for continuous and systematic improvements in education. Credits: 3.00

EDCI 52301 - Foundations Of Bilingual Education

Credit Hours: 3.00. This course builds foundational and practical knowledge of children's bilingual development and the sociocultural, cognitive, philosophical, and educational basis for high-quality dual language and other bilingual education programs. It focuses on research and current issues related to the bilingual development of emergent bilinguals in K-12 contexts. It is designed for pre-service and in-service bilingual teachers and administrators, in addition to other teachers of English language learners and researchers interested in high-quality and equitable educational programs for bilingual students.

Learning Outcomes: 1. Identify the various dimensions of bilingualism, bilingual language use, and bilingual language ability. 2. Outline

the dimensions of language proficiency and the challenges of measuring bilingualism. 3. Describe development processes and types of early and late development of bilingualism. 4. Describe the role of translanguaging in bilingual language development and use, and the connections between identity and bilingualism. 5. Describe the role of languages in society, including factors that contribute to language maintenance and loss. 6. Describe the cognitive aspects bilingualism. 7. Identify the features of various models of bilingual education and the theories that guide their implementation. 8. Describe historical and current policies, court decisions, and legislation that have shaped bilingual education. 9. Identify the essential features of strong bilingual programs that lead to high levels of bilingualism and biliteracy. 10. Explore the findings of specific research studies that provide evidence of the effectiveness of well-designed bilingual education programs. 11. Describe the ways bilingual education programs can address the needs of a all bilingual students, including students with exceptionalities and special needs. Credits: 3.00

EDCI 52401 - Teaching Methods In Bilingual Education

Credit Hours: 3.00. Application of theory, research, and guiding principles to providing high-quality instruction in dual language and other bilingual education programs in K-12 education. This course includes a specific focus on both program-level design of effective dual language programs, and effective language and literacy instruction for emergent bilingual students leading to high levels of bilingualism, biliteracy, and academic achievement. This course is designed for pre-service and in-service bilingual teachers and administrators, in addition to other teachers of English language learners and researchers interested in high-quality and equitable educational programs for bilingual students.

Learning Outcomes: 1. Identify and describe the principles and key aspects of the structure and curriculum of dual language bilingual education programs. 2. Define biliteracy and the key components of the Literacy Squared model. 3. Identify and describe the principles and key aspects of effective oral language instruction and the development of metalinguistic skills. 4. Identify and describe the principles and key aspects of effective reading instruction across two languages. 5. Identify and describe the principles and key aspects of effective writing instruction across two languages. 6. Identify and describe the principles and key aspects of effective assessment practices across two languages. 7. Develop effective lesson plans for bilingual and biliteracy development. 8. Identify and describe the principles and key aspects of whole school considerations in supporting effective dual language bilingual education programs. Credits: 3.00

EDCI 52600 - Language Study For Educators

Credit Hours: 3.00. (ENGL 52900) Covers foundational knowledge in language and linguistics for teachers and educational researchers. Topics include structure and functions of language, language acquisition and development, language diversity, classroom discourse, language and media, and literacy-language arts curriculum. A foundation for work in Literacy and Language Education.

Learning Outcomes: 1. Understand the concepts and theories of how second (and more) languages are acquired and processed through an examination of current research into second language acquisition. 2. Examine this research to develop a greater understanding of the issues and challenges faced by students as they learn English as a New Language, and how teachers can develop practice which address these needs. Credits: 3.00

EDCI 52800 - Human Performance Technology

Credit Hours: 3.00. This course provides an introduction to the field of human performance technology (HPT). It examines basic concepts and principles of human performance, the theoretical underpinnings of the field, research and application literature, and various approaches to solving human performance problems. A systematic approach to the analysis, design, development, implementation and evaluation of performance improvement interventions within organizations is emphasized.

Learning Outcomes: 1. Identify the major theoretical underpinnings of the field of HPT. 2. Describe the relationship between the systematic development of instruction and HPT. 3. Analyze a human performance system in order to diagnose a performance gap. 4. Determine whether training, a non-training performance intervention, or a combination is most appropriate for a given situation. 5. Construct a systemic plan to address performance issue(s), including coordinated interventions and evaluation strategies. 6. Design appropriate interventions to address specific performance gaps. Credits: 3.00

EDCI 53000 - English Language Development

Credit Hours: 3.00. Focuses on theoretical and practical knowledge for teachers about how second languages are learned, and on the educational and philosophical basis for second language teaching and learning. Links English language development to teaching and learning strategies and is designed for undergraduate and graduate students in education and practicing teachers.

Learning Outcomes: 1. Develop increased understanding of the English language development process by English language learners (ELLSs). 2. Describe the importance of the changing demographics in the U.S. and Indiana as they relate to ELLs. 3. Explore the literacy development of ELLs in broader sociocultural contexts. 4. Describe the importance of explicit teaching and the oral and written language development for ELLs. 5. Develop understanding of the nature and role of culture in language development and academic achievement, considering the development of literacy and biliteracy by ELLS. 6. Explore how individual differences affect English language development. 7. Gain experience in identifying the learning challenges of ELLs and assessing ELLs' learning in P-12 classrooms. 8. Collaborate with colleagues in activities and assignments and in planning to build partnerships with ELLs' families. 9. Develop understanding of their roles as ELL teachers and professionals in advocating on behalf of ELLs. 10. Discuss the role of the teacher in the English language development of ELLs. Credits: 3.00

EDCI 53100 - Learning Theories And Instructional Design

Credit Hours: 3.00. This course has been designed to help you learn how theories of human learning and motivation can be applied to the instructional process in order to make the process more effective, efficient, and/or appealing. The focus of the course is on two areas: 1) the theoretical principles that have contributed to the field of Instructional Design (ID), and 2) how those principles can be applied within practical settings.

Learning Outcomes: 1. Identify, describe, and explain the basic tenets of behavioral, cognitive, and constructivist learning theories. 2. Compare and contrast the contributions of various learning theories to the field of instructional design. 3. Identify and describe the basic components within various motivational theories and their impact upon the learning process. 4. Select appropriate principles derived from given theories and apply those within practical learning situations. Credits: 3.00

EDCI 53300 - Teaching And Learning Number And Operations

Credit Hours: 3.00. This course is designed to provide opportunities for mathematics educators to develop understanding of teaching and learning in the domain of number and operation. Central to this work is the construction of models of learners' understanding of number and operation and the use of those models to build and select curriculum. While curricular efforts have historically taken as central a formal view of mathematics and its construction, more recently curriculum has been written to engage learners and to build from knowledge of learners' understanding. In this course we will develop models of learner's understandings of different facets of number and operation and then use those models and our emerging understanding of curriculum to explore challenges in teaching and learning.

Learning Outcomes: 1. Develop models of learner's understandings of number and operation. 2. Use models of learner's understandings of number and operation to design and select appropriate and productive learning opportunities. 3. Develop knowledge of

key curricular development in mathematics education in the United States. 4. Associate teaching and curriculum with understandings of number and operation they might generate. 5. Use technology to support the development of ideas in number and operation. 6. Synthesize existing research to support inquiry in the teaching and learning of number operation. Credits: 3.00

EDCI 53400 - Teaching And Learning Geometry And Measurement

Credit Hours: 3.00. This course is designed to provide opportunities for mathematics educators to develop understanding of teaching and learning in the related domains of geometry and measurement. Central to this work is the construction of models of learners' understandings of geometry and measurement and the use of models to design instruction. Geometry, as a discipline in school mathematics, has historically and more currently been debated. In this course we will explore research in the teaching and learning of geometry and measurement. A synthesis of select literature will inform our efforts to develop models of learners' geometric reasoning and understanding of measurement. We will move past the development of models to the design of instruction meant to support understandings of concepts that utilizes technology.

Learning Outcomes: 1. Develop models of learner's understanding of measurement and concepts in geometry. 2. Use models of learner's understanding to design and select appropriate and productive learning opportunities. 3. Develop knowledge of the history of geometry as a school mathematics subject in the United States. 4. Develop and articulate a perspective on teaching and learning geometry and measurement with technology. 5. Synthesize existing research to support inquiry in the teaching and learning of geometry and measurement. Credits: 3.00

EDCI 53500 - Teaching And Learning Algebra And Functions

Credit Hours: 3.00. This is a course for current or prospective mathematics teachers wishing to explore ways of teaching algebra with a focus on addressing concerns related to student performance in algebra and increasing algebraic reasoning skills in the classroom. The course includes experiences with inquiry-based learning by engaging participants in algebra activities from two secondary National Council of Teachers of Mathematics (NCTM) standards-based curricula. The course will provide opportunities for participants to collaborate on the development of algebraic thinking in mathematics classrooms and will address pedagogical approaches to students' learning of algebra.

Learning Outcomes: 1. Content and pedagogical knowledge for teaching algebra. 2. Familiarity with NCTM standards-based mathematics curricular. 3. Disposition that values students' contributions and desires to motivate students to learn algebra using a variety of strategies, including engaging them in making sense of algebraic concepts and making use of their life experiences to find relevant contexts for algebra. Credits: 3.00

EDCI 53600 - Teaching And Learning Data Analysis And Probability

Credit Hours: 3.00. This course will provide opportunities for the growth of middle school mathematics teachers understanding of data analysis and probability as a means to help analyze and interpret experienced events. The course will address the following: selecting and using appropriate statistical methods to analyze data, developing and evaluating inferences and predictions that are based on data, and understanding and applying the basic concepts of probability. This course will also address pedagogical approaches to students' learning of data analysis and probability.

Learning Outcomes: 1. Employ research-based instructional strategies to develop statistical understanding in middle, secondary and tertiary settings, and for teacher professional development. 2. Develop tasks, questions, and lessons that can be used to assess as well as further develop students' understanding of statistics and probability. 3. Read and interpret research results and classroom-based articles that describe students' statistical and probabilistic reasoning. 4. Reflect on course readings and their practical teaching experience to consider how to best teach statistical and probability concepts. Credits: 3.00

EDCI 53900 - Introduction To K-12 Integrated Science, Technology, Engineering And Mathematics (STEM) Education

Credit Hours: 3.00. This course will provide students with a conceptual understanding of integrated K-12 Science,

Technology, Engineering and Mathematics (STEM) education and the nature of the disciplines of STEM. Students will explore implications for the teaching and learning of integrated STEM in a K-12 context through an evaluation of integrated approaches to STEM, national teaching standards and current research.

Learning Outcomes: 1. Explore the nature of the disciplines of STEM and their roles in a K-12 integrated STEM context. 2. Identify current approaches to integrated STEM education. 3. Explore issues related to diversity and equity in STEM education. 4. Define and describe how reform-based teaching and learning relates to nature of the disciplines of STEM. 5. Summarize the current research on teaching and learning through integrated STEM approaches. 6. Develop STEM integration activities for K-12 settings. 7. Develop an action research proposal to study a problem of interest in teaching or learning in K-12 STEM settings. Credits: 3.00

EDCI 54100 - Contemporary Issues In Career And Technical Education

Credit Hours: 3.00. Identification, analysis, synthesis, and implications of current issues and problems in career and technical education at the elementary, secondary, postsecondary, and adult levels; policy and literature review; formulation of alternatives and solutions.

Learning Outcomes: 1. Identify and analyze existing policy and programmatic problems and issues in career and technical education and related disciplines and fields. 2. Synthesize and summarize contemporary literature relating to problems and issues. 3. Formulate alternatives and solutions to existing problems and issues. 4. Examine the implications and potential impact (short- and long-range) of problems and issues in career and technical education for society and education in general. Credits: 3.00

EDCI 54300 - Instruction In Career And Technical Education

Credit Hours: 3.00. Contemporary trends and methods in teaching career and technical programs, learning styles and teaching styles, and a variety of creative instructional strategies for different educational contexts will be identified and analyzed.

Learning Outcomes: 1. Develop an understanding of the instructional process and learning theory in career and technical education and business and industry training. 2. Provide an overview of the major influences on learning and learning environments. 3. Acquire skills in instructional planning, implementation, and evaluation. 4. Analyze a variety of instructional strategies and resources in career and technical education and training. 5. Review and analyze instructional literature and research in career and technical education. 6. Gain experience in instructional planning and delivery. Credits: 3.00

EDCI 54400 - Career And Technical Education For Special Needs Learners

Credit Hours: 3.00. Legislative initiatives; identification of special needs learners at the elementary, secondary, postsecondary, and adult levels; learning characteristics; assessment; individualized planning; instructional adaptations; school and community resources; exemplary program models; research, trends, and issues; and evaluation.

Learning Outcomes: 1. Describe the major historical and contemporary legislative provisions affecting the delivery of career and technical education to special needs learners. 2. Identify and describe the educational characteristics of special needs learners, including students with disabilities, disadvantaged students, gifted and talented learners, non-traditional learners, and limited-English proficient speakers. 3. Describe and use appropriate strategies for assessment of the career needs, learning styles, and progress of special needs learners. 4. Develop and evaluate individualized education, career, and transition plans for a special needs learner. 5. Select and use appropriate instructional strategies, procedures, and materials. 6. Identify and select appropriate community, business, industry, school, governmental agency, occupational, and professional resources. 7. Compare and contrast various exemplary program models for special needs learners. 8.

Evaluate the major professional trends, issues, and implications for career and technical education programs for special needs learners. Credits: 3.00

EDCI 54500 - Planning In Career And Technical Education

Credit Hours: 3.00. Principles and strategies in planning new and improving existing career and technical education programs, strategic planning, needs assessment, community and workforce market research, information and data analysis, program improvement. Permission of Department required.

Learning Outcomes: 1. Develop an understanding of the principles and strategies in planning CTE and workforce education programs. 2. Provide an overview of the CTE district program plan. 3. Review Federal CTE and workforce education legislative planning regulations and guidelines. 4. Examine State CTE and workforce education legislative planning regulations and guidelines. 5. Critique various strategic planning models, strategies, and procedures. 6. Describe strategies for advocating for diversity and access and equity for special needs populations in CTE program planning policy and practice. 7. Evaluate local and CTE district planning factors and considerations. 8. Discuss community needs assessment and workforce market research, information and data analysis, and use of findings in decision-making. 9. Describe strategies for organizing and collaborating with program advisory committees. 10. Explain continuous program evaluation and improvement. Credits: 3.00

EDCI 54501 - Teaching STEM Through Agriculture, Food, And Natural Resources

Credit Hours: 3.00. The course focuses on the background and history of STEM movement and agricultural education, contemporary models, strategies, and justification for incorporation of science, technology, engineering and mathematics (STEM) concepts and practices into K-12 formal and non-formal agricultural education programs. Consider and develop the best practices for STEM teaching and learning and enhancement of STEM content in agriculture, food and natural resources (AFNR) context. The goal of the course is to help students develop knowledge about STEM integration and equip them with teaching knowledge and skills for designing K-12 lesson plans by using integrated STEM through AFNR. Students will learn strategies that promote engagement in integrated STEM through AFNR activities. At the end of the course, students should be able to design and implement research-based integrated STEM through AFNR lesson plans and assessment plans.

Learning Outcomes: 1. Analyze integrated models of STEM learning, and justify how a selected model informs best practices for science and agriculture, food, and/or natural resources teaching and learning. 2. Evaluate current national and state standards that help design lesson plans in non formal, and formal educational contexts. 3. Develop lesson plans by using agriculture, food, and/or natural resources as context to teach STEM content and concepts. 4. Describe life and 21st century skills that are relevant in agriculture, food, and/or natural resources contexts and demonstrate how these skills can be integrated into lesson plans. 5. Create an assessment plan to evaluate learning outcomes. 6. Apply learner-centered teaching strategies, such as inquiry-based learning, to teach the lesson plans. 7. Create a manuscript that can be used to disseminate the integrated STEM lesson to professional audiences. Credits: 3.00

EDCI 54800 - Teaching Mathematics To Diverse Learners

Credit Hours: 3.00. This course is designed to provide opportunities for in-service teachers to engage around issues of equity in mathematics education. Equity here is used as a broad construct intended to help us think about how to provide meaningful opportunities to learn for all the students in our mathematics classrooms. The notion of "diverse" here is also taken broadly. All students have special needs, but it is sometimes helpful to think about the needs of particular groups of students while at the same time avoiding reducing differences among students to stereotypes. Issues of diversity here include, but are not limited to race, culture, gender, disabilities, language, SES, and sexual orientation.

Learning Outcomes: 1. Increased awareness of diverse learners' challenges in mathematics education. 2. Developed discourse for equity

issues in mathematics education. 3. Knowledge of strategies to facilitate diverse learners' mathematical learning. Credits: 3.00

EDCI 54900 - Assessment In STEM Education

Credit Hours: 3.00. This course is designed to help teachers of STEM recognize the link between productive assessment and productive instruction, using the STEM education standards for teacher competence in educational assessment. This course is designed to help teachers meet those professional standards and understand the public pressure as well as instructional need for effective formative and summative assessment.

Learning Outcomes: 1. Choose appropriate assessment methods. 2. Develop appropriate assessment methods. 3. Administer scoring and interpreting assessment results. 4. Use assessment results to make decisions about individual students, plan teaching and develop curriculum. 5. Communicate assessment results to students, parents, and other educators. 6. Recognize inappropriate assessment methods and uses of assessment information. Credits: 3.00

EDCI 55000 - Career Education

Credit Hours: 3.00. An overview of contemporary legislation, educational reform, trends, and issues; career education program models; vocational and technical education, technology prep, and school-to-work systems; partnerships; foundations of career education; career development; curriculum; career guidance and counseling; career assessment; career planning practices; learning styles and instructional strategies; career information sources and resources; exemplary programs; and special needs populations and practices.

Learning Outcomes: 1. Describe the major legislative provisions and educational reforms affecting the delivery of career education. 2. Evaluate significant trends in career education, and professional and social issues. 3. Identify and adapt (a) career education model(s). 4. Describe the Career and Technical Education, Tech Prep, Career Pathways, and School-to-Career delivery systems. 5. Discuss effective partnerships between and among the school, the community, and business and industry. 6. Describe the foundations of career education. 7. Explain the career development process. 8. Identify the roles of elementary, middle, high school, postsecondary, and adult education; and business and industry in career education. 9. Develop career education curriculum; career clusters and pathways; and occupational, job, and task analysis. 10. Apply career guidance and counseling practices and procedures. 11. Utilize career assessment strategies. 12. Implement career planning practices and procedures. 13. Adapt appropriate learning styles and instructional strategies for individual learners. 14. Locate and use career information sources. 15. Identify, select, and utilize appropriate career information resources related to the school, community, governmental agency, occupational, and professional resources. 16. Identify, compare, contrast, and adapt exemplary career education programs. 17. Identify special needs populations and effective practices. Credits: 3.00

EDCI 55100 - Young Adult Literature

Credit Hours: 3.00. This course is a survey of classic and contemporary young adult texts. Students are introduced to the genre through reading notable young adult texts, applying relevant literary criticism, and investigating effective pedagogical strategies.

Learning Outcomes: 1. Read and respond to selected young adult texts in writing and in class discussion. 2. Explore the extent to which young adult texts portray the complex challenges of teenage life. 3. Explore the extent to which young adult texts, as imaginative narratives, affect teenage identity development. 4. Create a final project synthesizing young adult texts, theories of reading and response, and theories of adolescent development. Credits: 3.00

EDCI 55200 - Generalizable Skills Instruction In Career And Technical Education

Credit Hours: 3.00. Curriculum, assessment, planning, implementation, and evaluation relating to generalizable skills (also known as generic, transferable, or workplace skills) in career and technical education, other content areas, and special education programs; philosophical, historical, social, economic, political, and educational influencing factors; analysis and synthesis of current research and conceptual models; practical

applications for programs; instructional strategies; resources and support services, interdisciplinary collaboration approaches; applications for special needs learners; learning styles and characteristics.

Learning Outcomes: 1. Identify and analyze the philosophical, historical, social, economic, political, and educational factors influencing generalizable skills instruction in career and technical education programs. 2. Locate, analyze, and synthesize contemporary generalizable skills literature and research and its application in career and technical programs. 3. Identify, analyze, and apply a conceptual model for generalizable skills instruction regarding curriculum, assessment, planning, implementation, and evaluation. 4. Identify generalizable skills curriculum. 5. Examine and apply methods of generalizable skills curriculum development and revision. 6. Review and analyze functional, curriculum-based assessment, instruments, strategies, and procedures. 7. Describe and use procedures for using generalizable skills assessment data/information in individualized educational planning. 8. Identify the individual learning styles and characteristics of, and apply appropriate instructional approaches for, individual students in career and technical programs. 9. Identify, locate, select, and evaluate instructional resource materials and support services useful in generalizable skills instruction. 10. Identify, adapt, and develop methods for teaching generalizable skills in career and technical programs. 11. Develop and implement interagency collaboration strategies among career and technical education, special education, support/remedial services, and content related (e.g., mathematics, reading) school personnel. 12. Identify and select appropriate evaluation methods and procedures for determining the adequacy, quality, and effectiveness of generalizable skills instruction and support services in career and technical education programs. Credits: 3.00

EDCI 55201 - AI Integration In Education

Credit Hours: 3.00. This course aims to provide students with the knowledge and skills needed to understand and utilize Generative AI in education. Students will acquire fundamental coding skills and develop technical expertise in using and comprehending AI. By engaging in hands-on activities and analyzing real-world case studies, students will design and create their own AI applications using Google Teachable Machine to solve a specific problem of their choosing. Additionally, the course will examine ethical issues related to AI/GenAI, allowing students to establish guidelines for the meaningful integration of AI/GenAI in teaching and learning.

Learning Outcomes: 1. Define AI/GenAI and discuss its potential integration into education. 2. Create an innovative AI/Gen application using Google Teachable Machine. 3. Develop a learning activity using GenAI that caters to different learning preferences and needs. 4. Analyze and discuss the ethical issues surrounding the use of AI, specifically GenAI, in education from the perspectives of both learners and educators. Credits: 3.00

EDCI 55300 - Leadership Development In Career And Technical Education

Credit Hours: 3.00. Design, development, implementation, and evaluation of systems and strategies for enhancing the skills and knowledge of personnel seeking to become leaders in the field of Career and Technical Education (CTE); research related to critical and emerging leadership issues, strategies, policies, and resources are examined and applied to program improvement initiatives in schools, the workplace, agencies, and other organizations that serve a wide variety of youth, adolescents, young adults, and adults.

Learning Outcomes: 1. Identify and adapt models of staff development, in-service education, and program improvement. 2. Use organizational, adult learning, motivational, leadership, and social systems therapy in staff development and school-or agency-based program improvement activities. 3. Develop and implement organizational communications and group-related interactions effectively. 4. Evaluate the principles related to leadership style; organizational development, initiation and management of change, needs analysis, and

consultation strategies; and program improvement activities. 5. Locate current and emerging funding sources, as well as effective procedures for developing grant seeking and project management strategies. 6. Implement comprehensive strategies for developing assessing and improving programs, policies, practices, and services related to career and technical education programs. 7. Design and implement effective interagency collaboration initiatives. Credits: 3.00

EDCI 55600 - Educational Video Game Design

Credit Hours: 3.00. Designed to provide an introduction to the design of educational video games. The focus of the course is on two areas: 1) the learning, instructional design, and game design theories which can inform the design of effective and engage in educational video games, and 2) how to apply those theories within practical settings.

Learning Outcomes: 1. Become comfortable with the history, concepts, terminology, culture, and classification of educational video and computer games. 2. Explore current research on educational computer and video games. 3. Examine learning, instructional design, and game design theories for relevance to the design of educational computer and video games. 4. Apply theory be designing, developing, and implementing a prototype of an educational computer or video game as teams. Credits: 3.00

EDCI 55700 - Assessment Of Culturally And Linguistically Diverse Students

Credit Hours: 3.00. Critical review of research and practice in language proficiency and content-area assessment of culturally and linguistically diverse students in K-12 education, and the sociocultural dimensions of standardized testing, academic achievement, and accountability. Critical analysis of standardized language proficiency and literacy tests. Development of authentic alternative language, literacy and content-area assessments. Prerequisites: Background in K-12 education.

Learning Outcomes: 1. Describe and critically analyze historical foundations, current research issues, national and state policies, and current practices in the testing and assessment of culturally and linguistically diverse students. 2. Critically analyze the results of standardized language proficiency and academic achievement tests and their use in accountability programs. 3. Design, utilize, and critically analyze the results of alternative authentic language and content-area assessments. 4. Describe the impact of linguistic and cultural factors on the assessment process of linguistically diverse students. Credits: 3.00

EDCI 55800 - Integrated Science, Technology, Engineering And Mathematics (STEM) Education Methods-Secondary

Credit Hours: 3.00. Focuses on operationalizing the theoretical pedagogical approaches to integrated Science, Engineering, Mathematics and Agriculture (STEM) education. Collaboratively and cooperatively investigate, plan and deliver integrated learning experiences appropriate for secondary education. Course content will blend philosophical considerations with practical application. Permission of instructor required.

Learning Outcomes: 1. Engage in instructional conversations, collaboratively share instructional resources, and develop a sense of community for integrated STEM learning and teaching. 2. Contextualize STEM learning in authentic contexts. 3. Explain and apply socially and culturally relevant pedagogy in the context of STEM learning. 4. Discuss levels and types of integrated STEM content, pedagogy, and ways of knowing. 5. Develop and disseminate integrated STEM learning experiences. 6. Implement, assess and reflect on integrated STEM learning experiences in public school classrooms. 7. Articulate a framework explaining integrated STEM education. 8. Adapt existing singular discipline curriculum resources to leverage connections across disciplines to facilitate integration. Credits: 3.00

EDCI 55850 - Introduction To Teaching Engineering And Technology Design In The Context Of K-12 Integrated STEM

Credit Hours: 3.00. Engineering and technology design has gained considerable traction in many K-12 schools. In this

course, we will examine principals of engineering design and technology as well as where and how engineering and technology design best fits in a K-12 integrated STEM curriculum. Course participants will engage in authentic engineering and technology design experiences. Course participants will also design, develop, deliver integrated lessons that help K-12 students develop the knowledge, skills, and practices of engineering and technology design.

Learning Outcomes: 1. Demonstrate a broad understanding of engineering and technology education disciplines and concepts. 2. Scaffold engineering practices that support diverse learners and describe conceptual understanding and content knowledge of engineering and technology design skills through problem-based learning in i-STEM environments. 3. Comprehend and elaborate data-driven decision-making skills as practiced by engineering and technology professionals to develop solutions to design briefs that support K-12 learning in diverse learning environments. 4. Examine and evaluate the engineering design process in the context of integrated STEM education at the K-12 learning. 5. Collaborate and prepare pedagogical practices in integrated engineering and technology design through integrated STEM that support K-12 learning for a diverse group of learners. Credits: 3.00

EDCI 55900 - Academic Language And Content Area Learning

Credit Hours: 3.00. (ENGL 59900) Course focuses on theoretical and practical knowledge for teachers about how second languages are learned, and on the educational and philosophical basis for second language teaching and learning. The course links English language development to teaching and learning strategies and is designed for undergraduate and graduate students in education and practicing teachers.

Learning Outcomes: 1. Develop an understanding of the linguistic challenges of academic language in the content areas of science, language arts, mathematics, and the social studies for ELLs. 2. Gain experience in determining academic tasks that require advanced levels of reading and writing. 3. Learn about the development of academic literacy as ELLs move from elementary into secondary and post secondary education. Credits: 3.00

EDCI 55950 - Engineering And Technology Design Practicum

Credit Hours: 3.00. EPICS is a service-learning design course in which teams of students from across campus work together on long- term projects that benefit the community. Project work centers around the engineering, technology, and computing needs of a community partner, but interdisciplinary team interaction is an integral element for project success. Students may participate in EPICS multiple semesters and participation for multiple consecutive semesters on a project team is encouraged. Teams are composed of first year students through seniors.

Most EPICS projects last at least one-year, though partnership with the community organization continues for several years. Projects are intended to solve real problems, are defined in partnership with their community partners, and span the complete design process cycle [problem identification - specification development - conceptual design - detailed design - delivery - service/maintenance - retirement].

You receive academic credit for participating in EPICS. How academic credits are applied to your major depends on your degree program and is determined by your department and/or advisor. See https://engineering.purdue.edu/EPICS/purdue/epics-purdue/credit.

Learning Outcomes: 1. Apply material from their discipline to the design of community-based projects. 2. Understand design as a start-to-finish process. 3. Identify and acquire new knowledge as a part of the problem-solving/design process. 4. Be aware of the customer. 5. Function on multidisciplinary teams and an appreciation for the contributions from individuals from multiple disciplines. 6. Communicate effectively both orally and written with widely-varying backgrounds. 7. Be aware of professional ethics and responsibility. 8. Have an appreciation of the role that their discipline can play in social contexts. Credits: 3.00

EDCI 56000 - Educational Technology For Teaching And Learning

Credit Hours: 3.00. This course addresses the fundamentals of educational/learning technologies within both the traditional classroom, as well as the corporate/business training

environments. Students will explore and evaluate various tools/technologies and determine how, when, and why such technologies can/should be infused into normal, hybrid, or fully online learning situations. The goal of the course is to help the student plan, implement, and evaluate technology for teaching and learning.

Learning Outcomes: 1. Demonstrate the ability to access, generate, and manipulate information through the use of various software and technology apps. 2. Apply educational technology to communicate, collaborate, conduct research, and solve problems, as well as promote equitable, ethical, and legal use of computer/technology resources. 3. Apply and integrate educational technology to support instruction in selected developmental and content areas. Credits: 3.00

EDCI 56400 - Integration And Management Of Technology For Learning

Credit Hours: 3.00. This course focuses on techniques for and issues related to integrating technology in learning environments in a meaningful way. Topics covered stem from literature in the field and include (1) theoretical foundations of technology integration, including how technology can support a more personalized approach to learning, (2) instructional and learning issues with technology integration, (3) designing for the integration of technologies for in learning environments, and (4) emerging issues in research and practice with technology integration. Class activities are designed to model applications of learning technology, while class projects allow individuals to develop skills and knowledge in areas of your personal need or interest. The goal of the course is to help you develop an understanding of important issues associated with the integration and management of learning technology and to effectively plan, design, implement, and evaluate technology-based learning.

Learning Outcomes: 1. Apply educational technology to enhance professional growth and productivity. 2. Use technology to communicate, collaborate, conduct research, and solve problems. 3. Apply the information from this course into authentic settings. 4. Successfully integrate technology into different forms of instruction. Credits: 3.00

EDCI 56500 - Principles Of Adult Education

Credit Hours: 3.00. (ASEC 56500) Principles of adult education applied to helping adults learn, evaluating their performance, and determining their needs. Examines history, philosophy, and research of adult education. Explores techniques required in design and delivery of instruction for adults.

Learning Outcomes: 1. Examine principles and techniques for educating adults, including the history, philosophy, and research field. 2. Develop an individual philosophy of continuing and adult education for a wide variety of situations. 3. Apply principles, techniques, philosophy and research in development and design of adult education programs. Credits: 3.00

EDCI 56600 - Educational Applications Of Multimedia

Credit Hours: 3.00. Examination of educational applications of hypermedia tools and related research. Creation of hypermedia instructional materials. Incorporation of digitized media (sound, photographs, and motion clips) in hypermedia is explored.

Learning Outcomes: 1. Explain the effectiveness of a specific instructional design principle in educational multimedia design. 2. Demonstrate when and how to use specific instructional design principles within a given educational multimedia learning environment. 3. Address the key principles and methods for evaluating student outcomes in a multimedia learning environment. 4. Develop educational computer-based multimedia instructional materials with various software and tools. 5. Be familiar with the history of multimedia research and design and underlying assumptions from relevant theorists. 6. Explain variations in usability testing and its role in multimedia development. Credits: 3.00

EDCI 56700 - Action Research In Science Education

Credit Hours: 3.00. An introduction to various models and conceptions of teacher action research in science education. Students review literature on action research, participate in small research cohorts, and plan and conduct action research within their respective educational situations.

Learning Outcomes: 1. Develop an understanding of what action research is, how it is conducted, and what role it plays in the construction of teacher knowledge in science

education. 2. Plan and conduct action research within your respective educational situation. 3. Examine various models for action research in pre-service, in-service, and independent projects in science education. 4. Gain insight into the role action research plays in science education and science teacher education. Credits: 3.00

EDCI 56800 - Partnering With Web-Based Tools For Learner Centered Environments

Credit Hours: 3.00. Provides an in-depth look at Web-based digital tools for teaching and learning, with a focus on learner-centered activities and environments. Emphasis is given to applying the knowledge and skills necessary to create a Web-based, student-centered lesson/unit that provides diverse learners with opportunities for formal and informal learning. Course content is applicable to both independent and collaborative learning, as well as use of the Web as the sole educational delivery system or in combination with other approaches, including traditional classroom instruction.

Learning Outcomes: 1. Create a personal vision of 21st century schools or workplace and a personal definition of a 21st century learner. 2. Examine, in depth, a specific student-centered approach (e.g. project-based learning, problem-based learning, inquiry learning, authentic instruction, etc.) and discuss the similarities and differences among different approaches. 3. Create a video tutorial that teaches others how to use a specific Web 2.0 tool. 4. Design a learner-centered lesson that incorporates relevant Web 2.0 tools for the purpose of broadening and/or deepening students' understanding of specific curricular content. 5. Develop an implementation plan and create appropriate assessment measures to determine student learning in your own learner-centered lesson. Credits: 3.00

EDCI 56900 - Introduction To E-Learning

Credit Hours: 3.00. This course examines how the design and development of instruction are impacted by the use of the computer as delivery system. A primary focus is on effective learning design strategies for e-learning. Learners will identify and apply effective design practices with emphasis on project management, planning, and implementation. Education or training materials will be developed using appropriate authoring tools as determined by the instructional context. Learners will design an E-Learning module with end-to-end documentation of the design process (Project Plan, Design Document, Storyboard). Opportunities for collaborative feedback and evaluation will also be featured elements of the course experience.

Learning Outcomes: 1. Identify and implement sound design processes for e-learning. 2. Integrate relevant learning theory into e-learning design decisions. 3. Design, develop, and evaluate an effective e-learning module. Credits: 3.00

EDCI 57200 - Introduction To Learning Systems Design

Credit Hours: 3.00. An introduction to the principles of designing instructional materials and to instructional communication theory and techniques. Topics include objectives, student characteristics, media selection, communication variables, message design, and systematic evaluation.

Learning Outcomes: 1. Describe and apply the components of a systematic design process, their rationales, and uses. 2. Use a systematic design process and instructional psychology principles in performing an analysis of learning context analysis of learners, analysis of learning tasks, in design and development of assessments, and in design of formative and summative evaluation of the instruction itself. Credits: 3.00

EDCI 57300 - Instructional Development Practicum

Credit Hours: 2.00 or 3.00. Provides supervised field experience in programs involving instructional design development activities. Students participate in ongoing projects in the design, development, and evaluation of instructional materials and training programs in business and industry, medical facilities, or other settings deemed appropriate. Recommended prerequisites: EDCI 56900, EDCI 57200, and EDCI 67200. Permission of instructor required.

Learning Outcomes: 1. Design, develop, and evaluate a major instructional design project within a professional work setting/environment. 2. Create and manage an instructional design project within a professional setting following a specific timeline. Management of the process may require collaboration with supervisors,

subject matter experts, and others to complete the project in the most effective manner. Credits: 2.00 or 3.00

EDCI 57500 - Foundations Of Distance Learning

Credit Hours: 3.00. An introduction to the field of distance learning/education. Examination of basic concepts and principles of distance learning, the theoretical underpinnings of the field, research and application literature, and distance education delivery technologies. Focus is on integration of distance education technologies for learning and teaching.

Learning Outcomes: 1. Discuss common distance education (DE) definitions and theories. 2. Understand how distance education has evolved including the history, research and current trends of DE. 3. Select and demonstrate appropriate technologies for use in DE environments. 4. Identify appropriate instructional design methods. 5. Apply appropriate instructional design methods to DE scenarios. 6. Demonstrate understanding of unique challenges of teaching at a distance. 7. Appreciate common assessment and evaluation methods and incorporate them into DE scenarios. 8. Discuss potential issues and barriers faced by learners and instructors in DE environments. 9. Be aware of and discuss policies that relate to DE. 10. Be aware of current trends in the field of distance education and how they relate to your focus. Credits: 3.00

EDCI 57700 - Strategic Assessment And Evaluation

Credit Hours: 3.00. This course explores principles and techniques that can be used to carry out evaluations within an organization. The course also examines several aspects of conducting evaluations, including planning and designing an evaluation, developing appropriate instruments, using various methods to collect information, analyzing information obtained from those methods, and communicating results and recommendations. This course is designed to help learners understand the multiple ways that evaluation is used in instructional systems and provides opportunities to design various types of evaluation instruments. A portion of the course will examine the study of learner assessment as part of the evaluation of instructional programs; however, the course's focus is dedicated to the study of program evaluation.

Learning Outcomes: 1. Define evaluation within the context of human performance and learning. 2. Develop prototype evaluation tools and frameworks useful in training/education or workplace performance improvement. 3. Synthesize knowledge by developing an evaluation plan and tools for an actual setting. Credits: 3.00

EDCI 58000 - Foundations Of Curriculum

Credit Hours: 3.00. Introduction to the major historical and philosophical sources of curriculum ideas. Significant forces influencing curriculum decision making. Different theoretical approaches to the construction and analysis of curriculum.

Learning Outcomes: 1. Engage critically with germinal thinkers and thought in curriculum. 2. Examine various curriculum approaches and traditions within their historical and social contexts. 3. Explore the major philosophies that undergirds curriculum approaches and deliberation. 4. Analyze the political origins and implications of differing traditions within the curriculum field and within educational policy and practice. 5. Integrate learning from curriculum history, theory, and research into one's teaching, scholarship, and/or engagement. Credits: 3.00

EDCI 58500 - Multicultural Education

Credit Hours: 3.00. The course aims to develop understanding of multicultural education as an on-going reform process that addresses social justice issues through an examination of race, class, gender, ethnicity, language, sexual orientation, etc.

Learning Outcomes: 1. Develop awareness of multicultural issues in education and other fields. 2. Increase knowledge of multicultural education and applications of multicultural theories to education and other disciplines. 3. Develop skills in meeting the needs of diverse populations. Credits: 3.00

EDCI 58600 - Topics In Educational Reform

Credit Hours: 3.00. (EDFA 58600) Explore important and timely issues related to educational reform and restructuring. Topics include: school choice, curriculum reform, assessment, technology, and influences on the reform process.

Learning Outcomes: 1. Explore and develop awareness of important and timely issues related to educational reform and change. 2. Increase knowledge of important and timely

topics in educational reform theory and practice. 3. Develop skills of critical thinking and reflection in relationship to important and timely topics in educational reform theory and practice. Credits: 3.00

EDCI 58800 - Motivation And Instructional Design

Credit Hours: 3.00. This course has been designed to provide an in-depth study of motivation as one of the fundamental variables underlying human learning, behavior, and instructional design. The focus of the course is on two areas: 1) theories of motivation and the general principles that have contributed to the field of instructional design, and 2) how those principles are applied within practical design settings.

Learning Outcomes: 1. Identify and describe the basic tenets of various theories of motivation. 2. Compare and contrast the contributions that the various motivational theories offer to the field of instructional design. 3. Select appropriate principles derived from given theories and apply those principles within practical design situations. 4. Analyze motivational problems in learning and performance and design effective solutions. 5. Consider motivational theories and their relation to current research in Education and Instructional Design. Credits: 3.00

EDCI 59000 - Individual Research Problems

Credit Hours: 1.00 to 6.00. Opportunities for students to study particular problems under the guidance of a member of the This plan of individualized instruction may be used in any field of education or vocational education. Does not include thesis work. Permission of instructor required.

Credits: 1.00 to 6.00

EDCI 59100 - Special Topics In Education

Credit Hours: 1.00 to 4.00. Group study of a current problem or special topic of interest to professional educational personnel. Intensive study of research, theory, or practical aspects of a particular issue within the usual graduate class format.

Credits: 1.00 to 4.00

EDCI 59400 - Concluding Secondary Transition To Teaching Seminar

Credit Hours: 2.00. This seminar course offers a conclusion to the program, as well as a review of general educational concerns and issues applicable to all content area instruction at the middle and high school levels. It is often the last course taken in the TTT program by program participants. The course centers on discussions of educational issues, theories, and approaches that the students who are seeking licensure in any of the secondary areas available at Purdue will find helpful. Additionally, the course helps students prepare to obtain their teaching license and enter the teaching community as a secondary teacher. Permission of instructor required.

Learning Outcomes: 1. Reflect upon transition from being "student" to becoming "teacher". 2. Write a draft of current teaching philosophy/personal pedagogy. 3. Present to colleagues about a professional experience or accomplishment. 4. Find, evaluate, and explore uses for technology and web resources in content area. 5. Critically reflect upon year(s) in the TTT/STEM program, what was learned? What goals are set for future professional development as a teacher? Credits: 2.00

EDCI 59600 - Pedagogy I: Introductory Methods For Secondary Education Transition To Teaching Program

Credit Hours: 3.00. This course is the introductory seminar for the secondary Transition to Teaching (TTT) programs across disciplines. Students who enroll in this course will be seeking teaching licensure in one of the secondary program areas available at Purdue University. Therefore, instruction in the course will revolve around general educational concerns and issues that are applicable to all content area instruction at the middle and high school levels. Admission to the Transition to Teaching program required. Permission of department required.

Learning Outcomes: 1. Situate themselves philosophically within (or against) cultural-historical paradigms in education. 2. Demonstrate familiarity with practitioner-oriented journals, conferences, and resources available through at least one content-specific professional organization in their field. 3. Articulate their understanding of current education issues related to social justice, technology, and classroom management. 4. Apply backward design when planning courses, units, and lessons. 5. Select instructional strategies that promote active learning and deep understanding. 6. Explain how literacy pertains to their content area. 7. Describe appropriate modifications and interventions for diverse learners in their future classrooms. 8. Navigate program and licensing information and

processes from the Office of Clinical Practice and Teacher Education Licensure. Credits: 3.00

EDCI 59650 - Practical Pedagogy: Tools, Techniques, And Technology

Credit Hours: 3.00. This course is designed to help with inquiry into practical pedagogical practices. The course is based on individual experiences - where, who, what, and how you're teaching, and provides space for all to investigate and explore the aspects of teaching you want to know more about. The course is grounded in theory, yet focused on the practical and everyday tasks and aspects of teaching, including: tools, techniques, and technology related to community building, grading, trauma-informed practices, lesson planning, etc. Learning Outcomes: 1. Use an inquiry stance and reflect on their teaching practices. 2. Identify and inquire into tools, techniques, and technologies that will allow them to grow as teachers in their content area. 3. Discuss the realities of everyday teaching scenarios and find resources that help them solve pedagogical problems. 4. Research, discuss, and give presentations on pedagogical tools, techniques, and technologies that they are planning to incorporate into their own teaching, explaining how and why. 5. Use an asset-based lens toward their diverse student populations. 6. Build community, establish class routines and structures, select appropriate technological tools, and develop grading practices that are best suited for them and their students. Credits: 3.00

EDCI 59700 - Pedagogy II: Advanced Methods For Secondary Education Transition To Teaching Program

Credit Hours: 3.00. This sixteen-week course is the capstone methods course for the online Transition to Teaching (TTT) program. Students who enroll in this course will be seeking teaching licensure in one of the secondary program areas available at Purdue University. Therefore, instruction in the course will revolve around general educational concerns and effective teaching approaches that are applicable to all content area instruction at the middle and high school levels. This course extends engagement with the pedagogical principles of practice introduced in *Transition to Teaching: Pedagogy I*. The course also includes a fifty-hour field experience component. Admission to Transition to Teaching program required. Permission of department required. Learning Outcomes: 1. Plan learner-centered instruction and classroom management techniques that reflect cultural competency; are responsive to the characteristics, strengths, experiences, and needs of each student; and promote all student's development and learning. 2. Develop effective lesson and unit plans in short- and long-range instructional planning. 3. Describe project-based learning experiences that guide students to analyze the complexities of an issue and use creative thinking and innovative approaches to solve problems. 4. Identify skills and strategies for creating a safe, healthy, supportive, and inclusive learning environment that encourages all student's engagement, collaboration, and sense of belonging. 5. Identify skills and strategies for establishing a culture of learning that emphasizes high expectations for all students, promotes self-motivation, and encourages students' sense of responsibility for their own learning. 6. Use a variety of assessment results and data sources to evaluate and monitor student learning and progress; establish learning goals; and plan, differentiate, and continuously adjust instruction for individuals, groups, and classes. 7. Compare characteristics and benefits of virtual learning environments, online environments, face-to-face environments, and hybrid environments, and the strategies to work effectively in different types of environments to ensure student learning and growth. 8. Evaluate key areas for growth and goal setting after reviewing procedures for teacher evaluations and administrator expectations for professional teachers. 9. Reflect on field experience lesson planning, instructional delivery and student interactions. 10. Anticipate the requirements for edTPA and teacher certification. Credits: 3.00

EDCI 59900 - Research And Instructional

Coaching

Credit Hours: 3.00. This independent study, field-based course is designed to teach you about field-based research, instruction, and coaching in teacher education and elementary schools. You will have the opportunity to apply what you learn by developing and executing a mini-inquiry project including research questions, data collection, analysis, and findings for publication and/or program materials development.

Learning Outcomes: 1. Explore and identify research interests, sites, and projects then create and execute an attainable semester-long plan for research/inquiry. 2. Learn about, plan, teach & film exemplary critical literacy/interdisciplinary read aloud lessons and related activities for K-5. 3. Observe and/or coach PSTs through a DEI lens: coaching requires 22+ hours of K-5 US classroom teaching experience equivalent to EDCI363 or classroom teaching. Credits: 3.00

EDCI 60001 - Intro To Demonstrating Professional Competencies In LDT

Credit Hours: 1.00. This course is designed to help you to understand the knowledge and skills necessary for your successful online learning in the Learning Design and Technology program, with a focus on the process of earning digital badges aligned with professional competencies. In this orientation, you will explore what online learning entails and reflect on how you can best set yourself up to succeed in your studies. You will also learn and apply the process of both earning digital badges within the program and evaluating your peers' work as part of the badge earning process.

Learning Outcomes: 1. Students will learn the specifics of the LDT Master's program and its requirements familiarize yourself with resources, review targeted learning competencies, and program requirements. 2. Students will examine skills and approaches to obtain competency badges critical to your success as a student in the online program, including peer review, self-editing, effective time management, avoiding plagiarism, utilizing proper online etiquette and incorporating a positive disposition in your interactions with peer students, faculty and staff. 3. Students will become familiar with the badge earning process in LDT and progress in earning your first digital badges. Credits: 1.00

EDCI 60003 - LDT Professional Competencies Portfolio

Credit Hours: 1.00. This course will focus on completion of the competency portfolio reflecting on the depth and breadth of your educational growth since entering the Master's program. The purpose of the LDT competency portfolio is to demonstrate that you have mastered the graduate competencies. The portfolio will contain student evidence aligned with LDT competencies and will be reviewed by your committee. The completed competency portfolio is a requirement for graduation from the LDT Master's program. Prerequisites: EDCI 60001 and 60002.

Learning Outcomes: 1. Finalize students' competency-based portfolio. 2. Compose reflective narratives on Professional Foundations of LDT, Planning and Analysis, Design and Development, and Evaluation and Implementation. 3. Update and finalize resume or vita suitable for job searching. Credits: 1.00

EDCI 60400 - Social Studies In The Elementary School

Credit Hours: 3.00. Social Studies-content and place in the modern elementary education curriculum. Materials, instruction techniques, evaluation procedures, and understanding the syntax of the structure of social studies. Prerequisite: EDCI 36100 .

Credits: 3.00

EDCI 60500 - Teaching Integrated Science, Technology, Engineering And Math

Credit Hours: 3.00. Analysis of historical developments and present trends in science education; the designing, implementation, and evaluation of science programs; the role of research in present and future developments.

Learning Outcomes: 1. Identify, describe, and explain the fundamental tenets of different constructivist learning theories and their relevancy to STEM education. 2. Clarify and refine beliefs about teaching and learning in STEM education. 3. Identify and characterize students' ideas about STEM and how they influence learning. 4. Explore students' thinking and understanding of STEM through multiple strategies. 5. Describe ways to assess student learning in STEM. 6. Identify, practice, and reflect upon teaching strategies commensurate with teaching beliefs and knowledge about how

students learn STEM through an integrated approach. 7. Compare and evaluate curriculum resources for integrating STEM instruction. 8. Devise a comprehensive lesson plan for integrating STEM instruction based on science and engineering practices and teaching for all learners. 9. Teach and reflect upon an integrated STEM lesson employing multiple instructional strategies. 10. Evaluate student learning in the context of an integrated STEM lesson. Credits: 3.00

EDCI 61200 - Seminar In Literacy

Credit Hours: 3.00. Recent trends and research in literacy. Topics provide in-depth study of literacy acquisition in educational settings.

Learning Outcomes: 1. Investigate a specific topic of interest through readings, written work, and discussion. 2. Develop understandings of a new topic area relevant to the study of literacy and language. Credits: 3.00

EDCI 61300 - Seminar In The English Language Arts

Credit Hours: 3.00. Problems in the teaching of English: literature, language, rhetoric. Attention to recent scholarship and to its application in the public schools.

Learning Outcomes: 1. Think critically about historical and/or contemporary research and theory central to the field of English education. 2. Read and write reflectively and critically about the course content. 3. Engage in course discussions which encourage critical thought and personal engagement. Credits: 3.00

EDCI 61450 - Seminar In Bilingualism And Multilingualism

Credit Hours: 3.00. This course examines theories, research and educational practices in bilingualism and multilingualism. Students will become familiar with major conceptual and methodological issues in research about the use and acquisition of two or more languages in bi/multilingual societal and educational contexts. Individual and societal dimensions will be considered through the examination of a wide range of approaches. Accordingly, the course is transdisciplinary in nature, bringing together work from anthropology, education, psychology, and (socio)linguistics.

Learning Outcomes: 1. An understanding of the complex developmental history of literacy, including the role of visual literacy. 2. Familiarity with relevant research, and the ability to critically evaluate and discuss this literature. 3. Development of the professional skills of analytic and integrative thinking, discussion, and questioning. 4. A critical understanding of the role of classroom experience-both in terms of its social and political value and in terms of available resources and materials -- in the development of young children's literacy. Credits: 3.00

EDCI 61500 - Qualitative Research Methods In Education

Credit Hours: 3.00. Focuses on expanding graduate students' research skills to include knowledge of the theories and methods associated with qualitative and qualitative-quantitative combined research. Prerequisite: EDPS 53300 .

Learning Outcomes: 1. Increase knowledge of, analyze and comparatively evaluate the theoretical tenets and multiple traditions of qualitative research. 2. Increase knowledge of, understand and evaluate the multiple methods of inquiry used in qualitative research. 3. Understand the ethical and personal issues and concerns involved in qualitative research. Credits: 3.00

EDCI 61600 - Qualitative Data Collection And Analysis In Educational Research

Credit Hours: 3.00. This course focuses on expanding and applying students' knowledge of qualitative data collection and analysis with an emphasis on multiple approaches to data collection, analysis, and interpretation. Prerequisite: EDCI 61500 or permission of instructor.

Learning Outcomes: 1. Describe, analyze and evaluate the theoretical tenets and multiple paradigms of qualitative inquiry as applied to data collection and analysis. 2. Describe, analyze, and evaluate the role of the researcher in qualitative inquiry. 3. Describe, analyze, and evaluate the issues of representation, analysis, interpretation, writing, and validity in qualitative inquiry. 4. Understand multiple data collection methods and approaches to qualitative analysis. 5. Understand the ethical issues and concerns

involved in qualitative inquiry at an advanced level. Credits: 3.00

EDCI 61800 - Gender And Culture In Science Education

Credit Hours: 3.00. An examination of the different perspectives on issues of gender, culture, and science. Major topics include feminist critiques of scientific theories and methods, the work of women and minorities in science, the role science has played in the construction of race and gender, and topics in science education, such as girls' learning in science and the potential of inclusive practices in the science classroom. Prerequisite: EDCI 51800 or EDCI 58500 .

Learning Outcomes: 1. Develop an in-depth understanding of the role of gender and culture in science and science education. 2. Examine feminist and cross-cultural studies in science and science education. 3. Apply feminist and critical frameworks of analysis to various studies in science education. 4. Identify and evaluate the strengths and limitations of feminist and cultural critiques of science. 5. Synthesize related literature in an effort to gain in-depth knowledge about one or more areas of gender and culture in science and science education. Credits: 3.00

EDCI 61900 - Learning Science

Credit Hours: 3.00. The course provides a holistic study of how children and adults learn science; how the learner's ideas, ways of thinking, abilities to do science, and their attitudes towards and beliefs about science learning influence how they learn science.

Learning Outcomes: 1. Develop an increased understanding of the research literature in science education as it pertains to science learners. 2. Gain an appreciation of science learners and the different perspectives about how individuals learn science. 3. Apply science education research about science learners to instructional, curricular, and assessment development. Credits: 3.00

EDCI 62000 - Seminar In Mathematics Education

Credit Hours: 1.00 to 6.00. Selected topics in mathematics education. Typical topics considered are: (1) problem solving; (2) instructional strategies; (3) cognitive structure; (4) current curriculum; (5) current research. Permission of instructor required.

Learning Outcomes: 1. Examine, synthesize, and communicate a view of the state of mathematics education and situate one's research in it. 2. Create knowledge for the field of mathematics education and communicate findings to the professional community. 3. Communicate and act upon professional feedback in the processes of designing and conducting research and writing conference proposals and research reports. 4. Report on various stages and types of research (e.g., project design, data analysis, findings). Credits: 1.00 to 6.00

EDCI 62100 - Technology For Qualitative Research

Credit Hours: 3.00. Exploration of the effective use of technology to facilitate data collection, organization, and analysis. Emphasis on application of theoretically-based methodologies for handling and analyzing qualitative data through the use of qualitative research software. Course also includes attention to other hardware or software relevant to the collection, organization and analysis of qualitative data. Prerequisites: EDCI 61500.

Learning Outcomes: 1. Explore and practice the application of theoretically-based methodologies for handling and analyzing qualitative data through the use of qualitative research software (NVivo). 2. Explore and practice the following mobile applications that may be used for data collection and other research purposes: digital photo, audio, and video recording and editing apps; document scanning apps (Scanner Pro); notetaking apps (e.g., Evernote, Notability); Adobe Acrobat .pdf file management and mark-up apps (Notability); and the integration of these apps with NVivo. Credits: 3.00

EDCI 62200 - Seminar In Science Education

Credit Hours: 1.00 to 3.00. Current issues in science education. Typical topics considered are: (1) science curriculum; (2) concept learning; (3) teacher education; (4) intellectual developments; (5) current research. Prerequisite: EDCI 51700 , EDCI 51800 .

Credits: 1.00 to 3.00

EDCI 62400 - Seminar In Social Studies Education

Credit Hours: 3.00. An investigation of various aspects of the teaching of the social studies. One topic is dealt with in each enrollment. Master's candidates are expected to complete the first three topics. Areas include: (1) philosophic concepts used in the social studies; (2) curricular analysis and examination of new social studies materials; (3) methods of inquiry in the social studies; (4) research methodology in the social studies.

Credits: 3.00

EDCI 62700 - Current Topics In Learning Design And Technology

Credit Hours: 3.00. A critical analysis of problems, trends, issues, and programs related to the area of learning design and technology. Prerequisite: EDCI 51300 .

Learning Outcomes: 1. Critically analyze current issues and trends in the field related to a given topic. 2. Identify and discuss advantages and limitations to implementing specific emerging tools, strategies, and /or approaches. 3. Identify strategies for examining the effectiveness of specific emerging tools and strategies. Credits: 3.00

EDCI 62800 - Curriculum And Instruction Doctoral Seminar I

Credit Hours: 1.00. An examination of current issues and concerns related to doctoral study in Curriculum and Instruction. This course is intended for all new doctoral students in the Department of Curriculum and Instruction and should be taken within the first year of doctoral study.

Learning Outcomes: 1. Reflect on the roles and responsibilities of faculty members. 2. Identify steps to develop personally and professionally. 3. Describe major milestones of doctoral study in the department. 4. Identify ethical standards in the field of education. 5. Practice ethical conduct of research. 6. Identify research topics of personal interest and locate. 7. Locate and begin to review literature relevant to those topics. Credits: 1.00

EDCI 63300 - Instructional Design Project Management

Credit Hours: 3.00. This course focuses on the application of project management ideas, concepts, and strategies in instructional design settings. Students will be asked to consider the relationship between instructional design and project management, tools that can assist with managing instructional design projects, and factors influencing the instructional design project management process. Students will explore these topics by creating deliverables for instructional design cases and other interactive assignments.

Learning Outcomes: 1. Explain and reflect upon common project management terminology's role in instructional design projects. 2. Analyze and articulate the relationship between project management and instructional design. 3. Propose and/or develop relevant intervention strategies (instructional design and project management) to real-world instructional design issues that are consistent with arguments and evidence presented. 4. Integrate project management technologies and tools in the development of instructional design project management. 5. Interpret the role of interpersonal skills in and factors impacting project management instructional design initiatives. Credits: 3.00

EDCI 63500 - Content And Goals In Mathematics Education

Credit Hours: 3.00. Examines conceptions of what mathematics is and how those conceptions have influenced the mathematics curriculum over the course of American history. Prerequisite: Master's student standing or higher and enrolled in Mathematics Education.

Learning Outcomes: 1. Develop perspectives on and communicate various theories or theoretical frameworks related to mathematics curriculum. 2. Investigate and communicate a research based perspective on the underlying nature of curriculum. 3. Develop and communicate a historical perspective on evolution of mathematics curriculum. 4. Synthesize seminal and current research describing curriculum and curricular relationships in mathematics education. Credits: 3.00

EDCI 63600 - The Learning Of Mathematics: Insights And Issues

Credit Hours: 3.00. Examines research related to the learning of mathematics and to the relationships of social and cultural factors to the learning of mathematics. Prerequisite: Master's student standing or higher and enrolled in Mathematics Education.

Learning Outcomes: 1. Develop perspectives on and communicate orally and in writing various

theories or theoretical frameworks for learning mathematics. 2. Investigate and communicate orally and in writing core ideas and beliefs that form the thinking and research efforts in the learning of mathematics. 3. Critically reflect on and synthesize seminal and current research in mathematics learning. Credits: 3.00

EDCI 63700 - The Teaching Of Mathematics: Insights And Issues

Credit Hours: 3.00. Examines research related to mathematics teaching, including research on characteristics of mathematics teachers, the features of effective mathematics teaching, and the professional preparation and development of mathematics teachers. Prerequisite: Master's student standing or higher and enrolled in Mathematics Education.

Learning Outcomes: 1. Develop perspectives on and communicate orally and in writing various theories or theoretical frameworks related to teaching mathematics. 2. Investigate and communicate orally and in writing theoretical and empirical foundations of the research literature related to mathematics teaching, teacher education, and/or professional development. 3. Critically reflect on and synthesize seminal and current research in mathematics teaching, teacher education, and/or professional development. Credits: 3.00

EDCI 63800 - Curriculum And Instruction Doctoral Seminar II

Credit Hours: 1.00. This course consists of an examination of current educational research. EDCI and other faculty will present and lead discussions of their research. Students will be exposed to research within multiple paradigms and perspectives. This course is intended for all new doctoral students in the Department of Curriculum and Instruction and should be taken within the first year to doctoral study. Permission of instructor required.

Learning Outcomes: 1. Identify and understand contemporary education research concerns. 2. Identify and understand research within multiple paradigms and perspectives. 3. Interact with Purdue faculty about their current research interests. 4. Grow and develop as a professional. Credits: 1.00

EDCI 64400 - Legal Issues In Career And Technical Education

Credit Hours: 3.00. Comprehensive examination of contemporary federal, state, and local legislation; rules, policy, regulations, provisions, guidelines, and initiatives affecting the nature, establishment, and implementation of state and local programs at the secondary and postsecondary levels in career and technical education; need for legislation and initiatives and the reauthorization of existing legislation; social, political, and economic aspects of legislation; advocacy for legislation; and public policy and policy development. Approval of Department required.

Learning Outcomes: 1. Discuss the importance and impact of statutory law on the development and nature of career and technical education in the United States. 2. Describe and contrast the legislative process and policies at the national and state levels. 3. Review, articulate, and analyze critically the history of CTE and related legislation from 1862 to the present. 4. Explain and apply the major provisions of the current CTE and workforce federal legislation. 5. Relate and apply the content of the current Indiana State Plan for CTE to the provisions, requirements, and legal interpretation of Federal CTE legislation. 6. Examine critically and apply Indiana legislation and initiatives that provide authority, support, structure, and administration for CTE in the State. 7. Refine conceptual, analysis, synthesis, and evaluation skills. 8. Enhance their written and oral communication skills. Credits: 3.00

EDCI 64500 - Organization And Administration Of Career And Technical Education

Credit Hours: 3.00. Organizational structure and delivery systems at the national, regional, state, and local levels; program areas and services; legislative initiatives; federal, state, and local planning; administrative functions and practices; leadership development; trends; and issues.

Learning Outcomes: 1. Develop an understanding of the organizational structure and delivery systems at the national, regional, state, and local levels in career and technical education (CTE). 2. Provide an overview of the CTE program areas, career clusters, career pathways, and services and their relationships

to academic and special education. 3. Review federal and state legislation related to CTE. 4. Examine federal, state, regional, and local planning and funding activities. 5. Analyze administrative functions and practices and management systems. 6. Critique leadership and staff development initiatives in CTE. 7. Evaluate current trends and issues in the field. Credits: 3.00

EDCI 64600 - Supervision In Career And Technical Education

Credit Hours: 3.00. Purposes, principles, strategies, and procedures of supervision and management in career and technical education and related workforce education and development contexts: theory and practice: human resource development: environment, education, and management. Approval of Department required.

Learning Outcomes: 1. Define and describe contemporary supervision concepts. 2. Identify and explain principles of educational supervision. 3. Relate and analyze critically emerging concepts in supervision to social, political, economic, and cultural factors. 4. Describe and discuss a sequence of (clinical) experiences that provide optimum opportunity for developing educator competencies. 5. Identify and apply best practices experiences that have potential for practica, internships, and other work-based learning programs. 6. Identify and describe the stages of supervision. 7. Identify, evaluate, select, and apply techniques and strategies appropriate to the implementation of each stage of supervision. 8. Implement methods of supervision in pre-observation, conference, observation, analysis and strategy, conference, and post-conference contexts. 9. Develop awareness and participate in professional development opportunities in CTE and education. Credits: 3.00

EDCI 64700 - Research In Career And Technical Education

Credit Hours: 3.00. Rationale for and history of research in career and technical education; analysis of the research process and research methods; examination of the environment and support required for research; proposal development, and strategies for dissemination and utilization of research. Offered in alternate years.

Learning Outcomes: 1. Develop a rationale for disciplined inquiry in career and technical education. 2. Examine the history of research in career and technical education. 3. Analyze the research process and research methods. 4. Identify the environment and support required for research. 5. Describe strategies for the dissemination, utilization, and evaluation of research. Credits: 3.00

EDCI 64800 - Curriculum In Career And Technical Education

Credit Hours: 3.00. Overview of curriculum in career and technical education programs; business and industry training programs; curriculum planning, development, implementation, and evaluation; review and analysis of curriculum models.

Learning Outcomes: 1. Develop an understanding of curriculum and its relationship to other instructional phases in career and technical education and training. 2. Provide an overview of curriculum processes and procedures in career and technical education and business and industry training programs. 3. Review and analyze curriculum development research in career and technical education. 4. Acquire skills in curriculum needs assessment, planning, implementation, and evaluation. 5. Explore the theoretical, ethical, political, social, and economic factors related to curriculum development in career and technical education and training. 6. Gain experience in designing a curriculum plan and curriculum development. Credits: 3.00

EDCI 64900 - Assessment In Career And Technical Education

Credit Hours: 3.00. Goals and rationale for evaluation in education and work training contexts; assessment and measurement methods, techniques, and procedures; reliability, validity, and accuracy; construction and selection of instruments; data and information collection, analysis, and interpretation; meta evaluation; adaptations and modifications for special needs populations; and using assessment data and information.

Learning Outcomes: 1. Provide an overview of assessment in career and technical education and training programs. 2. Identify goals and a rationale for evaluation. 3. Explore contemporary assessment trends and practices. 4. Develop an understanding of career assessment and measurement methods, techniques, and procedures in career and technical education and training. 5. Examine several methods for estimating instrument reliability, validity, and accuracy. 6. Develop skills in the construction, analysis, and selection of assessment and measurement instruments and procedures in career and technical education and training programs. 7. Explore the ethical, psychological, political, social, economic, and educational issues related to assessment in career and technical education and training. 8. Gain experience in the collection and analysis of assessment data and information. 9. Develop skills in the evaluation of assessment and measurement instruments. 10. Explore a variety of appropriate procedures to interpret, disseminate, and use assessment data and information in career and technical education and training programs. Credits: 3.00

EDCI 65000 - Program Evaluation In Career And Technical Education

Credit Hours: 3.00. Goals and objectives of, and criteria for, program evaluation in career and technical education; evaluation models and methods; design and planning; issues; development and selection of instruments and procedures; data and information collection and analysis; preparing program evaluation reports; and using program evaluation results for program improvement.

Learning Outcomes: 1. Provide an overview of program evaluation. 2. Develop an understanding of the major concepts, principles, models, theories, and techniques of evaluation. 3. Acquire knowledge and skills in designing and planning program evaluations. 4. Explore the ethical, political, social, and economic issues related to evaluation. 5. Experience implementing the methods, procedures, and activities of a program evaluation plan. 6. Participate in the reporting, dissemination, and use of findings of program evaluations. Credits: 3.00

EDCI 65200 - Seminar In Family And Consumer Sciences Education

Credit Hours: 2.00 to 6.00. A critical analysis of current problems, trends, issues, and programs in family and consumer sciences education. Prerequisite: 12 credit hours in Education or equivalent professional training. Permission of instructor required.

Credits: 2.00 to 6.00

EDCI 65300 - Seminar In Career And Technical Education

Credit Hours: 1.00 to 9.00. Current trends, theory, and practices related to educational contexts and careers.

Learning Outcomes: 1. Review, synthesize, analyze, and critique current research in education, career and technical education, and related fields and disciplines. 2. Identify significant research problem areas and researchable problems in education. 3. Examine and evaluate research methods used and applicable in education fields and related disciplines. 4. Explore various research dissemination strategies. 5. Network with researchers in education and related fields. Credits: 1.00 to 9.00

EDCI 66000 - Learning Design And Technology Seminar

Credit Hours: 1.00. This course is an investigation of trends, developments, and issues in learning design and technology with a focus on current practices, problems, and research. This one-credit seminar is designed to help students learn about applications of instructional design and educational technology in various settings and to interact with faculty and guest speakers about topics related to the field and the LDT program.

Learning Outcomes: 1. Become familiar with resources available to support progression through your LDT graduate program. 2. Learn the specifics of the program and its requirements, including reviewing targeted learning competencies, portfolio requirements, program faculty, and the graduate handbook. 3.

Identify and work towards fulfilling short and long-term professional goals. 4. Identify a career pathway that is appropriate for you including the skills, knowledge, and attitudes you will need to be successful. 5. Gain real-world insights into LDT field. Credits: 1.00

EDCI 67000 - Learning Design And Technology Portfolio

Credit Hours: 1.00 to 2.00. This course was created to help guide LDT students near completion of their coursework to develop their competency portfolio. The competency portfolio is a requirement for graduation from the traditional LDT Master's program.

Learning Outcomes: 1. Develop an electronic version of your competency portfolio based on artifacts as evidence. 2. Compose narratives that explain how your artifacts demonstrate each competency. 3. Develop an updated resume or vita suitable for job searching. 4. Deconstruct relevant job postings in the field. Credits: 1.00 or 2.00

EDCI 67200 - Advanced Practices In Learning Systems Design

Credit Hours: 3.00. This course focuses on the application of learning systems design to real-world educational situations through the in-depth consideration of key instructional design processes (e.g., analysis, design, development, implementation, evaluation). Additionally, a key focus of the course is on the development of instructional design expertise. Prerequisite: EDCI 57200.

Learning Outcomes: 1. Analyze complex instructional design case situations and identify key components (e.g., issues, stakeholders, contextual variables, perspectives, alterative solutions, potential consequences). 2. Propose and/or develop relevant intervention strategies (instructional or non-instructional) to the issues presented in a case situation that are consistent with arguments and evidence presented. 3. Identify and apply key characteristics of expert problem solving to ill-structured ID problems. 4. Identify and discuss current issues, trends, and controversies in the profession. 5. Develop a case study of a specific instructional design problem. 6. Facilitate a case study of a specific instructional design problem. Credits: 3.00

EDCI 67300 - Issues And Methods In Learning Systems Design Research

Credit Hours: 3.00. Provides preparation to conduct independent research in the field of learning design and technology through direct participation in the research process: critically reviewing research, designing and conducting a research study, synthesizing and presenting results in written and oral formats. Prerequisites: EDPS 53300, EDCI 67600, EDCI 67700.

Learning Outcomes: 1. Describe the role of research in the field of Learning Design and Technology. 2. Design a research study to investigate a problem relevant to the field of Learning Design and Technology. 3. Conduct a research study in an applied (school, hospital, community agency) or experimental (lab, designed) setting. 4. Analyze, interpret, and discuss various sets of data. 5. Write a research report according to APA guidelines. 6. Present the results of a research study according to professional guidelines. Credits: 3.00

EDCI 67400 - Advanced Instructional Design Theory

Credit Hours: 3.00. Examines the impact of both psychological learning theories and instructional applications upon the development of various instructional design theories. Emphasis is on theory construction, influence of learning and educational principles, and the current and future possibilities of instructional design theory. Prerequisite: EDCI 53100 and 57200.

Learning Outcomes: 1. Identify and consider the key principles and underlying assumptions from several prominent Instructional Design Theories and articulate relationships across these areas. 2. Determine when, why, how, and under what conditions specific ID theoretical principles can be applied to resolve applied learning problems. 3. Assess the effectiveness of specific ID theories, explain their individual strengths and weaknesses, and propose alternative viewpoints, guidelines, and perspectives to enhance learning given specific situations. 4. Develop effective methods for analyzing and articulating sound and logical arguments regarding theoretical, instructional, and

technological relationships, positions, and conceptualizations. Credits: 3.00

EDCI 67500 - Instructional Strategies

Credit Hours: 3.00. Examines and applies the cognitive strategies and tactics that can be used by an instructional designer to improve human learning. Applications of various instructional strategies for specific cognitive tasks (e.g., concepts, mental models, problem solving) will to be covered. Additionally, best practices for a diverse range of instructional methods will be considered, as well as, the strategies for the entire instructional experience. Prerequisite: EDCI 57200. Permission of instructor required.

Learning Outcomes: 1. Identify, synthesize, and summarize practical, research based guidelines that facilitate the development of quality instructional results. 2. Identify, describe, and select relevant cognitive techniques/strategies (e.g., analogies, metaphors, imagery and mnemonics) and cite relevant research to indicate their appropriate use and effectiveness. 3. Identify, describe, and select relevant instructional methods (e.g., case-based instruction, cooperative learning, discussion, simulation, peer mentoring, reciprocal teaching, and discovery) and cite relevant research to indicate their appropriate use and effectiveness. 4. Identify, describe, and select relevant motivational strategies that can be incorporated to increase learner effort in a learning task and cite relevant research to indicate their appropriate use and effectiveness. 5. Given a task to evaluate instructional materials for specific content, identify the type of learning involved, select the appropriate set of instructional techniques, methods and strategies, and utilize those to design and propose an effective instructional outcome. Credits: 3.00

EDCI 67600 - Unpacking Research: Writing Literature Reviews In Learning Design And Technology

Credit Hours: 2.00. This course is designed to introduce the learner to the process of analyzing and preparing literature reviews on topics relevant to the field of Learning Design and Technology. Emphasis is placed on helping the learner to understand, critique, and synthesize the research literature in order to apply it to their own personal research agenda. Course activities and assignments are designed to help the learner develop the knowledge, tools, and strategies needed to become thoughtful consumers and producers of research and to use this knowledge to inform their practice. Learning experiences revolve around two major themes: 1) the examination and thoughtful critique of current research and 2) preparation of a thorough literature review that provides a rationale for continued study. Permission of instructor required.

Learning Outcomes: 1. Formulate a driving question about a specific topic in Learning Design and Technology. 2. Locate published literature (scholarly work) that supports the importance of the question. 3. Critically evaluate published research. 4. Read, interpret, and synthesize current research to create a thoughtful review that is persuasive and reliable. 5. Analyze and provide feedback to peers through a collaborative learning experience. Credits: 2.00

EDCI 67700 - Unpacking Research: Writing Research Proposals In Learning Design And Technology

Credit Hours: 2.00. This course is designed to introduce the novice researcher to the process of developing a research problem statement supported by literature resulting in a professional organization conference proposal and a proposal for a funding agency in the field of Learning Design and Technology. Permission of instructor required. Prerequisite: EDCI 67600.

Learning Outcomes: 1. Discuss current research in the LDT field. 2. Formulate a problem statement, purpose statement, and research questions to drive a potential research study. 3. Read, interpret, and synthesize current research to create a thoughtful review that is persuasive and reliable. 4. Analyze and provide feedback to peers through a collaborative learning experience. 5. Develop a research proposal that is ready to be put into place. 6. Identify areas for improvement in the research proposal writing process. Credits: 2.00

EDCI 67800 - Unpacking Research: Writing For Scholarly Publications In Learning Design And Technology

Credit Hours: 2.00. This course is designed to introduce the novice researcher to the process of publishing research in the field of Learning Design and Technology. Emphasis is placed on practical aspects of the publishing process as well as familiarizing students with the role that editors and reviewers play in that process. Prerequisite courses include: EDCI 67600 Writing Literature Reviews and EDCI 67700 Writing Research Proposals. Students must bring a draft manuscript completed through the methods portion into the course, and students must have completed research and collected data to facilitate completion of a research-based manuscript for publication during the course. Permission of instructor required.

Learning Outcomes: 1. Discuss current research in the LDT field. 2. Formulate a problem statement, purpose statement, and research questions to drive a potential research study. 3. Read, interpret, and synthesize current research to create a thoughtful review that is persuasive and reliable. 4. Analyze and provide feedback to peers through a collaborative learning experience. 5. Develop a research proposal that is ready to be put into place. 6. Identify areas for improvement in the research proposal writing process. Credits: 2.00

EDCI 67900 - Capstone: Inquiry Into Practice

Credit Hours: 3.00. This course conceptually centers on the Ghanaian Sankofa symbol of a bird retrieving an egg from its back while facing forward. This metaphor represents the need to "go back to the past and bring forward that which is useful" (About the Sankofa [n.d.]. Retrieved from https://cola.siu.edu/africanastudies/about-us/sankofa.php). The twin aspect of looking back with the future in mind plays out in consonance with the Portfolio course generally taken in tandem with this course. In this course, students will reinforce and extend their learning of key concepts across the program and deepen their engagement with a topic of interest to them through an action research project. Permission of department required.

Learning Outcomes: 1. Evaluate how your program's experiences, knowledge, and skills will inform your future action and pedagogical practices through reflection and self-critical inquiry. 2. Articulate where you are situated epistemologically, ontologically, and methodologically as educators and researchers within and across disciplines. 3. Demonstrate a commitment to ongoing development as knowledgeable and engaged advocates for equitable education through the exploration of intersectionality. 4. Conduct an action research project that identifies a problem within your classroom or school community and seeks to ameliorate it. 5. Communicate research findings with a broader audience of stakeholders. Credits: 3.00

EDCI 68000 - Curriculum & Instruction MS Portfolio

Credit Hours: 1.00. This course was created to help guide C&I students near completion of their coursework to develop their competency portfolio. A competency portfolio reflects the depth and breadth of a student's educational growth since entering the graduate program. The purpose of the C&I competency portfolio is to demonstrate that students have mastered the graduate competencies for the C&I online Master's program. The portfolio will contain student projects aligned with C&I competencies and will be reviewed by committee members. The competencies are based on the Curriculum & Instruction departmental competencies and several program-specific competencies. The competency portfolio is a requirement for graduation from the C&I Master's program. (Multiple media are welcome.) Permission of department required.

Learning Outcomes: 1. Develop an online version of your competency portfolio based on artifacts as evidence. 2. Compose reflective narratives that explain how your artifacts demonstrate each competency. 3. Develop an updated resume or vita suitable for job searching. 4. Deconstruct relevant job postings in the field. Credits: 1.00

EDCI 68200 - Contemporary Curriculum Theory

Credit Hours: 3.00. Critical examination of contemporary concepts of curriculum theory. Rational/technical curriculum, social needs/child centered curriculum. Socio-political curriculum theory; curriculum as existential, aesthetic, and phenomenological. Implications for current practice, school reform, and educational research.

Learning Outcomes: 1. Develop an understanding of the social theories and philosophies that inform contemporary curriculum theorizing. 2. Articulate the role of curriculum theorizing in defining and analyzing educational phenomena. 3. To utilize curriculum theory toward the development of educative responses to issues of ethics, equity, power,

and privilege. 4. To synthesize the complexity and tensions of various curriculum theories into frameworks for educational research. Credits: 3.00

EDCI 68400 - Seminar In Curriculum Studies

Credit Hours: 3.00. A course designed to allow for the in-depth exploration of specialized and timely topics in curriculum theory, practice, and reform. Though all specialized topics address both theory and practice, some topics focus more heavily on practice, and others focus more heavily on theory.

Learning Outcomes: 1. Explore and develop awareness of specialized and timely topics in curriculum theory, practice, and reform. 2. Increase knowledge of specialized and timely topics in curriculum theory, practice, and reform. 3. Develop skills of critical thinking and reflection in relationship to specialized and timely topics in curriculum theory, practice, and reform. Credits: 3.00

EDCI 69500 - Internship In Education

Credit Hours: 1.00 to 10.00. Amount of credit to be determined by nature and extent of the assignment. A special course in selected areas of education, designed to provide practical field experience under professional supervision in selected situations related to the candidate's area of specialization. Permission of instructor required.

Credits: 1.00 to 10.00

EDCI 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required.

Credits: 1.00 to 18.00

EDCI 69900 - Research PhD Thesis

Credit Hours: 1.00 to 18.00. Research PhD Thesis. Permission of instructor required.

Credits: 1.00 to 18.00

Educational and Psychological Studies

EDPS 10101 - Learning In Context-An Introduction To The Learning Sciences

Credit Hours: 3.00. This introductory course is designed to acquaint first year Learning Science students with the core concepts, principles, and research findings of the learning sciences as they apply to a wide range of formal and informal educational contexts. The course provides students with opportunities to interact with and learn about the scholarship of College of Education faculty who conduct research within the framework of the learning sciences. Students will learn about faculty projects that exemplify key features of the Learning Sciences such as attention to the complexity of learning environments, the study of social and cultural as well as individual dimensions of learning, and the cross-disciplinary nature of the field.

Learning Outcomes: 1. Identify the features of education as a design discipline. 2. Identify core principles, questions, and challenges, that define educational research and practice from a Learning Sciences perspective. 3. Identify the varied sources of cross-disciplinary knowledge that contribute to the design and study of effective learning environments. Credits: 3.00

EDPS 10500 - Academic And Career Planning (UCC: IL)

Credit Hours: 3.00. Builds understanding of career interests and personality characteristics related to academic and career decisions. Expands knowledge of Purdue academic programs and of the world of work. Introduces decision-making strategies.

University Core Curriculum (UCC): (UCC: IL)

Learning Outcomes: 1. Describe and explain multiple facets of your identity. 2. Identify and analyze potential academic majors. 3. Identify and analyze potential careers. 4. Evaluate potential majors and careers in relation to yourself. Credits: 3.00

EDPS 10600 - Mapping Your Career

Credit Hours: 1.00. A course designed to help students explore professional development and create an individualized career plan toward their career goals. Students can use this career plan while meeting educational goals at Purdue.

Learning Outcomes: 1. Describe your interests, skills, values, and motivations. 2. Identify and research potential career opportunities that match your career goals. 3. Develop verbal, written, and physical ("body language") communication skills. 4. Expand your knowledge of what a career is and plan for life beyond college. 5. Create a portfolio of professional tools you can use in the real world. Credits: 1.00

EDPS 17700 - Learning And Regulation Strategies For College Success

Credit Hours: 3.00. This course is designed to help students improve their college academic success by studying more

efficiently and effectively, through strategic engagement, learning, and performance. We examine and apply evidence-based learning, motivation, and regulation strategies beneficial for college and lifelong learning. Educational psychology provides the theoretical framework for practical application of intentional and informed learning, cognition, motivation and behavior regulation.

Learning Outcomes: 1. Integrate evidence-based strategies to strengthen learning across environment and disciplines. 2. Apply self-regulation techniques to strengthen learning. 3. Develop confidence in implementing learning strategies for college success, including working in groups. Credits: 3.00

EDPS 20001 - Special Populations Seminar: Focus On Students With Disabilities And Differentiation Approaches

Credit Hours: 1.00. (EDCI 20001) This seminar is focused on special populations of learners for teacher education majors with an emphasis on exceptional students and approaches to curricular differentiation. Students will engage in mentoring activities and ongoing support in their development as a professional. The goal of the seminar is to connect theory to practice by engaging in an immersive field experience that connects to content and courses taken concurrently. The seminar provides an environment conducive to fostering rich relationships with schools and communities, pursuing common inquiry, thinking critically about theory, content and practice and advocating for equitable schooling. This seminar includes a field experience targeting schools and classrooms including exceptional students. This seminar is intended to be taken concurrently with EDPS 24800 and EDPS 26501.

Learning Outcomes: 1. Identify key educational theories and describe practices for implementation across various educational field placements. 2. Discuss and use culturally responsive teaching and communication practices. 3. Reflect on their own learning and the learning of others, gaining insight into themselves, into teaching/learning, and into issues of diversity, equity and social justice. 4. Complete a minimum of 30 hours in the required field experience setting. 5. Demonstrate professional attitudes and conduct that facilitate learning and convey a positive image of the education profession. Credits: 1.00

EDPS 20002 - Special Populations Seminar: English Language Learners And Students With Gifts And Talents

Credit Hours: 1.00. This seminar is focused on special populations of learners for teacher education majors with an emphasis on students who are English learners and students with gifts, talents, and creativity. Students will engage in mentoring activities and ongoing support in their development as a professional. The goal of the seminar is to connect theory to practice by engaging in an immersive field experience that connects to content and courses taken concurrently. The seminar provides an environment conducive to fostering rich relationships with schools and communities, pursuing common inquiry, thinking critically about theory, content and practice and advocating for equitable schooling. This seminar includes a field experience targeting schools and classrooms with ELLs and students with gifts, creativity, and talents. This seminar is intended to be taken concurrently with EDPS 24000 and EDCI 37001.

Learning Outcomes: 1. Identify connections between educational theory to educational practice as related to ELLs and students with GCT. 2. Demonstrate active listening and constructive peer feedback during seminar sessions and in the field. 3. Engage in mentoring activities related to teaching and learning in a community of peers and professionals. 4. Reflect on their own learning, gaining insight into themselves and their interactions with the classroom as teachers of ELLs and students with GCTs. 5. Complete a minimum of 30 hours in a school-based clinical experience including classroom observations, tutoring, assisting teachers, small and large group instruction and practicing the duties of a teacher who works with ELLs and students with GCTs. 6. Demonstrate the professional attitudes and conduct that facilitate learning and convey a positive image of the education profession. Credits: 1.00

EDPS 21100 - Special Education Law, Policy, And Ethical Guidelines

Credit Hours: 3.00. This course provides opportunities for analysis and practical application of special education law and policy through discourse and advocacy. It is designed to provide students with a foundational understanding of special education, including the historical context for special education and the laws, policies, and ethical guidelines that have driven current

special education legislation. Special education professionals hold multiple roles...teacher, case manager, general education consultant, instructional aid supervisor, researcher, and administrator to name a few. Moreover, there are numerous responsibilities required to successfully work in each of these roles and in this course we focus on law, policy, and ethical guidelines where they are relevant to special education pre-service teachers and support personnel.

Learning Outcomes: 1. Use observation, academic and personal engagement, and assessment data to develop and understanding of their students as learners at the individual and group level. 2. Demonstrate a strong knowledge of applicable federal, state, local laws, regulations, and policies pertaining to individuals with exceptionalities and how these laws affect the delivery of services and supports. 3. Demonstrate the ability to advocate for resources and professional learning conditions to help individuals with exceptionalities meet instructional, behavioral, social, and transition goals and outcomes. 4. Demonstrate the knowledge to draft sound and ambitiously appropriate individualized education programs. 5. Demonstrate the ability to engage in professional activities and participate actively in peer and professional learning communities that benefit individuals with exceptionalities and families, colleagues and their own professional growth. 6. Demonstrate the ability to keep current with research and contemporary practices in multiple way. Credits: 3.00

EDPS 21200 - Collaboration And Family Engagement To Support Students With Disabilities

Credit Hours: 3.00. Students will learn strategies for communicating and collaborating with a variety of team members. Finally culture will be explored. Strategies for collaborating with family members, administrators, paraprofessionals and related service personnel will be explored. This course includes a field experience.

Learning Outcomes: 1. Differentiate between professional and personal perspectives that impact teamwork and collaboration. 2. Describe how cultural values, context (e.g., social expectations, home language, resources, etc.), and experiences impact families' educational involvement and student learning. 3. Describe the additional roles and potential stressors families of children with disabilities may experience. 4. Identify strategies and steps for developing home-school partnerships and facilitating communication with families and school personnel. 5. Identify roles and responsibilities of key members (e.g., speech, school counselor, general education, paraeducator, etc.) of the educational team. 6. Outline and describe strategies (e.g., collaborative goal setting, coteaching, planning, etc.) for training and problem solving. Credits: 3.00

EDPS 23500 - Learning And Motivation (UCC: BSS)

Credit Hours: 0.00 to 3.00. Introduction to concepts of learning and motivation in educational contexts (i.e., Educational Psychology). Influence of development, culture, and individual differences on learning and motivation. Uses of assessment and technology in promoting learning and motivation. A field-based experiential component is included.

University Core Curriculum (UCC): (UCC: BSS)

Learning Outcomes: 1. Understanding of the learning processes including the role of previous experiences and the constructive nature of learning, cognitive constraints, and the role of the social environment. 2. Understanding of the principles of cognitive, personal, social, and moral development. 3. Understanding of principles of motivation including how to initiate and maintain student engagement. 4. Understand the fundamental assessment concepts including the purpose of assessment, the importance of alignment to instructional goals, and the interpretation and use of data. 5. Understanding of the creation of environments conducive for learning. Credits: 0.00 to 3.00

EDPS 24000 - Children With Gifts, Creativity, And Talents

Credit Hours: 1.00. This course is an introduction to the intellectual, social, and emotional characteristics of gifted

children youth; philosophies of gifted education; and programmatic and classroom approaches for supporting gifted students generally and within different domains (e.g., intellectual, academic, creative, artistic, leadership). Cannot be taken concurrently with EDPS 24800.

Learning Outcomes: 1. Understand who gifted, creative and talented children are and how their talent development needs can be met in the school setting. 2. Recognize the diversity that exists within the gifted, creative, and talented population. 3. Understand the history, philosophical traditions, and paradigms of practice in gifted education. 4. Develop awareness of specific strategies for supporting gifted, creative and talented students within the school context. 5. Develop awareness of key professional resources in the field of gifted education and talent development. 6. Develop a personal identity as a practitioner of gifted education. Credits: 1.00

EDPS 24001 - Foundations Of Gifted Education And Differentiated Instruction

Credit Hours: 2.00. This course is an introduction to the intellectual, social, and emotional characteristics of gifted youth; philosophies of gifted education; and programmatic and classroom approaches for supporting gifted students generally and within different domains (e.g., intellectual, academic, creative, artistic, leadership). This course will also help you learn and apply various research-based strategies and curriculum models aligned with gifted education pedagogy. Through readings, in-person small group discussions, and direct application, you will establish the groundwork for differentiated instruction for all students.

Learning Outcomes: 1. Describe the history, philosophical traditions, paradigms, and policies of gifted education. [NAGC-CEC Standards (2013): 6.2] 2. Describe giftedness, creativity, and talented development related to students in school settings. [NAGC-CEC Standards (2013): 1.2, 1.2, 2.1, 5.4, 6.1] 3. Develop awareness of the diversity that exists within the gifted, creative, and talented population. [NAGCCEC Standards (2013): 1.1; 6.3] 4. Apply specific differentiation models and strategies as a response to the needs, interests, and abilities of learners by modifying curriculum, instruction, learning environment, and/or affect. [NAGCCEC Standards (2013): 3.3; 5.1] 5. Create and justify differentiated lessons that utilize instructional strategies and technologies to engage high-potential, gifted, and multi-exceptional students. [NAGC-CEC Standards (2013): 3.1-3.4, 4.2, 4.4, 5.1] 6. Evaluate curriculum and program model(s) would work best at the elementary, middle, and high school levels in your school district. [NAGC-CEC Standards (2013): 3.1, 5.1, 5.2, 6.1] Credits: 2.00

EDPS 24800 - Differentiating Curriculum And Instruction

Credit Hours: 1.00. This course provides a solid foundation and set of principles for differentiating curriculum and instruction in any classroom at any grade level. Students will explore a variety of evidence-based strategies, tools, and curriculum models that effectively meet the diverse needs of all learners. Through readings, online classroom meetings and discussions, case studies, differentiated instruction examples, direct application and reflection, students will deepen their understanding and need to differentiate. With an overarching goal of increasing achievement and developing student talents, this course includes the following major components: creating positive learning environments that support a) high-quality curriculum; b) diagnostic, formative and summative assessments to inform instructional decision-making; and c) flexible grouping addressing student differences in readiness, interest, and learning profile (including learning preference, intelligence preference, gender, culture, language preference, locale, and opportunities to learn) and appreciating how these differences influence the ways in which students learn. Understanding that process of differentiation involves modifying content, process, product, learning environment, and/or affect incorporating higher-order thinking skills, creative problem solving, project-based learning, authentic/respectful tasks, collaborative learning, and other evidence-based strategies to promote student achievement and talent development understanding how differentiation of curriculum and instruction fits within specific educational interventions and models, such as scaffolding, flexible grouping, Response to Intervention (Rtl), and Multi-Tiered System of Support(MTSS). Effective teachers do more than teach content; they teach unique individuals who enter classrooms with various levels of expertise, skills, abilities, social-emotional needs, and learning expectations. Effective teachers differentiate curriculum by personalizing content based on the particular needs and interests of their students. Effective teachers differentiate instruction by applying various grouping strategies, technology applications and thinking skills. The goal of every effective teacher is that every child learns something

new every day. Cannot be taken concurrently with EDPS 24000.

Learning Outcomes: 1. Describe and implement the concept of differentiation as a response to the needs, interests and abilities of learners by modifying curriculum, instruction, learning environment, and/or affect. 2. Demonstrate proficiency in assessing students readiness, interests, and learning profiles and in creating differentiated lessons that utilize instructional strategies and technologies to engage special populations of students in learning. 3. Develop, implement, and evaluate various differentiated instructional plans designed to maximize learning and demonstrate proficiency in analyzing and evaluating differentiated lessons taught by other teachers. 4. Evaluate and reflect upon your course experience and plan for your future use of knowledge and skills gained in this course. Credits: 1.00

EDPS 26500 - The Inclusive Classroom

Credit Hours: 3.00. Characteristics of students with special needs/talents; strategies for helping students learn and develop in general educational settings. Emphasis placed upon research evidence, case studies, problem-based learning, and development of a plan for an inclusive classroom. A field-based component is included.

Credits: 3.00

EDPS 26501 - The Inclusive Classroom

Credit Hours: 2.00. This course is designed to provide an overview of the characteristics of children (birth through age 21) with disabilities, causes of disability, assessment techniques, and instructional strategies. Emphasis is placed upon the development of an inclusive lesson plan based on student needs in the field experience classroom. Characteristics addressed include learning, behavioral, social-emotional, and communicative abilities and needs for students with mild and intense support needs. Issues related to cultural differences and family impact will also be addressed. A field-based component is included.

Learning Outcomes: 1. Know theoretical and historical perspectives of special education. 2. Demonstrate knowledge of both legal (Federal and State) and ethical guidelines as it relates to education and services for individuals with disabilities including the Individuals with Disabilities Education Act (IDEA), Section 504 and Americans with Disabilities Act (ADA). 3. Identify the academic, behavioral, social-emotional, cognitive, communication, and motor/physical characteristics of students with disabilities including etiologies and outcomes. 4. Know the importance of the role of families as it relates to special education and the potential impact of language, culture, and family background have on the delivery of special education services. 5. Know the educators' role (special education and general education) in assessing, collaborating and teaching individual academic, social, communication, daily living, and employment goals for individuals from birth to 21. 6. Learn strategies for creating an inclusive learning environment that includes individualized instructional strategies/supports for one or more individuals with disabilities. 7. Learn how to select and use appropriate formal and informal assessments that minimize bias. 8. Justify how planned strategies/supports address the learning needs of one or more individuals with disabilities. 9. Learn technologies to support instruction for students with disabilities. Credits: 2.00

EDPS 27001 - Characteristics Of Individuals With Mild Disabilities

Credit Hours: 3.00. This course addresses the characteristics of students with mild disabilities and the social, legal, and ethical issues that surround their academic and social-emotional concerns, educational experiences, implications and life-long outcomes. This course has a shared field experience with EDPS 36201.

Learning Outcomes: 1. Engage in legal discourse involving students with mild disabilities. 2. Demonstrate knowledge and understanding of mild disabilities. 3. Engage in data-driven decision making regarding lesson plan development. 4. Design a lesson plan that meets the needs of target learner with a mild disability. Credits: 3.00

EDPS 30000 - Student Leadership Development

Credit Hours: 1.00 to 3.00. Leadership in students is developed through lectures and experiential activities. Topic areas include

leadership styles; campus organizational structures; program planning; social and intellectual activities; human relations and cultural differences; motivation; team building; public relations. Permission of instructor required.

Credits: 1.00 to 3.00

EDPS 30100 - Peer Counseling Training

Credit Hours: 1.00 to 3.00. Students are trained to help peers deal with their problems and concerns. Training modules are used to build knowledge and skills in the duties of peer helpers; student development, communication, goal setting, and use of community resources are stressed. (EDPS 30100 and 30100 are for Horizon students only.) Permission of instructor required.

Credits: 1.00 to 3.00

EDPS 30101 - Motivation To Learn

Credit Hours: 3.00. This course introduces students to current social-cognitive and sociocultural theories of motivation for learning and academic achievement, and research framed by those theories. Both individual-level and contextual factors associated with motivation will be considered. The course will also address applications of theory in educational settings, including motivational interventions.

Learning Outcomes: 1. Be familiar with predominant social-cognitive theories of motivation and their related constructs. 2. Understand how social-cognitive and socio-cultural approaches to studying motivation differ conceptually, methodologically, and empirically. 3. Be familiar with a range of methodologies that are used to measure student motivation, and strengths and weaknesses of each. 4. Understand and think critically about research design issues in motivation research, including descriptive correlational, quasi-experimental, and design research. 5. Understand the implications of motivation for student learning and achievement, and how this association is affected by affective, behavioral, and cognitive engagement. 6. Be familiar with proximal and distal contextual factors that are associated with motivation, and reasons for those associations. 7. Be familiar with ways that teaching and learning practices can facilitate or impede optimal student motivation. Credits: 3.00

EDPS 30102 - Social-Emotional Aspects Of Learning In Diverse Environments

Credit Hours: 3.00. The course examines the role of social emotional competence in learning and builds understandings of the inter-relationships between theory, empirical evidence, and instructional practice. It takes the perspective that experiences across different learning contexts are interrelated and may influence each other in reciprocal ways. The course views social-emotional dimensions of learning as: embedded in person-environment transactions; tied to specific instructional (formal and/or informal) contexts over time; co-evolving with cognition and language; critical to psychological, behavioral, and learning outcomes. The focus is on intersection of social-emotional competence, learning, and instruction. The course is intended to provide the foundations (theoretical and empirical) that can help those interested in formal and informal instructional environments make informed educational decisions by considering the social-emotional dimensions of learning.

Learning Outcomes: 1. Students will develop familiarity with major theoretical perspectives that inform social and emotional development in learning contexts. 2. Students will be able to define and distinguish core theoretical principles and connect them to empirical evidence and instructional practices in formal and informal learning contexts. 3. Students will be able to think critically about and evaluate the characteristics of different learning environments (and the instructional practices within these environments) and their relationship to learner development. 4. Students will develop familiarity with research methods for studying and assessing social development in different contexts. 5. Students will be familiar with key dimensions of social-emotional competence. 6. Students will develop the ability to think critically about the dimensions of social-emotional competence and their links to learner development in different contexts. 7. Students will be familiar with the social processes that operate in key contexts. Credits: 3.00

EDPS 30200 - Adolescents Classroom Teacher

Credit Hours: 3.00. Students will develop understanding of physical, intellectual, emotional and social development of learners. Emphasis on individual differences and behavior patterns that influence the establishment of an orderly, healthy learning environment, and upon the teacher as an influence of the learning environment.

Credits: 3.00

EDPS 30400 - Assessment And Transition (Data-Based Decision-Making)

Credit Hours: 3.00. This course addresses assessment techniques and transition planning in special education, with applications to curriculum. It includes norm-referenced and curriculum-based measurement, error analyses, observational ratings, data-based decision-making, and transition planning from early intervention to post-secondary settings.

Learning Outcomes: 1. Apply their understanding of specialized curricula to inform their programmatic and instructional decisions for individuals with exceptionalities across a variety of contexts and the continuum of placement options (CEC 3.2) 2. Develop, select, administer, analyze, and interpret multiple measures of student learning, behavior, and the classroom environment to evaluate and support classroom and school-based systems of intervention for students with and without exceptionalities (CEC 4.1). 3. Develop, select, and administer multiple, formal and informal, culturally and linguistically appropriate measures and procedures that are valid and reliable, to contribute to eligibility determination for special education services CEC 4.2). 4. Assess, collaboratively analyze, interpret, and communicate students' progress toward measurable outcomes, using technology as appropriate, to inform both short and long-term planning, and make ongoing adjustments to instruction (CEC 4.3). 5. Utilize appropriate progress monitoring skills in order to develop individualized education plans (IEPs) for students. Credits: 3.00

EDPS 30500 - Special Education Seminar: Perspectives On Disability

Credit Hours: 1.00. This course is designed to broaden student understanding of disability by exploring across related fields including disability studies, neurodiversity, speech language development, and behavioral characteristics. The goal of this seminar is for students to make connections between special education theory and practice and theories and views of disability beyond special education. Through lecture, discussion, and reflection, students will learn about the construct of disability and how individual strengths, needs, services, and supports extend across the lifespan and beyond the special education classroom.

Learning Outcomes: 1. Identify key theories on disability and describe practices for how these theories can influence teacher practices across various education field placements. 2. Reflect critically on their own learning and the learning of others, gaining insight into themselves, into teaching/learning, and into issues of diversity, equity and social justice. 3. Complete a minimum of 20 hours in the required field experience setting. 4. Demonstrate professional attitudes and conduct that facilitate learning and convey a positive image of the education profession. Credits: 1.00

EDPS 30900 - Systematic And Explicit Instruction

Credit Hours: 3.00. Students will learn evidence based instructional strategies for students with disabilities. The key components of systematic and explicit instruction will be explored. Students will learn how to use explicit instructional strategies to foster engagement and motivation. Methods for implementing systematic instruction across academic, functional, communication, social, and behavior goals will be addressed. Additionally, implementation in a variety of settings including 1:1, small group, and large group settings will be explored. Planning for generalization and maintenance of skills will also be addressed.

Learning Outcomes: 1. Contrast and compare a range of pedagogical models (e.g. Constructivist, Cognitive, Behavioral, etc) in special education. 2. Use formative and summative assessment to identify students current level of performance and inform instructional planning and decision making. 3. Identify instructional strategies necessary for promoting engagement, motivation, and opportunities to respond. 4. Identify components of systematic instruction. 5. Identify and implement a variety of strategies necessary for preparing the setting to support learning. 6. Demonstrate understanding of how to use flexible grouping to meet individual and large group needs. Credits: 3.00

EDPS 31001 - Characteristics Of Individuals With Disability Who Require Intense Intervention

Credit Hours: 3.00. This course addresses the characteristics of individuals who require intense intervention and how learning, behavioral, social-emotional, and communicative needs impact their lives. This course will also explore the cultural differences, legal and ethical guidelines, family impact, transition to adulthood, and wraparound services. A field experience will provide opportunities to observe and participate in a school setting (early childhood through age 21).

Learning Outcomes: 1. Identify the academic, behavioral, social-emotional, cognitive, communication, and motor/physical characteristics of students requiring intense intervention. 2. Understand how language, culture, family background, and environment impact the education and development of individuals requiring intense intervention. 3. Investigate services within the school and community based on the individual target learner and his/her family needs. 4. Demonstrate ability to assess and address individual academic, social, communication, daily living, and employment goals EC-21. Credits: 3.00

EDPS 31100 - Supporting Exceptional Learners: Foundations And Mathematics

Credit Hours: 3.00. Teaching students with special needs requires the ability to locate evidence-based interventions, implement those interventions with fidelity, and track student performance over time. Mathematics is a content area in which success or failure yields major ramifications for postsecondary success. This course will cover the common math interventions employed for mild to severe disabilities across grade levels K-12.

Learning Outcomes: 1. Develop standards-based lesson plans for math that consider individual abilities, interests, learning environments, and cultural and linguistic factors. 2. Use technologies to support instructional assessment, planning, and delivery of mathematics for individuals with exceptionalities. 3. Identify strategies for teaching to mastery and promote generalization of learning in mathematics for both fluency and world problem solving. 4. Produce standards-based lesson plans for numeracy that incorporate evidence-based practices, classroom resources (e.g. peer and paraprofessional), and technological supports for use with students who have diverse learning needs. Credits: 3.00

EDPS 31200 - Inclusive Practices In Cross-Content Curriculum

Credit Hours: 3.00. This course aims to teach best practices for cross-content integration in an inclusive or self-contained classroom. It develops pre-service teacher understanding of core curricula along with how to integrate the curricula across subject areas. This course will also cover curricula to implement a well-rounded education (e.g., visual arts, dance, theater, music, etc.), provide methods for inclusive practices within the content, and discuss the implementation of collaborative approaches to cross-content planning and delivery.

Learning Outcomes: 1. Apply understanding of curricula across curricular content areas to develop integrated units of study which provide a well-rounded education. 2. Develop curricular content knowledge in order to develop learning progressions for individuals with exceptionalities. 3. Select appropriate curricula for individuals with exceptionalities across multiple content areas. 4. Teach cross-disciplinary knowledge and skills (e.g., critical and creative thinking, problem-solving) through integrated lesson planning and curricular units of study. 5. Implement cross-content curriculum across a wide range of settings through collaborative practices. Credits: 3.00

EDPS 31500 - Collaborative Leadership: Interpersonal Skills (UCC: OC)

Credit Hours: 3.00. The purpose of this course is to provide integrated study of listening as a collaborative leadership skill necessary for interpersonal and intrapersonal development. Focus is on the development of professional listening skills, and the understand of the role listening plays in collaborative leadership conflict resolution, interviewing, team building, and ethics.

University Core Curriculum (UCC): (UCC: OC)

Learning Outcomes: 1. Identify the essential elements of collaborative leadership. 2. Explain the importance of interpersonal and oral communication skills to the process of collaborative leadership. 3. Understand how

interpersonal and oral communication skills interact with thoughts, feelings, and behaviors. 4. Explain the importance of interpersonal skills in the understanding basic human motivation. 5. Demonstrate solid interpersonal and oral communication skills in class presentations; skills related to initiating and sustaining positive and collegial relationships, engaging in difficult conversations, and conveying meaning. Credits: 3.00

EDPS 31600 - Collaborative Leadership: Cross-Cultural Settings (UCC: BSS)

Credit Hours: 3.00. In this course, students will explore the cultural nuances of leadership in the United States as well as around the world. This course will include impact of globalism as a context for leadership, conflict resolution in a global environment, and other important factors that impact culturally diverse or global teams.

University Core Curriculum (UCC): (UCC: BSS)

Learning Outcomes: 1. Better understand what a culture is, broadly defined, and how it functions. 2. Better understand the importance of culturally aware, knowledgeable, and skillful leaders. 3. Increase professional and personal self-awareness in relation to leadership in diverse settings. 4. Better understand the importance of making cultural issues central for constructive conflict management. 5. Understand the complexity of leader-other interaction and impact of psycho-social variables on this interaction. Credits: 3.00

EDPS 31700 - Collaborative Leadership: Mentoring

Credit Hours: 3.00. The purpose of this course is to provide a theoretical and experiential overview of the basic elements of mentoring as a key aspect of effective collaborative leadership. The hallmark of this course is the inclusion of a service-learning component in which students will be paired with undergraduate mentees and required to participate in weekly mentoring meetings for the duration of the semester. This learning experience is designed to promote development of the knowledge, skills, and dispositions required for competent mentorship. Emphasis on peer mentoring.

Learning Outcomes: 1. Differenitate among various types, purposes, roles of mentoring/mentors. 2. Identify the essential elements of effective mentoring relationships. 3. Examine and discuss the ethical considerations involved in mentoring. 4. Acquire knowledge regarding how issues of diversity interact with the process of mentoring. 5. Evaluate empirical findings associated with mentoring. 6. Consider various approaches to evaluating mentoring and the outcomes of mentoring programs. Credits: 3.00

EDPS 32000 - Happiness And Well-Being: Introduction To Positive Psychology

Credit Hours: 3.00. Happiness and Well-Being: An Introduction to Positive Psychology is an undergraduate course designed to provide students with an introduction to the field of positive psychology while also learning valuable, impactful life skills that can improve individual well-being, resilience, flow, happiness, and mindfulness for those enrolled. The course is designed in such a way time is devoted to both lecture and discussion based learning as well as experiential activities in the classroom designed to expose students to positive psychology constructs. Students will be exposed to strength oriented approaches to understanding human behavior, the instillation of hope and optimism, and multiple other positive psychology concepts that augment understanding of psychology. Students should be willing to participate in experiential exercises using positive psychology methods designed to promote self-awareness and growth. Though this course derives material from psychology, applications of the material can be made across fields and majors; thus, all students will benefit from better understanding human behavior, happiness, and well-being from an inclusive, positive psychology perspective. This class introduces the student to the major topics of the growing area of positive psychology. Students will learn theories, techniques and research associated with methods that promote happiness and psychological well-being. This introductory class will begin the journey into positive psychology and provides a foundation for further study of applied psychology and counseling at the graduate level.

Learning Outcomes: 1. Understand the importance of balancing psychological understanding by integrating positive psychology concepts and positive assets/characteristics into conceptualization of deficit and difficulty most often found in psychology. 2. Develop an understanding of positive psychology concepts and their practical implications. 3. Identify the impact that positive psychology concepts can have in your specific

fields and future careers. 4. Understand human social behavior from a lens that incorporates understanding of the positive assets with individuals, communities, and systems. 5. Develop the ability to implement positive psychology concepts in your own life with the hope of improving well-being and happiness. Credits: 3.00

EDPS 32600 - Health, Wellness, And Adaptive Physical Education

Credit Hours: 3.00. Through a blend of theoretical knowledge and practical application, students will acquire the skills necessary to design and implement effective programs that promote overall student wellness. Students will gain a comprehensive understanding of health, wellness, and physical education of school-aged children with and without disabilities: emphasizing the importance of inclusive instruction. Additionally, students in this course will examine the responsibilities and opportunities for teachers in supporting and enhancing student health, with an emphasis on developing effective strategies for creating a healthy and safe learning environment for everyone.

Learning Outcomes: 1. Identify and explain how nutrition and common diseases promote health-related fitness and are associated with disease and injury prevention, for students with and without disabilities. 2. Identify and explain how, basic functions and structures of human body systems, including human growth and development, basic motor skills, movement patterns, and physical activities, promote participation and responsible behaviors and safety in various physical activities for students with and without disabilities. 3. Identify and describe the influence of family, peers, culture, media, technology, as well as student interpersonal relationships and communication, have on various health behaviors for students with and without disabilities. 4. Assess, design, and perform evidence-based health, wellness, and physical education instruction, for students with and without disabilities in promoting their overall health and physical well-being. Credits: 3.00

EDPS 32700 - Classroom Assessment

Credit Hours: 1.00 to 3.00. Evaluating the impact of instruction on student performance is one of the most important skills for an educator. Effective teachers ask themselves, "How do I know if students are truly learning? Are they meeting educational objectives in the content area?" Using well-chosen assessment approaches, teachers can address these questions. In this course, students will acquire assessment literacy: the ability to gather accurate information about student achievement, and use that information to make instructional decisions that will improve learning. Course activities will focus on assessment tasks relevant to P- 12 classroom settings.

Learning Outcomes: 1. Create a long -term assessment plan. 2. Develop constructed-response tasks with scoring rubrics that are clearly written, aligned with content-area performance goals, and free of bias. 3. Make reasonable interpretations of classroom and large-scale assessment results for individual learners and use these interpretations to inform instructional plans. 4. Provide informative feedback to learners about their assessment results. Credits: 1.00 to 3.00

EDPS 33500 - Reading Instruction For Tier 1 And Tier 2

Credit Hours: 2.00 to 3.00. Given the needs of variety of needs of readers throughout the educational system, this class will focus on effective interventions from the primary grades through high school. Instructors will present a balance of theoretical and practitioner-oriented aspects of reading development and instruction. The course will also examine evidence-based science of reading approaches designed to ensure all students have access to effective, researched-based literacy instruction.

Learning Outcomes: 1. Establish an understanding of P-12 science of reading principles and practices. 2. Develop an understanding of effective Tier 1 and Tier 2 reading instruction. 3. Understand how to implement Tier 1 and Tier 2 reading practices in a classroom. 4. Establish an understanding of reading difficulties/disabilities. 5. Extend knowledge of unique needs of struggling readers. Credits: 2.00 to 3.00

EDPS 34100 - Introduction To Philosophical Underpinnings And Concepts Of Applied Behavior Analysis

Credit Hours: 3.00. This course is the first of four courses in the Applied Behavior Analysis pathway for undergraduates in

teacher licensure programs and is also part of the course content required to become a Board Certified Assistant Behavior Analyst (BCaBA). The course will provide an introduction into the primary concepts and principles of applied behavior analysis. Students will be introduce to the fundamental knowledge and experiences for understanding Applied Behavior Analysis principles, concepts, and techniques, including operant behavior, reinforcement, punishment, choice, antecedent stimulus control, and verbal behavior. Students learn concepts and principles to increase or decrease target behavior, to facilitate behavior maintenance and generalization, and to evaluate effectiveness of instruction. This course includes a field placement.

Learning Outcomes: 1. Define and provide examples of behavior, response, and response class. 2. Define and provide examples of stimulus and stimulus class. 3. Define and provide examples of respondent and operant conditioning. 4. Define and provide examples of positive and negative reinforcement contingencies. 5. Define and provide examples of schedules of reinforcement. 6. Define and provide examples of positive and negative punishment contingencies. 7. Define and provide examples of automatic and socially mediated contingencies. 8. Define and provide examples of unconditioned, conditioned, and generalized reinforces and punishers. 9. Define and provide examples of operant extinction. 10. Define and provide examples of stimulus control. 11. Define and provide examples of discrimination, generalization, and maintenance. 12. Define and provide examples of motivating operations. 13. Define and provide examples of rule-governed and contingency-shaped behavior. 14. Define and provide examples of verbal operants. Credits: 3.00

EDPS 34200 - Applied Behavior Analysis - Assessment And Intervention

Credit Hours: 3.00. This course is one of four courses in the Applied Behavior Analysis pathway for undergraduates in teacher licensure programs and is also part of the course content required to become a Board Certified Assistant Behavior Analyst (BCaBA). This course offers the interventionist with the techniques for designing, implementing, and evaluating instructional and behavioral interventions grounded in the theories of applied behavior analysis. Specifically, the learner will be exposed to techniques for measuring target academic, behavior, social and adaptive skills, as well as methods for displaying and interpreting data. Additionally, learners will design interventions, and monitor progress and will be exposed to the foundational concepts and methods of ABA including defining behaviors, collecting data, and understanding the three-term contingency of behavior. This course includes a field placement.

Learning Outcomes: 1. Identify and define the basic concepts of applied behavior analysis including the foundations of ABA, interrelated domains, and dimensions of ABA. 2. Identify factors to consider when selecting target goals including client and environmental factors. 3. Define target skills utilizing observable and measurable terms including all components of an appropriate learning goal. 4. Identify measurable dimensions of behavior and appropriate measurement procedures, including advantages and disadvantages of each. 5. Demonstrate knowledge about the various single subject research designs and variations of each, including advantages and disadvantages of each, including those most appropriate for practice and ongoing documentation. 6. Identify potential interventions based on assessment results as well as client/student preferences and current repertoires. 7. Use stimulus prompts and fading (e.g., errorless, most-to-least, least-to-most, prompt delay, stimulus fading). 8. Describe the role of imitation and modeling in learning and demonstrate procedures for implementation. 9. Define stimulus control and strategies for establishing. 10. Describe and implement discrete trial and naturalistic teaching arrangement. Credits: 3.00

EDPS 34201 - Curriculum And Program Development In Gifted Education

Credit Hours: 3.00. This course is an introduction to curricular materials, curriculum development, and programs for gifted, creative, and talented (GCT) students. It serves the needs of pre-service teachers who are preparing to teach gifted students in mixed-ability, general education or specialized classrooms. Students will be exposed to established program and curriculum

models, as well as the nuts and bolts of developing curricular plans, materials, and specialized programs that support the advanced learning needs of gifted students. Major assignments will assess students' understanding and application of foundational concepts related to the education of students with gifts, creativity, and talent. Permission of instructor required.

Learning Outcomes: 1. Determine the degree of alignment between a gifted program's stated goals, continuum of services, and curriculum resources. [NAGC-CEC Standards (2013): 2.4, 3.1, 3.3, -4.4, 4.5, 5.1-5.3, 5.5, 6.1, 7.3] 2. Describe the most widely used curriculum and program models in gifted education. [NAGC-CEC Standards (2013): 3.1, 5.1, 5.2, 6.1] 3. Determine which curriculum and program model(s) would work best at the elementary, middle, and high school levels in your school district. You may conclude that particular models "fit" different grade levels better than others. [NAGC-CEC Standards (2013): 3.1, 3.4, 4.4, 5.1, 5.2, 6.1]. 4. Justify the use of differentiation to meet the academic needs of gifted students. [NAGC-CEC Standards (2013): 3.2-3.4, 4.2, 4.4, 5.1] 5. Evaluate educational materials and practices to assess their suitability for use with high-ability students. [NAGC-CEC Standards (2013): 2.4,3.3, 4.1-4.4, 5.1-5.3, 6.1] 6. Practice designing and revising lessons to incorporate instructional strategies well-suited for high-ability students. [NAGC-CEC Standards (2013): 2.1-2.4, 3.1-3.4, 4.2, 4.4, 4.5,5.1-5.5] Credits: 3.00

EDPS 34501 - Social And Affective Development Of Gifted Students

Credit Hours: 3.00. This course focuses on the social and emotional development of gifted and talented students and provides you with knowledge and skills needed to effectively support healthy psychosocial development through your work with gifted students. As well as providing an overview of the characteristics and needs of gifted students, we will also discuss special populations of gifted learners, diversity issues, family and peer relationships, and current educational approaches and counseling interventions, including considerations for career development for gifted students. Permission of instructor required.

Learning Outcomes: 1. Recognize the social and affective characteristics and needs of high-ability students; describe and apply research-based practices to support their affective developments across home, school, and community. [NAGC-CEC Standards: 1.1, 1.2, 2.1] 2. Practice designing products that incorporate meaningful and engaging social and affective components that promote social-emotional well-being, including coping skills, proactive, adaptive behaviors, performance skills, and social skills. [NAGC-CEC Standards: 2.1-2.3, 3.1, 3.4, 4.5, 5.1] 3. Discuss characteristics and needs of subpopulations of high-ability learners and the implications for academic instruction, ethical leadership development, and/or counseling interventions. [NAGC-CEC Standards: 2.1-2.3, 4.1-4.5, 6.1, 6.3] 4. Increase knowledge and experience through regular participation in class discussion boards, interaction with gifted students and their parents, and completion of an in-depth, original affective case study of a high-ability students K-12. [NAGC-CEC Standards: 3.1, 4.3, 4.5, 7.1-7.2] Credits: 3.00

EDPS 36100 - Use Of Assessment Techniques In Special Education

Credit Hours: 3.00. Assessment techniques for the exceptional child, with applications to curriculum. Includes norm-referenced and curriculum-based measurement, error analyses, and observational ratings. Admission to Teacher Education Program, passage of Gate A.

Credits: 3.00

EDPS 36201 - Positive Behavioral Supports

Credit Hours: 0.00 to 3.00. This course provides an overview of the theory, principles, and application of applied behavior analysis within positive behavior interventions and support. The course focuses on pre-service teacher preparation in designing and implementing group and individual behavior supports. Emphasis is on universal supports, targeted interventions, and data-driven decision-making.

Learning Outcomes: 1. Identify the basic principles of behavior and provide real-world examples. 2. Create behavioral expectations and design a corresponding behavior matrix. 3. Design class-wide reinforcement systems. 4.

Identify interventions to promote social emotional learning for all learners. 5. Apply data-driven decision making to provide and evaluate a multi-tiered systems of support. 6. Design tier-two targeted supports to teach appropriate behavior. 7. Define behavior. 8. Select appropriate behavior measurement system. 9. Measure and graph behavior to assist in data-driven decision making. Credits: 0.00 to 3.00

EDPS 36300 - Psychoeducational, Medical, And Physical Aspects Of Individuals With Disabilities

Credit Hours: 3.00. Introduction to characteristics of individuals with mild and severe intellectual disabilities: defining characteristics, etiological factors, assessment, social, legal and educational issues, and basic physical or medical disability management issues and techniques. Admission to Teacher Education Program, passage of Gates A required.

Learning Outcomes: 1. Demonstrate the knowledge of the roles and responsibilities of the educational team. 2. Demonstrate the knowledge of instructional strategies needed to promote independence. 3. Demonstrate the knowledge of motor tone and motor patterns. 4. Demonstrate the knowledge of proper positioning, lifting, and handling techniques. 5. Demonstrate the knowledge of feeding and toileting techniques. 6. Demonstrate the knowledge of infection control. 7. Demonstrate the knowledge of assessment and monitoring techniques of major health conditions. Credits: 3.00

EDPS 40099 - Topics In Design Based Research, Assessment And Evaluation

Credit Hours: 3.00. Design-Based Research (DBR) is inquiry that is driven by educational practice- the desire to understand and improve the practice of teaching and learning. Learning scientist employ DBR in order to implement innovative designs for teaching and learning in a variety of formal and informal educational settings (e.g., schools, museums, and extramural clubs) and to conduct research no teaching and learning that occurs in the context of their design innovations. The focus of this course is to help students develop a set of core competencies for systemically studying the teaching and learning of science in designed environments.

Learning Outcomes: 1. Understand the various forms of design-based research that are conducted in education. 2. Critically evaluate the strengths and limitations of examples of design-based research in the literature on science teaching and learning. 3. Develop a proposal for a design-based research study and present this proposal, both orally and in writing to a review panel of peers (classmates). Credits: 3.00

EDPS 40200 - P-12 Reading Methods For Exceptional Learners

Credit Hours: 2.00 to 3.00. This course is designed to meet the expectations of CEC, NCTQ, IDA and REPA 3 and prepare students in the science of reading for exceptional learners (including students with dyslexia and those with intensive needs) in Tiers 2 and 3. This course will provide implementation details on Response to Intervention (RTI) and Multi-tiered Systems of Support (MTSS). The course will present strategies and programs used in strategic and intensive intervention efforts for those learners needing additional, unique, and/or more focused remediation efforts. Topics will include understanding reading intervention research, the behavior analytic and learning sciences' contributions to understanding the reading process, the sequence of learning to read (systematic instruction), reading to learn, and the five components of reading instruction for P-12 learners. This course will specifically address the REPA 3 Standard: Focused work using (interventions that are direct, explicit, and multi-sensory) as a component of scientifically-based reading.

Learning Outcomes: 1. Review the five components of effective reading instruction for those in P-3 and those in grades 4-12. 2. Explain the models for remediation of prereading/reading difficulties and describe how they function: RTI, MTSS. 3. Describe and demonstrate how to use various screeners and progress monitoring assessments for P-12 students in Tiers 2 and 3. 4. Describe the meaning of direct and systematic instruction. 5. Demonstrate mastery of Corrective Reading sounds. 6. Demonstrate methods of increasing student engagement. 7. Discuss strategies to enhance content area reading performance. 8. Illustrate a scope and sequence for reading remediation for readers needing strategic and intensive intervention. 9. Explain how reading

instruction can be made more explicit for those needing more focused efforts 10. Demonstrate how to provide systematic and explicit small group/one-on-one reading instruction. 11. Describe Big Direct Instruction and published scientifically-based programs that are designed based on the science of reading instruction and demonstrate how they are implemented. 12. Describe the use of Universal Design for Learning and assistive technology approaches to increase access to reading materials and/or improve reading skills. Credits: 2.00 to 3.00

EDPS 40300 - Individual Social, Emotional, Behavioral Supports

Credit Hours: 3.00. This course is designed to prepare students with advanced knowledge and skills in designing and delivering individualized social-emotional and behavioral supports for learners. Emphasis will be placed on functional behavior assessment and function-based interventions and supports.

Learning Outcomes: 1. Identify the advanced principles of behavior and provide classroom examples. 2. Articulate the connection between social-emotional skills and challenging behavior. 3. Define learner behaviors. 4. Select an appropriate behavior measurement system for learner outcomes. 5. Measure and graph learner behavior. 6. Conduct a functional behavior assessment. 7. Develop and implement a behavior support plan. 8. Analyze learner data to guide educational programming decisions. Credits: 3.00

EDPS 41001 - Collaboration And Transition Practices For Individuals With Disabilities

Credit Hours: 3.00. This course addresses the professional collaborative practices for special educators, who work with school age students with disabilities. The topics of this course include collaboration with professionals, ancillary personnel, agencies, and families, problem-solving and dealing with conflict, co-teaching, and transition planning from early intervention to post-secondary settings. The possible products from this course include community resources, transition plans, co-teaching plans, and family interviews. No undergraduate student may be enrolled in this undergraduate course until they have been admitted to the teacher education program and passed Gates A and B.

Learning Outcomes: 1. Become familiar with the legal requirements of IDEA and other related laws, both federal and state as they relate to collaboration and transition. 2. Demonstrate proficiency in writing and interpreting transition plans. 3. Demonstrate knowledge in the use of both formal and informal assessments in determining student transition needs and supports. 4. Develop comprehensive plans for community-based instruction (including ecological inventories, site analyses, site development, instructional strategies, behavior management plans, data collection). 5. Demonstrate knowledge of interagency collaboration, professional development, and community resource development for the purpose of providing effective transition services. 6. Demonstrate a basic understanding of the government benefits (e.g., SSI, AFDC) for which persons with disabilities may be eligible. They will be familiar with the impact of work or other financial resources on maintaining these benefits. 7. Know about accessing and implementing information related to school and post-school private resources for persons with disabilities in the areas of government benefits, vocational services, estate planning, independent living, social and recreational services, transportation services, community integration and related services. 8. Demonstrate an understanding of the issues and barriers encountered by students, parents, and service providers as students with disabilities transition between grade and school levels. 9. Identify solutions to issues and barriers for all parties as individuals with disabilities transition through grade and school levels. Credits: 3.00

EDPS 41700 - Special Education Knowledge And Skills For General Educators

Credit Hours: 3.00. This course is the capstone course for the Special Education certificate and pathway. This course is designed to expose students to innovative strategies and best practices for promoting inclusive education. Students in this course will develop the habits of ongoing training and

professional development to support the variety of student needs in inclusive general education classes.

Learning Outcomes: 1. Describe shared instructional responsibility and the roles of school personnel who support the educational needs of students with disabilities. 2. Provide equitable access to and participation in the general curriculum for students with disabilities. 3. Know where to access current educational research that informs practice in the field. 4. Understand their responsibility for implementing IEP's. 5. Understand school policies regarding special education including those regarding referral, assessment, eligibility, and services for students with disabilities. 6. Understand when to consult with others who possess specialized expertise. 7. Understand students who have disabilities within the broader context of their families, cultural backgrounds, socioeconomic classes, languages, communities and peer/social groups. 8. Reflect on practices. Credits: 3.00

EDPS 42100 - Supporting Exceptional Learners: Social Studies And Science

Credit Hours: 3.00. This course is designed to prepare special educators to deliver social studies and science content to children and adolescents with disabilities across PK-12 settings. It will also prepare special educators to make programmatic and instructional decisions related to least restrictive environment, appropriate educational supports, assistive technology, accommodations, and modification specific to science and social studies instruction. This course includes assignments that will be linked to EDPS 46100 the Special Education Student Teaching Residency.

Learning Outcomes: 1. Use knowledge of general and specialized social studies curricula to individualize learning for individuals with exceptionalities. 2. Use knowledge of general and specialized science curricula to individualize learning for individuals with exceptionalities. 3. Use strategies to enhance language development and communication skills of individuals with exceptionalities across social studies and science content area. Credits: 3.00

EDPS 43000 - Creating And Managing Learning Environments

Credit Hours: 0.00 to 3.00. The purpose of this course is to enable you to develop a supportive, challenging, and growth-enhancing classroom community for students in elementary grades. Teachers need insightful understanding and strong skills to create a classroom community that enhances achievement, welcomes diversity, makes effective use of technology, and provides appropriate educational experiences for students with diverse needs, backgrounds, and developmental levels.

Learning Outcomes: 1. Develop skills for building classroom communities. 2. Analyze different approaches to classroom discipline and the effects of those approaches on the cognitive, social, and emotional development of diverse students. 3. Develop a personal philosophy of classroom discipline. 4. Understand how student diversity, developmental levels, technology, instructional design, room arrangement, and assessment techniques influence the classroom community and climate. 5. Develop strategies for effective management of professional time and tasks. 6. Learn how to collaborate with colleagues and parents to enhance student learning and development. 7. Develop a comprehensive plan for creating and managing the learning environment in a real or simulated teaching situation. Credits: 0.00 to 3.00

EDPS 43010 - Secondary Creating And Managing Learning Environments

Credit Hours: 1.00 to 3.00. This course is designed to develop advanced pre-service teachers' skills in recognizing classroom processes and understanding how teachers' beliefs and practices affect secondary students' engagement, learning, and motivation. It focuses on Effective Teaching - what it is, what it looks like, and different ways to enact it in the classroom.

Learning Outcomes: 1. Develop skills for building classroom communities. 2. Analyze different approaches to classroom discipline and the effects of those approaches on the cognitive, social, and emotional development of diverse students. 3. Develop a personal

philosophy of classroom discipline. 4. Understand how student diversity, developmental levels, technology, instructional design, room arrangement, and assessment techniques influence the classroom community and climate. 5. Develop strategies for effective management of professional time and tasks. 6. Learn how to collaborate with colleagues and parents to enhance student learning and development. 7. Develop a comprehensive plan for creating and managing the learning environment in a real or simulated teaching situation. Credits: 1.00 to 3.00

EDPS 44100 - Introduction To Ethics And Practice Of Applied Behavior Analysis

Credit Hours: 3.00. This course is the final course in the Applied Behavior Analysis pathway for undergraduates in teacher licensure programs and is also part of the course content required to become a Board Certified Assistant Behavior Analyst (BCaBA). This course will address the professional and ethical responsibilities of behavior analysts. Key issues of responsible conduct as it relates to areas such as confidentiality, consent, consultation, treatment planning, and research will be discussed and applied through case studies. Learners will be able to consider ABA techniques within the bounds of both legal and ethical frameworks.

Learning Outcomes: 1. Demonstrate understanding of BACB guidelines for the responsible conduct of applied behavior analysis. 2. Discuss scenarios involving ethical issues and describe appropriate solutions using BACB guidelines. 3. Identify appropriate ethical practices in ABA research. 4. Demonstrate understanding of empirically validated practices vs pseudoscience and non-validated practices within the context of service delivery. Credits: 3.00

EDPS 44200 - Advanced Intervention In Applied Behavior Analysis

Credit Hours: 3.00. This course is one of four courses in the Applied Behavior Analysis pathway for undergraduates in teacher licensure programs and is also part of the course content required to become a Board certified Assistant Behavior Analyst (BCaBA). This course will provide fundamental knowledge and experiences for understanding instructional and behavior interventions grounded in the principles of Applied behavior Analysis including a pivotal response training, functional communication training, video modeling, self-management, social skills training, and augmentative and alternative communication (AAC). Students learn procedures to increase or decrease target behavior, to facilitate behavior maintenance and generalization, and to evaluate effectiveness of instruction. Students will also learn strategies for consultation with other service providers as well as practices for effective supervision of others such as paraeducators.

Learning Outcomes: 1. Identify, distinguish between, and provide examples of core (basic and advanced) concepts and principles in the field of behavior analysis. 2. Describe the concepts of motivating operations and stimulus control and demonstrate application to instruction. 3. Demonstrate procedures for implementing functional communication training and describe the principles of ABA involved. 4. Describe processes and demonstrate procedures for implementing a variety of instructional strategies including pivotal response training, peer mediating learning, video modeling, augmentative and alternative communication, social skills training. 5. Describe strategies and procedures for implementing group contingencies. 6. Describe and demonstrate how to implement self-management programs. 7. Synthesize procedures for supervising implementors (e.g. paraeducators) through implementation of ABA strategies including behavior skills training. 8. Discuss strategies for consulting with other school and community-based providers including parents. Credits: 3.00

EDPS 45200 - Global Studies Seminar

Credit Hours: 1.00. (EDCI 45200) The course builds on students' international cross-cultural experiences, particularly Study Abroad. The course is required for those wishing to complete the Global Studies minor in the College of Education.

Learning Outcomes: 1. Discuss economic, social, and cultural diversity within a global context. 2. Describe the cultural, social and historical dynamics that influence individuals and groups. 3. Explain the perspective of the culture of another country through the study of

world languages, arts, spiritual traditions, mythology/literature, and/or through study abroad. 4. Identify examples of how social, behavioral, or historical knowledge informs and can shape personal, civic, ethical, or global decisions and responsibilities. 5. Clearly communicate a central message with the supporting materials. Credits: 1.00

EDPS 45900 - Assistive Technology (UCC: STS)

Credit Hours: 3.00. Use of technological applications in special education, including microcomputers, interactive video, auditory and visual enhancement, and other adaptive devices with individuals experiencing disabilities including learning disabilities, intellectual disabilities, sensory and physical disabilities. Typically offered Fall Spring.

University Core Curriculum (UCC): (UCC: STS)

Learning Outcomes: 1. Gain knowledge of the various types and forms of assistive technology. 2. Demonstrate an ability to discuss AT and services. 3. Conduct a professional presentation related to assistive technology. 4. Present a valid technology for repurposing. Credits: 3.00

EDPS 45901 - Assistive Technology (UCC: STS)

Credit Hours: 1.00. This course explores the use of Universal Design for Learning as a framework for Differentiated Instruction. Additionally, this course addresses the use of Augmentative and Alternative Communication and Assistive Technology by individuals with disability requiring mild, moderate, and intense intervention.

University Core Curriculum (UCC): (UCC: STS)

Learning Outcomes: 1. Understand the principals of UDL as a framework for differentiated instruction. 2. Understand the legal and ethical issues regarding UDL, Differentiated Instruction, AAC, and AT. 3. Assess individuals with disability for appropriate technology services and devices. 4. Demonstrate data-based decision-making to differentiate instruction and/or identify appropriate technology of a target learner requiring mild, moderate, or intense intervention. Credits: 1.00

EDPS 46000 - Strategies For Teaching Individuals With Mild And Moderate Disabilities Primary & Elementary Grades

Credit Hours: 3.00. This course is designed to prepare future special educators to plan and provide content area instruction in the core content areas to primary and elementary students with mild and moderate disabilities. Course content will include information on assessment, instructional design, and development of individualized education programs, research-based practices for promoting academic and behavioral growth, and content area literacy and numeracy, and your professional role as a teacher of students with mild disabilities. This course has a required concurrent enrollment in EDPS 46100.

Learning Outcomes: 1. Identify the legal requirements of academic goals and learning supports within individualized education plans (IEPs) and demonstrate understanding of assessment and monitoring procedures necessary to evaluate student progress. 2. Identify the principal instructional arrangements common to P-6 settings for students with mild disabilities, how the arrangement impacts classroom organization, and how to modify the arrangement to meet individual student needs. 3. Identify the common characteristics of evidence-based behavioral and instructional strategies implemented in P-6. These include class-wide (Tier 1) and targeted (Tier II) interventions. 4. Produce standards-based lesson plans for literacy and numeracy that incorporate evidence-based practices, classroom resources (e.g., peer and paraprofessional), and technological supports for use with students who have diverse learning differences. 5. Distinguish between accommodations, modifications, and interventions within the assessment, teaching and IEP development process. Credits: 3.00

EDPS 46100 - Practicum In Strategies For Teaching Individuals With Disabilities

Credit Hours: 1.00 to 6.00. Practicum experience in assessment and teaching of individuals with disabilities. Experience in design, delivery, implementation, and evaluation of instruction. No undergraduate students may be enrolled in any of these undergraduate courses until they have been admitted to teacher education. Admission to Teacher Education Program, passage of Gates A and B.

Learning Outcomes: 1. Provide instruction that is responsive to student differences and

promotes development and learning for all students. 2. Match expectations to the unique characteristics, abilities, developmental levels, and behavior of students. 3. Identify characteristics of students with disabilities and design classroom accommodations. 4. Adjust instruction according to student needs and performances. 5. Use a variety of evidence-based instructional strategies. 6. Plan and deliver standards-based, data-driven differentiated instruction that actively engages students in the learning process. 7. Demonstrate an appreciation and concern for students as individuals and interact with them in positive ways that encourage and teach appropriate behavior. 8. Model effective use of language. 9. Demonstrate effective classroom and behavior management and establish a positive, productive, and safe learning environment with high expectations for all students. 10. Integrate instructional technology by creating instructional materials, delivering instruction using technology, or encouraging student use of technology in assignments. 11. Reflect on practices. 12. Engage in professional development activities to remain current with best practices. 13. Collaborate effectively with colleagues, parents, and others to increase the effectiveness of instruction and engage in professional growth. Credits: 1.00 to 6.00

EDPS 46300 - Teaching Individuals With Severe Disabilities

Credit Hours: 3.00. Education of individuals with severe or multiple disabilities. Application of innovative technology, design of individual educational programs, strategies and methods for instruction, evaluation of instruction, community-based instruction, generalization and maintenance of skills. Admission to Teacher Education Program, passage of Gate A required.

Learning Outcomes: 1. Demonstrate the knowledge of the various aspects of trial management. 2. Demonstrate the knowledge of the ability to record, graph, and interpret ongoing data of student performance. 3. Demonstrate the knowledge of the ability to apply the principles of learning and strategies of instruction. 4. Demonstrate the knowledge of the components of community referenced curriculum and community-based instruction. 5. Demonstrate the knowledge of the inclusionary/collaborative strategies for students with severe disabilities. Credits: 3.00

EDPS 49000 - Individual Research And Teaching Experience

Credit Hours: 1.00 to 8.00. Primarily for teacher candidates requiring special, individualized experience in research or teaching. Permission of instructor required.

Credits: 1.00 to 8.00

EDPS 49100 - Topics And Issues In Education

Credit Hours: 1.00 to 3.00. Provides student with opportunity to strengthen preparation through study of selected educational topics and issues based upon individual needs and interests. One topic is considered in each enrollment.

Credits: 1.00 to 3.00

EDPS 49500 - Practicum In Gifted Education

Credit Hours: 3.00. The Practicum in Gifted, Creative, and Talented (GCT) Education is designed to be the culminating experience for those who are pursuing the GCT pathway as part of their teacher education undergraduate licensure program, with or without Indiana licensure. The overall goal of the course is derived from Standard 6 of the NAGC-CEC Teacher Preparation Standards in Gifted and Talented Education. Includes experiential learning. Required for those seeking GCT pathway in teacher education.

Learning Outcomes: 1. Develop as reflective practitioners who set and evaluate their progress toward personal goals for professional growth. 2. Create professional networks that can be sustained beyond the practicum experience. 3. Practice continuous improvement in teaching gifted, creative, and talented students. 4. Demonstrate the key ideas, standards, guiding principles, theories, models, and instructional strategies learned in EDPS 24000, 24800, 54200, & 54500. 5. Formalize philosophies of and personal identities as practitioners of GCT education. Credits: 3.00

EDPS 49800 - Supervised Teaching- Special Education (UCC: OC)

Credit Hours: 1.00 to 16.00. A student planning to enroll in EDCI 49600, EDCI 49800, EDCI 49900; EDPS 49800, EDPS 49900, EDPS 56100, or EDPS 56600 in the spring or fall semester of any academic year must secure, complete, and submit a student teaching application form between the middle of September and November 1 preceding the academic year during which he or she will be enrolled in the course. Failure to file the application during or prior to this time will make it virtually impossible for the student to receive a student teaching assignment for that year. Application forms may be obtained in and submitted to Room 3241, Liberal Arts and Education Building. Teaching full time in a school classroom under the supervision of the teacher in charge of the class and a University supervisor. No undergraduate students may be enrolled in any of these undergraduate courses until they have been admitted to teacher education. Admission to Teacher Education Program, passage of Gates A, B, and C.

University Core Curriculum (UCC): (UCC: OC)

Credits: 1.00 to 16.00

EDPS 49900 - Supervised Teaching Or Practicum In Endorsement Area

Credit Hours: 3.00 to 9.00. A student planning to enroll in EDCI 49600 , EDCI 49800 , EDCI 49900; EDPS 49800 , EDPS 49900, EDPS 56100, or EDPS 56600 in the spring or fall semester of any academic year must secure, complete, and submit a student teaching application form between the middle of September and November 1 preceding the academic year during which he or she will be enrolled in the course. Failure to file the application during or prior to this time will make it virtually impossible for the student to receive a student teaching assignment for that year. Application forms may be obtained in and submitted to Room 3241, Liberal Arts and Education Building. Teaching full time in an endorsement area in a school classroom under the supervision of the teacher in charge of the class and a University supervisor. No undergraduate students may be enrolled in any of these undergraduate courses until they have been admitted to teacher education. completion of education courses required for the endorsement area and admittance to teacher education program.

Credits: 3.00 to 9.00

EDPS 50000 - Group Counseling Theories And Techniques

Credit Hours: 3.00. Theoretical and experiential overview of fundamental elements of group work and group counseling processes. Broad topics include purposes and types of groups, therapeutic factors and stages of leadership skills, and multicultural, ethical, and legal aspects of group counseling.

Learning Outcomes: 1. Differentiate among various types and purposes groups and specializations in group work. 2. Identify the essential group dynamics involved in understanding group interactions. 3. Develop an understanding of the principles and challenges associated with planning a group intervention. 4. Develop an understanding of the principles and challenges associated with implementing a group intervention such as recruitment, therapeutic factors, and developmental stages of group. 5. Compare and contrast different perspectives on group leadership. 6. Examine and discuss the ethical considerations unique to group work. 7. Acquire knowledge regarding diversity-competent group practice. 8. Evaluate empirical findings associated with group work. 9. Consider various approaches to evaluating group processes (e.g., program evaluation) and the outcome of group work. Credits: 3.00

EDPS 50001 - Foundations Of Online Learning

Credit Hours: 1.00. This course is designed to help you to understand the knowledge and skills necessary for your successful online learning in the Online MSEd in Special Education program, with a focus on the process of completing University and Program specific requirements. In this orientation, you will explore what online learning entails and reflect on how you can best set yourself up to succeed in your studies.

Learning Outcomes: 1. Learn the specifics of the Online MSEd in Special Education program and its requirements. 2. Familiarize themselves with resources, review targeted learning competencies, and program requirements.

Credits: 1.00

EDPS 50002 - Foundations Of Licensure

Credit Hours: 1.00. This course is designed to guide candidates to complete required documents needed to determine appropriate clinical practice placement(s) for candidates within unique employment situations. This course includes two process applications required of all employed candidates: 1) Clinical Practice Pre-Application Process and 2) Clinical Practice Application Process.

Learning Outcomes: 1. Participate in specific Online MSEd in Special Education Program Clinical Practice Placement requirements.

Credits: 1.00

EDPS 50100 - Introduction To School Counseling

Credit Hours: 3.00. Presents an overview of counseling in elementary, middle, and secondary schools. Treats the history

of school counseling, developmental characteristics and problems of students, and counseling program elements and issues.

Learning Outcomes: 1. Articulate fundamentals of counseling in general and school counseling in particular, as well as skills and role of the school counselor. 2. Articulate basic history and current trends in school counseling. 3. Identify ways for school counselors to serve as change agents in the school culture and climate, as well as incorporate multicultural understandings into conceptualizing school counseling programs. Credits: 3.00

EDPS 50500 - Foundations Of Career Development And Assessment

Credit Hours: 3.00. Treats career development theories which emphasize aspects of the self in decision making, occupational classification systems, and educational and vocational information with applications to individual and group counseling.

Learning Outcomes: 1. Develop a comprehensive understanding of core and emerging theories and areas of research in career development. 2. Demonstrate the ability to conceptualize career counseling cases from various theoretical and multicultural perspectives. 3. Demonstrate the ability to integrate theory and research and utilize this information in such a way that it informs applications of career counseling and assessment. 4. Demonstrate understanding of the role cultural, individual difference (e.g., biological, personality), and developmental factors play in shaping career development processes. Credits: 3.00

EDPS 50700 - Counseling Multicultural And Diverse Populations

Credit Hours: 3.00. Counseling strategies for multicultural and diverse populations encountered by helping professionals. Among the populations considered are ethnic and cultural minorities, older persons, the gifted, and the disabled.

Learning Outcomes: 1. Examine how social and cultural factors influence the counseling relationship and are reflected in counseling theory and practice. 2. Develop strategies for working with diverse individuals, couples, families, groups, and communities. 3. Develop an awareness of multicultural and pluralistic trends, including characteristics and concerns of specific socially and culturally diverse groups. 4. Examine ethical and legal issues related to counseling diverse populations. Credits: 3.00

EDPS 50701 - Foundational Techniques For Telemental Health Providers

Credit Hours: 3.00. The purpose of this course is to provide a broad overview of individual therapy with adults via telemental health using a videoconferencing platform. Within this course, students will develop general, foundational knowledge related to pre-screening adults for individual therapy, conducting intakes with adult clients, engaging in individual therapy sessions with adult clients, terminating with adult clients, and managing risk with adult clients. Additionally, this course offers a brief overview of telemental health therapy with children, couples, families, and groups. This course is taught in an asynchronous manner and uses various strategies to facilitate student learning, which include: discussion boards, case studies, role plays, self-assessment papers, and pre-recorded lectures with associated PowerPoint slides. Access to necessary technology resources which includes but is not limited to: stable internet access, Brightspace, a telemental health or associated platform, and a computer, is required to complete the course.

Learning Outcomes: 1. Acquire basic knowledge for telemental health technologies/platforms. 2. Learn the basic function and operations of telemental health technologies/platforms. 3. Obtain an understanding of telemental health technologies' strengths and limitations. 4. Become familiar with the primary ethical considerations for telemental health practice. 5. Learn ethical considerations associated with telemental health practice. 6. Identify ethical considerations that are unique to telemental health practice as compared to in-person, face-to-face clinical practice. 7. Be encouraged to research and learn basic telemental health practice guidelines and laws for their associated profession and state-of-practice, respectively. 8. Learn about effective utilization of telemental health technologies/platforms for individual therapy with adults. 9. Acquire foundational

knowledge in conducting an effective pre-screening appointment for potential individual therapy clients with telemental health. 10. Become knowledgeable in how to use basic clinical skills within individual therapy via telemental health. 11. Learn about the termination and referral processes when working within telemental health. 12. Know how to address unexpected and unique issues associated with telemental health (e.g., loss of connectivity). 13. Able to successfully implement essential, foundational clinical skills within a telemental health technology/platform. 14. Engage in active discussion via online discussion boards regarding the application of clinical skills within telemental health. 15. Engage in active practice and application of foundational clinical skills as related to telemental health (i.e., role plays). 16. Foster self-awareness of their strengths and areas of growth regarding telemental health practice. 17. Work to identify their strengths and areas of growth regarding telemental health prior to learning course material. 18. Work to identify their newfound strengths and continued areas of growth regarding telemental health near completion of the course. 19. Learn risk management with adults via telemental health. 20. Learn how to address suicidality and homicidality in adults with telemental health practice. 21. Obtain introductory knowledge and skills in telemental health practice with couples, families, groups, and children. 22. Be provided with cursory knowledge regarding therapy with couples, families, groups, and children using a telemental health platform. Credits: 3.00

EDPS 50702 - Addressing Demographic Health Disparities In Telehealth

Credit Hours: 3.00. The practice of tele-mental health is expanding rapidly. This expansion reflects both increased opportunities afforded by technological advances within the healthcare field, as well as pressing needs to resolve persistent healthcare disparities associated with in-person services. As part of the Certificate in Telemental Health Counseling, this course will prepare students to take a systematic view of the challenges and opportunities of transitioning live practices to telehealth, by preparing students to Identify demographic telemental health disparities at local, national, and international levels; describe key barriers that produce demographic telemental health disparities; generate a telemental health access toolkit to address demographic disparities within a specific practice and/or field.

Learning Outcomes: 1. Identify demographic telemental health disparities at local, national, and international levels. 2. Explain the historical intersections across the fields of mental health, technology, and social justice. 3. Describe key barriers that produce demographic telemental health disparities. 4. Generate a telemental health access toolkit to address demographic disparities within your practice and field.

Credits: 3.00

EDPS 50703 - Introduction To Telemental Health Assessment And Intervention

Credit Hours: 3.00. As part of the Certificate in Telemental Health, this course will prepare students to take a systematic view of the challenges and opportunities of transitioning live practices to telehealth, by preparing students to apply intervention skills within a telehealth framework; identify key differences in telehealth procedures compared to in-person practice; apply skills for working with individuals, groups and families via telemental health processes and practices.

Learning Outcomes: 1. Consider and explain barriers and strengths of implementing various evidence-based practices in telemental health. 2. Effectively use strategies for implementing therapies via telemental health platforms. 3. Understand and utilize cognitive and behavioral interventions via telemental health platforms. 4. Understand the nuance of and deliver adherent

psychological assessment measures via telemental health platforms. Credits: 3.00

EDPS 50800 - Cultural And Linguistic Diversity In Special Education Programs

Credit Hours: 3.00. Living in a diverse society provides special education teachers and support personnel the opportunity to encounter a wide array of cultures in their educational settings. The course, designed for special education stakeholders (i.e., teachers, staff, support personnel, administrators), considers issues of human diversity, broadly defined to include ability, ethnicity, culture, gender identity, linguistic background, race, religion, socioeconomic status, and sexual orientation. This course challenges biased assumptions that influence the provision of educational services, and examines issues related to promoting equal learning opportunities in the classroom and other educational settings. It is designed to facilitate student examination of how diversity and diverse experiences shape systems that affect individuals, families, communities, and society. It allows students to explore their own cultures and the biases and internalized messages about those who are different from themselves. Students will be introduced to specific approaches to practice, and frameworks for equity, advocacy, and empowerment to support students who receive special education and/or applied behavior analysis (ABA) service, as well as their families. The course also includes information and discussion topics pertaining to the culturo-behavior science (CBS) specialization of the Association for Behavior Analysis International (ABAI) and to interpersonal communication skills - to include speaking, listening, reading, and writing - and their effect on students and families. Permission of instructor required.

Learning Outcomes: 1. Demonstrate a conscious awareness and working knowledge of diverse populations within education settings. 2. Demonstrate the knowledge to create safe, inclusive, culturally responsive learning environments and classroom management systems. 3. Demonstrate the ability to identify funds of knowledge and how they interact to form meaningful relationships with students and families. 4. Engage with others around identity and difference, and apply self-awareness to identify and manage the influence of personal biases and values in working in diverse settings. 5. Analyze and interpret historical and contemporary dynamics of privilege and oppression in society that lead to inequalities in access to educational resources. 6. Analyze, evaluate, and propose solutions to contemporary social problems found in schools, school districts, and ABA settings (E.g., culturally responsive PB IS, restorative justice, etc. 7. Implement strategies that encourage students' to value their own heritage; value richness of cultural diversity and commonality; respect diverse cultural groups; and reduce stereotyping. Credits: 3.00

EDPS 51500 - Foundations Of Applied Behavioral Analysis In School Settings

Credit Hours: 3.00. Application of learning theory, measurement procedures, verification of functional relationships, and developing knowledge of current significant research in applied behavior analysis.

Learning Outcomes: 1. Introduced to specific methods and teaching strategies for working with children with emotional and behavioral disabilities. 2. Prepared to systematically monitor student performance. 3. Prepare teachers to devise and implement usable functional behavior analysis and behavior management plans for students with emotional and behavioral disabilities. Credits: 3.00

EDPS 52000 - Characteristics Of Students With Intense Intervention Needs

Credit Hours: 3.00. EDPS 52000 will explore typical and atypical human development, characteristics and etiologies, as well as the influence of cultural, linguistic, and socioeconomic factors of students with intense intervention needs. Candidates will study medical conditions, physical and health needs, common medications, and the importance of transition plans, health-care plans, and behavioral and academic intervention plans designed to help students with intense intervention needs achieve desired positive learning outcomes. Candidates will be introduced to AAC systems, technology, materials, and other resources to support and enhance the communication skills of students with intense intervention and English learning needs. This course will also explore strategies for using digital tools and resources to communicate and collaborate with students, families, general education teachers, related service providers, paraprofessionals, community agencies, and other stakeholders to help students with mild disabilities achieve desired positive learning outcomes. In addition, candidates will analyze relationships across theory and practice, multiple perspectives and trends, and the application of these relationships within educational settings.

Candidates will explore major theories and concepts related to

online learning, virtual instruction, twenty-first-century skills, information literacy skills, and the diverse perspectives of online students and develop strategies for effectively integrating technologies into teaching and learning, discuss the benefits and challenges of technologies as educational tools, and apply technologies to meet a variety of learning purposes and needs. Learning Outcomes: 1. Recognize typical and atypical human development, characteristics and etiologies in order to address the educational needs of individuals with intense disabilities. 2. Apply knowledge of the effects of medical conditions, physical and health needs, and common medications (e.g., stimulant, antidepressant, antiepileptic) on students with intense exceptional needs. 3. Analyze the impact of disability on the multiple aspects (education, career, vocation, social relationships, recreation, and adult life) of the life of an individual with intense intervention needs, including the knowledge of the family's role in supporting learning and development. 4. Explain the influence of cultural, linguistic, and socioeconomic factors on the disproportionate identification of individuals with intense intervention needs from diverse groups. 5. Maintain a safe and healthy learning environment by utilizing universal precautions, applying appropriate body mechanics to ensure safety in transferring, lifting, positioning, and seating, and implementing specialized health-care interventions for students with intense physical and health needs. 6. Apply appropriate techniques for physical positioning, and maintain educational and assistive technologies to facilitate the learning of students with intense intervention needs. Credits: 3.00

EDPS 52400 - Effective Instruction For Students With Significant Reading Difficulties

Credit Hours: 3.00. This course will explore significant reading difficulties, such as dyslexia, and essential components of effective reading instruction. This course will investigate scientifically-based reading research (SBRR), evidence-based and developmentally appropriate reading instruction and interventions to support students with exceptionalities. Learning Outcomes: 1. Identify the foundations of language acquisition and literacy development, including cognitive, linguistic, cultural, social, and motivational factors that affect language acquisition and literacy development; and major components of reading development, including phonemic awareness, phonics, fluency, vocabulary, and text comprehension. 2. Explore the history, origins, and underlying causes of significant reading difficulties, including dyslexia. 3. Synthesize principles of scientifically based reading research (SBRR) and evidence-based reading instruction and intervention, such as applying data-based decision making, setting individual student learning goals, and using instruction grounded in SBRR. 4. Explain key concepts of phonemic awareness: the critical role of phonemic awareness in learning to read an alphabetic language; the distinction between phonological awareness (i.e., the awareness that oral language is composed of smaller units, such as spoken words and syllables) and phonemic awareness (i.e., a specific type of phonological awareness involving the ability to distinguish the separate phonemes in spoken words); and knowledge of the continuum of phonological- and phonemic-awareness skills development. 5. Summarize key concepts of phonics in developing accurate decoding and automaticity in word recognition; the importance of sequencing phonics instruction according to the increasing complexity of linguistic units; the reciprocity between decoding and encoding; and the continuum of phonics skills. 6. Create SBRR-based, evidence-based, and developmentally appropriate assessment, instruction, intervention, or extension lesson plan, and ongoing progress monitoring in phonemic awareness, phonics, fluency, vocabulary and academic language,

comprehension and analysis of informational, persuasive, and literary texts, including response to literature. Credits: 3.00

EDPS 52700 - Literacy Curricula For Learners With Exceptionalities

Credit Hours: 3.00. This course will explore research-supported general and specialized literacy curricula to prepare candidates to design and/or adapt instructional lessons and materials to meet the needs of students with exceptionalities.

Learning Outcomes: 1. Apply principles of UDL when selecting, adapting, and modifying assessments to accommodate student(s) with exceptionalities, including students who are nonverbal or English Learners. 2. Evaluate research-supported instructional strategies and materials appropriate to the strengths, needs, and characteristics of students with exceptionalities within the areas of literacy development, reading fluency, concepts of vocabulary and academic language, and comprehension and analysis of informational, persuasive, and literary text. 3. Apply strategies to work effectively with general education teachers and support staff to provide services that incorporate differentiated instruction, transition assessments, and assistive technology that facilitate student learning and the students' learning environment. 4. Create lesson plans, based on national, state, and/or local curricula standards and the scope and sequence of grade-level/chronologically-aged appropriate general education content-area curriculum that incorporate UDL, research-supported instructional strategies and materials, and provide meaning-filled learning opportunities. 5. Design lesson plans that incorporate UDL and apply research-supported strategies to provide specially designed reading and writing instruction, including strategies for providing explicit and systematic instruction and strategies for using technology to support various aspects of the reading and writing process and include instructional and assistive strategies to teach students to monitor errors in reading comprehension and writing. 6. Evaluate instruction, monitor progress, and make instructional changes to support student learning. Credits: 3.00

EDPS 53000 - Cognition And Learning In Context

Credit Hours: 3.00. Theories of learning and development, research on instruction and learning, and principles of measurement applied to educational problems.

Learning Outcomes: 1. Understand the central components of Behaviorism, differentiate between classical and operant conditioning, and apply the theories to teaching and learning. 2. Understand the central tenets of constructivism, identify a range of constructivist theories or perspectives, and distinguish constructivism from behaviorism. 3. Understand the central components of theories of learning and development developed by Bandura, Piaget, and Vygotsky, and apply them to teaching and learning. 4. Understand the roles of memory, expertise, transfer, conceptual change, meta-cognition, and self-regulated learning for student learning, and their implications for teaching. 5. Identify the central characteristics of instructional scaffolding, and cooperative and collaborative learning, how they are associated with learning, and how they may be instantiated. 6. Understand central tenets of sociocultural (or sociohistorical) and situated theories of learning and development and apply them to teaching and learning. 7. Understand the central characteristics of inquiry (or project-based learning) and their affordances and limitations with respect to teaching and learning. 8. Understand how policies (educational and otherwise), political priorities, beliefs, and national and international factors affect affordances for teaching and learning. Credits: 3.00

EDPS 53100 - Introduction To Measurement And

Instrument Design

Credit Hours: 3.00. An application-oriented introduction to constructing educational and psychological tests and surveys. Class sessions include guided practice with the process of instrument development, from trait and test task domain definition, item writing and revision, and item analysis, to score interpretation and validation.

Learning Outcomes: 1. Explain fundamental concepts and terminology in educational measurement. 2. Evaluate existing measurement instruments and score uses. 3. Contribute to development of instruments for measuring educational outcomes. 4. Interpret descriptive statistics for test and test item scores. Credits: 3.00

EDPS 53300 - Introduction To Educational Research I: Methodology

Credit Hours: 3.00. This course presents a sequence of journal articles and exercises that help introduce the foundational concepts of the course, including: research design, reliability and validity, various methodologies commonly used in educational research, and basic quantitative and qualitative data analyses. In addition, contrasting research conclusions are shown in the articles to help students learn why careful analysis of articles and their theoretical framing is critical to evaluating their conclusions.

Learning Outcomes: 1. Find research literature. 2. Read and critique educational research. 3. Deepen knowledge of at least one research area in education. 4. Design, conduct, analyze, and write a research project. Credits: 3.00

EDPS 53400 - Introduction To Educational Research II: Measurement Consideration

Credit Hours: 3.00. This course is designed to provide an overview of introductory quantitative data analysis methods in education. The course in specially designed to enhance students' quantitative reasoning and skills through discussions of issues in educational data and authentic data analysis experiences of a variety of education data. The topics to be covered in this course include data collection and description, sampling distributions, methods of quantitative data analysis often used in education research. Permission of instructor required.

Learning Outcomes: 1. Describe key concepts and principles of educational measurement. 2. Conduct comprehensive analyses of the characteristics of different assessments (including their advantages and limitations). Credits: 3.00

EDPS 53600 - Achievement Motivation And Performance

Credit Hours: 3.00. Study of current theory and research on the nature and development of achievement motivation. Motivation for intellectual and academic performance will be emphasized. Applications of theory in educational settings will be considered.

Credits: 3.00

EDPS 54000 - Gifted, Creative And Talented Children

Credit Hours: 3.00. This course is an introduction to the intellectual, social, and emotional characteristics of gifted youth; philosophies of gifted education; and programmatic and classroom approaches for supporting gifted students generally and within different domains (e.g., intellectual, academic, creative, artistic, leadership).

Learning Outcomes: 1. Understand who gifted, creative, and talented children are and how their talent development needs can be met in the school setting. 2. Recognize the diversity that exists within the gifted, creative, and talented population. 3. Understand the history, philosophical traditions, and paradigms of practice in gifted education. 4. Develop awareness of specific strategies for supporting gifted, creative, and talented students within the school context. 5. Develop awareness of key professional resources in the field of gifted education and talent development. 6. Develop a personal identity as a practitioner of gifted education. Credits: 3.00

EDPS 54100 - Identification And Evaluation In Gifted Education

Credit Hours: 3.00. This course provides an introduction to the instruments and procedures for identifying gifted, creative, and talented students, as well as the issues and procedures for evaluating gifted programs and individual student progress.

Learning Outcomes: 1. Demonstrate skills in assessing the evaluability of a gifted program. 2. Develop an evaluation plan that reflects understanding of key issues in gifted program evaluation. 3. Develop a figted program evaluation plan that demonstrates a utilization focus. 4. Demonstrate scholarly behaviors in exploring an interest linked to course content. 5.

Analyze key issues in selecting a student for gifted program participation and monitoring growth. Credits: 3.00

EDPS 54200 - Curriculum And Program Development In Gifted Education

Credit Hours: 3.00. This course is an introduction to the curriculum development and program design for meeting the needs of gifted, creative, and talented students. Students will be exposed to established program and curriculum models, as well as the nuts and bolts of developing curricular plans, materials, and specialized programs that support the advanced learning needs of gifted students.

Learning Outcomes: 1. Students will think strategically about gifted program design, including such design components as mission statements, program goals, building a continuum of services, and designing student selection procedures. 2. Students will become familiar with major program and curriculum models in gifted education. 3. Students will practice designing and revising lessons to incorporate instructional strategies well suited for high-ability students. 4. Students will become critical evaluators of educational materials and practices to assess their suitability for use with high-ability students. Credits: 3.00

EDPS 54500 - Social And Affective Development Of Gifted Students

Credit Hours: 3.00. This course focuses on the social and emotional development of gifted and talented students. An overview of the characteristics and needs of gifted subpopulations, diversity issues, and family/parenting concerns along with an introduction to current educational approaches and counseling interventions are provided. The course is designed to complement EDPS 54000.

Learning Outcomes: 1. Analyze, synthesize, and evaluate current research literature on the social and affective development of gifted students. 2. Discuss characteristics and needs of subpopulations of gifted and talented learners and the implications for academic instruction and/or counseling interventions. 3. Increase knowledge of issues related to the social and affective development of gifted students through class discussion, interaction with gifted students, and completion of CORE assignments. Credits: 3.00

EDPS 54700 - Foundations And Principles Of Applied Behavior Analysis

Credit Hours: 3.00. This course will provide a historical perspective of Applied Behavior Analysis as well as the core principles of ABA. The learner will be exposed to the foundational concepts and methods of ABA including defining behaviors, collecting data, and understanding the three-term contingency of behavior. Permission of instructor required.

Learning Outcomes: 1. Identify and define the basic concepts of applied behavior analysis including the foundations of ABA, interrelated domains, and dimensions of ABA. 2. Identify factors to consider when selecting target goals including client and environmental factors. 3. Define behavior utilizing observable and measurable terms including all components of an appropriate behavior goal. 4. Identify measurable dimensions of behavior and appropriate measurement procedures, including advantages and disadvantages of each. 5. Construct and interpret graphic displays of behavioral data. 6. Describe the key components of visual analysis and a strong experimental design including interobserver agreement and treatment fidelity. 7. Define reinforcement and punishment including application procedures, schedules of delivery, and key considerations. 8. Identify the types of preference assessments including similarity and differences in procedures. Credits: 3.00

EDPS 54800 - Ethics And Professional Practice Of Applied Behavior Analysis

Credit Hours: 3.00. This course will address the professional and ethical responsibilities of behavior analysts. Key issues of responsible conduct as it relates to areas such as confidentiality, consent, consultation, treatment planning, and research will be discussed and applied through case studies. Learners will be able to apply ABA techniques within the bounds of both legal and ethical frameworks. Permission of instructor required.

Learning Outcomes: 1. Demonstrate understanding of BACB guidelines for the

responsible conduct of applied behavior analysis. 2. Discuss scenarios involving ethical issues and describe appropriate solutions using BACB guidelines. 3. Identify appropriate ethical practices in ABA research. 4. Demonstrate and describe methods used to protect client/student confidentiality. 5. Demonstrate understanding of empirically validated practices vs. pseudoscience and non- validated practices within the context of service delivery. Credits: 3.00

EDPS 54900 - Verbal Behavior And Social Communication

Credit Hours: 3.00. This course will explore the development of verbal and social behavior as explained through tenets of applied behavior analysis. Students will identify the similarities and differences between verbal operants as well as appropriate function-based interventions to develop each including augmentative communication systems and functional communication training. Measurement and intervention for more complex social-communication skills will also be addressed. Permission of instructor required.

Learning Outcomes: 1. Understand and describe the historical perspective of Verbal Behavior in relation to Applied Behavior Analysis including differences between structural and functional approaches. 2. Describe verbal behavior in terms of the three term contingencies. 3. Define, describe, and differentiate the basic verbal operants. 4. Assess, interpret results and develop appropriate treatment plan to address target skills utilizing the VB-MAPP. 5. Identify and describe evidence-based practices for addressing communication for individuals with complex communication needs 6. Identify and describe evidence-based practices for increasing social-communication skills including intraverbal and listener behaviors. 7. Summarize and critically evaluate research on verbal and communication interventions for individuals with disabilities. Credits: 3.00

EDPS 55000 - Behavioral Consultation And Systems Change

Credit Hours: 3.00. This course will address the provision of behavioral analytic services through consultation within an implementation science framework. Application of ABA principles to evaluate and address system change will be explored including application of behavioral skills training. Techniques for program evaluation, collaborative planning, and progress monitoring will be discussed. Permission of instructor required.

Learning Outcomes: 1. Develop an understanding of implementation science frameworks and stages. 2. Describe, analyze, synthesize, evaluate and discuss factors that influence implementation of evidence-based practices. 3. Understand consultation theory and its application for decision-making in educational and family contexts. 4. Apply problem-solving techniques in collaborating with professional colleagues, parents and related personnel to provide for students' learning needs. 5. Articulate key principles of behavioral skills training and coaching. 6. Communicate the principles of behavior analysis in nontechnical language. Credits: 3.00

EDPS 55100 - Practicum In Applied Behavior Analysis

Credit Hours: 3.00. University-supervised fieldwork in applied behavior analysis. This practicum will facilitate development and fluency of essential professional and ethical skills necessary for the delivery of high-quality ABA services. Permission of instructor required.

Learning Outcomes: 1. Conduct assessment to determine the need for ABA services and guide intervention decision-making. 2. Design, implement, and monitor applied behavior interventions designed to increase or reduce target behaviors. 3. Explain, both verbally and in writing, behavioral analytic techniques, in technical and non-technical language appropriate for the audience. 4. Consult with and provide behavior skills training for behavior-change agents responsible for carrying out ABA program. 5. Demonstrate ability to analyze the incorporate findings from research into applied settings. Credits: 3.00

EDPS 55200 - Basic Concepts Of Applied

Behavior Analysis

Credit Hours: 3.00. This course is the first in a sequence of courses for the Applied Behavior Analysis Certificate Program. This course, in combination with the other courses, will provide fundamental knowledge and experiences for understanding Applied Behavior Analysis principles, concepts, and techniques, including observational analysis, data-based instruction, and social validity to increase students' social and task related behavior. Students learn procedures to increase or decrease target behavior, to facilitate behavior maintenance and generalization, and to evaluate effectiveness of instruction. Permission of instructor required.

Learning Outcomes: 1. Identify the goals of behavior analysis as a science (i.e., description, prediction, control) (A-1). 2. Explain the philosophical assumptions underlying the science of behavior analysis (e.g., selectionism, determinism, empiricism, parsimony, pragmatism) (A-2). 3. Describe and explain behavior from the perspective of radical behaviorism (A-3). 4. Distinguish among behaviorism, the experimental analysis of behavior, applied behavior analysis, and professional practice guided by the science of behavior analysis (A-4). 5. Describe and define the dimensions of applied behavior analysis (Baer, Wolf, & Risley, 1968) (A-5). 6. Define and provide examples of behavior, response, and response class (B-1). 7. Define and provide examples of stimulus and stimulus class (B-2). 8. Define and provide examples of respondent and operant conditioning (B-3). 9. Define and provide examples of positive and negative reinforcement contingencies (B-4). 10. Define and provide examples of schedules of reinforcement (B-5). 11. Define and provide examples of positive and negative punishment contingencies (B-6). 12. Define and provide examples of automatic and socially mediated contingencies (B-7). 13. Define and provide examples of unconditioned, conditioned, and generalized reinforcers and punishers (B-8). 14. Define and provide examples of operant extinction (B-9). 15. Define and provide examples of stimulus control (B-10). 16. Define and provide examples of discrimination, generalization, and maintenance (B-11). 17. Define and provide examples of motivating operations (B-12). 18. Define and provide examples of rule-governed and contingency-shaped behavior (B-13). 19. Define and provide examples of the verbal operants (B-14). 20. Define and provide examples of derived stimulus relations (B-15). Credits: 3.00

EDPS 55300 - Application Of Applied Behavior Analysis To Manage And Support Personnel

Credit Hours: 3.00. This course will teach students how to use applied behavior analysis to maximize the potential of an organization. Students will learn the role of a Behavior Analyst in implementing principles of applied behavior analysis to motivate employees, intervene with challenges in the organization, evaluate the program, and collect and deliver ongoing performance feedback. Permission of instructor required.

Learning Outcomes: 1. Define Organizational Behavior Management (OBM) and explain how it differs from other management approaches. 2. State three specialty areas of application of OBM. 3. Define Pinpoint and state the four components of behavior pinpointing. 4. Describe methods and tools for measurement in OBM. 5. Describe types of analysis in OBM. 6. State common intervention procedures used in organizations. 7. Apply OBM knowledge to assess targeted concern(s) and provide recommendations within an organization. 8. State characteristics of effective feedback. 9. Describe steps for evaluating reinforcers and delivering reinforcers. 10. Describe tools for evaluating performance change. Credits: 3.00

EDPS 55400 - Positive Learning Environments And Classroom Management

Credit Hours: 3.00. This course will focus on classroom PBIS practices to create positive learning environments (online and face-to-face), establish classroom expectations, and develop academic and behavioral routines to meet the social, emotional, and behavioral needs of students with exceptionalities. EDPS 55400 will support candidates as they develop classroom practices that are positive and preventative in nature and align to larger school and district positive behavioral supports.

Learning Outcomes: 1. Identify types, characteristics, strengths, limitations, and evaluate theoretical approaches and research-based models of behavior intervention, motivation, and reinforcement techniques used with students with exceptionalities. 2. Analyze how teacher attitudes and behaviors can affect students with and without disabilities and the ability to apply strategies for developing and maintaining rapport with all students. 3. Evaluate strategies for creating a safe, positive, equitable, and supportive classroom climate and apply those strategies to plan, manage, and modify the learning environment, including effective classroom routines. 4. Evaluate strategies to encourage students' active participation, meaningful engagement, and independent in individual and group activities, across learning environments. 5. Analyze barriers to accessibility (e.g., physical, technological) and apply strategies for adapting the environment to meet individual needs. 6. Create a plan to incorporate the use of paraeducators, volunteers, and/or tutors within the classroom environment. Credits: 3.00

EDPS 55500 - Differentiating Curriculum & Instruction

Credit Hours: 3.00. This course provides a solid foundation and set of principles for differentiating curriculum and instruction in any classroom at any grade level. Students will explore a variety of evidence-based strategies, tools, and curriculum models that effectively meet the diverse needs of all learners. Through readings, online class meetings and discussions, case studies, differentiated instruction examples, direct application, and reflection, students will deepen their understanding and need to differentiate. With an overarching goal of increasing achievement and developing student talents, this course includes the following major components: creating positive learning environments that support a) high-quality curriculum; b) diagnostic, formative, and summative assessments to inform instructional decision-making; and c) flexible grouping; addressing student differences in readiness, interest, and learning profile (including learning preference, intelligence preference, gender, culture, language preference, locale, and opportunities to learn) and appreciating how these differences influence the ways in which students learn and are motivated; understanding that the process of differentiation involves modifying content, process, product, learning environment, and/or affect; incorporating higher-order thinking skills, creative problem solving, project-based learning, authentic/respectful tasks, collaborative learning, and other evidence-based strategies to promote student achievement and talent development; understanding how differentiation of curriculum and instruction fits within specific educational interventions and models, such as scaffolding, flexible grouping, Response to Intervention (RTI), and Multi-Tiered System of Support (MTSS).

Learning Outcomes: 1. Deconstruct the concept of differentiation as a response to the readiness levels; interests; learning preferences and strengths; and academic, social, emotional needs of learners by modifying curriculum, instruction, learning environment, and/or affect. 2. Assess students' readiness, interests, and learning profiles to create differentiated lessons that utilize instructional strategies and technologies that motivate and engage students in learning, including those from special populations. 3. Develop, implement, and evaluate various differentiated instructional plans designed to maximize learning and demonstrate proficiency in analyzing and evaluating differentiated lessons taught by other teachers. 4. Evaluate and reflect upon your course experience and your plan to implement differentiation knowledge and skills gained in this course. Credits: 3.00

EDPS 55600 - Introduction To Quantitative Data Analysis Methods In Education I

Credit Hours: 3.00. This online course is designed to provide an overview of introductory quantitative data analysis methods in education. The course is specially designed to enhance students' quantitative reasoning and skills through discussions of issues in educational data and authentic data analysis experiences of a variety of education data. The topics to be covered in this course include data collection and description, sampling distributions, methods of quantitative data analysis often used in education research. Permission of instructor required.

Learning Outcomes: 1. Think critically about quantitative data analysis used in popular magazines, newspapers, and journal articles. 2. Apply the knowledge gained in the course to

analysis his/her own data with simple quantitative methods. 3. Understand common issues in analysis and interpretation of educational/social science data. 4. Design a research study, use a statistical software package to analyze the data generated from the research study, and appropriately interpret the results and report the conclusions of the study. Credits: 3.00

EDPS 55700 - Introduction To Quantitative Data Analysis Methods In Education II

Credit Hours: 3.00. This online course is the second quantitative data analysis methods sequences within the college of education. This course is specially designed to enhance students' quantitative reasoning and skills through discussions of issues in educational data and authentic data analysis experiences of a variety of education data. The topics to be covered in this course include simple/multiple linear regression, different types of group comparison methods (including n-way ANOVA, ANCOVA, Repeated-measures ANOVA, and Mixed ANOVA). The course is specifically designed: 1) to understand how the quantitative methods covered in the course can be used appropriately to address proposed research questions in education, and 2) to interpret quantitative results meaningfully for a given context. It is expected that all students who enroll in this course have completed at least one semester of introductory statistics course (e.g. STAT 50100 or equivalent.) Permission of instructor required.

Learning Outcomes: 1. Understand the common quantitative techniques and terminology used in studies that are presented in the popular press and education related journal. 2. Use and understand the principal numeric and graphical techniques to display and summarize education and social science related data. 3. Discuss common issues in analysis and interpretation of educational/social science data. 4. Design a research study, use a statistical software package to analyze the data generated from the research study, and appropriately interpret the results and report the conclusions of the study. 5. Expand their quantitative data analysis skills by taking advanced quantitative methods courses. Credits: 3.00

EDPS 55800 - Transition Education And Services

Credit Hours: 3.00. This course will explore a variety of resources, strategies, and techniques for promoting successful life transitions for students with mild and intense intervention needs before and throughout the school years and into postsecondary and adult settings.

Learning Outcomes: 1. Apply ethical guidelines, state and federal transition laws and policies (REPA 9.6, 9.7; CEC Int 1.1, 2.3: CEC Adv 2.2, 2.3, 3.3, 4.1, 5.1, 5.2, 6.1) 2. Evaluate state, school, and private resources (e.g. Individual Family Service Plans, Medicaid Waivers, Vocational Rehabilitation, Special Needs Trusts, Issues of Guardianship, Bureau of Developmental Disability Services) that promote successful life transitions (REPA 9.6, 9.7; CEC Int 2.1, 2.2, 2.3, 3.2, 5.2, 5.3, 5.6, 6.1, 6.2; CEC Adv 2.3, 3.2, 3.3, 3.4, 4.2, 5.1, 5.2). 3. Examine the rights, roles, and responsibilities of stakeholders and organizational resources concerning the transition process of students with exceptionalities (REPA 1.3, 1.4, 1.5, 9.6, 9.7; CEC Int. 1.1, 2.2, 2.3; CEC Adv 2.2, 2.3, 3.3, 4.2, 5.1, 6.1, 6.2, 6.3). 4. Create a transition-related lesson/activity to support positive, life-long transition outcomes (REPA 3.9, 9.2, 9.4, 9.5; CEC Int 2.1, 2.2, 2.3, 3.2, 5.2, 5.3, 5.6, 6.1, 6.2; CEC Adv 2.3, 3.2, 3.3, 3.4, 4.2, 5.1, 5.2). 5. Apply strategies to collaborate effectively with general education teachers, support staff, families and community/organizational resources to identify services that incorporate differentiated instruction, transition assessments, and assistive technology that facilitate student learning and promote positive transition outcomes. (REPA 4.6, 4.8, 9.3, 9.4, 9.5; CEC Int 1.1, 1.2, 2.3, 3.2, 4.2, 4.3, 5.2, 7.1, 7.2, 7.3; CEC Adv 1.1, 2.3, 3.2, 3.3, 4.2, 5.1, 5.2, 5.3, 6.2, 6.3, 7.1, 7.2, 7.3). 6. Apply strategies to support students with exceptionalities to develop and strengthen self-determination skills (REPA 7.8; CEC Int 1.1, 1.2, 2.1, 2.2, 2.3, 3.2, 5.2, 5.6, 6.1, 6.2; CEC Adv 1.1, 2.3, 3.2, 3.3,

3.4, 4.2, 5.1, 5.2, 6.2, 6.3). Credits: 3.00

EDPS 55900 - Introduction To The Experimental Analysis Of Behavior

Credit Hours: 3.00. This course introduces students to the theories, principles, and research conducted in experimental analysis of behavior (EAB). EAB began with highly controlled animal studies and has expanded to translational work with humans. Applied Behavior Analysis (ABA), the study of human behavior and the application of behavioral principles on socially significant behavior has evolved from EAB. Permission of instructor required.

Learning Outcomes: 1. Identify and analyze the major conceptual frameworks from the Experimental Analysis of Behavior (EAB). 2. Analyze areas of overlap between EAB and applied behavior analysis. 3. Apply the process of reading and extracting critical information from peer-reviewed empirical and conceptual papers in EAB. 4. Differentiate among the experimental analysis of behavior, applied behavior analysis, and professional practice guided by the science of behavior analysis. 5. Evaluate research methods used in EAB and how these are utilized to examine environmental determinants of behavior under experimental conditions. Credits: 3.00

EDPS 56010 - Clinical Practice I Experience: Practicum

Credit Hours: 1.00 to 6.00. This is a supervised clinical practice experience across two (2) special education settings, one at the elementary level (K-6) and a second experience at the secondary level (5-12) serving students with Mild and/or Intense Intervention Needs. These experiences take place over the course of 8-16 weeks depending upon availability and individual agreements with our partner district. These experiences are a coordinated effort between the Clinical Practice Coordinator, University Supervisor, and highly qualified, practicing Cooperating Teachers from both the elementary and secondary placements. Candidates assess, design and deliver lessons, manage student needs and behaviors, develop IEPs, integrate technology to support learning outcomes, collaborate with families and colleagues, and analyze the experience of facilitation a classroom and caseload of students. In addition, candidates will analyze relationships across theory and practice, multiple perspectives and trends, and the application of these relationships within educational settings. Candidates will explore major theories and concepts related to online learning, virtual instruction, twenty-first-century skills, informative literacy skills, and the diverse perspectives of online students and develop strategies for effectively integrating technologies into teaching and learning, discuss the benefits and challenges of technologies as educational tools, and apply technologies to meet a variety of learning purposes and needs.

Learning Outcomes: 1. Apply knowledge of instructional design to develop a series 3-5 lessons that include: observable and measurable instructional objectives, baseline assessment data, and plans that are incrementally appropriate to the learner and his/her ability to master the given content. 2. Apply knowledge and skills to develop an Individualized Education Program that is student centered, based on data, and collaborative. 3. Apply knowledge regarding principles of human behavior to analyze the ""function"" or the reason(s) behavior occurs and identify strategies to decrease inappropriate behaviors and increase appropriate behaviors. Credits: 1.00 to 6.00

EDPS 56300 - Data-Based Decision Making For Learners With Exceptionalities

Credit Hours: 3.00. Advanced procedures for educational assessment of exceptional individuals: norm-referenced and curriculum-based measurement, error analyses, and observational ratings. Adaptations and selections of tests for sensory impairments, behavioral styles, different intelligence levels and ages.

Learning Outcomes: 1. Apply terminology, theory, and the implications of measurement theory to select, administer, and score and interpret formal, informal, and/or curriculum-based assessment results for key stakeholders to make data-based decisions. 2. Apply principles of UDL to make decisions regarding selecting, adapting, and modifying assessments to accommodate student(s) with exceptionalities, including students who are nonverbal or English Learners. 3. Apply knowledge of the referral and classification procedures and interpret, report, and communicate results to stakeholders via paper and/or digitally. 4. Evaluate eligibility (including students from culturally and/or linguistically

diverse backgrounds and/or referred for interventions through the Response to Instruction (RtI) process), program (strategies for prioritizing areas of the general education curriculum and sequencing, implementing, and evaluating individualized learning objectives), and placement decisions (continuum of services: general education classroom, advantages and disadvantages of various placement options and programs) for students with exceptionalities. 5. Apply strategies for engaging in reflection and self-assessment activities to address one's own strengths and weaknesses, to become aware of one's own cultural biases and differences and dispositions toward students with intense exceptional needs and their families, to improve instruction, and to determine personal goals for professional growth. Credits: 3.00

EDPS 56400 - Mild Mental Handicaps: Historical Perspectives, Etiology, And Characteristics

Credit Hours: 3.00. Advanced study of persons with varying disabilities. Topics include: historical development; theoretical models; etiological factors; characteristics; assessment and intervention.

Credits: 3.00

EDPS 56500 - Math Curricula For Learners With Exceptionalities

Credit Hours: 3.00. This course will explore research-supported general and specialized math curricula to prepare candidates to design and/or adapt math lessons and instructional materials to meet the math needs of students with exceptionalities.

Learning Outcomes: 1. Apply principles of UDL when selecting, adapting, and modifying math assessments to accommodate student(s) with exceptionalities, including students who are nonverbal, have intense intervention needs, or are English Learners. 2. Evaluate research-supported math instructional strategies and materials appropriate to the strength, needs, and characteristics of students with exceptionalities. 3. Apply strategies to work effectively with general education teachers and support staff to provide services that incorporate differentiated instruction, transition assessments, and assistive technology that facilitate students' math learning and the students' learning environment. 4. Create math lesson plans, based on national, state and/or local math curricula standards, and the scope of sequence of grade-level/chronologically-aged appropriate general education math curriculum that incorporate UDL, research-supported math instructional strategies and materials, and provide meaning-filled math learning opportunities that facilitate student's ability to make connections (e.g., learning mathematics in the context of cooking and art). 5. Create math lesson plans that incorporate UDL and apply research-supported strategies to provide specially designed mathematics instruction, including strategies for problems and meaning-filled math learning opportunities that facilitate students' ability to make connections (e.g., learning mathematics in the context of cooking and art). 6. Evaluate math instruction, monitor progress, and make instructional changes to support students' math learning. Credits: 3.00

EDPS 56510 - Collaboration And Transition Practices In Special Education

Credit Hours: 3.00. Three modules related to collaboration and transition practices in special education are addressed. Included are theoretical frameworks and assessment for consultation and collaboration involving paraeducators and families.

Learning Outcomes: 1. Understand consultation theory and its application for decision-making in special and general education contexts. 2. Recognize conditions that strengthen or inhibit effective use of collaborative consultation. 3. Exhibit self-understanding and constructive use of individual differences for school-based collaboration in culturally diverse settings. 4. Demonstrate skills in facilitating family partnerships with schools to serve student needs. 5. Apply communication skills of effective verbal and non-verbal communication,

listening, avoiding communication roadblocks, dealing with resistance, being appropriately assertive, and resolving conflicts. 6. Use problem-solving techniques in collaborating with professional colleagues, parents and related and ancillary personnel to provide for students' learning needs. 7. Develop self-assessment techniques and tools for evaluating and improving consultation, collaboration, and co-teaching skills. 8. Formulate strategies for co-planning and co-teaching to serve students' special needs. 9. Explain responsibilities and strategies for supervising and planning with paraeducators, and for initiating involvement of school administrators in collaborative efforts. 10. Demonstrate awareness of need for organizing interrelated agencies in their roles as providers of the array of services required for students' special needs. 11. Cite key legislation that has impacted career and transition programs and services for youth and adults with disabilities. (Standard 2) 12. Explain theories and stages of life-long career development and how they impact the career decision-making process for individuals with disabilities. (Standard 2) 13. Identify methods, strategies, and materials used for instruction to facilitate career education, including participation in the IEP process. (Standard 2) 14. Explain theoretical models on which family intervention is predicated. (Standard 2) 15. Demonstrate an understanding of the impact a child with a disability has on the family, family dynamics, coping strategies, finances, and family communication and interaction patterns (Standards 1, 2) 16. Identify and define issues and strategies related to empowerment, and self-advocacy that are crucial to the successful career development of individuals with disabilities. (Standards 2, 3) 17. Develop an awareness of community resources available in career transition planning for students with disabilities at the elementary, middle, and secondary levels. (Standard 2) 18. Discuss issues related to parental involvement in career development and the educational process for youth and adults with disabilities. (Standards 1, 3) 19. Identify and describe services, supports, and resources available in post-secondary and employment settings for youth and adults with disabilities. (Standard 2) 20. Identify and define the issues related to interagency collaboration in the career and transition planning process for youth and adults with disabilities. (Standard 2)

Credits: 3.00

EDPS 56600 - Graduate Supervised Teaching Special Education

Credit Hours: 1.00 to 16.00. Demonstration of ability to function independently in special education setting by appropriately planning for student needs, implementing and evaluating plans, establishing appropriate classroom discipline, and interacting professionally with staff and parents. Permission of instructor required.

Credits: 1.00 to 16.00

EDPS 56601 - Clinical Practice Experience II (Student Teaching)

Credit Hours: 1.00 to 6.00. This course is a supervised 16-week teaching experience in special education. Candidates assess, design and deliver lessons, manage student needs and behaviors, develop IEPs, integrate technology to enhance learning outcomes and communication, collaborate with families and colleagues, and analyze the experience of facilitating a classroom and caseload of students.

Learning Outcomes: 1. Create lesson plans that apply research-supported strategies for providing specially designed written language including strategies for providing explicit and systematic instruction and strategies for using technology to support various aspects of the writing process and include instructional and assistive strategies to teach students to monitor for errors in their written language in order to produce legible documents. 2. Create lesson plans that apply research-supported strategies for providing specially designed mathematics instruction, including strategies for providing

explicit and systematic instruction and strategies for using technology to engage students in solving authentic, real-world problems. 3. Create lesson plans that apply research-supported strategies for providing specially designed science and social studies instruction, including strategies for providing explicit and systematic instruction, strategies for using technology to support students' learning, and strategies for incorporating inquiry-based instruction. 4. Create and implement lesson plans that include essential components of effective reading instruction, including explicit explanation, teacher modeling, guided practice, and independent practice. 5. Create and implement lesson plans that incorporate instructional practices, approaches, and methods for eliciting students' engagement in and motivation for reading. 6. Evaluate SBRR-based, evidence-based, and developmentally appropriate assessment, instruction, intervention, extension, and ongoing progress monitoring in the phonemic awareness, phonics, fluency, vocabulary and academic language, comprehension and analysis of informational, persuasive, and literary texts, including response to literature. 7. Apply principles of universal design for learning (UDL) and adaptive and assistive technologies. 8. Conduct functional behavioral assessments and use the results to develop and implement behavioral support plans for students with mild/intense exceptional needs coordinating the implementation among stakeholders and identify strategies and procedures for crisis prevention and intervention to ensure the safety of all. 9. Apply strategies, Council for Exceptional Children (CEC) Code of Ethics, federal and state laws, and other standards of the profession for using digital tools and resources to communicate and collaborate with students with mild/intense exceptional needs and their families, general education teachers, related services providers, other school staff members, representatives of community agencies, and other stakeholders to help students achieve desired learning outcomes, including students from diverse cultural, linguistic, and socioeconomic backgrounds and students who are chronically or terminally ill. 10. Supervise and communicate with paraeducators, volunteers, and tutors. 11. Analyze self-assessment activities to address one's own strengths and weaknesses, to become aware of one's own cultural biases and differences and dispositions toward students with intense exceptional needs and their families, to improve instruction, and to determine personal goals for professional growth. Credits: 1.00 to 6.00

EDPS 56800 - Social, Legal, And Ethical Issues Across The Lifespan

Credit Hours: 3.00. Survey of difference and similarities of children with exceptionality, including their nature and characteristics related to their developmental and educational needs. Analysis and practical application of social, legal, and ethical issues in the field of special education.

Learning Outcomes: 1. Explain the historical perspectives and foundations of general and special education policy, current issues, and research (REPA 1.1, 1.2; CEC Int. 1.1; CEC Adv. 3.3, 4.2, 6.1). 2. Apply ethical guidelines, state and federal laws and policies, and utilize the rights, roles, and responsibilities of stakeholders and organizations concerning the education of students with exceptionalities (REPA 1.3, 1.4, 1.5; CEC Int. 1.1, 2.2; CEC Adv 3.3, 4.2, 5.1, 6.1, 6.2, 6.3). 3. Evaluate the influence of cultural, linguistic, and socioeconomic factors on the disproportionate identification of individuals from diverse groups. (REPA 2.8.; CEC Int. 1.2, 2.2; CEC Adv. 2.3, 3.2, 4.2, 5.2). 4. Examine the roles and responsibilities of team members (RtI,

multidisciplinary, Case Conference Committee (CCC), families, student) to facilitate in developing, implementing, monitoring, and amending individualized programs for students with exceptionalities (IEPs, transition plans, health-care plans, and behavioral and academic intervention plans) setting goals, and monitoring progress toward goal each grading period. (REPA 4.3, 4.4, 4.5; CEC Int. 2.1, 2.2, 2.3, 7.1; CEC Adv. 4.2, 5.3). 5. Evaluate eligibility (including students from culturally and/or linguistically diverse backgrounds and/or referred for interventions through the Response to Instruction (RtI) process), program (strategies for prioritizing areas of the general education curriculum and sequencing, implementing, and evaluating individualized learning objectives), and placement decisions (continuum of services: general education classroom, advantages and disadvantages of various placement options and programs) for students with mild and/or intense exceptional needs. (REPA 4.1, 4.2, 4.7; CEC Int. 1.1, 1.2, 2.1, 2.3, 3.1, 3.2; CEC Adv 4.2, 5.1, 5.2). 6. Engage in professional development activities and professional organizations relevant to teaching students with exceptional needs, and knowledge of professional resources, organizations, and publications for enhancing one's professional skills and for engaging in lifelong professional development (REPA 10.4/10.5; CEC Int 1.2; CEC Adv. 5.4, 5.5, 6.4, 6.5). 7. Apply strategies for engaging in reflection and self-assessment activities to address one's own strengths and weaknesses, to become aware of one's own cultural biases and differences and dispositions toward students with intense exceptional needs and their families, to improve instruction, and to determine personal goals for professional growth (REPA 10.6/10.7; CEC Int 2.2, 2.3, 4.2, 5.1; CEC Adv. 6.3, 7.1). Credits: 3.00

EDPS 57100 - Advanced Assistive Technology

Credit Hours: 3.00. Introduction and overview of assistive technology for communication, education, employment, recreation, and daily living activities.

Learning Outcomes: 1. To learn about assistive technology for students with disabilities. 2. To learn about the integration of technology into teaching and learning within the field of special education. Credits: 3.00

EDPS 57300 - Medical And Physical Management Of Learners With Disability Or Chronic Illness

Credit Hours: 3.00. This course will explore instructional programs, interventions, services, and implications specific to independent living, career, education, and medical self-management procedures that support students with intense medical, physical, or chronic health care needs.

Learning Outcomes: 1. Apply knowledge of the effects of medical conditions, physical and health needs, and common medications (e.g., stimulant, antidepressant, antiepileptic) on students with exceptionalities. 2. Create a safe and healthy learning environment by utilizing universal precautions, applying appropriate body mechanics to ensure safety in the transferring, lifting, positioning, and seating, and implementing specialized healthcare interventions for students with physical and health needs. 3. Apply appropriate techniques for physical positioning and maintain educational and assistive technologies for facilitating student learning. 4. Apply knowledge of resources (model career, vocational, and transition programs), strategies, and techniques to promote positive life-long transition outcomes (school, postsecondary, adulthood) and self-management procedures for students with exceptionalities. Credits: 3.00

EDPS 57600 - Curricula For Learners With Intense Intervention Needs

Credit Hours: 3.00. This course will explore research-supported general and specialized content-area (reading, Math, Writing, Science, Social Studies) curricula as well as functional and independent skill curricula to prepare candidates to design and/or adapt instructional lessons and materials to meet the

needs of students with intense intervention needs.

Learning Outcomes: 1. Apply principles of UDL when selecting, adapting, and modifying assessments to accommodate student(s) with intense intervention needs, including students who are nonverbal or English Learners. 2. Evaluate research-supported instructional strategies and materials appropriate to the strengths, needs, and characteristics of students with intense exceptional needs. 3. Apply strategies to work effectively with general education teachers and support staff to provide services that incorporate differentiated instruction, transition, assessments, and assistive technology that facilitate student learning and the students' learning environment. 4. Create lesson plans, based on national, state, and/or local curricula standards and the scope and sequence of grade-level/chronologically-aged appropriate general education content-area curriculum (Reading, Math, Writing, Science, Social Studies) that incorporate UDL, research-supported instructional strategies and material, and provide meaning-filled learning opportunities that facilitate students' ability to make connections and generalize across settings. 5. Create lesson plant to provide specially designed functional skill instruction (explicit and systematic), that incorporates UDL, research-supported instructional strategies and materials, and provides meaning-filled learning opportunities to facilitate generalization across settings. 6. Evaluate instruction, monitor progress, and make instructional changes to support student learning. 7. Analyze a variety of language and communication strategies (AAC/Assistive Technologies) to increase functional communication. Credits: 3.00

EDPS 57701 - Development Of Learners With Mild Intervention Needs

Credit Hours: 3.00. This course will explore the 4 areas of child development and the milestones associated with Cognitive, Social/Emotional, Language and Communication, and Movement and Physical development. This foundation in typical development will allow candidates to better understand atypical development in relation to characteristics and etiologies of mild disabilities. Candidates will investigate the multiple impacts systems have on individuals with mild disabilities and their families.

Learning Outcomes: 1. Describe typical and atypical human development, characteristics and etiologies in order to address the educational needs of individuals with mild disabilities. 2. Apply knowledge of the effects of medical conditions, physical and health needs, and common medications (e.g., stimulant, antidepressant, antiepileptic) on students with mild exceptional needs. 3. Analyze the impact of disability on the multiple aspects (education, career, vocation, social relationships, recreation, and adult life) of the life of an individual with mile intervention needs, including the knowledge of the family's role in supporting learning development. 4. Explain the influence of cultural, linguistic, and socioeconomic factors on the disproportionate identification of individuals with mild intervention needs from diverse groups. 5. Apply strategies for engaging in reflection and self-assessment activities to address one's own strengths and weaknesses, to become aware of one's own cultural biases and differences and dispositions toward students with mild exceptional needs and their families to improve instruction, and to determine personal goals for professional growth. Credits: 3.00

EDPS 58900 - Special Topics For Teachers

Credit Hours: 1.00 to 4.00. Consideration of appropriate professional problems of experienced educational personnel in workshops or in-service programs.

Credits: 1.00 to 4.00

EDPS 59000 - Individual Research Problems

Credit Hours: 1.00 to 6.00. Opportunities for students to study particular problems under the guidance of a member of the This plan of individualized instruction may be used in any field of education or vocational education. Does not include thesis work.

Permission of instructor required.

Credits: 1.00 to 6.00

EDPS 59100 - Special Topics In Education

Credit Hours: 1.00 to 4.00. Group study of a current problem or special topic of interest to professional educational personnel. Intensive study of research, theory, or practical aspects of a particular issue within the usual graduate class format.

Credits: 1.00 to 4.00

EDPS 59200 - Principles & Philosophy Of Applied Behavior Analysis

Credit Hours: 3.00. The purpose of this course is to provide students with a working understanding of the conceptual framework of behavior analysis and the underlying theoretical and philosophical foundation of behavior analysis. The course will provide advanced coverage of the history, philosophical underpinnings, and advanced concepts and principles of behaviorism and behavior analysis. Permission of instructor required.

Learning Outcomes: 1. Identify and evaluate the goals of behavior analysis as a science. 2. Synthesize the philosophical assumptions underlying the science of behavior analysis. 3. Analyze behavior from the perspective of radical behaviorism. 4. Differentiate among the experimental analysis of behavior, applied behavior analysis, and professional practice guided by the science of behavior analysis. 5. Distinguish the dimensions of applied behavior analysis. Credits: 3.00

EDPS 60000 - Counseling Theories And Techniques

Credit Hours: 3.00. Examination of major counseling theories and counseling techniques, professional and ethical issues. Permission of instructor required.

Learning Outcomes: 1. Utilize theoretical approaches to individual personality, behavior, decision, and life difficulties in clinical settings with clients. 2. Develop and write case conceptualization through active application. 3. Ascertain how counseling theory informs counseling techniques. 4. Theoretically conceptualize client presentations based on the context of diversity-related strengths and limitations of counseling theory (i.e. age, ethnicity, disabilities, language, national origin, race, religion, sexual orientation, and SES).

Credits: 3.00

EDPS 60100 - Counseling Theories And Techniques Laboratory

Credit Hours: 3.00. Use of counseling techniques in a supervised laboratory; application of theories and techniques within varying employment settings. Concurrent Prerequisite: EDPS 60000 .

Learning Outcomes: 1. Identify counselor behaviors and characteristics that influence the helping process, including age, gender, ethnic differences, verbal and nonverbal behaviors, and personal characteristics, orientations, and skills. 2. Demonstrate essential interviewing and counseling skills, establishing appropriate counseling goals, designing intervention strategies, evaluating client outcomes, and successfully terminating the counselor-client relationship. Credits: 3.00

EDPS 60400 - Advanced Counseling Theories And Techniques

Credit Hours: 3.00. Integration of counseling theory, practice, and research. Emphasis on integrating counseling knowledge and skills with major counseling theories and interventions. Prerequisite: EDPS 60000 . Permission of instructor required.

Learning Outcomes: 1. Obtain knowledge of personality theories/concepts for conceptualizing client issues and designing interventions. 2. Understand the context and development of theories. Credits: 3.00

EDPS 60700 - Mixed Methods Research Designs And Applications

Credit Hours: 3.00. This course provides an overview of mixed methods research designs within social science and educational research. The focus of the course will emphasize the philosophical pragmatism embedded in enacting mixed methods research. Further, the course will demonstrate the utility and plausibility of integrating quantitative and qualitative data into a single study. This demonstration will be accomplished through reviewing the historical context of qualitative and quantitative research in social sciences and students' application of mixed methods research within their respective fields of study. Prerequisites: EDPS 53300, EDPS 55600, and EDPS 55700 and an introductory qualitative methods course (one of COM 58500, EDCI 61500, SOC 68600).

Learning Outcomes: 1. Understand the historical context of mixed methods research with specific attention to the epistemological

tenets of pragmatic research. 2. Recognize the use of mixed methods as researchers in your discipline implement these designs. 3. Describe the various mixed methods designs and explain how they are unique with respect to the timing of data collection, the prioritization (or lack thereof) of the phases in a mixed methods study, and the means of integrating data. 4. Comprehend the role of rigor in all phases of mixed methods research and critically digest mixed methods articles in the literature. 5. Develop skills to plan and conduct a mixed methods study in addition to writing a mixed methods study in the space limitations of academic journals. Credits: 3.00

EDPS 61000 - School Counseling Practicum

Credit Hours: 3.00. EDPS 61000 is a field experience for first year master's students in school counseling, consisting of a minimum of 100 hours in a school, under the supervision of both a site supervisor and a campus supervisor. Permission of instructor required. Prerequisites: EDPS 60000 and EDPS 60100 . Permission of instructor required.

Learning Outcomes: 1. Develop counseling competencies related to individual, small-group, and large-group interventions. 2. Increase knowledge of school settings, including organizational structure, processes, and mission. 3. Increase competence regarding articulating the role of the school counselor. 4. Increase awareness of legal and ethical concerns related to school counseling and to increase competence in ethical decision-making. Credits: 3.00

EDPS 61100 - School Counseling Seminar

Credit Hours: 3.00. Attention given to current topics, such as special education, gifted education, data management, grant writing, crisis intervention, service learning, K-12 career development, and systemic change. Prerequisite: EDPS 50100 . Permission of instructor required.

Learning Outcomes: 1. Understand and apply concepts from special education to their own field experiences. 2. Articulate a vision and mission for a comprehensive school counseling program. 3. Develop a program appropriate for their targeted setting and identify potential funding sources for that program. Credits: 3.00

EDPS 61200 - Advanced Applied Behavior Analysis

Credit Hours: 3.00. The purpose of this course is to expand knowledge and understanding of advanced applied behavior analytic theories and interventions. Specifically, this course will focus on interventions aimed at developing new skills as well as increasing and decreasing behaviors. Procedures for identifying and designing function based interventions will be addressed. Prerequisite: EDPS 36200 or 51500 and EDPS 58800.

Learning Outcomes: 1. Demonstrate knowledge of methods for increasing and decreasing behaviors such as antecedent and consequence-based interventions and group contingencies. 2. Demonstrate knowledge and skill in developing new behaviors through advanced techniques such as shaping, chaining, and differential reinforcement procedures. 3. Demonstrate knowledge and skill in procedures for assessing the function of behaviors including function based assessment and functional analysis. 4. Demonstrate knowledge of guiding principles and procedures to program for maintenance and generalization of behaviors. Credits: 3.00

EDPS 61400 - Advanced Counseling Practicum

Credit Hours: 3.00. Supervised use of personal and career counseling techniques applied to complex and difficult client situations. Permission of instructor required.

Learning Outcomes: 1. Display readiness to continue in practicum through exhibiting progress in: professionalism, reflective practice/self-assessment, scientific knowledge and methods, relationships, individual and cultural diversity, ethical and legal standards and policy, interdisciplinary systems, assessment, interventions, research/evaluation, supervision, management-administrative tasks, advocacy. Credits: 3.00

EDPS 61500 - Theories Of Counseling Supervision

Credit Hours: 3.00. Critical analysis of the theories and counseling supervision. Experiential exercises may be included. Prerequisite: EDPS 61400 . Permission of instructor required.

Learning Outcomes: 1. Develop knowledge of theories, methods, and problems in supervision. 2. Learn to think like a supervisor. 3. Understand individual and cultural differences in supervision. Credits: 3.00

EDPS 61700 - Professional Issues, Ethics, And History Of Counseling Psychology

Credit Hours: 3.00. Three primary areas in counseling psychology: 1) historical development within psychology; 2) American Psychological Association ethics, professional, and legal issues; and 3) the scientist-practitioner training model in counseling psychology identity. Permission of instructor required.

Learning Outcomes: 1. Understand counselling psychology's (a) history, (b) position within the psychology discipline and profession and (c) ethical, legal, and professional standards. 2. Gain a sense of how psychology and counselling psychology are embedded within and influenced by context (i.e., historical, societal, cultural, and economic factors). 3. Begin socialization into (a) the attitudes, values, skills, and activities of a counselling psychologist; and (b) the Purdue Counselling Psychology program. Credits: 3.00

EDPS 61801 - Intellectual & Neuropsychological Assessment

Credit Hours: 4.00. This course is designed to expose students to the theory and practice of intellectual and neuropsychological assessment. Students will receive instruction on the theoretical, psychometric, and best practice foundations of these types of assessment in the context of a lecture component, which will be followed by laboratory time in which students will gain experience in administering and scoring relevant tests. Although the WAIS-IV and WISC-IV will be the primary foci of this course, other tests of achievement, cognitive ability, and neuropsychological functioning will be covered. Students will also (a) gain experience in preparing written reports of their interpretations of assessment results, (b) develop an understanding of the history and development of cognitive ability and neuropsychological tests, and (c) explore implications for intellectual and neuropsychological assessment with diverse populations. Permission of instructor required. Prerequisite: EDPS 53300, B-.

Learning Outcomes: 1. Develop an understanding of the theoretical, historical, and psychometric foundations of intellectual and neuropsychological assessment. 2. Develop advanced knowledge of the administration, scoring, and interpretation of the major tests of cognitive ability (i.e., WAIS-IV, WISC-IV), and identify strengths and weaknesses of each. 3. Develop understanding of the ethical and multicultural issues associated with intellectual and neuropsychological assessment. 4. Demonstrate ability to select assessment tools appropriate to examinees' developmental and ability levels. 5. Demonstrate competence in reporting results and interpretation of assessment results in written form. Credits: 4.00

EDPS 61900 - Counseling Psychology Research Practicum

Credit Hours: 3.00. Application of qualitative and quantitative research designs in counseling psychology. Concurrent prerequisite: EDPS 61800(Inactive at PWL) and (PSY 60100 or STAT 50200) and Doctoral student standing enrolled in the Counseling Psychology Program.

Learning Outcomes: 1. Gain knowledge of research methodologies in counseling psychology. 2. Develop the ability to provide an evidentially based rationale for research, including consideration of multicultural issues. 3. Display awareness of counseling psychology research. 4. Demonstrate self-initiative and personal investment (a) in the research process and (b) in efforts to find and use relevant sources of information. 5. Apply the scientific method in critiquing and generating research studies. 6. Present research results in a manuscript that uses APA professional style. 7. Enhance oral and written communication skills through presentation of material in a clear, organized, grammatically correct, and engaging manner. 8. Develop professional writing and editing skills to prepare for careers as a counseling psychologist (e.g., scholarly contribution, reports). Credits: 3.00

EDPS 62000 - Counseling Seminar

Credit Hours: 1.00 to 4.00. Recent investigation and research in (1) counselor supervision; (2) professional issues; (3) counseling theories; (4) education of counselors and student

personnel workers; (5) counseling methodology; (6) vocational development; (7) elementary school counseling; (8) counselor consultation; and (9) other relevant topics. One topic is dealt with in each enrollment. Prerequisite: Open to graduate students who have successfully completed 12 credit hours of previous counseling personnel services courses.

Credits: 1.00 to 4.00

EDPS 62100 - Advanced Multicultural Counseling Theory And Practice

Credit Hours: 3.00. Advanced study and clinical application of racial and cultural theories in counseling. Knowledge and practicum components are integrated to facilitate development of awareness and skill competencies central to "Guidelines on Multicultural Education, Training, Research, Practice and Organizational Change for Psychologists" of the American Psychological Association. Prerequisite: EDPS 50700 . Permission of instructor required.

Learning Outcomes: 1. Increase understanding of ICD dimensions, and their intersection within persons, in relation to psycho-social development. 2. Identify and address institutional and social barriers that impede access, equity, and well-being for diverse populations. 3. Develop advanced skill in discussing ICD, comfortably and appropriately, in interpersonal and professional relationships. 4. Demonstrate awareness of potential interactions between cultural beliefs and attitudes and cognitive and affective experiences. Credits: 3.00

EDPS 62200 - Systems Concepts In Counseling And Development

Credit Hours: 3.00. Introduction to the use of systems concepts in the counseling professions. Individuals' development within relationships and family matrix, contemporary person-environment issues, and constructs for research and preventive, developmental, and remedial practice. Prerequisite: EDPS 61700 .

Learning Outcomes: 1. Obtain knowledge of terms, concepts, and principles of systems thinking. 2. Learn to develop systems hypotheses and evaluate their evidence. 3. Understand that the person exists within and is influenced by the socio-economic-historical context. Credits: 3.00

EDPS 62300 - Personality Assessment

Credit Hours: 3.00. Applied introduction to methods of administration, scoring, and interpretation of primarily objective personality assessments. Emphasis is placed on assessment of normative population with attention given to personal strengths, developmental factors, and issues of diversity.

Learning Outcomes: 1. Select appropriate batteries of personality measures based on particular referral situations and/or questions. 2. Administer, score, and interpret results of personality assessments. 3. Incorporate clinical interview and behavioral observation data into their interpretations of personality assessment results. 4. Interpret personality assessment results from developmental and multicultural perspectives. Credits: 3.00

EDPS 62400 - Advanced Off-Site Counseling Practicum And Supervision Theory

Credit Hours: 3.00. Supervised use of personal and/or career counseling and assessment applied to complex and difficult client situations. Critical analysis of counseling supervision theories. Prerequisite: EDPS 61400 . Permission of instructor required.

Learning Outcomes: 1. Demonstrate appropriate professional and ethical behavior in their interactions with agency clients and staff. 2. Design treatment plans that are based on appropriate assessment and conceptualization of client problems. 3. Develop the conceptual and critical thinking skills that are required of a scientist-practitioner, such as the ability to formulate and test hypotheses regarding the bases of client behavior. 4. Utilize interventions that are rooted in theory and research in counselling/psychotherapy, human development, and personality. 5. Demonstrate understanding and respect for clients' cultural values, identities (e.g., racial, gender), and desires for self-determined growth. 6. Demonstrate an increased awareness of clinical strengths as well as areas of growth and professional development. 7. Demonstrate ability to effectively use individual and group supervision. Credits: 3.00

EDPS 62500 - Human Growth And Development

Credit Hours: 3.00. An overview of lifespan development. Study

of major development theories of childhood, adolescence, and adulthood. Prerequisite: EDPS 60000 .

Learning Outcomes: 1. Demonstrate knowledge of the nature and needs of individuals at all developmental levels across the life span, including theories of individual and family development and transition. 2. Demonstrate knowledge of major theories of learning and personality development. 3. Demonstrate knowledge of cognitive and emotional aspects of growth, including learning, intellectual, and moral development. Credits: 3.00

EDPS 62800 - The Behavior Analyst As Supervisor

Credit Hours: 0.00 to 3.00. This course will address the provision of supervision of behavior analysis trainees and technicians utilizing principles and procedures of applied behavior analysis. Application of goal development, behavioral skills training, and progress monitoring within a behavioral analytic framework will be explored. Must be enrolled in ABA Certificate or Masters Program. Pre-requisite: EDPS 61200. Permission of instructor required.

Learning Outcomes: 1. Describe reasons for effective evidence-based supervision and outcomes of ineffective supervision. 2. Describe necessary components of the supervisory relationship. 3. Assess and select performance expectations for the supervisee and supervisor. 4. Describe components of behavioral skills training. 5. Apply supervision skills to teach assessment and intervention procedures as relevant to task list competencies. 6. State features of performance monitoring and performance feedback . 7. Evaluate supervisor effectiveness. 8. Describe ethics of and methods for providing ongoing professional development. Credits: 0.00 to 3.00

EDPS 63000 - Research Procedures In Education

Credit Hours: 3.00. Development of a philosophy of educational research and consideration of the methods for the selection and evaluation of techniques used in educational research. Techniques discussed are methods to control variables, sampling procedures, data collection procedures, statistical procedures, and research proposal development and writing. Prerequisite: EDPS 53300 , (PSY 60100 or EDPS 53300), STAT 50200 .

Learning Outcomes: 1. Understand the concepts, purposes, and methods that are fundamental to conduct systematic inquiry and to integrate them to conduct educational research. 2. Conceptualize and develop a research proposal for a problem in the student's substantive area; select the method most appropriate for the research problem(s) and defend the use of the method of inquiry. 3. Justify and explain thoroughly the specific method which will be used in his or her own research. Credits: 3.00

EDPS 63100 - Applied Educational Research Design Seminar

Credit Hours: 1.00 to 3.00. This seminar seeks to promote professionalism, research and scholarly productivity and collegial support among graduate students in gifted, creative (GCT), and talented studies, associated graduate students, visiting scholars, and interested others. A secondary purpose involves assisting GCT students, COE students, and associates with successful study and career preparation by focusing on research, grants, thesis preparation, graduate writing, proposal development, professional development, and degree completion. Finally, seminar offers students the opportunity to discuss, learn and "mess" around with current issues in the field and of personal interest. Seminar creates time and incentive for students to become more productive with their scholarship efforts, and offers students credit for work completed and formal support for the professional development and scholarship processes. In this course students should expect to attend, contribute, and participate. A variety of formats will be used, including, but not limited to: discussion, simulations, group work, lecture, guest speakers, and peer feedback. Prerequisite: EDPS 63000 and one graduate course in Statistics.

Learning Outcomes: 1. Engage with IRB process. 2. Write for publication. 3. Critically review and revise writing. 4. Engage in research. 5. Develop a professional vita. 6. Write conference proposals. 7. Create professional presentations. 8. Review relevant literature. Credits: 1.00 to 3.00

EDPS 63200 - Seminar In Research Procedures In Education

Credit Hours: 1.00 to 3.00. Experimental, field study, scientific survey, and prediction study methods in education. Internal and external validity, identification and development of research problems, criteria development, common methodological errors, strategies of analysis, and sources of acceptable educational

research literature will be reviewed. Critical analyses of the research methodology of educational research reports in the student's field. Prerequisite: EDPS 63000 or 53300 and course work in Statistics.

Learning Outcomes: 1. Develop specific advanced methodological skills and knowledge that are applicable to education research and practice. Credits: 1.00 to 3.00

EDPS 63300 - Seminar In Educational Psychology

Credit Hours: 1.00 to 3.00. Recent investigations and research in educational psychology. One topic is dealt with in each enrollment. The topics provide an in-depth study of those areas of psychological investigation in educational settings and problems. These areas include: (1) instructional technology and design; (2) individual differences and educational growth; (3) school learning: theory and research; (4) classroom behavior and social processes; (5) educational assessment; and (6) other relevant topics. Prerequisite: EDPS 53000 .

Credits: 1.00 to 3.00

EDPS 63500 - Psychometric Theory And Application

Credit Hours: 3.00. Advanced classical test theory and application of psychometric methods to study technical properties of tests. Prerequisite: (EDPS 53100 and STAT 50200), or (PSY 60100 or PSY 51200) or consent of Instructor.

Learning Outcomes: 1. Demonstrate an understanding of mathematical and statistical concepts in various measurements principles. 2. Apply understanding of reliability and validity in both classical and modern measurement theory frameworks to solve practical measurement problems. 3. Demonstrate knowledge of psychometric theories in scale development. 4. Read the literature related to psychometrics in their own substantive areas more critically. 5. Use measurement or scales more intelligently in research. 6. Explain different models of modern test theory. Credits: 3.00

EDPS 63600 - Item Response Theory

Credit Hours: 3.00. Models and model-data fit, estimation of ability and item parameters, item and test information, test construction, obtaining evidence of test reliability and validity, differential item functioning, norming, and equating. Prerequisite: EDPS 53100 , (PSY 60100 or STAT 50200 or STAT 51200).

Learning Outcomes: 1. Explain fundamental item response theory concepts and terminology. 2. Distinguish and select from among 1-, 2-, and 3- parameter item response models for dichotomous data in practical situations. 3. Demonstrate familiarity with the graded response and partial credit item response models for polytomous data, and multidimensional item response models. 4. Use item response models for testing applications, such as item calibration during instrument/item pool development, estimation of person parameters and conditional standard errors of measurement, investigation of differential item functions, and score linking. 5. Conduct item response modeling with specialized software and interpret the results. Credits: 3.00

EDPS 63800 - Factor Analytic Procedures

Credit Hours: 3.00. Introduction to exploratory and confirmatory factor analysis techniques and examination of the use of factor analysis in social sciences. Emphasis on application of methods. Students will develop skills to conduct factor analytic research and critically review use of factor analysis in research. Prerequisite: STAT 51200 , STAT 52400 .

Credits: 3.00

EDPS 65000 - Systematic Literature Review

Credit Hours: 3.00. This course is designed for advanced graduate students in special education and related disciplines. The goals of this course are: (a) Understand the principles and methodologies of conducting a systematic literature review. (b) Develop skills in identifying, evaluating, and synthesizing literature in education/special education; (c) Critically review and evaluate education/special education literature and research, and (d) Write a professional, scholarly review of research on a current issue or critical topic in education/special education.

Learning Outcomes: 1. Understand the principles and methodologies of conducting a systematic literature review. 2. Develop skills in identifying, evaluating, and synthesizing relevant literature. 3. Review and evaluate education / special education literature and research critically. 4. Apply the knowledge and write a professional, scholarly review of research on a current issue or critical topic in education/special education. Credits: 3.00

EDPS 65300 - Collaborative Learning

Credit Hours: 3.00. Techniques for fostering productive

collaboration in classrooms will be discussed along with the evidence for their educational effectiveness. The course will be research focused. Truth-wins, most -competent-member, and average-member models for comparing group performance to individual performance will be described. The goal will be to have students learn how to implement successful collaborative activities in classrooms while also developing the ability to further research in the field. In addition to course readings and class participation, students will be expected to propose a research study related to collaborative learning with emphasis on the literature review.

Learning Outcomes: 1. Implement successful collaborative activities in their classrooms while also developing the ability to further our understanding of the field. 2. Propose a research study related to collaborative learning with emphasis on the literature review. Credits: 3.00

EDPS 66100 - Seminal Research In Special Education

Credit Hours: 3.00. This course is designed to focus on the investigation and research in the field of special education, particularly research and articles that are considered seminal to the field of special education in general as well as various topics of study within special education. The course is meant to be an overview of critical pieces of research and literature in the field to provide students with a breadth view, and how the seminal articles have shaped the field of special education including special education laws and policies.

Learning Outcomes: 1. Comprehend seminal articles/research that have shaped the field of special education. 2. Analyze the impact of seminal research and its relevance to special education laws, policies, and practices. 3. Develop a comprehensive understanding of the field and its implications for educating students with special/diverse needs. 4. Identify and comprehend emerging seminal research in the field of special education/education. 5. Gain an understanding of the range of research conducted by faculty in the special education and related programs. 6. Develop skills in investigating and conducting research in special education. Credits: 3.00

EDPS 66300 - Organization And Administration Of Special Education

Credit Hours: 3.00. (EDST 66300) A comprehensive course in the organization and administration of special education including the organizational arrangements, identification, placement and service delivery, tests and assessments, program evaluation, personnel, and school/community relations.

Learning Outcomes: 1. Examine, discuss, and gain an understanding of the role of the special education director. 2. Apply the federal and state rules and regulations for special education in school settings. 3. Understand the role of litigation in the field of special education. 4. Understand special education funding options, identify budget preparation strategies and fund management. 5. Demonstrate ways to ensure parent involvement. 6. Discuss current trends and issues in educating children with disabilities, including ethnic and cultural diversity, discipline, suspension and expulsion. Credits: 3.00

EDPS 66400 - Seminar In Special Education

Credit Hours: 1.00 to 4.00. This seminar is for doctoral students in special education. Its purpose is to contribute to the development of student's professional competencies, including conducting and writing scholarly research, grant writing, university-level teaching, and professional engagement. To facilitate this growth each seminar will culminate in a scholarly product related to the seminar's focus.

Learning Outcomes: 1. Formulate clear and concise research questions and generate one idea for a research project. 2. Develop a comprehensive research plan for their ideas based on a review of the literature. 3. Produce a detailed research project proposal or carry out a research project that aligns with their own research interests. 4. Apply their knowledge in evidence-based practice and lead a session on academic intervention (e.g., reading, math, science, social studies) to effectively support students with diverse needs. Credits: 1.00 to 4.00

EDPS 68800 - Single Subject Research Design

Credit Hours: 0.00 to 3.00. Designed to introduce advanced level students to single subject research methodology in context of a science of human behavior, including design theory and application, measurement, experimental validity, applied behavior analysis, and data analysis procedures.

Learning Outcomes: 1. Demonstrate knowledge about the various single subject research designs and variations of each. 2. Demonstrate the ability to conduct reliable visual analysis, understand value of effect size for single subject design, and calculate effect size. 3. Demonstrate knowledge of the criteria for designing and evaluating high-quality, rigorous single subject design studies. 4. Demonstrate knowledge of the application of single subject research methodology in clinical and educational settings including designing, conducting, and analyzing a single subject study. Credits: 0.00 to 3.00

EDPS 69500 - Internship In Education

Credit Hours: 1.00 to 10.00. Amount of credit to be determined by nature and extent of the assignment. A special course in selected areas of education, designed to provide practical field experience under professional supervision in selected situations related to the candidate's area of specialization. Permission of instructor required.

Learning Outcomes: 1. Measure and evaluate one's professional growth and case conceptualization skills through use of audio tapes and case notes. 2. Demonstrate respect, understanding, and tolerance of multicultural and diversity issues as they relate to clients' need and concerns. 3. Demonstrate ethical and professional behavior in accord with the ACA Code of Ethics. Credits: 1.00 to 10.00

EDPS 69600 - Internship In Counseling Psychology

Credit Hours: 0.00. A special course in the practice activities of counseling psychology. Provides field experience under the supervision of a licensed psychologist. Permission of instructor required.

Learning Outcomes: 1. Learn advanced skills in psychotherapy. 2. Increase knowledge of psychological assessment. 3. Learn advanced skills in consultation and outreach activities. 4. Increase knowledge of administrative and professional issues. Credits: 0.00

EDPS 69700 - Education Specialist Project-Research

Credit Hours: 0.00 to 18.00. Educational Specialist project research. Permission of instructor required.

Credits: 0.00 to 18.00

EDPS 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required.

Credits: 1.00 to 18.00

EDPS 69900 - Research PhD Thesis

Credit Hours: 1.00 to 18.00. Research PhD Thesis. Permission of instructor required.

Credits: 1.00 to 18.00

Educational Leadership and Cultural Foundations

EDST 20010 - Educational Policies And Laws

Credit Hours: 1.00 to 3.00. The interactive course will provide an understanding of the history of schooling in the United States. A special emphasis will be placed on reviewing historical and contemporary educational policies and educational laws as each subject is critical to understanding social, historical, and cultural issues in the United States. Focus will also be on contemporary applications of historical ideas in the classroom and in school systems.

Learning Outcomes: 1. Know how education laws and policies influenced the American education system and vice versa. 2. Understand how race, ethnicity, gender, and social class have affected schooling experiences. 3. Evaluate how schools reflect societal, political, and cultural values historically. 4. Link these larger issues to reflective teaching practices. Credits: 1.00 to 3.00

EDST 49000 - Individual Research And Teaching Experience

Credit Hours: 1.00 to 8.00. Primarily for teacher candidates requiring special, individualized experience in research or teaching. Permission of instructor required.

Credits: 1.00 to 8.00

EDST 49100 - Topics And Issues In Education

Credit Hours: 1.00. Provides student with opportunity to strengthen preparation through study of selected educational topics and issues based upon individual needs and interests. One topic is considered in each enrollment.

Credits: 1.00

EDST 51200 - Foundations Of Educational Policy

Credit Hours: 3.00. (EDFA 51200) An examination of the relationship between policy, values, and social change in education, including the roles of local, state, and federal government in educational policymaking and the effects of

educational policies on societal issues such as equity, cultural diversity, and opportunity.

Learning Outcomes: 1. Understand the policy-making process at different levels of government. 2. Understand underlying values and theories of education behind different policy initiatives. 3. Understand the relationship between educational policy and social issues. Credits: 3.00

EDST 51300 - Educational Facilities Planning

Credit Hours: 3.00. (EDFA 51300) The course utilizes a systems approach as a basis for planning, construction, and utilization of school facilities. The primary audience for which the course is designed is aspiring school superintendents and central office leaders. Emphasis is placed on gaining the performances, dispositions, and knowledge necessary for successfully providing facilities to enhance the teaching/learning processes in meeting the educational needs of diverse learners. It is intended as a practical course oriented toward "tools" and school facilities in the state of Indiana. Permission of instructor required.

Learning Outcomes: 1. Describe the political and economic dimensions associated with the development and acquisition of facilities in Indiana. 2. Describe the various ways to finance renovation and /or new school construction in Indiana. 3. Identify and describe the required procedures for new school construction in Indiana. 4. Describe the involvement of professionals outside of education in the planning and construction of school facilities. 5. Understand terminology related to construction and maintenance of school facilities in Indiana. Credits: 3.00

EDST 51400 - Economics Of Education

Credit Hours: 3.00. A general course in financing education, including current economic theories, sources of revenues, and trends in fiscal structure and operations in education.

Learning Outcomes: 1. Develop and understand the goals of public education, why states invest in education, and the legal basis for financing public education. 2. Develop and understand the sources of revenues for public education and the approaches used to raise and distribute funds for school district operations. 3. Develop and understand the concepts of equity and adequacy and how these ideas are reflected in current state education policy and educational leadership practices. 4. Develop and understand budgeting strategies and procedures used by educational leaders to influence student achievement outcomes and realize other school-based goals. Credits: 3.00

EDST 51600 - School-Community Relations

Credit Hours: 3.00. (EDFA 51600) This course will stress concepts and principles relevant to school-community interaction. It will focus on the new roles of the public in education and will deal with problems encountered by educators in communicating with the public.

Learning Outcomes: 1. Design their commitment to build stronger family and community relationships with schools. 2. Understand important analytical, policy-relevant, and practice-oriented perspectives on family and community involvement in education 3. Develop skills and strategies for fostering mutually beneficial family and community connections with schools. Credits: 3.00

EDST 52000 - Educational Leadership, Governance, And Policy

Credit Hours: 3.00. The aim of this course is to explore and examine the complexities of contemporary PK-22 education leadership, administration, and governance. This course will cover the foundational administrative knowledge and skills necessary for transformational leadership at the modern primary, secondary, and post-secondary educational settings. The scope of this course seeks to cultivate an understanding of the functionality of educational systems as organizations within the context of a technologically, socially, and culturally changing world.

Learning Outcomes: 1. Analyze a variety of literature on PK-22 educational leadership, integrating relevant literature from the fields and disciplines of higher education, leadership, business, political science, and sociology. 2. Apply skillfully foundational PK-22 leadership knowledge and skills necessary for middle management and senior-level educational leadership in the context of a rapidly changing, culturally diversifying, technologically dynamic

global education field. 3. Understand sustainable transformational education leadership by repeatedly engaging in activities and assignments that: Require a comprehensive analysis and understanding of how the following interface: institutional finance and budgeting, strategic planning and assessment, organizational structure and culture, existing and emerging education policy, and the current social and political climate; Require an understanding and analysis of the common day-to-day and long-term challenges that contemporary PK-22 education administrators face in strategic decision-making; Require an evaluation of structural and cultural practices and norms in PK-22 education administration for the sake of comparative analysis. Credits: 3.00

EDST 52100 - Foundations In PK-XXII Educational Systems

Credit Hours: 3.00. This survey course broadly explores the complex foundations of U.S. educational systems from pre-kindergarten (PK) through the doctoral level of education (PK-22). Through the lenses of culture, history, politics, and society, this course seeks to examine factors that impact the policies and practices of PK-22 educational systems. From theoretical knowledge to philosophical orientations, the course interrogates the ways schools transform society and ways society transforms schools. The course incorporates a variety of engaged learning activities including discussion prompts, reflective journaling of course readings, and literature review and research writing. As such, this course challenges students to: 1. Describe and analyze the cultural, historical, political, and social foundations of PK-22 education systems; 2. Examine the interrelationships of culture, politics, and social structures related to educational systems; 3. Analyze and evaluate current issues in PK-22 education systems; 4. Construct connections between and among course topics, specifically drawing from educational models and philosophies.

Learning Outcomes: 1. Describe and analyze the cultural, historical, political, and social foundations of PK-22 education systems. 2. Examine the interrelationships of culture, politics, and social structures related to educational systems. 3. Analyze and evaluate current issues in PK-22 education systems. 4. Construct connections between and among course topics, specifically drawing from educational models and philosophies. Credits: 3.00

EDST 52200 - Culture And Social Issues In PK-XXII Education

Credit Hours: 3.00. The aim of this course is to engage students in the critical examination of cultural and social issues impacting PK-22 education at the local, state, and federal levels. This course will review the evolving functional role of PK-22 education in a diversifying global society. By way of critical intercultural and intracultural examination and reflection, this course seeks to cultivate a deeper understanding of the ways that education influences and is influenced by issues related to cultural and social change and conflict.

Learning Outcomes: 1. Analyze a variety of literature on cultural and social issues, integrating relevant literature from the fields and disciplines of education, anthropology, sociology, and political science. 2. Examine and evaluate the past and present activity /role of PK-22 entities during periods of social and cultural changes and conflict. 3. Reflect critically on intercultural and intracultural biases, perspectives, and positions, and the way that they might influence day-to-day interactions in educational environments. 4. Apply acquired knowledge and understanding of the corresponding relationship between culture/social issues and PK-22 education, to create comprehensive proposals and recommendations for PK-22 entities to engage with and address issues on diversity. Credits: 3.00

EDST 58900 - Special Topics For Teachers

Credit Hours: 1.00 to 4.00. (EDFA 58900) Consideration of appropriate professional problems of experienced educational personnel in workshops or in-service programs.

Credits: 1.00 to 4.00

EDST 59000 - Individual Research Problems

Credit Hours: 1.00 to 6.00. (EDFA 59000) Opportunities for students to study particular problems under the guidance of a member of the This plan of individualized instruction may be used in any field of education or vocational education. Does not include thesis work. Permission of instructor required.

Credits: 1.00 to 6.00

EDST 59100 - Special Topics In Education

Credit Hours: 1.00 to 4.00. (EDFA 59100) Group study of a current problem or special topic of interest to professional educational personnel. Intensive study of research, theory, or practical aspects of a particular issue within the usual graduate class format.

Learning Outcomes: 1. Vary due to nature of course. Credits: 1.00 to 4.00

EDST 60000 - Seminar In The Foundations Of Education

Credit Hours: 3.00. Recommended for those who have had a prior foundations course. Specialized studies in such areas as educational history, educational philosophy, educational sociology, religion and public education, current educational issues, and classical literature of education.

Credits: 3.00

EDST 60200 - Seminar: The School Principalship

Credit Hours: 3.00. Individual exploration in depth of selected aspects of the school principalship and critical analysis of related issues. Prerequisite: EDST 51200 .

Learning Outcomes: 1. Acquired proficiency in the Indiana Standards for School Leaders - Building Level content and skills. The Indiana Department of Education believes these content standards define those skills and abilities that school leaders must possess to produce greater levels of success for all students. The learning outcomes in this course are based on the Indiana standards focused on the students acquiring proficiency in: Leadership, Supervision, Vision and Mission, Change, Staff Recruitment & Selection, Staff Evaluation, Staff/Administrative Relations, Curriculum Leadership and Management, Student Discipline, Pupil Personnel Services, Professional Development, Ethics, Decision Making, Planning, Time Management and Teaching and Learning. Credits: 3.00

EDST 60700 - Administration Of Educational Systems

Credit Hours: 3.00. An examination of administrative function, process, structure, and practice. Special emphasis given to theory development in administration. Exploration of system analysis applications to educational administration. Prerequisite: EDST 51200 .

Learning Outcomes: 1. Acquired proficiency in the Indiana Standards for School Leaders - Building Level content and skills. The Indiana Department of Education believes these content standards define those skills and abilities that school leaders must possess to produce greater levels of success for all students. The learning outcomes in this course are based on the Indiana Standards focused on students acquiring proficiency in organizational and resource management, including using data to identify needs and priorities within the organization; identifying and addressing organizational barriers to student achievement; using technological tools to manage information and support effective management of the organization; and using practices for the safe, efficient and effective operation of school's physical plant, equipment and auxiliary services. Credits: 3.00

EDST 60800 - Business Management In Education

Credit Hours: 3.00. (EDFA 60800) This course explores the management and operation of the school business environment, the critical trends and issues in the field, and the internal and external determinants of school fiscal policy. As applicable, selected core and supplemental content and skills from the district level educator standards of the Indiana Standards for School Leaders are addressed in this course. Emphasis is on the integration of theory and practice. Prerequisite: EDST 51400 .

Learning Outcomes: 1. Know the success of managing the organization, operations, and resources of a district in a way that promotes a safe, efficient, and effective learning environment. 2. Act with integrity, fairly, and in an ethical manner. 3. Understand, respond to, and influence the larger political, social, economic, legal, and cultural context. Credits: 3.00

EDST 60900 - Legal Aspects Of American Education

Credit Hours: 3.00. (EDFA 60900) Legal foundations of education as established by constitutional provisions, court decisions, opinions of attorney generals, administrative rulings, and executive directives. Emphasis on legal theory and

principles currently in state of change. Stress of case study method of investigation into educational law. Prerequisite: 9 credit hours in Education.

Learning Outcomes: 1. Acquired proficiency in the Indiana Standards for School Leaders - Building Level content and skills. The Indiana Department of Education believes these content standards define those skills and abilities that school leaders must possess to produce greater levels of success for all students. The learning outcomes in this course are based on the Indiana standards focused on the student acquiring proficiency in human resource management; equity and access to educational programs, curricula and available supports; behavior management systems; school safety and emergency preparedness; student safety and welfare; and the rights and responsibilities of students, families, and school staff. Credits: 3.00

EDST 61000 - Supervision Of Instruction And Instructional Personnel

Credit Hours: 3.00. (EDFA 61000) A comprehensive approach to supervision and instruction that develops the knowledge, interpersonal, and leadership skills, which are then applied in a school setting for the purpose of instructional improvement. Models of supervision, leadership and evaluation will be examined to gain knowledge in order to apply effective strategies for diverse situations. The study of transformational change in today's schools will guide leadership knowledge to the task of direct assistance, collegiality, collaboration, culture of trust, professional development, dialectic inquiry, curriculum development and action research. Prerequisite: EDST 51200 .

Learning Outcomes: 1. Recognize the temper of diverse situations within their instructional leadership role and appropriately apply strategies that will address the situations. 2. Use the understanding and experience of instructional supervision concepts explored throughout this course and apply supervisory principles to the daily functions and responsibilities of an education administrator. 3. Demonstrate the ability to correctly apply various leadership concepts to various fact-based situations and formulate a plan of action to address each situation. 4. Accurately interpret the characteristics of a healthy organization (campus, district, etc.). 5. Evaluate the results of teacher and administrator interviews regarding system and recommend a teacher appraisal system that may improve the equality of observations and appraisals. Credits: 3.00

EDST 61200 - Seminar In Educational Administration And Curriculum

Credit Hours: 3.00. An analysis of current research and theory related to selected topics in educational administration and curriculum. One topic is studied in each enrollment. Permission of instructor required.

Credits: 3.00

EDST 61300 - Clinic For Educational Leaders

Credit Hours: 1.00 to 6.00. (EDFA 61300) Clinic for educational leaders.

Credits: 1.00 to 6.00

EDST 61400 - Leadership For Community Collaboration And Development

Credit Hours: 3.00. In this course, we will consider how school leaders can help develop and strengthen relationships between districts/corporations and their publics, for the mutual benefit of students, schools, families, and communities. Throughout selected core and supplemental district level educator standards of the Indiana Standards for School Leaders and the National Policy Board for Educational Administration are addressed. Emphasis is on the integration of theory and practice. Permission of instructor required.

Learning Outcomes: 1. Acquire knowledge and ability to foster mutually beneficial family and community connections with school districts. 2. Acquire knowledge and ability to understand needs of diverse families and communities. 3. Acquire knowledge and ability to assess research on school partnerships to identify best practices in their contexts. Credits: 3.00

EDST 61500 - Educational Policy And Decision Making

Credit Hours: 3.00. This course explores a variety of current legal, political, social, cultural and economic issues as they relate to educational policy and decision making. As applicable, selected core and supplemental content and skills from the district level educator standards of the Indiana Standards for School Leaders and ELCC/NPBEA standards are addressed in this course. Emphasis is on the integration of theory and practice. Prerequisite: EDST 51200 .

Learning Outcomes: 1. Act with integrity, fairly, and in an ethical manner. 2. Understand, respond to, and influence the larger political, social, economic, legal, and cultural context. Credits: 3.00

EDST 61600 - Analytical Techniques In Educational Management

Credit Hours: 3.00. This course is a mix of theory and practice concerning planning and implementation of the fiscal responsibilities that a superintendent of schools would engage in at the district level. The course exposes students to some of the key processes and activities related to planning for and implementing the school budget and related activities. The course examines such planning concepts as goal definition, decision-making, and evaluation of planning as it relates to the fiscal issues of a school corporation. A feature of the course is an emphasis on the process of dealing with the elements of change and planning for such as it relates to fiscal issues in educational organizations. Prerequisite: EDST 51400 or EDST 60800 .

Learning Outcomes: 1. Describe various functions of the school district business office. 2. Identify methods of decision making involved in allocating fiscal resources. 3. Identify various methods of budgeting. 4. Demonstrate an understanding of elementary accounting concepts. 5. Demonstrate an understanding of calculations and functions related to Indiana public school corporation funds. 6. Summarize the ways in which Indiana public school corporations are funded and the most recent legislation that will impact funding. 7. Demonstrate an understanding of the role of business with regard to insurance, transportation, food service, and maintenance. 8. Summarize the balance among expenditures, revenues, and the educational plan. Credits: 3.00

EDST 64000 - Higher Education Law

Credit Hours: 3.00. This course explores the legal framework within which institutions of higher education operate. Course materials, activities, and assignments will give students a deep understanding of how state and federal legislative bodies and courts operate. Students will read statutory materials and case law on legal issues related to higher education, including: free speech, religion, academic freedom, searches and seizures, due process rights, equal protection issues, individuals with disabilities, contracts and employment, torts and university liability. Permission of instructor required.

Learning Outcomes: 1. Think critically and reflectively. 2. Synthesize case law, and statutory and administrative law materials to create and share a robust understanding of how the varied sources of law inform all interactions at institutions of higher education. 3. Create new knowledge by synthesizing, applying, and communicating how the law can and should be applied in higher education institutions. 4. Learn and apply legal research skills that will empower them to contribute to legal scholarship. 5. Become more fluent in communicating complex legal concepts to stakeholders at different levels (students, peers, administrators, etc.). Credits: 3.00

EDST 64100 - Organization And Adminstration In Higher Education

Credit Hours: 3.00. The aim of this course is to explore and examine the complexities of organization and administration in higher education. To do so, the course will have a dual focus: organization, which includes forms, structures, systems, roles, and functions; and administration, including the three "Ps" - processes, products, and "players." The scope of the course seeks to create an appreciation for the complexity of the higher education system, specifically of colleges and universities as ecosystems, through exploration of these systems both horizontally across institutions and institutional types and vertically within the individual, single institution. Throughout the semester students will engage in a variety of analytic and critical perspectives through course readings, discussions, and assignments that encourage a multifaceted perspective. The course intends to provide an organizational framework and serve as the foundation for the courses in the Higher Education program of study.

Learning Outcomes: 1. Explore a variety of literature on organizational theory, integrating literature from the field of higher education as well outside disciplines of business, political science, & sociology. 2. Gain an applied knowledge of the complexity of higher education institutions as organizations by understanding: the different internal "players" involved in higher education administration and governance; a variety of external influences and factors that

may impact higher education institutions; the critical issues that impact the cultures and norms both within and across institutions; identify and apply organizational theory through analysis of critical issues facing higher education institutions. 3. Examine complex cultural, political, social and organizational issues from different perspectives - specifically the ability to conduct research and analysis using different organizational theory and frameworks. 4. Develop skills to succinctly and professionally articulate analysis and synthesis of relevant empirical research and literature. 5. Formulate and articulate rational arguments through discussions, peer review, and reflective and research writing. Credits: 3.00

EDST 64200 - Cultural Engagement In Higher Education Communities

Credit Hours: 3.00. The influence of culture is of particular import with issues facing the world today and Higher Education institutions (HEIs) are not immune to this reality. HEIs often serve as an institutional base for communities and have a vested interest in meaningful engagement with the communities that surround their campuses. This course is designed to enable learners to confidently communicate, build relationships, and work effectively in culturally diverse communities. Through exploration of a variety of intercultural theories, students will become aware of and be able to navigate the cultural influences in local, state, regional, national, and international higher education communities. As part of the course, students will engage in their communities through experiential, real-world, case study, and project management methods. Permission of instructor required.

Learning Outcomes: 1. Deepen their thinking and practice of community engagement and the positionality of the institution within its community. 2. Demonstrate that as a complex organization, Higher education functions as both a personal and a societal (public and private) benefit. 3. Demonstrate consistent critical attention and critical thinking to their own and others positionality including cultural identities, social and organizational power and privilege, and intercultural competence. 4. Formulate skills to better recognize, prevent, and resolve cross-cultural conflicts. 5. Construct effective cross-cultural relationships and work in an intercultural group setting. 6. Evaluate and summarize intercultural theories as applied to their individual/institutional contexts. 7. Describe a context for examining the organization of knowledge and institutions of higher education in relation to community-based problem solving. 8. Examine complex social and organizational issues from different perspectives - specifically the ability to conduct research and analysis using a variety of community engagement and cultural frameworks. 9. Formulate and articulate rational arguments through discussions, peer review, and reflective and research writing. 10. Apply theory to practice in a final community engagement research project. Credits: 3.00

EDST 64300 - Higher Education Economics And Finance

Credit Hours: 3.00. This course provides students with an overview of financial issues related to higher education. Students will discuss and evaluate topics such as the public versus private financial benefits of higher education, the financial relationship between institutions of higher education and both state and federal governments, and issues related to labor economics. Permission of instructor required.

Learning Outcomes: 1. Think critically and reflectively. 2. Synthesize, create, and communicate knowledge. 3. Engage in professional development. 4. Participate actively in the profession. Credits: 3.00

EDST 64400 - Policy And Politics In Higher Education

Credit Hours: 3.00. In this course, focused on historic and contemporary issues, research, and theories that shape public policy in higher education, students will critically examine the policy issues facing higher education today. The course will interrogate the ways politics and policy are leveraged to address issues of access and college success for all, dismantle systemic oppression, and improve upon higher education's ability to carry out its mission, vision, and purpose. Three main foci will be reviewed and applied throughout the course: The policymaking process: Students will gain a foundational knowledge of policy formation and implementation process at the federal, state, tribal/local levels; Methods of policy analysis: methods of analyzing, interpreting, and evaluating policy/policy issues; Policy research: multiple theoretical lenses and research trends

focused on continued improvement and development of higher education institutions, programs, and services. Permission of instructor required.

Learning Outcomes: 1. Gain and deepen foundational knowledge of HE politics and policy, including the reciprocity (or lack thereof) between federal, state, tribal/local policy, policy formation and implementation, and contemporary issues shaping HE politics and policymaking today. 2. Evaluate and apply public policy theoretical and conceptual frameworks as applied to their individual/institutional contexts. 3. Investigate the ways cultural/social/political contexts affect creation and implementation of public policy. 4. Explore how policy interacts with higher education's ability to deconstruct/level systemic oppression while creating opportunity for equity and access. 5. Examine issues of power, privilege and oppression in public policy by asking: who has power, resources, influence; how "they" use the power, resources, and influence; and whose perspectives, identities, and interests are represented in current policies. 6. Evaluate how policy effects the lived experiences of the higher education community - students, faculty, staff, administration and communities. 7. Examine complex cultural, political, and social issues from different perspectives - specifically the ability to conduct research and analysis using public policy frameworks. 8. Formulate and articulate rational arguments through discussions, peer review, and reflective and research writing. 9. Apply theory to practice through policy analysis and a final research proposal. Credits: 3.00

EDST 64500 - Higher Education Leadership And Management

Credit Hours: 3.00. This is the second in the series of courses on the Higher Education Organization. The aim of this course is to provide an overview of leadership and management of higher education institutions in the U.S. from relationship-rich and cultural lenses. The scope of the course seeks to create an appreciation for the complexity of the higher education system, specifically of colleges and universities as ecosystems, through exploration of the leadership and management types, systems and structures both horizontally across institutions and institutional types and vertically within the individual, single institution. The course will examine leadership and management from the presidency to managers at all levels in both academic and administrative units. Permission of instructor required. Prerequisite: EDST 64000.

Learning Outcomes: 1. Explore a variety of literature on HEI leadership and management, integrating literature from the field of higher education as well outside disciplines of business, political science, & sociology. 2. Gain an applied knowledge of the complexity of higher education institutions leadership and management by understanding; the different internal roles involved in higher education administration and governance; a variety of external influences and factors that may impact higher education institutions; the critical issues that impact the leadership and management cultures and norms both within and across institutions. 3. Analyze and reflect on their personal leadership styles based on HE theory, frameworks, and perspectives. 4. Identify and apply HEI leadership and management theory through analysis of critical issues facing higher education institutions. 5. Examine complex leadership and management issues from cultural, political and organizational perspectives - specifically the ability to conduct research and analysis using different HEI leadership and management theory and frameworks. 6. Develop skills to succinctly and professionally articulate analysis and synthesis of relevant empirical research and literature. 7. Formulate and articulate rational arguments through discussions, peer review, presentation, and reflective and research writing. 8. Apply theory to practice in a final leadership/management manuscript publication project. Credits: 3.00

EDST 64600 - Assessment And Evaluation In

Higher Education

Credit Hours: 3.00. The aim of this course is to explore and examine the complexities of assessment and evaluation within higher education systems, including but not limited to student learning, academic programs, student support services, and administrative services. The scope of the course seeks to create a practical understanding of assessment and evaluation, whereby we examine the foundations of assessment planning and development, explore various assessment techniques, explicate and develop a comprehensive assessment plan, and explain how approaches to data collection work in concert and separately to assess both student learning outcomes and program effectiveness.

Learning Outcomes: 1. Apply fundamental principles of assessment and evaluation. 2. Synthesize knowledge and skills of assessment essentials to create a comprehensive assessment plan. 3. Analyze various data collection methods as it relates to assessment and evaluation. 4. Evaluate findings from assessment plans and translate into practical actions that inform practice, policy, and institutional effectiveness. 5. Apply course content to problem-solving, program effectiveness, and the generating of interventions and services to enhance student experiences in higher education. Credits: 3.00

EDST 64700 - History Of American Higher Education

Credit Hours: 3.00. This course engages students to better understand the history of higher education in the United States from the Colonial era to the present. Upon completion, students will have an appreciation for how higher education institutions (HEIs) were (and continue to be) developed, as well as an understanding of who had access to these institutions over the past 200+ years, and who did not, from a social justice perspective.

Learning Outcomes: 1. Think critically and reflectively. 2. Synthesize, create, and communicate knowledge. 3. Engage in professional development. 4. Participate actively in the profession. Credits: 3.00

EDST 64800 - International And Intercultural Higher Education

Credit Hours: 3.00. This doctoral-level course critically examines the interconnected and interdependent world of international higher education through an intercultural lens. The course will employ a variety of critical theoretical perspectives (post-development, feminist, & equity frameworks as well as organizational/institutional models) to examine both the historical and contemporary developments in higher education throughout the globe. Topics will vary based on current issues but will center on the influences cultural, economic, political, & social factors have had on national and international higher education development. Permission of instructor required.

Learning Outcomes: 1. Demonstrate knowledge of the interwoven concepts related to internationalization, globalization, and intercultural higher education. 2. Explore a variety of literature on international and intercultural higher education, integrating literature from the field of higher education as well outside disciplines of business, political science, & sociology. 3. Analyze a HEI's internationalization plans, intercultural activities/strategies and various influences on these based on HE theory, frameworks, and perspectives. 4. Examine complex internationalization and intercultural issues from cultural, political and organizational perspectives - specifically the ability to conduct research and analysis using equity, feminist, post-colonialist and/or an organizational theory or framework. 5. Develop skills to succinctly and professionally articulate analysis and synthesis of relevant empirical research and literature. 6. Formulate and articulate rational arguments through discussions, peer discussion, and reflective and research writing. 7. Apply theory to practice in a final internationalization case study project. Credits: 3.00

EDST 66300 - Organization And Administration Of Special Education

Credit Hours: 3.00. (EDPS 66300) A comprehensive course in the organization and administration of special education including the organizational arrangements, identification, placement and service delivery, tests and assessments, program evaluation, personnel, and school/community relations.

Learning Outcomes: 1. Examine, discuss, and gain an understanding of the role of the special education director. 2. Apply the federal and state rules and regulations for special education

in school settings. 3. Understand the role of litigation in the field of special education. 4. Understand special education funding options, identify budget preparation strategies and fund management. 5. Demonstrate ways to ensure parent involvement. 6. Discuss current trends and issues in educating children with disabilities, including ethnic and cultural diversity, discipline, suspension and expulsion. Credits: 3.00

EDST 69400 - Intern In Educational Administration: Building Administrator

Credit Hours: 1.00 to 3.00. (EDFA 69400) Field experience in educational administration under university supervision in selected situations related to school building administration. Amount of credit to be determined by nature and extent of assignment. Permission of instructor required.

Learning Outcomes: * Credits: 1.00 to 3.00

EDST 69500 - Internship In Education

Credit Hours: 1.00 to 10.00. (EDFA 69500) Amount of credit to be determined by nature and extent of the assignment. A special course in selected areas of education, designed to provide practical field experience under professional supervision in selected situations related to the candidate's area of specialization.

Credits: 1.00 to 10.00

EDST 69700 - EdS Project-Research

Credit Hours: 0.00 to 18.00. Educational Specialist project in research. Permission of instructor required.

Credits: 0.00 to 18.00

EDST 69900 - Research PhD Thesis

Credit Hours: 1.00 to 18.00. Research PhD Thesis. Permission of instructor required.

Credits: 1.00 to 18.00

Electrical and Computer Engineering

ECE 19595 - Selected Topics In Electrical And Computer Engineering

Credit Hours: 1.00 to 5.00. Topics vary. Permission of department required.

Learning Outcomes: 1. Able to apply knowledge of mathematics, science and engineering. 2. Able to design and conduct experiments, as well as to analyze and interpret data. 3. Able to design a system, component, or process to meet desired needs. 4. Able to function on a multidisciplinary team. 5. Able to identify, formulate, and solve engineering problems. 6. Understand the professional and ethical responsibility. 7. Able to communicate effectively. 8. Understand the impact of engineering solutions in a global and societal context. 9. Recognize the need for, and an ability to engage in, life-long learning. 10. Know the contemporary issues. 11. Able to use the techniques, skills, and modern engineering tools necessary for engineering practice. Credits: 1.00 to 5.00

ECE 20001 - Electrical Engineering Fundamentals I

Credit Hours: 3.00. This course covers fundamental concepts and applications for electrical and computer engineers as well as for engineers who need to gain a broad understanding of these disciplines. The course starts by the basic concepts of charge, current, and voltage as well as their expressions with regards to resistors and resistive circuits. Essential concepts, devices, theorems, and applications of direct-current (DC), 1st order, and alternating-current (AC) circuits are subsequently discussed. Besides electrical devices and circuits, basic electronic components including diodes and transistors as well as their primary applications are also discussed.

Learning Outcomes: 1. Ability to analyze linear resistive circuits. 2. Ability to analyze 1st order linear circuits with sources and/or passive elements. 3. Ability to analyze electronic circuits with diodes and transistors. Credits: 3.00

ECE 20002 - Electrical Engineering Fundamentals II

Credit Hours: 3.00. Continuation of Electrical and Computer Engineering Fundamentals I. The course addresses mathematical and computational foundations of circuit analysis (differential equations, Laplace Transform techniques) with a focus on application to linear circuits having variable behavior as a function of frequency, with emphasis on filtering. Variable frequency behavior is further considered for applications of electronic components through single-transistor and operational amplifiers. The course ends with consideration of how circuits behave and may be modeled for analysis at high frequencies. Permission of Department required.

Learning Outcomes: 1. Analyze 2nd order linear circuits with sources and/or passive elements. 2. Compute responses of linear circuits with and without initial conditions via one-sided Laplace transform techniques. 3. Compute responses to

linear circuits using transfer function and convolution techniques. 4. Analyze and design transistor amplifiers at low, mid and high frequencies. 5. Ability to work with transmission line models to analyze circuits at high-frequency. 6. Use a CAD tool (e.g., SPICE) in circuit analysis and design. Credits: 3.00

ECE 20007 - Electrical Engineering Fundamentals I Lab

Credit Hours: 1.00. This is an introduction course in electronic measurement and circuit modeling, simulation and design techniques. These skills are developed through a variety of laboratory experiments ranging from voltage, current, and frequency, to resistors, inductors, capacitors, and operational amplifiers. When possible, the experiments develop practical skills through small design and soldering tasks. Finally, the course culminates in a two week group design project. In many ways this course is the laboratory of the co-requisite lecture course ECE 20001: Electrical Engineering Fundamentals I; however, we remind students that this is a standalone course that expects students will learn and demonstrate material not taught in ECE 20001.

Learning Outcomes: 1. Select and use electronic measurement instruments competently. 2. Design, wire, and troubleshoot electronic circuits. 3. Simulate electronic circuits. 4. Keep a laboratory notebook and prepare a formal laboratory report. 5. Function on an interdisciplinary team that draws on diverse backgrounds. 6. Design, build, and test resistor-inductor-capacitor, operational amplifier, etc. circuits to meet specifications. 7. Demonstrate knowledge of laboratory safety precautions. Credits: 1.00

ECE 20008 - Electrical Engineering Fundamentals II Lab

Credit Hours: 1.00. This is a course in electronic measurement, circuit modeling, simulation and design techniques. These skills are developed through a variety of laboratory experiments including discrete semiconductor measurement, transistor amplifiers, motor control, and operational amplifier internals. The experiments develop practical skills through small design and soldering tasks. Finally, the course culminates in a two week group design project. In many ways this course is the laboratory of the co-requisite lecture course ECE 20002 Electrical Engineering Fundamentals II; however, we remind students that this is a standalone course that expects students will learn and demonstrate material not taught in other courses.

Learning Outcomes: 1. Ability to competently select, use, and automate electronic measurement instruments. 2. Design, wire, and troubleshoot electronic circuits. 3. Ability to simulate electronic circuits. 4. Design, build, and test resistor-inductor-capacitor, operational amplifier, etc. circuits to meet specifications. 5. Demonstrate knowledge of laboratory safety precautions. 6. Maintain laboratory notes and create professional experiment reports. Credits: 1.00

ECE 20200 - Linear Circuit Analysis II

Credit Hours: 3.00. Continuation of ECE 20100. Use of Laplace Transform techniques to analyze linear circuits with and without initial conditions. Characterization of circuits based upon impedance, admittance, and transfer function parameters. Determination of frequency response via analysis of poles and zeros in the complex plane. Relationship between the transfer function and the impulse response of a circuit. Use of continuous time convolution to determine time domain responses. Properties and practical uses of resonant circuits and transformers. Input - output characterization of a circuit as a two-port. Low and high-pass filter design.

Learning Outcomes: 1. Able to compute impedances and admittances of components and circuits. 2. Able to compute responses of linear circuits with and without initial conditions via one-sided Laplace transform techniques. 3. Able to compute responses to linear circuits using transfer function and convolution techniques. 4. Able to analyze and compute responses of linear circuits containing mutually couples inductors and ideal transformers in the s-domain. 5. Able to analyze basic two port circuits using the various types of two port parameters and be able to construct such parameters from a given circuit. 6. Able to analyze and design basic LP, BP, HP and resonant circuits in the s-domain. Credits: 3.00

ECE 20400 - Introduction To Electrical And Electronic Circuits

Credit Hours: 4.00. Students will learn basics of electrical and electronic circuits including introduction to analog and digital electronic circuits. Measurement of electrical signals using meters, probes, and oscilloscopes are covered in the laboratory component of the course. Circuits are designed for minimum

hardware with emphasis on understanding analog and digital electronics with particular use of digital and analog microchips. Non-ECE majors who complete this course can continue the digital course sequence offered by the ECE department including microprocessor systems and interfacing, and digital signal processing. No credit will be given for ECE majors.

Credits: 4.00

ECE 20700 - Electronic Measurement Techniques

Credit Hours: 1.00. Experimental exercises in the use of laboratory instruments. Voltage, current, impedance, frequency, and wave form measurements. Frequency and transient response. Elements of circuit modeling and design.

Credits: 1.00

ECE 20800 - Electronic Devices And Design Laboratory

Credit Hours: 1.00. Laboratory experiments in the measurement of electronic device characteristics. Design of biasing networks, small signal amplifiers, and switching circuits.

Credits: 1.00

ECE 20869 - Discrete Math For Computer Engineering

Credit Hours: 3.00. This course introduces discrete mathematical structures and finite-state machines. Students will learn how to use logical and mathematical formalisms to formulate and solve problems in computer engineering. Topics include formal logic, proof techniques, recurrence relations, sets, combinatorics, relations, functions, algebraic structures, and finite-state machines.

Learning Outcomes: 1. Define, reason about, and operate on sets using basic set operations and Recursive definition. [1,7] 2. Represent and verify entailment arguments in predicate logic, both syntactically and semantically. [1,3,7] 3. Argue carefully using a variety of informal proof techniques, including mathematical induction. [1,3,7] 4. Count in a wide range of settings including permutations, combinations, countable infinities, and recurrence equations. [1,7] 5. Define and reason about functions and binary relations and work with their useful properties. [1] 6. Have an ability to define finite-state automata and regular expressions for languages, and relate these formalisms using non-determinism. [1,7] 7. Formulate algorithmic problems as decision problems and reason about their decidability and scalable solvability. [1,7] Credits: 3.00

ECE 20875 - Python For Data Science

Credit Hours: 3.00. This course will introduce Python programming to students through data science problems. Students will learn Python concepts as well as introductory data science topics, and will use their knowledge of Python (and prior programming experience) to implement data analyses.

Learning Outcomes: 1. Understand of regular expressions [1, 2]. 2. Use Python to write data analyses [1, 2, 6]. 3. Explain when data analyses are appropriate [1, 2, 3, 6]. 4. Explain the results of data analyses [2, 3, 5]. 5. Incorporate classes in their Python programs [1, 2, 6]. 6. Incorporate associative arrays in their programs [1, 2, 6]. Credits: 3.00

ECE 21000 - Electrical And Computer Engineering Sophomore Seminar

Credit Hours: 1.00. An introduction to the School of Electrical and Computer Engineering, ECE program objectives and outcomes, BSEE and BSCmpE degree requirements, and professional development.

Credits: 1.00

ECE 25500 - Introduction To Electronic Analysis And Design

Credit Hours: 3.00. Diode, bipolar transistor, and FET circuit models for the design and analysis of electronic circuits. Single and multistage analysis and design; introduction to digital circuits. Computer-aided design calculations, amplifier operating point design, and frequency response of single and multistage amplifiers. High-frequency and low-frequency designs are emphasized.

Learning Outcomes: 1. Able to identify and correctly utilize the external lead structure and basic electrical characteristics of common semiconductor devices (pn junctions, MOSFETs, ad BJTs). 2. Able to analyze and design d.c. bias circuits. 3. Able to utilize d.c. and a.c. models of semiconductor devices in both analysis and design. 4. Able to analyze and design single and multistage amplifiers at low, mid and high frequencies. 5. Able to use a CAD tool (e.g., SPICE) in circuit analysis and design. Credits: 3.00

ECE 26400 - Advanced C Programming

Credit Hours: 3.00. Continuation of a first programming course.

Topics include files, structures, pointers, and the proper use of dynamic data structures. A basic knowledge of the UNIX operating system and an introductory C programming course; C programming knowledge should include basic syntax, control structures, and file I/O, as well as experience in declaring and using functions.

Learning Outcomes: 1. Ability to read and write C programs that use files. 2. Ability to read and write C programs that use structures. 3. Ability to read and write C programs that use dynamic data structures. Credits: 3.00

ECE 27000 - Introduction To Digital System Design

Credit Hours: 4.00. An introduction to digital system design and hardware engineering, with an emphasis on practical design techniques and circuit implementation.

Learning Outcomes: 1. Analyze and design CMOS logic gates. 2. Analyze and design combinational logic circuits. 3. Analyze and design sequential logic circuits. 4. Analyze and design computer logic circuits. 5. Realize, test, and debug practical digital circuits. Credits: 4.00

ECE 28200 - UNIX Programming For Engineers

Credit Hours: 1.00. Introduction to the UNIX operating system, including the UNIX file system, UNIX tools, and utilities. Introduction to Shell programming. The emphasis will be on how these tools/utilities are utilized in the Computing Engineering field.

Credits: 1.00

ECE 29199 - Cooperative Experience I

Credit Hours: 0.00. Professional experience in electrical and/or computer engineering. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.

Learning Outcomes: 1. Apply knowledge to identifying and solving problems in the professional context. 2. Advance skills related to professional preparation, critical thinking, problem solving, communication, and teamwork. 3. Increase understanding of the profession and practice, basic industry principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

ECE 29299 - Cooperative Experience II

Credit Hours: 0.00. Professional experience in electrical and/or computer engineering. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.

Learning Outcomes: 1. Apply knowledge to identifying and solving problems in the professional context. 2. Advance skills related to professional preparation, critical thinking, problem solving, communication, and teamwork. 3. Increase understanding of the profession and practice, basic industry principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

ECE 29401 - Electrical And Computer Engineering Sophomore Seminar

Credit Hours: 1.00. An introduction to the School of Electrical and Computer Engineering, the program's objectives, and outcomes, BSEE and BSCmpE degree requirements, professional writing and multicultural and professional development.

Learning Outcomes: 1. Knowledge of the ECE educational objectives and required outcomes. 2. Knowledge of the BSEE and/or BSCmpE degree requirements. 3. Ability to prepare a satisfactory plan-of-study. 4. Ability to write effectively in the English language. 5. Appreciation for ethical, professional and academic conduct. Credits: 1.00

ECE 29595 - Selected Topics In Electrical And Computer Engineering

Credit Hours: 1.00 to 5.00. Topics vary. Permission of department required.

Learning Outcomes: 1. Able to apply knowledge of mathematics, science and engineering. 2. Able to design and conduct experiments, as well as to analyze and interpret data. 3. Able to design a system, component, or process to meet desired needs. 4. Able to function on a multidisciplinary team. 5. Able to identify, formulate, and solve engineering problems. 6. Understand the professional and ethical responsibility. 7. Able to communicate effectively. 8. Understand the impact of engineering solutions in a global and societal context. 9. Recognize the need for, and an

ability to engage in, life-long learning. 10. Know the contemporary issues. 11. Able to use the techniques, skills, and modern engineering tools necessary for engineering practice. Credits: 1.00 to 5.00

ECE 29600 - Electrical And Computer Engineering Projects

Credit Hours: 0.00 to 18.00. Projects in Electrical and Computer Engineering. Permission of Department required.

Learning Outcomes: 1. Ability to apply knowledge of mathematics, science, and engineering. 2. Recognition of the need for, and an ability, to engage in life-long learning. 3. Ability to use techniques, skills, and modern engineering tools necessary for engineering practice. Credits: 0.00 to 18.00

ECE 30010 - Introduction To Machine Learning And Pattern Recognition

Credit Hours: 3.00. Intelligent information processing, search and retrieval, classification, recognition, prediction and optimization with machine learning and pattern recognition algorithms such as neural networks, support vector machines, decision trees and data mining methods, current models and architectures, implementation topics especially in software, applications in areas such as information processing, search and retrieval of internet data, forecasting (prediction), classification, signal/image processing, pattern recognition, optimization, simulation, system identification, communications, control, management and finance. Topics covered will also be illustrated with the software package MATLAB and related toolboxes. Permission of instructor required.

Learning Outcomes: 1. An ability to apply knowledge of mathematics, science, and engineering. 2. An ability to design and conduct experiments, as well as to analyze and interpret data. 3. An ability to design a system, component, or process to meet desired needs within realistic constraints such as economic, environmental, social, political, ethical, health and safety, manufacturability, and sustainability. 4. An ability to function on multi-disciplinary teams. 5. An ability to identify, formulate, and solve engineering problems. 6. An ability to use the techniques, skills, and modern engineering tools necessary for engineering practice. 7. The broad education necessary to understand the impact of engineering solutions in a global, economic, environmental, and societal context. Credits: 3.00

ECE 30100 - Signals And Systems

Credit Hours: 3.00. Classification, analysis and design of systems in both the time- and frequency-domains. Continuous-time linear systems: Fourier Series, Fourier Transform, bilateral Laplace Transform. Discrete-time linear systems: difference equations, Discrete-Time Fourier Transform, bilateral Z-Transform. Sampling, quantization, and discrete-time processing of continuous-time signals. Discrete-time nonlinear systems: median-type filters, threshold decomposition. System design examples such as the compact disc player and AM radio.

Learning Outcomes: 1. Able to classify signals (e.g., periodic, even) and systems (e.g., causal, linear) and an understanding of the difference between discrete and continuous time signals and systems. 2. Able to determine the impulse response of a differential or difference equation. 3. Able to determine the response of linear systems to any input signal by convolution in the time domain. 4. Understand the definitions and basic properties (e.g., time-shift, modulation, Parseval's Theorem) of Fourier series, Fourier transforms, bilateral Laplace transforms, Z transforms, and discrete time Fourier transforms and an ability to compute the transforms and inverse transforms of basic examples using methods such as partial fractions expansions. 5. Able to determine the response of linear systems to any input signal by transformation to the frequency domain, multiplication, and inverse transformation to the time domain, an ability to apply the Sampling theorem, reconstruction, aliasing, and Nyquist's theorem to represent continuous-time signal in discrete time so that they can be processed by digital computers. Credits: 3.00

ECE 30200 - Probabilistic Methods In Electrical And Computer Engineering

Credit Hours: 3.00. An introductory treatment including probability of events, discrete and continuous random variables, multiple random variables, sums of random variables and long-

term averages, and elementary random processes. Applications involving uniform, Gaussian, exponential, geometric and related random variables. Introduction to parameter estimation and hypothesis testing. Discussion of wide-sense stationary random processes, including correlation functions, spectral densities and the response of linear time invariant systems. Course examples are drawn from signal processing, wireless communications, system reliability, and data science.

Credits: 3.00

ECE 30411 - Electromagnetics I

Credit Hours: 3.00. This course is a continued study of vector calculus, electrostatics, magnetostatics, and Maxwell's Equations. It serves as an introduction to electromagnetic waves and transmission lines, which is continued in ECE 30412.

Learning Outcomes: 1. Work with electrostatic fields and find electric and potential fields from charge distributions including the presence of dielectric materials. 2. Work with magnetostatic fields and find magnetic fields from current distributions including the presence of magnetic materials. 3. Work with time varying fields including wave propagation. 4. Work with transmission lines in the time and frequency domains. Credits: 3.00

ECE 30412 - Electromagnetics II

Credit Hours: 3.00. Electromagnetics II builds on Electromagnetics I (ECE 31100) and emphasizes time-varying electromagnetic fields. Both fundamental understanding and an appreciation for applications that span all technologies related to electrical and computer engineering are emphasized. The topics covered include: Maxwell's equations, plane waves, transmission lines, waveguides and cavities, and antennas and radiation. Applications addressed relate to photonics, communications, and imaging and sensing. More generally, illustrations cover the basic principles on which devices and systems used every day operate.

Learning Outcomes: 1. Understand time-varying fields and Maxwell's equations. 2. Understand plane electromagnetic waves. 3. Understand the theory and application of transmission lines. 4. Understand waveguides and cavity resonators. 5. Understand antennas and radiating systems. Credits: 3.00

ECE 30414 - Elements Of Fiber Optics, Lasers And Optoelectronics

Credit Hours: 3.00. Fundamental of photonics, guided-wave optics, optical fibers, lasers, photon detectors, integrated optical components, optical information processing, devices in communication and sensor applications. Topics include generation, transformation, modulation and detection of laser beams and their applications.

Learning Outcomes: 1. Analyze simple optical systems including dielectric slabs, thin lenses, reflectors, and optical resonators. 2. Analyze optical waveguides, examine fiber modes and waveguide properties. 3. Know the operations of gas lasers, semiconductor lasers and light emitting diodes. 4. Know the operational principles of optical detectors, including various optical detection schemes. 5. Understand of the key components of optical fiber communication systems. 6. Understand of novel concepts in photonics, including ultrafast optics, photonic crystals, optical interconnects, metal optics, and metamaterials. Credits: 3.00

ECE 30415 - Fiber Optics And Lasers Laboratory

Credit Hours: 1.00. This laboratory course exercises in lasers, modulation of laser beams, fiber components and systems. It covers some simple optical measurements like Power and beam spot measurement of Gaussian beams. Students learn about lens-pinhole spatial filters and beam expanders. Fourier transform, convolution and correlation are covered. Characteristics of LEDs and ILDs are shown. Students become familiar with optical fibers related experiments like Fiber-optic microbend intensity sensors, Electrooptic modulation, Fiber optic Mach-Zehnder interferometer etc. Students also learn how to build laser systems based on the knowledge acquired from previous labs and with some simple set up. Finally there is a final project where students can design a practical optical instrument based on their knowledge from the lab.

Learning Outcomes: 1. Handle basic optical components and equipment properly. 2. Assemble and align necessary optical components to perform simple optical experiments. 3. Design and test simple fiber communication systems. Credits: 1.00

ECE 30416 - Basics Of Engineering Optics

Credit Hours: 3.00. Fundamental of photonics, guided-wave optics, optical fibers, lasers, photon detectors, integrated optical components, optical information processing, devices in communication and sensor applications. Topics include generation, transformation, modulation and detection of laser beams and their applications.

Learning Outcomes: 1. Analyze simple optical

systems including dielectric slabs, thin lenses, and reflectors. 2. Model Gaussian beams and the transformation of beams. 3. Analyze and design polarization systems, including polarizers and wave plates. 4. Know of optical interferometers and the operations of interferometers such as the Michelson, Fabry-Perot and double-slit. 5. Analyze diffraction patterns. Credits: 3.00

ECE 30417 - Engineering Optics Laboratory

Credit Hours: 1.00. A set of laboratory experiments dealing with fundamentals and basic applications of geometrical optics, beams, polarization optics, wave optics and Fourier optics. Permission of instructor required.

Learning Outcomes: 1. Handle basic optical components and equipment properly. 2. Assemble a set of optical components to perform simple optical measurements. 3. Design and test simple free-space optical measurements and instruments. Credits: 1.00

ECE 30500 - Semiconductor Devices

Credit Hours: 3.00. Introduces and explains terminology, models, properties, and concepts associated with semiconductor devices. Provides detailed insight into the internal workings of the "building-block" device structures such as the pn-junction diode, Schottky diode, BJT, and MOSFET. Presents information about a wide variety of other devices including solar cells, LEDs, HBTs, and modern field-effect devices. Systematically develops the analytical tools needed to solve practical device problems.

Credits: 3.00

ECE 30600 - Electronic Circuits And Systems Laboratory

Credit Hours: 1.00. Experiments in electronic circuits and systems, including spectral analysis techniques, sampling, distortion measurements, random signals, signal-to-noise ratio and correlation.

Credits: 1.00

ECE 30653 - Introduction To Nanotechnology And Quantum Science & Technology

Credit Hours: 3.00. This interdisciplinary course offers an introduction to nanotechnology and quantum science and technology for undergraduate students in science and engineering. The students will develop understanding of interdisciplinary nature of these fields and utilize concepts in physics, chemistry and mechanics to describe and analyze unique properties of quantum and nanoscale objects. The course will provide the opportunity to get exposed to highly interdisciplinary nature of today's most active and rapidly expanding fields of research and technologies.

Learning Outcomes: 1. Define major types of nanoparticles and their sources. 2. Illustrate by simple calculations unique physical properties of nanoscale objects, e.g. calculate de Broglie wavelength, surface energy, melting point. 3. Describe basic nanostructure measurement methods. 4. Give examples of economic benefits of nano and quantum technology. 5. Describe approaches for managing security, health and environmental risks. Credits: 3.00

ECE 30700 - Electromagnetic Fields And Waves Laboratory

Credit Hours: 1.00. Experimental exercises illustrating concepts in electric and magnetic fields, transmission lines, electromagnetic fields, simple waveguides, and antennas.

Credits: 1.00

ECE 30800 - Systems Simulation And Control Laboratory

Credit Hours: 1.00. Instruction and laboratory exercises in the solution of differential equations that arise in the modeling of physical systems. Instruction in the principles of operation and design of linear control systems.

Credits: 1.00

ECE 30834 - Fundamentals Of Computer Graphics

Credit Hours: 3.00. Fundamental principles and techniques of computer graphics. The course covers the basics of going from a scene representation to a raster image using OpenGL. Specific topics include coordinate manipulations, perspective, basics of illumination and shading, color models, texture maps, clipping and basic raster algorithms, fundamentals of scene constructions. Permission of department required.

Learning Outcomes: 1. An understanding of the design issues for creating raster graphics. 2. An ability to apply rendering techniques to an actual computer graphics problem and associated datasets. 3. An understanding of object transformations, representations, transformations and perspective projections. 4. An understanding of color, illumination, and shading techniques. 5. An understanding of the rendering and rasterization techniques. 6. An understanding of the application of computer graphics techniques to visualization, animation,

and computer aided design. Credits: 3.00

ECE 30861 - Software Engineering

Credit Hours: 3.00. Introduction to the technical and social aspects of software engineering principles, with special emphasis on the process, methods, and tools needed to develop and test quality software products and systems.

Learning Outcomes: 1. Conduct object-oriented design and use unified modeling language. 2. Understand different models of software development processes. 3. Analyze requirements and write project specifications. 4. Develop a team software project on time and meet the specifications successfully. Credits: 3.00

ECE 30862 - Object-Oriented Programming In C++ And Java

Credit Hours: 3.00. C++ and Java programming languages, including classes, inheritance, encapsulation, polymorphism, class derivation, abstract classes, interfaces, static class members, object construction and destruction, namespaces, exception handling, function, overloading and overriding, function name overload resolution, container classes, and template classes.

Learning Outcomes: 1. An understanding of the concepts of inheritance and polymorphism. 2. An ability to overload operators in C++. 3. An understanding of the difference between function overloading and function overriding. 4. An ability to incorporate exception handling in object-oriented programs. 5. An ability to use template classes and the STL Library in C++. 6. An ability to write object-oriented programs of moderate complexity in Java. 7. An ability to write programs with multiple threads and use synchronization among threads. Credits: 3.00

ECE 30864 - Software Engineering Tools

Credit Hours: 1.00. This course will acquaint students with the toolkit of the modern software engineer. Students will learn the tools surrounding the software application itself, e.g., tools for software process, software construction, and software deployment. Examples include: integrated development editors (IDEs), version control systems, project management, bug tracking, scripting languages, testing aids, deployment technologies.

Learning Outcomes: 1. Use orchestration languages to manipulate diverse software systems. 2. Understand testing tools to assess software reliability and correctness. 3. Use software management tools. 4. Have an awareness of software deployment technologies and tradeoffs. Credits: 1.00

ECE 31032 - Power Systems Engineering

Credit Hours: 3.00. Introduction to the economic operation of power systems, three-phase circuit analysis, modeling of transformers and transmission lines, steady-state network analysis using a power flow, analysis during faults and state estimation.

Learning Outcomes: 1. Understand the function of the main components in a power system, and the basis of their circuit models. 2. Build a system representation from components' circuit models and to apply solution techniques to certain operational needs. Credits: 3.00

ECE 31033 - Power Electronics

Credit Hours: 3.00. Introduction to the fundamental operating principles of power conditioning circuits that are currently being used to effect power flow from AC to DC and vice versa. Emphasis is on the relationship between form and function of these circuits. Circuits discussed will include AC/DC line-commutated converters, DC/DC converters, DC/variable frequency converters, resonant converters, and AC/AC converters. Computer simulations will be used as a part of the coursework.

Learning Outcomes: 1. Apply knowledge obtained in earlier coursework and to obtain new knowledge necessary to design and test a microcontroller-based digital system. 2. Understand the engineering design process. 3. Function on a multidisciplinary team. 4. Be aware of professional and ethical responsibility. 5. Communicate effectively, in both oral and written form. Credits: 3.00

ECE 31100 - Electric And Magnetic Fields

Credit Hours: 3.00. Continued study of vector calculus, electrostatics, and magnetostatics, and Maxwell's equations. Introduction to electromagnetic waves, transmission lines, and radiation from antennas.

Credits: 3.00

ECE 31500 - Fundamentals Of Electrical Energy Engineering

Credit Hours: 3.00. Resistive circuit analysis with controlled sources. Sinusoidal frequency response, filters and Bode plots. Complex power in AC circuits, ideal transformers and three-

phase power. Power electronic circuits including diodes, transistor switches, rectifiers and AC-DC converters. Magnetic circuits, magnetic materials and B-H curves. Transformer equivalent circuit models. No credit will be given for ECE majors.

Learning Outcomes: 1. Apply knowledge of mathematics, science, and engineering. 2. Design and construct experiments, as well as to analyze and interpret data. 3. Design a system, component, or process to meet desired needs within realistic constraints such as economic, environmental, societal, political, ethical, health and safety, manufacturability, and sustainability. 4. Function on multi-disciplinary teams. 5. Identify, formulate, and solve engineering problems. 6. Understanding of professional and ethical responsibility. 7. Communicate effectively. Credits: 3.00

ECE 32100 - Electromechanical Motion Devices

Credit Hours: 3.00. The general theory of electromechanical motion devices relating electric variables and electromagnetic forces. The basic concepts and operational behavior of DC, induction, brushless DC, and stepper motors used in control applications are presented.

Learning Outcomes: 1. Analyze/design electromagnetic circuits/devices. 2. Understand the concepts and principles of electromagnetic energy conversion. 3. Understand the concept of time-varying transformations in the analysis of time-varying systems. 4. Analyze dc machines. 5. Understand converters for dc drives. 6. Analyze brushless dc machines. 7. Analyze induction machines. Credits: 3.00

ECE 32300 - Electromechanical Motion Devices And Systems Laboratory

Credit Hours: 1.00. Experiments closely coordinated with ECE 32100 involving measurement of fundamental parameters of various electromechanical devices using modern instrumentation techniques. Computer simulation is used to predict steady-state and dynamic operating characteristics. Comparison of predicted and measured performance is emphasized.

Learning Outcomes: N/A Credits: 1.00

ECE 32600 - Engineering Project Management

Credit Hours: 3.00. (ME 32600) Project management is an important skill that is needed in the private and public sectors as well as specialty businesses. This course will explore the challenges facing today's project managers and will provide a broad understanding of the project management environment focused on multiple aspects of the project.

Learning Outcomes: 1. Use library resources and internet resources to find information necessary for the project. 2. Use critical thinking in its design process. 3. Use creative approaches when necessary to obtain project objectives. 4. Analyze and interpret data. 5. Function effectively on a multi-disciplinary team through mutual support, consensus seeking, cooperation, and sharing responsibility. 6. Write a project report, adhering to the specified format using an appropriate writing style, grammar, and spelling. 7. Make an oral presentation using effective visual aids. 8. An understanding of professional and ethical responsibility. 9. The broad education necessary to understand the impact of engineering solutions in a global, economic, environmental, and societal context. 10. An ability to use the techniques, skills, and modern engineering tools necessary for engineering practice. Credits: 3.00

ECE 32700 - Engineering Economics

Credit Hours: 3.00. (ME 32700) Engineering Economics is designed as an overview of economics with a focus on how it relates to the practice of engineering. Topics include interest formulas, rate of return, life cost analysis, depreciation, taxes, and cash flow.

Learning Outcomes: 1. Understand the terminology used in engineering economic analysis. 2. Understand time-value-of-money concepts such as net present worth analysis, equivalent uniform annual worth analysis, benefit/cost analysis, internal rate of return analysis, loans, leveraging, and fixed-income investment analysis. 3. Understand the criteria for making economic-based decisions. 4. Analyze before-tax and after-tax cash flows. 5. Understand economic risk analysis techniques. 6. Conduct minimum life cycle cost tradeoffs between initial and repair costs. 7. Formulate economic solutions to real-world case study

problems. 8.Demonstrate capability to use Excel spreadsheet analysis in solving economic problems. 9. Experience working in a project team to solve an economic problem and make a presentation of the solution using PowerPoint. 10. Write a project report, adhering to the specified format for business reports using appropriate writing style, grammar, and spelling. 11. Learn how to estimate costs and perform an economic analysis in support of capstone design and other term projects. 12. Develop cash flow analysis problem solving techniques for passing exams including the Engineering Economics portions of the EIT exam. Credits: 3.00

ECE 33700 - ASIC Design Laboratory

Credit Hours: 2.00. Introduction to standard cell design of Application Specific Integrated Circuits (ASICs) using modern hardware description languages (HDLs). Emphasis on how to write HDL code that will map readily to hardware. Laboratory experiments using commercial grade computer-aided design (CAD) tools for HDL based design, logic simulation, automatic placement and routing, timing analysis and verification.

Learning Outcomes: 1. Design combinational and sequential logic in a variety of styles and awareness of resource usage. 2. Use, modify, create scripts to control logic synthesis. 3. Create a test bench and use it to verify a design that incorporates multiple sequential blocks. 4. Place, route, and verify timing of an ASIC design. 5. Determine the RTL architecture implied by HDL code of moderate complexity. 6. Explain the difference between various ASIC and digital system design approaches - standard cell, full custom, and programmable device. Credits: 2.00

ECE 34000 - Simulation, Modeling, and Identification

Credit Hours: 3.00. Investigation and evaluation of design problems through simulation of systems described by ordinary differential and difference equations. Development of simulation models from physical parameters and from experimental data. Topics include continuous, discrete, and hybrid models of electrical, mechanical, and biological systems. Laboratory experiences demonstrate concepts studied in text and lecture.

Credits: 3.00

ECE 36200 - Microprocessor Systems And Interfacing

Credit Hours: 4.00. An introduction to basic computer organization, microprocessor instruction sets, assembly language programming, and microcontroller peripherals.

Learning Outcomes: 1. Show ability to program a microcontroller to perform various tasks. 2. Show an ability to interface a microcontroller to various devices. 3. Show an ability to effectively utilize microcontroller peripheral. 4. Show an ability to design and implement a microcontroller-based embedded system. Credits: 4.00

ECE 36800 - Data Structures

Credit Hours: 3.00. Provides insight into the use of data structures. Topics include stacks, queues and lists, trees, graphs, sorting, searching, and hashing.

Learning Outcomes: 1. Understand various basic data structures, including stacks, queues, and trees. 2. Able to analyze time complexity and space complexity of algorithms. 3. Able to apply appropriate sorting and searching algorithms for a given application. 4. Able to apply graph theoretic techniques, data structures and algorithms for problem solving. 5. Able to design and implement appropriate data structures and algorithms for engineering applications. Credits: 3.00

ECE 36900 - Discrete Mathematics For Computer Engineering

Credit Hours: 3.00. This course introduces discrete mathematical structures and finite-state machines. Students will learn how to use logical and mathematical formalisms to formulate and solve problems in computer engineering. Topics include formal logic, proof techniques, recurrence relations, sets, combinatorics, relations, functions, algebraic structures, and finite-state machines.

Credits: 3.00

ECE 38199 - Professional Practice Co-Op I

Credit Hours: 0.00. To obtain professional practice with qualified employers within industry, government, or small business. Permission of department required.

Credits: 0.00

ECE 38200 - Feedback System Analysis And Design

Credit Hours: 3.00. In this course, classical concepts of feedback system analysis and associated compensation techniques are presented. In particular, the root locus, Bode diagram, and Nyquist criterion are used as determinants of stability.

Credits: 3.00

ECE 38299 - Professional Practice Co-Op II

Credit Hours: 0.00. To obtain professional practice with qualified employers within industry, government, or small business. Permission of department required.

Credits: 0.00

ECE 38399 - Professional Practice Co-Op III

Credit Hours: 0.00. To obtain professional practice with qualified employers within industry, government, or small business. Permission of department required.

Credits: 0.00

ECE 39399 - Cooperative Experience III

Credit Hours: 0.00. Professional experience in electrical and/or computer engineering. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.

Learning Outcomes: 1. Apply knowledge to identifying and solving problems in the professional context. 2. Advance skills related to professional preparation, critical thinking, problem solving, communication, and teamwork. 3. Increase understanding of the profession and practice, basic industry principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

ECE 39401 - Professional Communications And Diversity

Credit Hours: 1.00. This course provides ECE students with practice in relevant aspects of communication. Topics include: successfully seeking employment, working effectively in teams, delivering engaging presentations, and leveraging the advantages and challenges of diversity and inclusion.

Learning Outcomes: 1. Ability to function effectively on a team whose members create a collaborative and inclusive environment, plan tasks, and meet objectives. 2. Communicate effectively with a range of audiences. 3. Develop and explain solutions to engineering problems, taking public health and cultural factors into consideration. Credits: 1.00

ECE 39499 - Extensive Cooperative Experience IV

Credit Hours: 0.00. Professional experience in electrical and/or computer engineering. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.

Learning Outcomes: 1. Apply knowledge to identifying and solving problems in the professional context. 2. Advance skills related to professional preparation, critical thinking, problem solving, communication, and teamwork. 3. Increase understanding of the profession and practice, basic industry principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

ECE 39595 - Selected Topics In Electrical And Computer Engineering

Credit Hours: 1.00 to 5.00. Topics vary. Permission of department required.

Learning Outcomes: 1. Able to apply knowledge of mathematics, science and engineering. 2. Able to design and conduct experiments, as well as to analyze and interpret data. 3. Able to design a system, component, or process to meet desired needs. 4. Able to function on a multidisciplinary team. 5. Able to identify, formulate, and solve engineering problems. 6. Understand the professional and ethical responsibility. 7. Able to communicate effectively. 8. Understand the impact of engineering solutions in a global and societal context. 9. Recognize the need for, and an ability to engage in, life-long learning. 10. Know the contemporary issues. 11. Able to use the techniques, skills, and modern engineering tools necessary for engineering practice. Credits: 1.00 to 5.00

ECE 39599 - Extensive Cooperative Experience V

Credit Hours: 0.00. Professional experience in electrical and/or computer engineering. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.

Learning Outcomes: 1. Apply knowledge to identifying and solving problems in the

professional context. 2. Advance skills related to professional preparation, critical thinking, problem solving, communication, and teamwork. 3. Increase understanding of the profession and practice, basic industry principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

ECE 39600 - Industrial Practice Seminar I

Credit Hours: 1.00. A special seminar for cooperative education and curricular practical training students. Permission of instructor required.

Learning Outcomes: 1. Understanding of how an engineering internship or co-op work experience benefits academic and career goals. Credits: 1.00

ECE 39699 - Professional Practice Internship

Credit Hours: 0.00. To obtain professional practice with qualified employers within industry, government, or small business. Permission of department required.

Credits: 0.00

ECE 40020 - Sound Reinforcement System Design

Credit Hours: 3.00. An introduction to computational tools used in the measurement and analysis of electro-acoustic systems, and their application to sound reinforcement system engineering. Service learning based projects, serving the needs of community clients, provide the context for application of sound reinforcement system design principles and practices.

Learning Outcomes: 1. An ability to apply knowledge obtained in earlier coursework and to obtain new knowledge necessary to design a sound reinforcement system. 2. An understanding of the engineering design process. 3. An ability to function on a multidisciplinary team. 4. An awareness of professional and ethical responsibility. 5. An ability to communicate effectively, in both oral and written form. Credits: 3.00

ECE 40100 - Engineering Ethics and Professionalism

Credit Hours: 1.00. Some ethical, social, political, legal, and ecological issues that practicing engineers may encounter. (ECE 401 and ME 401 are cross-listed courses; students may not get credit for both ECE 401 and ME 401.)

Credits: 1.00

ECE 40400 - Introduction To Computer Security

Credit Hours: 3.00. Introduction to security issues related to the operation of computers and the workings of computer networks. Topics covered include introduction to cryptography, authentication protocols, digital signature algorithms, internet vulnerabilities, worms and virus propagation, denial of service attacks, etc. The students will also learn how to design firewalls to protect a system against unwanted intrusions. Permission of department required.

Credits: 3.00

ECE 40655 - Digital Integrated Circuit Analysis And Design

Credit Hours: 3.00. As applied to digital integrated circuits, the MDs transistor is studied in depth-from its fabrication to its electrical characteristics. Combinational, sequential, and dynamic logic circuits are considered. While the focus of the course is on CMOS technology, bipolar, nMOS, and BiCMOS circuits are introduced as well. SPICE is used as both an analysis and design tool. Semiconductor memory circuits are also discussed.

Learning Outcomes: 1. Demonstrate a basic knowledge of CMOS IC processing and layout. 2. Demonstrate an understanding of CMOS inverter operation, both static and dynamic. 3. Demonstrate an understanding of CMOS combinational logic circuit design and analysis. 4. Demonstrate an understanding of basic CMOS arithmetic circuits. 5. Demonstrate an understanding of CMOS digital array design. 6. Demonstrate an understanding of basic CMOS sequential logic analysis. 7. Demonstrate an understanding of memory technologies and designs. 8. Demonstrate an ability to design, and analyze and simulate a CMOS digital circuit. Credits: 3.00

ECE 40656 - CMOS Analog And Mixed Signal Integrated Circuits

Credit Hours: 3.00. This course is a review of technology and modeling of CMOS transistors; Analysis, and design of CMOS monolithic integrated circuits for analog and mixed-signal applications. Consideration of amplifier circuit design, and fabrication techniques with circuit simulation using Cadence. Simple and advanced CMOS operational amplifiers, comparators, sample and hold circuits, switch capacitor circuits and data converters; Design of analog and mixed-signal circuit building blocks.

Learning Outcomes: 1. Design a simple single-stage amplifier in a standard CMOS technology and verify the design using simulation. 2.

Design a simple CMOS operational amplifier and verify the design using simulation. 3. Design an advanced operational amplifier in a standard CMOS technology and verify the design using simulation. 4. Analyze a voltage comparator in a standard CMOS technology and verify the design using simulation. 5. Analyze a sample and hold circuit and perform simulations. 6. Analyze a switched capacitor circuit and perform simulations. 7. Analyze a data-convertor circuit. Credits: 3.00

ECE 40801 - Introduction To Computer Vision

Credit Hours: 3.00. This course is an introduction to computer vision. The course will cover both classical and deep-learning approaches to recognizing objects in images and activities in video. Topics to be covered include scene classification, object localization, segmentation, and activity recognition. The course will cover both the theory behind methods to solve these problems as well as how they are implemented in systems like PyTorch. Permission of department required.

Learning Outcomes: 1. Construct and train a neural network. 2. Construct and train an object detector. 3. Construct and train an activity classifier. 4. Work in a team to construct a solution to a computer vision problem. Credits: 3.00

ECE 40802 - Introduction To Natural Language Processing

Credit Hours: 3.00. This course is an introduction to modern natural language processing and computational linguistics. This course covers morphological, syntactic, semantic, and pragmatic processing as well as applications such as information extraction, question answering, and machine translation. This course will cover fundamental topics as well as recent advances from the literature.

Learning Outcomes: 1. Design and implement a natural language parser. 2. Construct a semantic representation from natural-language input. 3. Train and use a neural network for NLP. 4. Use natural-language technology to construct and demo a new application. Credits: 3.00

ECE 40862 - Software For Embedded Systems

Credit Hours: 3.00. This course provides an introduction to software design for embedded computing systems. Major topics covered include the importance of time and timing in embedded systems, embedded software organization (FSM-based program design, polled loop systems, foreground-background systems, event driven architectures, multi-tasking, etc.), real-time scheduling and real-time operating systems, wired/wireless networked embedded systems, debugging techniques for embedded software, and advanced topics such as memory-safe programming, implementing reentrant functions, and minimizing code space, memory usage, and power consumption. The course features a series of integrated assignments using state-of-the-art embedded hardware platforms, embedded software design tools, and real-time operating systems that reinforce the concepts taught in the lectures.

Learning Outcomes: 1. Understand the embedded software design process and tools used. 2. Understand various software architectures for embedded systems. 3. Apply advanced debugging techniques to embedded software. 4. Analyze and implement real-time embedded applications. 5. Design and implement distributed applications for networked embedded systems. Credits: 3.00

ECE 40875 - Data Mining Basic Concepts And Techniques

Credit Hours: 3.00. This course introduces fundamental techniques in data mining, such as the techniques that extract useful knowledge from a large amount of data. Topics include data preprocessing, exploratory data analysis, association rule mining, clustering, classification, anomaly detection, recommendation and graph analysis. The applications of these techniques in real-world decision making in various domains, such as science, business, biology, health care, transportation, will be discussed.

Learning Outcomes: 1. Describe and explain the process of data mining. 2. Formulate problems in real-world applications into data mining tasks and solve the problems using data mining techniques. 3. Implement software programs that conduct data mining and evaluate the output of data mining programs. 4. Work in a team and present data mining solutions to people in scientific or other disciplines. Credits: 3.00

ECE 41015 - Introduction To Smart Grid

Credit Hours: 3.00. This course is an introduction to the concepts of data communications, cybersecurity, and information privacy on a smart-grid environment. Understanding the differences between power grid employed worldwide since the end of the 19th century and the new power grid system with

distributed energy sources, this course outlines the key issues involved in enhancing: the distribution system, engaging electricity demand and utility regulation. Students will learn the main challenges and solutions to mitigate the issues associated with the integration of variable energy resources, transmission expansion and the impact of distributed generation and electric vehicles.

Learning Outcomes: 1. Describe the operation of conventional power grid systems including its generation, transmission and distribution, and the new power grid system with distributed energy sources along the transmission and distribution lines. 2. Develop simplified models to describe different components on both traditional and the smart grid. 3. Design and specify renewable energy systems (e.g., solar and wind energy sources) as well as storage devices (e.g., batteries) connected to the smart grid. 4. Develop load flow analysis of power grids. 5. Understand the main data communications standards. 6. Classify the cybersecurity vulnerabilities and understand the risks of an attack on the grid. Credits: 3.00

ECE 41023 - Electromechanical Motion Control

Credit Hours: 3.00. The operation, analysis, and control of electromechanical systems are covered, including a treatment of electromechanical devices, power electronics, and control systems. Sample applications include servo-systems, propulsion drives, and variable-speed rotational equipment.

Learning Outcomes: 1. Understand the structure, design, and operating characteristics of dc drive systems including dc/dc converters, associated switching strategies, dynamic-average-value models, and speed/position/trajectory motion control systems. 2. Understand the structure, design and operating characteristics of brushless dc drive systems including dc/ac inverters, associated switching strategies, dynamic-average-value models, and speed/position/trajectory motion control systems. 3. Understand the operating principles and control of stepper motors including the design of optimum acceleration/deceleration profiles. 4. Understand the operating principles and control of field-oriented induction motor drives. 5. Understand the structure, operating characteristics, and modeling of switched reluctance motor drive systems. Credits: 3.00

ECE 41200 - Introduction To Engineering Optics

Credit Hours: 3.00. The control and characteristics of optical radiation are covered. Applications to optical instrumentation, thin films, holography, and polarizing optics are discussed.

Learning Outcomes: 1. Analyze simple optical systems (dielectric slabs, thin lenses, reflectors). 2. Model Gaussian beams and the transformation of beams. 3. Analyze and design polarization systems, including polarizers and wave plates. 4. Know optical interferometers and the operations of interferometers such as the Michelson, Fabry-Perot and double-slit. 5. Analyze diffraction patterns. Credits: 3.00

ECE 41300 - Introduction To Optics Laboratory

Credit Hours: 1.00. A set of laboratory experiments dealing with fundamentals and applications of geometrical optics, polarization optics, wave optics, and Fourier optics.

Learning Outcomes: 1. Design, construct, and test a simple optical system by assembling a set of optical components. 2. Test the operation of simple interferometers. 3. Make holograms using lab equipment. 4. Design practical optical system (e.g.; barcode scanner, laser microphone, etc.) and analyze its performance. Credits: 1.00

ECE 41400 - Elements Of Electro And Fiber Optics

Credit Hours: 3.00. Introduction to the use of lasers, fiber and integrated optical components and devices in communication and sensory applications. Topics include generation, transformation, modulation, deflection, and detection of laser beams, and their applications in fiber communication sensory systems.

Credits: 3.00

ECE 41500 - Electro- And Fiber Optics Laboratory

Credit Hours: 1.00. Laboratory exercises in lasers, hologram, modulation and deflection of laser beams, fiber components, and systems.

Credits: 1.00

ECE 43200 - Elements Of Power System

Engineering

Credit Hours: 3.00. Fundamental concepts of power system analysis, transmission line parameters, basic system models, steady-state performance, network calculations, power flow solutions, fault studies, symmetrical components, operating strategies, and control.

Learning Outcomes: 1. Understand the function of the main components in a power system, and the basis of their circuit models. 2. Able to build a system representation from components' circuit models and to apply solution techniques to certain operational needs. Credits: 3.00

ECE 43201 - Elementary Power Systems Engineering

Credit Hours: 3.00. Fundamental concepts of power systems analysis, transmission line parameters, basic system models, steady state performance, network calculations, power flow solutions, fault studies, symmetrical components, operating strategies and control.

Learning Outcomes: 1. Understand the functions of the main components in a power system, and the basis of their circuit models. 2. Build a system representation from components' circuit models and to apply solution techniques to certain operational needs. Credits: 3.00

ECE 43500 - Object-Oriented Design Using C++ And Java

Credit Hours: 3.00. Review of OO design with C++ and Java. Difficulties caused by multiple inheritances in C++. Taking advantage of Run-Time Identification in C++. Multi-threading, AWT, and Network Programming in Java. Discussion of Java applets, beans, and servlets. Unified modeling language. Use-case analysis. Constructing conceptual models. System sequence diagrams. "Gang of Four" design patterns. Case studies. Permission of instructor required.

Credits: 3.00

ECE 43700 - Computer Design And Prototyping

Credit Hours: 4.00. An introduction to computer organization and design, including instruction set selection, arithmetic logic unit design, datapath design, control strategies, pipelining, memory hierarchy, and I/O interface design.

Credits: 4.00

ECE 43800 - Digital Signal Processing With Applications

Credit Hours: 4.00. The course is presented in five units. Foundations: the review of continuous-time and discrete-time signals and spectral analysis; design of finite impulse response and infinite impulse response digital filters; processing of random signals. Speech processing; vocal tract models and characteristics of the speech waveform; short-time spectral analysis and synthesis; linear predictive coding. Image processing: two-dimensional signals, systems and spectral analysis; image enhancement; image coding; and image reconstruction. The laboratory experiments are closely coordinated with each unit. Throughout the course, the integration of digital signal processing concepts in a design environment is emphasized.

Credits: 4.00

ECE 44000 - Transmission Of Information

Credit Hours: 4.00. Analysis and design of analog and digital communication systems. Emphasis on engineering applications of theory to communication system design. The laboratory introduces the use of advanced engineering workstations in the design and testing of communication systems.

Learning Outcomes: 1. Recognize and analyze in the time and frequency domain the performance of amplitude and frequency modulated analog communications systems in the presence of noise. 2. Understand the importance, computation, and measurement using modern test equipment of standard performance measures of analog systems, which include bandwidth and signal to noise ratio. 3. Recognize and analyze in the time and frequency domains the performance of various digital modulation formats, including ASK, QAM, PSK, and FSK in the presence of noise. 4. Understand the importance, computation, and measurement using modern test equipment of standard performance measures of digital systems which include bandwidth and hit error probability. 5. Understand the basics of information theory and error control codes including the effect of error control codes on the bandwidth and bit error probability of digital systems. Credits: 4.00

ECE 44100 - Distributed Parameter Systems

Credit Hours: 3.00. Transient and steady-state behavior of transmission lines, wave guides, antennas, propagation, noise, microwave sources, and system design.

Credits: 3.00

ECE 45300 - Fundamentals Of Nanoelectronics

Credit Hours: 3.00. Nanoelectronic devices are an integral part of our life, including the billion-plus transistors in every smartphone, each of which has an active region that is only a few hundred atoms long. This course is designed to convey the

key concepts developed in the last 25 years which constitute the fundamentals of nanoelectronics and mesoscopic physics, assuming a minimal set of prerequisites. Topics covered include the new Ohm's law, conductance quantization, the nanotransistor, spin valves, thermoelectricity, quantum systems and the non-equilibrium Green's function (NEGF) method.

Learning Outcomes: 1. Ability to perform semiclassical analysis of charge flow in nanoelectonic devices. 2. Ability to perform semiclassical analysis of spin flow and heat flow in nanoelectronic devices. 3. Ability to perform quantum analysis of nanoelectonic devices.

Credits: 3.00

ECE 45500 - Integrated Circuit Engineering

Credit Hours: 3.00. Analysis, design, and fabrication of silicon bipolar and MOSFET monolithic integrated circuits. Consideration of amplifier circuit design and fabrication techniques with circuit simulation using Spice-2. Integrated operational amplifiers with difference amplifiers, current sources, active loads, and voltage references. Design of IC analog circuit building blocks.

Credits: 3.00

ECE 45600 - Digital Integrated Circuit Analysis And Design

Credit Hours: 3.00. As applied t digital integrated circuits, the MDs transistor is studied in depth-from its fabrication to its electrical characteristics. Combinational, sequential, and dynamic logic circuits are considered. While the focus of the course is on CMOS technology, bipolar, nMOS, and BiCMOS circuits are introduced as well. SPICE is used as both an analysis and design tool. Semiconductor memory circuits are also discussed.

Credits: 3.00

ECE 45700 - Electronic Design Laboratory

Credit Hours: 1.00. Laboratory exercises illustrating the design and application of electronic circuits. Case studies of circuits presently in existing instruments, such as the color television receiver sampling oscilloscope, are used as a basis for the circuits investigated or designed. Pulse and analog circuits studied, as well as high voltage and power supplies. Signal processing, modulation, and sampling are used to demonstrate the circuits as interconnected into a complete system.

Credits: 1.00

ECE 46300 - Introduction To Computer Communication Networks

Credit Hours: 3.00. An introduction to the design and implementation of computer communication networks. The focus is on the concepts and the fundamental design principles that have contributed to the global Internet success. Topics include: digital transmission and multiplexing, protocols, MAC layer design (Ethernet/802.11), LAN interconnects and switching, congestion/flow/error control, routing, addressing, performance evaluation, internetworking (Internet) including TCP/IP, HTTP, DNS etc. This course will include one or more programming projects.

Learning Outcomes: 1. An understanding of the fundamental principles underlying packet switching networks, and different Local Area Network technologies. 2. An ability to implement network protocols using network socket programming. 3. An understanding of the key principles behind retransmission protocols, congestion control algorithms, and TCP. 4. An understanding of the basic concepts of routing.

Credits: 3.00

ECE 46800 - Introduction To Compilers And Translation Engineering

Credit Hours: 4.00. The design and construction of compilers and other translators. Topics include compilation goals, organization of a translator, grammars and languages, symbol tables, lexical analysis, syntax analysis (parsing), error handling, intermediate and final code generation, assemblers, interpreters, and an introduction to optimization. Emphasis is on engineering a compiler or interpreter for a small programming language - typically a C or Pascal subset. Projects involve the stepwise implementation (and documentation) of such a system. Department permission required.

Credits: 4.00

ECE 46900 - Operating Systems Engineering

Credit Hours: 4.00. The design and construction of operating systems for both individual computers and distributed (networked) systems. Basic concepts and methods for managing processor, main memory, block-structured storage, and network resources are covered. Detailed examples are taken from a number of operating systems, emphasizing the techniques used in networked versions of UNIX. These techniques are applied to design improvements of portions of a simplified, networked, UNIX-based operating system; the improvements are implemented and their performance is evaluated in laboratory experiments.

Credits: 4.00

ECE 47000 - Curricular Practical Training

Credit Hours: 0.00. An electrical and/or computer engineering work experience. This internship experience is intended to complement the student's academic plan of study and help prepare him/her for his/her future role as a practicing engineer. A letter from the prospective employer stating the period of employment, hours per week, job title, job qualifications, and job minimum period of employment is required. This course may not be taken in successive semesters. Permission of department required.

Credits: 0.00

ECE 47001 - Part-Time Curricular Practical Training

Credit Hours: 0.00. A part-time electrical and/or computer engineering work experience. This internship experience is intended to complement the student's academic plan of study and help prepare him/her for his/her future role as a practicing engineer. Permission of department required.

Learning Outcomes: 1. Apply knowledge to identifying and solving problems in the professional context. 2. Build skills realted to professional preparation, critical thinking, problem solving, communication, and teamwork. 3. Increase understanding of the profession and practice, basic professional principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

ECE 47100 - Embedded Microcontroller, Microprocessor, and DSP-Based Systems

Credit Hours: 3.00. A structured approach to the development and integration of embedded microcontroller/microprocessor/DSP-based systems. The course provides students with design experience of embedded systems. The course covers the microprocessor selection, the configuration of peripheral components, and the hardware abstraction techniques. The course also covers the C programming techniques for embedded systems and using a fixed point microprocessor for floating point calculations.

Credits: 3.00

ECE 47300 - Introduction To Artificial Intelligence

Credit Hours: 3.00. The course introduces fundamental areas of artificial intelligence: knowledge representation and reasoning; machine learning; planning; game playing; natural language processing; and vision.

Learning Outcomes: No change Credits: 3.00

ECE 47700 - Digital Systems Senior Project

Credit Hours: 4.00. A structured approach to the development and integration of embedded microcontroller hardware and software that provides senior-level students with significant design experience applying microcontrollers to a wide range of embedded systems (e.g., instrumentation, process control, telecommunications, and intelligent devices). The primary objective is to provide practical experience developing integrated hardware and software for embedded microcontroller systems in an environment that models one which students will most likely encounter in industry. Permission of instructor required.

Learning Outcomes: 1. Apply knowledge obtained in earlier coursework and to obtain new knowledge necessary to design and test a microcontroller-based digital system. 2. Understand the engineering design process. 3. Function on a multidisciplinary team. 4. Be aware of professional and ethical responsibility. 5. Communicate effectively, in both oral and written form. Credits: 4.00

ECE 48300 - Digital Control Systems Analysis And Design

Credit Hours: 3.00. The course introduces feedback computer controlled systems, the components of digital control systems, and system models on the z-domain (z-transfer functions) and on the time domain (state variable representations.) The objectives for system design and evaluation of system performance are considered. Various discrete-time controllers are designed including PID-controllers, state and output feedback controllers, and reconstruction of states using observers. The systems with the designated controllers are tested by simulations.

Learning Outcomes: 1. Understand digital feedback control systems. 2. Know constructing discrete-time mathematical model system. 3, Know the analyzing system behavior using discrete-time model and evaluating the system performance. 4. Know to use controller design techniques to make the system behavior satisfy specified design objectives. 5. Evaluate and test the system performance using digital simulations. Credits: 3.00

ECE 49022 - Electrical Engineering Senior Design Projects

Credit Hours: 4.00. Lecture sessions provide the student with background information on the design and management of projects. Formal lectures cover, for example, design for manufacturability, design for quality, test and evaluation, reliability and ethics, patents and copyrights, plus case studies. During the laboratory sessions, the students work in teams on challenging open-ended electrical engineering project that draws on previous coursework. Projects routinely involve standard design facets (such as consideration of alternative solutions, feasibility considerations, and detailed system descriptions) and include a number of realistic constraints (such as cost, safety, reliability, and aesthetics). Lectures require use of the I-Clicker system.

Learning Outcomes: 1. Apply knowledge obtained in earlier coursework and to obtain

new knowledge necessary to design and test a system, component, or process to meet desired needs. 2. Understand the engineering design process. 3. Function on an interdisciplinary team. 4. Acquire an awareness of professional and ethical responsibility. 5. Develop effective communication skills, both oral and written. Credits: 4.00

ECE 49401 - Professional Communication Capstone

Credit Hours: 1.00. This course provides ECE students an opportunity to refine their professional communication skills before launching into the workplace or graduate school. Topics include: ethics in ECE, workplace communication (written and verbal), and plans for professional growth.

Learning Outcomes: 1. Communicate effectively with a range of audiences. 2. Function effectively on a team whose members together create a collaborative and inclusive environment, plan tasks, and meet objectives. 3. Ability to make informed judgments based ethical and professional responsibilities in engineering situations, giving consideration to global, economic, environmental, and/or societal contexts. Credits: 1.00

ECE 49500 - Selected Topics In Electrical And Computer Engineering

Credit Hours: 1.00 to 4.00. Topics vary. Permission of department required.

Credits: 1.00 to 4.00

ECE 49595 - Selected Topics In Electrical And Computer Engineering

Credit Hours: 1.00 to 5.00. Topics vary. Permission of department required.

Learning Outcomes: 1. Able to apply knowledge of mathematics, science and engineering. 2. Able to design and conduct experiments, as well as to analyze and interpret data. 3. Able to design a system, component, or process to meet desired needs. 4. Able to function on a multidisciplinary team. 5. Able to identify, formulate, and solve engineering problems. 6. Understand the professional and ethical responsibility. 7. Able to communicate effectively. 8. Understand the impact of engineering solutions in a global and societal context. 9. Recognize the need for, and an ability to engage in, life-long learning. 10. Know the contemporary issues. 11. Able to use the techniques, skills, and modern engineering tools necessary for engineering practice. Credits: 1.00 to 5.00

ECE 49600 - Electrical And Computer Engineering Projects

Credit Hours: 0.00 to 18.00. Arrange Hours and Credit. Topics vary. Permission of department required.

Learning Outcomes: 1. Apply fundamental laws of electrical and electronic circuits to analyze systems and circuits. 2. Assemble and test circuits (virtual and real), measuring electrical quantities using standard instrumentation. 3. Decompose a system into functional blocks; and in some applications, blocks into circuits. 4. Utilize technology to control electronic circuit actions. 5. Utilize structured problem solving techniques to analyze fundamental applications in electronics. 6. Demonstrate knowledge of and apply electrical safety. Credits: 0.00 to 18.00

ECE 50024 - Machine Learning

Credit Hours: 3.00. An introductory course to machine learning, with a focus on supervised learning using linear models. The course will have four parts: (1) mathematical background on linear algebra, probability, and optimization. (2) classification methods including Bayesian decision, linear regression, logistic, regression,
and support vector machine. (3) robustness of classifier and adversarial examples. (4) learning theory on the feasibility of learning, VC dimension, complexity analysis, bias-variance analysis. Suitable for senior undergraduates and graduates with a background in probability, linear algebra, and programming.

Learning Outcomes: 1. Apply basic linear algebra, probability, and optimization tools to solve machine learning problems. 2. Understand the principles of supervised learning methodologies, and can comment on their advantages and limitations. 3. Explain the trade-os in model complexity, sample complexity, bias, variance, and generalization error in the learning theory. 4. Implement,

debug, and execute basic machine learning algorithms on computers. Credits: 3.00

ECE 50435 - Introduction To Quantum Science And Technology

Credit Hours: 3.00. This course introduces engineering students with no background in quantum mechanics to the fundamental concepts of quantum physics and how these principles are being used to create revolutionary quantum information technologies. The course aims to develop an understanding of quantum phenomena and identify engineering challenges and opportunities of various quantum information technologies. Topics covered include the fundamentals of quantum mechanics, the quantization of electrical circuits and electromagnetic fields, and the interactions between (artificial) atoms and electromagnetic fields. These topics are discussed in the context of popular hardware platforms and how they can be harnessed to create quantum computers, quantum communication systems, and quantum sensing systems.

Learning Outcomes: 1. Apply fundamental quantum mechanical principles to analyze simple quantum systems. 2. Analyze the properties of quantum electrical circuits and electromagnetic fields. 3. Analyze the interactions between (artificial) atoms and classical and quantum electromagnetic fields. 4. Use engineering judgement to assess the capabilities and challenges of revolutionary quantum technologies. Credits: 3.00

ECE 50616 - Physics And Manufacturing Of Solar Cells

Credit Hours: 3.00. This course introduces the electronic, optical and material properties and the manufacturing of photovoltaic devices. Topics include electronic charge separation, transportation and recombination; optical concentration, trapping and confinement; material preparations in photovoltaic systems; bulk crystal, thin-film and organic photovoltaic device configurations; energy storage; as well as emerging concepts in photovoltaics. Discussions also involve the process and equipment for the manufacturing of various photovoltaic modules, with special emphasis on driving down the cost of photovoltaic systems.

Learning Outcomes: 1. Understand different market segments for photovoltaics and their key requirements. 2. Understanding of p-n junctions, drift and diffusion of charges, LUMO and HOMO. 3. Extract efficiency from i-v characteristics of photovoltaic cells. Credits: 3.00

ECE 50631 - Fundamentals Of Current Flow

Credit Hours: 1.00. Traditional description of electronic motion through a solid is based on diffusive transport which means that the electron takes a random walk from the source to the drain. However, modern nanoelectronic devices often have channel lengths comparable to a mean free path so that electrons travel ballistically, or "like a bullet." This course provides a unified conceptual framework for ballistic and diffusive transport of both electrons and phonons, that is very different from what is taught in standard courses, but indispensable to understanding nanolectronic devices.

Learning Outcomes: 1. Explain the new perspective on conductivity and its relation to the standard Drude formula. 2. Evaluate quantities like the density of states, number of modes, electron density and conductivity for a given energy-momentum relation. 3. Explain concepts like the minimum interface resistance and the two Landauer formulas. Credits: 1.00

ECE 50632 - Introduction To Quantum Transport

Credit Hours: 1.00. This course introduces the Schrödinger equation, uses the tight-binding method to discuss the concept of bandstructure and E(k) relations, along with simple quantum transport problems. No prior background in quantum mechanics or statistical mechanics is assumed.

Learning Outcomes: 1. Explain tight-binding model, reciprocal lattice and evaluate dispersion relation. 2. Explain NEGF equations, dephasing, quantum point contact and evaluate quantities like the transmission, the self-energy and spectral functions. 3. Use Pauli spin matrices and evaluate quantities like spin density. Credits: 1.00

ECE 50633 - Boltzmann Law: Physics To Computing

Credit Hours: 1.00. This course introduces the key concepts of equilibrium statistical mechanics leading to the celebrated Boltzmann law and how it leads to Boltzmann machines and related concepts in modern machine learning. No prior background in statistical mechanics is assumed.

Learning Outcomes: 1. Explain the law of equilibrium and entropy. 2. Understand the operation of Boltzmann machines. 3. Understand the operation of quantum circuits. Credits: 1.00

ECE 50635 - An Introduction To Data Analysis, Design Of Experiment, And Machine Learning

Credit Hours: 1.00. This course will provide the conceptual foundation so that a student can use modern statistical concepts and tools to analyze data generated by experiments or numerical simulations. We will also discuss the principles of the design of experiments so that the data generated by experiments/simulations are statistically relevant and useful. We will conclude with a discussion of analytical tools for machine learning and principal component analysis. At the end of the course, a student will be able to use a broad range of tools embedded in MATLAB and Excel to analyze and interpret their data.

Learning Outcomes: 1. Analyze data taken from variety of sources. 2. Design randomized experiments and analyze the results. 3. Understand key machine learning algorithms and use them in illustrative examples. Credits: 1.00

ECE 50641 - Semiconductor Fundamentals

Credit Hours: 1.00. This course about semiconductors is designed to provide a foundation to understand the operation of devices such as transistors, diodes, solar cells, light-emitting devices, etc. The course does not discuss devices - it prepares students to understand the operation of semiconductor devices. The treatment is physical and intuitive, and not heavily mathematical. Technology users will gain an understanding of the semiconductor physics that is the basis for devices. Semiconductor technology developers may find it a useful starting point for diving deeper into condensed matter physics, statistical mechanics, thermodynamics, and materials science. The course presents an electrical engineering perspective on semiconductors, but those in other fields may find it a useful introduction to the approach that has guided the development of semiconductor technology for the past 50+ years. Topics include semiconductor fundamentals such as energy bands, bandgaps, effective masses, electrons and holes, and elements of quantum mechanics. The Fermi function, doping, and carrier densities are then discussed. Carrier transport and generation-recombination are examined along with the important concept of quasi-Fermi levels. The course concludes with the "semiconductor equations," which provide a complete, mathematical description of electrons and holes in semiconductors (subject to some important simplifying assumptions) and ends with a discussion of how energy band diagrams provide a qualitative solution to these equations.

Learning Outcomes: 1. Be familiar with computing basic semiconductor quantities such as electron and hole drift and diffusion currents, recombination-generation rates, and quasi-Fermi levels. 2. Simplify and apply the semiconductor equations to specific semiconductor problems. 3. Draw and interpret energy band diagrams for specific semiconductor problems. Credits: 1.00

ECE 50642 - Fundamental Of Transistors

Credit Hours: 1.00. This course is designed for anyone seeking a sound, physical, intuitive understanding of how modern transistors operate. Important technology considerations and applications of transistors are also discussed. The focus is on MOSFETs for digital logic, but other types of transistors are briefly considered. The course is broadly accessible to students with only a very basic knowledge of semiconductor physics and electronic circuits and should be useful for advanced undergraduates, beginning graduate students, as well as practicing engineers and scientists. Topics include device metrics for digital and analog circuits, traditional MOSFET theory, the virtual source model, 1D and 2D electrostatics, Landauer/transmission approach to nanotransistors, the limits of MOSFETs, as well as a quick look at HEMTs, bipolar transistors, and compact circuit models.

Learning Outcomes: 1. Understand MOSFET IV characteristics and device metrics and be able to analyze measured transistors characteristics and extract key device parameters. 2. Have a sound understanding of the physical operation of transistors and be acquainted with the traditional theory of the MOSFET. 3. Be familiar with 1D/2D/3D MOS electrostatics and appreciate the need for advanced MOSFET structures such as the FinFET. 4. Understand modern transport theory (the transmission approach) and its application to nanoscale MOSFETs. 5. Be introduced to other barrier-controlled transistors, such as HEMTs and bipolar transistors. 6. Know what a physics-based compact model is and the role they play in electronics. Credits: 1.00

ECE 50650 - Applied Quantum Computing I - Fundamentals

Credit Hours: 1.00. This fundamentals course is part 1 of the series of quantum computing courses and covers aspects from fundamentals to present-day hardware platforms to quantum software and programming. This course provides the essential foundations required to understand computing models built from the principles of quantum mechanics. This course requires a minimal set of engineering and science prerequisites but will allow students to develop a physical and intuitive understanding of the topics.

Learning Outcomes: 1. Learn the fundamental postulates of quantum mechanics and how they

can be mapped onto present-day quantum information processing models. Credits: 1.00

ECE 50651 - Applied Quantum computing II - Hardware

Credit Hours: 1.00. This course is part 2 of the series of Quantum computing courses, which covers aspects from fundamentals to present-day hardware platforms to quantum software and programming. The goal of part 2 is to provide the essential understanding of how the fundamental quantum phenomena discussed in part 1 can be realized in various material platforms and the underlying challenges faced by each platform. To this end, we will focus on how quantum bits (qubits, the building block of quantum information processing) can be defined in each platform, how such qubits are manipulated and interconnected to form larger systems, and the sources of errors in each platform. With an emphasis on present-day leading candidates, we will discuss the following specific quantum material platforms: 1) Superconductor-based and 2) Atom/ion traps-based. The material will appeal to engineering students, natural sciences students, and professionals whose interests are in using and developing quantum information processing technologies.

Learning Outcomes: 1. Understand domain-specific quantum algorithms and how to run them on present-day quantum hardware. Credits: 1.00

ECE 50652 - Applied Quantum Computing III - Software and Algorithm

Credit Hours: 1.00. This course is part III of the series of Quantum computing courses, which covers aspects from fundamentals to present-day hardware platforms to quantum software and programming. The goal of part III is to discuss some of the key domain-specific algorithms that are developed by exploiting the fundamental quantum phenomena (e.g. entanglement) and computing models discussed in part I. We will begin by discussing classic examples of quantum Fourier transform and search algorithms, along with its application for factorization (the famous Shor's algorithm). Next, we will focus on the more recently developed algorithms focusing on applications to optimization, quantum simulation, quantum chemistry, machine learning, and data science. A particularly exciting recent development has been the emergence of near-intermediate scale quantum (NISQ) computers. We will also discuss how these machines are driving new algorithmic development. A key aspect of the course is to provide hands-on training for running (few qubit instances of) the quantum algorithms on present-day quantum hardware. For this purpose, we will take advantage of the availability of cloud-based access to quantum computers and quantum software. The material will appeal to engineering students, natural sciences students, and professionals whose interests are in using as well as developing quantum technologies.

Learning Outcomes: 1. Understand how present-day material platforms are built to perform quantum information processing tasks. Credits: 1.00

ECE 50653 - Fundamentals Of Nanoelectronics

Credit Hours: 3.00. The modern smartphone is enabled by a billion-plus nano-transistors, each having an active region that is barely a few hundred atoms long. Interestingly the same amazing technology has also led to a deeper understanding of the nature of current flow on an atomic scale. The aim of this course is to make the fundamentals of nanoelectronics accessible to anyone in any branch of science or engineering, assuming very little background beyond linear algebra and differential equations, although we will be discussing advanced concepts in non-equilibrium statistical mechanics that should be of interest even to specialists. We first introduce a new perspective connecting the quantized conductance of short ballistic conductors to the familiar Ohm's law of long diffusive conductors, along with a brief description of the modern nano-transistor. We then address fundamental conceptual issues related to the meaning of resistance on an atomic scale, the interconversion of electricity and heat, the second law of thermodynamics and the fuel value of information. Finally we introduce the concepts of quantum transport as applied to modern nanoscale electronic devices.

Learning Outcomes: 1. Perform semi-classical analysis of charge flow in nanoelectronic devices. 2. Perform semi-classical analysis of the interconversion of heat and electricity in nanoelectronic devices. 3. Perform quantum analysis of nanoelectronic devices. Credits: 3.00

ECE 50836 - Introduction To Data Mining

Credit Hours: 3.00. This course introduces fundamental techniques in data mining, i.e., the techniques that extract useful knowledge from a large amount of data. Topics include data preprocessing, exploratory data analysis, association rule mining, clustering, classification, anomaly detection, recommendation and graph analysis. Students are expected to gain the skills to formulate data mining problems, solve the problems using data mining techniques and interpret the output.

Learning Outcomes: 1. Describe and explain the process of data mining. 2. Formulate problems in real-world applications into data mining tasks and solve the problems using data mining techniques. 3. Implement software programs that conduct data mining and evaluate the output of data mining programs. 4.

Present data mining solutions to people in scientific and other disciplines. Credits: 3.00

ECE 50863 - Computer Network Systems

Credit Hours: 3.00. The goal of this course is to provide students with a proper grounding in the basic concepts and seminal work in computer network protocols and systems, and to introduce students to research in the field. The course will cover classical concepts such as network architecture, switching, routing, congestion control, and quality-of-service, and discuss recent developments in these areas. The course will also cover new developments in networking such as network measurements, network management, overlay networking and peer-to-peer systems, network security, and new network architectures. The course will emphasize a system-oriented and empirical view of internet architecture. Graduate standing or consent of instructor.

Learning Outcomes: 1. Understand the architectural principles underlying internet design. 2. Understand LAN interconnects, routing algorithms, and congestion control algorithms. 3. Identify, formulate, and solve problems encountered in the design of networks. 4. Implement networking systems and rigorously evaluate them using systematic empirical methods. Credits: 3.00

ECE 51000 - Introduction To Biometrics

Credit Hours: 3.00. Biometrics is an emerging technology for automatic human identification and verification using unique biological traits. Compared to traditional identification and verification methods, biometrics is more convenient for users, reduces fraud, and is more secure. It is becoming an important ally of security, intelligence, law enforcement, and e-commerce. The principle of various biometric technologies and systems is introduced. Especially, students analyze and design fingerprint recognition, face recognition, iris recognition, voice recognition, and multimodal biometric systems. Students have hands-on experience in designing and analyzing biometric systems.

Credits: 3.00

ECE 51012 - Electromechanics

Credit Hours: 3.00. The general theory of electromechanical motion devices relating electric variables and electromagnetic forces. The basic concepts and operational behavior of dc, induction, brushless dc, and stepper motors used in control applications are presented. Prerequisite by Topic: Basic circuit analysis; Elementary electromagnetics; Elementary mechanics.

Learning Outcomes: 1. Acquire knowledge of magnetics and magnetic materials as it relates to electromechanical devices. 2. Understand the energy conversion process including field energy, co-energy, force and torque production. 3. Be familiar with the use in reference frame theory in the analysis of rotational electromechanical devices. 4. Understand the operation of rotating electric machines including stepper motors, permanent magnet ac machine, and induction machines. 5. Understand the acceptable and unacceptable practice with regard to taking exams, working on homework, working on the project, and the implications of unacceptable practices. Credits: 3.00

ECE 51018 - Hybrid Electric Vehicles

Credit Hours: 3.00. Introduction to architectures and technologies associated with electric and hybrid electric vehicles including their constituent components. Specific topics include electric and hybrid electric drive trains, energy storage (batteries/ultracapacitors, fuel cells), electromechanical energy conversion (induction and permanent magnet motors and generators), power electronics, vehicle-level modeling and control, and optimization. Prerequisite by Topic: Energy conversion and power electronics.

Learning Outcomes: 1. Understand the principal architectures of electric and hybrid electric vehicles. 2. Analyze performance characteristics and understand limitations of each architecture. 3. Understand the principal components of an HEV including the energy storage, conversion, transmission, and control subsystems. 4. Integrate disparate subsystem models to form end-to-end vehicle model. Credits: 3.00

ECE 51032 - Computational Methods For Power System Analysis

Credit Hours: 3.00. System modeling of power networks. Description of modern electricity markets. Analysis of the economic dispatch problem using optimality conditions. Planning of distributed energy resources. Smart grid applications. Machine learning applications to power systems (forecasting, demand-side management, and fault detection). Assigned projects will involve implementing some of the methods using realistic power system models.

Learning Outcomes: 1. Explain how electricity markets work and how various computational methods are used in power system operations and planning. 2. Understand formulation and solution techniques applied to normal operation

of large power systems. 3. Implement existing optimization packages to solve power system problems. 4. Use machine learning methods to answer questions about power system operations. Credits: 3.00

ECE 51100 - Psychophysics

Credit Hours: 3.00. (PSY 51100) An examination of the relationship between physical stimuli and perception (visual, auditory, haptics, etc.). Includes a review of various methods for studying this relationship and of the mathematical and computational tools used in modeling perceptual mechanisms. Permission of department required.

Credits: 3.00

ECE 51214 - CMOS Analog IC Design

Credit Hours: 3.00. The course covers general topics in CMOS analog IC design; biasing, noise, single stage amplifiers, differential amplifiers, OP-Amp, OTA, frequency domain analysis, and active filters. While the focus of the course is on CMOS IC design, design in bipolar andBi CMOS technologies are introduced as well. A design project is a key component of the course. The students conduct group or individual design projects. Process Design *Kit* and EDA tools are provided for the design projects.

Learning Outcomes: 1. Have basic knowledge of bias circuits. 2. Have basic knowledge of noise analysis. 3. Understand single-stage amplifiers and their applications. 4. Understand differential Op-amp, OTA, and practical design skills. 5. Understand feedback circuits. 6. Understand basic active filters, practical design skills, and applications. Credits: 3.00

ECE 51216 - Digital Systems Design Automation

Credit Hours: 3.00. This course will provide an introduction to the tools used to design and analyze circuits at the logic level of abstraction (where circuits are composed of gates and flip-flops). Most digital chips used in computing and electronic systems (including microprocessors, graphics processors, chips used in network routers, cell phones, digital audio/video appliances, automotive electronics) are entirely or largely designed using EDA tools. This course will focus on the foundations of logic-level EDA tools, including the design of exact and heuristic algorithms that form the basis for VLSI Computer-Aided Design. Topics covered include an overview of the IC design flow and levels of abstraction, synthesis of two-level (AND-OR / PLA) circuits, multi-level logic synthesis and technology mapping, sequential circuit synthesis, Logic-level verification using Boolean Satisfiability and BDDs, Timing Analysis, Power analysis and Reduction, and design techniques for emerging nanoscale technologies.

Learning Outcomes: 1. Design minimal combinational logic circuits. 2. Design minimal finite-state machines. Credits: 3.00

ECE 51220 - Applied Algorithms

Credit Hours: 3.00. Solving large-scale problems typically rely on many clever data structures and algorithms. This course aims to cover many such useful algorithms for solving large-scale problems. These algorithms include greedy algorithms, dynamic programming and more advanced graph algorithms. The course also aims to demonstrate how such algorithms can be applied to solve optimization problems encountered in engineering applications. In particular, applications in the design of VLSI (very large scale integration) at circuit, layout, or system level will be used to demonstrate how an engineering problem can be formulated as a tree/graph problem and solved using established tree/graph algorithms.

Learning Outcomes: 1. Demonstrate an understanding of greedy algorithms and dynamic programming (ABET outcome 1). 2. Demonstrate an n understanding of advanced graph algorithms (ABET outcome 1). 3. Demonstrate an ability to design and implement appropriate data structures and algorithms for engineering applications (ABET outcomes 1 and 2). Credits: 3.00

ECE 51300 - Diffraction, Fourier Optics, And Imaging

Credit Hours: 3.00. Modern theories of diffraction and Fourier optics for imaging, optical communications, and networking. Imaging techniques involving diffraction and/or Fourier analysis with application to tomography, magnetic resonance imaging, synthetic aperture radar, and confocal microscopy. Additional topics in optical communications and networking, including wave propagation in free space, fiber, integrated optics, and related design issues. Simulation studies, using Matlab and other software packages for analysis and design. Offered odd years.

Learning Outcomes: 1. A knowledge of a number of important technologies based on wave propagation such as digital diffractive imaging techniques and devices involving the principles of diffraction and/or Fourier analysis and synthesis techniques. 2. A knowledge of developments in the areas of device fabrication and computer technology for the fabrication of optical components and implementation of imaging/focusing modalities not possible until

recently. 3. An ability to deal with the analysis of imaging and focusing techniques involving diffraction. 4. A knowledge of a number of other topics, such as dense wavelength division multiplexing (DWDM) systems and devices, micro/nano systems in need of rigorous diffraction theory, image and phase recovery involving Fourier analysis and Fourier iterative optimization techniques, focusing of wave energy and daylighting. 5. An ability to utilize the theoretical analysis of such topics based on Fourier analysis and synthesis for system and device fabrications. Credits: 3.00

ECE 51500 - Software Engineering For Embedded Systems

Credit Hours: 3.00. This course teaches the object-oriented system analysis and design for embedded systems. Unified modeling language and Shlaer/Mellor methodology are studied. Assigned project will lead students through the cycles of information gathering, problem analysis, model design, and model implementation for software development.

Credits: 3.00

ECE 51501 - Smart Grid

Credit Hours: 3.00. The course analyzes the history of the U.S. power grid and to the basic concepts on the current electric power system. The main challenges on the transition of the traditional power system with unidirectional power flow to the new and complex system connected to renewable sources and bidirectional power flow capability is also presented in this course. In addition, the impact of distributed generation and electric vehicles is discussed along with cybersecurity and information privacy issues inherent in this new power grid.

Credits: 3.00

ECE 52301 - Nanosystems Principles

Credit Hours: 3.00. (ME 52301) This is the introductory course in the nanosystems area. It introduces students to the principles and applications of nanosystems. The course begins with an introduction to the nanometer scale phenomena. It then introduces students to the basic elements resulting in nanosystems: nanoscale materials, processes, and devices. It also provides students with a basic understanding of the tools and approaches that are used for the measurement and characterization of nanosystems, and their modeling and simulation. Moreover, the course covers the applications of nanosystems in a wide range of industries, including information technology, energy, medicine, and consumer goods. The course concludes with a discussion of the societal and economical significance of these applications, including benefits and potential risks.

Credits: 3.00

ECE 52600 - Fundamentals Of MEMS And Micro-Integrated Systems

Credit Hours: 3.00. (BME 58100) Key topics in micro-electro-mechanical systems (MEMS) and biological micro-integrated systems; properties of materials for MEMS; microelectronic process modules for design and fabrication. Students will prepare a project report on the design of a biomedical MEMS-based micro-integrated system. Offered in alternate years. Permission of department required.

Credits: 3.00

ECE 52601 - Integrated Nanosystems Processes And Devices

Credit Hours: 3.00. (ME 52601) This course covers processes and devices associated with integrated nanosystems. Integrated nanosystems refer to systems which consist of integrated micro-, meso-, and/or macro-scale parts, and their core components are realized by nano-scale materials, processes, and devices. The course, while covering processes which result in integrated nanosystems, will focus on the theory and operation of select electronic, electromechanical, and biomedical devices which are used for information technology, sensing, medical, and other applications. The lectures will be complemented by hands-on laboratory experience. Permission of instructor required.

Credits: 3.00

ECE 52702 - Advanced Power Electronics Converters

Credit Hours: 3.00. The course introduces students to advanced power electronics converters dealing with ac voltage. The power electronics topologies considered in this course are sorted into two groups: multilevel configurations and back-to-back converters. The multilevel configurations presented are: a) neutral-point-clamped, b) cascade, c) flying capacitor, and d) non-conventional multilevel configurations. The back-to-back converters presented are: a) three-phase to three-phase, b) single-phase to three-phase, c) single-phase to single-phase ac-dc-ac converters. A new methodology will be employed to present comprehensively multilevel and back-to-back converters topologies. The main applications of those converters are in renewable energy systems, active power filters, energy efficiency devices and motor drive systems. Permission of instructor required.

Credits: 3.00

ECE 52800 - Measurement And Stimulation Of The Nervous System

Credit Hours: 3.00. (BME 52800) Engineering principles addressing questions of clinical significance in the nervous system: neuroanatomy, fundamental properties of excitable tissues, hearing, vision, motor function, electrical and magnetic stimulation, functional neuroimaging, disorders of the nervous system, development and refinement of sensory prostheses.

Credits: 3.00

ECE 53301 - Wireless And Multimedia Computing

Credit Hours: 3.00. A treatment of Voice and Video over IP and wireless communication algorithms, protocols, standards, and implementation using multicore digital signal processors and communications processor modules. Discussion of voice over IP and wireless communication algorithms, protocols and standards, and advanced wireless and voice over IP applications.

Credits: 3.00

ECE 53401 - Embedded Autonomous Systems In Automotive Platforms

Credit Hours: 3.00. A treatment of Embedded and Autonomous Systems: Motor Control, Image Vision, Sensors, Security, Neural Networks, SLAM, Machine and Deep Learning, Protocols, Standards and Implementation using Multiprocessors, Multicores, ISP, Bluebox and APEX.

Credits: 3.00

ECE 53600 - Introduction To Computational Intelligence

Credit Hours: 3.00. Basic concepts in theory and paradigms for neural networks, evolutionary computation, and fuzzy logic; algorithms and applications for hybrids of these tools known as computational intelligence are explored. Topics include artificial neural networks, fuzzy systems, and evolutionary computation. Implementations of a number of paradigms are presented, including particle swarm optimization. Applications to various areas, such as biomedical engineering and nonlinear control, are examined.

Credits: 3.00

ECE 53700 - Multimedia Applications

Credit Hours: 3.00. Treatment of multimedia algorithms and implementation using high-speed multimedia processors. Detailed discussion of entropy coding, transform coding, speech compression, image compression, video compression, and architecture, addressing modes, and instruction set of multimedia processors.

Credits: 3.00

ECE 53800 - Digital Signal Processing I

Credit Hours: 3.00. Theory and algorithms for processing of deterministic and stochastic signals. Topics include discrete signals, systems, and transforms, linear filtering, fast Fourier transform, nonlinear filtering, spectrum estimation, linear prediction, adaptive filtering, and array signal processing.

Learning Outcomes: 1. Understand the autocorrelation and covariance methods of estimating the correlation matrix. 2. Know the Discrete Time Fourier Transform (DTFT) and its relationship to the Discrete Fourier Transform (DFT). 3. Comprehend of parametric methods of spectrum estimation, including autoregressive modeling, minimum variance, linear prediction, and eigendecomposition-based methods. 4. Understand nonparametric methods of spectrum estimation, including the periodogram and the correlogram. 5. Understand of linear filters, including the Wiener filter, as applied stochastic to signals. 6. Introduce to adaptive filters, including the method of steepest descent and the least-mean-square (LMS) algorithms. Credits: 3.00

ECE 53801 - Discreet Event Dynamic Systems

Credit Hours: 3.00. This course introduces discrete event dynamic systems with their applications in system modeling, analysis, and control. Models such as automata, Petri nets, Markov chain, and queueing systems are introduced, along with analysis of their dynamics. Discrete event simulation methods are included. Examples from various engineering applications are given. Permission of instructor required.

Credits: 3.00

ECE 53900 - Foundations Of Advanced Engineering I

Credit Hours: 3.00. Several mathematical tools applied in the engineering discipline are discussed. Statistical methods, including construction of confidence interval and hypothesis testing, as well as regression and regression analysis, are discussed. Discrete tools are discussed; these include logic and mathematical reasoning, combinatorics, groups and finite fields. Applications of some of these tools in engineering problems are introduced. Decision Theory including Bayes Theorem and applying Bayes Theorem to form decision problems. Permission of instructor required.

Credits: 3.00

ECE 54400 - Digital Communications

Credit Hours: 3.00. Introduction to digital communication systems and spread spectrum communications. Topics include analog message digitization, signal space representation of digital signals, binary and M-ary signaling methods, detection of binary and M-ary signals, comparison of digital communication systems in terms of signal energy and signal bandwidth requirements. The principal types of spread spectrum systems are analyzed and compared. Application of spread spectrum to multiple access systems and to secure communication systems is discussed.

Credits: 3.00

ECE 54700 - Introduction To Computer Communication Networks

Credit Hours: 3.00. A qualitative and quantitative study of the issues in design, analysis, and operation of computer

communication and telecommunication networks as they evolve toward the integrated networks of the future, employing both packet and circuit switching technology. The course covers packet and circuit switching, the OSI standards architecture and protocols, elementary queuing theory for performance evaluation, random access techniques, local area networks, reliability and error recovery, and integrated networks.

Learning Outcomes: 1. Demonstrate an understanding of the fundamental principles underlying computer communication networks. [1,3,4;a,e] 2. Demonstrate an ability to obtain mathematical models of networking systems. [1,2,4;a,e] 3. Demonstrate an ability to perform queueing analysis of simpler queueing networks, convergence analysis of routing protocols, and stability analysis of random access mechanisms. [1,2,4;a,e,k] 4. Demonstrate an ability to solve simple network design and optimization problems to meet specifications in though put and delay. [1,4;a,c,e,k] 5. Demonstrate an ability to use simulation tools for network analysis and design. [1,3,4;a,c,e,k] Credits: 3.00

ECE 54800 - Introduction To 2D And 3D Digital Image Processing

Credit Hours: 3.00. An introduction to 2D and 3D image processing. Lecture and projects covering a wide range of topics including 2D and 3D image analysis, image segmentation; color image processing, image sharpening, linear and filtering, image restoration, and image registration. Permission of instructor required.

Credits: 3.00

ECE 55200 - Introduction To Lasers

Credit Hours: 3.00. An introduction to lasers and laser applications which does not require a knowledge of quantum mechanics as a prerequisite. Topics include: the theory of laser operation; some specific laser systems; nonlinear optics; optical detection; and applications to optical communications, holography, laser-driven fusion, and integrated optics.

Credits: 3.00

ECE 55400 - Electronic Instrumentation And Control Circuits

Credit Hours: 3.00. Analysis and design of special amplifiers, pulse circuits, operational circuits, DC amplifiers, and transducers used in instrumentation, control, and computation.

Credits: 3.00

ECE 55700 - Integrated Circuit Fabrication Laboratory

Credit Hours: 3.00. Laboratory exercises in the fabrication and testing of silicon integrated circuits. Both bipolar and MOS integrated circuit test chips are fabricated and tested. Laboratory technique, the technology of integrated circuit fabrication, and electrical characterization are emphasized. Permission of department required.

Credits: 3.00

ECE 55801 - Advanced Systems On A Chip (SoC) Designs For Image Processing Using FPGAs

Credit Hours: 3.00. This class covers advanced concepts in using Field Programmable Gate Arrays (FGPAs) designed with and HDL (VHDL for example: Very High Speed IC Hardware Description Language). The students will learn complex interface design, advanced hardware and embedded system design and parallel processing. Projects and lessons will focus on application in Digital Imaging Systems. Lecture and projects covering topics including: VHDL mapped to FPGA for state machine design, hardware and software VGA control, image filtering, data transfer to bus, and embedded controller integration. Permission of instructor required.

Credits: 3.00

ECE 55900 - MOS VLSI Design

Credit Hours: 3.00. An introduction to most aspects of large-scale MOS integrated circuit design including: device fabrication and modeling; inverter characteristics; designing CMOS combinational and sequential circuits; designing arithmetic building blocks and memory structures; interconnect and timing issues; testing and verification; and system design considerations. Term projects involve the complete design of a functional logic block or system using CAD tools.

Credits: 3.00

ECE 56200 - Introduction To Data Management

Credit Hours: 3.00. Emphasis is on the design of systems that can manipulate and retrieve data from large databases using high level formal languages. Topics covered are: data models and data independence, normalization in relational databases, development of high level query languages for relational and hierarchical models, pictorial query languages, object oriented systems, and object oriented databases. The course includes a project that accounts for about 20 percent of the grade for the course. Offered odd years. Permission of department required.

Credits: 3.00

ECE 56300 - Programming Parallel Machines

Credit Hours: 3.00. This course presents methods and techniques for programming parallel computers, such as multicore and high-end parallel architectures. Various parallel algorithms will be presented to demonstrate different techniques for identifying parallel tasks and mapping them onto parallel machines. Realistic science/engineering applications and their characteristics will be discussed. Parallel architectures to be considered are shared-memory and distributed-memory multiprocessor systems. Programming paradigms for these

machines will be compared, including directive-based (OpenMP), message passing (MPI) and thread-based (Posix threads) methods. Methodologies for analyzing and improving the performance of parallel programs will be discussed. There will be a class project in which each student parallelizes and tunes the performance of a large computation application or develops/improves a tool that helps this process. Each student will prepare one lecture for a selected topic. Offered during odd years.

Credits: 3.00

ECE 56401 - Computer Security

Credit Hours: 3.00. In this course the discussion will include the following topics: (not necessarily in this order) security policies, confidential policies, integrity policies, security models, security design, access control, cryptography, key management, authentication, program and software, security, malicious logic, intrusion detection, network security, security attacks and countermeasures, operation system security, smartcard tamper-resistant devices, phishing, legal and ethical issues in computer security, and selected topics.

Credits: 3.00

ECE 56500 - Computer Architecture

Credit Hours: 3.00. An introduction to the problems involved in designing and analyzing current machine architectures. Major topics include performance and cost analysis, pipeline processing, vector machines and numerical applications, hierarchical memory design, and multiprocessor architectures. A quantitative approach allowing a computer system designer to determine the extent to which a design meets design goals is emphasized.

Credits: 3.00

ECE 56601 - Real-Time Operating Systems And Applications

Credit Hours: 3.00. This course introduces students to the principles of modern operation systems focusing on real-time operation systems and embedded operation systems and their applications. Permission of instructor required.

Credits: 3.00

ECE 56800 - Embedded Systems

Credit Hours: 3.00. This course provides an introduction to the design of embedded and ubiquitous computing systems including their hardware and software architectures, design methodologies and tools, and communication protocols. The lectures are organized into three parts namely, (a) basic design principles including specification and modeling, hardware components and platforms, software organization, embedded and real-time operating systems, interfacing with external environments using sensors and actuators, and communication in distributed embedded systems, (b) advanced topics such as energy management, safety and reliability, and security, and (c) case-studies of real-world systems from a variety of embedded application domains such as biomedical devices, smart cards and RFID, networked sensors, personal computing devices, home appliances and electronics, mobile robotics, etc. In addition to hands-on programming assignments using off-the-shelf embedded system development kits, the course will feature a comprehensive project where students will design, implement, and evaluate a prototype embedded system.

Credits: 3.00

ECE 56810 - Design With Embedded Systems

Credit Hours: 3.00. This course provides an overview of the architectures, design considerations, features and applications of embedded processors with digital signal processing capabilities. The course emphasizes design consideration for embedded systems. Different applications such as Internet of Things, Voiceover IP, Machine to Machine, Wearable Devices, Smart Homes, Medical Devices, Drones and Wireless Systems, are considered.

Credits: 3.00

ECE 56900 - Introduction To Robotic Systems

Credit Hours: 3.00. The topics to be covered include: basic components of robotic systems; selection of coordinate frames; homogeneous transformations; solutions to kinematic equations; velocity and force/torque relations; manipulator dynamics in Lagrange's formulation; digital simulation of manipulator motion; motion planning; obstacle avoidance; controller design using the computed torque method; and classical controllers for manipulators. Basic knowledge of vector-matrix manipulations required.

Credits: 3.00

ECE 57000 - Artificial Intelligence

Credit Hours: 3.00. Introduction to the basic concepts and various approaches of artificial intelligence. The first part of the course deals with heuristic search and shows how problems involving search can be solved more efficiently by the use of heuristics and how, in some cases, it is possible to discover heuristics automatically. The next part of the course presents ways to represent knowledge about the world and how to reason logically with that knowledge. The third part of the course introduces the student to advanced topics of AI drawn from machine learning, natural language understanding, computer vision, and reasoning under uncertainty. The emphasis of this part is to illustrate that representation and search are fundamental issues in all aspects of artificial intelligence.

Credits: 3.00

ECE 57101 - System Modeling And Design For Smart Devices

Credit Hours: 3.00. Introduction to the mobile computing and the principles to design and implement application system for a smart device, including mobile computing architecture, mobile and pervasive computing environments, applications and services, context-aware computing, and human-computer interaction. Permission of instructor required.

Credits: 3.00

ECE 57300 - Compilers And Translator Writing Systems

Credit Hours: 3.00. This course presents the concepts needed to efficiently design and implement translators. Basic compiler/translation theory and technology are briefly reviewed, after which the course focuses on software tools for the automatic construction of translators, as well as more complex concepts involving the construction of compiler symbol tables, etc. Using C on ECN UNIX, each student will construct a simple lexical-recognizer generator, parser generator, and code-generator generator. Basic understanding of compilers and proficiency in C language required.

Credits: 3.00

ECE 57700 - Engineering Aspects Of Remote Sensing

Credit Hours: 3.00. Introduction to the concepts of multispectral image data generation and analysis. Basic principles of optical radiation, reflection, and measurement in natural scenes. Fundamentals of multispectral sensor design and data analysis for complex scenes. Application of signal processing and signal design principles and of statistical pattern recognition to these problems. Spatial image processing methods and algorithms as appropriate to land scene data. Practice with analysis of actual aircraft and spacecraft data in a cross-disciplinary environment. Offered even years.

Learning Outcomes: 1. Knowledge of a number of important technologies based on multispectral/hyperspectral remote sensing and related image processing techniques. 2. Knowledge of machine learning techniques such as deep learning for remote sensing technologies. 3. Knowledge of developments in the areas of statistical analysis for remote sensing. 4. Knowledge of a number of other topics, such as MATLAB and Python for remote sensing algorithms. 5. Ability to utilize the theoretical analysis of topics based statistical pattern recognition and machine learning for various system designs. Credits: 3.00

ECE 58000 - Optimization Methods For Systems And Control

Credit Hours: 3.00. Introduction to optimization theory and methods, with applications in systems and control. Nonlinear unconstrained optimization, linear programming, nonlinear constrained optimization, various algorithms and search methods for optimization, and their analysis. Examples from various engineering applications are given. Elements of linear algebra and calculus of several variables and some experience with MATLAB helpful.

Credits: 3.00

ECE 58500 - Automotive Control

Credit Hours: 3.00. Basic engine operation; Air-Fuel Ratio control, Idle Speed control, Knock control,Fuel injection timing control, Ignition control of SI engines; Engine fault diagnosis; Driveline modeling and control, Clutch phasing control; Hybrid Electric Vehicle and its control; Wheel model and complete vehicle model; Observers, Friction coefficient estimators, Tire contact patch force estimators; Anti-lock brake control, Traction control, Yaw stability control, Drive-By-Wire systems.

Credits: 3.00

ECE 58900 - State Estimation And Parameter Identification Of Stochastic Systems

Credit Hours: 3.00. Introduction to point estimation, least squares, Bayes risk, and maximum likelihood. Optimum mean-square recursive estimation for nondynamic stochastic systems. State estimation for discrete-time and continuous-time dynamic systems. Parameter identification of stochastic systems using maximum likelihood. Stochastic approximation, least squares, and random search algorithms. Offered in alternate years.

Credits: 3.00

ECE 59500 - Selected Topics In Electrical Engineering

Credit Hours: 1.00 to 3.00. Formal classroom or individualized instruction on topics of current interest. Permission of instructor required.

Credits: 1.00 to 3.00

ECE 60000 - Random Variables And Signals

Credit Hours: 3.00. Engineering applications of probability theory. Problems on events, independence, random variables, distribution and density functions, expectations, and characteristic functions. Dependence, correlation, and regression; multivariate Gaussian distribution. Stochastic processes, stationarity, ergodicity, correlation functions, spectral densities, random inputs to linear systems; Gaussian processes. Prerequisite: Master's student standing or higher.

Learning Outcomes: 1. Problems on events, independence, random variables, distribution and density functions, expectations, and characteristic functions. 2. Dependence, correlation, and regression; multi-variate Gaussian distribution. 3. Stochastic processes, stationarity, ergodicity, correlation functions, spectral densities, random inputs to linear systems; Gaussian processes. Credits: 3.00

ECE 60004 - Communication For Engineering Leaders

Credit Hours: 1.00. The goal of this course is to upskill talented engineers' communication abilities. By the end of the course,

you should have new adeptness at creating and delivering powerful presentations on a short deadline, as well as strategies for leading others effectively.

Learning Outcomes: 1. Create engaging, effective presentations and documents. 2. Design plans for valuable, productive workplace and team interactions. 3. Develop a leadership or mentoring plan tailored to your specific workplace. Credits: 1.00

ECE 60022 - Wireless Communication Networks

Credit Hours: 3.00. This course will cover fundamental concepts in mobile wireless systems such as propagation and fading, cellular systems, channel assignment, power control, handoff, mobility management. It will also cover system and standards issues including second-generation circuit switched and third-generation packet switched networks, wireless LANs, mobile IP, and ad hoc networks. Besides providing an overview of current technologies, the emphasis on the course will be to identify the challenges that face the engineers of wireless communications networks. Prerequisites: ECE 54700. Prerequisite by Topic: Students are expected to enter the course with an introductory graduate-level understanding of networking, as well as a basic understanding of probability obtained from a typical undergraduate EE program. Permission of instructor required.

Learning Outcomes: 1. Acquire a solid understand of the fundamental principles of wireless communication networks. 2. Use basic analytical tools to study the performance of cellular and ad hoc wireless networks. 3. Present results through written communication. 4. Identify the key challenges facing future wireless networks. Credits: 3.00

ECE 60141 - Foundations Of Computational Imaging

Credit Hours: 3.00. This class presents a collection of mathematical and statistical methods that form the foundation of modern computational imaging research and applications. Computational imaging seeks to form images from sensor data and is widely used in applications including consumer imaging, scientific imaging, industrial inspection, and security imaging. This class provides an advanced treatment of computational imaging based on an inverse-problems framework and blends perspectives from applied math, statistics, physics, and applications. The topics covered include stochastic modeling of images, Bayesian estimation, inverse methods, optimization, convexity, majorization techniques, constrained optimization and proximal methods, plug-and-play methods for advance prior models, the EM algorithm, Bayesian networks, Markov chains, hidden Markov models, and stochastic simulation. The underlying theory is presented in the context of applications including image restoration, tomographic reconstruction, clustering, classification, and segmentation.

Learning Outcomes: 1. Understand how to model an imaging system. 2. Understand widely used methods for solving inverse problems in imaging applications. 3. Implement an image reconstruction algorithm for applications such as deconvolution and denoising. 4. Understand how probability can be used to model imaging systems and images. 5. Understand basic approaches to optimization of quadratic and non-quadratic functions. 6. Understand MAP and ML estimation methods. Credits: 3.00

ECE 60146 - Deep Learning - Theory And Practice Of Deep Neural Networks

Credit Hours: 3.00. This course teaches the theory and practice of deep neural networks from basic principles through state-of-the-art methods. The class blends hands-on programming, using a variety of state-of-the-art programming frameworks, with theoretical treatment based on current literature. Implementation will emphasize the use of the Pytorch language and the use of dynamic computational graphs. Some previous experience with optimization techniques is important for success in the course.

Learning Outcomes: 1. Understand how to design a neural network architecture that is appropriate for a wide range of specific applications. 2. Create an efficient implementation of a wide range of standard neural network architectures in Pytorch. 3. Use neural networks to solve applications problems in classification, regression and data generation. 4. Understand how the fundamental theory of optimization can be used to efficiently train neural networks. 5. Understand the trade-offs between optimization techniques and how these techniques can be selected to achieve the best neural network training. 6. Understand and use current theory of neural network performance. 7. Understand the limitation of existing neural network theory and the likely directions of future research. Credits: 3.00

ECE 60200 - Lumped System Theory

Credit Hours: 3.00. An investigation of the basic theory and techniques of modern system theory, emphasizing linear state model formulations of continuous and discrete time systems in the time domain and frequency domain. Coverage includes notions of linearity, time invariance, discrete and continuous time state models, canonical forms, associated transfer functions and impulse response models, the state transition matrix, the Jordan form, controllability, observability, and stability. Prerequisite: Master's student standing or higher and concurrent prerequisite: MA 51100.

Credits: 3.00

ECE 60270 - Structure And Dynamics Of Large-Scale Networks

Credit Hours: 3.00. Large-scale networks are prevalent in both engineered systems (e.g., the Internet, the power grid, industrial control networks, large robotic swarms and sensor networks) and in natural systems (e.g., genetic networks, ecological networks, social and economic networks). While the specific details of such networks will depend on the application, the last few decades have seen the emergence of an underlying "science" of networks, comprised of a common language (graph theory) for representing large-scale networks, along with mathematical models and analytical techniques for studying structure and dynamics. This course will provide a detailed introduction to the field of network science. It will develop common mathematical representations of networks, metrics for identifying important features of networks, generative mechanisms for networks (including both random-graph and strategic network formation perspectives), and tools for studying dynamical processes on networks (such as information cascades, opinion dynamics and interconnected dynamical systems). This is an introductory course that establishes several of the fundamental tools and concepts in network science, and requires only an undergraduate background in probability and linear algebra.

Learning Outcomes: 1. Characterize networks based on degree distributions, clustering coefficients, diameter, etc. 2. Identify influential nodes via centrality metrics. 3. Analyze random and strategic (game-theoretic) models for large-scale networks. 4. Analyze dynamical processes and stability of interconnected dynamical systems on networks. Credits: 3.00

ECE 60281 - Intro To Mathematical Fundamentals For Systems And Control

Credit Hours: 1.00. This course serves as background for ECE 60200 Lumped System Theory, ECE 69500 Epidemic Processes over Networks, and ECE 69500 Structure and Dynamics of Large-Scale Networks, and other similar courses. The course will make the necessary mathematical background for the aforementioned courses accessible by decomposing and illustrating difficult concepts with a number of real-world examples and problems for students to work out. Namely, the course consists of five modules: 1) Linear Algebra, 2) Basic Graph Theory, 3) Basic Control Theory, 4) Probability, and 5) Optimization. Prerequisite: Linear Algebra (MA 26500 or MA 26200) or equivalent, ECE 30200 or equivalent.

Learning Outcomes: 1. Analyze equations involving matrices by applying algebraic concepts such as rank, null space, linear independence, and eigenvalues. 2. Define graph properties such as diameter, degrees, and connectivity, and apply them to analyze networked systems. 3. Define properties of linear systems, including controllability, observability, and stability, and apply them to design state estimators and feedback controllers. 4. Define probability distributions and moments of random variables and characterize the long-term behavior of stochastic processes. 5. Specify the fundamental optimality conditions for optimization problems and implement basic algorithms to find the optimizers. Credits: 1.00

ECE 60282 - Epidemic Processes

Credit Hours: 1.00. This course provides a control theory and data science approach to traditional epidemic models. Traditional epidemiological ideas will be explored and combined with probability theory and systems theoretic ideas to be able to capture spread behavior, learn from data, and design mitigation techniques. Namely, the course consists of four modules: 1) Virus Models, 2) Limiting Behavior, 3) Parameter Identification, and 4) Mitigation Algorithms. Prerequisite: ECE 60281.

Learning Outcomes: 1. Differentiate between distinct compartmental models for epidemics (SI, SIS, SIR, etc.) and identify the best model for a given scenario. 2. Analyze the limiting behavior of models for epidemic processes by identifying the different possible equilibria of the models and specifying conditions for converging to different equilibria. 3. Estimate model parameters from data for the different epidemic models. 4. Employ the estimated model parameters to forecast the impact of an outbreak. 5. Choose the best model for a given

scenario/dataset by employing their knowledge of the epidemic models and by comparing the fit from the estimated parameters and the forecast accuracy. 6. Develop and implement mitigation algorithms for the different models of epidemic processes. Credits: 1.00

ECE 60283 - Epidemic Processes Over Networks

Credit Hours: 1.00. This course presents a class of epidemic models from a network science, control theoretic, and data science perspective. Networked epidemiological ideas will be explored combined with probability theory and systems theoretic ideas to be able to capture spread behavior, learn the behavior from data, and design mitigation techniques. Namely, the course consists of three modules: 1) Networked Virus Models, 2) Limiting Behavior of Networked Virus Models, and 3) Parameter Identification & Mitigation Algorithms. Prerequisites: ECE 60281 and ECE 60282.

Learning Outcomes: 1. Differentiate between distinct networked compartmental models for epidemics (SI, SIS, SIR, etc.) in order to identify the best model for a given scenario. 2. Analyze the limiting behavior of networked models for epidemic processes by identifying the different possible equilibria of the models and specifying conditions for converging to different equilibria. 3. Estimate model parameters from data for the different networked epidemic models. 4. Employ the estimated model parameters to forecast the spread of an outbreak. 5. Choose the best networked model for a given scenario/dataset by employing their knowledge of the epidemic models and by comparing the fit from the estimated parameters and the forecast accuracy. 6. Develop and implement mitigation algorithms for the different models of epidemic processes. 7. Leverage the advantages and disadvantages of using networked models of epidemics processes versus group models in a given situation. Credits: 1.00

ECE 60400 - Electromagnetic Field Theory

Credit Hours: 3.00. Review of general concepts (Maxwell's equations, materials interaction, boundary conditions, energy flow); statics (Laplace's equation, Poisson's equation); distributed parameter systems (classification of solutions, transmission lines, and wave-guides); radiation and antennas (arrays, reciprocity, Huygen's principle); a selected special topic (e.g., magnetostatics, waves in anisotropic media and optical fibers). Offered in alternate years. Prerequisite: Master's student standing or higher.

Credits: 3.00

ECE 60419 - Numerical Simulations Of Electro-Optic Energy Systems

Credit Hours: 3.00. Introduction to computational techniques employed in research on energy systems involving quantum electronics and electromagnetics. You will learn the strengths and weaknesses of each approach; what types of problem call for which one; and how your simulation will perform. Techniques include eigenvalue problems, fast Fourier transforms, band structure calculations, rigorous-coupled wave analysis, beam-propagation methods, finite-difference time-domain, and finite element methods. Applications include nanophotonics, photovoltaics, thermal management, radiative control, and nonlinear optics. Prerequisite by Topic: Elect/Magn Interactions (ECE 60400 or equivalent); Programming For Engineers (C, MATLAB, or similar); Linear Algebra; Ordinary Differ. Equatn; and Signals and Systems.

Learning Outcomes: 1. Explain strengths and weaknesses of computational techniques for electro-optic systems. 2. Calculate computational complexity of a given algorithm. 3. Perform conventional and Fast Fourier transforms, based on existing codes. 4. Solve for eigenvalues and eigenvectors, for both standard and generalized eigenproblems. Credits: 3.00

ECE 60420 - Radio Frequency Integrated Circuits

Credit Hours: 3.00. This course aims at analysis and design of CMOS integrated radio frequency (RF), microwave and mm-wave circuits. Various modules of an RF transceiver are discussed including low noise amplifiers, mixers, oscillators, frequency synthesizers and power amplifiers. A term project on design of an RF to mm-wave module is also required.

Learning Outcomes: 1. Know various wireless standards, modulation techniques and CMOS technology. 2. Know matching network, transmission line effects, scattering parameters. 3. Know analysis and design of CMOS low noise amplifiers from RF to mm-wave frequencies. Credits: 3.00

ECE 60421 - Nanophotonics And Metamaterials

Credit Hours: 3.00. The course will cover nanoscale processes and devices and their applications for manipulating light on the nanoscale. The following topics will be covered: Fundamentals, Maxwell's equations, light-matter interaction, dispersion, EM

properties of nanostructures; Photonic crystals and photonic crystal fibers; Photonic and plasmonic nanocircuits; Silicon nanophotonics; Metal optics; Manipulating light with plasmonic nanostructures; Plasmonic nano-sensors; Near-field optics; Metamaterials: artificial magnetism and negative refractive index; Metamaterials: superlens and hyperlens; Transformation optics and cloaking; Nanolasers; Tunable and active plasmonic materials; Refractory plasmonics; Plasmonics for energy conversion, data storage and biomed applications; Metasurfaces; Intro to quantum photonics. Prerequisites by Topic: Basic knowledge of electromagnetism and solid state materials, Maxwell equations and band structure of solids.

Learning Outcomes: 1. Derive, calculate and analyze the optical properties of metals including plasma frequency, relaxation time, dielectric constant, reflection and transmission coefficients. 2. Derive and analyze the optical properties of nanophotonic systems including color centers in solids, metallic nanoparticles, metal-dielectric slabs, thin metal films, metamaterial slabs with negative refraction. 3. Analyze surface plasmon polariton waveguides and waveguide properties. 4. Articulate the fundamentals of optics of structured media. 5. Demonstrate an understanding of novel concepts in photonics, including photonic crystals, metamaterials, nanoscale interconnects, metal optics, transformation optics, nanolasers, nanosensors, super- and hyperlens and quantum nanophotonics. Credits: 3.00

ECE 60422 - Primer On RF Design

Credit Hours: 1.00. This course covers the fundamentals of RF design. It is designed as a first course for students or engineers with limited background in high-frequency electronics. Engineers that need to understand the 'RF language' and gain working knowledge of critical RF concepts will benefit from taking this course. Students in this class will learn the basic RF tools and design principles. By the end of this class students will be able to understand important RF concepts and how these are related to the design of practical RF blocks.

Learning Outcomes: 1. Describe and articulate the basic design principles of RF systems and modules. 2. Use common tools and techniques in the RF design space. Credits: 1.00

ECE 60423 - RF System Design

Credit Hours: 1.00. Following the 'Primer on RF Design' course, this class focuses on system-level issues. We discuss several important design considerations including noise, non-linearity, distortion, sensitivity and dynamic range and their impact in selecting the appropriate system architecture. The course also covers common receiver architectures including superheterodyne and direct-conversion receivers.

Learning Outcomes: 1. Describe and articulate the basic design principles of RF modules and transceivers. 2. Describe and articulate common transceiver architectures. 3. Use tools and analysis techniques to estimate the impact of non-linear effects, noise and interferences on transceivers. Credits: 1.00

ECE 60424 - RF Design: Passive And Active Components

Credit Hours: 1.00. Following the 'Primer on RF Design' course, this class focuses on passive and active components. We use the techniques learnt in the previous course, to design advanced RF devices including couplers, filters and amplifiers. Current research topics are discussed as appropriate.

Learning Outcomes: 1. Describe and articulate the basic design principles of RF passive and active components. 2. Design RF couplers, filters and amplifiers. 3. Use tools and analysis techniques to support the design of RF filters and amplifiers. Credits: 1.00

ECE 60432 - Nanophotonic Modeling

Credit Hours: 1.00. This course is an introduction to photonic materials and devices structured on the wavelength scale. Generally, these systems will be characterized as having critical dimensions at the nanometer scale. These can include nanophotonic, plasmonic, and metamaterials components and systems. Co-requisite: ECE 60400 or equivalent.

Learning Outcomes: 1. Write down photonic modes using Bloch's theorem. 2. Calculate standing wave modes at the band edge of a 1D periodic photonic crystal. 3. Calculate TE and TM modes at the band edge of a 2D square-periodic photonic crystal. 4. Draw the irreducible Brillouin zone for a 2D triangular lattice photonic crystal. 5. Calculate the band structure of a 2D triangular lattice photonic crystal for the lowest 8 bands using MIT Photonic Bands. 6. Identify the lowest-energy photonic bandgap in TE and TM polarizations associated with a 2D triangular lattice photonic crystal. 7. Use a ray-optics

transfer matrix to calculate the reflection and transmission associated with multiple optical elements. 8. Use a wave-optics T-matrix to calculate transmission and reflection through several dielectric layers arranged in a 1D stack. 9. Use a wave-optics S-matrix to calculate transmission and reflection through several dielectric layers arranged in a 1D stack. 10. Use Singular Value Decomposition in CAMFR to calculate the eigenmodes associated with a photonic crystal waveguide structure consisting of a row of defects. 11. Calculate the quality factor of a resonant mode using the FDTD method. 12. Calculate the band structure of a 2D periodic structure using the FDTD method. 13. Calculate the relative enhancement in the local density of photonic states associated with a defect in a 2D photonic crystal using the FDTD method. 14. Calculate a transmission spectrum using the Finite Element Method. 15. Calculate a transmission spectrum for a waveguide using the Beam Propagation Method. 16. Calculate the emission spectrum of a photonic emitter using the Finite Element Method. Credits: 1.00

ECE 60600 - Solid State Devices

Credit Hours: 3.00. A relatively-broad, moderate-depth coverage of semiconductor devices and related topics. The first portion of the course presents and examines semiconductor fundamentals required in the operational analysis of solid state devices. A detailed examination of the PN junction diode and PN junction devices follows. The final portion of the course treats heterojunction surface devices including the Schottky diode, the MOS capacitor and the MOSFET. Offered in alternate years. Prerequisite: Master's student standing or higher.

Credits: 3.00

ECE 60614 - Reliability Physics Of Nanoelectronic Transistors

Credit Hours: 3.00. This course will focus on the physics of reliability of small semiconductor devices. In traditional courses on device physics, the students learn how to compute current through a device in response to applied voltage. However, as transistors are turned on and off trillions of times during the years of operation, gradually defects accumulate within the device so that at some point the transistor does not work anymore. The course will explore the physics and mathematics regarding how and when things break a topic of great interest to semiconductor device engineers. Prerequisites: ECE 60600 required; ECE 61200 and ECE 55800 are recommended.

Learning Outcomes: 1. Acquire a deep understanding regarding a topic of broad interest to academic community and to the industry. 2. Think critically related to broad range of topics involving various aspects of reliability physics. Credits: 3.00

ECE 60645 - High-speed Semiconductor Devices

Credit Hours: 3.00. As semiconductor device geometry miniaturizes, the device becomes faster and some devices move into the quantum-effect region. These high-speed devices are the key components for future electronic systems in communications, computers, control, and consumer applications. This course covers the physics and operational principles of these devices to meet the needs of microelectronics in the 21st century. This course emphasizes the integration of the state-of-the-art technologies such as high-k dielectrics, SiGe, SiC and GaN devices. This course is intended for graduate students in science and engineering who are either i) interested in pursuing research in semiconductor materials, structures or devices, or ii) seeking the broad device background on the state-of-the-art technologies for a future R&D career in the microelectronic industry. Co-requisite: ECE 60600.

Learning Outcomes: 1. Produce homework and presentations at the course that use appropriate formats, knowledge of electronic materials and devices, and documentation styles while controlling the right technical terms, writing skills including grammar and spelling. 2. Demonstrate an understanding of technical contents of the course and writing reports as a process that includes multiple drafts, collaboration, feedback, and reflection. 3. Examine critically, summarize, apply, analyze, and synthesize information as the basis for developing original ideas and claims. 4. Demonstrate proficiency in identifying, reading, evaluating, analyzing, and using reliable sources of technical contents of this course. Credits: 3.00

ECE 60800 - Computational Models And Methods

Credit Hours: 3.00. Computation models and techniques for the analysis of algorithm complexity. The design and complexity analysis of recursive and nonrecursive algorithms for searching,

sorting, set operations, graph algorithms, matrix multiplication, polynomial evaluation and FFT calculations. NP-complete problems. Prerequisite: Master's student standing or higher.

Learning Outcomes: 1. Learn computation models and techniques for the analysis of algorithm complexity. 2. Learn the design and complexity analysis of recursive and non-recursive algorithms for searching, sorting, set operations, graph algorithms, matrix multiplication, polynomial evaluation and FFT calculations. 3. Learn the NP-complete problems. Credits: 3.00

ECE 60827 - Programmable Accelerator Architectures

Credit Hours: 3.00. Programmable hardware accelerators seek to fulfill the promise of continued performance and energy-efficiency gains in the era of a slowing Moore's law, larger problem sizes and an increased focused on energy-efficiency. These factors have caused hardware acceleration to become ubiquitous in today's computing world and critically important in computing's future. This class will introduce students to the architectures of programmable accelerators. We will delve deeply into the architectures of modern massively parallel accelerators like GPUs, culminating in a course project. General topics in hardware acceleration will be discussed, including but not limited to GPGPU and massively parallel computing, approximate accelerators, reconfigurable hardware and programmable hardware for machine learning. Pre-requisite: ECE 43700 or equivalent and ECE 56500.

Learning Outcomes: 1. Learn knowledge and scholarship. 2. Learn communication. 3. Learn critical thinking. 4. Learn ethical and responsible research. 5. Have professionalism. Credits: 3.00

ECE 60872 - Reliable And Secure Computer Systems

Credit Hours: 3.00. The course provides an introduction to the hardware and software methodologies for specifying, modeling and designing fault-tolerant systems supported by case studies of real systems. The material presents a broad spectrum of hardware and software error detection and recovery techniques that can be used to build reliable networked systems. The lectures discuss how the hardware and software techniques interplay, what techniques can be provided in COTS hardware, what can be embedded into operating system and network communication layers, and what can be provided via a distributed software layer and in the application itself. Prerequisite by Topic: Any one high level programming language experience; A basic background in probability.

Learning Outcomes: 1. Formulate design principles for dependable systems. 2. Analyze mathematically a system for its dependability properties. 3. Understand and apply hardware dependability techniques. 4. Understand and apply software dependability techniques. 5. Understand and apply networking dependability techniques. 6. Design, develop, and present an innovative project on dependable systems. Credits: 3.00

ECE 60874 - Mobile Computing Systems

Credit Hours: 3.00. This course will introduce the technologies of mobile computing systems for various applications, including multimedia, cloud services, location-based services, data collections and privacy. This course will include both hands-on assignments writing mobile applications as well as reading recently published papers on the technologies. The students will design mobile services and present their projects.

Learning Outcomes: 1. Examine recent technologies in mobile computing. 2. Design mobile services and present their projects. 3. Plan for data collection and respect users' privacy. Credits: 3.00

ECE 61000 - Energy Conversion

Credit Hours: 3.00. Basic principles of static and electromechanical energy conversion. Control of static power converters. Reference frame theory applied to the analysis of rotating devices. Analysis and dynamic characteristics of induction and synchronous machines. State variable analysis of electromechanical devices and converter supplied electromechanical drive systems. Prerequisite: Master's student standing or higher.

Credits: 3.00

ECE 61010 - Time Domain Simulation And Optimization For Design

Credit Hours: 1.00. This is a skills course that teaches time domain simulation and multi-objective design optimization. This course will serve the needs of students in power and energy system and component design, but is widely applicable to all areas of engineering and does not require domain specific knowledge.

Learning Outcomes: 1. Code accurate and computationally efficient simulation models. 2. Comprehend the theory of single- and multi-objective optimization. 3. Utilize single-and multi-objective optimization effectively/efficiently. Credits: 1.00

ECE 61014 - Electromagnetic And Electromechanical Component Design

Credit Hours: 3.00. This course focuses on the design of electromagnetic and electromechanical systems, with power applications. The course includes optimization methods, modeling techniques for design (as opposed to for simulation), and the formulation of design problems as optimization problems. Prerequisite by Topic: Knowledge of the use of field and co-energy techniques to calculate force/torque, Understanding of theory of operation of permanent magnet ac machines (brushless dc machines), basic knowledge of electromagnetic fields.

Learning Outcomes: 1. Understand multi-objective design techniques as they relate to the design of power magnetic devices. 2. Understand the use of computationally efficient methods of solving field problem including analytical methods and magnetic equivalent circuits. 3. Understand loss mechanisms in power magnet devices including hysteresis, eddy current, and resistive losses. 4. Understand design of distributed conductors systems such as rotating electric machinery. 5. Understand working practices on homework, exams, and projects. 6. Understand how to compete component architectures in a rigorous and meaningful way. Credits: 3.00

ECE 61016 - Power Electronic Converters And Systems

Credit Hours: 3.00. The objective of this course is to educate students in the operation, detailed modeling, average-value modeling, and control design of power electronics converters and systems of converters. Prerequisite by Topic: Basic knowledge of ordinary differential equations, solution of ODEs using numerical methods, state-space system representation, basic feedback control design with frequency domain methods, reference frame theory, some knowledge of rotating electric machinery. Permission of instructor required. Prerequisites: ECE 61010. Concurrent prerequisites: ECE 61000 and ECE 38200. Concurrent prerequisites by topic: synchronous machines (wound rotor and permanent magnet), reference frame theory, three-phase inverters, basic frequency domain control techniques, state-space representation of systems.

Learning Outcomes: 1. Understand switched circuits. 2. Understand average-value analysis techniques. 3. Understand feedforward/feedback control of power electronic converters. 4. Understand waveform level and average-value simulation techniques for switched systems. 5. Understand several ac-dc, dc-ac, and dc-dc power conversion topologies. 6. Understand inverter modulation techniques. 7. Understand ethical homework and project practices, and implication of failure to adhere to these. 8. Understand how to effectively present project results. Credits: 3.00

ECE 61020 - Operation Of Modern Power Systems

Credit Hours: 3.00. Overview of modern power system operations. Economic dispatch of assets as a constrained optimization problem, and solution methods. The unit commitment problem formulation, and solution methods. Power flow solution methods. Security-constrained economic dispatch and unit commitment. The optimal power flow. Automatic generation control. Operation of power markets. Prerequisites: ECE 43200. Co-Requisites: ECE 58000.

Learning Outcomes: 1. Read and communicate the findings of the latest power system operations, control, and economics literature. 2. Write software to perform various modern power system functions, such as: security-constrained economic dispatch and unit commitment, dc or ac power flow analysis, and optimal power flow. 3. Appreciate the computational challenges related to large-scale electric power systems analysis. Credits: 3.00

ECE 61025 - Finite Element Analysis Of Electric Machines

Credit Hours: 3.00. Application of advanced numerical methods for the characterization of the steady-state and dynamic characteristics of electromechanical energy conversion devices including solenoids, synchronous, induction, and permanent-magnet machines.

Learning Outcomes: 1. Apply basic concepts of vector calculus to quantify and correlate the physical variables of electromagnetic fields. 2. Interpret Maxwell's equations in the context of electric machinery. 3. Recognize how variational calculus can be used to reformulate the partial differential equations governing the magnetic field. 4. Solve linear and nonlinear quasi-magnetostatic problems of electromechanical energy conversion devices

numerically using the finite element method. 5. Develop custom-made software for conducting finite element analysis of electric machinery. Credits: 3.00

ECE 61200 - Advanced VLSI Devices

Credit Hours: 3.00. Device physics of advanced transistors. Process, device, circuit, and systems considerations affecting development of new integrated circuit technologies. Review of metal oxide semiconductor (MOS) fundamentals along with key process and circuit concepts. Short channel effects in sub-micron channel length metal oxide semiconductor field-effect transistors (MOSFETs) including device scaling considerations. Device physics and technology issues for sub-100 nm (nanoscale) MOSFETs. Limits of silicon device technology and key issues in the continuing miniaturization of devices. Alternative device structures to replace bulk MOSFET. Computer simulation employed throughout the course to examine device issues and prototype new device technologies. Offered in alternate years. Prerequisite: ECE 60600 .

Credits: 3.00

ECE 61220 - Advanced VLSI Design

Credit Hours: 3.00. The objective of this course is to train the students with advanced digital circuit design techniques that can be instrumental in achieving higher energy efficiency and resilience to process variations in scaled technologies. Prerequisite: ECE 55900 or equivalent.

Learning Outcomes: 1. Design challenges associated with scaled MOSFETs, including short channel effects, leakage mechanisms, process variations, reliability issues and interconnect parasitics. 2. Understand advantages and disadvantages of emerging technologies and circuit design challenges. 3. Understand adaptive design techniques to increase resilience to process variations. 4. Understand low power/ultra-low power design in near-threshold/sub-threshold region. 5. Understand advanced SRAM design. 6. Understand memory design in emerging technologies. 7. Understand Computing-in-Memory. 8. Understand Device-Circuit Co-design in Advanced Technologies. Credits: 3.00

ECE 61500 - Nonlinear Optics

Credit Hours: 3.00. An in-depth study of nonlinear optics. After a review of linear effects, several nonlinear optical processes and applications are discussed. These include electro-optic switches and modulators, harmonic light generators, sum and difference frequency mixing, parametric amplifiers and oscillators, and phase conjugate mirrors. Discussions of nonlinear spectroscopy include topics such as two-photon absorption, saturation spectroscopy, Raman spectroscopy and double-optical resonance measurements. Photonechoes and other transient effects, and surface effects are also discussed. Offered in alternate years. Prerequisite: ECE 55200 , ECE 60400 .

Credits: 3.00

ECE 61600 - Ultrafast Optics

Credit Hours: 3.00. A study of the physics, technology, and applications of ultrashort laser pulses. Topics covered include the following: methods for generating and measuring ultrafast laser pulses; basic physical processes affecting ultrashort pulses; devices for manipulating ultrashort pulses; ultrafast nonlinear optics, including nonlinear optics in fibers, nonlinear refractive index effects, pulse compression, solitons, and all-optical switching; time-resolved spectroscopy of ultrafast materials processes; and applications to ultrafast optoelectronics. In addition, each student will select a specific topic for in-depth study. Offered in alternate years. Prerequisite: ECE 55200 .

Credits: 3.00

ECE 61700 - Antennas: Design And Applications

Credit Hours: 3.00. Electrically small antennas; arrays; wire antennas and feeding arrangements; aperture antennas such as slots, horns, and parabolic reflectors; antennas for multiple frequencies including log-periodic and other frequency independent types; receiving antennas and the concept of antenna temperature; antenna measurements and evaluation. Prerequisite: ECE 44100 and concurrent prerequisite: ECE 60400 .

Credits: 3.00

ECE 61800 - Numerical Electromagnetics

Credit Hours: 3.00. The numerical solution of Maxwell's equations is studied. Numerical methods such as the Finite Element Method and the Finite Difference Method are presented for the solution of both differential and integral equations. Applications studied include: waveguides (microstrip, VLSI interconnects, optical, discontinuities), scattering (frequency selective surfaces, arbitrary scatterers), antennas, magnetics, semiconductor devices, and inverse scattering. Papers in the current literature are used. Offered every third semester. Prerequisite: ECE 60400 .

Credits: 3.00

ECE 62000 - Introduction To Biomedical Imaging Systems

Credit Hours: 3.00. (BME 63000) Overview of biomedical imaging systems and analysis. Examination of various imaging modalities, including X-ray, ultrasound, nuclear, and MRI. Microscopy including how images are formed and what types of information they provide. Image analysis techniques, including analysis of cardiac ultrasound, mammography, and MRI functional imagery. Offered in alternate years. Concurrent

prerequisite: ECE 63700.

Credits: 3.00

ECE 62400 - Multimedia Systems

Credit Hours: 3.00. Provides a general coverage of three major areas that include multimedia data management (logical and physical modeling), broadband network architectures and protocols for distributed multimedia communication, and user interface environments. Various models and specification methodologies in these areas are introduced. The discussion is augmented with various case studies. Prerequisite: ECE 54700 , ECE 56200 .

Credits: 3.00

ECE 62500 - Analysis Of Electromechanical Systems II

Credit Hours: 3.00. Extension of ECE 525. Electric propulsion systems including presentation of cycloconverter and rectifier-inverter drive systems. Dynamic and steady-state analysis of machine performance with series controlled rectifiers in the stator or rotor phases. MMF space harmonic analysis. Prerequisite: ECE 62500.

Credits: 3.00

ECE 62700 - Introduction To Cryptography And Secure Communication

Credit Hours: 3.00. Introduces the basic concepts of cryptography. Various cipher systems are presented, including transposition and substitution systems, Block ciphers, RSA, and Knapsack. Methods used to attack ciphers are discussed with emphasis on complexity. Case studies of the use of cryptographic methods in communication systems are presented with some consideration given to privacy issues. Offered in alternate years. Prerequisite: ECE 60000 .

Credits: 3.00

ECE 62900 - Introduction To Neural Networks

Credit Hours: 3.00. Information processing with neural networks, biological and engineering implications, learning algorithms, current neural network models and architectures, implementational topics, applications in areas such as signal/image processing, pattern recognition, optimization, simulation, system identification, nonlinear prediction, communications, and control. Concurrent prerequisite: ECE 60000 .

Credits: 3.00

ECE 63300 - Modeling And Simulation Of Power System Components

Credit Hours: 3.00. Recommended for those interested in learning to use computer simulation to investigate the dynamic and controlled behavior of electrical power components. Beginning with an introduction to MATLAB/SIMULINK, the course goes through the key steps of modeling, implementing and verifying the simulation of single and three-phase transformers, single and three-phase induction machines, three-phase wound field synchronous machines and permanent magnet machines useful in power applications, each case amply illustrated in projects around some interesting topics. Students are expected to implement and verify about 10 simulation projects and also discuss observed behaviors on topics such as inrush current in transformers, motoring, generating and braking operation of machines, and pulsating torque from subsynchronous resonance. Prerequisite: ECE 43200 .

Credits: 3.00

ECE 63400 - Digital Video Systems

Credit Hours: 3.00. Digital video systems. Characteristics of basic analog video systems, including bandwidth constraints, color encoding, and composite signal formation. Digital video concepts with emphasis on processing of time-varying images. Topics include: filtering, enhancement, restoration, and motion estimation and prediction. Digital video compression techniques, including intraframe coding approaches, with particular emphasis on JPEG. MPEG1 and MPEG2 video compression standards. Low bit rate approaches, including H.261, H.263, and MPEG4. Applications include: video servers, transmission systems, high definition television, multimedia systems, and videoconferencing systems. Offered in alternate years. Concurrent prerequisite: ECE 60000 .

Credits: 3.00

ECE 63700 - Digital Image Processing I

Credit Hours: 3.00. Introduction to digital image processing techniques for enhancement, compression, restoration, reconstruction, and analysis. Lecture and experiments covering a wide range of topics. 2-D signals and systems, image analysis, and image segmentation. Achromatic vision, color image processing, color imaging systems, image sharpening, interpolation, decimation, linear and nonlinear filtering, printing and display of images. Image compression, image restoration, and tomography. Offered every third semester.

Credits: 3.00

ECE 63800 - Principles Of Digital Color Imaging Systems

Credit Hours: 3.00. Basic principles of color science: physiology of the human eye, trichromatic and color opponent models for color, and uniform color spaces. Color reproduction in electronic imaging systems: color models for input and output devices, color imaging system calibration, color quantization and halftoning, and color printing. Color appearance and computational color: color appearance models, models for color constancy, and physics-based models for color. Offered in alternate years. Prerequisite: 51100 and Master's student standing or higher.

Credits: 3.00

ECE 63900 - Error Control Coding

Credit Hours: 3.00. The theory and practice of error control coding is examined. The study includes the arithmetic of Galois fields as well as linear block, cyclic, and convolutional codes. Some applications of codes in digital communication systems

and in computer systems are presented. Offered every third semester. Concurrent prerequisite: ECE 60000 .

Credits: 3.00

ECE 63901 - Error Correction Coding And Secret Sharing

Credit Hours: 3.00. The theory and practice of error control coding is examined. The study includes the arithmetic of Galois fields as well as linear block, cyclic, and convolution codes. Some applications of codes in digital communication systems and in computer systems are presented. The dual of error coding, secret sharing is also discussed. Several secret sharing schemes will be presented. Applications of secret sharing are discussed. Permission of instructor required.

Credits: 3.00

ECE 64100 - Model Based Image And Signal Processing

Credit Hours: 3.00. An advanced treatment of the methods in model-based signal and image processing including stochastic modeling of multidimensional signals, Bayesian estimation, inverse methods, doubly stochastic models, regularized inversion, the EM algorithm, Bayesian networks, Markov chains, optimization, convexity, majorization techniques, and stochastic simulation. The underlying theory is presented in the context of applications including image restoration, tomographic reconstruction, clustering, classification, and segmentation. Prerequisite: ECE 60000, 63700.

Learning Outcomes: 1. Understand how to model an imaging system. 2. Understand widely used methods for solving inverse problems in imaging applications. 3. Implement an image reconstruction algorithm for applications such as deconvolution and denoising. 4. Understand how probability can be used to model imaging systems and images. 5. Understand basic approaches to optimization of quadratic and non-quadratic functions. 6. Understand MAP and ML estimation methods. Credits: 3.00

ECE 64200 - Information Theory And Source Coding

Credit Hours: 3.00. A treatment of the basic concepts of information theory. Determination of channel capacity and its relation to actual communication systems. Rate distortion theory is introduced, and the performance of various source codes is presented. Offered in alternate years. Prerequisite: ECE 60000 .

Credits: 3.00

ECE 64500 - Estimation Theory

Credit Hours: 3.00. This course presents the basics of estimation and detection theory that are commonly applied in communications and signal processing systems. Applications in communications and signal processing will be considered throughout. Prerequisite: ECE 60000 .

Credits: 3.00

ECE 64700 - Convex And Stochastic Optimization And Applications

Credit Hours: 3.00. Convex optimization and dynamic programming with application to various disciplines in ECE, including wireless and wireline communications, networks, electrical systems, and machine learning. The goal is to model a research problem as an optimization problem, and use the insights from the optimization algorithms to design implementable protocols and solutions that are tailored to the needs of the applications (e.g., operating in decentralized settings and under stochastic uncertainty). The instructor may tailor the content to reflect current trends and goals of research. Examples of relevant topics are: convex sets and functions, convex program, Lagrange duality, primal and dual decomposition, proximal optimizations, stochastic approximation, Markov decision processes, dynamic programming and approximate dynamic programming. The exposition of the theory will be connected to various ECE applications, such as congestion control, wireless power control and opportunistic scheduling, cross-layer design, demand response, renewable integration, spectrum sharing and cognitive radio, machine learning, optimization of UAV (unmanned aerial vehicles) aided communications. Prerequisite: ECE 60000.

Learning Outcomes: 1. Be equipped with the basic theory of convex optimization, Markov decision processes, (approximate) dynamic algorithms, and be able to apply these tools to research problems. Credits: 3.00

ECE 64800 - Wavelet, Time-Frequency, And Multirate Signal Processing

Credit Hours: 3.00. Advanced topics in signal processing, including time-frequency analysis, multiscale edge detection, wavelet bases and filter banks, and techniques for approximation, estimation, and compression using wavelets. Offered in alternate years. Prerequisite: ECE 53800 .

Credits: 3.00

ECE 65000 - Topics In Solid-State Devices And Materials

Credit Hours: 1.00 to 3.00. An introductory treatment of selected device and materials related topics. Topics will change from semester to semester and will be announced in advance. The list of possible topics includes solid state microwave devices, optoelectronics, laser-quantum electronics, magnetics, noise in semiconductor devices, acoustic wave devices, energy conversion, device fabrication, electroceramics, MOS devices, thin-film devices, and memory devices.

Credits: 1.00 to 3.00

ECE 65400 - Solid State Devices II

Credit Hours: 3.00. Introduction to advanced concepts in semiconductor devices as an extension and continuation of ECE 60600 . Topics include charge storage and transfer in deep depletion MOS devices (CCDs and DRAMs); negative differential mobility and transit time effects in microwave oscillators (Gunn and IMPATT diodes); spontaneous and stimulated emission, quantum efficiency, and charge confinement in photonic devices (LEDs and double heterojunction lasers); and quantum efficiency and spectral response in conventional and avalanche photodiodes. Prerequisite: ECE 60600 .

Credits: 3.00

ECE 65600 - Electronic Transport In Semiconductors

Credit Hours: 3.00. A treatment of the microscopic and phenomenological physics of carrier transport in bulk semiconductors and in semiconductor devices. The Boltzmann transport equation is introduced as are techniques for solving it analytically and numerically. The physics of carrier scattering in common semiconductors is explored. Theoretical treatments of low and high field transport are compared with measured results. Balance equations are derived as moments of the Boltzmann Transport Equation and are applied to the analysis of sub-micron semiconductor devices. Students are expected to be able to apply elementary concepts of quantum mechanics and solid state physics. Offered every third semester. Prerequisite: ECE 60600 .

Credits: 3.00

ECE 65800 - Semiconductor Material And Device Characterization

Credit Hours: 3.00. A comprehensive survey of modern characterization techniques routinely used to determine solid-state material and device parameters. Concepts and theory underlying the techniques are examined, and sample experimental results are presented. The coverage includes electrical, optical, chemical, and physical characterization methods. Offered in alternate years. Prerequisite: ECE 60600 .

Credits: 3.00

ECE 65900 - Quantum Phenomena In Semiconductors

Credit Hours: 3.00. This course is designed for graduate students familiar with semiconductor fundamentals, with engineering electromagnetics and with linear algebra, but having no significant acquaintance with either quantum mechanics or statistical mechanics. The purpose of the course is to introduce the relevant concepts of quantum mechanics and nonequilibrium statistical mechanics as possible using device-related examples. Topics include: preliminary concepts, equilibrium, restoration of equilibrium, transport, effective mass equation, optical properties, advanced concepts. Offered every third semester. Prerequisite: ECE 60600, MA 51100.

Credits: 3.00

ECE 66100 - Computer Vision

Credit Hours: 3.00. This course deals with how an autonomous or a semi-autonomous system can be endowed with visual perception. The issues discussed include: sampling from a topological standpoint; grouping processes; data structures, especially hierarchical types such as pyramids, quadtrees, octrees, etc.; graphic theoretic methods for structural description and consistent labeling; issues in 3-D vision such as object representation by Gaussian spheres, generalized cylinders, etc. Prerequisite: ECE 57000 .

Credits: 3.00

ECE 66200 - Pattern Recognition And Decision-Making Processes

Credit Hours: 3.00. (CS 66200) Introduction to the basic concepts and various approaches of pattern recognition and decision-making processes. The topics include various classifier designs, evaluation of classifiability, learning machines, feature extraction and modeling. Prerequisite: ECE 30200 .

Credits: 3.00

ECE 66300 - Advanced Compilation And Automatic Programming

Credit Hours: 3.00. This course presents the concepts needed to design and implement production quality code generators for any of the more popular languages and families of computer architecture (including various pipelined, superscalar, and macro-parallel machines). Flow analysis and concurrency detection, as well as optimizations and loop and irregular code parallelizations, are covered in detail. Using C on ECN UNIX, each student will complete a project implementing a simple optimizer/parallelizer. Prerequisite: ECE 56500 , CS 50200 or ECE 46800 or ECE 57300 .

Learning Outcomes: 1. Apply automated reasoning techniques and tools to analyze and verify programs and reactive systems. 2. Explain and implement program synthesis algorithms and methodologies. 3. Apply program synthesis techniques to automate programming tasks in an application domain.

Credits: 3.00

ECE 66400 - Formal Languages, Computability, And Complexity

Credit Hours: 3.00. Topics in computability theory and formal languages include recursive function theory, the equivalence of various generic programming languages for numeric calculations and string manipulations, regular languages and finite state automata, and context-free and context-sensitive languages. In complexity theory, emphasis is on the theory of NP-completeness, including proof methods, the distinctions

between strong- and weak-sense NP-completeness, NP-hardness, and performance-guaranteed approximation algorithms. Offered in alternate years. Prerequisite: ECE 60800 .

Credits: 3.00

ECE 66600 - Advanced Computer Systems

Credit Hours: 3.00. The study of theoretical aspects of advanced computer systems where multiprocessing is used. Topics include the design, architecture, and performance evaluation of multiprocessor memories, interconnection networks, and computational pipelines. Also included are the topics of scheduling, synchronization, resource allocation, load-balancing, partitioning and deadlock avoidance in multiprocessors. Also covered are the design and analysis of parallel algorithms, programming languages and automatic approaches to parallelism detection/exploitation for concurrent computation. Prerequisite: ECE 56500 , ECE 60800 .

Credits: 3.00

ECE 67000 - Modeling And Optimization Of High-Performance Interconnects

Credit Hours: 3.00. RLC extraction of VLSI interconnects. Modeling of interconnects as RLC trees or networks. Elmore delay model. Reduced-order modeling: moment matching, Pade approximation, and Krylov-subspace methods. Device modeling with consideration of resistive shielding in the interconnection load. Delay calculation with consideration of devices and interconnects. Repeater insertion and planning at floorplanning. Timing-driven placement: zero-slack algorithm for delay budgeting, net-based placement, and path-based placement. High-performance clock synthesis: zero-skew routing, bounded-skew routing, and useful-skew routing. Term projects investigating interconnect-related issues are assigned. Prerequisite: ECE 55900 .

Credits: 3.00

ECE 67300 - Distributed Computing Systems

Credit Hours: 3.00. Discussions of the design issues of distributed computing systems (DCS). The general theory of distributed transaction management, reliability, and resource management is discussed. Various algorithms and specification methodologies for DCS are introduced. A general coverage of the three major areas of DCS, namely: distributed operating systems, distributed databases, and distributed AI is provided. The discussion is augmented with various case studies. Prerequisite: ECE 46900 or introductory course in operating systems.

Credits: 3.00

ECE 67500 - Introduction To Analysis Of Nonlinear Systems

Credit Hours: 3.00. An introduction to modeling of dynamic control systems. State plane and numerical methods for solving modeling equations. Linearization and describing function techniques. Stability concepts. Controller and state estimator design for nonlinear systems. Variable structure sliding mode control. Vector field techniques. Introduction to chaos. Offered in alternate years. Prerequisite: ECE 60200 .

Credits: 3.00

ECE 67600 - Academic Oral Communication For International Research Students

Credit Hours: 0.00. Discussions of and activities related to such topics as appropriate nonverbal communication; learning styles; strategies for effective speech and listening; and speech acts for the classroom, office, and laboratory. Individual weekly tutoring sessions to improve speech comprehension. Prerequisite: Master's student standing or higher and Electrical & Computer Engineering majors only. Permission of department required.

Credits: 0.00

ECE 67700 - Communication Aspects Of Academic Research

Credit Hours: 0.00. Topics relevant to oral and written communication needs of Ph.D. students. Three papers are written: a journal article review, a literature review, and the choice of a thesis proposal, conference paper, or a journal article. Library and Internet research strategies and resources; research/writing ethics; citing sources; citation styles; and academic language. Oral presentations based on the written projects. Extensive peer revision and editing and out-of-class writing conferences with the instructor. Prerequisite: Master's student standing or higher and Electrical & Computer Engineering majors only. Permission of department required.

Credits: 0.00

ECE 67800 - Radar Engineering

Credit Hours: 3.00. An introduction to the system aspects of modern radar engineering. The theoretical basis for radar performance analysis is developed and applied to radars designed for a variety of different applications. Consideration is given to system parameters such as receiver noise, antenna characteristics, operating frequency, target characteristics, transmitted signal modulation, and methods of detection. Attention is given to radars for special purposes, such as automatic range and angle tracking, moving target indication, and resolution enhancement through synthetic aperture techniques. Offered in alternate years. Prerequisite: ECE 60000 .

Credits: 3.00

ECE 67900 - Advanced Digital Communications

Credit Hours: 3.00. Provides a detailed examination of optimum digital communication principles and introduces three advanced topics critical to the design of digital communication systems: system synchronization; techniques for communication in nonideal channels (equalization); and communication over fading/multipath channels. Theoretical principles and practical implementations are considered. Prerequisite: ECE 54400 , ECE 60000 .

Credits: 3.00

ECE 68000 - Modern Automatic Control

Credit Hours: 3.00. Theoretical methods in optimal control theory. Topics include the calculus of variations and the Pontryagin minimum principle with applications to minimum energy problems. Geometric methods will be applied to the solution of minimum time problems. Computational methods, singular problems, observer theory, and sufficient conditions for existence of solutions are also discussed. Offered in alternate years. Prerequisite: ECE 60200 .

Credits: 3.00

ECE 68400 - Linear Multivariable Control

Credit Hours: 3.00. A state space investigation of multi-input, multi-output control design problems from the geometric perspective. The course will detail the theory and design algorithms needed for a solution to the state feedback eigenvalue assignment problem, the disturbance decoupling problem with and without internal stability, the output stabilization problem, and the tracking (or regulator) problem with internal stability. Offered in alternate years.

Credits: 3.00

ECE 68800 - VLSI Testing And Verification

Credit Hours: 3.00. Discusses different aspects of VLSI testing and formal verification of designs. Design and manufacturing defect models are introduced along with test generation and fault simulation algorithms targeting the different fault models. Both combinational and sequential logic testing are covered, and different synthesis for testability schemes such as BIST (Built-In-Self-Test), scan path design, etc., are introduced. Other new and emerging test and verification techniques also are discussed. Offered every third semester. Prerequisite: ECE 55900 .

Credits: 3.00

ECE 69200 - Introduction To Graduate Research

Credit Hours: 1.00 to 3.00. Research-related activities supervised by an ECE faculty member to introduce newly admitted ECE graduate students to the methods and culture of doing research. Possible activities might include, but are not limited to, participation in group research meetings, association with an advanced graduate student, and individualized reading or project work. A description of the activity, approved by the faculty supervisor, must be filed with the ECE Graduate Office. Permission of instructor required.

Learning Outcomes: 1. Develop knowledge and scholarship (thesis/non-thesis). 2. Develop communication (thesis/non-thesis). 3. Develop critical thinking (thesis/non-thesis). 4. Develop ethical and responsible research (thesis) or professional and ethical responsibility (non-thesis). Credits: 1.00 to 3.00

ECE 69300 - Advanced Intern Project

Credit Hours: 1.00. Graduate-level project course in ECE based on off-campus intern position. Individual research projects are approved by the supervising Purdue ECE faculty member before registering for the course. An approved written report must be filed before credit is accepted. This course cannot be used to satisfy the minimum course requirements for the master's or Ph.D. degrees. Permission of instructor required.

Credits: 1.00

ECE 69311 - Advanced Internship

Credit Hours: 1.00 to 3.00. Graduate-level Internship based course, in an off-campus internship position. Internship must be in the area of Electrical & Computer Engineering. Individual Internship must be preapproved by the supervising ECE faculty member before the student can register for the course. A written report must be submitted and approved by the faculty before credit is accepted. This course cannot be used to satisfy the minimum course requirements for the Master's or Ph.D. degrees. Permission of instructor required.

Credits: 1.00 to 3.00

ECE 69400 - Electrical And Computer Engineering Seminar

Credit Hours: 0.00. Seminar presentations by representatives from industry, members of the faculty of the School of Electrical and Computer Engineering, and other staff and faculty of Purdue University. The presentations introduce the student to a wide variety of current topics relevant to the technical and career aspects of electrical and computer engineering. Technical topics span the entire spectrum of electrical and computer engineering. Career topics include the importance of interpersonal communications, opportunities beyond graduate school, interviewing techniques, and descriptions of non-typical jobs. Required of electrical and computer engineering graduate students at Purdue during one of their first two semesters in residence.

Credits: 0.00

ECE 69401 - Electrical And Computer Engineering Graduate Seminar

Credit Hours: 0.00. Seminar presentations by members of the faculty of the Department of Electrical and Computer Engineering, staff and other faculty of IUPUI, researchers from academia, and representatives from industry. The presentations introduce the student to a wide variety of current topics relevant to the technical, educational and career aspects of electrical and computer engineering. This course cannot be used to satisfy the PhD seminar requirement. Permission of department required.

Credits: 0.00

ECE 69409 - Electrical And Computer Engineering PhD Student IUPUI Residency Course

Credit Hours: 1.00. This course is for ECE PhD students who are required to be enrolled at Purdue West Lafayette for their PhD program although research instruction and all related activities occur at the IUPUI Campus.

Credits: 1.00

ECE 69500 - Advanced Topics In Electrical And Computer Engineering

Credit Hours: 1.00 to 3.00. Formal classroom or individualized instruction on advanced topics of current interest. Permission of instructor required.

Credits: 1.00 to 3.00

ECE 69600 - Advanced Electrical Engineering Projects

Credit Hours: 0.00 to 18.00. Individual research projects to be approved by the supervising faculty member before registering for the course. An approved written report must be filed before credit is accepted. Permission of instructor required.

Credits: 0.00 to 18.00

ECE 69700 - Directed Reading In Electrical Engineering

Credit Hours: 1.00 to 3.00. Individualized reading course supervised by an appropriate faculty member and pertaining to a topic not intended for a subsequent project or thesis done by that student. Approval for each reading course must be obtained from the department prior to registration. Permission of instructor required.

Credits: 1.00 to 3.00

ECE 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required.

Credits: 1.00 to 18.00

ECE 69900 - Research PhD Thesis

Credit Hours: 1.00 to 18.00. Research PhD Thesis. Permission of instructor required.

Credits: 1.00 to 18.00

Electrical and Computer Engineering Technology

ECET 11600 - Electrical Circuits

Credit Hours: 3.00 or 4.00. This course covers circuit components, R, L, C; voltage; current; power; Ohm;s law, Kirchhoff' laws; series and parallel circuits; electrical measurements; sinusoidal voltages; currents; impedances; transformers; motors; polyphase systems, and the National Electrical Code. This course is a service course for non-ECET majors.

Learning Outcomes: 1. Identify and recognize electrical safety practices. 2. Identify the terminology associated with current, voltage, and dc circuits. 3. Convert from one unit of measure to another. 4. Draw schematic circuits of batteries, and calculate the total voltage and current available for different series, parallel, and series-parallel cell and battery connections. 5. Accurately read resistor color code and verily & the results with an ohm meter. 6. Compute total resistance for series, parallel, and series-parallel circuits. 7. Measure total resistance for series, parallel, and series-parallel circuits. 8. Solve problems involving power, current and voltage. 9. Solve unknown values in series, parallel, and series-parallel dc circuits. 10. Identify the terminology associated with magnetism inductance and capacitance. 11. Demonstrate how capacitance reacts in a circuit. 12. Identify the terminology associated with alternating current. 13. Setup an Oscilloscope and accurately measure. 14. Describe and accurately measure RMS, peak, and peak-to-peak voltages. 15. Explain the effects of capacitor and inductors in AC circuits. 16. Solve for capacitive and inductive reactance in AC circuits. 17. Demonstrate the characteristics of a series RC Network. 18. Work with others in laboratory problem solving.

Credits: 3.00 or 4.00

ECET 15500 - Digital Fundamentals II

Credit Hours: 3.00. A continuation of ECET 10900. Sequential logic circuits, flip-flops, counters, finite state machines, programmable logic devices, shift registers, logic families, and introductory computer concepts.

Credits: 3.00

ECET 15700 - Electronics Circuit Analysis

Credit Hours: 4.00. Capacitors, inductors, switching circuits, transformers, rectifiers, linear regulators, dependent sources, operational amplifiers, BJT- & MOSFET-based small-signal amplifiers, waveform generation, and programmable analog devices are studied. Circuit fundamentals such as Kirchhoff's laws are utilized in analysis and design of circuits. Computer simulation is used.

Credits: 4.00

ECET 16400 - Applied Object-Oriented Programming

Credit Hours: 3.00. Problem solving and computing with emphasis on electrical engineering technology applications. Introduction to an object programming language as applied to solving electrical technology problems.

Credits: 3.00

ECET 17700 - Data Acquisition And Systems Control

Credit Hours: 3.00. Fundamental electrical parameters and measurement techniques are introduced. These are then applied to implementing power interfaces, actuators and sensors. Modules that provide signal conditioning, data conversion, filtering and controllers are evaluated. A full, closed loop control system is built and evaluated.

Learning Outcomes: 1. Make laboratory measurements using digital multi-meters, oscilloscopes, and a microcomputer. 2. Implement and evaluate the performance of each of the following elements at the module level while calculating key circuit parameters: Switching and linear power interfaces; Light, sound, motion, and temperature actuators and sensors; Amplifiers, signal conversion, and filters. On/off, linear, and computer controllers. 3. Evaluate the static and the dynamic performance of a closed loop system constructed of the elements from items 1 and 2 above. Credits: 3.00

ECET 17900 - Introduction To Digital Systems

Credit Hours: 3.00. This course introduces computing systems and defines the major classes of computing devices. Sequential and concurrent operations, along with logic and control structures, are covered. Knowledge of fundamental computing principles is discovered. Common software tools are used to create, test, and debug systems. Systems are constructed from standard blocks with a focus on subsystem operation and performance, troubleshooting/debugging and testing. Common applications of embedded systems are introduced.

Learning Outcomes: 1. Develop and utilize algorithms and flowcharts to create microcontroller applications to solve a given problem. 2. Apply the fundamental control structures and logic operations to control program flow within microcontroller applications. 3. Demonstrate the ability to convert numbers between number systems (bases) and compute arithmetic operations within microcontroller applications. 4. Utilize the primary tools used to create, test, and debug computing system hardware and software components. 5. Construct electronic hardware systems to solve a given microcontroller problem. Credits: 3.00

ECET 20700 - AC Electronics Circuit Analysis

Credit Hours: 4.00. AC circuits including the j operator, phasors, reactance and impedance are studied. Circuit laws, network theorems, and the fundamental concepts of Fourier analysis are applied and used in the study of topics such as passive filters, IC filters, amplifiers, resonant circuits, single-phase and three-phase circuits. Computer aided analysis of circuits is used.

Credits: 4.00

ECET 20900 - Introduction To Microcontrollers

Credit Hours: 4.00. This course is an introduction to microcontroller hardware and software, focusing on embedded control applications. Interconnections of components, peripheral devices, bus timing relationships, structured C-language programming, debugging, input/output techniques, and use of PC based software development tools are studied.

Credits: 4.00

ECET 22400 - Electronic Systems

Credit Hours: 3.00. This course is a survey of key electrical and electronics systems, their basic performance and applications. DC fundamentals include sources, resistance, Ohm's and Kirchhoff's Laws with simple circuits. AC systems include transformers and reactive elements, power production and distribution, filtering, motors and relays. Computer systems are presented with a microprocessor and provide the ability to write and read both digital and analog data. Analog systems include diodes, transistors, IC amplifiers, and analog-digital and digital to analog conversions. The semester closes by combining all of the topics presented in the control of motor speed.

Learning Outcomes: 1. Apply Ohm's Law and Kirchhoff's Laws to series and parallel DC circuits. 2. Define, measure, and apply sinusoidal parameters in passive RLC circuits. 3. Explain power generation and distribution. 4. Use a microprocessor to input, output, and manipulate digital and analog signals. 5. Apply diodes, transistors, analog ICs, ADC and DAC to control the performance of a motor. Credits: 3.00

ECET 22700 - DC And Pulse Electronics

Credit Hours: 3.00. Capacitors, inductors, oscillators, rectifiers, bipolar and MOSFET power switches, switching power supplies, half-and full-H bridges, switching audio power amplifiers, and linear regulators are studied. Computer-aided analysis of circuits is utilized.

Learning Outcomes: 1. Explain the characteristics of capacitors, inductors, rectifier diodes, Zener diodes, IC regulators, bipolar junction transistors (BJTs), field effect transistors (MOSFETS), and general purpose operational amplifiers. 2. Apply the principles of

circuit analysis to the following: switching and linear power supplies, op-amp based amplifiers, BJT and MOSFET switches, Class D amplifier, wave shape generators, RC and RL circuits. 3. Simulate circuits and compare actual data to simulated data. 4. Construct electronic circuit according to a given schematic. 5. Measure electrical parameters, using digital multimeters, signal generators, and oscilloscopes. 6. Interpret laboratory experiment data. Credits: 3.00

ECET 22900 - Concurrent Digital Systems

Credit Hours: 3.00. This course establishes a foundation for concurrent digital systems. Common methods of describing digital circuit operation are studied along with the techniques for translation between any two methods. Basic building blocks of digital systems are defined and applied. Analysis techniques for combinational and sequential logic circuits or subsystems are covered. Computer-based development tools, programmable logic devices, and technical reference sources are used to build, test, and evaluate digital systems.

Learning Outcomes: 1. Translate between any two forms of logic circuit descriptions: English, Boolean equation, Truth Table, Logic Diagram, Timing Diagram, Hardware Description language. 2. Anticipate the output of functional blocks given the current inputs or a recent event. 3. Validate the operation of any logic circuit using the simulator, Function generator, oscilloscope or DVM. Credits: 3.00

ECET 23110 - Electrical Machines

Credit Hours: 3.00. An introduction to the fundamental concepts and applications of transformers, induction motors, and single-phase and three-phase power systems. Design and optimization of power systems based on National Electrical Code guidelines. Laboratory experiments in the design, operation, and measurement of electromechanical systems.

Learning Outcomes: 1. State and practice the principles of electrical safety. 2. Apply the principles of circuit analysis to calculate real, reactive, and apparent power in single and three-phase circuits. 3. Explain the operating principles of electric machines and transformers. 4. Use mathematical models to solve engineering technology power problems. 5. Design basic power and motor circuits in accordance with applicable standards (NEC, etc.), including sizing wires, circuit breakers or fuses, and overload protection. 6. Understand the application of NEC Chapter 2 Wiring and Protection, Article 230 (see Figure 1) and Chapter 4 Equipment for General Use, Article 430 (see Figure 2). 7. Use Joint International Congress (JIC) standard drafting practices and symbols to construct a ladder diagram. 8. Understand how to properly size the components for a defined application. 9. Understand and compare the characteristics of electric motors. 10. Understand the ethical consideration of the elimination of PCB's as transformer and cooling liquid. Credits: 3.00

ECET 23120 - Industrial Controls

Credit Hours: 3.00. An introduction to Industrial Controls with a focus on relay logic and PLC logic. Design and optimization of control systems based on National Electrical Code guidelines and methods for development of schematics and coding for industrial controls. Laboratory experiments in the design, coding, operation, and documentation of industrial control systems.

Credits: 3.00

ECET 27000 - Electronics Prototype Development And Construction

Credit Hours: 3.00. This course introduces project planning and basic concepts in electronic design automation (EDA). The student develops a portion of an electronic system by utilization of EDA, design for testing, design for manufacturability (DFM), and component selection techniques. New construction methods and testing techniques are introduced.

Learning Outcomes: 1. Design an electronic device or system to accomplish a given task. 2. Demonstrate appropriate electronic assembly techniques. 3. Develop and execute appropriate testing techniques on electronic devices and systems. 4. Apply appropriate software applications to develop a prototype. 5. Apply graphical communication techniques to convey technical information. 6. Apply principles of design for manufacturability and design for testing to a project. 7. Employ teaming methods on a project. Credits: 3.00

ECET 27400 - Wireless Communications

Credit Hours: 3.00. The theory and techniques of wirelessly sending information (voice, music, data) from one location to another is studies from a systems point of view. This includes a signal analysis, modulation techniques, transmitters, receivers, low noise amplifiers, and filters in the RF frequency spectrum. In addition, special topics of current interest are introduced. This course incorporated a student-based communication design and analysis laboratory.

Learning Outcomes: 1. Perform power calculations, such as dB, dBm, dBuV. 2. Describe, identify and apply Fourier concepts communication signals and systems, such as wave shapes, signal mixing, carrier waves. 3. Evaluate, describe and calculate the effects of noise on communication circuits and systems. 4. Demonstrate the concepts and applications of amplitude, frequency, and phase modulation techniques. 5. Describe and compare the operation of various receiver and transmitter blocks and systems. 6. Describe and apply the concepts of EMC, EMI and RFI to RF components, circuits and systems. 7. Describe and apply the fundamentals of cellular communication, such as frequency reuse, spread spectrum techniques and network technologies. 8. Describe and apply the fundamentals of digital communications, such as coding, bandwidth and modulation techniques. 9. Demonstrate use of RF laboratory equipment including the spectrum analyzer and RF generator. Credits: 3.00

ECET 27700 - AC And Power Electronics

Credit Hours: 3.00. AC Circuits including the j operator, phasors, reactance and impedance are studies. Circuit laws, network theorems, and the application of circuit analysis techniques to amplifiers used in power electronics, including power MOS devices, thyristors, and other appropriate applications. Computer-aided analysis of circuits is used.

Learning Outcomes: 1. Calculate phasor and time domain representation of a sine wave. 2. Analyze series, parallel and series-parallel passive and active AC circuits. 3. Analyze multi-loop, multi-source AC circuits using advanced techniques. 4. Analyze and design given series and parallel resonance circuits. 5. Compute the average voltage, rms voltage and power produced by a wide variety of waveshapes using integral definitions. 6. Describe the linear performance of MOS devices. 7. Analyze and design linear power amplifiers using op amps and MOS devices. 8. Apply thyristors, snubbing, thyristor triggers and proportional interfaces. 9. Evaluate the performance of a variety of AC circuits, using appropriate standard laboratory measurement procedures and simulations. Credits: 3.00

ECET 27900 - Embedded Digital Systems

Credit Hours: 3.00. A course emphasizing the advanced applications of embedded digital systems. Topics include embedded system architecture, use of advanced programmable counter/timer arrays, analog interfaces, serial communication, and interrupts.

Learning Outcomes: 1. Solve problems by the application of C programs emphasizing I/O and peripherals. 2. Demonstrate knowledge and skill in the application of parallel ports, counter-timers, programmable counter arrays, serial ports and interrupts. 3. Demonstrate a conceptual understanding of embedded microcontroller system hardware system design. 4. Demonstrate the use of software development tools such as an editor, an assembler, a C compiler, a linker and locator, an object-to-hex converter, etc. 5. Demonstrate fluency in the language of advanced microprocessors. Credits: 3.00

ECET 28400 - Computer Communications

Credit Hours: 4.00. An introductory course in data communication systems. The hardware and software issues in computer communications are studied. Emphasis on hands-on experience in computer communications, such as cabling, use of communication devices and media, choice of networking topologies, protocols, and platforms.

Credits: 4.00

ECET 28404 - Contemporary Communication System

Credit Hours: 4.00. An introductory course in communications that introduces and evaluate basic concepts and principle of contemporary communication systems. The hardware and

software issues in contemporary communications are studied. Emphasis is given on experiential experience in the signals and systems used in contemporary communications such as types of signals and systems use of communication devices and media choice of networking technologies protocols and platforms. Permission of department required.

Learning Outcomes: 1. Describe communication systems and their basic underlying characteristics. 2. Analyze signals in the time and frequency domains. 3. Explain the necessity and the concept of modulation in communication systems. 4. Explain the concept and the use of signal-to-noise ratio and its importance to communication systems. 5. State the relationship between bandwidth and information rate for a given communication system. 6. Describe and contrast different types of modulation schemes. 7. Solve problems that demonstrate the overall concept of computer communications and networking technologies. 8. Describe and explain various types of computer networks, network topologies. 9. Describe the basis of data communications and computer networking, such as: digital signals, serial and parallel transmission, communication modes, digital encoding and error detection methods used in networking. 10. Describe and explain the function of each layer in the OSI Reference Model. 11. Describe and explain how local area networks are configured and specified. 12. Describe and explain how data is transmitted through interconnected networks from both hardware and software aspects. 13. Describe the TCP / IP protocol used for transporting Internet messages. 14. Describe the application of multiplexer, de-multiplexer, types of multiplexing accesses, and switching technology. 15. Describe and explain the applications of networking interconnection devices such as repeaters, bridges, routers, and gateways. 16. Explain the Internet architecture, TCP / IP, IP, Ipv6, and contemporary interconnect models. 17. Describe and explain how WAN and some special types of interconnected networks, such as industrial networks are setup. 18. Demonstrate skills for life-long learning through term project presentation by locating, evaluating and applying relevant information using external resources such as the Internet, data books, trade publications and library resources. Credits: 4.00

ECET 29801 - Laboratory Teaching Aide In Electrical Engineering Technology

Credit Hours: 1.00 to 3.00. This course allows a student to serve as an undergraduate teaching aide in the laboratory. The student will work with and support a course instructor in the undergraduate teaching labs. Hours, subject matter, and credit to be arranged by faculty. Course content applies toward the EET Professional Experience requirement. Department and Instructor permission required.

Learning Outcomes: 1. Explain and communicate lab steps clearly. 2. Recognize problems and implement troubleshooting techniques. 3. Demonstrate operation and use of test equipment. Credits: 1.00 to 3.00

ECET 29900 - Selected Electrical Engineering Technology Subjects

Credit Hours: 0.00 to 6.00. Hours and subject matter to be arranged by staff. Permission of instructor required.

Learning Outcomes: 1. Vary due to the content of the project and will be approved by the EET curriculum subcommittee. Credits: 0.00 to 6.00

ECET 30200 - Introduction To Control Systems

Credit Hours: 4.00. This first course in industrial controls is applications oriented and includes on-off type open- and closed-loop control systems, and analog-based systems. Major topics include relay and programmable controller-based systems.

Credits: 4.00

ECET 30201 - Introduction To Industrial Controls

Credit Hours: 3.00. This course examines the concepts, devices and common practices associated with control systems with a primary focus on industrial implementations. Additionally, the course provides a hierarchical examination of the implantation of control theory. Programmable logic controllers serve as the primary platform for presenting applications in interfacing and control of electromechanical and pneumatic devices. Electrical industrial safety standards are presented and emphasized throughout the course.

Learning Outcomes: 1. Demonstrate an

understanding of common electrical, pneumatic, and mechanical safety standards and practices. 2. Identify, describe, and compute the parameters of key functional blocks of a basic control system. 3. Describe, interpret and implement control scenarios in ladder logic, flow chart and programmatic forms. 4. Construct, program and trouble shoot basic control circuits and systems using programmable logic controllers. Credits: 3.00

ECET 30700 - Analog Network Signal Processing

Credit Hours: 4.00. This is an advanced course in network analysis that stresses network theorems and solutions of time- and frequency-domain problems. Transform circuit and signal analysis using Laplace and Fourier techniques are developed, culmination in active filter design applications. Software techniques, such as MATLAB(r) and LabVIEW(tm), to solve mathematical problems are employed.

Credits: 4.00

ECET 30903 - Advanced Embedded Microcontrollers

Credit Hours: 3.00. This course emphasizes advanced applications of embedded microcontrollers, included are microcontroller architecture, use of advanced programmable counter/timer arrays, interrupts, multi-tasking, analog interfaces, hardware abstraction and their peripherals. Permission of department required. Permission of instructor required.

Learning Outcomes: 1. Designate and setup a linker to specify memory spaces for code, data, constants, and I/O. 2. Use a real-time high-level code debugger to test and debug programs including instruction stepping, setting up breakpoints and examining variables. 3. Use standard C-language coding conventions. 4. Manipulate I/O bits (clear and set) using C language logic instructions and bit-fields. Credits: 3.00

ECET 31800 - Foundations Of Audio Electronics

Credit Hours: 3.00. The design, fabrication, and testing of the electronics that comprise audio signal transduction, transmission, processing, amplification and delivery to a loudspeaker are studied at an introductory level. Computer-aided analysis of circuits is used.

Learning Outcomes: 1. Quantify and measure sound and signal levels in terms of dB. 2. Convert dB, crest factor, THD, and frequency cut-off specifications into circuit design parameters. 3. Interface circuitry to microphones and loud speakers. 4. Design, build, and test a small audio system containing differential transmitters, differential amplifiers, simple active filters summers/mixers, class AB and class D power and bridged audio power amplifiers. Credits: 3.00

ECET 32100 - Introduction To Nanotechnology

Credit Hours: 3.00. This course explores the downsizing of electronic and mechanical devices and introduces the field of nanotechnology. Properties of nanomaterials and the tools of nanotechnology are studied. Interdisciplinary research and commercial applications are reviewed. The course involves participation in research seminars and hands-on laboratory experiences with nanotechnology instrumentation.

Learning Outcomes: 1. Identify the basic concepts behind nanotechnology. 2. Describe the tools of nanotechnology. 3. Develop a model of the Scanning Probe Microscope. Credits: 3.00

ECET 32300 - Introduction To Electric Vehicle Systems

Credit Hours: 3.00. The course is an introduction to electric vehicle (EV) technology analysis and configuration. The course explores the integrated mechanical and electrical power and control systems including the management of integrated power and control systems within an electric vehicle. Students perform detailed analysis of and develop design approaches for electrically powered vehicles.

Learning Outcomes: 1. Calculate horsepower requirements for various electric vehicle configurations. 2. Calculate efficiency of an electric vehicle. 3. Compare and contrast the various types of motors/controllers and their associated benefits and limitations. 4. Compare and contrast the various battery technologies related to electric vehicles. Credits: 3.00

ECET 32700 - Instrumentation And Data Acquisition Design

Credit Hours: 3.00. This course builds upon the prerequisite knowledge and covers implementation of electric systems to measure and record mechanical, electrical, and biological parameters. Signal characteristics, transducer specification and selection, signal conditioning and transmission design, data conversion, software, and an overall system error budget are developed.

Learning Outcomes: 1. Differentiate appropriate transducers for sensing various signals, including mechanical, biological, and electrical. 2. Design, simulate and verify signal conditioning circuits. 3. Implement analog-to-digital converters and examine conditioned data for sampling and quantization effects. 4. Create software programs to interface with analog-to-digital converters, process data, and display or utilize the results. 5. Evaluate common sources of errors in instrumentation systems. Credits: 3.00

ECET 32900 - Advanced Embedded Digital Systems

Credit Hours: 3.00. This course focuses on the study and application of real-time embedded systems. Real-time operating systems (RTOS) are introduced and applied. Students learn and use programming and scripting languages to discover the advantages and limitations of RTOS application in the lab.

Learning Outcomes: 1. Define, compare and contrast embedded systems terms and the concepts of soft and hard real time. 2. Identify and explain real time operating system operational concepts. 3. Demonstrate the application of software design, documentation, and version control tools. 4. Demonstrate the application of an RTOS application programming interface and testing techniques to evaluate embedded system functional correctness and performance. Credits: 3.00

ECET 33300 - Power Electronics In Energy Systems

Credit Hours: 3.00. A study of fundamentals and applications of switch-mode DC-DC and DC-AC power electronic converters. The emphasis is given to hardware development aspects. Students will learn how to safely work with high power and high voltage circuits.

Learning Outcomes: 1. Describe how power electronics enable energy efficiency in various applications such as energy conservation, renewable energy, and transportation. 2. Design and build switch mode DC-DC and DC-AC converters using commercially available components. 3. Develop closed loop control circuits for DC-DC converters using voltage mode and peak-current mode methods. 4. Simulate power electronic circuits. Credits: 3.00

ECET 33400 - Embedded Cross-Platform Interface And Communication

Credit Hours: 3.00. Project-oriented, hands-on study of embedded communication protocols, advanced OOP targeted for hand-held devices and low power embedded systems interface. A PC based OS with cross-platform development environments designing system solutions targeted for device platforms and interfacing with microcontroller systems. Topics include microcontrollers, SoC, various OS platforms, RTOS, embedded IoT protocols.

Learning Outcomes: 1. Use cross-platform development tools to design embedded solutions for low-power devices. [Problem Solver: ABET 3-1] 2. Be able to interface, and analyze sensors and actuator wired and wireless embedded communication protocols. [Problem Solver: ABET 3-4] 3. Be able to work in project teams to design, test, and implement robotic (low power device) control across multiple platforms. [Innovator: ABET 3-2 and Communicator: 3-5] Credits: 3.00

ECET 33700 - Continuous Systems Analysis And Design

Credit Hours: 3.00. This is an advanced course in continuous systems analysis and design. Systems may include RCL circuits, op amp circuits, and DC permanent magnet motors. Systems analyses using differential equations and Laplace Transform techniques are developed, culminating in active filter and closed loop PID system design. Software tools, circuit simulation, and advance calculators are used to solve differential, integral, and differential equation problems.

Learning Outcomes: 1. Analyze first and second order circuits using differential equations and Laplace transforms. 2. Analyze and identify the output response of first-order and second-order systems with regards to gain, resonance, and damping. 3. Use Laplace transforms to analyze and tune the performance of a linear system with proportional-integral-derivative (PID) negative feedback. 4. Use Laplace transforms to analyze and design 1st through 4th order active filters. 5. Evaluate the performance of circuits using standard laboratory

measurements and simulations. Credits: 3.00

ECET 33900 - Digital Signal Processing

Credit Hours: 3.00. The course introduces students to the fundamental principles associated with processing discrete time signals. The architecture, instruction set and hardware and software development tools associated with a fixed point general purpose VLSI digital signal processor are examined. Some common real-time applications are implemented such as digital filters and DFT-based spectral estimation on a typical fixed point digital signal processor.

Learning Outcomes: 1. Describe the architectural features of a DSP and relate these to the DSP kernel equation. 2. Manipulate different binary number formats associated with a fixed point DSP. 3. Develop and debug simple programs that involve SOPs, modulo addressing, scaling and extraction of result, and common DSP program structures. 4. Describe the consequences and limitations of sampling baseband signals including the Nyquist rate and bandwidth, quantization noise, aliasing, frequency folding, reconstruction, spectrum of sampled baseband signals. 5. Express a sampled deterministic analog signal in closed mathematical form and expanded form using the unit sample. 6. Express a sampled signal in terms of the Z transform, in expanded and closed form. 7. Describe the relationship between the transfer function and impulse response in an LTI system. 8. Describe the operation of convolution and its implementation using hand calculations, mathematical software packages, and a fixed-point DSP. 9. Design and analyze FIR filters with the aid of a mathematical software package such as MATLAB. Credits: 3.00

ECET 34900 - Advanced Digital Systems

Credit Hours: 3.00. This course investigates complex digital systems that are implemented with field programmable gate arrays (FPGAs) using concurrent and sequential digital design techniques. Applications will include interfacing with analog signals and memory systems.

Learning Outcomes: 1. Design FPGA solutions for given digital design problems using a hardware description language (HDL). 2. Design FPGA solutions for given digital problems using a high-level sequential programming language for embedded processors. 3. Design FPGA solutions by decomposing a system into concurrent and sequential functional blocks and using hierarchical system development techniques. 4. Verify digital designs using simulation and hardware prototyping. 5. Analyze and design memory subsystems. 6. Apply ADC and DAC circuits to interface digital systems with analog devices/systems. Credits: 3.00

ECET 35100 - Instrumentation Applications For Technology

Credit Hours: 3.00 or 4.00. Introduction to the basic concepts and terminology of instruments. This course covers the procedures and techniques essential to measurement of physical quantities (such as pressure, flow, temperature, and level measurements) and analysis of that data. Students will use data acquisition systems and computer control software to complete laboratory exercises.

Credits: 3.00 to 4.00

ECET 35901 - Computer Based Data Acquisition Applications

Credit Hours: 3.00. This course focuses on the study and application of computer based data acquisition (DAQ) systems. Concepts of high resolution and high throughput data acquisition are introduced and applied. Students learn and use programming and scripting languages to discover the interfacing, advantages and limitations of computer based (DAQ) systems.

Learning Outcomes: 1. Define, compare and contrast common data acquisition terms. 2. Analyze the advantages and limitations of DAQ systems. 3. Demonstrate proficiency with software tools and computer based data acquisition. 4. Develop user-friendly applications for the purpose of DAQ system control. 5. Collect, analyze, and reduce data from a system for the purpose of written and oral reporting. Credits: 3.00

ECET 36400 - Fundamentals Of Electromagnetics

Credit Hours: 3.00. This course introduces the fundamentals of electromagnetics in both theory and application. Wave propagation, transmission lines, port parameters, antenna

theory, and antenna design are studied. Other topics include Maxwell's equations, propagation losses, RF signal measurement, impedance matching, and Smith chart applications.

Learning Outcomes: 1. Demonstrate knowledge of transmission line theory and application. 2. Apply and analyze transmission line systems using Smith carts. 3. Demonstrate the fundamentals and use of port parameters. 4. Design impedance matching networks using analytical methods and Smith charts. 5. Demonstrate and apply electromagnetic theory. 6. Describe and apply the fundamentals of electromagnetic wave propagation. 7. Design, simulate and analyze antennas. 8. Use RF simulation software for the analysis and design of RF circuits. 9. Demonstrate the use of RF laboratory equipment including the vector network analyzer, spectrum analyzer and RF generator. Credits: 3.00

ECET 36900 - Applied Computer Vision For Sensing And Automation

Credit Hours: 3.00. This course provides fundamental knowledge of integrated computer imaging or vision systems for sensing, quality control and automation applications. Fundamental basis of optics, illumination, camera types with associated technologies, and image acquisition to develop a customized computer imaging or vision systems will be covered. Algorithms for image processing, image analysis and pattern recognition will also be covered. Emerging technologies-based integrated computer vision or imaging system for sensor system, inspection, quality control and automation in different sectors (medical, manufacturing, security, construction etc.) will be examined. Parallel laboratory hands-on experience will allow the students to apply and validate the concepts learned in the lecture.

Learning Outcomes: 1. Identify different components of a computer vision/imaging system and their needs. 2. Identify and specify different components of a computer imaging system for selected different applications. 3. Interpret and implement different operations related to image processing, image analysis and image understanding. 4. Evaluate different real-world case studies to learn from successes and failures related to computer imaging system-based devices or components. 5. Formulate or create tentative solution for selected real world applications. Credits: 3.00

ECET 37100 - Automation, Instrumentation, and Process Control

Credit Hours: 3.00 or 4.00. A project-oriented course combining key areas of automation, instrumentation and process control. The course covers automatic testing, computer interfacing, data collection, robotic controls, programmable logic controllers, and graphical process control software. A final project is an integrated system.

Credits: 3.00 or 4.00

ECET 37201 - Continuous Control Electronics

Credit Hours: 3.00. A study of the electronic design of the elements of closed-loop analog and digital systems. Topics include characteristics of process and servo systems, analysis and design of the electronics used to acquire the process variable; condition, transmit, and receive the signal; implement a single loop control algorithm, and provide proportional power. Several sensor types and interpretation of their static and dynamic specifications are included. Controllers employed include student designed analog, and embedded microprocessor, and commercial single loop controllers. Software is used to model components and analyze open and closed-loop systems.

Learning Outcomes: 1. Evaluate the performance of a closed loop system. 2. Use simulation software to analyze a control system. 3. Select sensors to meet given performance parameters. 4. Design, implement, and analyze the electronic circuits necessary to interface with sensors, covert-transmit-receive-scale signals, produce control signals, and apply continuous power to actuators. 5. Select, install, document, tune, and troubleshoot SISO (single input-single output) closed-loop systems. Credits: 3.00

ECET 37300 - Applied Electronic Drives

Credit Hours: 3.00. This course covers operational principles and application development consideration of all subsystems that make up electric drives: electric machines, power-electric based converters, mechanical system requirements, feedback controller design, and the interaction of drives with the utility grid. State of the art drive development tools are introduced through hands-on activities.

Learning Outcomes: 1. Describe the structure of electronic drive systems and their role in various applications such as flexible production

systems, energy conservation, renewable energy, and transportation, making electric drives an enabling technology. 2. Understand the basic principles of power electronics in drives using switch-mode converters and pulse width modulation to synthesize the voltages in dc and ac motor drives. 3. Understand the operation of DC, AC, and brushless DC motors. 4. Construct and test traditional and electronic drive circuit for above motors. 5. Analyze various signals present in electric drive to evaluate drive performance. 6. Learn speed control of the above machines. Credits: 3.00

ECET 37600 - Electrical Energy Systems

Credit Hours: 3.00. This course is an introduction to a wide range of electrical energy systems technologies. Topics include fundamentals of energy conversion, which includes large- and small-scale generation, energy storage, and end-use. Processes include coal, nuclear, solar, wind, hydro, and biomass and their application in central and distributed power systems. The power grid, micro-grids, and smart grid technologies are also explored. The goal is to introduce students to the breadth of technology in the rapidly growing and changing field of energy systems.

Learning Outcomes: 1. Demonstrate the process cycles, theory of operation, and roles of significant equipment for various energy conversion, energy storage, and power distribution technologies. 2. Characterize and calculate power, efficiency, environmental, and economic quantities related to various energy conversion, energy storage, and power distribution technologies. 3. Discuss problems and trending solutions related to power and energy systems such as technological limitations, environmental impacts, and economic limitations both locally and worldwide. Credits: 3.00

ECET 38001 - Global Professional Issues In Engineering Technology

Credit Hours: 3.00. This course addresses professional ethics, legal issues, professional development, technology transfer, and corporate culture as they relate to EET graduates and our global society. Information relating to personal job and career choices, resumes, and interviews are included.

Learning Outcomes: 1. Demonstrate awareness in areas of intercultural knowledge and effectiveness. 2. Demonstrate awareness in areas of ethical reasoning. 3. Demonstrate awareness in areas of global citizenship and social awareness. 4. Identify applications of professional and ethical responsibilities including respect for diversity. 5. Demonstrate the ability to engage in self-directed continuing professional development. 6. Demonstrate knowledge of the impact of engineering technology solutions in a societal and global context. Credits: 3.00

ECET 38100 - Electrical Distribution Systems

Credit Hours: 4.00. A study of the design and operation of electric distribution systems including estimated demand, demand calculations, energy conservation, faults on power systems, power quality, power factor improvement, electric rates, voltage drops, protective devices, illumination, and the applicable portions of the National Electric Code (NEC). Both new facilities and additions to existing facilities are included.

Credits: 4.00

ECET 38404 - Fundamentals Of Contemporary Signal Of Processing

Credit Hours: 4.00. Fundamentals of processing techniques applied to signals and systems in both time and frequency domains are studies. Both continuous-time and discrete-time linear systems are introduced. Analysis methods such as: Fourier series, Fourier transform, bilateral Laplace transform, difference equations, discrete-Time Fourier transform, bilateral 7-Transform are introduced. Common applications such as waveform generation, FIR and IIR digital filtering, DFT and FFT based spectral analysis and filtering are covered. Use of software tools is emphasized throughout the course. Department permission required.

Learning Outcomes: 1. Classify various types of signals and systems. 2. Determine the impulse response of a differential or difference equation. 3. Determine the response of linear systems to any input signal by convolution in the time domain. 4. Understand the definitions and basic properties of Fourier series, Fourier transforms, bilateral Laplace transforms, Z transforms, and discrete time Fourier transforms. 5. Compute the transforms and inverse transforms of basic examples. 6. Determine the response of linear

systems to any input signal by transformation to the frequency domain, multiplication, and inverse transformation to the time domain. 7. Adhere to Nyquist sampling principles when developing a signal processing problem solution. 8. Calculate coefficients for FIR filter and IIR filter. Explain the fundamental source of the equations used. 9. Write programs to implement FIR filter and IIR filter. 10. Use a software simulation package to analyze system stability. 11. Convert a z-transform equation into a difference equation and implement it in software. 12. Generate the equivalent time-domain signal of a z-transform. 13. Generate the DFT of a number sequence. 14. Explain the output of a DFT based on the number of samples and sampling frequency. 15. Demonstrate self-learning ability by presenting a paper on any signal processing application to explain the application and its relevance. Credits: 4.00

ECET 38502 - Introduction To Automotive Electronics Laboratory

Credit Hours: 1.00. This course is a laboratory study of automotive electronics components and systems. The main topics are electronic circuit fundamentals, sensor characterization and signal conditioning, and actuator control.

Credits: 1.00

ECET 38600 - Building Electrical Codes And Standard Practices

Credit Hours: 3.00. A course in the design of building wiring, machine wiring and electrical control systems using relevant codes and standards to layout commercial and industrial facilities and manufacturing processes.

Learning Outcomes: 1. Identify codes and standards that pertain to the design and installation of building electrical systems. 2. Choose proper components for a wiring application. 3. Use commercial power system analysis software to assist in the design of an electrical distribution system. 4. Design lighting for office, industrial, and other areas. 5. Apply the appropriate standards to provide proper protection for electoral circuits. 6. Calculate balanced, three-phase short-circuit currents for a distribution system in accordance with applicable standards. Credits: 3.00

ECET 38800 - Analog IC Applications

Credit Hours: 3.00. This course is a study of the applications of analog integrated circuits. Topics include linear amplifiers, IC specifications, linear regulators, waveform generation, linear and switched-capacitor active filters, and nonlinear circuit applications. Computer aided analysis of these circuits is also presented.

Learning Outcomes: 1. Analyze and design a wide variety of digitally controlled analog circuits, selecting among several alternative configurations, accounting for the non-ideal IC behavior, and selecting appropriate devices. 2. Evaluate the performance of a variety of analog circuits, using appropriate standard laboratory measurement procedures, and simulations. Credits: 3.00

ECET 39000 - Lab Assistant In Electrical Engineering Technology

Credit Hours: 0.00 to 3.00. This course allows a student to serve like an employee as an undergraduate teaching assistant in the laboratory, lab exercise/apparatus developer, or undergraduate researcher. Hours, subject matter, and credit to be arranged by faculty. Course content applies toward the EET Professional Experience requirement. Permission of instructor required.

Learning Outcomes: 1. Meet the expectations of an employer. 2. Behave professionally in employer/ employee relationship. 3. Behave professionally in employee/client relationship. 4. Manage time and resources to meet expectations. Credits: 0.00 to 3.00

ECET 41500 - Digital Hardware Modeling Using Hardware Description Languages (HDL)

Credit Hours: 3.00. This course introduces students to various contemporary Hardware Description Languages (HDL) for modern digital logic systems. The course will emphasize on Verilog HDL. It covers logic-synthesis and high-level-synthesis in the context of HDL coding constructs for platform-independent and dependent technologies applicable to modern semiconductor industry testing. Students are also exposed to the subset of HDL that may be used for synthesis of custom logic for edge devices. HDL simulation and synthesis labs and projects are performed using commercial and/or academic VLSI CAD tools.

Learning Outcomes: 1. Gain proficiency in

popular HDL for modeling digital systems. 2. Use CAD tools to synthesize HDL code. 3. Verify/validate results through simulation and testing. 4. Identify effective HDL constructs for reconfigurable programmable logic vs. custom logic. 5. Apply HDL in real-world projects, including the development of complex digital systems for emerging technologies. Credits: 3.00

ECET 42301 - Electrical Vehicle Integration And Fabrication

Credit Hours: 3.00. This course requires students to develop a detailed design, develop a time/action plan, perform research on existing electronic vehicle systems, develop a procurement plan for electronic vehicle components, design and fabricate custom electric vehicle components, and construct an electric vehicle. The completed electric vehicle is extensively tested for safety, performance, and energy efficiency.

Learning Outcomes: 1. Design and fabricate custom electrical vehicle components. 2. Execute the construction of an electrical vehicle. 3. Measure energy efficiency of an electrical vehicle. 4. Implement appropriate electric vehicle instrumentation for various electric vehicle configurations. 5. Optimize an electric vehicle configuration for maximum efficiency. Credits: 3.00

ECET 42800 - Audio Electronics-Selected Topics

Credit Hours: 3.00. Define, implement, and evaluate the performance of the electronic elements in a professional audio system such as preamplifiers, signal encoding and transmission, signal reception and decoding, mixers, post processors, power amplifiers, limiting and protection, and intelligent power supplies. Both analog and digital signal processing may be implemented in each of the electronic elements.

Learning Outcomes: 1. Define parameters used to specify the performance of the electronic elements of a professional grade audio system. 2. Specify the electronic elements in a professional grade audio system to satisfy a given set of parameters. 3. Design, implement, and evaluate the electronic elements in a professional grade audio system. Credits: 3.00

ECET 42801 - Advanced Acoustics And Audio Engineering Technologies

Credit Hours: 3.00. This course introduces topics on acoustics and audio features/elements from hardware and/or software perspectives. Topics covered include the preparation and augmentation of audio data and designing, implementing, and evaluating the audio data using AI machine learning. This course also investigates electro-acoustic applications, their hardware element details, and their contributions to the system. This will pave students' understanding of the state-of-the-art technology in the acoustic and audio engineering technology field.

Learning Outcomes: 1. Define sound features that are both speaker-independent and -dependent. 2. Analyze acoustic/audio signals using AI machine learning. 3. Investigate electro-acoustic transducers and applications. 4. Review and evaluate acoustics/audio-related state-of-arts technology. Credits: 3.00

ECET 43000 - Electrical And Electronic Product And Program Management

Credit Hours: 3.00. This course deals with the planning of electrical and electronic products and projects. Research methods are studied to support new product development including customer needs and the development of engineering requirements. Formal techniques such as functional decomposition, top-down and bottom-up design techniques are studied. Planning and design alternatives to meet cost, performance, and user-interface foals are emphasized. Technical topics are revisited with emphasis on new applications. The various types and levels of new product system tests are studied. New product planning, scheduling, and management techniques are studied, along with the usage of software tools for project scheduling and management. Creativity is stressed, and the different approaches taken by the designers are compared and discussed.

Learning Outcomes: 1. Apply the engineering design lifecycle process. 2. Evaluate customer needs as part of the definition of the solution to a problem. 3. Evaluate alternative designs to solve a problem and then decide on the most appropriate design to pursue. 4. Define a workable plan to create a design to solve a product development problem. 5. Plan and construct a Gantt chart to be followed during senior design. 6. Write a formal technical proposal to be carried through in senior design. Credits: 3.00

ECET 43100 - International Capstone Project

Planning And Design

Credit Hours: 3.00. The course deals with the planning and execution of an industry sponsored senior capstone project carried out jointly with students from a foreign academic institution. Project management and systems engineering methods are studied to support the development of solutions to open-ended problems proposed by industry. Formal techniques such as functional decomposition, top-down and bottom-up, requirement matrix, analysis of alternatives are studied and applied to the projects. Project planning techniques including work breakdown structures, Gantt charts and resource planning are studied and applied to meet cost, performance and project goals. The various types and levels of new system tests are studied and applied. Electronic and internet communication tools shall be used to maintain team and project progress. Foreign travel shall be required for at least one face to face team meeting during the execution of the project. Permission of Instructor required.

Learning Outcomes: 1. Apply the engineering design lifecycle process. 2. Evaluate customer requirements and constraints as part of problem definition. 3. Evaluate multiple design solutions and quantitatively select optimal solution. 4. Define a workable design plan to solve the industry problem. 5. Plan and construct a Gantt chart to be followed during the project. 6. Produce appropriate project documentation. 7. Interact appropriately regarding international cultural diversity particularly in project planning and execution. Credits: 3.00

ECET 43400 - PC Systems II

Credit Hours: 4.00. Real-time PC-based operating systems. Programming Graphical User Interface in C++. Embedded PC hardware, busses, and peripheral programming. Writing and integrating device drivers.

Learning Outcomes: 1. Write GUI programs using an object-oriented language. 2. Write programs that require multiple threads. 3. Write a server-client data transfer program using TCP/IP calls. 4. Write a program that handles interrupts in an OS environment. 5. Write a program that transfers data on a Serial Port. 6. Write a program that controls a peripheral using the I2C bus. 7. Write programs that generate time intervals using timers. 8. Examine communications via typical device busses. Credits: 4.00

ECET 43600 - Electrical Power Transmissions, Distribution, And Smart Control

Credit Hours: 3.00. A course on the simple modeling and simulation of the power grid systems, power flow analysis, and advanced meter infrastructure (AMI). The fundamentals learned in this course will be useful in the study of the effects of distributed energy resources and storage in Smart Grid environment.

Learning Outcomes: 1. Explain the role of components of electrical power transmission and distribution network. 2. Identify characteristics of DC and AC transmission lines and cable systems. 3. Identify the characteristics of various power system loads and power quality issues. 4. Calculate and simulate power flow in a power systems network. 5. Explain how to stabilize power systems. 6. Apply Advanced Meter Infrastructure (AMI) as it is used in Smart Grid applications. Credits: 3.00

ECET 43900 - Advanced Digital Signal Processing

Credit Hours: 3.00. The course builds on the basic principles and applications of Digital Signal Processing with a view to implementing advanced DSP techniques. These techniques are chosen to form some of the building blocks that are used in specialization areas such as the biomedical, communications and energy management fields.

Learning Outcomes: 1. Write and debug basic DSP applications on a VLSI DSP 2. Write and debug advanced DSP techniques and applications drawn from areas such as communications and biomedical signal processing. 3. Embed software modules from DSP libraries into specific applications. Credits: 3.00

ECET 44200 - Programming Robots With ROS

Credit Hours: 3.00. Robot Operating Systems (ROS) will be used as a programming platform to explore the topics of computer vision, SLAM (Simultaneous Localization and Mapping), path planning, grasping, and social interaction in robotic systems, as well as programming large systems for physical interaction with the world. Self-contained implementation projects are core to the class. Student knowledge of a procedural programming language, familiarity with robotics, and a rudimentary understanding of matrices is assumed.

Learning Outcomes: 1. Apply software versioning techniques to the programming of large software projects with hardware in-the-loop. 2. Build ROS software consisting of pre-written packages and custom packages to implement complex robotic applications on arms and vehicles. 3. Apply basic software engineering techniques to designing and documenting software. 4. Apply and evaluate computer vision techniques based on templates to track objects in 2-D. 5. Synthesize 3-D computer vision techniques for 3-D sensors from 2-D algorithms. 6. Analyze and evaluate hardware sensors with respect to specific software task needs. 7. Apply SLAM methods to real-world scenes to interpret the world on real hardware in real-time. 8. Analyze execution times and evaluate trade-offs in computational hardware performance with respect to sensor data throughput. 9. Implement feedback controllers and tune for specific hardware characteristics. 10. Apply manual path planning techniques to 2-D and 3-D maps extracted from SLAM algorithms. 11. Apply automatic path planning tools and software to 2-D and 3-D maps extracted from SLAM algorithms. Credits: 3.00

ECET 44400 - Wireless Systems: Design And Measurement

Credit Hours: 3.00. In this course wireless RF signals and microwave circuit designs are studied. Topics include signal analysis, RF signal measurement, microstrip design and analysis, Smith chart applications, RF circuit design, s-parameters, power dividers and couplers, filter design, and advanced RF PCB layout.

Learning Outcomes: 1. Apply knowledge of RF component non-idealities. 2. Design, simulate and test RF amplifiers, filters, and power dividers. 3. Apply RF test methods and procedures to RF components, circuits and systems. 4. Demonstrate microstrip and stripline analysis and design. 5. Apply RF simulation software for the analysis and design of RF circuits. 6. Demonstrate printed circuit board layout techniques for high frequency applications. 7. Demonstrate the use of RF laboratory equipment including the vector network analyzer, spectrum analyzer and RF generator. Credits: 3.00

ECET 46000 - Project Design And Development

Credit Hours: 3.00. An extensive individual or small group design project is carried out with guidance from a faculty advisor. This course includes determining customer requirements, considering design alternatives, prototyping, project integration, and testing. The project is completed as a robust prototype. The course concludes with a formal written report and a presentation of the project to faculty and invited industrial guests.

Learning Outcomes: 1. From a formal project proposal, create a functional prototype to solve the given problem. 2. Utilize a software scheduling package to plan and track the progress of a project. 3. Weigh design alternatives for customer requirements, efficiency, reliability, and cost. 4. Apply formal test procedures to the developed prototype. 5. Analyze the data acquired during testing of the prototype. 6. Present a project orally to a specific audience. 7. Write a technical report including conclusions and recommendations for further work. Credits: 3.00

ECET 46100 - International Capstone Project Execution

Credit Hours: 3.00. This course completes the development and execution of an international industry sponsored senior capstone project carried out jointly with students from a foreign academic institution. Project management and systems engineering methods are applied in the development of solutions to open-ended problems proposed by industry. Design tools including failure mode and effects analysis and configuration management are studied and applied. A manufacturing plan supported by both in process and validation test plans are developed and applied to demonstrate compliance to project requirements. The project is completed with the generation of a proof of concept demonstration that satisfies project requirements. The course concludes with a formal written report and presentation. Electronic and internet communication tools shall be used to maintain team and project progress. Foreign travel shall be required for at least one face to face team meeting during the execution of the project. Permission of Instructor required.

Learning Outcomes: 1. Create a functional proof of concept (POC) to solve the given problem. 2. Plan and track progress on the project utilizing a software scheduling package. 3. Apply formal test procedures to the developed proof of concept. 4. Analyze test data and draw valid conclusions on the POC compliance to project requirements. 5. Present a project to an industrial sponsor and faculty audience. 6. Write a technical report. 7. Interact appropriately regarding international cultural diversity particularly in project planning and execution. Credits: 3.00

ECET 47600 - Smart Grid Technology And Applications

Credit Hours: 3.00. This smart-grid (SG) technology and applications is designed to introduce new topics related to distributed generation, micro-grids, renewable energy sources, and smart home applications. Topics covered include design, modeling, control, and analysis of smart-grid systems. Concepts dealing with computational intelligence, decision support systems, smart metering, optimization, and energy storage are addressed. The laboratory component will provide students with hands-on experience in the utilization of smart-grid technologies and applications.

Learning Outcomes: 1. Identify fundamental elements and structure of smart grids and microgrids including communication networks. 2. Model, simulate, and analyze various distributed energy resources. 3. Interpret and implement smart grids computational techniques using decision support tools and optimization. 4. Evaluate different real-world case studies for smart grids applications. 5. Develop effective solutions for real-world applications considering environmental issues, standards, and regulations related to smart grids. Credits: 3.00

ECET 48001 - Engineering Technology Capstone I

Credit Hours: 3.00. This is the first course of a two-term senior capstone sequence. The skills needed to define, design and develop engineering technology solutions are introduced and developed. Planning and designing alternatives that meet cost, performance, and user-interface goals are emphasized. Project planning, scheduling, and management techniques are studied. Different design approaches are compared. Teamwork, global and societal concerns, and professional ethics are integrated into course projects.

Learning Outcomes: 1. Apply the engineering design process to engineering technology problems. 2. Evaluate customer needs when defining a solution. 3. Determine a preferred solution. 4. Define and develop a plan for implementing a technical solution. Credits: 3.00

ECET 48400 - Digital Wireless Systems

Credit Hours: 3.00. This course investigates the theory and implementation of digital wireless systems for current and next generation communication systems. Cognitive radio systems and technologies will be studied and implemented.

Credits: 3.00

ECET 48404 - Emerging Information, Communication And Technologies

Credit Hours: 4.00. An advanced course in the Computer Engineering Technology program that introduces and evaluates emerging systems, services and applications in information, communication, and technologies (ICT) areas. In the laboratory, students use utilities to evaluate and analyze various emerging subjects so that certain level of mastery f the subjects can be demonstrated. Permission of department required.

Learning Outcomes: 1. Facilitating students' critical thinking ability on the emerging subjects of the internet, internet protocols and the delivery of communication services using the internet by focusing on the fundamentals of these systems and applications. 2. Developing competence in analysis and application of technologies in computer networking. 3. Developing competence in analysis and application of technologies in telecommunications and wireless communications. 4. Understanding the operations and development trends of emerging technologies in ICT areas. Credits: 4.00

ECET 49000 - Senior Design Project Phase I

Credit Hours: 1.00 or 2.00. An extensive individual design and/or analytical project performed in consultation with one or more faculty advisors. Collaboration with representatives of industry, government agency, or community institutions is encouraged. Evidence of extensive and thorough laboratory performance is required. PHASE I includes, but is not limited to, faculty acceptance of project proposal, defining and limiting project objectives, initial research and source contacts,

procurement of materials, and periodic progress reports.

Credits: 1.00 or 2.00

ECET 49100 - Senior Design Project Phase II

Credit Hours: 2.00 to 5.00. PHASE II includes, but is not limited to, continued research and finalized design, oral presentation to faculty and other interested parties, and a written technical report.

Learning Outcomes: 1. Demonstrate the elements of System Design Principles. 2. Apply principles of Electrical Engineering Technology theory, problem solving techniques, and practical laboratory knowledge to design, implement, test, and bring to completion of a working project. 3. Demonstrate sufficient written communications skills. 4. Demonstrate sufficient oral communication skills. Credits: 2.00 to 5.00

ECET 49300 - Ethics And Professionalism In Technology

Credit Hours: 1.00. Factors involved in the ethical decision making in engineering and technology professions on both a local and global scale will be presented. Workplace issues such as socio-economic and cultural differences, professionalism, ethical codes, employee and community safety, whistle blowing, diversity and sexual harassment will be discussed. Case studies will guide student activities.

Credits: 1.00

ECET 49900 - Electrical Engineering Technology

Credit Hours: 1.00 to 9.00. Hours and subject matter to be arranged by staff. Cannot be used to replace EET 48000, 49600, or 49700. Permission of instructor required.

Learning Outcomes: 1. Vary with the project, and are subject to EET curriculum subcommittee approval. Credits: 1.00 to 9.00

ECET 52400 - Applied Electromagnetics

Credit Hours: 1.00 to 3.00. This course provides an advanced treatment of electromagnetics and applications at the graduate level for engineering technology students. Electric and magnetic field theory is presented, including Maxwell's equations. Topics include vector analysis, electric and magnetic fields, Maxwell's equations, electromagnetic wave radiation, and propagation. A semester-long project based on applied electromagnetics is required for each student. Knowledge of RF measurement equipment, such as spectrum analyzers and vector network analyzers is required.

Learning Outcomes: 1. Perform electromagnetic analysis, using vectors and differential and integral vector operations. 2. Perform electrostatic analysis and calculation in Cartesian, cylindrical and spherical coordinate systems. 3. Calculate the electric charge and electric and magnetic fields using Coulomb's Law, Gauss's Law, and Ampere's law. 4. Use Maxwell's equations in integral form and differential form to solve boundary value problems. 5. Derive and calculate the electromagnetic plane waves propagation in two and three dimensional space. 6. Determine and calculate the electromagnetic fields in rectangular and cylindrical waveguides. 7. Evaluate the performance of circuits using standard laboratory measurements and simulations. Credits: 1.00 to 3.00

ECET 53500 - Energy Sustainability

Credit Hours: 3.00. A study of energy auditing, energy saving opportunities of commercial and industrial systems, utility rate structures, economic evaluation of investments, potential energy saving retrofits, maintenance considerations, and cogeneration opportunities. Data analysis and report writing are practiced using data from a real world energy audit.

Learning Outcomes: 1. Identify and describe the energy conservation opportunities in industrial and commercial systems. 2. Apply energy auditing techniques. 3. Apply electrical and mechanical engineering principles to improve energy efficiency of systems. 4. Determine energy cost and consumption indexes using energy rate structures. 5. Examine the economic evaluation of energy conservation solutions. 6. Use DOE energy assessment tools. 7. Evaluate existing systems for energy recovery and cogeneration opportunities. 8. Use web-based and published material in energy analysis. 8. Evaluate existing systems for Smart Grid opportunities with smart utility meters. Credits: 3.00

ECET 53600 - Embedded Systems Security

Credit Hours: 3.00. This course focuses on the implementation and application of cryptographic algorithms and protocols in embedded systems. An overview of the security problem and the science of cryptography and cryptanalysis is presented. The notion of the security perimeter in terms of physical access to

assets in embedded hardware subsystems is studied. Students implement and apply various ciphers on 8-bit to 32-bit embedded platforms, comparing and contrasting computational and data throughout performance. Permission of instructor required.

Learning Outcomes: 1. Identify and describe cryptography, cryptanalysis, and security perimeters of embedded systems. 2. Identify and describe key performance issues and tradeoffs in the design and application of cryptographic algorithms and protocols in embedded systems. 3. Identify and describe the main areas of research focus in embedded system security and whey they are important. 4. Identify, describe, and apply tools used in cryptographic analysis and performance characterization of embedded systems. 5. Identify, describe, analyze and apply cryptographic algorithms and protocols including but not limited random number and key generators, private-key and public-key ciphers and protocols, and one-way hash functions. Credits: 3.00

ECET 54100 - Robotics And Cyber-Physical Systems Seminar

Credit Hours: 0.00 to 1.00. This course is a series of lectures from eminent local, national, and international researchers in the field of robotics, cyber-physical systems, and related areas (such as computer vision, autonomy, wearables, etc.).

Learning Outcomes: 1. Understand the state-of-the-art of research and practice in robotics and cyber-physical systems. Credits: 0.00 to 1.00

ECET 54400 - Real-Time And Embedded Systems

Credit Hours: 3.00. Real-time systems are hardware/software systems in which a timely response by a computer to external stimuli is vital to the performance of the system's objectives. This is the study of temporal determinism. Embedded systems are those with special-purpose microcomputers designed into the system for explicit purposes. Examples of such are the computers on your car's engine that control fuel injection, fly-by-wire attitude controls in modern jet aircraft, even the microcontroller inside a cellular phone. In these examples, the computer has a specific, limited task that is part of the functionality of the device and specifying average performance of that computer is insufficient for successful completion of the task at hand. Imagine if the flight controls of a Boeing 787 on final landing approach experienced a "network lag" similar to that which occurs occasionally while you're reading e-mail. If the controls stop responding at a critical time, a horrific crash could occur. Even if the system doesn't freeze up 99.999% of the time, it can still result in disaster.

Learning Outcomes: 1. Analyze a given embedded system application with respect to the hard real-time, soft real-time and non-real-time aspects of the system that simultaneously exist. 2. Analyze the implications of Real-Time Systems vs. non-Real-Time Systems. 3. Analyze the basic components of machine organization with regard to implications for time-deterministic performance. 4. Evaluate the schedulability of collections of tasks with respect to different implementations of task schedulers and task dispatchers. 5. Apply advanced software engineering techniques to designing and documenting software. 6. Synthesize solutions to problems involving control of real-time systems. Credits: 3.00

ECET 54900 - Advanced Computer Vision For Sensing And Automation

Credit Hours: 3.00. This course focuses on advanced issues related to an integrated computer vision system for sensing, quality control and automation applications.

Learning Outcomes: 1. Analyze and evaluate different components of a computer imaging system for different applications. 2. Analyze and apply different image processing, image analysis and image understanding (pattern recognition) algorithms along with their underlying theories. 3. Design and test different computer vision processes by using selected computer program, software and/or developing specific computer program(s). 4. Appraise and analyze different real-world case studies to learn from successes and failures related to computer vision system-based devices or components. 5. Develop and test tentative solution for selected real-world sensing, inspection, quality control and automation applications via project-based activity(ies).

Credits: 3.00

ECET 58100 - Workshop In Electrical And Computer Engineering Technology

Credit Hours: 0.00 to 8.00. Advanced study of technical and professional topics. Emphasis is on new developments relating to technical, operational, and training aspects of industry and technology education.

Learning Outcomes: 1. Vary by course offering. Credits: 0.00 to 8.00

ECET 59000 - Special Problems In Electrical And Computer Engineering Technology

Credit Hours: 1.00 to 6.00. Independent study of a special problem under the guidance of a member of the staff. Does not substitute for either M.S. thesis or M.S. project credit. Permission of instructor required.

Learning Outcomes: 1. Vary by course offering. Credits: 1.00 to 6.00

ECET 59800 - Directed MS Project

Credit Hours: 1.00 to 3.00. A formal investigation of a particular problem under the guidance of the advisory committee. Not applicable to a thesis option plan of study. Enrollment during at least two consecutive terms for a total of three credits is required. Permission of instructor required.

Learning Outcomes: 1. Varies by students research topic. Credits: 1.00 to 3.00

ECET 63800 - Selected Topics In Sensor Networks

Credit Hours: 3.00. This course examines general sensor network concepts, with a focus on a particular area of research and development. Current applications are studied, culminating with the analysis, characterization and/or examination of a sensor network. Permission of instructor required.

Learning Outcomes: 1. Identify and describe sensor network applications. 2. Identify and describe key performance issues and tradeoffs in the design and application of sensor networks. 3. Identify and describe the main areas of research focus in sensor networks and whey they are important. 4. Identify, describe, and apply tools used in sensor network analysis, simulation, characterization, control, and information retrieval. 5. Analyze, calculate and simulate or measure critical performance metrics of sensor networks and their components (nodes, gateways, etc.). Credits: 3.00

ECET 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required.

Learning Outcomes: 1. Varies by student research topic. Credits: 1.00 to 18.00

Engineering

ENGR 10000 - First-Year Engineering Lectures

Credit Hours: 0.00 or 1.00. An introduction to the engineering profession.

Credits: 0.00 or 1.00

ENGR 10300 - Introduction To Engineering In Practice

Credit Hours: 1.00. Weekly small group seminars led by faculty designed to introduce a specific topic, problem, or discipline of engineering to First-Year Engineering students. Seminars are designed to help students explore a single area of engineering and/or to assist in their decision of an engineering degree program.

Credits: 1.00

ENGR 10301 - Introduction To Engineering In Practice

Credit Hours: 1.00. Weekly small seminars led by faculty designed to introduce a specific topic, problem or discipline of engineering to First-Year Engineering students. Seminars are designed to help students explore a single area of engineering and/or assist in their decision of an engineering degree. Permission of department required.

Learning Outcomes: 1. Introduce a specific topic, problem or discipline of engineering to First-Year Engineering students. Credits: 1.00

ENGR 10351 - Space Engineering Seminar

Credit Hours: 1.00. The purpose of this course is to help you see and appreciate the multi-disciplinary nature of space engineering, to give you an awareness that will aid you in developing your career. Space engineering includes a vast number of topics where expertise is needed by industry and NASA and a good understanding of this if vital to finding opportunities for your own interest and expertise to start you on a career.

Learning Outcomes: 1. Identify multiple career paths pursued by people in aerospace with various degrees; including those of people still working in aerospace and those of people who used their aerospace engineering degree as a basis for a career in a different field. 2. Recognize the broad range of products, topics, applications and systems on which aerospace engineers work. 3. Understand the variety of

topical expertise needed for space commerce and exploration. 4. Have an awareness of issues related to inclusion and intercultural teams. Credits: 1.00

ENGR 10400 - Introduction To Engineering And Purdue

Credit Hours: 1.00. Weekly small group seminars led by upper-class engineering students, enabling a broader understanding of engineering disciplines at Purdue, covering skills and techniques for academic success, and offering instruction and practice in career preparation and employment-finding skills.

Learning Outcomes: 1. Successfully transition to Purdue by balancing academic and personal life. 2. Develop life skills it takes to succeed as an engineering student. 3. Understand the academic and career opportunities within the different fields of engineering. 4. Develop a mentor-mentee relationship with your Peer Mentors. 5. Develop a network of classmates with whom to study and socially interact. 6. Learn about Purdue University resources. 7. Learn more about the fields of engineering you want to study and with which you may work. Credits: 1.00

ENGR 10500 - First-Year Engineering Seminar

Credit Hours: 1.00. A selection of invited lectures, participation exercises, and lab tours designed to acquaint exceptionally well-motivated students with opportunities to enhance their undergraduate engineering education through independent study, special research projects, overseas study, and other opportunities that may be available for students who are inclined to seek extraordinary challenges.

Credits: 1.00

ENGR 11700 - First-Year Engineering Honors Seminar

Credit Hours: 3.00. A course in computer programming, covering fundamentals of the C programming language. Other language(s) or materials will be covered to prepare Honors students to do the best possible work in their professional school courses. Students will be introduced to structured problem-solving and top-down programming techniques. Laboratory exercises will accelerate learning of fundamental materials through supervised repetitive practice, while more traditional individual and team projects will provide practice in the decomposition and solution of larger problems.

Credits: 3.00

ENGR 12600 - Engineering Problem Solving And Computer Tools

Credit Hours: 3.00. Introduction to the solving of open-ended engineering problems and the use and of computer software, including UNIXTM, computer communications, spreadsheets, and MATLAB. Explicit model-development activities are utilized, and students are expected to develop skill at working in teams. This is emphasized both in laboratories and on projects.

Credits: 3.00

ENGR 13000 - Transforming Ideas Into Innovations (UCC: IL)

Credit Hours: 4.00. This introductory course to engineering teaches skills in managing complex problems related to design, systems analysis with computational tools, and academic professional development. Through multiple experiences, students will learn effective methods to design and analyze behaviors of complex engineering systems with an eye for innovation. These experiences will develop their skills in teaming, project management, logical reasoning, sustainability, coupled with oral, written and visual communication for multiple audiences. This course also develops students ability to build computational tools (e.g., Python, MATLAB and Excel) to analyze the performance of systems using fundamental concepts associated with physical science and data science (e.g., mathematical modeling, data processing, numerical modeling, statistics). Professional identify development is critical to preparing students for making an informed decision in their choice of major and the development of professional skills to succeed in that major. Therefore, the course includes learning experiences to help them gather and process information about all the engineering academic pathways they could choose at Purdue. Permission of instructor required.

University Core Curriculum (UCC): (UCC: IL) Learning Outcomes: The learning outcomes for this course have more than 2,000 characters. Please see the course catalog for the learning outcomes. Credits: 4.00

ENGR 13100 - Transforming Ideas To Innovation I (UCC: IL)

Credit Hours: 2.00. A partnership between Schools and Programs within the College of Engineering, introduces students to the engineering professions using multidisciplinary, societally relevant content. Developing engineering approaches to systems, generating and exploring creative ideas, and use of quantitative methods to support design decisions. Explicit model-development activities (engineering eliciting activities, EEAs) engage students in innovative thinking across the engineering disciplines at Purdue. Experiencing the process of design and analysis in engineering including how to work effectively in teams. Developing skills in project management, engineering fundamentals, oral and graphical communication, logical thinking, and modern engineering tools (e.g., Excel and MATLAB).

University Core Curriculum (UCC): (UCC: IL) Learning Outcomes: 1. Describe the engineering disciplines at Purdue and the interrelationships among them as well as know what graduates of at least three disciplines of engineering do. 2. Use a problem formulation and solving process to translate written problem statements into a mathematical model that allows for a logical comparison of approaches and tradeoffs in an engineering design. 3. Communicate technical information orally and visually and develop basic knowledge and introductory skills for cross-cultural communication. 4. Explain how an engineering problem solving process in related to a design process. 5. Apply a design process to: generate ideas, model, analyze, predict, and build an innovative object of engineering interest taking into consideration its societal and environmental impact. 6. Implement simple algorithmic solutions to engineering problems and in design using the most appropriate engineering tool. 7. Demonstrate appropriate knowledge and behaviors for effective and ethical membership on a technical team (i.e., teaming skills). 8. Exhibit a work ethic appropriate for the engineering profession. Credits: 2.00

ENGR 13200 - Transforming Ideas To Innovation II

Credit Hours: 2.00. A partnership between Schools and Programs within the College of Engineering continues building on the foundation developed in ENGR 13100. Students take a more in-depth and holistic approach to integrating multiple disciplines perspectives while constructing innovative engineering solutions to open-ended problems. Extending skills in project management engineering fundamentals, oral and graphical communication, logical thinking, teamwork, and modern engineering tools (e.g., Excel and MATLAB).

Learning Outcomes: 1. Describe the engineering disciplines at Purdue and the interrelationships among them as well as know what graduates of at least three disciplines of engineering do. 2. Apply engineering fundamentals and basic engineering science concepts to create feasible engineering solutions that are justifiable. 3. Use a problem identification process to create written engineering criteria to satisfy a problem. 4. Use an engineering formulation and solving process to translate an engineering scenario into a model. 5. Explain how an engineering problem solving process relates to a design process. 6. Design a process to communicate technical information orally and visually and demonstrate skills for cross-cultural communication. 7. Apply an engineering problem solving and design process to: generate ideas, model, analyze, predict, and build an innovative object of engineering interest taking into consideration its societal and environmental impact. 8. Apply a systems approach in solving engineering problems and in undertaking design projects. 9. Demonstrate appropriate knowledge and behaviors for effective and ethical membership on a technical team (i.e., teaming skills). 10. Exhibit a work ethic appropriate for the engineering profession. Credits: 2.00

ENGR 13300 - Transforming Ideas To Innovation, EPICS/VIP (UCC: IL)

Credit Hours: 2.00. Introduces students to the engineering professions using multidisciplinary, societally relevant content. Students will develop engineering approaches to systems, generate and explore creative ideas, and use quantitative methods to support design decisions. Students will experience the process of design and analysis in engineering including how to work effectively in teams, and will develop skills in project management, engineering fundamentals, oral and graphical communication, logical thinking, and modern engineering tools (e.g., Excel and MATLAB). An emphasis will be placed on computing logic development and builds upon the co-requisite experience of the students in the EPICS class.

University Core Curriculum (UCC): (UCC: IL) Learning Outcomes: 1. Examine and analyze career information from various resources to make informed decisions about which engineering discipline to pursue. 2. Develop metacognitive skills in evaluating own teamwork and leadership abilities, recognizing how own

behavior impact the whole team, and make team process adjustments when necessary. 3. Explain critical and diverse use of modeling in engineering to understand problems, represent solutions, compare alternatives, make predications, etc. 4. Use multiple models, estimation, and logic to triangulate and evaluate information coming from various data sources. 5. Collect, analyze, and represent data to make informative explanations and persuasive arguments. 6. Develop a logical problem solving process which includes sequential structures, conditional structures, and repetition structures for fundamental engineering problems. 7. Solve fundamental engineering problems using computer tools. 8. Perform basic file management tasks using an appropriate computer tool. 9. Work effectively and ethically as a member of a technical team. 10. Develop a work ethic appropriate for the engineering profession. 11. Reflect on personal and team performance to achieve continuous improvement. Credits: 2.00

ENGR 14100 - Honors Creativity And Innovation In Engineering Design I (UCC: IL)

Credit Hours: 3.50. This course introduces students to the engineering professions using multidisciplinary, societally relevant content. Students develop engineering approaches to systems, generate and explore creative and innovative ideas, and use of computational methods to support design decisions. Design challenges and projects engage students in innovative thinking across the engineering disciplines at Purdue. Students experience the process of design and analysis in engineering including how to work effectively in teams. Students also develop skills in project management, engineering fundamentals, oral and graphical communication, logical thinking, and modern engineering tools (e.g., Excel®, LabView®, MATLAB®, and Python).

University Core Curriculum (UCC): (UCC: IL)

Learning Outcomes: 1. Describe the engineering disciplines at Purdue and the interrelationships among them as well as know what graduates of at least three disciplines of engineering do. 2. Understand and apply engineering fundamentals and basic engineering science concepts to model, analyze, predict build, and evaluate an object of engineering interest using a design process. 3. Develop the ability to evaluate complex systems. 4. Develop strategies to facilitate generating creative ideas for complex design challenges. 5. Show how the engineering problem solving is related to the design process. 6. Use the engineering problem solving process to translate written problem statement into a mathematical model that is suitable for algorithmic development. 7. Communicate technical information to justify decision made during a problem solving situations (e.g. design, troubleshoot, or product selection). 8. Develop a logical and systematic problem solving process and use that process for software development, which includes sequential structures, conditional structures, and repetition structures. 9. Implement simple algorithmic forms of engineering models/problems using the most appropriate computer tool (LabVIEW, MATLAB, and Python). 10. Perform basic file management tasks using an appropriate computer tool. 11. Demonstrate appropriate knowledge and behaviors for effective and ethical membership on a technical team (i.e., teaming skills). 12. Develop skills for cross-cultural communication. 13. Exhibit a work ethic appropriate for the engineering profession. Credits: 3.50

ENGR 14200 - Honors Creativity And Innovation In Engineering Design II

Credit Hours: 3.50. This course continues building on the foundation developed in ENGR 14100 . Students take a more in-depth and holistic approach to integrating multiple disciplines perspectives while constructing innovative engineering solutions to open-ended problems. The students extend and continue to develop skills in project management, engineering fundamentals, oral and graphical communication, logical thinking, teamwork, and modern engineering tools (e.g., C, Excel®, LabView®, MATLAB®, and Python).

Learning Outcomes: 1. Describe, in greater depth, the engineering disciplines at Purdue

and the interrelationships among them as well as know what graduates of at least three disciplines of engineering do. 2. Apply engineering fundamentals and basic engineering science concepts to create feasible engineering solutions that are justifiable. 3. Use a problem identification process to create written engineering criteria to satisfy a problem. 4. Use an engineering formulation and solving process to translate an engineering scenario into a mathematical model. 5. Explain how an engineering problem solving process relates to a design process. 6. Design a process to communicate technical information orally and visually and demonstrate skills for cross-cultural communication. 7. Further development of strategies to facilitate generating creative ideas for complex design challenges. 8. Apply an engineering problem solving and design process to: generate ideas, model, analyze, predict, and build an innovative object of engineering interest taking into consideration its societal and environmental impact. 9. Implement complex algorithmic solutions to engineering problems/designs using the most appropriate computer tool (C , Excel, LABVIEW, MATLAB, and Python) and be able to explain your rationale for your choice. 10. Apply a systems approach in solving engineering problems and in undertaking design projects. 11. Synthesize your knowledge of effective and ethical membership on a technical team (i.e., teaming skills) to appropriately behavior. 12 Exhibit a work ethic appropriate for the engineering profession. Credits: 3.50

ENGR 16100 - Honors Introduction To Innovation And The Physical Science Of Engineering Design I (UCC: IL/SCI)

Credit Hours: 4.00. This course introduces students to the engineering profession using physics-based, multidisciplinary, societally relevant content. Students develop engineering approaches to systems, generate and explore creative and innovative ideas, and use of computational methods to support design decisions. In particular, the students will develop the ability to model and investigate physical systems at the microscopic and macroscopic levels with a focus on vectors analysis, linear momentum, angular momentum, work-energy, and solid material interactions. Design challenges and projects will explore a wide range of natural phenomena experimentally and computationally (utilizing MATLAB and Python) and engage students in innovative thinking across the engineering disciplines at Purdue. They will learn the basics of descriptive statistics, data analysis, sensitivity analysis, and decision-making. Students experience the process of design and analysis in engineering including how to work effectively in teams. Students also develop skills in project management, engineering fundamentals, oral and graphical communication, logical thinking, and modern engineering tools.
*(Both ENGR 16100 AND ENGR 16200 are required to meet the IL or SCI requirement)

University Core Curriculum (UCC): (UCC: IL/SCI) Learning Outcomes: 1. Discuss the engineering education process, courses, and options, explain and compare engineering job functions and roles, and use this information to prepare a moderately well-informed course of study for academic and career success (3). 2. Employ academic and career success strategies including managing your personal learning approach, using time management techniques, and demonstrating a personal growth mindset to thoughtfully pursue course activities and the course as a whole (2). 3. Plan and implement systematic design processes using formal engineering management and design tools such as work breakdown structures and House of Quality to design innovative products and systems (6). 4. Investigate and decompose systems in order to design and construct mathematical or computer models that can be employed to better understand or control the systems (6). 5. Describe a wide range of physical phenomena using a few fundamental physical laws (12). 6. Learn how to implement a unified approach that relates microscopic behavior to macroscopic behavior. These include mechanical theories based on particle, spring, and material models (10). 7. Model natural phenomena using computer simulations

(5). 8. Demonstrate professional communication skills in the areas of technical writing to produce engineering reports, in presentations to convey engineering evidence and findings verbally and graphically to audiences, and in interpersonal communication to work with other members of the class (2). 9. Work alongside individuals with diverse backgrounds, utilizing the team environment to learn interdependently, give and demand accountability, and accomplish engineering tasks, while recognizing teaming as an open-ended problem that needs to be actively managed and reflected upon (3). 10. Evaluate engineering problems to reach evidence-based conclusions, drawing upon one or more sources of information and data interpretation skills including interpolation, regression, curve fitting, statistics, and data cleaning (5). 11. Incorporate the consideration of engineering ethics, including social, safety, and sustainability issues into instances of engineering thinking and engineering problem solving so that the broader impacts of engineering work are evaluated and accounted for (3). 12. Apply fundamental engineering skills and knowledge relating to units, dimensions, estimation, visualization, significant digits, and the problem presentation method to engineering applications (2). 13. Display proficiency in the applications of engineering content knowledge including basic statistics (5). Credits: 4.00

ENGR 16200 - Honors Introduction To Innovation And The Physical Science Of Engineering Design II (UCC: IL/SCI)

Credit Hours: 4.00. Students will take an in-depth and holistic approach to integrating multiple disciplines perspectives while constructing innovative engineering solutions to open-ended problems. The students continue to explore more complicated models of physical systems, especially internal energy, entropy, models of gases and fluids, and statistical thermodynamics. The students will extend the concepts learned in ENGR 16100 and continue to develop skills in project management, engineering fundamentals, oral and graphical communication, logical thinking, teamwork, and modern engineering tools (e.g. MATLAB and Python). In addition, students will learn how to use hypothesis testing to make informed, quantitative decisions. Finally, they will build systems that incorporate feedback control in an effort to identify and characterize physical material systems.

*(Both ENGR 16100 AND ENGR 16200 are required to meet the IL or SCI requirement)

University Core Curriculum (UCC): (UCC: IL/SCI) Learning Outcomes: 1. Utilize knowledge of the engineering education process, courses, and options, and engineering job functions and roles to prepare a final course of study for academic and career success (3). 2. Develop a unified approach to microscopic and macroscopic behavior of gases and fluids, especially the use of statistics and quantized atomic levels to motivate basic thermodynamic theories (10). 3. Apply the unified approach to material interactions to a broad array of applications including asteroids, black holes, nuclear fission and fusion, quantization in atoms and molecules, and heat capacity (7). 4. Model natural phenomena using computer simulations (7). 5. Integrate engineering ethics, including social, safety, and sustainability issues into engineering thinking and engineering problem solving to ensure that the broader impacts of engineering work are consistently evaluated and accounted for (3). 6. Display proficiency in the applications of engineering content knowledge including statistics, statics, mechanics of materials, the universal accounting equation, electrical theory, and design of experiments (8). 7. Employ academic and career success strategies including managing your personal learning approach, using time management techniques, and seeking opportunities for self-improvement to thoughtfully pursue course activities and the course as a whole (2). 8. Plan and implement systematic design processes using formal project management and design tools such as work breakdown structures and House of

Quality to design innovative products and systems (2). 9. Investigate and decompose systems in order to design and construct mathematical or computer models that can be employed to better understand or control the systems (6). 10. Analyze and translate problems into algorithms composed of logical constructs and be able to create programming-language-independent system charts and flow diagrams embodying those algorithms (5). 11. Demonstrate professional communications skills in the areas of technical writing, presentations, and interpersonal communication, to produce engineering reports, convey engineering findings and evidence in writing, verbally, and graphically to readers or audiences, and to work with other members of the class (3). 12. Work alongside individuals with diverse backgrounds in teams, learn interdependently in the team environment, give and demand accountability, and accomplish engineering tasks, while recognizing teaming as an open-ended problem that needs to be actively managed and reflected upon (3). 13. Investigate engineering problems to reach evidence-based conclusions, drawing upon one or more sources of information and data interpretation skills including interpolation, regression, curve fitting, statistics, and data cleaning (3). 14. Apply fundamental engineering skills and knowledge relating to units, dimensions, estimation, spatial reasoning, graphical representation, significant digits, and the problem presentation method to engineering challenges (2). Credits: 4.00

ENGR 17600 - Professional Internship I

Credit Hours: 0.00. Professional experience in engineering. Program coordinated by department with cooperation of participating employers. Students submit a summary report.

Credits: 0.00

ENGR 18000 - Minorities In Engineering Seminar

Credit Hours: 1.00. Explores the challenges that minority engineering students have in making a smooth and informed transition to college from high school. The content and activities may be of particular interest to engineering students from underrepresented groups as they adjust to the University's environment. The course provides a setting for entering students to explore career opportunities in the various fields of engineering. Open to all entering engineering students.

Credits: 1.00

ENGR 18500 - Engineering Career Planning

Credit Hours: 1.00. An engineering-oriented course designed to assist students in planning for their educational, career, and personal development. Individual and group projects, computer-aided guidance. Course will incorporate autobiographies, resumes, and academic and career planning exercises. Interest inventories and personal appraisal surveys will be utilized. Computer-based guidance systems will be utilized, including ESCAPE (Engineering Specific Career Advisory Problem-solving Environment). (Eight-week session)

Credits: 1.00

ENGR 19400 - Women In Engineering Seminar

Credit Hours: 1.00. An overview of the career opportunities for women in engineering. The content and activities of the course may be of particular interest to women. Speakers from a variety of engineering organizations discuss their career paths and share their strategies for success. Students also meet weekly in small groups led by engineering seniors for additional information, interaction, and support from their peers in engineering. Open to all entering engineering students.

Credits: 1.00

ENGR 19500 - First-Year Engineering Projects

Credit Hours: 1.00 to 6.00. Topics vary. Permission of instructor required.

Credits: 1.00 to 6.00

ENGR 19700 - Introduction To Programming Concepts

Credit Hours: 2.00. Basic concepts and applications of software programming for solving engineering problems. Topics include techniques for developing structured algorithms, data input and output, conditional statements, loops, recursion, functions, arrays, and elementary concepts in mathematical programming. Examples, homework, and applications of programming concepts make extensive use of the C programming language.

Credits: 2.00

ENGR 20000 - Cooperative Education Practice I

Credit Hours: 1.00. A semester or summer of external, full time, related career experiences designed to enhance the student's preparedness for an intended career with business, industry or government agency. A comprehensive written report on the internship practice is required. A minimum of 10 weeks and 200 hours are required for credit.

Credits: 1.00

ENGR 20010 - Engineering Career Enrichment Internship I

Credit Hours: 1.00. Semester of external career related experiences designed to enhance the student's preparedness for entering an initial or second career. A minimum of 10 weeks and 200 hours are required for credit.

Credits: 1.00

ENGR 23099 - Cooperative Education Seminar I

Credit Hours: 1.00 or 2.00. (PSY 23099) This seminar course is optional for Co-Op students when they are on campus. In this course, students share their work experiences, receive feedback from the instructor and seminar participants, and continue their professional development. Prerequisite: Student must have completed at least one Co-Op work term. May be repeated once after the second work term. Can be taken for two credits subsequent to completing two back-to-back work terms. Instructor permission required.

Learning Outcomes: 1. Develop oral and written presentation skills. 2. Expand knowledge of the engineering profession. 3. Learn from the experiences of other participants and apply that knowledge to the situation. Credits: 1.00 or 2.00

ENGR 25000 - Cooperative Education Practice II

Credit Hours: 1.00. A semester or summer of external, full time, related career experiences designed to enhance the student's preparedness for an intended career with business, industry or government agency. A comprehensive written report on the internship practice is required. A minimum of 10 weeks and 200 hours are required for credit.

Credits: 1.00

ENGR 25010 - Engineering Career Enrichment Internship II

Credit Hours: 1.00. Semester of external career related experiences designed to enhance the student's preparedness for entering and initial or second career.

Credits: 1.00

ENGR 26099 - Learning While Working Full-Time Co-Op I

Credit Hours: 0.00. Co-Op is an academic program with oversight by assigned Faculty Coordinators who serve as the instructor for participating students. Learning While Working participants are undergraduate students who work part-time (10-20 hours per week) in paid computer science, engineering, polytechnic, or management positions during the academic year terms (fall and spring semesters) for an employer with a local operations or offering a remote work opportunity. During the summer term, Learning While Working students work in full-time positions at any location offered by the employer. During the academic year, Learning While Working students register for a full-time course load, and also for this zero-credit hour Learning While Working course. During the summer term, Learning While Working students register for a zero-credit hour Co-Op course. This course will help students set goals for their work experiences and reflect on skill growth and receive feedback from their employer supervisor and Purdue Co-Op supervisor. Prerequisite: Student must be eligible to participate in the Cooperative Education (Co-Op) program and have written documentation of valid work session with approved Co-Op employer. Permission of instructor required.

Learning Outcomes: 1. Set goals for a work experience. 2. Articulate how classroom learning is applied to the workplace. 3. Translate work experiences to their resume. 4. Articulate how the work experience improved skills such as communication, teamwork, and problem-solving. Credits: 0.00

ENGR 27199 - Professional Practice Flex Co-Op I

Credit Hours: 0.00. Co-Op is an academic program with oversight provided by assigned Faculty Coordinators who serve as the Instructor for participating students. In the Flex Co-Op program, students must work for their first employer for a minimum of two work sessions, and then have the option to continue for one-to-three additional work sessions; or, after completing two work sessions with the first employer, the student may elect to start with a second employer. If the student elects to change employers, they must notify their first employer and their Faculty Coordinator in writing at the conclusion of the second work session. The student must commit to work for the second Co-Op employer for a minimum of two work sessions. Permission of instructor required.

Learning Outcomes: 1. After each work session, the instructor assesses course outcomes via student evaluation of the work session, supervisor evaluation of the student's performance, and a technical report written by the student summarizing their experience. Credits: 0.00

ENGR 27299 - Professional Practice Flex Co-Op II

Credit Hours: 0.00. Co-Op is an academic program with oversight provided by assigned Faculty Coordinators who serve as the Instructor for participating students. In the Flex Co-Op program, students must work for their first employer for a minimum of two work sessions, and then have the option to continue for one-to-three additional work sessions; or, after completing two work sessions with the first employer, the student may elect to start with a second employer. If the student elects to change employers, they must notify their first employer and their Faculty Coordinator in writing at the conclusion of the second work session. The student must commit to work for the second Co-Op employer for a minimum of two work sessions. Permission of Instructor required.

Learning Outcomes: 1. After each work session,

the instructor assesses course outcomes via student evaluation of the work session, supervisor evaluation of the student's performance, and a technical report written by the student summarizing their experience. Credits: 0.00

ENGR 29199 - Cooperative Experience I

Credit Hours: 0.00. Professional experience in engineering. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.

Learning Outcomes: 1.Apply knowledge to identifying and solving problems in the professional context. 2.Advance skills related to professional preparation, critical thinking, problem solving, communication, and teamwork. 3.Increase understanding of the profession and practice, basic industry principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

ENGR 29299 - Cooperative Experience II

Credit Hours: 0.00. Professional experience in engineering. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.

Learning Outcomes: 1.Apply knowledge to identifying and solving problems in the professional context. 2.Advance skills related to professional preparation, critical thinking, problem solving, communication, and teamwork. 3.Increase understanding of the profession and practice, basic industry principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

ENGR 29600 - Experimental Courses

Credit Hours: 0.00 to 6.00. Experimental classes offered at the freshmen/sophomore level on a temporary basis to test the viability of offering the course on a permanent basis.

Learning Outcomes: n/a Credits: 0.00 to 6.00

ENGR 29701 - Global Engineering Orientation

Credit Hours: 1.00. Forum in preparation of study and work abroad. Understanding of cultural differences and collaborating across cultural boundaries, professionalism and ethics in foreign work and academic environments, leadership and teamwork options in foreign environments. Permission of instructor required.

Learning Outcomes: 1. Be provided with foundation in global engineering communication skills. 2. Outline teamwork and leadership opportunities available through participation in the global engineering community. 3. Be provided with globally diverse and multicultural experiences and discuss case studies to prepare them for upcoming international internships and semester study abroad. 4. Identify resources available for academic studies and industrial work experience abroad. 5. Develop a strong ethical framework and cultural sensitivity to prepare for the global professional workplace. Credits: 1.00

ENGR 30301 - Business Essentials Executive Forum

Credit Hours: 2.00. This course will provide undergraduate engineering students access to Purdue Engineering alumni working in the C-suite, as well as basic knowledge regarding the understanding of corporate financial statements. The forum is a lecture-discussion course featuring executives from engineering firms, tech companies, and other organizations. Emphasis is placed on the actual practice of leadership in corporate America, on career selection and mobility, on styles of leadership, and on other business topics not normally covered in undergraduate engineering courses.

Learning Outcomes: 1. Have a fundamental understanding of basic financial statements, ratios, and methods used to make business decisions. 2. Understand the backgrounds, traits, qualities, and mindsets of Purdue undergraduate engineering alumni at the executive level. 3. Acquire up-to-date knowledge of business essentials needed for corporate leadership. 4. Discover career opportunities for engineers in the business function of organizations. Credits: 2.00

ENGR 30500 - Fundamentals Of Innovation Theory And Practice

Credit Hours: 3.00. This course is designed to provide students with initial exposure to the fundamental patterns, mindsets, behaviors, attributes, tools, and methods employed in the innovative activity of individuals and organizations. Emphasis is placed on understanding and effectively utilizing techniques to

systematically drive innovation that are drawn from the fields of business, design, problem-solving, engineering, and the social sciences. Lecture, in-class small group activities, and individual and team assignments are employed across an array of contemporary socio-technical challenges to provide students with the opportunity to apply conveyed theory and methods to rigorously structure problems, understand involved stakeholders, utilize innovation motifs and analogical reasoning to develop robust views of potential solutions spaces, tailor solution design to stakeholder context, consider the full suite of functional, social, and emotional dimensions that could influence solution prioritization, and document and systematically assess underlying solution assumptions to iterate toward a viable and sustainable forward-looking plan that could achieve target outcomes. This course counts toward, serves as a required entry course for, the College of Engineering Minor in Innovation and Transformational Change.

Learning Outcomes: 1. Develop working knowledge of established innovation forms and motifs. 2. Demonstrate ability to link innovation motifs to specific classes of problems. 3. Understand, and be able to pursue, the core aspects of an end-to-end innovation process. 4. Recognize the mental models, mindsets and behaviors of innovators. 5. Gain awareness of the approaches various forms of organizations take to systematically innovate. 6. Acquire leadership and communication skills through teamwork, oral presentations, and written deliverables. Credits: 3.00

ENGR 31000 - Engineering In Global Context (UCC: STS)

Credit Hours: 3.00. This course provides students with opportunities to study how engineering is intertwined with larger economic, social, cultural, and technological dynamics in an era of intensified globalization. Its major goals are to help students understand and appreciate what engineering is, how engineers are trained, what engineers do, and how engineering and society interact. The course approaches these themes through discussion of: the relation and interaction of engineering, science, technology, and society; the historical origins and development of engineering as a profession; diversity issues in engineering and other STEM fields; engineering in cross-national/cultural contexts; and contemporary challenges related to globalization, ethics, and sustainability. In summary, the course is designed to help students understand what it means to identify as, and/or work with, engineers. Recitation sections and/or independent projects (at the instructor's discretion) provide further opportunities for students to expand their knowledge and improve their skills in relation to course themes.

University Core Curriculum (UCC): (UCC: STS) Learning Outcomes: 1. Describe and evaluate the specific kinds of knowledge and methods typically employed by engineers, including in comparison with other professional fields. 2. Understand the historical development of engineering education and the engineering profession in the United States. 3. Recognize how national differences are important in engineering work, including by comparing and contrasting different national cultures and styles of engineering. 4. Explain the significance of diversity in engineering education and professional practice, including by evaluating competing perspectives on diversity in different historical and sociocultural contexts. 5. Understand contemporary trends and issues related to globalization, ethics, social responsibility, and sustainability, and interpret their significance in relation to engineering education and practice. 6. Demonstrate written communication capabilities at the level of emerging or higher (as defined by the Purdue Core Curriculum guidelines). Credits: 3.00

ENGR 33099 - Cooperative Education Seminar II

Credit Hours: 1.00 or 2.00. This seminar is optional for Co-Op students when they are on campus. In this course, students share their work experiences, receive feedback from the instructor and seminar participants, and continue their professional development. Prerequisite: Student must have completed at least two Co-Op work terms. May be repeated once after the fourth work term. Can be taken for two credits subsequent to completing two back-to-back work terms. Instructor permission required.

Learning Outcomes: 1. Develop oral and written presentation skills. 2. Expand knowledge of the engineering profession. 3. Receive feedback from the instructor and seminar participants. 4. Continue professional development. Credits: 1.00 or 2.00

ENGR 35000 - Cooperative Education Practice IV

Credit Hours: 1.00. A semester or summer of external, full time, related career experiences designed to enhance the student's preparedness for an intended career with business, industry or

government agency. A comprehensive written report on the internship practice is required.

Credits: 1.00

ENGR 36099 - Learning While Working Full-Time Co-Op II

Credit Hours: 0.00. Co-Op is an academic program with oversight by assigned Faculty Coordinators who serve as the instructor for participating students. Learning While Working participants are undergraduate students who work part-time (10-20 hours per week) in paid computer science, engineering, polytechnic, or management positions during the academic year terms (fall and spring semesters) for an employer with a local operations or offering a remote work opportunity. During the summer term, Learning While Working students work in full-time positions at any location offered by the employer. During the academic year, Learning While Working students register for a full-time course load, and also for this zero-credit hour Learning While Working course. During the summer term, Learning While Working students register for a zero-credit hour Co-Op course. This course will help students set goals for their work experiences and reflect on skill growth and receive feedback from their employer supervisor and Purdue Co-Op supervisor. Prerequisite: Student must be eligible to participate in the Cooperative Education (Co-Op) program and have written documentation of valid work session with approved Co-Op employer. Permission of instructor required.

Learning Outcomes: 1. Set goals for a work experience. 2. Articulate how classroom learning is applied to the workplace. 3. Translate work experiences to their resume. 4. Articulate how the work experience improved skills such as communication, teamwork, and problem-solving. Credits: 0.00

ENGR 36199 - Learning While Working Part-Time Co-Op I

Credit Hours: 0.00. Co-Op is an academic program with oversight by assigned Faculty Coordinators who serve as the instructor for participating students. Learning While Working participants are undergraduate students who work part-time (10-20 hours per week) in paid computer science, engineering, polytechnic, or management positions during the academic year terms (fall and spring semesters) for an employer with a local operations or offering a remote work opportunity. During the summer term, Learning While Working students work in full-time positions at any location offered by the employer. During the academic year, Learning While Working students register for a full-time course load, and also for this zero-credit hour Learning While Working course. During the summer term, Learning While Working students register for a zero-credit hour Co-Op course. This course will help students set goals for their work experiences and reflect on skill growth and receive feedback from their employer supervisor and Purdue Co-Op supervisor. Prerequisite: Student must be eligible to participate in the Cooperative Education (Co-Op) program and have written documentation of valid work session with approved Co-Op employer. Permission of instructor required.

Learning Outcomes: 1. Set goals for a work experience. 2. Articulate how classroom learning is applied to the workplace. 3. Translate work experiences to their resume. 4. Articulate how the work experience improved skills such as communication, teamwork, and problem-solving. Credits: 0.00

ENGR 36299 - Learning While Working Part-Time Co-Op II

Credit Hours: 0.00. Co-Op is an academic program with oversight by assigned Faculty Coordinators who serve as the instructor for participating students. Learning While Working participants are undergraduate students who work part-time (10-20 hours per week) in paid computer science, engineering, polytechnic, or management positions during the academic year terms (fall and spring semesters) for an employer with a local operations or offering a remote work opportunity. During the summer term, Learning While Working students work in full-time positions at any location offered by the employer. During the academic year, Learning While Working students register for a full-time course load, and also for this zero-credit hour Learning While Working course. During the summer term, Learning While Working students register for a zero-credit hour Co-Op course. This course will help students set goals for their work experiences and reflect on skill growth and receive feedback from their employer supervisor and Purdue Co-Op supervisor. Prerequisite: Student must be eligible to participate in the Cooperative Education (Co-Op) program and have written documentation of valid work session with approved Co-Op employer. Permission of instructor required.

Learning Outcomes: 1. Set goals for a work experience. 2. Articulate how classroom learning is applied to the workplace. 3. Translate work experiences to their resume. 4. Articulate how the work experience improved skills such as communication, teamwork, and problem-solving. Credits: 0.00

ENGR 37399 - Professional Practice Flex Co-Op III

Credit Hours: 0.00. Co-Op is an academic program with oversight provided by assigned Faculty Coordinators who serve as the Instructor for participating students. In the Flex Co-Op program, students must work for their first employer for a minimum of two work sessions, and then have the option to continue for one-to-three additional work sessions; or, after completing two work sessions with the first employer, the

student may elect to start with a second employer. If the student elects to change employers, they must notify their first employer and their Faculty Coordinator in writing at the conclusion of the second work session. The student must commit to work for the second Co-Op employer for a minimum of two work sessions. Permission of Instructor required.

Learning Outcomes: 1. After each work session, the instructor assesses course outcomes via student evaluation of the work session, supervisor evaluation of the student's performance, and a technical report written by the student summarizing their experience.

Credits: 0.00

ENGR 37499 - Professional Practice Flex Co-Op IV

Credit Hours: 0.00. Co-Op is an academic program with oversight provided by assigned Faculty Coordinators who serve as the Instructor for participating students. In the Flex Co-Op program, students must work for their first employer for a minimum of two work sessions, and then have the option to continue for one-to-three additional work sessions; or, after completing two work sessions with the first employer, the student may elect to start with a second employer. If the student elects to change employers, they must notify their first employer and their Faculty Coordinator in writing at the conclusion of the second work session. The student must commit to work for the second Co-Op employer for a minimum of two work sessions. Permission of Instructor required.

Learning Outcomes: 1. After each work session, the instructor assesses course outcomes via student evaluation of the work session, supervisor evaluation of the student's performance, and a technical report written by the student summarizing their experience.

Credits: 0.00

ENGR 37599 - Professional Practice Flex Co-Op V

Credit Hours: 0.00. Co-Op is an academic program with oversight provided by assigned Faculty Coordinators who serve as the Instructor for participating students. In the Flex Co-Op program, students must work for their first employer for a minimum of two work sessions, and then have the option to continue for one-to-three additional work sessions; or, after completing two work sessions with the first employer, the student may elect to start with a second employer. If the student elects to change employers, they must notify their first employer and their Faculty Coordinator in writing at the conclusion of the second work session. The student must commit to work for the second Co-Op employer for a minimum of two work sessions. Permission of Instructor required.

Learning Outcomes: 1. After each work session, the instructor assesses course outcomes via student evaluation of the work session, supervisor evaluation of the student's performance, and a technical report written by the student summarizing their experience.

Credits: 0.00

ENGR 38199 - Professional Practice Co-Op I

Credit Hours: 0.00. Professional experience in engineering. Program coordinated by Office of Professional Practice with cooperation of participating employers. Students submit a summary report and company evaluation. Permission of Instructor required.

Learning Outcomes: 1. The Director of the Office of Professional Practice serves as the facilitating body to: a) moderate the progress of students after each academic work session b) assess course outcomes via student evaluation of work sessions, supervisor evaluation of student and work session technical report

Credits: 0.00

ENGR 38299 - Professional Practice Co-Op II

Credit Hours: 0.00. Professional experience in engineering. Program coordinated by Office of Professional Practice with cooperation of participating employers. Students submit a summary report and company evaluation. Permission of Instructor required.

Learning Outcomes: 1. The Director of the Office of Professional Practice serves as the facilitating body to: a) moderate the progress of students after each academic work session b) assess course outcomes via student evaluation of work sessions, supervisor evaluation of student and work session technical report

Credits: 0.00

ENGR 38399 - Professional Practice Co-Op III

Credit Hours: 0.00. Professional experience in Engineering. Program coordinated by Office of Professional Practice with cooperation of participating employers. Students submit a summary report and company evaluation. Permission of Instructor required.

Learning Outcomes: 1. The Director of the Office of Professional Practice serves as the facilitating body to: a) moderate the progress of students after each academic work session b)

assess course outcomes via student evaluation of work sessions, supervisor evaluation of student and work session technical report

Credits: 0.00

ENGR 39399 - Cooperative Experience III

Credit Hours: 0.00. Professional experience in engineering. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.

Learning Outcomes: 1.Apply knowledge to identifying and solving problems in the professional context. 2.Advance skills related to professional preparation, critical thinking, problem solving, communication, and teamwork. 3.Increase understanding of the profession and practice, basic industry principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

ENGR 39499 - Extensive Cooperative Experience IV

Credit Hours: 0.00. Professional experience in engineering. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.

Learning Outcomes: 1.Apply knowledge to identifying and solving problems in the professional context. 2.Advance skills related to professional preparation, critical thinking, problem solving, communication, and teamwork. 3.Increase understanding of the profession and practice, basic industry principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

ENGR 39501 - Breakthrough Thinking Complex Challenges

Credit Hours: 3.00. This course is intended to help students understand and effectively employ the principles underlying breakthrough thinking. Students will participate in cross-disciplinary teams to design solutions to a complex societal challenge in conjunction with a partner organization, in an experiential learning setting. Case discussions of historical breakthroughs will be used to introduce techniques for the identification of opportunities, the design of solutions, and the launch, test, and iteration of such solutions. Emphasis will be placed on the effective use of techniques from various fields, such as business, design, problem-solving, engineering, and the social sciences.

Credits: 3.00

ENGR 39599 - Extensive Cooperative Experience V

Credit Hours: 0.00. Professional experience in engineering. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.

Learning Outcomes: 1.Apply knowledge to identifying and solving problems in the professional context. 2.Advance skills related to professional preparation, critical thinking, problem solving, communication, and teamwork. 3.Increase understanding of the profession and practice, basic industry principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

ENGR 39600 - Experimental Courses

Credit Hours: 0.00 to 6.00. Experimental classes offered at the junior level on a temporary basis to test the viability of offering the course on a permanent basis.

Credits: 0.00 to 6.00

ENGR 39602 - Undergraduate Experiential Training - Research

Credit Hours: 0.00. This course is meant to promote meaningful reflection on the different experiential learning research environments a student may participate in such as Summer Undergraduate Research Fellowship and Research for Pay internship. Additional data will be collected on each student's experience regarding pay, project, position, etc. Assignments will include goal setting, goal evaluation, reflection, and resume writing. Guidance will be provided within the Brightspace page and throughout the pre/post-experience survey assignments. Permission of instructor required.

Learning Outcomes: 1. Have enhanced critical thinking, problem-solving skills, and intellectual growth. 2. Gain practical skills, research methodologies, and confidence in their abilities. 3. Be better prepared for graduate studies.

Credits: 0.00

ENGR 39603 - Undergraduate Experiential Training - Semiconductors

Credit Hours: 0.00. This course is meant to promote meaningful reflection on the different experiential learning environments a student may participate in which focus on workforce development and the acquisition and practice of technical skills.

This course will supplement the Summer Training Awareness & Readiness for Semiconductions (STARS) program. Additional data will be collected on each student's experience regarding pay, project, position, etc. Assignments will include goal setting, goal evaluation, reflection, public speaking as it relates to the workforce domain, and resume writing in addition to industry/sector-specific technical training. Guidance will be provided within the Brightspace page and throughout the pre/post-experience survey assignments. Permission of instructor required.

Learning Outcomes: 1. Have enhanced critical thinking, problem-solving skills, and intellectual growth. 2. Gain practical skills, research methodologies, and confidence in their abilities. 3. Be better prepared for the semiconductor sector-specific technical training. Credits: 0.00

ENGR 39697 - Global Engineering Projects

Credit Hours: 1.00 to 3.00. Students will work in teams to formulate solutions to engineering problems. Project topics will focus on a problem outside the U.S. and/or incorporate teammates from international universities. International teams may work remotely with the possibility for international travel and in-person collaboration. Permission of instructor required.

Learning Outcomes: 1. Obtain practical skills through engagement in a real-life project utilizing engineering principles. 2. Enhance communication and teamwork skills through experience working on a diverse team. Credits: 1.00 to 3.00

ENGR 39699 - Professional Practice Internship

Credit Hours: 0.00. Professional experience in engineering. Program coordinated by Office of Professional Practice with cooperation of participating employers. Students submit a summary report and company evaluation. Permission of Instructor required.

Learning Outcomes: 1. The Director of the Office of Professional Practice serves as the facilitating body to: a) moderate the progress of students after each academic work session b) assess course outcomes via student evaluation of work sessions, supervisor evaluation of student and work session technical report Credits: 0.00

ENGR 39700 - Global Engineering Experience

Credit Hours: 1.00. Forum for students participating in an international internship or study abroad experience. Students will complete weekly guided writing assignments during the first 15 weeks of their international experience. Assignments will aid students with integration into the host community. Students will demonstrate increased awareness of the nature and complexities of intercultural communication by applying various theories to their lived experiences. To be taken concurrently with international internship/study abroad experience. Permission of instructor is required.

Learning Outcomes: 1. Apply cultural theories to their personal experiences. 2. Deepen understanding of cultural differences, inter-cultural communication and their cultural competency. 3. Develop strategies to bridge cultural gaps and the ability to identify, manage, communicate and apply emotions effectively and appropriately. 4. Understand challenges of studying or working in a foreign country and develop a strong ethical framework and cultural sensitivity to succeed in a global workplace. Credits: 1.00

ENGR 39799 - GEARE Domestic Internship

Credit Hours: 0.00. Domestic internship experience for GEARE program. Program coordinated by Office of Professional Practice with cooperation of participating employers. Students to obtain professional practice with domestic employers within industry, government or small business. Permission of instructor required.

Learning Outcomes: 1. The Assistant Director of Global Professional Practice Programs in the Office of Professional Practice serves as the facilitating body to: a) moderate the progress of students through the requirements of the GEARE program requirements b) assess course outcomes via student evaluation of work sessions and work session technical report Credits: 0.00

ENGR 39899 - GEARE Global Internship

Credit Hours: 0.00. Global internship experience for GEARE program. Program coordinated by Office of Professional Practice with cooperation of participating employers. Students to obtain professional practice with global employers within industry, government or small business. Permission of instructor required.

Learning Outcomes: 1. The Assistant Director of Global Professional Practice Programs in the Office of Professional Practice serves as the facilitating body to: a) moderate the progress of students through the requirements of the

GEARE program requirements b) assess course outcomes via student evaluation of work sessions and work session technical report Credits: 0.00

ENGR 40400 - Instruction, Mentorship And Leadership

Credit Hours: 1.00. This course provides students with valuable mentorship, leadership, and instructional opportunities through participation in the College of Engineering mentorship programs. The weekly seminar will feature a combination of student-led discussions, guest speakers, and practical team-building skills.

Learning Outcomes: 1. Articulate the core tenets of their own philosophy of mentorship. 2. Apply effective mentoring strategies to overcome the challenges of mentorship. 3. Evaluate their own mentorship ability and style, as well as evaluate their own mentorship needs. 4. Build effective relationships with mentees. Credits: 1.00

ENGR 40600 - Engineering Ambassador Leadership Seminar

Credit Hours: 1.00. Students will engage in a weekly seminar that includes topics such as leadership, professional skills, teamwork, and Purdue culture. Students will utilize these skills while representing Purdue College of Engineering to current and prospective students, alumni, donors, legislators, and other supporters of Purdue College of Engineering. Student must be selected as a College of Engineering Ambassador; be currently enrolled full-time in the College of Engineering; have completed no less than three academic semesters at Purdue; have a cumulative GPA of 2.8 or higher. Permission of department required.

Learning Outcomes: 1. Provide students with theoretical and experiential basis from which they may acquire and enhance their knowledge and skills in the areas of: Leadership principles and models; Purdue structure, culture, and engineering education opportunities; Personal/professional effectiveness, including teamwork and public speaking. 2. Provide students with the opportunity to develop a personal philosophy of leadership that includes an understanding of self, others, and community. Credits: 1.00

ENGR 43099 - Cooperative Education Seminar III

Credit Hours: 1.00 or 2.00. This seminar course is optional for Co-Op students when they are on-campus. In this course, students share their work experiences, receive feedback from the instructor and seminar participants, and continue their professional development. Prerequisite: Student must have completed at least three Co-Op work terms. Can be taken for two credits subsequent to completing two back-to-back work terms. Instructor permission required.

Learning Outcomes: 1. Develop oral and written presentation skills. 2. Expand knowledge of the engineering profession. 3. Learn for the experiences of other participants and apply that knowledge to the situation. Credits: 1.00 or 2.00

ENGR 46099 - Learning While Working Full-Time Co-Op III

Credit Hours: 0.00. Co-Op is an academic program with oversight by assigned Faculty Coordinators who serve as the instructor for participating students. Learning While Working participants are undergraduate students who work part-time (10-20 hours per week) in paid computer science, engineering, polytechnic, or management positions during the academic year terms (fall and spring semesters) for an employer with a local operations or offering a remote work opportunity. During the summer term, Learning While Working students work in full-time positions at any location offered by the employer. During the academic year, Learning While Working students register for a full-time course load, and also for this zero-credit hour Learning While Working course. During the summer term, Learning While Working students register for a zero-credit hour Co-Op course. This course will help students set goals for their work experiences and reflect on skill growth and receive feedback from their employer supervisor and Purdue Co-Op supervisor. Prerequisite: Student must be eligible to participate in the Cooperative Education (Co-Op) program and have written documentation of valid work session with approved Co-Op employer. Permission of instructor required.

Learning Outcomes: 1. Set goals for a work experience. 2. Articulate how classroom learning is applied to the workplace. 3. Translate work experiences to their resume. 4. Articulate how the work experience improved skills such as communication, teamwork, and problem-solving. Credits: 0.00

ENGR 46399 - Learning While Working Part-Time Co-Op III

Credit Hours: 0.00. Co-Op is an academic program with oversight by assigned Faculty Coordinators who serve as the instructor for participating students. Learning While Working participants are undergraduate students who work part-time (10-20 hours per week) in paid computer science, engineering,

polytechnic, or management positions during the academic year terms (fall and spring semesters) for an employer with a local operations or offering a remote work opportunity. During the summer term, Learning While Working students work in full-time positions at any location offered by the employer. During the academic year, Learning While Working students register for a full-time course load, and also for this zero-credit hour Learning While Working course. During the summer term, Learning While Working students register for a zero-credit hour Co-Op course. This course will help students set goals for their work experiences and reflect on skill growth and receive feedback from their employer supervisor and Purdue Co-Op supervisor. Prerequisite: Student must be eligible to participate in the Cooperative Education (Co-Op) program and have written documentation of valid work session with approved Co-Op employer. Permission of instructor required.

Learning Outcomes: 1. Set goals for a work experience. 2. Articulate how classroom learning is applied to the workplace. 3. Translate work experiences to their resume. 4. Articulate how the work experience improved skills such as communication, teamwork, and problem-solving. Credits: 0.00

ENGR 46499 - Learning While Working Part-Time Co-Op IV

Credit Hours: 0.00. Co-Op is an academic program with oversight by assigned Faculty Coordinators who serve as the instructor for participating students. Learning While Working participants are undergraduate students who work part-time (10-20 hours per week) in paid computer science, engineering, polytechnic, or management positions during the academic year terms (fall and spring semesters) for an employer with a local operations or offering a remote work opportunity. During the summer term, Learning While Working students work in full-time positions at any location offered by the employer. During the academic year, Learning While Working students register for a full-time course load, and also for this zero-credit hour Learning While Working course. During the summer term, Learning While Working students register for a zero-credit hour Co-Op course. This course will help students set goals for their work experiences and reflect on skill growth and receive feedback from their employer supervisor and Purdue Co-Op supervisor. Prerequisite: Student must be eligible to participate in the Cooperative Education (Co-Op) program and have written documentation of valid work session with approved Co-Op employer. Permission of instructor required.

Learning Outcomes: 1. Set goals for a work experience. 2. Articulate how classroom learning is applied to the workplace. 3. Translate work experiences to their resume. 4. Articulate how the work experience improved skills such as communication, teamwork, and problem-solving. Credits: 0.00

ENGR 49001 - Breakthrough Thinking For Complex Challenges

Credit Hours: 3.00. This course helps students learn and effectively employ high-impact design principles and structured problem solving methods to address complex multi-stakeholder socio-technical challenges. Case discussions of historical and contemporary high impact solutions to complex challenges are used to introduce techniques to frame problems, structure ambiguity, intentionally design non-incremental solutions, and communicate, trial, and iterate solutions to drive adoption and multifaceted sustainability. Techniques are drawn from multiple schools of thought such as business, design, engineering, and the social sciences. Over the course of the term, multi-disciplinary student teams directly apply cumulative learning to address selected parts of a real-world complex societal challenge in close collaboration with a partner organization, in an experiential learning format. This course can be counted toward the College of Engineering Minor in Innovation and Transformational Change and the Burton D. Morgan Center for Entrepreneurship (BDMCE) Certificate in Entrepreneurship and Innovation. Permission of instructor required.

Learning Outcomes: 1. Employ rigorous issue analysis methods to develop mutually-exclusive collectively-exhaustive structured inventories of the issues involved in a major challenge. 2. Understand stakeholder motivation and interpret the funds, services, and influence exchanged in stakeholder ecosystems. 3. Understand the benefits and limitations of qualitative and quantitative methods to identify and interpret stakeholder needs. 4. Gain familiarity with habit conversion methodologies and the role they can play in design activities. 5. Recognize the importance of empathy in solution design and apply structured ideation methods to engender empathy in designers. 6. Understand patterns of innovation success and the contextual circumstances in which they apply. 7. Understand combinatorial business design methods to explore and prioritize alternative paths to achieve financial sustainability for an idea. 8. Discern the broader societal impacts of design activities. 9. Develop robust assessments of the assumptions underlying

new ideas and means to test those assumptions rapidly and at low cost. 10. Recognize and define influence paths and communication methods to drive awareness, consideration, conversion, and retention of new solutions. Credits: 3.00

ENGR 49400 - Women In Engineering Senior Seminar: Gender In The Workplace

Credit Hours: 1.00. This course provides junior and senior engineering students an opportunity to maximize their earning potential, promotion opportunities, and retention within engineering or related fields. Enrolled students will 1) become aware of and discuss solutions for internal and external barriers which can prevent women from reaching their greatest potential in the workforce; 2) enhance professional development and transition skills required to move successfully from an academic to professional environment; and 3) acquire skills and knowledge to serve as engineering role models/ambassadors for diverse populations. The content and activities of the course may be of particular interest to women. Permission by instructor required.

Learning Outcomes: 1. Identify and develop solutions to internal and external barriers which prevent attainment of career trajectory. 2. Define and apply professional and transition skills to move from academic to professional environment in order to improve the workforce experience and promotion opportunities. 3. Recognize and engage in engineering stewardship opportunities to build general public knowledge about the field of engineering. 4. Utilize coaching skills developed in class to assist themselves and others in making decisions/taking action. Credits: 1.00

ENGR 49600 - Experimental Courses

Credit Hours: 0.00 to 6.00. Experimental classes offered at the senior level on a temporary basis to test the viability of offering the course on a permanent basis.

Credits: 0.00 to 6.00

ENGR 49700 - Global Engineering Capstone

Credit Hours: 1.00. Forum for students returning from international internship and/or study abroad experience. Students will explore personal development resulting from the international experience as it relates to changes in world-view, understanding of culture, interpersonal skills and career aspirations. They will learn to highlight international experiences on resumes and in interviews. Students will apply and share their cultural knowledge through structured activities and summarize their entire global experience through a poster presentation. To be taken in semester following international internship/study abroad experience. Permission of instructor is required.

Learning Outcomes: 1. Identify skills gained through the international experience. 2. Able to highlight experiences on resumes and in interviews. 3. Apply skills to current and future inter-cultural situations and develop a strong ethical framework and cultural sensitivity to succeed in a global workplace. Credits: 1.00

ENGR 50000 - Global Design Team V

Credit Hours: 0.00 to 3.00. Global Design Team brings together undergraduate and graduate students from different disciplines, inside and outside of the College of Engineering to design solutions to solve real-world problems over the course of one academic semester. Depending on the size and scope of the project, teams may range from one to twenty students under the advisement of a faculty member. GDTs partner student teams with non-governmental organizations, businesses and/or other research institutions in international development projects. Approval for registration is granted based on an application process that takes into consideration previous design experience, level of interest in the topic and GPA. Permission of department required.

Learning Outcomes: 1. An awareness of varying regulations, codes of practice, standards, technical specifications testing/inspection procedures, environmental regulations, and systems of measurement between countries and regions. 2. Familiarity with the concept of a "global product platform". 3. Ability to apply familiar concepts to unfamiliar, real-world problems. 4. Ability to use design tools to solve engineering problems. 5. Ability to adapt to cultural norms in a professional arena and act appropriately. 6. Ability to make ethical and socially responsible decisions in the context of a culture divergent from my own. 7. Ability to analyze problems from a different cultural frame of reference. 8. Ability to communicate professionally in a culturally-appropriate manner. 9. Ability to practice social and cultural responsibility, e.g. resource sustainability. 10. Proficiency in a second language. 11. Ability to be cross-culturally adaptable/flexible. 12. Ability

to contribute to a culturally-diverse team. Credits: 0.00 to 3.00

ENGR 50100 - Engineering Management Graduate Program Seminar

Credit Hours: 1.00. Seminar focused on graduate-level development for Interdisciplinary Engineering (IDE) professional master's students in key professional skill areas including technical management, engineering industry awareness, networking, and methods for obtaining a professional position after graduation. Permission of instructor required.

Learning Outcomes: 1. Function in a technical manager role by engaging with industry partners. 2. Construct an attractive professional brand by applying the characteristics of an effective online presence. 3. Enhance knowledge about successfully transitioning to industry by directly communicating with program graduates. 4. Write an effective resume and cover letter by implementing tangible connections between professional development assessment results and university resources. 5. Execute job search activities strategically by comparing engineering job markets, both domestically and internationally, regarding employment requirements, job growth, and salary range. 6. Develop a skills-based functional resume by synthesizing engineering course backgrounds with industry job requirements. 7. Generate graduate-level interview skills by participating in engineering industry mock interviews. Credits: 1.00

ENGR 50200 - Engineering Leadership

Credit Hours: 3.00. Engineering leadership is the ability to inspire and guide engineering and technology-focused teams and organizations to achieve strategic outcomes. The successful engineering leader creates value at the intersection of technical systems and human systems. This course introduces students to evidence-based, practice-proven frameworks and tools related to (1) leadership presence, (2) cognitive diversity and psychological safety in teams, and (3) designing and transforming organizations and ecosystems.

Learning Outcomes: 1. Describe characteristics of effective leaders in engineering and technology-focused teams and organizations. 2. Apply tools and frameworks for effective leadership of engineering and technology-focused teams and organizations. 3. Analyze the potential strengths and potential of various leadership approaches and behaviors in engineering and technologically focused teams and organizations. Credits: 3.00

ENGR 59600 - Special Topics

Credit Hours: 0.00 to 6.00. Special topic courses for projects or special interest in Engineering.

Learning Outcomes: 1. Will vary by course. Credits: 0.00 to 6.00

ENGR 60100 - Doctor Of Engineering Fundamentals

Credit Hours: 1.00. This course is designed to guide students in creating individual development plans tailored to their academic and professional aspirations as part of the Doctor of Engineering (D.Eng.) program. Students will learn to assess their skills, interests, and values, aligning them with potential research and academic paths. The course will cover setting realistic goals, identifying resources, and developing strategies for personal and academic growth. The course will also detail the differences between a professional doctorate (D.Eng) and a PhD program. Students will engage in workshops and activities that foster self-reflection and practical planning skills. By the end of the course, students will have a personalized roadmap that outlines the steps necessary to achieve their graduate school objectives. As the foundational course for the Doctor of Engineering program, students are expected to take this course during their first year of the program.

Learning Outcomes: 1. Create an individual development plan (IDE). 2. Understand graduate school and how it aligns with your professional objectives. 3. Develop a workflow and plan for your studies. 4. Critique your individual development plan. 5. Establish professional and academic connections with students and faculty in the D.Eng. program. 6. Identify and engage with potential faculty advisor(s) and dissertation committee members. Credits: 1.00

ENGR 60200 - Engineering Research Fundamentals

Credit Hours: 3.00. This course is designed to teach students basic research fundamentals, including critical analysis of scientific literature, scientific communication, hypothesis development and basics of scientific writing. At the course's end, students will be able to critically review literature and present their scientific thoughts and findings in both written and

oral forms. Students will also have opportunities to implement writing, presentation, and networking strategies that are key to success beyond graduate school. An introduction to ethical research practices will also be provided. Finally, students are expected to provide feedback to peers and improve their scientific writing and editing skills through weekly writing sessions. Through self-guided reading and online discussions, students will master the art of analyzing scientific literature, communicating their arguments, and offering peer feedback to colleagues.

Learning Outcomes: 1. Understand and comprehend the basics in research methodology and applying them in research/ project work. 2. Find literature relevant to a research problem, analyze research and retain and retrieve its content for future use. 3. Apply research guidelines regarding record keeping. 4. Apply approaches for the development and formulation of research questions, objectives, and hypotheses. 5. Apply approaches to good writing for research proposals, papers, and theses. 6. Communicate research plans to peers and non-expert audiences, including oral and poster presentations. 7. Identify common ethical issues in research. Credits: 3.00

ENGR 60300 - Doctor Of Engineering Seminar

Credit Hours: 1.00. The graduate seminar is designed to provide students with the opportunity to explore and engage with current research topics, trends, and developments within engineering. The seminar will feature a different guest speaker each week. Here are the benefits of participating in the seminar: Knowledge expansion: You will gain insights into cutting-edge research; Exposure to diverse research areas: You will be exposed to a broader range of topics and research areas. This exposure will help you gain a more comprehensive understanding of current cutting-edge research topics and techniques. It can also inspire new research ideas and perspectives that you may not have considered previously; Developing critical thinking skills: You will refine your critical thinking by asking questions and participating in discussions during the seminars; Developing presentation skills: You will observe different presentation styles and effective communication techniques that you can use as examples to develop your own; Networking: You will be able to interact with professors, researchers, and peers from within and outside your program.

Learning Outcomes: 1. List critical areas and topics being investigated across a variety of engineering disciplines and areas. 2. Summarize a research presentation. 3. Identify improvements for current research practices. 4. Identify effective presentation styles and effective communication techniques. 5. Network with your peers and provide feedback. Credits: 1.00

ENGR 69199 - Professional Practice Graduate Co-Op I

Credit Hours: 0.00. Graduate cooperative education experience. Program coordinated by the Office of Professional Practice with cooperation from academic disciplines and participating employers. Students submit technical report and company evaluation. Permission of Instructor required.

Credits: 0.00

ENGR 69299 - Professional Practice Graduate Co-Op II

Credit Hours: 0.00. Graduate cooperative education experience. Program coordinated by the Office of Professional Practice with cooperation from academic disciplines and participating employers. Students submit technical report and company evaluation. Permission of Instructor required. Prerequisite: ENGR 69199.

Credits: 0.00

ENGR 69399 - Professional Practice Graduate Co-Op III

Credit Hours: 0.00. Graduate cooperative education experience. Program coordinated by the Office of Professional Practice with cooperation from academic disciplines and participating employers. Students submit technical report and company evaluation. Permission of Instructor required. Prerequisite: ENGR 69299.

Credits: 0.00

ENGR 69499 - Professional Practice Graduate Co-Op IV

Credit Hours: 0.00. Graduate cooperative education experience. Program coordinated by the Office of Professional Practice with cooperation from academic disciplines and participating employers. Students submit technical report and company evaluation. Permission of Instructor required. Prerequisite: ENGR 69399.

Credits: 0.00

ENGR 69699 - Professional Practice Graduate Internship

Credit Hours: 0.00. Graduate internship experience. Program coordinated by the Office of Professional Practice with cooperation from academic disciplines and participating employers. Students submit technical report and company evaluation. Permission of Instructor required.

Credits: 0.00

ENGR 69810 - Engineering Research

Credit Hours: 1.00 to 18.00. Designed for online engineering graduate students to participate in a mentored research experience. Permission of instructor required.

Learning Outcomes: 1. Vary due to nature of course. Credits: 1.00 to 18.00

ENGR 69900 - Doctor Of Engineering Research

Credit Hours: 1.00 to 18.00. This research dissertation course will reflect the student's work to prepare and pass the preliminary examination, prepare and pass the dissertation proposal and successfully defend and pass the Doctor of Engineering dissertation. Research expectations will be determined by the instructor and student. Permission of instructor is required.

Learning Outcomes: 1. Vary due to research expectations. Credits: 1.00 to18.00

Engineering Education

ENE 49800 - Undergraduate Research In Engineering Education

Credit Hours: 1.00 to 3.00. Individual research projects for students with the approval of their academic advisors. Requires prior approval of, and arrangement with, a faculty research advisor in the Department of Engineering Education. Written and oral final reports are required. Permission of instructor required.

Credits: 1.00 to 3.00

ENE 50100 - Professional Development In Engineering Education

Credit Hours: 1.00. This course provides beginning engineering education graduate students opportunities to define themselves with the engineering education department and within the field of engineering education. Students, faculty, and outside speakers present research topics, academic opportunities, and other information that will enhance students' graduate experiences. Permission of instructor required.

Learning Outcomes: 1. Develop a plan for completing a professional engineering education portfolio. (Students will demonstrate an ability to reflect critically upon their learning goals and articulate learning plan.) 2. Identify and interact with members of the engineering education community at local and national levels. (Students will develop and enhance their communication skills and other professional development skills.) 3. Identify and utilize resources that will help students to complete their doctoral program and to transition into the professional engineering education community. (Students will obtain knowledge of academic and professional resources in engineering education.) Credits: 1.00

ENE 50101 - Foundations Of Engineering Education

Credit Hours: 3.00. In this course, new doctoral students in engineering education explore their roles within the field of engineering education, create a learning plan that maps to program requirements, and develop habits of mind to support their ongoing professional development. Students learn to write clearly and coherently in an academic context. Students examine research trends and faculty interests so they can make informed choices about advising and program opportunities. Permission of instructor required.

Learning Outcomes: 1. Critically reflect upon personal learning goals, and articulate a learning plan that will eventually result in a professional portfolio. 2. Develop skills in academic writing. 3. Understand the research interests of local faculty members. 4. Identify resources that will facilitate the student's transition into the engineering education community. Credits: 3.00

ENE 50200 - History And Philosophy Of Engineering Education

Credit Hours: 3.00. Examines the history and philosophy of engineering education by: (1) exploring the history of engineering education through archival research and historical documents (critical moments, tensions, issues); (2) investigating philosophies of education and the philosophies that have guided engineering as a profession; and (3) critiquing the evolution of engineering education, identifying alternative scenarios, and imagining a future role in engineering education. This course introduces students to the field of engineering education while broadening their views of the roles of interrelationships between teaching and research. Open to students in Engineering Education. Permission of instructor required.

Learning Outcomes: 1. Develop a culture of critical reflection, engagement, and collaborative learning. 2. Provide opportunities for students to identify and understand tools to inquire into the history and philosophy of engineering education and develop the skills for using these tools. 3. Provide opportunities for students to use these inquiry tools to form persuasive arguments about the nature of

engineering education. Credits: 3.00

ENE 50300 - Engineering Education Inquiry

Credit Hours: 3.00. This course is conceived as a bridge between beginning graduate students' knowledge of technical research and modes of inquiry appropriate to the new field of engineering education. It is designed as the entryway to required research method courses taken as part of the students' plan of study. By the end of this survey course, students will be able to critique research in terms of the quality of the authors' argument based on their chain of reasoning, and will recognize that the articulation of a research question, the significance of the question, the choice of methods in regards to the research goals, and the transparency of the explanation of the methodology are all the parts of the chain of reasoning. Permission of instructor required.

Learning Outcomes: 1. Provides a pathway into the discipline that characterizes the diversity of approaches to engineering education research and research topics. 2. Create opportunities to discuss the need for rigorous engineering education research. 3. Develop critical understanding of relationships between research problem, method, and design. 4. Foster community development and collaborative efforts among students and engineering education researchers. 5. Help students identify conceptual hurdles and individual pathways into research activities. 6. Support students' identity development as an engineering education researcher. Credits: 3.00

ENE 50400 - Leadership, Policy, And Change In Science, Technology, Engineering, And Mathematics (STEM) Education

Credit Hours: 3.00. This course provides a foundation for examining historical and current perspectives of STEM education programs and policy at the secondary and postsecondary levels. Focusing on the relationships among education policy, leadership theories, and models of systemic change, this course will enable students to situate and envision their potential role in shaping engineering education within the context of the larger education landscape. Students will synthesize course readings, examine education policy, and reflect on leadership theories and change, as well as explore how they can influence leadership, policy, and /or organizational change in STEM education through a semester project.

Learning Outcomes: 1. Evaluate leadership theories and the leadership process. 2. Identify and evaluate factors that contribute to effective leadership within organizations. 3. Analyze education policy at local, state, and national levels with a focus on STEM education. 4. Evaluate models of systemic change and diffusion of innovative processes. 5. Understand key aspects, strategies, and applications of systemic change in education. 6. Generate strategies to implement change within STEM education environments. Credits: 3.00

ENE 50500 - Theories Of Development And Engineering Thinking

Credit Hours: 3.00. This course examines theories of human development, learning and epistemology in the context of Engineering Education. A broad survey of readings guides an in-depth study of fundamental theories of development and knowledge generation as it relates to pedagogy and research. A rich body of theoretical literature will be studied in order to explore its relation to engineering education. Work in the course aims to construct answers to the following three questions: (1) How do theories of human learning, development, and epistemology help us think about engineering? (2) How do they relate to engineering education? (3) How do they inform research method and practice in engineering education? No restrictions. It is helpful, however, for students to have engaged in prior reading-and writing- intensive courses that required them to synthesize large amounts of information. For this reason, it is recommended that students are enrolled currently in a graduate program at Purdue University. Permission of department required.

Learning Outcomes: 1. Summarize and critique theories of learning and development. 2. Propose connections between theories of learning and development and engineering thinking. 3. Apply theories of learning and development to the construction of engineering learning environments. 4. Generate engineering education research questions that are aligned with respective theories of learning and development. 5. Remember the main points of historically important theories of learning and development. 6. Consider how different theories of learning and development might be used as frameworks for your individual research projects (e.g. your dissertation research). Credits: 3.00

ENE 50600 - Content, Assessment And Pedagogy: An Integrated Engineering Design

Approach

Credit Hours: 3.00. The course is explicitly identified in the ENE-PhD requirements as a "foundation course" required for all students. This course is intended to be taken early in a graduate student's curriculum and therefore is designed to be a bridge between the student's previous experience with engineering (education, work, and teaching) and new engineering education research-based approaches. It is intended as an entryway to help students apply an engineering design approach to the design of instruction. To meet this aim, the course involves an iterative project-based approach in a context (design site) that is chosen by the student for its relevance, interest and potential application.

Learning Outcomes: 1. Develop and articulate an engineering design approach for content, assessment, and pedagogy (CAP). 2. Critically describe the research-based features of each of the elements - content, assessment and pedagogy. 3. Apply the principles and theories to the design of a course, module, lesson plan, or other instructional setting. 4. Use reflection and dialogue as a tool of self-discovery for shaping and refining personal philosophies for the design of instruction. 5. Participate in a ""community of practice"" culture through formation of our own community and participation in the broader community of engineering education. Credits: 3.00

ENE 55400 - Globalization And Engineering

Credit Hours: 3.00. The focus is on the multifaceted dynamics of globalization, and its impact on engineering practice and the lives and education of engineers. The course emphasizes engineering and globalization from the perspectives of the emerging Asian economies and Europe, as well as the United States. This course is designed for practicing engineers and engineering educators. It is taught within a learner-centric, highly interactive, collaborative learning environment in which students are expected to learn from the experiences and thinking of each other, as well as from the instructor, and other course resources. The course places emphasis on reading, writing, web-based research, and discussion. Students are recommended (but not required) to have a minimum of two years work experience as a practicing engineer and strong communication skills (self-assessed). Permission of instructor is required.

Learning Outcomes: 1. Have increased global awareness. 2. Have knowledge of the dynamics of globalization as an economic and social process including contrasting theories and interpretations of events. 3. Have knowledge of how globalization is studied and characterized by economists, political scientists, and sociologists. 4. Able to interpret studies and research on globalization. 5. Understand the nature and roles of engineering education and life-long learning within the globalization dynamic. 6. Understand the innovation process within a global enterprise including contrasting theories and the ability to analyze specific cases. 7. Able to lead and innovate within a rapidly globalizing profession. 8. Know the engineering profession, engineering education, and globalization from the perspectives of countries beyond the United States, particularly perspectives from Europe and the emerging economies of Asia. Credits: 3.00

ENE 58600 - Exploring Alternative Career Paths As An Engineering Educator

Credit Hours: 3.00. This course is designed for graduate students in engineering or closely related fields who want to be involved in educating current or future engineering students or practicing engineers or in communicating technical material to others, including teachers, the public, or policymakers - but are not currently interested in a tenure-track faculty position. It explores a wide range of positions in formal education, informal education (e.g., museums, foundations), industry, and government and offers an opportunity to learn and practice some skills typically required for success in those positions.

Learning Outcomes: 1. Describe non-tenure-track positions of interest to them and where to look for those types of positions. 2. Build and maintain networks with people who have similar interests. 3. Prepare a professional development plan to develop and polish the skills they need in their current or future position. 4. Write an effective proposal seeking funding for a project of interest. Credits: 3.00

ENE 59000 - Special Problems In Engineering Education

Credit Hours: 1.00 to 6.00. Project or special topics of contemporary importance or of special interest that are outside the scope of the standard graduate curriculum. Interested students should seek a faculty advisor by meeting individual

faculty members who work in their area of special interest and prepare a brief description of the work to be undertaken and expected outcomes and deliverables. An individual project must be approved by the faculty member supervising the project and the student's advisor before registering for the course. An approved written report is required. Permission of instructor required.

Learning Outcomes: 1. Objectives vary based on course topics. Credits: 1.00 to 6.00

ENE 59500 - Special Topics In Engineering Education

Credit Hours: 0.00 to 6.00. Primarily designed for specialized topic areas for which there is no specific course, workshop, or individual study plan, but having enough student interest to justify the formalized teaching of a course. Permission of instructor required.

Learning Outcomes: 1. Objectives and outcomes vary due to nature of course. Credits: 0.00 to 6.00

ENE 62000 - Design, Cognition And Learning

Credit Hours: 3.00. Design is central to engineering: it is an integral part of the engineering profession and how we educate future professionals. Design cognition and learning is an area of engineering education research that seeks to understand what designers know and how they learn, and what tools best support design activity (e.g. collaboration, innovation, etc.). This research draws from many perspectives including cognitive psychology and the learning sciences, organizational learning, engineering and product design, architecture, human-centered interaction, and creativity and innovation. Themes in the course include (1) design knowledge, (2) what theories help understand design knowing and learning, (3) what are ways to study designers and design activity, and (4) how may design research inform design education and practice? Permission of instructor required.

Learning Outcomes: 1. Explore and critique multiple perspectives on design cognition and learning, some of which are synergistic and some of which conflict, to develop a more sophisticated understanding that acknowledges and builds on different perspectives. 2. Stretch, broaden, and challenge perspectives. 3. Share and clarify ideas through writing and discussion. 4. Develop a landscape view of cognition knowing and learning that may also reveal gaps in knowledge. 5. Critique and discuss a variety of ways people study design to better understand what methods are appropriate for what kinds of research goals. 6. Examine data drawn from a variety of methods (e.g., verbal protocol analysis, sketches, surveys, debrief interviews and reports). 7. Experience different resources across disciplinary communities. 8. Identify central resources for finding information. 9. Develop an awareness of differences across diverse design communities (e.g., differences in language, values, approaches). 10. Experience and reflect on design through in class activities. 11. Examine other designers (peers as well as existing design data) to develop skills of noticing and seeing that may be used to guide personal reflections on a design philosophy, to develop a research proposal, or to develop an awareness of the kinds of challenges learners experience about design knowing. 12. Synthesize ideas through class discussion, activities, and out-of-class reflection blog posts. 13. Give and receive feedback on the final course project at multiple points in the term. 14. Develop an application of research on design knowing and learning (a philosophy statement, a research proposal, an education proposal, a synthesis to identify gaps). Credits: 3.00

ENE 63000 - Cognitive Devices In Science, Technology, Engineering And Mathematics Learning Environments

Credit Hours: 3.00. This course explores the nature of technologies we use to assist in thinking, learning and teaching. Specific focus is on cognitive tools associated with engineering activities and how to blend these tools with science and mathematical knowledge. These will range from representational tools, computational tools and cognitive tools for supporting individual and group thinking and learning. Participants in this course will be able to evaluate various learning technologies relative to specific learning goals and outcomes and will design a technological tool to support thinking, learning and/or teaching about concepts in science, engineering, mathematics and technology. Participants will also be able to identify assessment methods that indicate cognitive change in learners as a measure of the effectiveness of a device/tool in context of an activity.

Learning Outcomes: 1. Evaluate various learning technologies relative to specific

learning goals and outcomes and will design a technological tool to support thinking, learning, and/or teaching about concepts in science, engineering, mathematics and technology. 2. Identify assessment methods that indicate cognitive change in learners as a measure of the effectiveness of a device/tool in context of an activity. Credits: 3.00

ENE 68500 - Educational Methods In Engineering

Credit Hours: 3.00. (CHE 68500) Students will learn how to teach in an engineering environment where both classroom and laboratory instruction is intertwined. Classroom techniques, such as lectures, cooperative groups, mastery and PSI, TV and video, and guided design will be studied, in addition to class preparation issues, such as ABET accreditation and design content. Students will study motivation, learning theories and cycles, and personality types. Includes teaching practice and group projects. Student must be admitted into a Ph.D. program in Engineering or other technical discipline (Finished with MS or MS-bypass). Not open to students who have taken PSY 69500/EDPS 63400. Permission of Instructor required.

Learning Outcomes: 1. Summarize and critique theories of learning and development. 2. Propose connections between theories of learning and development and engineering thinking. 3. Apply theories of learning and development to the construction of engineering learning environments. 4. Generate engineering education research questions that are aligned with respective theories of learning and development. 5. Remember the main points of historically important theories of learning and development. 6. Consider how different theories of learning and development might be used as frameworks for your individual research projects (e.g. your dissertation research). Credits: 3.00

ENE 68700 - Mentored Teaching In Engineering

Credit Hours: 1.00 or 3.00. Mentored experience in the teaching of engineering, with structured opportunities for individual reflection. All students create a scholarly teaching portfolio. Students who register for three credits conduct a scholarship of teaching and learning project. Prerequisites: Significant concurrent responsibility for teaching an engineering course. Registration in or completion of ENE 50600 (Content, Assessment And Pedagogy) or ENE 68500 (Educational Methods In Engineering); or instructor permission required.

Learning Outcomes: 1. Think critically about the relationships between your teaching experiences and the readings in this course and the prerequisite courses. 2. Use reflection, mentoring, and student feedback to learn from teaching experiences. 3. Explain the reasons for choices of teaching methods. 4. Analyze evidence of student learning. 5. Identify and address ethical issues in teaching situations. 6. Plan and carry out a scholarly investigation of teaching and learning through the SoTL project. Credits: 1.00 or 3.00

ENE 69000 - Seminar In Engineering Education

Credit Hours: 0.00. Seminar course covering a broad range of current discovery, learning, and engagement topics in Engineering Education. Seminar presentations by representatives from academia, industry, other external institutions, and members of the Purdue University community. This is a required course for the graduate program in the Department of Engineering Education.

Learning Outcomes: 1. Develop an understanding of the field of Engineering Education in its widest possible applications. 2. Develop an appreciation of the various interdisciplinary research efforts being pursued Engineering Education has the potential to provide leadership. Credits: 0.00

ENE 69500 - Advanced Topics In Engineering Education

Credit Hours: 0.00 to 6.00. Primarily designed for specialized topic areas for which there is no specific course, workshop, or individual study plan, but having enough student interest to justify the formalized teaching of a course. Permission of instructor required.

Credits: 0.00 to 6.00

ENE 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. MS Thesis. Permission of instructor required.

Learning Outcomes: 1. Make satisfactory progress on Master's research. Credits: 1.00 to 18.00

ENE 69900 - Research PhD Thesis

Credit Hours: 1.00 to 18.00. PhD Thesis. Permission of instructor required.

Credits: 1.00 to 18.00

Engineering Projects in Community

Service

EPCS 10100 - First Year Participation In EPICS (UCC: STS)

Credit Hours: 1.00. Together, Engineering Projects in Community Service (EPICS) courses create a vertical project track under which students work in multidisciplinary teams on long-term engineering-based design projects. Projects of at least one year in duration are intended to solve real problems that are defined in consultation with "customers" from not-for-profit community and education organizations. EPCS courses are open to students from all disciplines; each student contributes expertise in his/her academic discipline. Each team consists of a mix of first-year, sophomores, juniors, and seniors. Students are encouraged to participate in an EPICS project team for two or more semesters. First-year students participating in EPCS 10100 gain insight into the specific project, and more generally, into the design and development process. They attend planning and reporting meetings with the customer and are expected attend all team meetings. Under the mentorship of the team's sophomores, juniors and seniors they perform and report upon tasks consistent with their level of discipline expertise. May be repeated for credit.

University Core Curriculum (UCC): (UCC: STS) Learning Outcomes: 1. Able to apply material from their discipline to the design of community-based projects. 2. Understand the design as a start-to-finish process. 3. Able to identify and acquire new knowledge as a part of the problem-solving/design process. 4. Aware of the customer. 5. Able to function on multidisciplinary teams and an appreciation for the contributions from individuals from multiple disciplines. 6. Able to communicate effectively with audiences with widely-varying backgrounds. 7. Aware of professional ethics and responsibility. 8. Appreciate the role that their discipline can play in social contexts. Credits: 1.00

EPCS 10200 - First Year Participation In EPICS (UCC: STS)

Credit Hours: 2.00. Continuation of EPCS courses (see EPCS 10100). Participants in EPCS 10200 gain insight into the specific project, and more generally, into the design and development process. They attend planning and reporting meetings with the customer and are expected to attend all team meetings. Working with team's sophomores, juniors and seniors they perform and report upon tasks consistent with their level of discipline expertise. EPCS 10200 is offered for two credits and is intended for students who have exhibited significant achievement in EPCS 10100 and desire the level of responsibility that is appropriate for two credits. May be repeated for credit. Permission of department required.

University Core Curriculum (UCC): (UCC: STS) Learning Outcomes: 1. Able to apply material from their discipline to the design of community-based projects. 2. Understand design as a start-to-finish process. 3. Identify and acquire new knowledge as a part of the problem-solving/design process. 4. Aware of the customer. 5. Able to function on multidisciplinary teams and an appreciation for the contributions from individuals from multiple disciplines. 6. Able to communicate effectively with audiences with widely-varying backgrounds. 7. Aware of professional ethics and responsibility. 8. Appreciate of the role that their discipline can play in social contexts. Credits: 2.00

EPCS 11100 - First Year Participation In EPICS I (UCC: STS)

Credit Hours: 1.00. Together, Engineering Projects in Community Service (EPICS) courses create a vertical project track under which students work in multidisciplinary teams on long-term engineering-based design projects. Projects of at least one-year in duration are intended to solve real problems that are defined in consultation with "customers" from not-for-profit community and education organizations. EPCS courses are open to students from all disciplines; each student contributes expertise in his/her academic discipline. Each team consists of a mix of first-year, sophomores, juniors, and seniors. Students are encouraged to participate in an EPICS project team for two or more semesters. First-year students participating in EPCS gain insight into the specific project, and more generally, into the design and development process. They attend planning and reporting meetings with the customer and are expected to attend all team meetings. Under mentorship from upper-level students and instructors, they perform and report upon design tasks consistent with their level of discipline expertise.

University Core Curriculum (UCC): (UCC: STS) Learning Outcomes: 1. An ability to apply material from their discipline to the design of community-based projects. 2. An understanding of design as a start-to-finish process. 3. An ability to identify and acquire new knowledge as

a part of the problem-solving/design process. 4. An awareness of the customer. 5. An ability to function on multidisciplinary teams and an appreciation for the contributions from individuals from multiple disciplines. 6. An ability to communicate effectively with audiences with widely-varying backgrounds. 7. An awareness of professional ethics and responsibility. 8. An appreciation of the role that their discipline can play in social contexts. Credits: 1.00

EPCS 12100 - First Year Participation In EPICS II (UCC: STS)

Credit Hours: 1.00. Together, Engineering Projects in Community Service (EPICS) courses create a vertical project track under which students work in multidisciplinary teams on long-term engineering-based design projects. Projects of at least one year in duration are intended to solve real problems that are defined in consultation with "customers" from not-for-profit community and educational organizations. EPCS courses are open to students from all disciplines; each student contributes expertise in his/her academic discipline. Each team consists of a mix of first-year, sophomores, juniors, and seniors. Students are encouraged to participate in an EPICS project for two or more semesters. First-year students participating in EPICS gain insight into the specific project, and more generally, into the design and development process. Under mentorship from upper-level students and instructors, they perform and report upon design tasks consistent with their level of discipline expertise.

University Core Curriculum (UCC): (UCC: STS) Learning Outcomes: 1. Ability to apply material from their discipline to the design of community-based projects. 2. Understanding of design as a start-to-finish process. 3. Ability to identify and acquire new knowledge as a part of the problem-solving/design process. 4. Awareness of the customer. 5. Ability to function on multidisciplinary teams and an appreciation for the contributions from individuals from multiple disciplines. 6. Ability to communicate effectively with audiences with widely-varying backgrounds. 7. Awareness of professional ethics and responsibility. 8. Appreciation of the role that their discipline can play in social contexts. Credits: 1.00

EPCS 20100 - Sophomore Participation In EPICS (UCC: STS)

Credit Hours: 1.00. Continuation of EPCS courses (see EPCS 10100). Sophomores participating in EPCS 20100 gain insight into the specific project, and, more generally, into the design and development process. They attend planning and reporting meetings with the customer and are expected attend all team meetings. Under the mentorship of the team's juniors and seniors they perform and report upon tasks consistent with their level of discipline expertise. EPCS 20100 is offered for one credit.

University Core Curriculum (UCC): (UCC: STS) Learning Outcomes: 1. Able to apply material from their discipline to the design of community-based projects. 2. Understand the design as a start-to-finish process. 3. Able to identify and acquire new knowledge as a part of the problem-solving/design process. 4. Aware of the customer. 5. Able to function on multidisciplinary teams and an appreciation for the contributions from individuals from multiple disciplines. 6. Able to communicate effectively with audiences with widely-varying backgrounds. 7. Aware of professional ethics and responsibility. 8. Appreciate the role that their discipline can play in social contexts. Credits: 1.00

EPCS 20200 - Sophomore Participation In EPICS (UCC: STS)

Credit Hours: 2.00. Continuation of EPCS courses (see EPCS 10100). Sophomores participating in EPCS 20100 gain insight into the specific project, and, more generally, into the design and development process. They attend planning and reporting meetings with the customer and are expected attend all team meetings. Under the mentorship of the team's juniors and seniors they perform and report upon tasks consistent with their level of discipline expertise. EPCS 20200 is offered for two credits. Permission of instructor required.

University Core Curriculum (UCC): (UCC: STS) Learning Outcomes: 1. Able to apply material from their discipline to the design of community-based projects. 2. Understand the design as a start-to-finish process. 3. Able to identify and acquire new knowledge as a part of the problem-solving/design process. 4. Aware of the customer. 5. Able to function on multidisciplinary teams and an appreciation for

the contributions from individuals from multiple disciplines. 6. Able to communicate effectively with audiences with widely-varying backgrounds. 7. Aware of professional ethics and responsibility. 8. Appreciate the role that their discipline can play in social contexts. Credits: 2.00

EPCS 30100 - Junior Participation In EPICS (UCC: STS)

Credit Hours: 1.00. Continuation of EPCS courses (see EPCS 10100). The responsibilities of juniors include working with the seniors in the planning and organization of the project, contributing to the design process, problem-solving by contributing expertise from their discipline, meeting with the customer, and the mentorship of sophomores and freshmen. EPCS 30100 is offered for 1 credit. The EPICS procedures manual provides information on expected relative workload for EPCS 30100 and EPCS 30200 students. May not be taken concurrently with EPCS 30200 .

University Core Curriculum (UCC): (UCC: STS) Learning Outcomes: 1. Able to apply material from their discipline to the design of community-based projects. 2. Understand design as a start-to-finish process. 3. Able to identify and acquire new knowledge as a part of the problem-solving/design process. 4. Aware of the customer. 5. Able to function on multidisciplinary teams and an appreciation for the contributions from individuals from multiple disciplines. 6. Able to communicate effectively with audiences with widely-varying backgrounds. 7. Aware of professional ethics and responsibility. 8. Appreciate the role that their discipline can play in social contexts. Credits: 1.00

EPCS 30200 - Junior Participation In EPICS (UCC: STS)

Credit Hours: 2.00. Continuation of EPCS courses (see EPCS 10100). The responsibilities of juniors include working with the seniors in the planning and organization of the project, contributing to the design process, problem-solving by contributing expertise from their discipline, meeting with the customer, and the mentorship of sophomores and freshmen. EPCS 30200 is offered for two credits. The EPICS procedures manual provides information on expected relative workload for EPCS 30100 and EPCS 30200 students. May not be taken concurrently with EPCS 30100 .

University Core Curriculum (UCC): (UCC: STS) Learning Outcomes: 1. Able to apply material from their discipline to the design of community-based projects. 2. Understand design as a start-to-finish process. 3. Able to identify and acquire new knowledge as a part of the problem-solving/design process. 4. Aware of the customer. 5. Able to function on multidisciplinary teams and an appreciation for the contributions from individuals from multiple disciplines. 6. Able to communicate effectively with audiences with widely-varying backgrounds. 7. Aware of professional ethics and responsibility. 8. Appreciate the role that their discipline can play in social contexts. Credits: 2.00

EPCS 40100 - Senior Participation In EPICS (UCC: STS)

Credit Hours: 1.00. Continuation of EPCS courses (see EPCS 10100). Seniors are responsible for the management tasks of planning and organizing their team project activity. They are expected to contribute expertise from their discipline to the design of the team's projects throughout most of the design process phases of problem identification, specification development, design, production, and deployment. Seniors will also meet with the customer and mentor the freshman, sophomores and juniors. Seniors using EPCS 40100/EPCS 40200 to fulfill capstone or design requirements where approved for their major may be required to satisfy additional course requirements specified by their degree program. EPCS 40100 is offered for 1 credit. The EPICS procedures manual provides information on expected relative workload for EPCS 40100 and EPCS 40200 students. May not be taken concurrently with EPCS 40200 .

University Core Curriculum (UCC): (UCC: STS) Learning Outcomes: 1. Able to apply material from their discipline to the design of community-based projects. 2. Understand design as a start-to-finish process. 3. Able to identify and acquire new knowledge as a part of the problem-solving/design process. 4. Aware of the customer. 5. Able to function on multidisciplinary teams and an appreciation for the contributions from individuals from multiple disciplines. 6. Able to communicate effectively

with audiences with widely-varying backgrounds. 7. Aware of professional ethics and responsibility. 8. Appreciate the role that their discipline can play in social contexts. Credits: 1.00

EPCS 40200 - Senior Participation In EPICS (UCC: STS)

Credit Hours: 2.00. Continuation of EPCS courses (see EPCS 10100). Seniors are responsible for the management tasks of planning and organizing their team project activity. They are expected to contribute expertise from their discipline to the design of the team's projects throughout most of the design process phases of problem identification, specification development, design, production, and deployment. Seniors will also meet with the customer and mentor the freshman, sophomores and juniors. Seniors using EPCS 40100 /40200 to fulfill capstone or design requirements where approved for their major may be required to satisfy additional course requirements specified by their degree program. EPCS 40200 is offered for 2 credits. The EPICS procedures manual provides information on expected relative workload for EPCS 40100 and EPCS 40200 students. May not be taken concurrently with EPCS 40100 .

University Core Curriculum (UCC): (UCC: STS) Learning Outcomes: 1. Able to apply material from their discipline to the design of community-based projects. 2. Understand design as a start-to-finish process. 3. Able to identify and acquire new knowledge as a part of the problem-solving/design process. 4. Aware of the customer. 5. Able to function on multidisciplinary teams and an appreciation for the contributions from individuals from multiple disciplines. 6. Able to communicate effectively with audiences with widely-varying backgrounds. 7. Aware of professional ethics and responsibility. 8. Appreciate the role that their discipline can play in social contexts. Credits: 2.00

EPCS 41100 - Senior Design Participation In EPICS

Credit Hours: 1.00. Continuation of EPICS courses. Seniors using EPCS 41100 to fulfill capstone or design requirements where approved for their major may be required to satisfy additional course requirements specified by their degree program. EPCS 41100 is offered for 1 credit. The EPICS procedures manual provides information on expected relative workload for EPCS 41100 and EPCS 41200 students. Seniors are responsible for the management tasks of planning and organizing their team project activity. They are expected to contribute expertise from their discipline to the design of the team's projects throughout most of the design process phases of problem identification, specification development, design, production, and deployment. Seniors will also meet with the customer and mentor the first year, sophomores and juniors. May not be taken concurrently with EPCS 41200 .

Learning Outcomes: 1. An ability to apply material from their discipline to the design of community-based projects. 2. An understanding of design as a start-to-finish process. 3. An ability to identify and acquire new knowledge as a part of the problem-solving/design process. 4. An awareness of the customer. 5. An ability to function on multidisciplinary teams and an appreciation for the contributions from individuals from multiple disciplines. 6. An ability to communicate effectively with audiences with widely-varying backgrounds. 7. An awareness of professional ethics and responsibility. 8. An appreciation of the role that their discipline can play in social contexts. Credits: 1.00

EPCS 41200 - Senior Design Participation In EPICS

Credit Hours: 2.00. Continuation of EPICS courses. Seniors using EPCS 41200 to fulfill capstone or design requirements where approved for their major may be required to satisfy additional course requirements specified by their degree program. EPCS 41200 is offered for 2 credits. The EPICS procedures manual provides information on expected relative workload for EPCS 41100 and EPCS 41200 students. Seniors are responsible for the management tasks of planning and organizing their team project activity. They are expected to contribute expertise from their discipline to the design of the team's projects throughout most of the design process phases of problem identification, specification development, design, production, and deployment. Seniors will also meet with the customer and mentor the first year, sophomores and juniors. May not be taken concurrently with EPCS 41100 .

Learning Outcomes: 1. An ability to apply material from their discipline to the design of community-based projects. 2. An understanding of design as a start-to-finish process. 3. An ability to identify and acquire new knowledge as a part of the problem-solving/design process. 4. An awareness of the customer. 5. An ability to

function on multidisciplinary teams and an appreciation for the contributions from individuals from multiple disciplines. 6. An ability to communicate effectively with audiences with widely-varying backgrounds. 7. An awareness of professional ethics and responsiblity. 8. An appreciation of the role that their discipline can play in social contexts. Credits: 2.00

EPCS 49000 - EPICS Special Topics Course

Credit Hours: 1.00 to 3.00. Projects of special interest outside the scope and structure of the standard EPICS courses. Interested students seek a faculty advisor in their area of special interest and together prepare a brief description of the work to be undertaken. Permission of instructor required.

Credits: 1.00 to 3.00

Engineering Technology

ENGT 10200 - Industrial Technology Aerospace Studies

Credit Hours: 3.00. This course introduces students to the world of aeronautics, flight, and engineering. Students apply scientific and engineering concepts to design materials and processes that measure, repair, improves, and extend aeronautical systems.

Learning Outcomes: 1. Explain the principles of atmospheric and space flight. 2. Apply concepts of orbital mechanics, using industry-standard software. 3. Explore career opportunities in aerospace engineering and technology. Credits: 3.00

ENGT 10300 - Industrial Technology Exploring Civil Engineering And Architecture

Credit Hours: 3.00. Students learn various aspects of civil engineering and architecture, apply their knowledge to designing and development of a commercial property. Students learn about documenting their project, problem-solving, and communications in the civil engineering community.

Learning Outcomes: 1. Apply aspects of building and site design for commercial projects. 2. Use industry-standard 3-D architectural software to document work. 3. Compare/contrast the roles of architects and civil engineers. 4. Explore various career opportunities in civil engineering and architecture. Credits: 3.00

ENGT 10500 - Industrial Technology Introduction To Design

Credit Hours: 3.00. This course develops students' problem-solving skills, with emphasis placed upon the concept of developing a three-dimensional model of an object. Students focus on the application of visualization processes and tools currently used in the design and manufacturing environments.

Learning Outcomes: 1. Apply the engineering design process to real-world problems. 2. Create detailed technical drawings. 3. Present design solutions to stakeholders. 4. Explore the economic, environmental, and societal impact of engineering solutions. Credits: 3.00

ENGT 10600 - Industrial Technology Digital Electronics

Credit Hours: 3.00. This course is the study of applied digital logic. Students will study the application of electronic logic circuits and apply Boolean logic to the solution of problems. Students will design circuits, export their design to a printed program that generates printed circuit boards, and construct the design using electronic components.

Learning Outcomes: 1. Design digital electronic circuits. 2. Apply various number systems and logic gates. 3. Design combinational and sequential circuits. 4. Use industry-standard software to design/simulate digital circuits. Credits: 3.00

ENGT 10700 - Industrial Technology Principles Of Engineering

Credit Hours: 3.00. This course explores various engineering systems and manufacturing processes. Students examine how the field of engineering technology addresses social and political consequences of technological change.

Learning Outcomes: 1. Apply the engineering design process to real-world problems. 2. Explain mechanical systems, including simple/compound machines, mechanisms, and motion. 3. Design basic electrical circuits. 4. Explore applications of robotics and automation in engineering. Credits: 3.00

ENGT 10800 - Industrial Technology Computer-Integrated Manufacturing

Credit Hours: 3.00. This course builds on students' solid modeling skills to develop manufactured products. Students evaluate products using mass property analysis, make appropriate modifications, and use prototyping equipment to produce three-dimensional models of the solutions.

Learning Outcomes: 1. Use computer-aided

design and computer-aided manufacturing software to optimize production workflows. 2. Use computer numerical control machines to transform digital designs into physical products. 3. Integrate robotic systems to improve efficiency and precision. 4. Analyze economic aspects of manufacturing. Credits: 3.00

ENGT 10900 - Industrial Technology Engineering Design And Development

Credit Hours: 3.00. In this capstone course students work in teams to design and construct a solution to an engineering problem, applying the knowledge and skills previously developed. Students maintain a portfolio of their design and development activities. Teams are responsible for making final presentations of the solution to an engineering review panel.

Learning Outcomes: 1. Apply the engineering design process. 2. Conduct research to support design decisions. 3. Present and defend design decisions. 4. Explore the societal, ethical, and environmental impacts of engineering. Credits: 3.00

ENGT 18000 - Engineering Technology Foundations

Credit Hours: 3.00. This course introduces School of Engineering Technology students to resources and skills that will help them to be successful in their studies and ultimately in their careers. The skills needed to define and solve technical problems in engineering technology are developed. Instruction is given in analytical and computational problem-solving techniques. Application of software for analysis and communication is emphasized. Teamwork, global and societal concerns, and professional ethics are integrated into course projects.

Learning Outcomes: 1. Select the most appropriate degree program. 2. Apply algebraic and trigonometric skills to solve engineering technology problems. 3. Apply computational tools to address engineering technology problems. 4. Identify professional issues in engineering technology. 5. Plan and execute a strategy for success in a chosen degree program. Credits: 3.00

ENGT 18100 - Engineering Technology Applications

Credit Hours: 1.00. Basic electrical, electronics, mechanical, and process laboratory skills are introduced, including simple troubleshooting techniques and safety practice. Relevant engineering technology projects are emphasized.

Learning Outcomes: 1. Operate safely in a lab environment. 2. Use standard lab instrumentation to take measurements accurately. 3. Communicate relevant experimental results. 4. Complete an engineering technology team project. Credits: 1.00

ENGT 18200 - Gateway To Engineering Technology

Credit Hours: 4.00. This course introduces School of Engineering Technology students to the resources and skills needed to define and solve technical problems, which will help them be successful in their studies and ultimately in their careers. Instruction is given in analytical and computational problem-solving techniques. The application of software for analysis and problem-solving is emphasized. Foundational principles for electrical, industrial, manufacturing, and mechanical engineering technology are studied. Teamwork, global and societal concerns, and professional ethics are integrated into course.

Learning Outcomes: 1. Develop an academic pathway for success in the student's selected major. 2. Select appropriate strategies and technologies to solve technical problems. 3. Apply foundational principles and tools of electrical, industrial, manufacturing, and mechanical engineering technology to address technical problems. 4. Apply computational tools to address technical problems. 5. Work in a team to solve an engineering technology problem. 6. Demonstrate awareness of professional standards, practices, culture, and issues in engineering technology. Credits: 4.00

ENGT 22670 - Sustainable Energy Technologies: An International Perspective

Credit Hours: 3.00. This course is a survey of sustainable energy technologies taught at Ostfalia University in Wolfenbuttel, Germany during the two-week International Summer University Program. Wind, Solar, Hydro-electric, Hydrogen Fuel Cell, Biomass, and other technologies are studied along with the future of Nuclear and Coal powered generation. The economic aspects of shifting to renewable energy sources by Germany are presented. Field trips to energy-related industries and historic cities occur nearly every day. Permission of instructor required.

Learning Outcomes: 1. Increase intercultural

awareness. 2. Identify various sustainable energy technologies. 3. Describe technological issues associated with each generation method. 4. Explain economic issues associated with implementation of sustainable energy. 5. Identify events in history that shaped the German culture. Credits: 3.00

ENGT 29000 - Special Topics In ENGT

Credit Hours: 1.00 to 3.00. Group instruction in new or specialty areas of engineering technology is provided by SOET faculty, subject to SOET curriculum subcommittee approval. Hours, subject matter, and credit to be arranged by faculty. Permission of department required.

Learning Outcomes: 1. Learning outcomes will match the course content and are subject to SOET curriculum subcommittee approval. Credits: 1.00 to 3.00

ENGT 29900 - Engineering Technology Project

Credit Hours: 1.00 to 3.00. Independent project or study of a special topics is conducted under the supervision of appropriate SOET faculty. Hours and subject matter must be arranged with the instructor and approved by the SOET curriculum subcommittee before enrolling in the course. Permission of department required.

Learning Outcomes: 1. Learning outcomes will depend on the content of the project and will be approved by the SOET curriculum subcommittee. Credits: 1.00 to 3.00

ENGT 39000 - Special Topics In Engineering Technology

Credit Hours: 1.00 to 3.00. Group instruction in new or specialty areas of engineering technology is provided by SOET faculty, subject to SOET curriculum subcommittee approval. Hours, subject matter, and credit to be arranged by faculty. Permission of department required.

Learning Outcomes: 1. Learning outcomes will be reviewed by the SOET CC subcommittee as part of the course proposal. Credits: 1.00 to 3.00

ENGT 39900 - Engineering Technology Project

Credit Hours: 1.00 to 6.00. Independent project or study of a special topic is conducted under the supervision of appropriate SOET faculty. Hours and subject matter must be arranged with the instructor and approved by the SOET curriculum subcommittee before enrolling in the course. Permission of department required.

Learning Outcomes: 1. Learning outcomes vary, and will be approved by the SOET curriculum subcommittee. Credits: 1.00 to 6.00

ENGT 48000 - Engineering Technology Capstone I

Credit Hours: 3.00. This is the first course of a two-term senior capstone sequence. The skills needed to define, design and develop engineering technology solutions are introduced and developed. Planning and designing alternatives that meet cost, performance, and user-interface goals are emphasized. Project planning, scheduling, and management techniques are studied. Different design approaches are compared. Teamwork, global and societal concerns, and professional ethics are integrated into course projects.

Learning Outcomes: 1. Apply the engineering design process to engineering technology problems. 2. Evaluate customer needs when defining a solution. 3. Determine a preferred solution. 4. Define and develop a plan for implementing a technical solution. Credits: 3.00

ENGT 48001 - Engineering Technology Capstone I

Credit Hours: 3.00. This is the first course of a two-term senior capstone sequence. The skills needed to define, design and develop engineering technology solutions are introduced and developed. Planning and designing alternatives that meet cost, performance, and user-interface goals are emphasized. Project planning, scheduling, and management techniques are studied. Different design approaches are compared. Teamwork, global and societal concerns, and professional ethics are integrated into course projects.

Learning Outcomes: 1. Apply the engineering design process to engineering technology problems. 2. Evaluate customer needs when defining a solution. 3. Determine a preferred solution. 4. Define and develop a plan for implementing a technical solution. Credits: 3.00

ENGT 48100 - Engineering Technology Capstone II

Credit Hours: 3.00. This is the second course of two-term capstone sequence, addressing an industry-based problem. The focus of the course is on designing and implementing an acceptable solution.

Learning Outcomes: 1. Participate effectively in teams. 2. Use appropriate research and discipline processes to design a solution. 3. Develop a final project report, properly acquiring, using, and citing sources. 4. Identify

limitations/improvements as well as strengths of the design solution. 5. Present final solution recommendations. Credits: 3.00

ENGT 49000 - Special Topics In Engineering Technology

Credit Hours: 1.00 to 3.00. Group instruction in new or specialty areas of engineering technology is provided by SOET faculty, subject to SOET curriculum subcommittee approval. Hours, subject, matter, and credit to be arranged by faculty. Permission of department required.

Learning Outcomes: 1. Learning outcomes will vary, and are subject to SOET curriculum subcommittee approval. Credits: 1.00 to 3.00

ENGT 49900 - Engineering Technology Project

Credit Hours: 1.00 to 6.00. Independent project or study of a special topic is conducted under the supervision of appropriate SOET faculty. Hours and subject matter must be arranged with the instructor and approved by the SOET curriculum subcommittee before enrolling in the course. Permission of department required.

Learning Outcomes: 1. Learning outcomes will vary with the project, and are subject to SOET curriculum subcommittee approval. Credits: 1.00 to 6.00

ENGT 50100 - Graduate Research Seminar

Credit Hours: 0.00 or 1.00. This course is intended to orient new graduate students to the Engineering Technology (ET) program and faculty. This includes PhD students and students pursuing a Master's degree through a thesis or directed project option. This does not include students pursuing a Master's degree with coursework only. Research activities within ET and throughout Purdue University are discussed. Student resources and opportunities are reviewed to give the students the tools they need to be successful. In addition, this course provides a way to develop a natural cohort of graduate students. This course is a graduate seminar course focused on the ET program. Graduate status or upper-division undergraduate. Permission of department required.

Learning Outcomes: 1. Summarize research interests of ET graduate faculty. 2. Interpret Purdue University research activities and resources and apply this knowledge to their particular research plan. 3. Generate MS or PhD preliminary documents based on ET specific requirements. 4. Implement effective use of library resources and ability to write scholarly information in accepted format styles. Credits: 0.00 or 1.00

ENGT 50200 - Developmental Testing And Innovation Seminar

Credit Hours: 0.50 or 1.00. The course introduces Engineering Technology and the requirements to fulfill the master's and/or Ph.D. Technology degrees. The seminar can include graduate faculty from the SoET, the NAVY, and other Engineering and Technology related disciplines from the Purdue Polytechnic, College of Engineering, and other STEM-related disciplines across campus.

Learning Outcomes: 1. Interpret Purdue University and Navy research activities and resources applying the knowledge to their particular research plan. 2. Generate M.S. or Ph.D. preliminary documents based on Engineering Technology or NAVY-specific research requirements. 3. Implement effective intellectual use of Purdue library and Navy resources for the ability to write scholarly information in accepted university and/or Navy format styles. Credits: 0.50 or 1.00

ENGT 50700 - Fundamentals Of Collaborative Leadership And Agile Strategy For Engineering Technology

Credit Hours: 3.00. This course will provide students with a foundation in collaborative leadership and agile strategy. The course brings together theories and insights from a variety of disciplines including engineering, management, psychology, and social science. Increasingly manufacturing management is being called upon to apply their technical skills in collaborative environments that cut across organizational units and inter-organizational boundaries. Understanding how to design and guide collaborations and apply agile approaches for meeting strategic objectives is an important skill set and knowledge base in the 21st-century economy, defined more by open networks than the ridged hierarchies of the past.

Learning Outcomes: 1. Describe characteristics of highly effective leaders in engineering and technology-focused teams and organizations. 2. Apply tools and frameworks for highly effective leadership of engineering and technology-focused teams and organizations. 3. Analyze the potential strengths and potential of various leadership approaches and behaviors in engineering and technologically focused teams and organizations. Credits: 3.00

ENGT 50900 - Applied Computational Methods

Credit Hours: 1.00 to 3.00. This class covers the mathematics

typically needed for research in engineering technology and is especially suited to the needs of ENGT student. The class includes basic calculus, introductory numerical methods, implemented in MATLAB, and elementary linear algebra. It uses relevant, practical problems to teach concepts and provides the students with actionable information. The starting point is graphical and numerical solutions of systems of non-linear algebraic equations. The class progresses to simple ordinary differential equations. Prerequisite: Six credits of undergraduate classes in technical mathematics, focusing on calculus.

Learning Outcomes: 1. Working understanding of algebra. 2. Solve systems of linear and nonlinear equations. 3. Calculate eigenvalues. 4. Working understanding of basic calculus. 5. Find derivatives and integrals of basic functions analytically. 6. Show graphical representations of integrals and derivatives. 7. Working knowledge of basic numerical methods. 8. Approximate derivatives using finite differences. 9. Find roots of nonlinear equations. 10. Implement a numerical algorithm using MATLAB. 11. Working knowledge of simple differential equations. 12. Solve an ordinary differential equation (ODE) using finite differences. 13. Solve an ODE numerically in MATLAB. Credits: 1.00 to 3.00

ENGT 51000 - Internet Of Things And Cybersecurity For Engineering And Technology

Credit Hours: 3.00. The internet has brought about the ability to embed computing into everyday devices to allow them to send and receive information. These devices, known as the Internet of Things (IoT), will require management at all levels to understand the inherent security risks due to the interconnection via the internet. Illegally accessing (hacking) IoT is increasingly becoming the most pervasive form of industrial espionage in use today. Understanding the threats aimed at IoT and how to protect IoT will be the key to keeping sensitive corporate information and secrets secure and private, and will require everyone's participation, not just the IT department. For this course students will learn the basics of research of and into cybersecurity, and the techniques used to commit industrial related crimes; how to detect these potentially catastrophic crimes; and the means to protect one of the company's most important assets...its systems and data.

Learning Outcomes: 1. Analyze security regulations relevant to their industry. 2. Apply a cybersecurity framework based upon industry regulations. 3. Analyze privacy issues with Internet of Things. 4. Analyze the difference between threats, vulnerabilities and risks as it relates to Internet of Things. 5. Apply techniques to mitigate risk to Internet of Things. 6. Evaluate the inherent benefits of using IoT, potential risks to IoT, and how to use a cybersecurity framework to help mitigate risk to IoT. Credits: 3.00

ENGT 54000 - Change Management For Enterprise Sustainability

Credit Hours: 3.00. Change management is at the core of an engineering organization's processes and data, and it affects every member of the enterprise. Change management provides a method for identifying, analyzing, preparing, implementing, validating, and documenting engineering changes throughout a product's lifecycle, to ensure everyone in the organization is working from the same product record and changes are communicated in real-time. In this course, the core elements, data structures, stakeholders, and workflows of change management and their role as enablers of the digital thread and the digital enterprise are discussed. The application of the industry standard CM2 methodology is emphasized as a strategy to provide control, maintain data integrity, and improve visibility and traceability of changes.

Learning Outcomes: 1. Summarize the challenges that engineering and manufacturing organizations face when managing quality, options, and variants throughout a product lifecycle. 2. Construct and justify a product hierarchy and its associated datasets. 3. Estimate the magnitude of corrective action for a given change and compare it to the application of conformance measurements. 4. Assess the impact of an engineering change. 5. Evaluate and interpret the CM2 model, an industry-standard closed-loop change management process. 6. Differentiate and prepare the main change objects for authorizing and managing work. 7. Summarize the challenges and complexities of lifecycle sustainment and assess how they differ from those in product development. 8. Prepare a detailed change implementation plan. Credits: 3.00

ENGT 54200 - Cyber-Animal Systems I:

Technology-Enhanced Animal Welfare

Credit Hours: 3.00. Cyber-Animal Systems is an interdisciplinary course involving hardware science, software science, and animal science students, who will study the interaction of animals and computer-controlled systems. The course addresses recent advances in robotics, data science, and animal husbandry that combine to create collaborative robots, wearable devices, and biological and environmental sensing systems that improve the practice of precision animal agriculture. Topics include case studies of technology adoption in animal agriculture, impacts of animal welfare on farm production and climate, and the importance of animal societies, confounding variables in animal studies, and animal anxiety on the design of experiments for technology integration. All students will learn mentoring techniques for tutoring other students from different disciplines so they develop skills in "lifelong teaching".

Learning Outcomes: 1. Explain the needs of farmers and technologists related to agricultural animal welfare. 2. Create and apply mentoring plans to support peers who are not familiar with your area of expertise. 3. Define animal welfare and apply the procedures of a basic animal welfare assessment. 4. Critically evaluate sensors, processing techniques and systems used to monitor and measure animal welfare and production. 5. Analyze measurement systems for data integrity and availability in a networked environment. 6. Apply design-of-experiments techniques that balance data requirements with the ethics of animal use and animals' needs. 7. Synthesize critiques from reviewing contemporary animal science and IoT literature. Credits: 3.00

ENGT 55000 - Manufacturing System Design For Sustainability

Credit Hours: 3.00. This course prepares manufacturing and information technology leaders to design and analyze manufacturing processes to achieve manufacturing system objectives that meet internal and external customers quality, cost and delivery requirements within a safe environment. The course project covers major aspects of manufacturing system design and Industry 4.0 in the context of meeting customer needs. Technology leaders and entrepreneurs learn how to work with others to develop the design of manufacturing systems that are sustainable (business, ecological, social, technological) for the long term. When to use lean and six-sigma techniques in the context of the manufacturing enterprise system design to meet customer needs will be assessed from a system design perspective, through analytical and computer simulation techniques, and through the use of physical modeling tools.

Learning Outcomes: 1. Relate why and how the design of manufacturing processes/equipment that support manufacturing system requirements enables lower cost, high quality, on-time delivery, volume and mix flexibility, sustainability, and continuous improvement. 2. Determine why our tone affects the ability to make systems improvements; realize that the origin of at least 90 percent of all issues is due to the system design and implementation and not the people. 3. Apply a structured approach and language to identify, describe, and relate system design thinking to implementation structure and work - i.e. Lean is an outcome of effective system design. 4. Align performance measures to reinforce manufacturing system design requirements with the knowledge that total cost results from the system design. 5. Design a manufacturing system and the included manufacturing processes to establish product flow, part families and takt time -- time per unit (average pace of customer demand). 6. Create a controllable, robust system design, i.e., a manufacturing system that meets customer quality and delivery expectations in spite of disruptions. 7. Reduce the 5 Delays that increase manufacturing lead time by using manufacturing system design. 8. Apply methods to evaluate and develop Manufacturing Systems, including the Manufacturing System Design Decomposition (MSDD), Capability Maturity Model Integration (CMMI), Six Sigma (DMAIC) Process. 9. Describe why Tone, Plan Do Check Act (PDCA), Standard Work, Takt Time and a Robust / Controllable System Design are necessary for continuous improvement and sustainability. 10. Develop an organizational structure to sustain and improve the manufacturing system. Credits: 3.00

ENGT 56100 - Metrology Concepts And Applications

Credit Hours: 3.00. Metrology is a fundamental concept required for obtaining scientific data and understanding instrumentation. This course introduces the concepts of metrology associated with measurement systems: sensors, signal conditioning, data acquisition and analysis, as well as the error propagation. System and environmental noise are investigated along with methods to mitigate influences of noise. Standards and calibration of instrumentation are also studied. Concepts of metrology for the seven basic units of measurements are described from the macro to nano-scale.

Learning Outcomes: 1. Classify instrumentation necessary to make measurements of interest. 2. Summarize standards and calibration associated with measurements. 3. Implement various methods of reducing system and environmental noise. 4. Calculate errors budgets and adjust instrumentation to meet error budgets. 5. Identify ethical and international aspects of measurement science.

Credits: 3.00

ENGT 57100 - Applied Nanotechnology

Credit Hours: 3.00. The emerging field of nanotechnology introduces new challenges and opportunities in a variety of career fields. This course introduces students to the concepts of nanotechnology including electronics/mechanics, materials, tools and applications. The experience allows students to move beyond the boundaries of standard application of mechanical and electrical systems into the next generation or dimension of their chosen fields. The course incorporates experiential instruction to reinforce the concepts learned in the lecture. Permission of department required.

Learning Outcomes: 1. Summarize the basic concepts behind nanotechnology. 2. Design nanoelectronic devices. 3. Characterize materials at the nano regime. 4. Extrapolate nanoelectronic applications. 5. Identify ethical and international aspects of nanotechnology.

Credits: 3.00

ENGT 58100 - Workshop In Engineering Technology

Credit Hours: 1.00 to 21.00. This course number is used to pilot and develop new graduate level courses. Each 58100 course number is followed by either a unique alphabetic suffix (e.g., ABC) or numeric suffix (e.g., 123) and is given a unique title and course description. These courses can be included in a graduate plan of study with the usual condition that they must be approved by the student's graduate committee. Accordingly, it is important to discuss these courses with your faculty advisor and committee prior to registration. Permission of instructor required.

Learning Outcomes: 1. Vary by course offering.

Credits: 1.00 to 21.00

ENGT 58300 - Applied Engineering Statistics For Industry

Credit Hours: 3.00. The purpose of this course is to teach the practitioner how to use and make better-informed decisions as a manager for making optimum process, business, or personnel decisions. Emphasis will be placed on Verification, Validation in R&D, Manufacturing, QA/QC, basic probability, Summarizing Data, Basic Tools (flowcharts, fishbone diagrams, Pareto charts), Process Capability - Cp/Cpk. Upper and lower control limits/charts, Use of Control Charts for Continual Improvement, Six Sigma, Design of Experiments, Taguchi Methodology and Data Analytics will also be covered.

Learning Outcomes: 1. Demonstrate the importance of the Central Limit Theorem and its application. 2. Evaluate the capability of a process using the process capability index (CPI). 3. Analyze variation reduction in relation to process capability and design of experiments. 4. Articulate how single-piece flow, standard work, and continuous improvement processes enable variation reduction. 5. Determine the expected number of defects from a given process. 6. Explain the statistical meaning of Six Sigma. 7. Differentiate between Type I and Type II errors. 8. Calculate the sample size based on specified Type I and Type II Error. 9. Calculate a confidence interval. 10. Define direct run rate I first time through and its calculation. 11. Develop a hypothesis test. 12. Calculate regression and correlation of data and distinguish between correlation and causation. 13. Select and evaluate the test statistic for different kinds of hypothesis tests and make statistical inference decisions. 14. Construct and evaluate an ANOVA table and make statistical inference decisions. 15. Differentiate among different types of experimental designs and design an experiment. 16. Demonstrate the Taguchi quality loss function and how to make

quality loss calculations. 17. Classify the procedural errors that can occur in experimental design, such as confirmation bias. 18. Explain data mining and Big Data and their role in the future of experimental design. Credits: 3.00

ENGT 59000 - Special Problems In Engineering Technology

Credit Hours: 1.00 to 3.00. The ENGT 59000 course code is intended primarily for students to undertake targeted study or projects to develop depth in an area related to their area of research, where no other comparable course is available at Purdue or conveniently elsewhere. You may take up to 9 credits of ENGT 59000 as part of your Plan of Study. Requests to extend the number of credits must be decided within your graduate committee and documented with the Graduate Chair. Permission of instructor required.

Learning Outcomes: 1. Vary by course offering. Credits: 1.00 to 3.00

ENGT 60500 - Engineering Technology Research Writing Strategies

Credit Hours: 2.00 to 3.00. The stated Master of Science in Engineering Technology graduate course teaches research literature mining and analysis found in Purdue licensed databases. Focuses on detail, a measurable topic, literature review, reporting, citation, data visualization using APA. Requires research paper writing aligned with ARWE specifications for in-depth research preparation and reporting. Students will research a topic relevant to a workplace problem in their industry. For example, a new technology, a process (Giga Casting for example), a material, supply chain, digitization, industry 4/5.0, sustainability, workforce diversity, aging workforce, ethics in the workplace, offshoring vs. onshoring, direct part marking, inventory/project management, cybersecurity risks, facility management, energy management, patents/intellectual property or environmental compliance. Keep in mind, Before You Start, that whichever topic you choose, the problem must be measurable. Measurable either from a quantitative or qualitative statistic perspective. Your topic will have to be tied to a global grand engineering challenge we face as a society and/or industry.

Learning Outcomes: 1. Evaluate the data you collected by completing the Workplace Information Literacy Strategies (WILS) activity to determine your research topic. 2. Analyze research topic/focus gained from the WILS, correlate a measurable research problem statement, and relate it to one of the 14 global, grand engineering challenges. 3. Create an Introduction to the problem statement. 4. Synthesize collected data by writing a review of the literature which supports the research problem topic. 5. Evaluate different research measures for the problem, choosing one to assess the problem. 6. Analyze the research measure(s) by using ChatGPT to help determine optimum research measure to write up. 7. Create a research methodology by writing a detailed script on how you intend to measure the research problem. 8. Submit expected deliverables in a timely manner after evaluating your final analysis report, synthesizing the introduction, research problem statement, review of literature, and research measure. 9. Present a compelling oration of your research topic and significance as to why the topic should be pursued or funded. The creation of a three-minute video debriefing is not an exercise in "watering down" research but forcing you to consolidate your ideas and concisely explain your research discoveries for senior leadership approval and funding. 10. Complete written assignments using APA format and NO passive wording or adverbs. Adhere to the MET 527 Academic Research Writing Expectations (ARWE) handout document. Failure to not read and follow the ARWE document will prove to be an unsuccessful assignment/course experience. 11. Perform individually AND not fall into the plagiarism trap. Credits: 2.00 to 3.00

English

ENGL 10400 - English Composition I

Credit Hours: 3.00. Emphasis on the organization of the expository theme. Directed writings of themes based on personal experience, on the relationship between experience and language, and on the relationship between experience and ideas.

Credits: 3.00

ENGL 10500 - English Composition II

Credit Hours: 3.00. The second half of the basic composition sequence. Extensive practice in writing clear and effective prose. Instruction in logic, structure, and style.

Credits: 3.00

ENGL 10600 - First Year Composition With Conferences (UCC: IL/WC)

Credit Hours: 4.00. This 4-credit hour composition course includes student-teacher conferences. Students in this course produce between 7,500-11,500 words of polished writing (or 15,000-22,000 total words, including drafts or the equivalent). Within the course, students will learn to write with a rhetorical awareness of diverse audiences, situations, and contexts; critically think about writing and rhetoric through reading, analysis, and reflection; provide constructive feedback and incorporate feedback into their own writing; perform research and evaluate sources to support claims; and engage multiple digital technologies for different purposes.

University Core Curriculum (UCC): (UCC: IL/WC) Learning Outcomes: 1. Demonstrate rhetorical awareness of diverse audiences, situations, and contexts. 2. Compose a variety of texts in a range of forms, equaling at least 7,500-11,500 words of polished writing (or 15,000-22,000 words, including drafts). 3. Critically think about writing and rhetoric through reading, analysis, and reflection. 4. Provide constructive feedback to others and incorporate feedback into their writing. 5. Perform research and evaluate sources to support claims. 6. Engage multiple digital technologies to compose for different purposes. Credits: 4.00

ENGL 10800 - First Year Composition (UCC: IL/WC)

Credit Hours: 3.00. In this 3-credit hour composition course students should expect an emphasis on self-guided work. Students in this course produce between 7,500-11,500 words of polished writing (or 15,000-22,000 total words, including drafts or the equivalent). Within the course, students will learn to write with a rhetorical awareness of diverse audiences, situations, and contexts; critically think about writing and rhetoric through reading, analysis, and reflection; provide constructive feedback and incorporate feedback into their own writing; perform research and evaluate sources to support claims; and engage multiple digital technologies for different purposes.

University Core Curriculum (UCC): (UCC: IL/WC) Learning Outcomes: 1. Demonstrate rhetorical awareness of diverse audiences, situations, and contexts. 2. Compose a variety of texts in a range of forms, equaling at least 7,500-11,500 words of polished writing (or 15,000-22,000 words, including drafts). 3. Critically think about writing and rhetoric through reading, analysis, and reflection. 4. Provide constructive feedback to others and incorporate feedback into their writing. 5. Perform research and evaluate sources to support claims. 6. Engage multiple digital technologies to compose for different purposes. Credits: 3.00

ENGL 19500 - Introducing English

Credit Hours: 1.00. This introductory seminar familiarizes students with the different majors in English as well as potential career opportunities, introduces them to departmental and College of Liberal Arts resources, and promotes community through participation in English Department activities. These include visits to the Writing Lab (English) and the Career Center (CLA); common read book discussions; & more.

Learning Outcomes: 1. Define the different majors and concentrations within English. 2. Identify important resources in the English Department and College of Liberal Arts. 3. Articulate key concepts related to the Department's annual common read. 4. Produce well-reasoned written essays about assigned the reading and activities. Credits: 1.00

ENGL 20102 - Introduction To Digital Humanities

Credit Hours: 3.00. This is an interdisciplinary foundational course that combines theory and practice to teach students in and about digitally mediated culture. Accordingly, this course fosters a critical understanding of the digital and its implication for the development of a technologically driven society. Students will be introduced to digital inquiry and critical practice and explore the ways that the digital transforms knowledge acquisition and production across the humanities, social sciences and sciences. Students will engage in readings and activities that help them form substantive perspectives on the digital formulations and practice through digital technologies and tools. Students will also experiment with digital methods and tools by building a digital project. This course places an emphasis on engaged learning through online and in-class discussion, digital activities, and collaborative work.

Learning Outcomes: 1. Identify various concepts and methods in digital humanities. 2. Apply a variety of methods and tools to conduct digital humanities research. 3. Research the transformative potential of digital methods through critical inquiry. 4. Create a process for developing and completing a digital project.

Credits: 3.00

ENGL 20200 - Engaging English (UCC: HUM)

Credit Hours: 3.00. This theme-based course introduces students to the field of English, and provides foundational liberal arts skills. It teaches, for instance, critical and creative thinking, reading, and writing using a variety of genres, texts, and media.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Explain the methods, objects of study, and applications of English Studies. 2. Apply multiple critical approaches to define cultural complexities. 3. Apply knowledge of written and visual literacies for working with diverse media. 4. Explain and apply different methods of reading. 5. Explain and apply foundational skills of English Studies, such as close reading, written persuasion and argument through evidence. Credits: 3.00

ENGL 20300 - Introduction To Research For Professional Writers

Credit Hours: 3.00. Introduction to research sources and methods useful for professional writers, including electronic resources. Focus on collecting print and online information, interviewing, surveying, and conducting observations; and on evaluating, summarizing, analyzing, and reporting research.

Credits: 3.00

ENGL 20400 - Special Topics In Writing

Credit Hours: 3.00. A course in writing, with the special topic selected by the instructor.

Credits: 3.00

ENGL 20500 - Introduction To Creative Writing

Credit Hours: 3.00. Practice in writing short prose narratives and poetry for students who have finished composition and wish to develop their skills further. Workshop criticism. CTL:IEL 1230 Introduction To Creative Writing

Learning Outcomes: 1. Compose original poetry. 2. Compose original fiction. 3. Analyze and critique peer work by using the vocabulary of craft.. Credits: 3.00

ENGL 20700 - Introduction To Rhetoric & Argument

Credit Hours: 3.00. Introduces the art, science, and practical applications of rhetoric through ancient, contemporary, and transcultural concepts. Helps students gain a grounded understanding of rhetoric and its application in everyday life and professional contexts. This course will feature the application of persuasion in diverse fields and for diverse purposes. Students will learn to apply rhetorical principles to written, visual, and multimodal forms.

Learning Outcomes: 1. Articulate a comprehensive understanding of the evolution of rhetoric, from ancient to contemporary theorists. 2. Summarize the role of proofs in human communication and evaluate how rhetorical strategies can be used in persuasive messaging. 3. Develop and apply skills in identifying, analyzing, and employing rhetorical frameworks to enhance persuasive communication strategies. 4. Select rhetorical strategies appropriate for written, visual, and multimodal forms. Credits: 3.00

ENGL 21500 - Inventing Languages

Credit Hours: 3.00. "Invented languages" include linguistic systems created for fictional worlds, such as Dothraki (Game of Thrones), Na'vi (Avatar), Elvish (Lord of the Rings) and Klingon (Star Trek), as well as languages invented for international communication by real speakers, such as Esperanto. In this course, you will study these systems, learn the major properties of natural human languages, and construct your own rudimentary languages.

Learning Outcomes: 1. Understand the characteristics and goals of various invented languages from linguistic, cultural, and historical perspectives. 2. Show mastery of basic concepts of language structure and language typology. 3. Elucidate mastery of basic concepts of sociolinguistics, historical linguistics, and linguistic anthropology. 4. Explain how natural languages has influenced the development of invented languages. 5. Construct a rudimentary language system and create a back story, dictionary, grammar, and sample text. Credits: 3.00

ENGL 21700 - Figures Of Myth And Legend I: Monsters (UCC: HUM)

Credit Hours: 3.00. This course traces specific monster case studies across a variety of genres and media from the ancient to the modern period. It explores the way monsters define and police the boundaries of what it means to be human, and provide a common language for crystallizing specific social, ethnic, and national practices.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Explain the relationship

between monsters and nationalism/national identity. 2. Explain disability theory and the cultural coding of unusual bodies. 3. Produce written, verbal, and visual communication that demonstrates critical thinking, creative problem solving, empathy, and visual literacy. 4. Apply historical and global awareness. Credits: 3.00

ENGL 21800 - Figures Of Myth And Legends II: Heroes And Villains (UCC: HUM)

Credit Hours: 3.00. This class offers in-depth explorations of the larger-than-life leaders (on the side of good, and sometimes evil, too) who have become models for how we think of heroism, charisma, and what it means to seek and wield power over others. From the chivalric Knights of the Round Table to the frightening energy of the Viking comitatus bands, it will show that no models of mythic leadership come without their complications--or admirable qualities.

University Core Curriculum (UCC): (UCC: HUM)

Learning Outcomes: 1. Compare legal and cultural ethical codes across different cultures. 2. Define models of leadership to understand different versions of heroism, villainy, manliness, and gender coding of behavior. 3. Demonstrate knowledge of how the past influences present social modes and mores. 4. Argue through textual evidence across a variety of media. Credits: 3.00

ENGL 21900 - Figures Of Myth And Legend III: Magic And Marvels (UCC: HUM)

Credit Hours: 3.00. This course surveys stories of elves, fairies, wizards, witches, etc., and explores the allure of all things marvelous, strange, and magical. It considers how language itself constitutes a kind of magic; examines magic as technology and vice versa, since, as Arthur C. Clarke famously declared: "Any sufficiently advanced technology is indistinguishable from magic"; and seeks to understand how people across history have used stories of magic to reinforce (mystify) or upend (defamiliarize) the status quo.

University Core Curriculum (UCC): (UCC: HUM)

Learning Outcomes: 1. Compare a variety of imaginative texts from Anglophone and other cultures, and be able to analyze them critically. 2. Define how both magic and science are not fixed but rather variable and culturally specific. 3. Demonstrate knowledge of how stories code difference, and either reinforce (mystify) or upend (defamiliarize) the status quo. 4. Argue through textual evidence across a variety of media. Credits: 3.00

ENGL 22002 - Technology And Play

Credit Hours: 3.00. This course introduces students to games, as well as investigating innovations and controversies in the gaming industry. It will explore theories of play, how technological innovations and business practices in both digital and analog gaming (through board games, video games, tabletop games, and esports) mediate or structure the experience of play. It will also survey the rise of myriad gaming subcultures, including celebrity streamers and esports.

Learning Outcomes: 1. Identify important categories of games. 2. Demonstrate critical thinking skills of observation, explanation, and interpretation to assess sociological and cultural trends in the different spaces of gaming. 3. Produce original work using logic, creativity, and interpretive skills examining different games and industry practices. Credits: 3.00

ENGL 22300 - Literature And Technology (UCC: STS)

Credit Hours: 3.00. This class uses literature to explore how technological innovation both enables and constrains creativity. It also explores how technology has been represented in literature, and examines the relationship between literature and new media.

University Core Curriculum (UCC): (UCC: STS)

Learning Outcomes: 1. Define technology and its implications. 2. Employ multiple approaches to critical thinking well-suited to cultural complexities. 3. Demonstrate written, visual, and technological literacies while working with diverse media. 4. Demonstrate creativity through remediation (moving information from one medium to another) and iteration. 5. Explain the relationship between information and digital media production. 6. Explain and employ multiple critical approaches to narrative and storytelling. Credits: 3.00

ENGL 22400 - Literature, Money, And Markets

Credit Hours: 3.00. This course explores the interconnections among markets, business and its management, and literature. It examines representations of traditional markets (industry, finance, and global trade) as well as alternative markets (the market in bodies, the black market, and the digital marketplace

economy). The course will present a wide-ranging survey of canonical texts, orienting the reader as to how classics from Chaucer to Dickens are engaged in the business of thinking about business. But it will also engage with alternative viewpoints and contemporary concerns about business practices, literature, and individual consciousness in the techno-digital age.

Learning Outcomes: 1. Define "market". 2. Apply historical knowledge to explain current business systems. 3. Explain literature's power to inform economic practices. 4. Apply traditional and visual literacy to produce market analysis. Credits: 3.00

ENGL 22500 - Literature, Inequality, And Injustice (UCC: HUM)

Credit Hours: 3.00. This course introduces students to literature addressing inequality and social justice. Questions will include: What is social justice? How do literary works reproduce or resist dominant ideologies? How does literature provide tools to map social and economic formations? What role have literary works played in emancipatory and egalitarian political movements? Readings and comparison of these texts will help examine how literature maintains a variety of communities.

University Core Curriculum (UCC): (UCC: HUM)

Learning Outcomes: 1. State knowledge about diversity and inclusion (including, but not limited to, histories of race, gender, and class). 2. Produce effective written and verbal communication that demonstrates critical thinking, creative problem solving, and empathy. 3. Access and analyze information across a range of media. Credits: 3.00

ENGL 22600 - Narrative Medicine (UCC: STS)

Credit Hours: 3.00. "Narrative Medicine" encompasses stories about the interior lives of doctors and medical professionals, the complexities of medicine past and present, and health-care for patients and their families. Ultimately, this course emphasizes the essential role of rhetoric and storytelling in the face of medical crisis and uses stories about illness and disability to explore the human condition.

University Core Curriculum (UCC): (UCC: STS)

Learning Outcomes: 1. Explain medicine from a humanistic perspective. 2. Explain contemporary health issues. 3. Define storytelling as an intellectual and empathic discourse. 4. Analyze fictional and factual narratives (stories). Credits: 3.00

ENGL 22700 - Elements Of Linguistics (UCC: BSS)

Credit Hours: 3.00. A summary of what is known about human language, its structure, its universality, and its diversity; language in its social setting; language in relation to other aspects of human inquiry and knowledge. CTL:IEL 1260 Introduction To Linguistics

University Core Curriculum (UCC): (UCC: BSS)

Credits: 3.00

ENGL 22800 - Language And Social Identity

Credit Hours: 3.00. This course introduces linguistic diversity, including regional, cultural, and stylistic variation within a single language, code-switching in bilingual communities, and colonial, immigrant, Creole, indigenous, and sign languages. It also explores the role of language in supporting various types of social identity (e.g., age, gender, social class, race, ethnicity) as well as power structures that enable discrimination against less powerful groups.

Learning Outcomes: 1. Distinguish empirically-grounded facts about linguistic diversity and language use from popular attitudes and opinions that are not based in facts. 2. Recognize the legitimacy and systematic structure of all language varieties. 3. Describe the phonetic, lexical, grammatical, and pragmatic features as found in the language of different groups, through close analysis of primary linguistic data. 4. Show how individuals use linguistic features to help construct their social identities, through the close examination of case studies. 5. Recognize forms of linguistic discrimination as depicted in the popular media and as enacted in the education system, the workplace, the judicial system, and daily life. Credits: 3.00

ENGL 22900 - Creole Languages And Cultures

Credit Hours: 3.00. This course introduces the concept of pidgin and creole languages across the world, with a focus on English-based pidgins and creoles. It addresses their geographical distribution and some of their cultural manifestations such as music, food and literature on both sides of the Atlantic. The course presents a general view of the historical events that led to the formation of creole languages and to the development of the African diaspora. We will consider different varieties of creole languages and (their) cultures including English-based creoles in West Africa such as Kru (Liberia and Sierra Leone), Nigerian Pidgin and Cameroonian Pidgin; in the Caribbean such as Jamaican, San

Andreas, Nicaraguan and Limonense, contrasting them with the Spanish-based creole Palenquero; and the three most predominant creoles in the U.S. Louisiana Creole, Gullah and Hawaii Creole, to understand their characteristics and their history. We will explore the ways in which the languages manifest in the music and literature of the contexts where they are spoken. Finally, we will consider the African diaspora as a fundamental thread that ties (English-based) creole languages and peoples together. In exploring these issues, the course will draw on a variety of theoretical concepts and traditions from sociolinguistics, creole studies and African American studies.

Learning Outcomes: 1. Identify the cultural and linguistic legitimacy and importance of creole languages in the world. 2. Describe general historical events that led to the development and origin of creole languages. 3. Distinguish general cultural and grammatical features in creole languages that differ from non-creole languages. 4. Show how individuals use creole languages in literature and music. 5. Identify attitudes towards creole languages, the language's relationship to the African diaspora, and its relationship to linguistic diversity in North America. Credits: 3.00

ENGL 23000 - Great Narrative Works (UCC: HUM)

Credit Hours: 3.00. Reading and discussion of great narratives from Homer's Odyssey to the present, considering works from a variety of cultures and time periods in order to develop an understanding of their ideas, structures, styles, and cultural values.

University Core Curriculum (UCC): (UCC: HUM)

Credits: 3.00

ENGL 23100 - Introduction To Literature

Credit Hours: 3.00. Reading and discussion of great works of various types to develop an understanding of their ideas, structures, and styles. Includes poetry, drama, biography, essay, and prose fiction. CTL:IEL 1270 Appreciation Of Literature

Credits: 3.00

ENGL 23200 - Thematic Studies In Literature

Credit Hours: 3.00. Examination of a particular theme, such as the hero, death, or the city, and the techniques by which it is treated in various literary works, usually in more than one genre. Current offerings available from counselors.

Credits: 3.00

ENGL 23400 - Literature And The Environment (UCC: STS)

Credit Hours: 3.00. Literary study of nature writing; writing from the natural sciences; and canonical poetry, fiction, and essays through an ecological lens. Introduces students to ecocritical thought and environmental literary history.

University Core Curriculum (UCC): (UCC: STS)

Learning Outcomes: 1. Demonstrate knowledge of a range of genres, topics, and discursive conventions of literature about the environment. 2. Discuss those genres, topics, and conventions in relation to their diverse historical, cultural, and aesthetic contexts. 3. Produce well-reasoned written arguments about the literature they study based on appropriate use of textual evidence. Credits: 3.00

ENGL 23700 - Introduction To Poetry (UCC: HUM)

Credit Hours: 3.00. Reading and discussion of poetry from different periods aimed at enhancing the student's understanding of genre, form, and style; how poetry grows out of and speaks to its historical moment; and how poetry addresses pressing social issues.

University Core Curriculum (UCC): (UCC: HUM)

Learning Outcomes: 1. Demonstrate introductory knowledge of a range of genres, topics, and literary conventions of poetry. 2. Discuss those genres, topics, and conventions in relation to their diverse historical, cultural, and aesthetic contexts. 3. Produce well-reasoned written arguments about the literature they study based on appropriate use of textual evidence. Credits: 3.00

ENGL 23800 - Introduction To Fiction (UCC: HUM)

Credit Hours: 3.00. Reading and discussion of fiction from different periods aimed at enhancing the student's understanding of genre, form, and style; how fiction grows out of and speaks to its historical moment; and how fiction addresses pressing social issues.

University Core Curriculum (UCC): (UCC: HUM)

Learning Outcomes: 1. Demonstrate introductory knowledge of a range of genres, topics, and literary conventions of fiction. 2. Discuss those genres, topics, and conventions in relation to their diverse historical, cultural, and aesthetic contexts. 3. Produce well-reasoned written arguments about the literature

they study based on appropriate use of textual evidence. Credits: 3.00

ENGL 24000 - British Literature Before 1789 (UCC: HUM)

Credit Hours: 3.00. A historically oriented survey of genres, authors, and texts from the medieval to the Romantic period.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Demonstrate knowledge of a range of genres, topics, and literary conventions from the pre-Romantic period. 2. Discuss those genres, topics, and conventions in relation to their diverse historical, cultural, and aesthetic contexts. 3. Produce well-reasoned written arguments about pre-Romantic literature based on appropriate use of textual evidence. Credits: 3.00

ENGL 24100 - British Literature After 1789 (UCC: HUM)

Credit Hours: 3.00. A historically oriented survey of genres, authors, and texts from the Romantic period on.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Demonstrate knowledge of a range of genres, topics, and literary conventions from the Romantic period on. 2. Discuss those genres, topics, and conventions in relation to their diverse historical, cultural, and aesthetic contexts. 3. Produce well-reasoned written arguments about literature from the Romantic period to the present based on appropriate use of textual evidence. Credits: 3.00

ENGL 24900 - Great British Books

Credit Hours: 3.00. Why are British books so compelling? This course examines the dynamic history of British literature and explores how canonical and contemporary texts shaped the cultural landscape of Britain, the British Empire, and the world.

Learning Outcomes: 1. Identify and make convincing arguments about major genres of British literature, including essays, journals, autobiographies, poetry, drama, and fiction. 2. Identify the diversity of peoples, interests, and ideologies within British literature and culture, and the texts that define them. 3. Define and analyze how literary texts both reflect and produce culture. 4. Produce successful academic writing, including a debatable thesis, and appropriately presented evidence. Credits: 3.00

ENGL 25000 - Great American Books (UCC: HUM)

Credit Hours: 3.00. What makes great American books so compelling? This course examines the dynamic history of American literature and explores how canonical and contemporary books have shaped the cultural landscape of the U.S. and the world.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Demonstrate knowledge of a range of genres, topics, and literary conventions related to great American books. 2. Discuss those genres, topics, and conventions in relation to their diverse historical, cultural, and aesthetic contexts. 3. Produce well-reasoned written arguments about American books based on appropriate use of textual evidence. Credits: 3.00

ENGL 25700 - Literature Of Black America

Credit Hours: 3.00. A survey of literature written by black American authors. Close attention is paid to the history of black literature and to the historical context in which it was written, as well as to the texts of major works by black writers.

Credits: 3.00

ENGL 26200 - Greek And Roman Classics In Translation

Credit Hours: 3.00. Study of important works of Greek and Roman literature, their intrinsic literary values, and their influence on later European and American writing and thinking.

Credits: 3.00

ENGL 26400 - The Bible As Literature (UCC: HUM)

Credit Hours: 3.00. A literary study of selections from the Old and New Testaments as examples of Hebrew and early Christian literature.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Explain the methods, objects of study, and applications of literary studies and the liberal arts, especially related to the Bible. 2. Employ critical approaches from basic building blocks to more advanced ones suited to cultural complexities. 3. Explain and employ different genres of reading, including

argument through evidence and close reading. 4. Demonstrate written and visual literacies by analyzing diverse media. 5. Demonstrate knowledge of and proficiency in different types of writing, including argument through evidence and written persuasion. 6. Demonstrate content knowledge of specific Biblical books and their genres. Credits: 3.00

ENGL 26600 - World Literature: From The Beginnings To 1700 A.D. (UCC: HUM)

Credit Hours: 3.00. (CMPL 26600) World literature in translation. A comparative and chronological survey of the masterpieces of Eastern and Western literature. CCN: IEL 1250 World Literature 1

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Demonstrate knowledge of a range of genres, topics, and literary conventions characteristic of world literatures. 2. Discuss those genres, topics, and conventions in relation to their diverse historical, cultural, and aesthetic contexts. 3. Produce well-reasoned written arguments about the literature they study based on appropriate use of textual evidence. Credits: 3.00

ENGL 26700 - World Literature: From 1700 A.D. To The Present (UCC: HUM)

Credit Hours: 3.00. (CMPL 26700) World literature in translation. A comparative and chronological survey of the masterpieces of Eastern and Western literature. Typically offered Summer Fall Spring. CCN: IEL 1251 World Literature 2

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Demonstrate knowledge of a range of genres, topics, and literary conventions characteristic of world literatures. 2. Discuss those genres, topics, and conventions in relation to their diverse historical, cultural, and aesthetic contexts. 3. Produce well-reasoned written arguments about the literature they study based on appropriate use of textual evidence. Credits: 3.00

ENGL 27600 - Shakespeare On Film (UCC: HUM)

Credit Hours: 3.00. Considers the relation of the written text of five or six Shakespeare plays to multiple film versions from a wide variety of times and cultures, e.g., the United States, England, France, Italy, Japan, Denmark, India, and Russia. Typically offered Fall Spring Summer.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Explore a selected set of Shakespeare's plays through a comparative analytical lens. 2. Compare and contrast various film versions of Shakespeare's plays in their respective contexts. 3. Respond to the films and written texts through reflective and critical writings and discussions. Credits: 3.00

ENGL 27900 - The American Short Story In Print And Film

Credit Hours: 3.00. Analysis of American short stories of the nineteenth and twentieth centuries, their filmed versions, their printed scenarios, and critical writings about the tales and their adaptations.

Credits: 3.00

ENGL 28000 - Games, Narrative, Culture

Credit Hours: 3.00. This is an introduction to the field of game studies, and to games as narrative and cultural media. We will look at the stories games tell; the way their narrative elements or plot devices intersect with the culture around the games and gaming itself; and how all these things come together to affect game design, meaning, and play.

Learning Outcomes: 1. Demonstrate knowledge of key concepts in both game studies and narrative theory in order to critique a game's systems and narrative elements. 2. Articulate how a game's narrative and the industry's workplace practices are situated in specific historical and cultural contexts. 3. Demonstrate critical thinking skills suited to cultural and historical complexities. 4. Articulate concise, coherent arguments about the effects of writing, narrative, and workplace practices and policies on the video game industry and a game's audience. Credits: 3.00

ENGL 28600 - The Movies (UCC: HUM)

Credit Hours: 3.00. Introduction to the movies from classic to contemporary films. Typically offered Fall Spring.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Demonstrate knowledge of a range of topics and conventions related to classic and contemporary films. 2. Discuss those topics and conventions in relation to their diverse historical, cultural, and aesthetic

contexts. 3. Produce well-reasoned written arguments about classic and contemporary films based on appropriate use of evidence. Credits: 3.00

ENGL 30100 - Ways Of Reading

Credit Hours: 3.00. Introduction to literary theory and practice. Close reading of and significant writing about selected literary texts informed by a variety of critical and/or theoretical perspectives.

Learning Outcomes: 1. Identify various theoretical approaches to literature, and then apply them to literary texts. 2. Define important literary terms, genres, and conventions within their historical, cultural, and aesthetic contexts. 3. Produce well-reasoned arguments about literary texts based on appropriately selected, evaluated, and presented textual evidence. Credits: 3.00

ENGL 30400 - Advanced Composition (UCC: IL/WC)

Credit Hours: 3.00. Designed for students who wish additional training in composition beyond the basic requirements. Extensive practice in the writing of mature expository, critical, and argumentative prose. (The course satisfies the Indiana certification requirement of three hours of advanced composition.)

University Core Curriculum (UCC): (UCC: IL/WC) Learning Outcomes: 1. Produce over 8,000 words of polished, rhetorically effective writing, fit for the academy, work, and civic life. 2. Use strategies of close reading and sound research methods for depth of understanding, expansion of knowledge, and honing critical acumen. 3. Apply rhetorical principles and techniques to a variety of writing tasks. 4. Read primary texts on rhetorical history and theory in order to understand them and use them. 5. Expand your knowledge of how persuasion permeates all aspects of life - verbal, visual, and material and increased your ability to discern better and worse forms of influence and argument. Credits: 3.00

ENGL 30600 - Introduction To Professional Writing

Credit Hours: 3.00. Development of skill in analyzing rhetorical situations in the workplace. Practice in planning, writing, evaluating, and revising a variety of documents typical of those used in the arts and industry.

Learning Outcomes: 1. Understand the basic rhetorical theories that underlie professional and technical writing. 2. Explore issues and challenges in professional writing in a variety of professional and technical contexts. 3. Produce critical writing on rhetorical issues in the field. 4. Solve workplace or organizational problems using writing. Credits: 3.00

ENGL 30900 - Digital Design And Production

Credit Hours: 3.00. The development of the ability to write and design documents using electronic publishing technologies. Students will receive instruction in writing, graphics, and publishing software and will write, design, produce, and critique a number of publications.

Learning Outcomes: 1. Understand the foundational principles of document design and gain practical experience with contemporary design tools. 2. Build portfolio pieces that employ a design thinking approach, both in content and execution 3. Apply theories of document design to a variety of different genres directed to different audiences and rhetorical purposes. Credits: 3.00

ENGL 31600 - Craft Of Fiction From A Writer's Perspective

Credit Hours: 3.00. This course focuses on the craft of fiction with some consideration of its underlying principles from a writer's perspective. Topics of study may include works of fiction, statements of aesthetics and craft, and various fictional forms.

Learning Outcomes: 1. Analyze published fiction by applying terms of fiction craft. 2. Identify the effects of fiction forms by articulating their differences and/or similarities. 3. Analyze their own fiction by applying the terms of fiction craft. Credits: 3.00

ENGL 31700 - Craft Of Poetry From A Writer's Perspective

Credit Hours: 3.00. This course focuses on the craft of poetry with some consideration of its underlying principles from a writer's perspective. Topics of study may include works of poetry, statements of aesthetics and craft, and various poetic

forms.

Learning Outcomes: 1. Analyze published poetry by applying terms of poetry craft. 2. Identify the effects of poetry forms by articulating their differences and/or similarities. 3. Analyze their own poetry by applying the terms of poetic craft. Credits: 3.00

ENGL 32001 - Rhetoric, Artificial Intelligence, And Technology

Credit Hours: 3.00. This course examines the relationships between rhetoric and generative artificial intelligence (AI) using classical and contemporary rhetorical theory. While exploring how AI can support writing, students will gain insights into the challenges posed by AI, including issues of ethics, freedom, privacy, and sustainability. Includes application of rhetorical principles to the design and critique of new technologies.

Learning Outcomes: 1. Use knowledge of rhetorical history and contemporary rhetorical theory to evaluate the emergence of generative artificial intelligence (AI). 2. Write and design workplace documents by engaging common elements of AI tools, such as prompts and training data. 3. Integrate AI tools with other writing tools to create persuasive and informative content in diverse media. 4. Develop ethical approaches to using AI in research, persuasion, and critique. Credits: 3.00

ENGL 32101 - Content Strategy & Rhetoric

Credit Hours: 3.00. This course explores common methods for intentionally auditing, developing, and managing content across multiple media. Students will consider how different audiences and purposes shape how content is structured and delivered in varying rhetorical contexts and diverse media. Emphasizes both analytical and technical elements of content strategy.

Learning Outcomes: 1. Create and implement content strategies aligned with organizational goals and tailored to specific audiences, contexts, and purposes. 2. Perform content audits and inventories using common approaches such as lifecycle development and user testing. 3. Articulate how specific needs influence the structure and delivery of content across multiple media. 4. Use tools such as content management systems to engage and inform relevant stakeholders and contributors. Credits: 3.00

ENGL 32200 - Word, Image, Media (UCC: HUM)

Credit Hours: 3.00. This course introduces students to the study of images, their relationship to language, and their functions in media. From decoding advertising messages to analyzing digital journalism, students will learn how images and their viewers make meaning in a variety of media contexts.

University Core Curriculum (UCC): (UCC: HUM)

Learning Outcomes: 1. Analyze images using multiple critical methods. 2. Explain how images and their viewers make meaning. 3. Explain what role images play (or have played) in our cultures. 4. Explain what it means to negotiate so many images in our daily lives. 5. Produce effective written, verbal, and visual communication that demonstrates critical thinking, creative problem solving, empathy, and visual literacy. 6. Access and analyze information. Credits: 3.00

ENGL 32700 - English Language I: History And Development

Credit Hours: 3.00. Introduction to the history of the English language, its sounds, inflections, words, and sentence structures. Cultural and historical events affecting this history, and the interplay between language and literature.

Credits: 3.00

ENGL 32800 - English Language II: Structure And Meaning

Credit Hours: 3.00. The structure of American English and its dialects, with emphasis on syntax and semantics, including parts of speech, sentence structure, and meaning. Implications of recent theory for the teaching of English. Credit will not be given for both ENGL 32800 and LING 32100 .

Credits: 3.00

ENGL 32900 - English Language III: Sound And Form

Credit Hours: 3.00. The structure of American English and its dialects, with emphasis on phonology and morphology. Implications of recent theory to the teaching of English.

Credits: 3.00

ENGL 33000 - Games And Diversity

Credit Hours: 3.00. This course looks critically at diversity in games, game development, and in the larger mainstream games community. Students will analyze and play games that related to women, minorities, members of the LGBTQ community, and/or those who lack access because of disability.

Learning Outcomes: 1. Analyze a game's

narrative based on a specific frame of diversity (i.e. gender, ethnicity, sexuality, and/or disability). 2. Explain how video games relate to contemporary cultural issues. 3. Use evidence-based arguments to defend a position related to video games and diversity. Credits: 3.00

ENGL 33200 - Games And User Experience (UX)

Credit Hours: 3.00. This course connects gamers and their experiences with games by developing ways to harvest gaming experiences for the improvement of games. We aim to prepare you to better understand gaming experiences, use those understandings to improve games in development, and be able to think and write critically about those experiences.

Learning Outcomes: 1. Identify and address the variables affecting usability investigation. 2. Articulate and employ methods for collecting and processing usability/user experience information about games. 3. Practice evidence-based arguments on game development and improvements. Credits: 3.00

ENGL 34100 - Topics In Science, Literature, And Culture

Credit Hours: 3.00. This course focuses on issues in and representation of science and technology in various texts, including literature, film, science, and theory. May be repeated for credit only under a different topic.

Credits: 3.00

ENGL 34200 - Legal Fictions

Credit Hours: 3.00. This course explores legal conflicts through literature. It uses the narratives created by the cat-and-mouse of procedural dramas, emotionally charged trial scenes, and dramatic courtroom struggles, to introduce different schools of jurisprudence, and to critically examine the decisions made by those with social and legal governing power.

Learning Outcomes: 1. Explain the intersections of legal and literary practice. 2. Define different schools or theories of jurisprudence. 3. Explain and analyze legal and cultural complexities. 4. Construct sustained and persuasive arguments based on textual evidence. Credits: 3.00

ENGL 34300 - Labor And Literature

Credit Hours: 3.00. This course introduces its students to the transformative synergy between the labor of literature and labor within literature. In contrast to accepting the marketplace as a societal monolith, the readings illustrate the role of labor in creation. This course will examine labor taken in its broadest sense, from the labor of self-fashioning to the labor of industries; the labor of life and the labor of destruction and the implications of the laboring body from market creation to market collapse. Diverse readings range from traditional literary staples to modern representations of the labor market.

Learning Outcomes: 1. Explain who is allowed to participate in, and who is excluded from financial, economic, and other markets, and why. 2. Explain both individual and institutional roles in the labor market. 3. Define diverse worldviews of what constitutes labor. 4. Write reasoned arguments about labor and its connections to literature. Credits: 3.00

ENGL 34400 - Environmental Ethics, Policy, And Sustainability

Credit Hours: 3.00. Environmental Ethics, Policy and Sustainability is an interdisciplinary course designed to open new pathways into ethical and eco-critical inquiry in the Anthropocene age. The course analyzes disciplinary differences in approaching the ethical, the human, and environmental problems such as sustainability, development, biodiversity, global security, and climate change. Students will explore what it means to be ethical in and through an interrogation of our contemporary conceptions of what it means to be human. These interrogations in turn will prompt us to reconsider human creations such as knowledge, culture, and technology, which will push us to genuinely think how humans as a species situate their creations within the realm of what they call Nature. Students will be introduced to the history of environmental studies in the discipline, to the rise of what is now known as "postcolonial ecocriticism" to theoretical inquiry into modern technology, and to other recent developments in the fields of environmental studies.

Learning Outcomes: 1. Learn, describe, and relate key developments in environmental ethics. 2. Distinguish and translate different perspectives concerning ethical challenges. 3. Comprehend the efficacies of environmental positions, and learn to push the boundaries of different disciplinary approaches to environmental dilemmas. 4. Evaluate the limitations of positions and the complex frameworks surrounding ethical problems in order to offer more imaginative and resilient solutions. Credits: 3.00

ENGL 34500 - Games And World Building

Credit Hours: 3.00. Every game designer and gamer knows that there is more to narrative than just words on a page and more to worldbuilding than images on a screen. This course

looks at the ways that narrative worlds get built-in games. We will begin by looking at the narrative elements in analog games that have been the foundation of many digital games and move on to look at the elements in digital games that come together to form the worlds.

Learning Outcomes: 1. Comprehend theoretical texts about game design and world building and demonstrate this by discussing them in class and with written assignments. 2. Analyze digital and analog games for specific world building techniques and strategies and demonstrate this via class discussion and written assignments. 3. Synthesize what they have learned about world building from theoretical texts and gameplay and demonstrate this by applying it to a final project in which they design their own game worlds. Credits: 3.00

ENGL 35000 - American Literature Before 1865 (UCC: HUM)

Credit Hours: 3.00. A historically oriented survey of genres, authors, and texts from European colonization to the U.S. Civil War. CTL:IEL 1210 American Literature I

University Core Curriculum (UCC): (UCC: HUM)

Learning Outcomes: 1. Demonstrate knowledge of a range of genres, topics, and literary conventions from the pre-Civil War period. 2. Discuss those genres, topics, and conventions in relation to their diverse historical, cultural, and aesthetic contexts. 3. Produce well-reasoned written arguments about pre-Civil War literature based on appropriate use of textual evidence. Credits: 3.00

ENGL 35100 - American Literature After 1865 (UCC: HUM)

Credit Hours: 3.00. A survey of American literature from the Civil War to the present. CTL:IEL 1211 American Literature II

University Core Curriculum (UCC): (UCC: HUM)

Learning Outcomes: 1. Demonstrate knowledge of a range of genres, topics, and literary conventions from the post-Civil War period on. 2. Discuss those genres, topics, and conventions in relation to their diverse historical, cultural, and aesthetic contexts. 3. Produce well-reasoned written arguments about post-Civil War literature based on appropriate use of textual evidence. Credits: 3.00

ENGL 35200 - Native American Literature

Credit Hours: 3.00. Study of literature by Native American authors in a variety of genres-novels, short stories, poetry, autobiography--using literary analysis, as well as historical, legal, and ethnographic materials.

Credits: 3.00

ENGL 35400 - Asian American Literature

Credit Hours: 3.00. Study of Asian American Literature covering issues such as immigration, identity, class, and gender.

Credits: 3.00

ENGL 35800 - Black Drama

Credit Hours: 3.00. A critical analysis and discussion of selected representative works by African American dramatists - from William Wells Brown to the moderns.

Credits: 3.00

ENGL 35900 - Black Women Writers

Credit Hours: 3.00. (AAS 35900) This course introduces students to the rich and varied literary texts produced by black women writers. Literary analysis, along with a consideration of historical, cultural, gender, and racial contexts will be emphasized.

Credits: 3.00

ENGL 36000 - Gender And Literature (UCC: HUM)

Credit Hours: 3.00. An introduction to feminist approaches to the study of literature, including poetry, drama, fiction, and/or autobiography. Examines how gender intersects with race, ethnicity, sexual orientation, and class in shaping authorship, reading, and representation.

University Core Curriculum (UCC): (UCC: HUM)

Credits: 3.00

ENGL 36500 - Literature And Imperialism (UCC: HUM)

Credit Hours: 3.00. A study through cultural and theoretical works of the impact of imperialism on the ruling nations.

University Core Curriculum (UCC): (UCC: HUM)

Learning Outcomes: 1. Formulate significant critical questions about language, gender, sexuality, race, and/or ethnicity and how identity shapes our lives, experiences, institutions, and cultures, particularly in the context of imperialism/colonialism. 2. Develop a foundational knowledge of the historical contexts of and theoretical approaches to literary texts: gain an introductory knowledge of

postcolonial literary theory. 3. Improve close reading and textual analysis skills. 4. Improve critical thinking skills: improve formal writing skills: use textual evidence to support their views, effectively incorporating (and correctly citing) primary and scholarly secondary sources in their writing and class discussion. Credits: 3.00

ENGL 36600 - Postcolonial Literatures

Credit Hours: 3.00. A study of Third World Literature, film, and theory that emerged during and after Western rule.

Learning Outcomes: 1. Develop an appreciation and analytical understanding of non-Western literature and culture from the formerly colonized world. 2. Develop a foundational knowledge of historical contexts, scholarly approaches, and theoretical perspectives to literary text formulate significant critical questions about language, gender, sexuality, race, and/or ethnicity and how identity shapes our lives, experiences, institutions, and cultures, particularly in the context of imperialism / colonialism. 3. Gain a complex understanding of global cultures. 4. Gain an introductory knowledge of postcolonial literary theory. 5. Improve close reading and textual analysis skills. 6. Improve critical thinking skills: improve formal writing skills: use textual evidence to support their views, effectively incorporating (and correctly citing) primary and scholarly secondary sources in their writing and class discussion. Credits: 3.00

ENGL 36700 - Mystery And Detective Fiction (UCC: HUM)

Credit Hours: 3.00. An introduction to the detective genre, examining its origins, its characteristics, and its intersections with empiricism, forensic science, race, class, gender, sex, and empire.

University Core Curriculum (UCC): (UCC: HUM)

Learning Outcomes: 1. Be familiar with the generic conventions of, and theoretical approaches to, the detective genre. 2. Use detective fiction to improve students' historical, cultural, and global awareness. 3. Practice analyzing, interpreting, and synthesizing information within and across texts and other media. 4. Practice successful academic writing, including a debatable thesis, as well as appropriately-selected and presented evidence. Credits: 3.00

ENGL 37300 - Science Fiction And Fantasy (UCC: HUM)

Credit Hours: 3.00. Representative works of science fiction and fantasy examined in relation to both mainstream and popular literature. Emphasis is on technique, theme, and form.

University Core Curriculum (UCC): (UCC: HUM) Credits: 3.00

ENGL 37401 - Studies In British Literary History

Credit Hours: 3.00. This class focuses on one of several important British literary-historical periods, ranging from medieval English to modern British literature. In it, students will examine individual authors and texts while also gaining a wider understanding of their historical context. Students will also engage with a variety of genres and practice numerous critical approaches to literature.

Learning Outcomes: 1. Identify and construct arguments about genres of, and theoretical approaches to, historical literature. 2. Explain the diversity of peoples, interests, and ideologies with specific British literacy-historical periods. 3. Show how literary artifacts are both agents and reflections of culture. 4. Construct written arguments that demonstrate historical, cultural, and global awareness. 5. Produce successful academic writing, including a debatable thesis, and appropriately presented evidence. Credits: 3.00

ENGL 37700 - Modern And Contemporary Poetry

Credit Hours: 3.00. A study of poetry in English from the twentieth century to the present.

Learning Outcomes: 1. Identify the form and analyze the significances of modern and contemporary poems. 2. Discuss modern and contemporary poems in relation to their historical, cultural, and aesthetic contexts. 3. Produce well-reasoned and written arguments about modern and contemporary poems. Credits: 3.00

ENGL 37800 - Studies In American Literary History

Credit Hours: 3.00. This class focuses on one of several important American literary-historical periods: colonial, nineteenth-, or twentieth- and twenty-first-century literature. In it, students examine individual authors and texts while also gaining a wider understanding of their historical context. Students also will engage with a variety of genres and practice numerous critical approaches to literature.

Learning Outcomes: 1. Identify and construct arguments about genres of, and theoretical approaches to, historical literature. 2. Explain the diversity of peoples, interests, and ideologies with specific American literary-historical periods. 3. Show how literary artifacts are both agents and reflections of culture. 4. Construct written arguments that demonstrate historical, cultural, and global awareness. 5. Produce successful academic writing, including a debatable thesis, and appropriately presented evidence. Credits: 3.00

ENGL 37900 - The Short Story

Credit Hours: 3.00. A study of the development and features of the short story genre.

Learning Outcomes: 1. Demonstrate knowledge of a range of topics and literary conventions related to the short story genre. 2. Discuss those topics and conventions in relation to their diverse historical, cultural, and aesthetic contexts. 3. Produce well-reasoned written arguments about short stories based on appropriate use of textual evidence. Credits: 3.00

ENGL 38000 - Issues In Rhetoric And Public Life (UCC: IL/WC)

Credit Hours: 3.00. Study of how language and media create belief and change. Examines ancient and contemporary rhetorical theory as it applies to public discourse, media, and technology.

University Core Curriculum (UCC): (UCC: IL/WC) Learning Outcomes: 1. Demonstrate knowledge of a range rhetorical techniques and practices in the public realm, past and/or present. 2. Discuss those techniques and practices in relation to their diverse historical, cultural, and technological contexts. 3. Produce well-reasoned written arguments about the rhetorical techniques and practices they study using appropriate forms of research and evidence. Credits: 3.00

ENGL 38100 - The British Novel (UCC: HUM)

Credit Hours: 3.00. Survey of British novels ranging from the eighteenth- to the twenty-first centuries.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Demonstrate knowledge of a range of topics and literary conventions related to the British novel. 2. Discuss those topics and conventions in relation to their diverse historical, cultural, and aesthetic contexts. 3. Produce well-reasoned written arguments about British novels based on appropriate use of textual evidence. Credits: 3.00

ENGL 38200 - The American Novel (UCC: HUM)

Credit Hours: 3.00. A survey of American novels ranging from the eighteenth century to the twenty-first-centuries.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Demonstrate knowledge of a range of topics and literary conventions related to the American novel. 2. Discuss those topics and conventions in relation to their diverse historical, cultural, and aesthetic contexts. 3. Produce well-reasoned written arguments about American novels based on appropriate use of textual evidence. Credits: 3.00

ENGL 38600 - History Of Film To 1950

Credit Hours: 3.00. This survey crosses the divide between the silent film era and the "talkies" to explore narrative, experimental, and documentary styles of feature films from the 1890s to 1950.

Learning Outcomes: 1. Demonstrate knowledge of a range of topics and conventions related to film from its origins through the mid-twentieth century. 2. Discuss those topics and conventions in relation to their diverse historical, cultural, and aesthetic contexts. 3. Produce well-reasoned written arguments about pre-1950 films based on appropriate use of

evidence. Credits: 3.00

ENGL 38700 - History Of Film Since 1950

Credit Hours: 3.00. A survey of narrative, experimental, and documentary styles of feature films from the mid-twentieth century to the present.

Learning Outcomes: 1. Demonstrate knowledge of a range of topics and conventions related to films from the mid-twentieth century. 2. Identify and articulate connections among these topics and conventions as they relate to their diverse historical, cultural, and aesthetic contexts. 3. Produce well-reasoned written arguments about post-1950 films based on appropriate use of evidence. Credits: 3.00

ENGL 38900 - Literature For Children (UCC: HUM)

Credit Hours: 3.00. This course surveys eighteenth, nineteenth-century, and early-twentieth-century literature for children, including the so-called "golden age" of children's myth, fairy tales, and fantasy, as well as domestic fiction for girls and adventure books for boys.

University Core Curriculum (UCC): (UCC: HUM)

Learning Outcomes: 1. Know important genres of children's literature as well as their historical, cultural, and aesthetic contexts. 2. Know important theoretic approaches to the study of children's literature as well as debates about the ethics of writing for children. 3. Empathize through considering perspectives on childhood from authors whose life experiences are different from students' own. 4. Write clearly and produce elements of academic writing, including a thesis, as well as appropriately selected, evaluated, and presented textual evidence. Credits: 3.00

ENGL 39000 - Practicum In Tutoring Writing

Credit Hours: 1.00 to 3.00. A practicum to teach undergraduates to teach writing in the one-to-one setting of a writing lab.

Credits: 1.00 to 3.00

ENGL 39100 - Composition For English Teachers

Credit Hours: 3.00. Exploration of the theory, research, and pedagogy of teaching writing at the secondary level. Topics include the development of writing assignments and related activities, the study of writing process models, and the evaluation of student work in a variety of genres.

Learning Outcomes: 1. Design lesson plans for secondary writing instruction. 2. Incorporate writing-process strategies into assignments and activities. 3. Develop prompts for student writing in a variety of genres. 4. Map instructional activities to formal state or national curricular standards. 5. Reflect on differentiating lessons for diverse learners. Credits: 3.00

ENGL 39200 - Young Adult Literature

Credit Hours: 3.00. This course examines the construct of Young Adult Literature as a genre crafted specifically for adolescents. Using both classic and contemporary novels, as well as relevant theoretical and research texts, this course explores how YA literature is defined, what it offers to adolescent readers, and how it is situated in the literary landscape.

Learning Outcomes: 1. Read, respond to, and analyze selected works of Young Adult literature in order to think critically about various concepts and issues connected to the genre. 2. Explore, analyze, and critique the extent to which selected Young Adult literature affects and reflects teenage life. Credits: 3.00

ENGL 39300 - Interdisciplinary Approaches To Environmental And Sustainability Studies

Credit Hours: 3.00. (ANTH 39300) This course is the lynchpin of the undergraduate Certificate in Environmental and Sustainability Studies. It will present a series of case studies, core concepts, and problem questions that integrate the following three academic approaches: 1) Human Dimensions and Environment/Sustainability, 2) Engineering and Environment/Sustainability, and 3) Environmental/Sustainability Sciences.

Learning Outcomes: 1. Identify, describe, and relate the diverse causes (social, cultural, political, ethical, economic, historical, scientific, and engineered) and consequences of pressing environmental and sustainability challenges, such as climate change, resource scarcity, biodiversity, population growth. 2. Distinguish, paraphrase, and translate different disciplinary perspectives on these key environmental and sustainability challenges. 3. Familiarize themselves with the efficacies, and learn to push the boundaries, of different disciplinary

approaches by comparing and contrasting solutions to environmental issues. 4. Combine different disciplinary approaches by synthesizing reorganizing, and reformulating diverse viewpoints. 5. Demonstrate ability to communicate across disciplines on environmental and sustainability problems. Credits: 3.00

ENGL 39600 - Studies In Literature And Language

Credit Hours: 1.00 to 3.00. A course in the study of a special topic directed by an instructor in whose particular field of specialization the content of the course falls.

Learning Outcomes: 1. Students will think critically about course content. 2. Students will read and write reflectively and critically about course content. 3. Students will engage in course discussions, either online or face-to-face, which encourage critical thought and personal engagement. Credits: 1.00 to 3.00

ENGL 39900 - Beyond English

Credit Hours: 3.00. This class is designed for third- and fourth-year English majors. It will help students translate the worth of English and the humanities to the world beyond the university, providing them with tools to articulate their achievements and prepare for their professional and adult lives.

Learning Outcomes: 1. Be familiar with economic, scientific, and humanistic arguments for the value of English and the humanities. 2. Practice speaking clearly, writing persuasively, and collaborating effectively. 3. Enhance career preparation and professionalization. Credits: 3.00

ENGL 40600 - Review Writing

Credit Hours: 3.00. Intensive practice in the writing of book, film, and theatre criticism, as well as reviews of musical programs and art exhibits. Readings in critics to serve as possible models. Audience analysis of newspapers and periodicals that would be potential markets.

Credits: 3.00

ENGL 40700 - Intermediate Poetry Writing

Credit Hours: 3.00. Study and practice of methods of composing poetry, with primary emphasis on the student's own work. Workshop criticism and discussion of published writing.

Learning Outcomes: 1. Write and revise poems by using effective imagery, line breaks, stanzas, compression, and linguistic playfulness; 2. Produce a portfolio of poems by revising according to suggestions received in workshop and in individual conferences with the instructor. 3. Be cognizant of the range of the genre by reading and discussing key works of modern and contemporary poetry. Credits: 3.00

ENGL 40800 - Creative Writing Capstone

Credit Hours: 3.00. This course will focus on the writing and revision of the capstone thesis in Creative Writing, consisting of a substantial portfolio of either fiction or poetry with an introductory essay. Workshop, discussion of published writing, and individual conferences will form the center of the course with readings, lecture, and discussion of various literary topics. Permission of instructor required.

Learning Outcomes: 1. Master specific topic on either poetry or fiction writing by giving a formal in-class presentation. 2. Master either poetry or fiction writing by producing a portfolio of their own creative work. 3. Understand their aesthetic by producing a formal essay which analyzes their creative writing. Credits: 3.00

ENGL 40900 - Intermediate Fiction Writing

Credit Hours: 3.00. Study and practice of methods of composing fiction, with a primary emphasis on the student's own work. Workshop criticism and discussion of published fiction.

Learning Outcomes: 1. Write and revise fiction by using effective character development, plot and scene. 2. Produce a polished fiction by revising according to suggestions received in workshop. 3. Be cognizant of the range of the genre by reading and discussing key works of modern and contemporary fiction. Credits: 3.00

ENGL 41100 - Studies In Major Authors

Credit Hours: 3.00. A study of the literary, critical, or cinematic works of one or two influential authors or directors. A project-based capstone seminar containing a significant research component. May be repeated for credit only with a different topic.

Learning Outcomes: 1. Demonstrate knowledge of a range of genres, topics, and literary conventions of the works of a particular author. 2. Discuss those genres, topics, and conventions in relation to their diverse historical, cultural, and aesthetic contexts. 3. Produce a

substantial work or project: a research essay; a digital humanities project; a scholarly edition; or a comparable service learning project. Credits: 3.00

ENGL 41200 - Studies In Genre

Credit Hours: 3.00. A study of literary or cinematic works that share distinctive formal features. A project-based capstone seminar containing a significant research component. May be repeated for credit only with a different topic.

Learning Outcomes: 1. Demonstrate detailed knowledge of a single literary genre. 2. Discuss that genre in relation to its diverse historical, cultural, and aesthetic contexts. 3. Produce a substantial work or project: a research essay; a digital humanities project; a scholarly edition; or a comparable service learning project. Credits: 3.00

ENGL 41300 - Studies In Literature And History

Credit Hours: 3.00. A study of literature or film produced during a well-defined historical period from the view of its social, political, religious, and economic contexts. A project-based capstone seminar containing a significant research component. May be repeated for credit only with a different topic.

Learning Outcomes: 1. Demonstrate knowledge of a range of genres, topics, and literary conventions of a particular period in history. 2. Discuss those genres, topics, and conventions in relation to their diverse historical, cultural, and aesthetic contexts. 3. Produce a substantial work or project: a research essay; a digital humanities project; a scholarly edition; or a comparable service learning project. Credits: 3.00

ENGL 41400 - Studies In Literature And Culture

Credit Hours: 3.00. A study of literature or film from the perspective of the cultural norms and values it expresses, celebrates, and challenges. A project-based capstone seminar containing a significant research component. May be repeated for credit only with a different topic.

Learning Outcomes: 1. Demonstrate knowledge of the relationship between literary texts and their culture. 2. Discuss those relationships in light of texts' diverse historical and aesthetic contexts. 3. Produce a substantial work or project: a research essay; a digital humanities project; a scholarly edition; or a comparable service learning project. Credits: 3.00

ENGL 41900 - Multimedia Writing

Credit Hours: 3.00. Explores the rhetorical and cultural aspects of multimedia design, implementation and publishing. Students will create a broad spectrum of multimodal texts such as digital videos, podcasts and Web sites. The course focuses on preparing students to adapt to ever-changing media landscapes.

Learning Outcomes: 1. Use theories of rhetoric to develop texts, think critically, solve problems, and engage with the needs of diverse audiences. 2. Apply data-driven approaches to specific rhetorical contexts, problems, and situations. 3. Design multimedia documents and digital texts that include attention to accessibility and usability. 4. Communicate complex information via a variety of mediums and or genres. 5. Use common tools for creating multimedia and integrating visuals in written documents. Credits: 3.00

ENGL 42000 - Business Writing

Credit Hours: 3.00. This course helps students become better business writers, across a wide range of audiences, for multiple purposes, and in a variety of media. This course engages business-related material with an awareness of audience needs and contexts. It prepares students to address problems in the workplace, social, or global levels.

Learning Outcomes: 1. Use theories of rhetoric to develop texts, think critically, solve problems, and engage with the needs of diverse audiences. 2. Apply data-driven approaches to specific rhetorical contexts, problems, and situations. 3. Compose effective, field-specific business documents through a process of analysis and revision. 4. Create business documents in collaborative, distributed, and/or networked environments. 5. Adapt to workplace specific writing practices. Credits: 3.00

ENGL 42100 - Technical Writing

Credit Hours: 3.00. This course teaches the practice and principles of technical writing. The course emphasizes rhetorical approaches to research and writing, teaching concepts such as usability and accessibility. Students write diverse technical documents such as memos, technical reports, documentation and websites.

Learning Outcomes: 1. Use theories of rhetoric to develop texts, think critically, solve problems, and engage with the needs of diverse audiences. 2. Apply data-driven approaches to specific rhetorical contexts, problems, and situations. 3. Communicate complex technical information, processes and procedures in a variety of genres. 4. Compose effective, industry specific, technical documents that emphasize the importance of usability and accessibility for the rapidly changing field of technical writing. 5. Produce team-written technical projects for specific contexts and industries. Credits: 3.00

ENGL 42201 - Writing For The Health And Human Sciences

Credit Hours: 3.00. This course applies rhetorical principles to the writing of health, hospitality, nutrition and other related fields. It will prepare students to write in diverse modalities for technical, professional and lay audiences.

Learning Outcomes: 1. Use theories of rhetoric to develop texts, think critically, solve problems, and engage with the needs of diverse audiences. 2. Apply data-driven approaches to specific rhetorical contexts, problems, and situations. 3. Employ theories and approaches of medical and science writing to adapt to the rapidly changing industries of healthcare and public health. 4. Compose effective healthcare and public health documents with an awareness of the accessibility and usability needs of patients, providers and caregivers. 5. Communicate complex healthcare and public health information while writing both individually and in teams. Credits: 3.00

ENGL 42400 - Writing For High Technology Industries

Credit Hours: 3.00. Applies principles of effective professional writing to the planning, production, and evaluation of computer user manuals and other writing tasks.

Learning Outcomes: 1. Communicate technical knowledge through writing. 2. Think and write about writing in high technology workplaces. 3. Write concisely, precisely, and with economy of language. 4. Become familiar with the best practices and procedures for documenting advanced technologies. 5. Become familiar with adapting technical language and requirements for a non-specialist audience. 6. Become familiar with composing and delivering policies or new procedures to colleagues or co-workers. 7. Become familiar with practical strategies for improving your resume, conduct, and online presence. Credits: 3.00

ENGL 43201 - Editing And Publishing

Credit Hours: 3.00. Editing and Publishing is a professional writing workshop that teaches students how to proofread, copyedit, substantive edit, and global edit documents. Students will learn how to navigate the publishing industry and work with authors on print, electronic, online, and multimedia documents.

Learning Outcomes: 1. Understand how the publishing industry operates, especially from an editor's perspective. 2. Apply the four levels of edit (global editing, substantive editing, copyediting, and proofreading) in an editorial project. 3. Work collaboratively with authors to produce clearly written and persuasive documents. 4. Edit document design and graphics in a document. 5. Interact with publishers to bring a text from manuscript form into a published manuscript. Credits: 3.00

ENGL 43300 - Writing Proposals And Grants

Credit Hours: 3.00. Writing Proposals and Grants is a professional writing workshop that teaches students to write workplace proposals and grants in for-profit and not-for-profit companies and organizations. Students will also learn how to write business plans, a specialized form of proposal.

Learning Outcomes: 1. Analyze rhetorical situations to determine needs of readers and contexts. 2. Generate new ideas for businesses, products, and services. 3. Organize proposals and grants using various proposal genres. 4. Write in a plain and persuasive style that is appropriate to readers. 5. Design documents in ways that make information accessible. 6. Edit and revise proposals and grants. 7. Work with authors, customers, and funding agencies to

sharpen the message of a proposal or grant. Credits: 3.00

ENGL 43400 - Science And Medical Writing

Credit Hours: 3.00. Science and Medical Writing is a professional writing workshop that teaches students how to write in medical and scientific fields. Students will learn the genres and conventions that are used by medical writers and science writers, as well as editors in these fields.

Learning Outcomes: 1. Analyze rhetorical situations to determine needs of readers and contexts. 2. Identify the appropriate genre for a writing project. 3. Edit and proofread scientific and medical documents. 4. Design documents that pertain specifically to medical and scientific texts. 5. Create and effectively use tables, charts, and graphics common in the sciences and medicine. 6. Develop skills for working with authors and publishers in scientific and medical fields. Credits: 3.00

ENGL 43900 - Topics In Disability Studies

Credit Hours: 3.00. Explores cultural, social, and political meanings and effects of disability in relation to literature and/or rhetoric. Specific topics will vary.

Learning Outcomes: 1. Discuss the strengths and weaknesses of different models for understanding disability. 2. Understand ways normalcy is socially constructed. 3. Identify cultural practices that exclude disabled people. 4. Compare and contrast disability with other identity categories such as race, gender, and sexuality. 5. Discuss ways in which culture defines disability as impairing one's subjectivity and even humanity. 6. Analyze literary representations of disabled characters. 7. Examine the role of disability in literary works more broadly. Credits: 3.00

ENGL 44200 - Shakespeare

Credit Hours: 3.00. Shakespeare's dramatic craftsmanship, poetry, humor, characterization, psychology, and modern pertinence illustrated in representative tragedies, comedies, and history plays.

Credits: 3.00

ENGL 44300 - Craft Seminar

Credit Hours: 3.00. Study of fiction, poetry, creative nonfiction, storytelling, and/or hybrid form theory and techniques, both in published texts and student manuscripts. Students produce multiple texts and drafts. Workshop criticism. Can be taken up to three times for credit.

Learning Outcomes: 1. Develop a greater understanding of the form and theory of fiction, poetry, creative nonfiction, storytelling, and/or hybrid texts. 2. Read published creative texts, including very recent texts, in order to understand the conventions of and current practices within the field. 3. Read, discuss, and offer feedback on other students' drafts. 4. Draft and revise multiple pieces to produce high-quality, polished work suitable for submission to creative publications. Credits: 3.00

ENGL 46000 - Studies In Women's Literature

Credit Hours: 3.00. A study of literary works by women according to a specific theme, historical period, genre, or culture, e.g., Nineteenth-Century Women Novelists, Madness in Women's Writing, Caribbean Women Writers. May be repeated only with different topic.

Credits: 3.00

ENGL 46200 - The Bible As Literature: The Old Testament

Credit Hours: 3.00. A study of the Old Testament - Pentateuch, Prophets, and other books such as Psalms, Proverbs, Job, and Ecclesiastes - with emphasis on its unique literary characteristics.

Credits: 3.00

ENGL 46300 - The Bible As Literature: The New Testament

Credit Hours: 3.00. A study of the New Testament, with emphasis on its unique literary characteristics.

Credits: 3.00

ENGL 47000 - Advanced Topics In Rhetorical Studies

Credit Hours: 3.00. Study of rhetorical theories and practices past and present. Includes readings in primary texts in the history and theory of rhetoric. May be repeated for credit with a different topic.

Learning Outcomes: 1. Demonstrate advanced understanding of rhetorical concepts, theories, and practices. 2. Analyze and assess rhetorical situations from which arguments are generated; evaluate arguments and their public, institutional, or organizational success; produce arguments in a variety of genres and forms. 3.

Demonstrate understanding of how and why rhetoric accomplishes its work from a variety of perspectives across the humanities and sciences. Credits: 3.00

ENGL 48800 - Internship In Professional Writing

Credit Hours: 3.00 to 6.00. This course provides on-the-job experience in various kinds of professional writing, combined with a seminar in applied rhetoric. Students work in selected internship settings, participate in seminar discussions of their work, and read selections appropriate to their internship. Permission of instructor required.

Credits: 3.00 to 6.00

ENGL 49000 - Worksite Internship Practicum

Credit Hours: 1.00 to 3.00. Course facilitates the transition between an English undergraduate degree and the workplace or professional life. The course has two components: a professor-guided component and a practicum component in a chosen area. Permission of instructor required.

Credits: 1.00 to 3.00

ENGL 49200 - Literature In The Secondary Schools

Credit Hours: 3.00. Exploration of the theory, research and pedagogy supporting the teaching of literature at the secondary level. Topics include text selection, instructional strategies, adolescent literacy, student engagement and the use of alternative texts.

Credits: 3.00

ENGL 49400 - Research Practicum For Undergraduates

Credit Hours: 2.00 or 3.00. This course introduces students to research techniques and trains them to participate in a research laboratory or a professor-sponsored research project. Permission of instructor required.

Credits: 2.00 or 3.00

ENGL 50100 - Introduction To English Studies

Credit Hours: 3.00. Introduction to graduate studies in English with special emphasis on research and reference tools, methods of bibliography, and the writing of scholarly papers. Prerequisite: Fulfillment of the basic composition requirement and 6 credit hours in English.

Credits: 3.00

ENGL 50200 - Practicum In Teaching College Composition

Credit Hours: 1.00. Reading professional literature, preparing syllabi; evaluating student papers, leading discussions. Required of all teaching assistants in their initial semesters.

Credits: 1.00

ENGL 50500 - Approaches To Teaching College English

Credit Hours: 3.00. Reading professional literature on the teaching of writing, linguistics, and ESL. Studies of methodologies, issues of assessment, and the relationship between theory and pedagogy. This course is not part of the degree requirement. Open only to teaching assistants in the Department of English. Permission of instructor required.

Credits: 3.00

ENGL 50600 - Introduction To English And General Linguistics

Credit Hours: 3.00. General study of language and linguistic theory with emphasis on English. Problems and methods in phonology, morphology, syntax, and semantics. Current techniques of linguistics analysis.

Credits: 3.00

ENGL 50700 - Advanced Poetry Writing

Credit Hours: 3.00. Study and practice of advanced methods of composing poetry, with primary emphasis on the student's own work. Workshop criticism and discussion of published writing.

Learning Outcomes: 1. Write and revise poems, using all the skills from ENGL 40700 but at a more proficient level. 2. Produce a portfolio of poems revised according to suggestions received in workshop and in individual conferences with the instructor. 3. Acquire a broader knowledge of the context of contemporary poetry by reading and discussing several volumes by contemporary poets.

Credits: 3.00

ENGL 50900 - Advanced Fiction Writing

Credit Hours: 3.00. Study and practice of advanced methods of composing fiction, with the primary emphasis on the student's own work. Workshop criticism and discussion of published writing.

Learning Outcomes: 1. Write and revise fiction, using all the skills from English 40900 but at a more proficient level. 2. Produce polished fiction revised according to suggestions received in workshop and feedback from the instructor. 3. Acquire a broader knowledge of the context of contemporary fiction by reading and discussing work by several contemporary fiction writers.

Credits: 3.00

ENGL 51100 - Semantics

Credit Hours: 3.00. An introduction to and survey of current semantic theories and methods with an emphasis on English. Basic concepts of linguistic semantics and its relation to the other semantics. Compositional (transformational), model-

theoretical (truth-conditional), pragmatic, and contextual semantics.

Credits: 3.00

ENGL 51200 - English Syntax And Syntactic Theory

Credit Hours: 3.00. Introduction to English syntactic structure, syntactic argumentation, and syntactic theory. Emphasis on one current theory as the primary theoretical framework, with other theories considered.

Credits: 3.00

ENGL 51300 - English Phonology

Credit Hours: 3.00. Introduction to current phonological theory, with applications to descriptions of American and British English. Articulatory description of English phonological structure and contrastive analysis of phonetic variation across dialects. Evolution of the stress system of English and its utilization by poets writing metrical verse.

Credits: 3.00

ENGL 51500 - Advanced Professional Writing

Credit Hours: 3.00. Production of documents and coordination of publishing projects for clients and users; application of advanced principles of document design, rhetoric, collaboration, and project management; and team writing in a computer-networked environment.

Credits: 3.00

ENGL 51600 - Teaching English As A Second Language: Theoretical Foundations

Credit Hours: 3.00. Survey of theories of learning and teaching English as a second/foreign/international language. Focus is on current theories and their implications for practice.

Learning Outcomes: 1. Demonstrate an understanding of current theories of second-language learning and teaching and their implications. Credits: 3.00

ENGL 51800 - Teaching English As A Second Language: Principles And Practices

Credit Hours: 3.00. Studies of issues and principles in ESL/EFL program development. Emphasis is on practical application of theory in a variety of English learning and teaching contexts in the U.S. and abroad.

Credits: 3.00

ENGL 52000 - Eighteenth-And Nineteenth-Century Literature

Credit Hours: 3.00. Study of key texts and movements in literature from the 18th and 19th centuries, with emphasis on historical, cultural, and theoretical contexts. Literary movements may include (but are not limited to): Neoclassicism, Sentimentalism, Romanticism, Victorianism, Realism, and Naturalism. Genres may include (but are not limited to): poetry, drama, the essay, autobiography/memoir, travel narratives, various forms of the novel, and short fiction. Critical concerns may include (but are not limited to) close textual studies, reception studies, the relation of literature to social and technological change, and the relation of literature to other artistic and cultural modalities. Additional topics include (but are not limited to) the history of critical interpretation, contemporary theoretical frameworks, and research methods and practices.

Learning Outcomes: 1. Explain the historical, cultural, and theoretical contexts shaping key works of 18th- and 19th-century literature. 2. Analyze literary texts using contemporary critical and theoretical frameworks. 3. Compare and contrast the ways in which 18th- and 19th-century literature engages with themes including individualism, democracy, and industrialization. 4. Assess the influence of historical and cultural events on the development of literary styles and genres. Credits: 3.00

ENGL 52100 - Medieval Language And Literature

Credit Hours: 3.00. This course offers an in-depth exploration of key texts and themes from medieval English literature, focusing on the period roughly from the 9th to the 15th century. With an emphasis on texts' historical, cultural, and literary contexts, this course examines genres such as epic, romance, religious allegory, and early drama. Key topics include the nature of early English heroism as derived from the Germanic/Norse traditions, the development of chivalric and romance literature from the French tradition, the role of women in medieval narratives, the development of the English language, and the intersection of secular and religious thought.

Learning Outcomes: 1. Identify and recall key works of medieval literature along with their authors, historical contexts, and major themes. 2. Demonstrate an understanding of the major literary genres and forms in medieval literature and will explain their cultural and historical significance. 3. Apply critical concepts and methodologies in medieval literary studies to interpret and analyze primary texts within their historical and social contexts. 4. Analyze the representation of key themes in medieval literature and will compare these representations across different works and traditions. 5. Evaluate scholarly interpretations of medieval texts, critically assessing different

critical approaches and methodologies, and developing informed, evidence-based arguments. Credits: 3.00

ENGL 52200 - Renaissance Literature

Credit Hours: 3.00. This course is an intensive survey of the major genres (epic, drama, lyric, prose) and writers of the English Renaissance (1400-1700) within the context of England's history and the European Renaissance primarily. Key themes include the rediscovery of classical antiquity, the emergence of individualism, the influence of religion and science, and the changing conceptions of gender and power. Critical readings and research activities will demonstrate the significant role of English Literature in the development of world literature and globalization.

Learning Outcomes: 1. Identify various theoretical approaches to literature and then apply them to Renaissance literary texts. 2. Define important literary terms, genres, and conventions within their cultural, and aesthetic contexts in relation to the specific era of the Renaissance, 1300-1700. 3. Produce clear oral communication and written text, especially well-reasoned arguments about literary texts and their interaction with the Renaissance era and the era's reception, based on appropriately selected, evaluated, and presented textual evidence. 4. Practice, employ, and begin developing primary research activities associated with literary studies, especially those most applicable to the Renaissance era.

Credits: 3.00

ENGL 53200 - The English Novel In The Nineteenth Century

Credit Hours: 3.00. A survey of fiction up to about 1880, including such novelists as Scott, Dickens, Thackeray, the Brontes, Eliot, and Meredith.

Credits: 3.00

ENGL 54100 - Studies In Chaucer's Canterbury Tales

Credit Hours: 3.00. Critical reading of The Canterbury Tales and related works in Middle English, with attention to the literary and cultural background and to secondary studies.

Credits: 3.00

ENGL 54300 - Shakespeare In Critical Perspective

Credit Hours: 3.00. Shakespeare's plays read in context of historical and contemporary literary theory and criticism, considering such issues and approaches as structuralism, Marxism, deconstruction, new historicism, colonialism, sexuality, race, and gender.

Credits: 3.00

ENGL 54700 - British Romanticism

Credit Hours: 3.00. Readings from among the works of the High Romantics and other figures; discussion of historical, philosophical, cultural debates of the era, with attention to current critical and theoretical developments in the field.

Credits: 3.00

ENGL 54800 - Victorian Literature

Credit Hours: 3.00. A study of selected English poetry and prose, largely nonfiction, from circa 1830-1900. Includes readings from such figures as Arnold, Barrett, Bronte, Browning, Carlyle, Mill, Rosetti, Ruskin, and Tennyson.

Credits: 3.00

ENGL 55200 - Studies In Major American Authors

Credit Hours: 3.00. A study of the works of one or two influential American authors.

Credits: 3.00

ENGL 55300 - Colonial And Early American Literature

Credit Hours: 3.00. A survey of American literature to about 1820. Texts of major and minor authors, such as Bradford, Bradstreet, Rowlandson, and Cooper, are viewed within their cultural context.

Credits: 3.00

ENGL 56000 - Modern American Poetry

Credit Hours: 3.00. A survey of modern American poetry. Emphasis will be on major writers such as Eliot, Pound, Frost, Stevens, and Lowell, but attention will be paid to lesser figures.

Credits: 3.00

ENGL 56002 - Twentieth- And Twenty-First Century Literature

Credit Hours: 3.00. Study of key texts and movements in literature from the 20th and 21st centuries, with emphasis on historical, cultural, and theoretical contexts. Topics may include modernism, postmodernism, global literatures, postcolonial studies, environmental writing, and evolving narrative forms in response to technological and social change. Focus on critical interpretation, research methodologies, and contemporary theoretical frameworks.

Learning Outcomes: 1. Explain the historical, cultural, and theoretical contexts shaping key works of 20th- and 21st-century literature. 2. Analyze literary texts using contemporary critical and theoretical frameworks, such as

formalism, disability studies, postmodernism, postcolonialism, and ecocriticism. 3. Compare and contrast the ways in which 20th- and 21st-century literature engages with themes such as identity, politics, technology, and globalization. 4. Assess the influence of historical and cultural events (such as World War I, the Cold War, and 9/11) on the development of literary styles and genres. Credits: 3.00

ENGL 56300 - Historical Linguistics

Credit Hours: 3.00. (ANTH 56300, LC 56300) A survey of mechanisms and motivations of linguistic change. Topics include: phonological, morphological, semantic and syntactic change, comparative and internal reconstruction, linguistic variation, language contact, and linguistic typology.

Credits: 3.00

ENGL 56500 - Sociolinguistics

Credit Hours: 3.00. (ANTH 56500, COM 56500, LC 56500, LING 56500) An introduction to language in its social context, focusing on uses and users of language. Topics include social class, ethnic group, gender, language attitudes, and bilingualism.

Credits: 3.00

ENGL 56900 - Contemporary Criticism And Theory

Credit Hours: 3.00. Study of contemporary criticism and theory generally focused on such schools and movements as structuralism, psychoanalysis, poststructuralism, feminism, new historicism, cultural studies, and gay and lesbian studies.

Credits: 3.00

ENGL 57000 - Introduction To Semiotics

Credit Hours: 3.00. The study of languages, literatures, and other systems of human communication. Includes a wide range of phenomena which can be brought together by means of a general theory of signs. The course deals with three fundamental areas: 1) verbal communication, 2) nonverbal communication (iconic systems, gestures, body language, etc.), and 3) communication through art forms.

Credits: 3.00

ENGL 57900 - Modern British Fiction

Credit Hours: 3.00. Critical study of twentieth-century novels, mainly before World War II, by such writers as Conrad, Lawrence, Forster, Joyce, and Woolf.

Credits: 3.00

ENGL 58500 - Creative Nonfiction Writing

Credit Hours: 3.00. Study and practice of advanced methods of composing creative nonfiction, with primary emphasis on the student's own work. Workshop criticism and discussion of published writing. Learning Outcomes: 1. Write and revise sophisticated creative nonfiction through the study and practice of techniques unique to the genre. 2. Produce polished creative nonfiction revised according to suggestions received in workshop and feedback from the instructor. 3. Acquire a broader knowledge of the context of contemporary creative nonfiction by reading and discussing work by several contemporary fiction writers. Credits: 3.00

ENGL 58900 - Directed Writing

Credit Hours: 1.00 to 3.00. Writing (creative, popularly technical, biographical, historical, philosophical) on subjects of the student's choice. Individual conferences only; no class meetings. Permission of instructor required.

Credits: 1.00 to 3.00

ENGL 59000 - Directed Reading

Credit Hours: 1.00 to 3.00. Directs the reading of students with special interests. Guides students in profitable reading in subjects of their own choice. Individual conferences; no class meetings. Permission of instructor required.

Credits: 1.00 to 3.00

ENGL 59100 - Introduction To Composition Theory

Credit Hours: 3.00. A survey of major contemporary theories of invention and style, including such topics as heuristics; the aims and modes of discourse; stylistics; readability theories; sentence-combining; error analysis; audience; and evaluation. Applications to teaching will be made.

Credits: 3.00

ENGL 59200 - Postcolonial Studies

Credit Hours: 3.00. Study of works from once colonized cultures in Africa, Asia, and the Caribbean, and/or postcolonial diasporas. Individual sections will focus on one or more of the following: literature, women's literature, film, or feminist and cultural theory.

Credits: 3.00

ENGL 59400 - Contemporary Poetry

Credit Hours: 3.00. Study of poetry of the past two or three decades, both American and foreign, and their interaction. Attention to influences, "schools," and little magazines, as well as to conventional sources.

Credits: 3.00

ENGL 59500 - Contemporary American Fiction

Credit Hours: 3.00. Intensive study of contemporary and postmodern American fiction within various formal, theoretical, and cultural contexts, including multiculturalism, poststructuralism, and gender analysis, among others.

Credits: 3.00

ENGL 59600 - Advanced Studies In Literature Or Language

Credit Hours: 3.00. Advanced study of a topic within the instructor's fields of specialization. Emphasis on scholarly analysis and research.

Learning Outcomes: 1. Think critically about course content. 2. Read and write reflectively and critically about the course content. 3. Engage in course discussions, either online or face to face, which will encourage critical thought and personal engagement. Credits: 3.00

ENGL 59700 - Contemporary Black Feminist Literature

Credit Hours: 3.00. An intense examination of recent literary works by black women along with various critical theories constructed about black women's literature, beginning with the premise that black feminism is a "sign to be interrogated, a locus of contradictions."

Credits: 3.00

ENGL 59900 - Academic Language And Content Area Learning

Credit Hours: 3.00. (EDCI 55900) Course focuses on theoretical and practical knowledge for teachers about how second languages are learned, and on the educational and philosophical basis for second language teaching and learning. The course links English language development to teaching and learning strategies and is designed for undergraduate and graduate students in education and practicing teachers.

Learning Outcomes: 1. Develop an understanding of the linguistic challenges of academic language in the content areas of science, language arts, mathematics, and the social studies for ELLs. 2. Gain experience in determining academic tasks that require advanced levels of reading and writing. 3. Learn about the development of academic literacy as ELLs move from elementary into secondary and postsecondary education. Credits: 3.00

ENGL 60100 - Teaching Literature At The College Level

Credit Hours: 3.00. Focuses on the practical and theoretical issues related to teaching literature at the college level. Topics include course design, literary canons and text selection, teaching and learning styles, close reading, writing about literature, assessment, and professional ethics. Prerequisite: ENGL 50100 or consent of department. Restricted to graduate students in the Department of English.

Learning Outcomes: 1. Understand practical and theoretical issues of teaching literature to undergraduates. 2. Demonstrate familiarity with a variety of methods for teaching literature of various genres and encouraging active learning. 3. Design effective writing assignments and assess them effectively. 4. Understand the rights and responsibilities of students and instructors. Credits: 3.00

ENGL 60111 - Introduction To Scientific, Technical, Medical, And Healthcare Writing

Credit Hours: 3.00. Introduction to Scientific, Technical, Medical, and Healthcare Writing offers an overview of the genres, conventions, and strategies that these professional fields have in common. This course is the gateway course into the online Professional Certificate and Masters in Scientific, Technical, and Medical Communication. Permission of department required.

Learning Outcomes: 1. Identify the written, spoken, and media genres that are common to scientific, technical, medical, and healthcare industries. 2. Explain how genres and conventions are used in professional workplaces within a variety of industries. 3. Demonstrate how common communication strategies can allow a writer, speaker, or media user to explain scientific, technical, medical, and healthcare concepts and to persuade others. 4. Develop a common genre set that is applicable to the needs of a particular workplace within a broader scientific, technical, medical, and healthcare industry. 5. Evaluate existing communication practices at a workplace or within an industry and make recommendations for improvements. Credits: 3.00

ENGL 60211 - Science Writing

Credit Hours: 3.00. This course teaches students how to use the various writing styles and rhetorical strategies that are common in popular science and the scientific workplace. More specifically, they learn how to analyze, prepare, and edit technical and professional documents needed to effectively communicate within scientific professions, with specialized focus on reporting science news, conducting interviews with scientists, and identifying and explaining current debates in

science. Permission of department required.

Learning Outcomes: 1. Describe, analyze, and understand the particular written genres that are needed in the field of science writing. 2. Explain and translate scientific information to scientists, policy makers, and the public 3. Understand and demonstrate the ways in which rhetorical choices construct meaning in scientific contexts. 4. Analyze audiences for various forms of science writing, predict their needs, and craft writing that is audience appropriate. 5. Conduct professional interviews with scientists and other stakeholders in scientific issues in order to clearly articulate the findings of those interviews in a written format. Credits: 3.00

ENGL 60311 - Medical And Healthcare Writing

Credit Hours: 3.00. This course helps students master various genres, writing styles, and rhetorical strategies common in medical and healthcare contexts. More specifically, you will learn how to analyze, prepare, and edit documents that are used to communicate within and about the healthcare industry (i.e., protocols, patient educational materials, and proposals). Permission of department required.

Learning Outcomes: 1. Identify and understand the written genres that are common in healthcare and medical fields. 2. Analyze audiences for medical and healthcare documents and understand their needs. 3. Generate and translate health complex medical information to both healthcare professionals and the public. 4. Organize information in a way that is accessible and useful in healthcare workplaces. 5. Develop and design professional quality medical documents such as protocols, patient educational materials, and proposals. Credits: 3.00

ENGL 60411 - Writing Proposals And Grants

Credit Hours: 3.00. Writing Proposals and Grants teaches students how to analyze requests for proposals, analyze problems, devise project plans, and write proposals for for-profit corporations and non-profit organizations. Permission of department required.

Learning Outcomes: 1. Interpret and analyze a request for proposals (RFP). 2. Identify the ""problem"" that initiated the RFP by determining its causes and effects. 3. Develop clear objectives, outcomes, and deliverables that will make a project attractive to a client. 4. Propose a project plan that meets the client's needs and expectations. 5. Demonstrate why your company or organization is uniquely qualified to take on the project. 6. Compare the costs and benefits for readers of accepting a project proposal or grant proposal. 7. Present a proposal orally or in video form to decision-makers. Credits: 3.00

ENGL 60500 - Computers In Language And Rhetoric

Credit Hours: 3.00. Seminar that investigates how computers figure in contemporary theories of text and text making. Typical topics: critiques of technology, hypertext, cyberspace, computer-mediated communication, Internet, electronic writing, online research, pedagogy, and publishing.

Credits: 3.00

ENGL 60511 - Editing And Publishing

Credit Hours: 3.00. The purpose of this course is to show you how to use professional editing techniques to produce high-quality and publishable documents. Students learn how to work as a professional editor at four "levels of edit," which include proofreading, copyediting, substantive editing, and development editing. Permission of department required.

Learning Outcomes: 1. Apply editing techniques at the four levels of edit (proofreading, copyediting, substantive editing, and development editing). 2. Demonstrate effective decisions about the kinds of editing needed and expected for a task or a piece of writing. 3. Employ editing and publishing terminology and knowledge to a variety of documents in a variety of situations. 4. Demonstrate the use of proofreading and copyediting marks as used in print-based and electronic documents. 5. Employ strategies for doing substantive editing on larger documents in scientific, technical, medical, and healthcare professional settings. Credits: 3.00

ENGL 60600 - Seminar In Poetry Writing

Credit Hours: 3.00. An advanced course in the writing of poetry. Workshop criticism. Study of the work of established writers. Prerequisite: admission to the MA program in creative writing.

Learning Outcomes: 1. Enhance active reading skills through the close examination and critique of the poetry, notebooks, and letters of established poets. 2. Enhance feedback skills through thoughtful, frank, tactful, and intelligent critiques of your classmates' poems. 3. Enhance writing skills through intensive writing of original poetry and through structure exercises. Credits: 3.00

ENGL 60611 - Technical Communication

Credit Hours: 3.00. The purpose of this course is to show students how to write technical documentation and produce high-quality and reader-centered documents. They learn to write documents in several modalities, including print, electronic, audio, and video. Permission of department required.

Learning Outcomes: 1. Apply technical concepts, processes, and terms effectively for the purposes of informing and persuading. 2. Identify, analyze, and understand the particular written genres and conventions of various workplaces so that they can be shaped to fit one's professional needs. 3. Classify and identify audiences for specific technical documents. 4. Demonstrate an understanding audience needs by crafting writing, designing documents, and producing audio-visual texts that address and take those needs into consideration. 5. Produce and manage common professional documents in collaboration with others. Credits: 3.00

ENGL 60700 - The Theory And Craft Of Creative Writing

Credit Hours: 3.00. A study of the craft of poetry, fiction, or drama with some consideration of underlying theories. Prerequisite: admission to the MA program in creative writing.

Learning Outcomes: 1. Develop reading and analysis skills of the techniques used in other authors' writing. 2. Apply analysis skills learned from other authors' writing to your own writing through imitation and adaptation. 3. Develop skills in the teaching of writing through peer review, discussion, and presentations. Credits: 3.00

ENGL 60711 - Designing Documents, Interfaces, And Graphics

Credit Hours: 3.00. The purpose of this course is to introduce students to visual rhetoric principles that are commonly used to design documents and interfaces, as well as show them how to use multimedia tools for designing visual texts. Students also learn how to create effective visuals, such as graphs, charts, and tables. Permission of department required.

Learning Outcomes: 1. Recognize gestalt principles of design and how they operate in documents and interfaces. 2. Critique the design of documents and interfaces to determine whether they are working properly and determine how they can be improved. 3. Utilize computer-based design tools for designing documents and multimedia texts. 4. Create effective graphs, charts, and tables that complement written text. 5. Explain how design, typography, and color work together to make documents and interfaces intuitive, accessible, and attractive. 6. Develop a reliable design process that governs the visual design of individual and team-based projects. Credits: 3.00

ENGL 60811 - Entrepreneurship Communication

Credit Hours: 3.00. The purpose of this class is to teach students how to use design thinking and information experience (IX) strategies to be innovative and generate new ideas for products and services. Students will learn how to write a business model and pitch that business model to investors or their supervisors. Permission of department required.

Learning Outcomes: 1. Identify and use written genres that are common in business start-ups. 2. Use design thinking principles to envision new products and services, empathize with users, and ideate with new technology. 3. Analyze a market for your business and its products and services. 4. Develop a marketing strategy for raising awareness of your business. 5. Propose a new business concept by writing a business plan or model. Credits: 3.00

ENGL 60900 - Seminar In Fiction Writing

Credit Hours: 3.00. An advanced course in the writing of fiction. Workshop critiques. Prerequisite: Admission to the creative writing program.

Learning Outcomes: 1. Enhance reading skills

through close examination of other writers, including classmates and professional writers. 2. Enhance vocabulary for the creative writing discourse community. 3. Enhance feedback skills through thoughtful, frank, tactful, and intelligent discussion of your classmates stories and novel chapters. 4. Expand reading and writing aesthetics, and understanding of what literature is and can be, that will guide your reading and writing in the future. 5. Produce fiction benefitting a third-year thesis. Credits: 3.00

ENGL 60911 - User Experience And Design Thinking

Credit Hours: 3.00. The purpose of this courses is to show students how to employ User Experience (UX) principles to design documents, interfaces, and products for scientific, technical, healthcare, and medical situations, making those interactions intuitive, easy, and even pleasurable. Design thinking broadens out the focus, using design as a systematic way of understanding a company's customers, defining their problems and needs, ideating to create new solutions with emerging technologies, and prototyping those solutions. Permission of department required.

Learning Outcomes: 1. Critique the design of interfaces and documents through user experience (UX) principles. 2. Assess UX situations and anticipate the needs and problems that users, customers, and clients are try to solve. 3. Select UX strategies for designing interfaces and documents that users find useful and even pleasurable to interact with. 4. Demonstrate the use of design principles that can be used across media and platforms to design products, interfaces, and documents. 5. Develop a sense of empathy for users that allows product and document designers to see situations from the users perspective. 6. Learn how to ideate in ways that reframe existing problems, enhance creativity, and open new pathways for designing products and services. Credits: 3.00

ENGL 61400 - Middle English Literature

Credit Hours: 3.00. Study of representative works in the major literary traditions and genres of Middle English literature (exclusive of Chaucer): lyric, romance, satire, and allegory. Detailed examination of major works, such as Sir Gawain and the Green Knight, Piers Plowman, and Pearl.

Credits: 3.00

ENGL 62000 - Classroom Communication In ESL For Teaching Assistants

Credit Hours: 5.00. Student must be enrolled in the Graduate School and a non-native speaker of English. Permission of department required.

Credits: 5.00

ENGL 62100 - Written Communication For International Graduate Students

Credit Hours: 3.00. A course in English composition for non-native English-speaking graduate students.

Credits: 3.00

ENGL 62200 - Issues In Composition Studies: Classical Period To The Renaissance

Credit Hours: 3.00. The course historicizes issues in composition studies from the sophists to the Renaissance. Prerequisite: ENGL 59100 .

Credits: 3.00

ENGL 62400 - Issues In Composition Studies: Modern Period

Credit Hours: 3.00. The course historicizes issues in composition studies from the eighteenth century to the mid-twentieth century. Prerequisite: ENGL 59100 .

Credits: 3.00

ENGL 62500 - Seminar On Empirical Research In Writing

Credit Hours: 3.00. An analysis and evaluation of empirical research concerned with composing processes, critical literacy, disciplinary writing, various writing cultures, and composition pedagogy. Students will study empirical research designs and develop a project in one of the above areas. Prerequisite: ENGL 59100 .

Credits: 3.00

ENGL 62600 - Postmodernism And Issues In Composition Studies

Credit Hours: 3.00. The course historicizes how various postmodern theories and practices (cultural, political, ethical, philosophical, technological, aesthetic) influence the study and teaching of written discourse. Prerequisite: ENGL 59100 .

Credits: 3.00

ENGL 62700 - Seminar In Linguistics

Credit Hours: 3.00. Investigation of a topic in advanced linguistics research.

Credits: 3.00

ENGL 62800 - Natural Language Processing

Credit Hours: 3.00. (ECE 66900) This course focuses on

keyword-driven question answering systems; transition networks; parsing procedures for context-free grammars; theory of transformational grammars; implementation of recursive transition networks; implementation of augmented transition networks; representation of conceptual dependencies; surface semantic conceptual analysis; conceptual dependency parsing; generating natural language from a conceptual base; scripts, plans, and goals; building conversationalist programs. Prerequisite: ENGL 50600 or ECE 57000 .

Credits: 3.00

ENGL 62900 - Seminar In English As A Second Language

Credit Hours: 3.00. In-depth study of variable subjects relating to the nature of English as a second/foreign/international language and its learning and teaching. Prerequisite: ENGL 51600 .

Credits: 3.00

ENGL 63000 - Seminar In Second Language Writing

Credit Hours: 3.00. An overview and examination of major issues in the theory, research, and practice of writing in English as a second language. Prerequisite: ENGL 51600 or ENGL 59100 .

Credits: 3.00

ENGL 63100 - World Englishes

Credit Hours: 3.00. Investigation of the use, spread, and development of English as an international language. Topics include: non-native varieties, language contact and change, new English literatures, and the teaching of English as an international language. Prerequisite: ENGL 50600 .

Credits: 3.00

ENGL 66800 - Seminar In Interpretation And Cultural Theory

Credit Hours: 3.00. Examination of selected developments in social, cultural, and hermeneutical theories from the eighteenth century to the present.

Credits: 3.00

ENGL 66900 - Introduction To Visual Theory And Visual Culture

Credit Hours: 3.00. Visual studies is the multidisciplinary study of images, viewers, and vision. Students will be provided with an overview of the theories, practices, and histories of the visual from a variety of disciplinary perspectives and historical periods. The seminar will be organized around a series of basic questions (such as "What is an image?" "How do images produce meaning?" "What do images do?" "What is vision?") whose responses have come to constitute the field as well as its transdisciplinarity. Readings will be drawn from seminal works in visual theory, cultural semiotics, cultural theory, intermediality, art history, media studies as well as the psychology, philosophy, and science of vision.

Learning Outcomes: 1. Demonstrate knowledge of the theories, practices, and histories of the visual from a variety of disciplinary perspectives and historical periods (including what is an images are and how they produce meaning). 2. Produce a finished conference paper and abstract. 3. Produce a finished undergraduate syllabus on a topic related to the course and student expertise. Credits: 3.00

ENGL 67400 - Seminar In Language Testing

Credit Hours: 3.00. An introduction to the techniques, practices, and history of language testing. Introduces the basic tenets of measurement and the issues and controversies related to the measurement of language ability.

Credits: 3.00

ENGL 68000 - Seminar In Rhetoric And Composition

Credit Hours: 3.00. A variable content course dealing with topics such as cultural studies and composition, medieval rhetoric, renaissance rhetoric, literacy, historiographies of rhetoric, qualitative studies, and professional writing theory. Prerequisite: ENGL 59100 .

Credits: 3.00

ENGL 68100 - Hutton Lectures In Rhetoric And Composition

Credit Hours: 3.00. Reading and discussion of the work of contemporary scholarship in rhetoric and composition, accompanied by lectures by visiting scholars.

Credits: 3.00

ENGL 69000 - Internship In Second Language Studies/ESL

Credit Hours: 1.00 to 3.00. Part-time or full-time practical work experience in selected situations related to the student's field of study. The internship must be located at an off-campus site unless a special exception is granted by the Graduate School. Permission of instructor required.

Learning Outcomes: 1. Students will have acquired knowledge of how various institutions function and gained competence in the specific area (e.g., testing/test construction, teaching/teacher education, materials and curriculum design) and will have critically reflected upon the experience. Credits: 1.00 to 3.00

ENGL 69200 - Scholarly Writing And Publishing

Credit Hours: 3.00. Guides graduate students through preparing an essay for journal publication. Activities include

selecting appropriate venues, daily revision, outlining, workshopping, and hearing guest speakers. At the end of the course, students will formally submit their essay publication. Prerequisites: ENGL 50100 or instructor permission. Students must have an essay draft in hand that they wish to work on revising.

Learning Outcomes: 1. Produce and publish high-quality research in peer-reviewed journals. 2. Understand the hows and whys of publishing. 3. Demonstrate general professionalization of graduate students. 4. Assess and edit writing of self and others. 5. Demonstrate ethical professional behavior. Credits: 3.00

ENGL 69600 - Seminar In Literature

Credit Hours: 3.00. Advanced study of special subjects.

Learning Outcomes: 1. Think critically about course content. 2. Read and write reflectively and critically about the course content. 3. Engage in course discussions, either online or face to face, which will encourage critical thought and personal engagement. Credits: 3.00

ENGL 69800 - Research MA Or MFA Thesis

Credit Hours: 1.00 to 18.00. Research MA Or MFA Thesis. Permission of instructor required.

Credits: 1.00 to 18.00

ENGL 69900 - Research PhD Thesis

Credit Hours: 1.00 to 18.00. Research PhD Thesis. Permission of instructor required.

Credits: 1.00 to 18.00

Entomology

ENTM 10100 - Insect Biology And Societal Grand Challenges

Credit Hours: 1.00. An introduction to the roles of insect biologists in addressing societal grand challenges.

Learning Outcomes: 1. Appreciate the scope of societal grand challenges. 2. Understand and demonstrate where Insect Biology and grand challenges intersect. 3. Evaluate and critique popular literature and media surrounding these issues. 4. Identify gaps in our current knowledge and understand future needs. Credits: 1.00

ENTM 10200 - The Practice Of Science

Credit Hours: 2.00. A critical examination of science, best practices for conducting science, the contribution of research to knowledge accumulation, and the ethical obligations of scientists.

Learning Outcomes: 1. Understand and practice the fundamental components of conducting scientific investigations (observation, explanation, and investigation). 2. Understand the concept of falsifiable hypotheses and their role in the practice of science. 3. Understand concepts underlying approaches to the quantitative analysis of data. 4. Appreciate the importance of accuracy, precision, and the identification and mitigation of sources of error in data collection and analysis. 5. Understand the ethical expectations of peers, sponsors, and the general public in the practice of science. 6. Understand the distinction between science and pseudoscience, and be able to recognize each. Credits: 2.00

ENTM 10500 - Insects: Friend And Foe (UCC: SCI/STS)

Credit Hours: 3.00. A one-semester course for nonscience students who want to know more about insects - the most numerous organisms on earth. An introduction to insects and their relationship with humankind, including interesting aspects of insect biology; insects in music, decoration, history; use of insects in teaching at the elementary school level; their use in art, photography, and drawing; insects as human food.

University Core Curriculum (UCC): (UCC: SCI/STS) Credits: 3.00

ENTM 12800 - Investigating Forensic Science (UCC: STS)

Credit Hours: 3.00. Designed for both forensic science majors and non-majors, this course will provide an overview of the issues affecting the study and practice of forensic science as defined by the National Academy of Science 2009 report: "Strengthening Forensic Science". Using a mixture of popular media (film, television, news articles) as well as more conventional academic peer-reviewed articles, students will learn how the scientific method is applied to forensic investigations including; identifying pseudoscience, crime lab procedures, DNA evidence, errors in thinking and problem-solving, types of fraud, and the influence of the "CSI Effect".

University Core Curriculum (UCC): (UCC: STS)

Learning Outcomes: 1. Recognize basic phases of science and the procedural steps of the scientific method and explain the difference

between the two. 2. Recognize the difference between science and pseudoscience and how poor forensic science impacts the application of law. 3. Understand how basic procedural issues affect crime labs. 4. Recognize how a need for confidence in measurement impacts the scientific method and how this need shapes the current paradigm in forensic science. 5. Recall basic tenants of DNA evidence. 6. Understand the primacy of DNA evidence under the current paradigm of forensic science compared to other forensic science disciplines. Credits: 3.00

ENTM 20100 - Scientific And Technical Communication

Credit Hours: 3.00. Students gain a foundation for communicating science and insect biology at multiple levels through study and practice. Prior completion of a college-level composition course is strongly recommended.

Learning Outcomes: 1. Develop and practice skills to describe research and present results and conclusions from research to peers to non-scientist audiences both in written and oral formats. 2. Understand the difference between scientific and science writing and effectively communicate science to various general public audiences both orally and through writing. Credits: 3.00

ENTM 20600 - General Entomology (UCC: SCI)

Credit Hours: 2.00. A general course on insect structure, function, biology, ecology and population management. Coordinated with the ENTM 20700 laboratory as an introductory course in entomology.

University Core Curriculum (UCC): (UCC: SCI) Credits: 2.00

ENTM 20700 - General Entomology Laboratory

Credit Hours: 1.00. Laboratory exercises parallel topics presented in ENTM 20600 . Insect structures and function are studied as a basis for learning to identify insects and other arthropods.

Credits: 1.00

ENTM 21000 - Introduction To Insect Behavior (UCC: SCI)

Credit Hours: 3.00. Description and introductory analysis of innate and learned insect behavior, including basic orientations and movements, behavioral periodicity, communication, chemical and structural defenses, host selection and feeding, reproduction, and insect societies. General biology and introductory entomology are desirable, but not essential.

University Core Curriculum (UCC): (UCC: SCI) Credits: 3.00

ENTM 22810 - Forensic Investigation (UCC: SCI)

Credit Hours: 4.00. Forensic science investigation, crime scene management and field data collection techniques. Includes crime scene recognition and the documentation, collection, preservation, and processing of crime scene evidence. Emphasizes the place of field data collection as the first step in a sequence that takes evidence from scene to the lab for analysis and finally into the court of law.

University Core Curriculum (UCC): (UCC: SCI) Learning Outcomes: 1. Demonstrate use of the scientific method to identify problems, formulate and test hypotheses, conduct experiments and analyze data, and derive conclusions. 2. Demonstrate critical thinking by using data and reasoning to develop sound responses to complex problems. 3. Demonstrate the ability to write and speak with effectiveness while considering audience and purpose. Credits: 4.00

ENTM 22820 - Forensic Analysis (UCC: SCI)

Credit Hours: 4.00. Forensic science evidence analysis, crime lab evidence management and data analysis techniques. Focuses on the accuracy, precision and integrity in evidence analysis for a survey of forensic disciplines. Emphasizes the place of forensic analysis as a necessary second step in a sequence that takes evidence from scene, to the lab for analysis and finally into the court of law.

University Core Curriculum (UCC): (UCC: SCI) Learning Outcomes: 1. Appreciate the scope of science in forensic analysis. 2. Develop an understanding of the scientific method in the context of the law. 3. Develop an understanding of the particulars for each forensic sub-discipline. 4. Experience the basic techniques employed by the sub-disciplines reviewed. Credits: 4.00

ENTM 22830 - Forensic Testimony And Ethics

Credit Hours: 3.00. The final course in the forensic science program core, focuses on the legal ramifications that arise when forensic science is applied at the crime scene, in the crime lab and in the courtroom. Students are introduced to ethical issues that form the basis of all scientific investigations and the role of scientists as expert witnesses in maintaining the moral integrity

of our justice system.

Learning Outcomes: 1. Recognize how science and the legal system interact throughout a case life history, and the role played in presenting scientific conclusions at trial. 2. Identify the ethical issues associated with scientific investigations at the scene, including the ability to avoid bias and correct for problems before a case is compromised. 3. Identify the ethical issues associated with scientific investigations at the lab, including the ability to avoid bias and correct for problems before a case is compromised. 4. Identify the ethical issues associated with avoiding bias, correcting for errors and providing testimony as an expert scientific witness. Credits: 3.00

ENTM 22840 - Forensic Entomology Principles

Credit Hours: 2.00. An overview to the four disciplines of forensic entomology. An introduction to stored products, urban, medical/veterinary, and medico-legal entomology.

Learning Outcomes: 1. Understand the broad field of forensic entomology coverage. 2. Define each discipline within forensic entomology. 3. Explain the depth of human and insect interactions. 4. Discuss the role an entomologist can play in a forensic context. 5. Develop an understanding of and explain what each discipline of forensic entomology handles. 6. Categorize the insects that are important to and used in each discipline. 7. Compare and contrast the context that each discipline deals with. 8. Describe the historical impact insects have played within each discipline. Credits: 2.00

ENTM 22841 - Forensic Entomology Principles Lab

Credit Hours: 1.00. An optional laboratory component to Principles of Forensic Entomology. Insects of importance in the fields of stored products, urban, medical/veterinary, and medico-legal will be covered, including morphological identifications and an assessment of their biology and damage.

Learning Outcomes: 1. Experience the basic techniques and skills employed by each of the four main disciplines reviewed. 2. Classify and identify insects within each discipline using morphological characteristics. 3. Develop appropriate collecting and rearing techniques for each type of insect. 4. Evaluate an entomological scenario and create guidelines on how to best handle the situation. Credits: 1.00

ENTM 24200 - Data Science

Credit Hours: 3.00. Develop a data science skill set that complements coursework in mathematics, statistics, and experimental design. Data Science facilitates research by developing skills in data sourcing, formatting and using different types of data, and hypothesis generation. Mathematical communication skills are developed through data graphics, animation, and delivery of results through multiple platforms including interactive simulations on webpages.

Learning Outcomes: 1. Source different types of data and know what analyses are appropriate for each type. 2. Transform and format data for analyses. 3. Detect trends in data as part of hypothesis generation. 4. Communicate findings to different audiences through appropriate graphics and animations, including through web pages. 5. Write R scripts to accomplish all of the above. Credits: 3.00

ENTM 25300 - Insect Physiology And Biochemistry

Credit Hours: 4.00. Introductory course in insect cell biology, biochemistry, and physiology including structures and functions of insect internal and external tissues and organs. A year of college biology or equivalent knowledge is expected.

Learning Outcomes: 1. Understand (i) the structure and functions of insect cells, the major internal organ systems of insects, the insect integument, and homeostatic mechanisms; (ii) insect development and reproduction, and their endocrine control; and (iii) the neural mechanisms that underlie the interactions of insects with their environment and coordinated behavior. 2. Understand the physical and chemical principles underpinning animal physiology. 3. Understand the dependence of function on structure in physiology and biochemistry. 4. Acquire familiarity with commonly used experimental procedures for research in insect physiology and biochemistry.

Credits: 4.00

ENTM 27500 - Honors Course - Lower Division

Credit Hours: 1.00 to 4.00. Utilized to offer a new honors course for a maximum of three years. Variable title, credit, and instructional type. Course may be repeated for credit if content and titles are different. Offered primarily to first and second-year students. Courses offered must be approved by departmental or program faculty, and the College of Agriculture Honors Committee. Must be enrolled in an Honors program. Permission of department required.

Learning Outcomes: 1. Demonstrate proficiency in their chosen discipline that incorporates knowledge, skills, technology, and a professional conduct. 2. Demonstrate critical thinking by using data and reasoning to develop sound responses to complex problems. Credits: 1.00 to 4.00

ENTM 29199 - Cooperative Experience I

Credit Hours: 0.00. Professional experience in entomology. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.

Learning Outcomes: 1. Apply knowledge to identifying and solving problems in the professional context. 2. Advance skills related to professional preparation, critical thinking, problem solving, communication, and team work. 3. Increase understanding of the profession and practice, basic industry principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

ENTM 29299 - Cooperative Experience II

Credit Hours: 0.00. Professional experience in entomology. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.

Learning Outcomes: 1. Apply knowledge to identifying and solving problems in the professional context. 2. Advance skills related to professional preparation, critical thinking, problem solving, communication, and team work. 3. Increase understanding of the profession and practice, basic industry principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

ENTM 29400 - Topics In Forensic Sciences

Credit Hours: 1.00 to 4.00. This course will address the needs for our students to have current information about important emerging areas of Forensic Science and will provide a mechanism for recording such studies on their transcript.

Learning Outcomes: 1. The series is intended to develop content knowledge and critical thinking skills and allow students to demonstrate critical thinking by using data and reasoning to develop sound responses to complex problems. Credits: 1.00 to 4.00

ENTM 29410 - Laboratory Topics In Forensic Science

Credit Hours: 1.00 to 4.00. This course provides students with combined lecture and laboratory experience in important emerging areas of Forensic Science.

Credits: 1.00 to 4.00

ENTM 29500 - Topics In Entomology

Credit Hours: 1.00 to 4.00. Special topics in entomology not available in other entomology courses.

Credits: 1.00 to 4.00

ENTM 29510 - Laboratory Topics In Entomology

Credit Hours: 1.00 to 4.00. Special topics in entomology not available in other entomology courses that include laboratory.

Credits: 1.00 to 4.00

ENTM 30100 - Experimentation And Analysis

Credit Hours: 3.00. Introduction to experimentation and quantitative data analysis in the life sciences with a focus on examples from insect biology.

Learning Outcomes: 1. Start with an observation and design appropriate experiment that recognizes and avoids common pitfalls. 2. Apply the general linear model and its variants in data analysis. 3. Appropriately use common basic statistical packages. Credits: 3.00

ENTM 31100 - Insect Ecology

Credit Hours: 3.00. Insect ecology investigates the fundamental concepts of ecology as they relate to insects, including insect interactions, other insects and their environment. Topics include population and community ecology, plant-insect interactions, insect biodiversity and biogeography, and theoretical and applied ecology. Examples from current entomological and ecological studies are used. Completion of college biology or an introductory course in entomology is recommended.

Learning Outcomes: 1. Comprehend ecological principles at different scales of biological

organization, from the individual to the population to the community to the ecosystem. 2. Understand the mechanisms that mediate interactions of insects with their biotic and abiotic environments. 3. Appreciate the importance of insects as stabilizing and destabilizing components of food webs. 4. Recognize the value and application of insect ecology n solving real-world problems. 5. Demonstrate critical thinking by using data and reasoning to develop sound responses to complex problems. Credits: 3.00

ENTM 31200 - Plant-Insect Chemical Ecology

Credit Hours: 3.00. An overview of the structure and function of natural and synthetic chemical products in insect ecology. One year of college biology. One year of college chemistry strongly recommended.

Learning Outcomes: 1. Appreciate the history and scope of chemical ecology as a discipline. 2. Understand the role of chemistry in the biology/ecology of plants and animals. 3. Appreciate how chemical products influence processes at various levels of biological integration - from genes to ecosystems. 4. Evaluate and critique primary literature on chemical ecology. 5. Recognize the application of insect chemical ecology in solving grand challenges in entomology. Credits: 3.00

ENTM 32810 - Practical Molecular Biology

Credit Hours: 3.00. Students explore molecular technology commonly used in population genetics and diagnostics and apply them to questions in Insect Biology and Forensics.

Learning Outcomes: 1. Appreciate the scope and application of modern Forensic Biology and Insect Biology. 2. Appreciate the scope, diversity and utility of a variety of modern molecular typing techniques as they are used to address Grad Challenges. 3. Perform the primary techniques used in current entomological and forensic molecular data generation: DNA extraction and quantification, PCR, gel electrophoresis and sample purification. 4. Perform molecular data generation analysis. Credits: 3.00

ENTM 32820 - Medico-Legal Entomology

Credit Hours: 3.00. This course explores the main topics covered under medico-legal entomology (MLE). Specifically, the course will focus on the role that insects play in abuse, neglect, and death investigations. Students will experience rearing and identifying the major forensically important insect groups associated with medico-legal investigations. Finally, students will gain an appreciation of the scope of MLE through the analysis of two mock cases.

Learning Outcomes: 1. Establish an understanding of how insects are in used in legal investigations. 2. Define and defend the types of insect evidence presented in abuse & neglect cases. 3. Define and defend the types of insect evidence presented in death investigations. 4. Explain how insects are used to answer various questions in legal investigations. 5. Collect, rear and identify forensically important specimens. 6. Identify forensically important specimens down to family, genus or species level. 7. Demonstrate and explain proper collection techniques from decomposing remains. 8. Demonstrate and explain proper rearing techniques for forensically important insects. 9. Experience medico-legal entomology. 10. Compare and explain the life cycle of forensically important flies. 11. Analyze two medico-legal scenes. 12. Compose forensic entomology case reports. Credits: 3.00

ENTM 33500 - Introduction To Insect Identification

Credit Hours: 4.00. This class is designed for learning more about the collection and identification of adult insects. Emphasis will be placed on collection and sampling techniques, the preparation of specimens for future study, and identification.

Learning Outcomes: 1. Use keys and other published resources to identify unknown insects to the correct family and by-sight identification. 2. Collect a diversity of insects and related arthropods and to prepare specimens to professional standards. 3. State the scientific names, critical taxonomic characters, natural history and biology, unique or interesting

behaviors, ecological role, taxonomic relationships and impacts on human activities of selected families. Credits: 4.00

ENTM 35300 - Insecticides And Environment

Credit Hours: 3.00. Insecticides, their interactions with biological organisms and the environment, regulatory policies, environmental and human health outcomes, and current controversies. A year of college biology and college chemistry or equivalent knowledge is expected.

Learning Outcomes: 1. Communicate to the public about insecticide issues including risk, best practices for management and use. 2. Apply principles of toxicology including dose response, target sites, differential toxicity, and resistance. 3. Evaluate environmental hazards, their management and mitigation. 4. Interpret and implement insecticide label instructions. 5. Explain how Risk Assessment and Management is implemented in the U.S. to protect human health and safety balance economic and environmental risks. Credits: 3.00

ENTM 39000 - Professional Experience Programs In Entomology

Credit Hours: 0.00. Supervised professional experiences in entomology, integrated pest management, or urban/industrial pest control. Programs must be preplanned and conducted under the direction of the departmental coordinator with the cooperation of an employer. Students must submit a summary report. Permission of instructor required.

Credits: 0.00

ENTM 39100 - Professional Experience Programs In Forensic Sciences

Credit Hours: 0.00 to 8.00. The course provides a mechanism for students to record unpaid internships and appropriate professional experiences in Forensic Science on their transcript. Permission of department required.

Learning Outcomes: 1. Experiential learning through interactions with professionals. Credits: 0.00 to 8.00

ENTM 39300 - Insect Biology Practicum

Credit Hours: 1.00. Imbedded programmatic experiences for undergraduate students in Insect Biology including focused reflection on the knowledge, skills, and values necessary for contributions in the discipline. Permission of instructor required.

Learning Outcomes: 1. Survey and experience the scope of the discipline of Insect Biology. 2. Be able to make relevant connections to their own academic, professional and personal motivations and goals in Insect Biology. 3. Understand procedures and approaches useful for research, teaching and extension in Insect Biology. 4. Communicate to others how societal grand challenges are being addressed through the lens of the mentor's program. Credits: 1.00

ENTM 39310 - Insect Biology Practicum II

Credit Hours: 1.00. This course provides imbedded programmatic experiences for undergraduate students. It introduces students to the breadth of the discipline of entomology by engaging them at a programmatic level. This is accomplished by incorporating students into laboratory meetings, research, extension or teaching activities and through discussions with the faculty instructor about the goals and motivations driving their weekly research, extension or teaching activities and how these activities address societal grand challenges. All students enrolled in ENTM 39310 will be required at the end of each of the 8-week sessions and provide a recorded presentation overviewing some aspect of the mentor's program and its linkage to societal grand challenges. Permission of department required.

Learning Outcomes: 1. Survey and experience the scope of the discipline of entomology. 2. Provide students with an opportunity to make relevant connections to their own academic, professional and personal motivations and goals in entomology. 3. Understand procedures and approaches useful for research, teaching and extension in entomology. 4. Communicate to others how societal grand challenges are being addressed through the lens of the mentor's program. Credits: 1.00

ENTM 39399 - Cooperative Experience III

Credit Hours: 0.00. Professional experience in entomology. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.

Learning Outcomes: 1. Apply knowledge to identifying and solving problems in the professional context. 2. Advance skills related to professional preparation, critical thinking, problem solving, communication, and team work. 3. Increase understanding of the profession and practice, basic industry

principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

ENTM 39499 - Extensive Cooperative Experience IV

Credit Hours: 0.00. Professional experience in entomology. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.

Learning Outcomes: 1. Apply knowledge to identifying and solving problems in the professional context. 2. Advance skills related to professional preparation, critical thinking, problem solving, communication, and team work. 3. Increase understanding of the profession and practice, basic industry principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

ENTM 39599 - Extensive Cooperative Experience V

Credit Hours: 0.00. Professional experience in entomology. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.

Learning Outcomes: 1. Apply knowledge to identifying and solving problems in the professional context. 2. Advance skills related to professional preparation, critical thinking, problem solving, communication, and team work. 3. Increase understanding of the profession and practice, basic industry principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

ENTM 40000 - Entomology Study Abroad

Credit Hours: 0.00 to 8.00. Utilized to record credits earned through participation in Purdue study abroad programs with cooperating foreign universities.

Credits: 0.00 to 8.00

ENTM 40100 - Addressing Grand Challenges Through Insect Biology

Credit Hours: 1.00. This course engages students in an examination of societal grand challenges by identifying the problems, understanding the current state of knowledge, identifying knowledge gaps, and implementing possible solutions. Permission of department required.

Learning Outcomes: 1. Explain how the accumulated knowledge and experiences of Insect Biology majors can be applied to address Grand Challenges. 2. Demonstrate where capstone projects and grand challenges intersect. 3. Explain roles insect biologists play in addressing grand challenges, and the relationship to future career options. 4. Demonstrate skills in communication, critical thinking and teamwork. Credits: 1.00

ENTM 41000 - Applied Insect Biology

Credit Hours: 2.00. Identification, biology and management of insects associated with global food and energy security and human and animal health and well-being. Students are expected to have a knowledge of college biology.

Learning Outcomes: 1. Identify insects impacting global food and energy security, human and animal health and well-being, and environmental integrity. 2. Demonstrate familiarity with the biology of insect pests. 3. Understand and demonstrate the principles and practice of insect management and conservation. Credits: 2.00

ENTM 41001 - Insects Of Urban Landscapes

Credit Hours: 1.00. Students focus on identification and biology of insects associated with turfgrass and ornamental plants. The role of experimentation in applied insect biology is examined.

Learning Outcomes: 1. Identify pest and beneficial insects associated with turfgrass and ornamental plants. 2. Understand and describe the biology of pest and beneficial insects associated with turfgrass and ornamental plants. 3. Participate in the design, implementation, analysis, summary and critique of a semester-long group research project or experiment in applied insect biology. Credits: 1.00

ENTM 41002 - Insects Of Agricultural Crops

Credit Hours: 1.00. Students focus on identification, biology, and management of pests of agricultural crops, identification of natural enemies, and application of scientific method to applied insect biology.

Learning Outcomes: 1. Identify pest insects associated with agricultural crops and

understand their biology and management. 2. Identify natural enemies of pest species associated with agricultural corps and explain how they can be used in pest management. 3. Participate in the design, implementation, analysis, summary and critique of a semester-long group research project or experiment in applied insect biology. Credits: 1.00

ENTM 42820 - Carrion Ecology

Credit Hours: 3.00. This course explores how carrion interact with the environment and other organisms during the decomposition process. Focus will be given to an understanding of the process itself, how investigators collect information about the process, and how research is conducted into the process of decomposition. Students will carry out an experiment and write their results up in the format of a peer reviewed article.

Learning Outcomes: 1. Explain the process of decomposition. 2. Describe and distinguish the stages of vertebrate decomposition, including when those stages begin and end and what variables define a given stage. 3. Describe and explain the abiotic factors that influence decomposition. 4. Describe and explain the biotic factors that influence decomposition. 5. Explain the nutrient flow through a carrion resource, including how various living organisms take advantage of such resources. 6. Experience carrion ecology field techniques. 7. Measure the abiotic factors that influence decomposition. 8. Measure the biotic factors that influence decomposition. 9. Evaluate a decomposition scene and strategize site data collection. 10. Identify the species the animals that frequent a carrion source. 11. Develop and implement a research project. 12. Plan, propose and defend a scientific research project related to carrion ecology. 13. Build a budget for a research project. 14. Build a collection strategy SOP for a research project. 15. Conduct a proposed research project. 16. Analyze the results of a research project. 17. Write-up, print and submit a research paper on your project, using the format for INSTARS or JPUR. Credits: 3.00

ENTM 42890 - Forensic Science Teaching

Credit Hours: 3.00. This course provides an opportunity for students who have completed forensic science courses to assist in that course previously taken, reinforcing the skills, expanding their mastery of the scientific method and how it pertains to forensic science as well as introducing basic pedagogical tools for instruction to the student. Permission of Instructor required.

Learning Outcomes: 1. Display mastery in the scientific method in the context of the law. 2. Demonstrate appropriate presentation skills. 3. Demonstrate appropriate assessment and pedagogical skills. Credits: 3.00

ENTM 43100 - Human-Wildlife Conflicts

Credit Hours: 3.00. Exploration of conflicts between human interests and wildlife and the regulations policies and legislation used to minimize conflicts. Negative interactions may be real or perceived, economic or aesthetic, social or political, and may pose risks to human health and safety. Emphasis on the causes of conflict and resolutions that seek to balance protection or conservation of wildlife with protection of other public resources and individual property owners. Prior knowledge of college-level general biology and ecology is expected.

Learning Outcomes: 1. Identify common causes of human-wildlife conflicts. 2. Evaluate the impacts of the conflict damage/threat. 3. Prescribe options for resolving the conflict. 4. Measure effectiveness of applied mitigation strategies. Credits: 3.00

ENTM 47500 - Honors Course-Upper Division

Credit Hours: 1.00 to 4.00. Utilized to offer a new honors course for a maximum of three years. Variable title, credit, and instructional type. Course may be repeated for credit if content and titles are different. Offered primarily to third and fourth-year students. Courses offered must be approved by departmental or program faculty, and the College of Agriculture Honors Committee. Must be enrolled in an Honors program. Permission of department required.

Learning Outcomes: 1. Demonstrate proficiency in their chosen discipline that incorporates knowledge, skills, technology, and a professional conduct. 2. Demonstrate critical thinking by using data and reasoning to develop sound responses to complex problems. Credits: 1.00 to 4.00

ENTM 49310 - Insect Biology Capstone Experience

Credit Hours: 2.00 or 4.00. Insect Biology majors complete a

capstone project under the guidance of a faculty mentor. Permission of instructor required.

Learning Outcomes: 1. Conduct a capstone project and analyze and interpret the information generated. Credits: 2.00 or 4.00

ENTM 49320 - Insect Biology Capstone Experience II

Credit Hours: 2.00 to 4.00. This course is an experiential meant to familiarize students with the options and procedures associated with the Entomology capstone experience and provide students with an avenue for fulfilling their capstone requirement by conducting a capstone project. Students may use a research, extension or teaching project to meet this requirement. Although the capstone project may build on or extend a previously conducted undergraduate research project, independent study, or study abroad, students enrolled in ENTM 49320 must conduct their capstone project in a manner that is independent from any other project for which credit will be awarded or for which they will be paid as an employee. Students may enroll in ENTM 49320 and conduct the capstone project at any time during the last 2 years of study. Permission of department required.

Learning Outcomes: 1. Demonstrate their ability to integrate their accumulated knowledge and technical and social skills in order to identify and solve a problem relevant to Entomology. 2. Conduct a capstone project and analyze or interpret the information generated. Credits: 2.00 to 4.00

ENTM 49390 - Insect Biology Capstone Forum

Credit Hours: 1.00. Students apply their accumulated knowledge to grand challenges and careers in insect biology. Permission of department required.

Learning Outcomes: 1. Demonstrate ability to integrate accumulated knowledge, technical and social skills to identify and solve a problem relevant to Insect Biology. 2. Communicate the results the Capstone mentored research project through oral and written presentations. Credits: 1.00

ENTM 49400 - Advanced Topics In Forensic Sciences

Credit Hours: 1.00 to 4.00. This course will provide an avenue for students to pursue knowledge in emerging advanced areas of Forensic Science. Permission of department required.

Learning Outcomes: 1. The series is intended to develop content knowledge and critical thinking skills and allow students to demonstrate critical thinking by using data and reasoning to develop sound responses to complex problems. Credits: 1.00 to 4.00

ENTM 49410 - Advanced Laboratory Topics In Forensic Science

Credit Hours: 1.00 to 4.00. This course will provide an avenue for students to pursue laboratory techniques in emerging advanced areas of Forensic Science. Permission of Department required.

Credits: 1.00 to 4.00

ENTM 49500 - Advanced Topics In Entomology

Credit Hours: 1.00 to 4.00. Special topics in entomology at upper division level not available in other entomology courses. Permission of department required.

Learning Outcomes: 1. Learn information about important emerging areas of entomology including but not limited to new invasive species, advance in biotechnology, advances in insect science and topics that prepare students to address emerging problems at the state, national and global levels. 2. Demonstrate critical thinking by using data and reasoning to develop sound responses to complex problems. Credits: 1.00 to 4.00

ENTM 49510 - Advanced Laboratories In Entomology

Credit Hours: 1.00 to 4.00. Special laboratories in entomology at upper division level not available in other entomology courses. Permission of department required.

Credits: 1.00 to 4.00

ENTM 49700 - Special Problems In Forensic Science

Credit Hours: 1.00 to 4.00. This course will provide an opportunity for qualified sophomores, juniors and seniors to engage in the study of special Forensic Science problems not covered in regular coursework. It will also provide a mechanism for recording these independent studies on their transcript. Permission of department required.

Learning Outcomes: 1. To develop content knowledge and critical thinking skills and allow students an opportunity to demonstrate critical thinking by using data and reasoning to develop sound responses to complex problems. Credits: 1.00 to 4.00

ENTM 49800 - Special Problems In Entomology

Credit Hours: 1.00 to 4.00. Open to qualified sophomores, juniors, and seniors who want to study special problems in entomology not covered in regular coursework. Permission of instructor required.

Credits: 1.00 to 4.00

ENTM 50800 - Integrative Insect Taxonomy

Credit Hours: 4.00. A multisource approach to understanding insect taxonomy, morphology, and evolution. We will compare traditional classification schemes with new hypotheses of insect evolutionary relationships based on an array of data sources. Students learn the importance of natural history collections and how to prepare insect specimens for permanent storage. We will explore insect diversity through hands-on laboratory exercises and field research.

Learning Outcomes: 1. Identify insects to family by to sight. 2. Implement field techniques for collecting insect specimens. 3. Demonstrate proper insect collection preparation and curation. 4. Understand the principles of insect morphology, classification, and nomenclature. 5. Understand phylogenetic hypotheses and their implementation in insect taxonomy. 6. Integrate skills through a final class project on insect evolution. Credits: 4.00

ENTM 52500 - Medical And Veterinary Entomology

Credit Hours: 3.00. Introduction to the biology and control of arthropods of medical and veterinary importance, and coverage of the natural history and abatement of selected arthropod-related diseases, including arboviral encephalitis, filariasis, leishmaniasis, Lyme disease, malaria, plague, spotted fever, trypanosomiasis, and myasis. Offered in odd-numbered years.

Credits: 3.00

ENTM 59500 - Special Topics

Credit Hours: 1.00 to 4.00. Specialized topics not covered in other courses. May be repeated for credit if the course topic is not repeated. The specific topic offered is indicated on the student's record. Permission of instructor required.

Credits: 1.00 to 4.00

ENTM 60000 - Graduate Student Orientation

Credit Hours: 1.00. Introduction and orientation to the requirements and culture of the Department of Entomology, the College of Agriculture, and Purdue University. Intended for graduate students in their first year.

Learning Outcomes: 1. Know the administrative regulations and procedures of Entomology and the Graduate School. 2. Know the history of Entomology. 3. Know the land grant mission and the role of Entomology. 4. Know the University hierarchy. 5. Know the roles, rules and expectations of the apprentice and mentors. 6. Begin creation of a career plan. 7. Develop strategies for effective networking. 8. Learn how to communicate within the discipline through oral and poster presentations. 9. Participate in independent activities. Credits: 1.00

ENTM 60200 - Insect Biology

Credit Hours: 3.00. A comprehensive course in entomology, for graduate students with little entomological background, that introduces students broadly to insect structure, function, behavior, ecology, pest management, and systematics. Students apply broad knowledge in each of the topic areas to a specific insect and are expected to be able to read and critically evaluate primary literature and summarize it in written and oral presentations. One year of college biology is strongly recommended.

Learning Outcomes: 1. Become conversant with entomology terms and definitions. 2. Be proficient in search techniques for the primary literature, to read, evaluate and discuss the primarily literature, and be able to extract information from primary sources and apply it to their own area of research. Credits: 3.00

ENTM 60900 - Science Writing

Credit Hours: 1.00. This course is designed for graduate students (MS or PhD) at any stage in their professional career who are seeking formal training in manuscript and grant writing for a scientific audience. Students will be required to attend class and prepare for in-class group discussions and writing activities by reading assigned sections of the text or associated papers. Students will also be required to prepare a written assignment (manuscript or grant) over the course of the semester, which they will use to practice and hone newly acquired skills, as well as participating in peer evaluation of one another's writing. Permission of department required.

Learning Outcomes: 1. Utilize resources and approaches (e.g. online tools, peer-writing groups, time management skills) to develop regular writing habits. 2. Perform critiques of scientific manuscripts and research proposals. 3. Provide constructive criticism to fellow students on writing assignments. 4. Learn steps and basic principles (e.g. language, narrative

structure, revision Revised: 08/11/21 process) used to write clear and concise scientific papers for a variety of audiences. 5. Apply principles of science writing to develop a complete draft of a specific section(s) of the MS/PhD research proposal, critical literature review, manuscript or other academic work (with instructor permission). Credits: 1.00

ENTM 61000 - Current Trends In Insect Pest Management

Credit Hours: 3.00. Concepts of pest management and dynamics of pest populations, with emphasis on population regulation in theory and practice. The principles of applied ecology that pertain to insects and agricultural crops and systems. Identification, biology, behavior, and relationships of pests of forage, fiber, and vegetable crops. A knowledge of introductory entomology is recommended. Offered in even-numbered years.

Learning Outcomes: 1. Identify key insects in economically important IPM systems. 2. Design a pest management plan that includes preventive practices, sampling and economic thresholds. 3. Identify gaps in management techniques and propose new research directions. 4. Discuss key IPM concepts. Credits: 3.00

ENTM 61100 - Toxicology Of Insecticides

Credit Hours: 3.00. The chemistry, mode of action, and metabolism of insecticides and related compounds in both insect and vertebrate systems. Evaluation of toxic action, principles of selective toxicity, insecticide resistance, and environmental effects are also discussed. A minimal knowledge of entomology is required. Knowledge of biochemistry and neurobiology is useful. Offered in even-numbered years.

Credits: 3.00

ENTM 64200 - Analysis Of Ecological Data

Credit Hours: 3.00. Intermediate course in analysis options for biological and ecological data. Topics include: univariate, multivariate, parametric and non-parametric analysis and their basis; advanced graphical techniques; basic mapping with and without geographical information systems; simulation modeling; associated coding for open source platforms. A previous graduate-level course in statistics is required. Working knowledge of ANOVA, t-tests, linear regression, and assumptions and distributions of test statistics for these is assumed.

Learning Outcomes: 1. Know data and analysis requirements when planning experiments and observational studies. 2. Apply several univariate and multivariate statistical analyses. 3. Model or simulate simple biological or ecological systems. 4. Use several different graphing techniques including mapping, three-dimensional plots, and animations. 5. Write code to accomplish 1-4 within open-source software. 6. Develop critical thinking skills. 7. Foster creativity by finding alternative solutions to analytical challenges. 8. Develop both the written and the technical side of communication skills. Credits: 3.00

ENTM 69100 - Special Problems

Credit Hours: 1.00 to 12.00. Special research topics of interest to graduate students and not included in assigned coursework. Permission of instructor required.

Credits: 1.00 to 12.00

ENTM 69200 - Special Topics

Credit Hours: 1.00 to 4.00. Advanced topics in specialties of department members such as, but not limited to: biochemistry and physiology; biological control; insect pest management; veterinary entomology; nematode systematics; pathology; systematics. The field in which work is offered will appear on the student's record. Doctoral student standing. Permission of instructor required.

Credits: 1.00 to 4.00

ENTM 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required.

Credits: 1.00 to 18.00

ENTM 69900 - Research PhD Thesis

Credit Hours: 1.00 to 18.00. Research PhD Thesis. Permission of instructor required.

Credits: 1.00 to 18.00

Entrepreneurship

ENTR 20000 - Introduction To Entrepreneurship And Innovation

Credit Hours: 3.00. This course introduces students to the process of turning ideas, inventions, and innovations into new business ventures. It covers foundational entrepreneurial concepts and practices, as well as the leadership, teamwork, and communication skills required of individuals who choose to become entrepreneurs or to act entrepreneurially in established organizations. It serves as the first required core course for the Certificate in Entrepreneurship and Innovation.

Learning Outcomes: 1. Explain how innovation and entrepreneurship drive economic growth. 2.

Use creativity and ideation techniques to identify market opportunities. 3. Evaluate the feasibility of new venture opportunities using secondary market research. 4. Interpret financial statements, profit and loss, and breakeven analysis. 5. Identify sources of funding for new ventures. 6. Understand how to prepare a proper legal and ethical foundation for a new venture. 7. Describe the role of intellectual property protection in the venture development process. 8. Define the roles of diverse individuals on an entrepreneurial team. 9. Prepare and deliver persuasive business presentations. Credits: 3.00

ENTR 31000 - Marketing And Management For New Ventures

Credit Hours: 3.00. This course builds on the foundational skills developed in ENTR 20000 (prerequisite course) to bring students through the process of launching a new venture. Students work in teams to develop and validate business models for potential startups. This occurs through experiential activities including gathering feedback from potential customers, creating forecasts, developing a go-to-market strategy, and pitching to investors. Students can choose ENTR 31000, ENTR 31500, or ENTR 32500 to serve as the second required core course for the Certificate in Entrepreneurship and Innovation.

Learning Outcomes: 1. Validate new business concepts and business models. 2. Conduct primary market research with prospective customers. 3. Apply the financial knowledge necessary for sales forecasting and cash flow management. 4. Evaluate methods to acquire and manage financial resources for a proposed venture. 5. Persuade investors and partners to support an entrepreneurial venture. 6. Identify and recruit talent for an entrepreneurial team. 7. Participate effectively as a team member or leader. Credits: 3.00

ENTR 31500 - Business Planning For Social Entrepreneurship

Credit Hours: 3.00. This course builds on entrepreneurship concepts and skills developed in ENTR 20000 (prerequisite course) to understand the differences, benefits, and opportunities associated with social impact business models. Students work in teams on experiential activities including gathering customer feedback, creating forecasts, developing a strategy, and pitching to stakeholders and investors. Students can choose ENTR 31000, ENTR 31500, or ENTR 32500 to serve as the second required core course for the Certificate in Entrepreneurship and Innovation.

Learning Outcomes: 1. Develop convincing social enterprise business models. 2. Conduct feasibility analysis. 3. Create pro-forma financial statements. 4. Understand legal, regulatory, and ethical issues social entrepreneurs face. 5. Understand the process of recruiting, hiring, and developing a new venture team. 6. Identify sources of funding and investor needs. 7. Persuade potential investors to support a social impact venture. 8. Participate effectively as a team member or leader. Credits: 3.00

ENTR 32500 - Global Entrepreneurship And Innovation

Credit Hours: 3.00. This course builds on the foundational skills developed in ENTR 20000 (prerequisite course), to provide students with a comprehensive understanding of entrepreneurship in a global context. It explores the differences, challenges, and opportunities associated with developing international ventures and expanding into overseas markets. Through topic lectures, case studies, and experiential team projects, students will gain insight into global trends, cultural nuances, business models, strategies, and pitching to stakeholders and investors. Students can choose ENTR 31000, ENTR 31500, or ENTR 32500 to serve as the second required core course for the Certificate in Entrepreneurship and Innovation.

Learning Outcomes: 1. Identify economic, political, technological, ethical, and cultural factors influencing entrepreneurship in global settings. 2. Develop cross-cultural awareness to navigate diverse business environments. 3. Conduct feasibility analysis for international venture establishment and expansion. 4. Recognize critical aspects of global supply chains and associated business implications. 5. Describe international funding sources and currency considerations. 6. Explore global entrepreneurship and innovation ecosystems as scalability engines. 7. Understand the process of recruiting, hiring, and developing a global team. 8. Participate effectively as a team member or leader. Credits: 3.00

ENTR 39000 - Special Topics In Entrepreneurship And Innovation

Credit Hours: 1.00 to 3.00. The requested course will provide the opportunity to develop courses which fulfill the "option" course requirement for the Certificate in Entrepreneurship and Innovation Program. Option courses are designed to provide depth in certain disciplines related to entrepreneurship and innovation, and/or entrepreneurship and innovation in relation to specific industries or markets.

Credits: 1.00 to 3.00

ENTR 39699 - Internship And Research Experiences

Credit Hours: 0.00. Interns for Indiana internships work experience with participating employers. Students submit a summary report and company evaluation. Through a mutual selection process, students may be placed as interns with entrepreneurial companies. Placements are determined through a screening process based upon students' skills and experiences gained through their major fields of study. Fulfills a capstone requirement for the Certificate in Entrepreneurship and Innovation Program. Contact the Office of Professional Practice. Permission of instructor required. Discovery Park Undergraduate Research Internships. Check the DURI website for further information. https://www.purdue.edu/discoverypark/duri/.

Learning Outcomes: 1. Gain skills and experiences through their major fields of study. Credits: 0.00

ENTR 46000 - Internship And Career Preparation Seminar

Credit Hours: 1.00. This course is a distance option course for the Certificate in Entrepreneurship and Innovation. It equips students with professional skills based on entrepreneurship competencies. Students develop resources to illustrate their skills, talents, abilities, and goals to increase career preparedness. They learn what it takes to successfully transfer academic skills to a workplace setting and develop an entrepreneurial mindset that sets them apart from other job seekers.

Learning Outcomes: 1. Improve self-awareness of professional skills development through assessments and reflection. 2. Create a professional brand through an improved LinkedIn profile, resume review, interviewing, and networking skills. 3. Showcase educational and professional skills in an e-portfolio or website. Credits: 1.00

ENTR 47000 - Gender, Diversity And Leadership

Credit Hours: 3.00. This course serves as an option course for the Certificate in Entrepreneurship and Innovation. It provides a social and historical perspective of gender and diversity in leadership and entrepreneurship, as well as practical skills students can use to develop their own leadership abilities. This highly interactive course provides the opportunity for students to meet with diverse leaders from a variety of organizations. Topics of social, political, and economic interest are covered, as are discussions of current issues and research relevant to leadership success.

Learning Outcomes: 1. Define the social, cultural, organizational, and historical dimensions of gender and leadership. 2. Identify contemporary gender and leadership issues. 3. Practice communication, negotiation, and other skills relevant to leadership success. Credits: 3.00

ENTR 48000 - Entrepreneurial Leadership And Careers

Credit Hours: 3.00. This course prepares students for entrepreneurial careers by requiring them to apply the knowledge and skills learned in prerequisite entrepreneurship courses to the development of their professional goals and networks. Students explore how they can use their entrepreneurial talents, skills, and interests in a variety of ways, including launching startups, joining family businesses, or being intrapreneurs in established organizations. The course serves as a capstone for the Certificate in Entrepreneurship and Innovation.

Learning Outcomes: 1. Identify unique personal entrepreneurial strengths to help shape career decisions. 2. Understand the practical application of team building and leadership. 3. Explore different types of entrepreneurial careers in startups and large organizations. 4. Research and interview entrepreneurs about career pathways. 5. Use secondary research to assess potential employers and their alignment with personal goals. 6. Explore options for using entrepreneurial skills within existing organizations. 7. Understand key elements of personal financial planning and management. 8. Build a personal brand and use social media platforms to expand professional networks. 9. Create a personal business plan. Credits: 3.00

ENTR 48100 - Consulting For Emerging Enterprises

Credit Hours: 3.00. This course is an experiential course that requires students to apply the knowledge and skills learned in

prerequisite entrepreneurship courses to a real-world consulting project for a startup, small business, or non-profit organization. Student teams use a three-stage consulting model to guide project contracting, data gathering, and value creation for the client. In-class time focuses on developing consulting knowledge and competencies that are applied directly to client interactions and project execution. The course serves as a capstone for the Certificate in Entrepreneurship and Innovation. Class size is limited. Permission of the instructor is required.

Learning Outcomes: 1. Develop consulting skills through a hands-on consulting engagement. 2. Think strategically about a small business in a complex and changing environment. 3. Practice leadership and organization skills by establishing priorities, setting expectations, and completing objectives within a team. 4. Effectively use consulting tools and practices to analyze operations establish priorities for improving effectiveness and growing the business. 5. Collaborate with clients by establishing positive relationships, building trust, sharing information, educating, learning, and solving problems. 6. Create value for a consulting client through tangible deliverables including new methods, processes, systems, products and services that will have a lasting impact on the long-term growth of the business. 7. Network with entrepreneurs and service providers from a variety of disciplines. Credits: 3.00

ENTR 48200 - Venture Planning Studio

Credit Hours: 3.00. This course is an experiential course that brings students through the process of creating a startup company as they would in a real-world business incubator or venture studio. They apply knowledge and methodologies related to design thinking, lean startup, financial planning, and fundraising to develop robust business models. Students can bring their own ideas to the course or contribute to one that will be identified. The purpose of this course is to develop in students the confidence and competence to transform a venture idea into a viable startup company. The course serves as a capstone for the Certificate in Entrepreneurship and Innovation.

Learning Outcomes: 1. Use design thinking to generate new ideas for to solve stakeholder problems. 2. Employ Customer Forces and Jobs to Be Done models and methodologies to inform a Lean Canvas. 3. Create unique value propositions and concepts for new products, technologies, or services. 4. Conduct customer interviews to identify market opportunities and risks. 5. Define cost structure, pricing, and go-to-market strategy. 6. Develop pro-forma financial statements. 7. Build a minimal viable product (if appropriate). 8. Present a persuasive investor pitch deck. Credits: 3.00

ENTR 49000 - Senior Level Special Topics In Entrepreneurship And Innovation

Credit Hours: 1.00 to 3.00. The requested course will provide the opportunity to develop capstone courses for the Certificate in Entrepreneurship and Innovation Program. Capstone courses are designed to provide students with the opportunity to apply the knowledge acquired in Certificate Program "core" and "option" courses to hands-on, real world activities related to entrepreneurship and innovation.

Credits: 1.00 to 3.00

ENTR 50000 - Technology Commercialization Seminar

Credit Hours: 2.00. This course is a seminar that focuses on topics related to technology realization, commercialization, and entrepreneurship. Topics pertaining to these areas are covered through readings, class discussion, and presentations by invited speakers.

Learning Outcomes: 1. Evaluate a new technology in terms of its value proposition and product/market fit. 2. Document how to conduct market analysis and customer development. 3. Give examples of why intellectual property protection, legal business formation, and contracts are important to startup companies. 4. Describe why raising money is essential for technology entrepreneurship. 5. Differentiate the various resources supporting entrepreneurs in the community. Credits: 2.00

ENTR 50100 - Technology Commercialization Practicum

Credit Hours: 2.00. This course introduces a variety of cross-disciplinary topics to develop the skills needed to realize technology. Each week, students learn specific methodologies and techniques and apply these through case studies and class projects.

Learning Outcomes: 1. Conduct market research for a new technology. 2. Define market

segments through market analysis. 3. Evaluate business models for a new technology. 4. Develop a go-to-market strategy for a new venture. 5. Create and deliver an investor pitch for a new venture. Credits: 2.00

ENTR 59000 - Graduate Level Special Topics In Entrepreneurship And Innovation

Credit Hours: 1.00 to 3.00. The requested course will provide the opportunity for graduate students to participate in entrepreneurship courses focused on the skills and knowledge necessary to launch and lead new business ventures, the examination of the feasibility and market potential of new technologies, and/or the development of business plans.

Learning Outcomes: 1. Acquisition of the skills and knowledge necessary to launch and lead new ventures. 2. Examination of the feasibility and market potential of new products or technologies. 3. The development of business plans for new ventures. Credits: 1.00 to 3.00

Environmental and Ecological Engineering

EEE 23000 - Engineering Economics And Environment

Credit Hours: 3.00. This course introduces life cycle analysis concepts; every process and material involved in an object's life is accounted for in a system boundary to quantify the effect an item has on the world's environment. Students will become familiar with how materials are sourced from nature, how they are processed into components, how those components are assembled into consumer items, how the consumer item continues to require resources, and how the item is eventually disposed. Particular focus is given to how each of these topics impacts societies and environments at both local and global scales.

Learning Outcomes: 1. Design engineering and manufacturing systems with reduced environmental and ecological impact using industrial ecology principles. 2. Describe principles of life cycle analysis (LCA), including its different forms, its limitations, its endpoints, and the common tools, techniques, and databases available to assist in LCA. 3. Identify common relationships and dynamics in complex systems, including environmental systems, socio-economic systems, and engineered systems. 4. Conduct a limited life cycle analysis on an industrial product or process, with a defined analysis goal. 5. Quantify the physical inputs and outputs of specific engineering processes that comprise a product life cycle. 6. Demonstrate awareness of the roles and responsibilities of stakeholders in complex contemporary environmental issues. 7. Identify implicit and explicit impacts on various stakeholder groups from policies and decisions on environmental issues and engineering solutions. 8. Develop an equitable engineering design proposal. Credits: 3.00

EEE 25000 - Environmental, Ecological, And Engineering Systems

Credit Hours: 3.00. An overview of systems thinking and examples, and applications to environmental, ecological, and engineering systems. Students will develop an understanding of complex and global systems, along with the tools and analysis methods required to deal with them. Basic environmental and ecological science concepts are also included.

Learning Outcomes: 1. Understand the types of relationships and dynamics common in complex systems, including environmental systems, ecological systems, and engineering systems. 2. Able to apply fundamental systems tools and modeling approaches to a wide variety of engineering, environmental, and ecological problems. 3. Understand the foundational concepts and vocabulary of global environment and ecological systems. 4. Appreciate the complexity of contemporary issues related to society and EEE, including and understanding of the roles and responsibilities of stakeholders. Credits: 3.00

EEE 29001 - Introduction To Environmental & Ecological Engineering Seminar

Credit Hours: 2.00. Guest presenters, peer panelists, and small group discussions introduce students to the knowledge, skills, and abilities needed in order to exhibit the highest levels of professionalism & stewardship expected of an Environmental and Ecological Engineering graduate. Topics include planning a course of study; internship, research, study abroad opportunities; career planning and placement skills; professional responsibility and ethics; and functioning as a professional.

Learning Outcomes: 1. Communicate

professionally in both formal and informal settings. 2. Create career documents (e.g., resumes, cover letters, LinkedIn Profiles) that demonstrate professionalism and critical thinking. 3. Understand how their actions and/or inactions are perceived in professional settings. 4. Identify and justify their curricular path at Purdue University. 5. Identify a variety of curricular, extra-curricular, and professional opportunities that will best support the achievement of their career goals. Credits: 2.00

EEE 29199 - Cooperative Experience I

Credit Hours: 0.00. Professional experience in environmental and ecological engineering. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.

Learning Outcomes: 1. Apply knowledge to identifying and solving problems in the professional context. 2. Advance skills related to professional preparation, critical thinking, problem solving, communication, and teamwork. 3. Increase understanding of the profession and practice, basic industry principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

EEE 29299 - Cooperative Experience II

Credit Hours: 0.00. Professional experience in environmental and ecological engineering. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.

Learning Outcomes: 1. Apply knowledge to identifying and solving problems in the professional context. 2. Advance skills related to professional preparation, critical thinking, problem solving, communication, and teamwork. 3. Increase understanding of the profession and practice, basic industry principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

EEE 29500 - Experimental Course

Credit Hours: 0.00 to 6.00. Topics vary. Arrange hours and credit. Permission of instructor required.

Credits: 0.00 to 6.00

EEE 30000 - Environmental And Ecological Systems Modeling

Credit Hours: 3.00. Introduction to computational methods for describing physical, chemical, and microbiological processes that occur in natural and engineered aqueous systems, including rivers and lakes, and within water and wastewater treatment systems. Emphases on understanding and conceptualizing important processes, data analysis, algorithm development, and competency in the use of programming tools.

Learning Outcomes: 1. Apply simple models to natural and engineered systems. 2. Identify processes critical to proper formulation of ecological and environmental models. 3. Formulate models to analyze specific issues concerning natural waters and wastewaters. 4. Encode model algorithms into common software packages. 5. List limitations and assumptions of classic and self-formulated models. Credits: 3.00

EEE 35000 - Introduction To Environmental And Ecological Engineering

Credit Hours: 3.00. Introduction to water pollution, air pollution, noise, hazardous and solid wastes, and their control. Environmental impact statements and global pollution issues. Field trips required.

Learning Outcomes: 1. An ability to apply material balance tools to environmental systems. 2. An ability to describe the different types of air, soil, and water pollutants and how they affect environmental quality on a local or global scale. 3. An ability to explain the principles of water, wastewater, air, soil, and hazardous waste treatment processes. 4. An ability to describe the professional and ethical responsibility of engineers in the context of environmental management. 5. An ability to describe the key roles and responsibilities of public institutions and private organizations in managing environmental resources. Credits: 3.00

EEE 35500 - Engineering Environmental Sustainability (UCC: STS)

Credit Hours: 3.00. (CE 35500) An introduction to the examination of global-scale resource utilization, food, energy and commodity production, population dynamics, and their ecosystem impacts.

University Core Curriculum (UCC): (UCC: STS) Learning Outcomes: 1. Students will be creative thinkers that can collect and analyze appropriate data and information, and perform necessary quantitative analysis to develop original and innovative management strategies for real-world sustainability problems. 2. Students will be able to individually and in teams skillfully communicate in writing, orally, and with multimedia their ideas and conclusions about managing sustainability issues in a manner that increases knowledge and understanding of the audience. 3. Students will be critical thinkers that can identify the environmental, social, political, and economic dimensions of technical challenges and evaluate their own and others' perspectives in forming logical opinions and conclusions. 4. Students will be able to effectively identify information needs, efficiently acquire appropriate information, and critically evaluate and use it in an ethical and scholarly fashion to gain understanding of and communicate about sustainability issues, challenges, and strategies. 5. Students will become global citizens and socially aware by gaining knowledge of diverse international and cultural perspectives and display social responsibility and leadership in managing sustainability issues, ultimately increasing their global literacy. 6. Students will learn how to be a productive team member, constructively evaluate their own and others' performances, resolve conflicts effectively and encourage the willing contributions of everyone. Credits: 3.00

EEE 36000 - Environmental And Ecological Engineering Laboratory

Credit Hours: 1.00 to 3.00. An introduction to laboratory methods of analysis of Environmental and Ecological Engineering systems. Topics will change from semester to semester and will be announced in advance. The list of possible topics includes experimental design, treatment of data, the analytical determination of chemical and biological constituents in water, soil, and air; analysis of environmental and ecological engineering processes; analysis of life-cycle characteristics and impacts of consumer products and commodities; methods of prevention and remediation of manufacturing waste streams.

Learning Outcomes: 1. Ability to acquire experimental data and evaluate experimental error and variability. 2. Understanding of data reduction, analysis and presentation. 3. Ability to produce professional technical communication of experimental conclusions. 4. Ability to summarize results of quantitative analysis to propose management strategies for environmental problems. Credits: 1.00 to 3.00

EEE 36001 - Water Quality And Treatment Laboratory

Credit Hours: 3.00. Laboratory procedures are described and performed that examine chemical, physical, and biological properties and constituent concentrations of natural waters. In addition, water treatment process experiments are performed to show how constituent concentrations can be altered during water treatment processes. Procedures include the analytical determination of several chemical and biological constituents in water by titrimetric, colorimetric, or chromatographic methods, whereas treatment processes include reactor design, pH adjustment, ion exchange, lime softening, coagulation, and disinfection.

Learning Outcomes: 1. Apply physical, chemical, and biological principles to each experimental procedure or measurement technique. 2. Conduct laboratory experiments, making quantitative measurements to assess water quality and water treatment process performance. 3. Organize, report, and graphically display experimental data in common software packages. 4. Analyze and evaluate experimental data on its quality and significance (i.e., usefulness). 5. Identify issues (i.e., problems) with data collection and data uses. Credits: 3.00

EEE 36002 - Environmental Sustainability For Industry, Laboratory

Credit Hours: 3.00. This lab course provides an opportunity for students to gain hands-on experience with the physical and analytical tools of industrial sustainability. These include experimental methods for product testing and air quality measurement; design and planning of experiments; statistical interpretation of experimental data; design and environmental

assessment of building energy use, combustion systems, and electrical circuits; and life-cycle management of electronic equipment and other household products. Students are encouraged to complete their statistics requirement.

Learning Outcomes: 1. Develop a hypothesis and design experiments to test the hypothesis. 2. Conduct/interpret statistical analysis of experimental results. 3. Describe power and energy demand in multiple contexts including electricity, combustion, and heat transfer. 4. Propose energy efficiency solutions and evaluate their economic and environmental consequences. 5. Design and measure the material and environmental impacts of a product's life cycle, including production, waste handling, and end-of-life scenarios. 6. Produce technical reports that clearly communicate methods, results, and conclusions for a professional audience. Credits: 3.00

EEE 38000 - Environmental Chemodynamics

Credit Hours: 3.00. Introduction to chemical thermodynamics and general equilibrium processes in environmental and ecological engineering systems. Introduction to the first and second laws of thermodynamics; properties of pure substances; ideal and real gases; thermodynamic cycles and processes; heat transfer and combustion; and chemical equilibrium in aquatic solutions, including equilibria between phases and reaction equilibria. Emphasis is on understanding and conceptualizing important processes, and competency in thermodynamic calculations.

Learning Outcomes: 1. Apply the First and Second Laws of thermodynamics to closed and open systems. 2. Understand, identify, and quantify the environmental impacts of closed and open systems, based on mass and energy transfer. 3. Analyze full-scale systems, and compare actual and theoretical operation. 4. Understand the structure and reactivity of environmentally relevant organic compounds. 5. Calculate concentrations of different components in equilibrium and non-equilibrium environmental systems. Credits: 3.00

EEE 38399 - Professional Practice Co-Op III

Credit Hours: 0.00. Professional experience in Environmental and Ecological Engineering. Program coordinated by EEE with cooperation of participating employers and the Office of Professional Practice. Students submit summary report and company evaluation. Permission of department required.

Learning Outcomes: 1. Apply knowledge to identifying and solving problems in the professional engineering context. 2. Advance skills related to professional preparation, critical thinking, problem solving, communication, and teamwork. 3. Increase understanding of the engineering profession and practice, basic engineering principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

EEE 38500 - Environmental Soil Chemistry

Credit Hours: 4.00. (AGRY 38500) Designed as an upper-level introductory course covering environmental soil chemistry concepts in framework most applicable to inorganic and organic chemical contamination of soil and water resources and intended for students in environmental science fields that may not have a strong chemistry and/or math background. (el.5).

Learning Outcomes: 1. Demonstrate proficiency in their chosen discipline that incorporates knowledge, skills, technology, and professional conduct. 2. Demonstrate use of the scientific method to identify problems, formulate and test hypotheses, conduct experiments and analyze data, and derive conclusions. 3. Demonstrate critical thinking by using data and reasoning to develop sound responses to complex problems. 4. Demonstrate the ability to write and speak with effectiveness while considering audience and purpose. 5. Demonstrate the ability to work effectively as part of a problem-solving team. 6. Demonstrate knowledge of a range of cultures and an understanding of human values and points of view of other than their own. 7. Demonstrate ability to apply social, economic, political, and environmental principles to living in a global community. 8. Demonstrate awareness of civic responsibility to community and society at large. 9. Demonstrate skills necessary for lifelong learning. Credits: 4.00

EEE 39000 - Environmental And Ecological Engineering Professional Practice Seminar

Credit Hours: 1.00. Seminar lectures and discussions to

introduce students to aspects of professional practice within Environmental and Ecological Engineering. Topics include career planning and placement skills, professional responsibility and ethics, functioning as a professional, and other current important topics in the profession. Students will interact with several practicing Environmental and Ecological Engineers.

Learning Outcomes: 1. Develop professional skills that will allow them to enter into the professional Environmental and Ecological Engineering field. 2. Gain an understanding of major professional issues. 3. Begin development of a personal approach to ethical professionalism. 4. Gain experience in professional communication. 5. Gain knowledge of the range of opportunities available in the profession. Credits: 1.00

EEE 39399 - Cooperative Experience III

Credit Hours: 0.00. Professional experience in environmental and ecological engineering. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.

Learning Outcomes: 1. Apply knowledge to identifying and solving problems in the professional context. 2. Advance skills related to professional preparation, critical thinking, problem solving, communication, and teamwork. 3. Increase understanding of the profession and practice, basic industry principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

EEE 39499 - Extensive Cooperative Experience IV

Credit Hours: 0.00. Professional experience in environmental and ecological engineering. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.

Learning Outcomes: 1. Apply knowledge to identifying and solving problems in the professional context. 2. Advance skills related to professional preparation, critical thinking, problem solving, communication, and teamwork. 3. Increase understanding of the profession and practice, basic industry principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

EEE 39500 - Experimental Course

Credit Hours: 0.00 to 6.00. Topics vary. Arrange hours and credits. Permission of instructor required.

Credits: 0.00 to 6.00

EEE 39599 - Extensive Cooperative Experience V

Credit Hours: 0.00. Professional experience in environmental and ecological engineering. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.

Learning Outcomes: 1. Apply knowledge to identifying and solving problems in the professional context. 2. Advance skills related to professional preparation, critical thinking, problem solving, communication, and teamwork. 3. Increase understanding of the profession and practice, basic industry principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

EEE 39699 - Professional Practice Internship

Credit Hours: 0.00. One-session professional experience in environmental and ecological engineering. Program coordinated by EEE with cooperation of participating employers and the Office of Professional Practice. Students submit summary report and company evaluation. Permission of department required.

Learning Outcomes: 1. Apply knowledge to identifying and solving problems in the professional engineering context. 2. Advance skills related to professional preparation, critical thinking, problem solving, communication, and teamwork. 3. Increase understanding of the engineering profession and practice, basic engineering principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

EEE 43000 - Industrial Ecology And Life Cycle Analysis

Credit Hours: 3.00. The outputs and processes associated with industrial systems are examined, with special emphasis placed on interactions of these systems with environmental and ecological systems. A full product life cycle perspective is stresses, including energy and material flows, processes used to produce materials and realize products, and the management of end-of-life products.

Learning Outcomes: 1. An understanding of the

principles of industrial ecology and an ability to apply these principles to specific engineering and manufacturing systems in order to create designs with reduced environmental and ecological impact. 2. Knowledge of life cycle analysis (LCA), its different forms, its limitations, its endpoints, and the common tools, techniques, and databases available to assist in LCA. 3. The ability to perform a limited life cycle analysis on an industrial product or process, with a defined analysis goal. 4. An understanding of the complex interactions between industrial and environmental systems. Credits: 3.00

EEE 45600 - Wastewater Treatment Processes

Credit Hours: 3.00. (CE 45600) Fundamental design principles and practice of wastewater treatment to prepare students for designing wastewater treatment systems. The major topics include design and construction process, preliminary treatment of wastewater, primary treatment, wastewater microbiology, secondary treatment, nitrogen removal, phosphorus removal, attached microbial growth, secondary settling, disinfection and post-aeration, tertiary treatment, and wastewater plant residuals management.

Learning Outcomes: 1. Understand design principles and practice of wastewater treatment. 2. Apply the knowledge to select the best process to treat wastewater. 3. Design a wastewater treatment component or process to meet water quality goals. 4. Critically review relevant literature or contemporary issues in wastewater treatment. Credits: 3.00

EEE 47200 - Community-Engaged Engineering & Design

Credit Hours: 3.00. Utilizing a transdisciplinary approach in a real-world, client-based service-learning design experience, students will lead the design and implementation of community-engaged sustainability projects integrating not only their discipline-specific knowledge, but community partner and stakeholder knowledge as well. This course will require travel outside of class to community partner sites to collaborate in the design process. Sustainability projects to improve the health and wellness of communities will be implemented at multiple sites. The complex and dynamic relationships between social, economic, environmental, and political sectors in such community-engaged projects will be investigated.

Learning Outcomes: 1. Display social responsibility, civic engagement, and leadership in addressing sustainability issues: evaluate and apply diverse perspectives from multiple stakeholders to site-specific design solutions; connect and extend academic knowledge to improve the health and wellness of communities; take informed, responsible action to address ethical, social, and environmental challenges related to sustainability at partner sites; communicate project efforts in a creative, well-organized, and logical manner. 2. Design novel, context-appropriate solutions to sustainability issues using a transdisciplinary knowledge production model: describe the interconnectivity between environmental, social, political, and economic issues surrounding technical solutions; apply a transdisciplinary knowledge production model; propose solutions to open-ended design problems that demonstrate a deep comprehension of the issues. 3. Engage in the complexities of a negotiated design process occurring between multiple stakeholders in a professional and ethical manner: demonstrate empathy and adaptability in working with teammates and stakeholders with varied skills, talents, abilities, and work strategies; create project deliverables that demonstrate cohesive stakeholder functionality; critically evaluate personal and others' contributions to the overall success of the projects. Credits: 3.00

EEE 48000 - Environmental And Ecological Engineering Senior Design

Credit Hours: 1.00 to 3.00. Senior-level environmental and ecological engineering design projects. Projects will integrate knowledge and skills earlier in the degree program and stress the application of the design process to interdisciplinary environmental and/or ecological engineering systems. Permission of department required.

Learning Outcomes: 1. An ability to apply material and concepts from previous EEE coursework to an innovative design project. 2. An understanding of the complete design

process and an ability to perform the process. 3. An ability to identify and acquire new knowledge as a part of the problem-solving/design process. 4. An ability to function on multidisciplinary teams. 5. An ability to communicate professional design and design decisions effectively. 6. An awareness of professional ethics and responsibility of engineers. 7. An appreciation of the role of engineering and of EEE in social contexts. Credits: 1.00 to 3.00

EEE 48001 - Environmental And Ecological Engineering Senior Design I

Credit Hours: 1.00. Senior-level environmental and ecological engineering design projects. Projects will integrate knowledge and skills earlier in the degree program and stress the application of the design process to interdisciplinary environmental and/or ecological engineering systems. Permission of department required.

Learning Outcomes: 1. Have an ability to apply material and concepts from previous EEE coursework to an innovative design project. 2. Have an understanding of the complete design process and an ability to perform the process. 3. Identify and acquire new knowledge as a part of the problem-solving/design process. 4. Have an ability to function on multidisciplinary teams. 5. Communicate professional design and design decisions effectively. 6. Have an awareness of professional ethics and responsibility of engineers. 7. Gain an appreciation of the role of engineering and of EEE in social contexts. Credits: 1.00

EEE 48002 - Environmental And Ecological Engineering Senior Design II

Credit Hours: 2.00. Senior-level environmental and ecological engineering design projects. Projects will integrate knowledge and skills earlier in the degree program and stress the application of the design process to interdisciplinary environmental and/or ecological engineering systems.

Learning Outcomes: 1. Have an ability to apply material and concepts from previous EEE coursework to an innovative design project. 2. Have an understanding of the complete design process and an ability to perform the process. 3. Identify and acquire new knowledge as a part of the problem-solving/design process. 4. Have an ability to function on multidisciplinary teams. 5. Communicate professional design and design decisions effectively. 6. Gain an awareness of professional ethics and responsibility of engineers. 7. Gain an appreciation of the role of engineering and of EEE in social contexts. Credits: 2.00

EEE 48100 - Reflective Practitioner

Description: Credit Hours: 1.00. Reflective practice is a term coined by Donald Schon in The Reflective Practitioner (1983). Reflective practice is the capacity to reflect on action to engage in a process of continuous learning. Reflective practice can be an important tool in practice-based professional learning settings where people learn from their own professional experiences, rather than from formal learning or knowledge transfer. It may be the most important source of personal professional development and improvement. It is also an important way to bring together theory and practice. A person who reflects throughout their practice is not just looking back on past actions and events, but is taking a conscious look at emotions, experiences, actions, and responses, and using that information to add to their existing knowledge base and reach a higher level of understanding. Critical reflection as part of experiential education generates, deepens, and documents learning. As a result of this course, you will be able to articulate the value of your experiential education opportunities toward marketing yourself for potential job opportunities and develop the skills needed to become a reflective practitioner for promotional growth in your future career. Permission of department required.

Learning Outcomes: 1. Reflect on experiential education experiences; Identify knowledge and skills gained from experiences; Identify connections between experiences and disciplinary knowledge. 2. Apply theories and concepts to practical sustainability problems; Identify ways in which individual actions within experiences contributed to improving sustainability; Identify ways to individually contribute to improving sustainability in future professional practice. 3. Synthesize experiential education experiences into a career development plan; Articulate strengths and weaknesses observed within experiences; Develop a self-improvement plan for future

professional practice; Identify a potential career path; Synthesize knowledge and skills gained into high-quality LinkedIn page and Strengths Statement. Credits: 1.00

EEE 49500 - Experimental Course

Credit Hours: 0.00 to 6.00. Topics Vary. Arrange hours and credit. Permission of instructor required.

Credits: 0.00 to 6.00

EEE 49800 - Environmental And Ecological Engineering Projects

Credit Hours: 0.00 to 6.00. Topics vary. Arrange hours and credits. Permission of instructor required.

Credits: 0.00 to 6.00

EEE 51601 - Indoor Air Quality

Credit Hours: 3.00. The course covers the fundamentals of indoor air pollutant dynamics in buildings and their heating, ventilation, and air conditioning systems.

Learning Outcomes: 1. Evaluate mechanistically pollutant transport dynamics in buildings through application of material balance models. 2. Apply fundamental principles of aerosol physics to characterize the behavior of indoor aerosols from several nanometers to tens of micrometers in size. 3. Evaluate human exposure to indoor aerosols and analyze the effectiveness of engineering control strategies for indoor air pollution. 4. Read and critically analyze papers in the technical literature on indoor air quality and aerosols. 5. Gain additional insight regarding specific topics related to indoor air quality and aerosols through a rigorous course project. 6. Analyze, and discuss in a group-setting, contemporary indoor air quality issues facing our global society. 7. Prepare and review written and oral technical communication. Credits: 3.00

EEE 53000 - Life Cycle Assessment: Principles And Applications

Credit Hours: 3.00. This course covers the basic concept of life cycle thinking, framework and computational structure of process and economic input-output based life cycle assessment (LCA), state-of-the-art LCA software tools, industrial case studies, and recent advances in LCA methodology. Students are required to complete a group project that could potentially facilitate the adaptation of LCA tools in engineering research, education, or practice.

Learning Outcomes: 1. Conduct an LCA study using state-of-the-art software tools and databases according to ISO I4040 standards. 2. Identify the limitations and weakness of an existing LCA study. 3. Develop customized inventory dataset using information available in literature and current inventory databases. 4. Develop a simplified yet functional LCA software tool tailored for an enterprise or organization. 5. Combine LCA results with economic and social impact analysis to support decision making. Credits: 3.00

EEE 54400 - Environmental Organic Chemistry

Credit Hours: 3.00. (AGRY 54400) The fundamental properties and processes responsible for the fate of organic chemicals in the environment, with emphasis on soil and water chemistry. Areas to be addressed will include both conceptual and theoretical aspects of processes relevant to environmental fate of contaminants; measurement, estimation, correlation, and application of the parameters most commonly used to assess various chemodynamic properties in soil-water systems.

Learning Outcomes: 1. Demonstrate an understanding of the fundamental properties and processes controlling the environmental fate of organic contaminants in surface and subsurface environments. 2. Understand how variations in chemical structure change chemical behavior including solubility, volatility, acid-base speciation and reactivity. 3. Quantify chemical distribution between soil-water, soil-air, water-air and liquid-liquid compartments. 4. Understand and quantify how environmental and anthropogenic factors change chemical behavior and distribution in the environment. 5. Apply partition coefficients and mass balance approaches to predict chemical distribution between various environmental compartments. 6. Demonstrate an understanding of how abiotic and biotransformation processes affect chemical fate in the environment. 7. Demonstrate an understanding how chemical, soil and subsurface properties impact choice of remediation strategies. Credits: 3.00

EEE 55000 - Physico-Chemical Processes In Environmental Engineering I

Credit Hours: 3.00. Theory and principles of design for processes used in environmental engineering, with emphasis on water and wastewater treatment. Processes include: coagulation, flocculation, sedimentation, centrifugation, filtration, disinfection, adsorption, and gas/liquid transfer.

Learning Outcomes: 1. Learn fundamental principles of physico/chemical processes that are commonly used by Environmental Engineers with an emphasis on water treatment. 2. Understand principles that have a broad application in Environmental Engineering and other disciplines. 3. Focus on fundamental concepts so as to prompt application in a wide range of settings and to promote creativity. Credits: 3.00

EEE 55201 - Environmental Biotechnology

Credit Hours: 3.00. This course focuses on fundamentals of molecular biology and biotechnology for environmental applications. The major topics include activated sludge processes, stoichiometry, kinetics, anaerobic digestion, biological nitrogen and phosphorus removal, emerging contaminants, molecular microbiology tools, biofouling, antibiotic resistance, and biofuels.

Learning Outcomes: 1. Understand the latest development in environmental biotechnology and their applications in contaminant removal and public health protection. 2. Critically review relevant literature on selected topics in environmental biotechnology and identify areas for improvement. 3. Deliver effective presentations. 4. Write clearly and ethically. Credits: 3.00

EEE 55401 - Water Chemistry For Environmental And Ecological Engineering

Credit Hours: 3.00. Principles of chemistry applied to the analysis and distribution of the chemical composition of natural waters and engineered water systems. Course topics include acid/base, complexation, precipitation/dissolution, sorption and redox reactions in the context of environmental and ecological engineering. Case studies focus on water chemistry in research and practice, such as lead in drinking water, recovery of valuable products from wastewater, chemistry of engineered carbon dioxide capture, and engineered treatment of surface waters. Case studies vary each year.

Learning Outcomes: 1. Describe the unique properties of water, and the relevance to natural and engineered systems. 2. Explain fundamental principles of chemical equilibrium and kinetics, and apply principles to calculations and solving contemporary challenges in water chemistry systems. 3. Classify chemical reactions and mass transfer, and deduce which categories are present in a particular system. 4. Evaluate and formulate technological approaches to reduce environmental impacts of anthropogenic activities, based on water chemistry principles. Credits: 3.00

EEE 56000 - Environmental And Ecological Engineering In-Context

Credit Hours: 0.50 to 3.00. An introduction to current challenges and issues in Environmental and Ecological Engineering (EEE) applications. Topics will change from semester to semester and will be announced in advance. The list of possible topics includes current events, emerging challenges, adaptations to new regulations, innovative environmental and ecological engineering processes, life-cycle impacts of manufactured products, and sustainable management of industrial waste streams.

Learning Outcomes: 1. Design experiments and evaluate experimental data, error and variability. 2. Understand environmental systems and processes. 3. Communicate professionally to the public about complex technical issues. 4. Develop management strategies for environmental problems. Credits: 1.00 to 3.00

EEE 57000 - Solid And Hazardous Waste Management

Credit Hours: 3.00. Students will be introduced to the regulation of solid and hazardous wastes; engineering design, planning and analysis of solid and hazardous waste management facilities.

Learning Outcomes: 1. Solve basic problems related to pollutant generation, waste collection and composition, recycling, and thermal conversion processes. 2. Apply knowledge of topics from chemistry such as stoichiometry, kinetics, and equilibrium to gas generation, and waste composition. 3. Understand the role of an engineer involving regulations, ethics, professionalism, engineering practice and

registration. 4. Demonstrate an ability to communicate effectively. 5. Solve environmental and public health problems associated with man-made and natural disasters. Credits: 3.00

EEE 59500 - Environmental And Ecological Engineering Projects

Credit Hours: 0.00 to 6.00. Topics vary. Permission of instructor required.

Credits: 0.00 to 6.00

EEE 59800 - Environmental And Ecological Engineering Projects

Credit Hours: 0.00 to 6.00. Topics vary. Arrange hours and credit. Permission of instructor required.

Credits: 0.00 to 6.00

EEE 69000 - Environmental And Ecological Engineering Graduate Seminar

Credit Hours: 0.00. Combination of invited speakers (outside and inside Purdue) including graduate students. Topics will range across environmental and ecological engineering with an emphasis on current topics.

Learning Outcomes: 1. Increased understanding of academic and research topics in Environmental and Ecological Engineering (EEE). 2. Improve ability of EEE graduate students to think critically about research and presentation skills of others. 3. Increased ability to critique his or her own work. Credits: 0.00

EEE 69199 - Professional Practice Graduate Co-Op I

Credit Hours: 0.00. Professional experience in environmental and ecological engineering. Program coordinated by EEE with cooperation of participating employers and the Office of Professional Practice. Students submit summary report and company evaluation.

Learning Outcomes: 1. Apply knowledge to identifying and solving problems in the professional engineering context. 2. Advance skills related to professional preparation, critical thinking, problem solving, communication, and teamwork. 3. Understand of the engineering profession and practice, basic engineering principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

EEE 69299 - Professional Practice Graduate Co-Op II

Credit Hours: 0.00. Professional experience in environmental and ecological engineering. Program coordinated by EEE with cooperation of participating employers and the Office of Professional Practice. Students submit summary report and company evaluation. Permission of department required.

Learning Outcomes: 1. Apply knowledge to identifying and solving problems in the professional engineering context. 2. Advance skills related to professional preparation, critical thinking, problem-solving, communication, and teamwork. 3. Increase understanding of the engineering profession and practice, basic engineering principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

EEE 69399 - Professional Practice Graduate Co-Op III

Credit Hours: 0.00. Professional experience in environmental and ecological engineering. Program coordinated by EEE with cooperation of participating employers and the Office of Professional Practice. Students submit summary report and company evaluation. Permission of department required.

Learning Outcomes: 1. Apply knowledge to identifying and solving problems in the professional engineering context. 2. Advance skills related to professional preparation, critical thinking, problem-solving, communication, and teamwork. 3. Increase understanding of the engineering profession and practice, basic engineering principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

EEE 69500 - Experimental Courses

Credit Hours: 0.00 to 6.00. Topics vary. Arrange hours and credit. Permission of instructor required.

Credits: 0.00 to 6.00

EEE 69699 - Professional Practice Internship

Credit Hours: 0.00. One-session professional experience in environmental and ecological engineering. Program coordinated by EEE with cooperation of participating employers and the Office of Professional Practice. Students submit summary report and company evaluation. Permission of department required.

Learning Outcomes: 1. Apply knowledge to identifying and solving problems in the professional engineering context. 2. Advance

skills related to professional preparation, critical thinking, problem-solving, communication, and teamwork. 3. Increase understanding of the engineering profession and practice, basic engineering principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

EEE 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required.

Learning Outcomes: 1. Learning objectives vary per student. Credits: 1.00 to 18.00

EEE 69900 - Research PhD Dissertation

Credit Hours: 1.00 to 18.00. Research PhD Dissertation. Permission of instructor required.

Learning Outcomes: 1. Learning objectives are student dependent. Credits: 1.00 to 18.00

Film and Video

FLM 24100 - Foundations Of Cinema Production

Credit Hours: 3.00. The course introduces students to the principles and practice of professional video production. Through lectures, viewing, discussions, and laboratory exercises, students will acquire the tools necessary to transform their concepts, or those of their clients, into successful video productions.

Learning Outcomes: 1. Summarize the cinema production process. 2. Apply visual storytelling concepts and techniques to the cinema production process. 3. Plan and create productions, making use of the cinema process. 4. Identify a variety of professional and career opportunities. Credits: 3.00

FLM 29100 - Special Topics In Film/Video Studies

Credit Hours: 1.00 to 4.00. Special topics or projects under the direction of an instructor in a particular field of specialization.

Learning Outcomes: 1. Objectives vary per topic. Credits: 1.00 to 4.00

FLM 29102 - Special Topics In Live Production

Credit Hours: 1.00 to 4.00. Special topics or projects under the direction of an instructor in a particular field of specialization.

Learning Outcomes: 1. Vary by topic. Credits: 1.00 to 4.00

FLM 29103 - Special Topics In International Cinema

Credit Hours: 1.00 to 4.00. Special topics or projects under the direction of an instructor in a particular field of specialization.

Learning Outcomes: 1. Vary by topic. Credits: 1.00 to 4.00

FLM 29104 - Special Topics In Directing

Credit Hours: 1.00 to 4.00. Special topics or projects under the direction of an instructor in a particular field of specialization.

Learning Outcomes: 1. Vary by topic. Credits: 1.00 to 4.00

FLM 29105 - Special Topics In Screenwriting

Credit Hours: 1.00 to 4.00. Special topics or projects under the direction of an instructor in a particular field of specialization.

Learning Outcomes: 1. Vary by topic. Credits: 1.00 to 4.00

FLM 29106 - Special Topics In Cinematography

Credit Hours: 1.00 to 4.00. Special topics or projects under the direction of an instructor in a particular field of specialization.

Learning Outcomes: 1. Vary by topic. Credits: 1.00 to 4.00

FLM 29107 - Special Topics In Editing

Credit Hours: 1.00 to 4.00. Special topics or projects under the direction of an instructor in a particular field of specialization.

Learning Outcomes: 1. Vary by topic. Credits: 1.00 to 4.00

FLM 29108 - Special Topics In Cinema Studies

Credit Hours: 1.00 to 4.00. Special topics or projects under the direction of an instructor in a particular field of specialization.

Learning Outcomes: 1. Vary by topic. Credits: 1.00 to 4.00

FLM 32100 - Live Production I: Theater/Music/Arts

Credit Hours: 1.00 to 4.00. This experiential course furthers the students' understanding of live video production. Lecture combined with various production experiences increase the students' proficiency with professional technology and equipment as well as narrative development.

Learning Outcomes: 1. Demonstrate an understanding of the technique and technology of live camera, live audio, and simple broadcast graphics. 2. Examine storytelling in a live multi-camera production. 3. Identify career options and job types within live production. Credits: 1.00 to 4.00

FLM 32200 - Live Production I: Fall/Winter Sports

Credit Hours: 1.00 to 4.00. This experiential course furthers the students' understanding of live sports video production. Lecture combined with various production experiences increase the students' proficiency with professional technology and

equipment as well as the art and storytelling of the craft. Potential Men's and Women's Fall/Winter sports include Cross Country, Soccer, Volleyball, Football, Swimming & Diving, Wrestling, Basketball, or Track & Field.

Learning Outcomes: 1. Demonstrate an understanding of the technique and technology of live camera, live audio, and simple broadcast graphics. 2. Examine storytelling in a live multi-camera production. 3. Identify career options and job types within live production. Credits: 1.00 to 4.00

FLM 32300 - Live Production I: Winter/Spring Sports

Credit Hours: 1.00 to 4.00. This experiential course furthers the students' understanding of live sports video production. Lecture combined with various production experiences increase the students' proficiency with professional technology and equipment as well as the art and storytelling of the craft. Potential Men's and Women's Winter/Spring sports include Swimming & Diving, Wrestling, Basketball, Baseball, Softball, Tennis, Golf, or Track & Field.

Learning Outcomes: 1. Demonstrate an understanding of the technique and technology of live camera, live audio, and simple broadcast graphics. 2. Examine storytelling in a live multi-camera production. 3. Identify career options and job types within live production. Credits: 1.00 to 4.00

FLM 33000 - International Cinema

Credit Hours: 3.00. This course is designed to develop students' seeing, reading, speaking, writing, and critical thinking skills, and especially to improve visual competency, awareness of visual culture, and knowledge of selected international cinema. All films will be shown with English subtitles.

Learning Outcomes: 1. Explain and assess different ways of seeing as an introduction to understanding visual theory. 2. Demonstrate understanding of the concepts and techniques of cinematography, processing, and reading images and film. 3. Recognize, select, and justify choices for seeing and interpreting the visual. 4. Identify and analyze culturally conditioned references. Credits: 3.00

FLM 35100 - Screenwriting

Credit Hours: 3.00. Students will gain a working knowledge of basic narrative elements and how these elements work to form a story. Writing and re-writing a three-act outline and an original screenplay will give you an understanding of script language and process.

Learning Outcomes: 1. Identify Aristotelian Three-Act Structure as applied to the screenplay. 2. Develop a specific technique of writing based on the course teachings. 4. Critique the work of self and others, including proper and professional screenplay formatting. 5. Determine methods to assess success or failure of writer's intent. Credits: 3.00

FLM 36100 - Cinematography

Credit Hours: 3.00. This intermediate course in Cinematography will further prepare the student to use the technology of the camera as a basis for the art and visual storytelling of motion pictures. The student will also receive the basic background needed for understanding the skills and processes of a single camera production environment.

Learning Outcomes: 1. Discuss production techniques in film and video using the vocabulary of the industry. 2. Explore the production process for single camera environments. 3. Demonstrate an understanding of basic shot types and execute examples of these shots. 4. Demonstrate an understanding of the technology of capturing the moving image. 5. Identify career options and job types within film and video production. Credits: 3.00

FLM 37100 - Editing I

Credit Hours: 3.00. The course introduces students to the principles of film and video editing. Projects, discussions, demonstrations, and hands-on exercises expose students to the technical and artistic aspects of the editing process.

Learning Outcomes: 1. Summarize the basic concepts involved in the editing process. 2. Compare and contrast historical and modern approaches to film and video editing. 3. Develop proficiency with industry standard software. 4. Execute an example of the editing process under strict time constraints. Credits: 3.00

FLM 37200 - Editing II

Credit Hours: 3.00. This course instructs students in advanced principles of film and video editing and color grading. Projects, discussions, demonstrations, and hands-on exercises expose students to the technical and artistic aspects of the editing

process.

Learning Outcomes: 1. Develop an increased understanding of the art, technique, and philosophies of the editing process 2. Examine the concepts involved in the color grading process and visual effects. 3. Demonstrate techniques for basic color grading and visual effects. 4. Develop further proficiency with industry standard software. Credits: 3.00

FLM 41000 - Internship In Film/Video/Media Production

Credit Hours: 1.00 to 4.00. Internships in one of the professional areas of film, video or media production. Internships are supervised by appropriate faculty in a particular field of specialization. Permission of instructor required.

Learning Outcomes: 1. Vary due to nature of course. Credits: 1.00 to 4.00

FLM 42200 - Live Production II: Fall/Winter Sports

Credit Hours: 1.00 to 4.00. This experiential course furthers the students' understanding of Producing and Directing live sports video and television. Lecture combined with various production experiences increase the students' proficiency with professional technology and equipment as well as the art and storytelling of the craft. Potential Men's and Women's Fall/Winter sports include Cross Country, Soccer, Volleyball, Football, Swimming & Diving, Wrestling, Basketball, or Track & Field. Permission of instructor required.

Learning Outcomes: 1. Identify career options and job types within live event production. 2. Operate the core components of a live video system, including a switcher, replay system, and advanced broadcast graphics. 3. Create examples of visual storytelling using live, multi-camera, production techniques. Credits: 1.00 to 4.00

FLM 42300 - Live Production II: Winter/Spring Sports

Credit Hours: 1.00 to 4.00. This experiential course furthers the students' understanding of Producing and Directing live sports video and television. Lecture combined with various production experiences increase the students' proficiency with professional technology and equipment as well as the art and storytelling of the craft. Potential Men's and Women's Winter/Spring sports include Swimming & Diving, Wrestling, Basketball, Baseball, Softball, Tennis, Golf, or Track & Field. Permission of instructor required.

Learning Outcomes: 1. Identify career options and job types within live event production. 2. Operate the core components of a live video system, including a switcher, replay system, and advanced broadcast graphics. 3. Create examples of visual storytelling using live, multi-camera, production techniques. Credits: 1.00 to 4.00

FLM 44200 - Directing The Narrative Short Film

Credit Hours: 3.00. Students will gain knowledge of all phases of film production in the course of completing multiple short films. This class will emulate standard film industry practices and guidelines.

Learning Outcomes: 1. Summarize the overall film production process. 2. Create examples of each stage of the production process. 3. Construct multiple complete films, in the roles of Director and/or Assistant Director, using professional and industry standard techniques based upon the production process. 4. Evaluate completed films for content and technique. Credits: 3.00

FLM 44600 - Producing Non-Fiction Video

Credit Hours: 3.00. This advanced course builds on previous knowledge and exposes students to the role of an independent video producer. By working with real-world clients on real-world projects, students will gain valuable experience in guiding productions from start to finish. Additionally, students will learn basic fundamentals of entrepreneurship and business skills designed to begin to prepare students to form their own video production business.

Learning Outcomes: 1. Summarize an understanding of the art, technique, philosophies, and business of the video production. 2. Construct budgets and business plans. 3. Organize, plan, and create video productions simulating professional processes and techniques. 4. Develop and produce multiple unique projects by working closely with real-world clients. Credits: 3.00

FLM 49100 - Special Topics In Film/Video Studies

Credit Hours: 1.00 to 4.00. Special topics or projects under the direction of an instructor in a particular field of specialization.

Learning Outcomes: 1. Varies due to nature of course. Credits: 1.00 to 4.00

FLM 49102 - Special Topics In Live Production

Credit Hours: 1.00 to 4.00. Special topics or projects under the direction of an instructor in a particular field of specialization.

Learning Outcomes: 1. Vary by topic. Credits: 1.00 to 4.00

FLM 49103 - Special Topics In International Cinema

Credit Hours: 1.00 to 4.00. Special topics or projects under the direction of an instructor in a particular field of specialization.

Learning Outcomes: 1. Vary by topic. Credits: 1.00 to 4.00

FLM 49104 - Special Topics In Directing

Credit Hours: 1.00 to 4.00. Special topics or projects under the direction of an instructor in a particular field of specialization.

Learning Outcomes: 1. Vary by topic. Credits: 1.00 to 4.00

FLM 49105 - Special Topics In Screenwriting

Credit Hours: 1.00 to 4.00. Special topics or projects under the direction of an instructor in a particular field of specialization.

Learning Outcomes: 1. Vary by topic. Credits: 1.00 to 4.00

FLM 49106 - Special Topics In Cinematography

Credit Hours: 1.00 to 4.00. Special topics or projects under the direction of an instructor in a particular field of specialization.

Learning Outcomes: 1. Vary by topic. Credits: 1.00 to 4.00

FLM 49107 - Special Topics In Editing

Credit Hours: 1.00 to 4.00. Special topics or projects under the direction of an instructor in a particular field of specialization.

Learning Outcomes: 1. Vary by topic. Credits: 1.00 to 4.00

FLM 49108 - Special Topics In Cinema Studies

Credit Hours: 1.00 to 4.00. Special topics or projects under the direction of an instructor in a particular field of specialization.

Learning Outcomes: 1. Vary by topic. Credits: 1.00 to 4.00

FLM 49900 - Capstone In Film/Video/Media Production

Credit Hours: 2.00 or 4.00. The Capstone in Film/Video/Media Production is intended to be the culminating experience of the Film/Video Studies or Film/Video and Theatre Production major. Each student Students will create a project of their own design. Students will pitch their project ideas to the program director and/or faculty and should develop a project based around their future career goals. Example areas include narrative/fiction cinema, documentary/non-fiction filmmaking, television production, live event production, etc. Students will fulfill the role of Writer/Producer/Director for their project (and potentially Director of Photography, Editor, etc.). This creative work will culminate in a presentation to an audience. Permission of instructor required.

Learning Outcomes: 1. Develop a complete and significant project idea/vision/creative work. 2. Plan out the execution of the creative work. 3. Assemble a team with which to craft the developed vision. 4. Complete the work to a professional level of quality. 5. Present the work to an audience with a Q&A session. Credits: 2.00 or 4.00

Food Science

FS 16100 - Science Of Food (UCC: STS)

Credit Hours: 3.00. Chemical and physical properties of foods; issues pertaining to safety, food-diet-health relationship; government regulations pertaining to food safety, quality and additives; preservation techniques and transformation of agricultural commodities to food products; Food facts, myths, and practices that are important for making intelligent food decisions. Course may also be offered for dual credit with cooperating Indiana high schools upon documented approval by the Department of Food Science.

University Core Curriculum (UCC): (UCC: STS) Credits: 3.00

FS 16200 - Introduction To Food Processing

Credit Hours: 1.00. Application of introductory food science principles (e.g., food chemistry, food microbiology, and unit operations) to food processing; emphasis will be placed on food formulation, pilot-scale process design, and resulting food quality. May require class trips.

Credits: 1.00

FS 16300 - Introduction To Fermentation Sciences

Credit Hours: 3.00. This course will provide an overview of the use of microorganisms in the food, pharmaceutical and chemical industries. The course will introduce fundamental concepts associated to the microbiological transformation of various substrates to produce desirable products such as foods, beverages, pharmaceuticals or chemical compounds. As an introductory course, the scientific principles of fermentation processes will be gradually introduced through the analysis of familiar fermented food products, such as bread, cheese, beer, wine, cocoa, coffee, etc. Once the fundamental concepts are learned, examples of advanced fermentation technology for production of pharmaceutical products and fine chemicals will be presented.

Learning Outcomes: 1. Explain the role of microorganisms in the transformation of various substrates into desirable products. 2. Identify

the type of microorganism (bacteria, yeast or mold) involved in the production of various fermented foods and beverages. 3. Explain the impact of environmental processing conditions (T, pH, aw, O2) on microbial growth. 4. Recognize the similarities across a wide variety of products made through fermentation. Credits: 3.00

FS 24500 - Food Packaging

Credit Hours: 1.00. Elements of packaging science and technology applied to preservation, distribution, and marketing of food products; packaging materials; principles of diffusion and permeability; procedures for developing, evaluating, and testing food packages; packaging requirements for specific types of foods; other special topics of current interest.

Learning Outcomes: 1. Appreciate the important role that packaging plays in today's sophisticated food processing operations, its effect on final product quality and self-life, and its influence on distribution methods and marketing related decisions. 2. Understand the basic packaging materials and the technology to produce food packages. 3. Understand basic concepts of diffusion, permeation, and migration, especially as they relate to package properties, food quality, and product shelf-life. 4. Develop general guidelines for selecting appropriate packaging materials to fit the needs of specific food products. 5. Have a general appreciation of the methods used to test and evaluate packaging materials for specific properties and whole containers for integrity, suitability, and overall performance. 6. Intelligently discuss current food packaging related topics (i.e. package degradability/recyclability, tamper evident/proof packaging, modified atmosphere packaging, aseptic packaging, microwaveable packaging, etc.) Credits: 1.00

FS 27500 - Honors Course - Lower Division

Credit Hours: 1.00 to 4.00. Utilized to offer a new honors course for a maximum of three years. Variable title, credit, and instructional type. Course may be repeated for credit if content and titles are different. Offered primarily to first- and second-year students. Courses offered must be approved by instructor and College of Agriculture Honors Committee. Permission of instructor required.

Learning Outcomes: 1. Have critical thinking. 2. Have communication. 3. Have cultural understanding. 4. Know civic responsibilities. 5. Have professional preparation. 6. Know scientific principles. 7. Know social science principles. 8. Able to teamwork. Credits: 1.00 to 4.00

FS 29100 - Special Assignments

Credit Hours: 1.00 to 3.00. Open to primarily freshmen and sophomores who desire to study special problems in science not covered in regular coursework. May be repeated for credit with instructor permission. Permission of instructor required.

Credits: 1.00 to 3.00

FS 29199 - Cooperative Experience I

Credit Hours: 0.00. Professional experience in food science. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.

Learning Outcomes: 1. Apply knowledge to identifying and solving problems in the professional context. 2. Advance skills related to professional preparation, critical thinking, problem solving, communication, and team work. 3. Increase understanding of the profession and practice, basic industry principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

FS 29299 - Cooperative Experience II

Credit Hours: 0.00. Professional experience in food science. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.

Learning Outcomes: 1. Apply knowledge to identifying and solving problems in the professional context. 2. Advance skills related to professional preparation, critical thinking, problem solving, communication, and team work. 3. Increase understanding of the profession and practice, basic industry principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

FS 29800 - Sophomore Seminar

Credit Hours: 1.00. Current food science issues will be discussed by students, staff, and guest speakers. Career planning and improvement of communication skills will be emphasized.

Learning Outcomes: 1. Construct a professional resume that includes educational background and experience. 2. Construct a professional cover letter in reference to a job posting. 3. Demonstrate the ability to professionally answer interview questions in an interview setting. 4. Demonstrate the ability to present information with PowerPoint software. 5. Identify your Myers Briggs personality profile. 6. Explore some current issues in the food industry. 7. Plan your coursework for each semester through graduation. Credits: 1.00

FS 34000 - Introduction To Food Law And Regulations

Credit Hours: 1.00. This course will cover basic knowledge and familiarity of the principal law and regulations governing raw and processed foods. Class meets during weeks 1-5.

Learning Outcomes: 1. To gain a basic knowledge and familiarity of the principal laws and regulations governing raw and processed foods. 2. To develop an understanding of the law's core - adulteration and misbranding. 3. To learn basic food labeling and health claim regulations. 4. To obtain a working knowledge of US food law and promulgated regulations, current issues concerning food regulations, and how to obtain further information for specific regulatory problems. Credits: 1.00

FS 34100 - Food Processing I

Credit Hours: 2.00. Applications of the fundamentals of food engineering, microbiology, and chemistry to methods of food processing and preservation; emphasis will be on processing concepts, preparation for food processing, food formulation, and thermal processing.

Learning Outcomes: 1. Explain the sources of variability of raw food materials and their impact on food processing operations. 2. List and describe the major methods covered in class to control deterioration and spoilage in foods. 3. Identify the conditions under which important pathogens are commonly inactivated, killed, or made harmless in foods. 4. Identify conditions including sanitation practices under which microorganisms are commonly inactivated, killed, or made harmless in foods. 5. Demonstrate use mass and energy balances for a food process. 6. Explain the transport processes and unit operations involved in processing a particular food. 7. Identify the principles and current practices of processing techniques and the effects of processing parameters in product quality. 8. Predict changes in food quality during storage or processing. 9. Understand the requirements for water utilization and waste management in food and food processing. Credits: 2.00

FS 34200 - Food Processing I Laboratory

Credit Hours: 1.00. This laboratory course applies food engineering principles and thermal processing methods for production of safe and high-quality foods. The course will include applications of mathematics and physics principles in food processing operations, engineering problem-solving exercises and laboratory demonstrations. Engineering concepts such as heat transfer, fluid flow, mass and energy balances applied to various food systems will be a major portion of this laboratory.

Learning Outcomes: 1. Apply mathematical principles to food processing application. 2. Demonstrate an understanding of energy, heat transfer and fluid flow principles. 3. Apply engineering principles to thermal processing of foods. 4. Identify conditions under which microorganisms are commonly inactivated, killed, or made harmless in foods including pasteurization, sterilization, and aseptic processing. 5. Demonstrate use mass and energy balances for a food process. Credits: 1.00

FS 36100 - Food Plant Sanitation

Credit Hours: 1.00. Relation of food-plant sanitation to good manufacturing practices and regulations affecting sanitation; organization of a food-plant sanitation program; sanitary building and equipment construction; selection of cleaning, sanitizing, and pesticidal compounds; water, air, and waste treatment; food storage and transportation.

Credits: 1.00

FS 36200 - Food Microbiology

Credit Hours: 3.00. Microbiology of foods, with emphasis on the conditions for growth of microorganisms and degradation of food components, preservation methods, use of Hazard Analysis and Critical Control Point (HACCP) concepts, and microorganisms associated with foodborne illness, and modern detection methods.

Learning Outcomes: 1. Students should be able to identify the major components of food that affect microbial growth, to identify degradation in foods when microorganisms grow. 2. Students will be able to explain how preservations methods affect microbes in food, to explain major foodborne pathogens and under what conditions they thrive, to use microbiological information and molecular techniques to solve practical problems of the food industry. Credits: 3.00

FS 36300 - Food Microbiology Laboratory

Credit Hours: 2.00. Classic and molecular methods for enumerating, isolating, and identifying spoilage, fermentative, and pathogenic food microorganisms in food systems.

Learning Outcomes: 1. Perform proper aseptic technique. 2. Sample foods for microbial analyses. 3. Test food products for common microorganism. 4. Interpret data obtained from microbiological analysis. 4. Understand basic molecular techniques used to identify foodborne pathogens. Credits: 2.00

FS 37200 - Fermentation Microbiology

Credit Hours: 3.00. This course explores the principles underlying the design of microbes for their use in biotechnological applications. This project-based course will teach students fundamental molecular biology techniques, important parameters for strain selection and genetic engineering, and reactor design and operation in bioprocessing. Additionally, this course will cover today's diverse bioengineering goals and tools and the role of microbial biotechnology in society.

Learning Outcomes: 1. Articulate the concept of microbial cell factories and the relationship of microorganisms to food and industrial fermentations. 2. Identify genetic and environmental approaches to control the products, rate, and yield of bioconversion. 3. Understand microbial metabolic pathways and how they are engineered. 4. Design genetic strategies to engineer microbes. 5. Read primary literature relevant to fermentation biotechnology. Credits: 3.00

FS 37300 - Fermentation Microbiology Laboratory

Credit Hours: 1.00. The course provides a laboratory-based experiential learning experience with the learning of fundamental aspects of genetic, physiological and substrate manipulation to achieve product formation in industrial microbes.

Learning Outcomes: 1. Understand the genetic manipulation and physiological factors involved in successful fermentation approaches. 2. Apply various methods of monitoring growth of various bioreactor formats. 3. Manipulate and correlate growth with yield of organisms and products. 4. Identify the basic problems which cause fermentation processes to fail and understand the reasons for failure. 5. Create and troubleshoot a simple fermentation process. Credits: 1.00

FS 38000 - Fermented Food Products

Credit Hours: 1.00. This course will allow students to learn and integrate concepts from microbiology, biochemistry, and processing used in the production of representative fermented food products. Students will learn how to design and make specific fermented foods.

Learning Outcomes: 1. Explain the role of specific microorganisms (lactic acid bacteria, yeasts) in the transformation of specific substrates into fermented food products. 2. Explain the chemical and biochemical changes whereby specific substrates are converted into fermented foods. 3. Understand the interdisciplinary nature of fermentative processes by integrating food safety, nutrition, microbiology, economic, and regulatory considerations in process design. 4. Design a laboratory scale process to produce a fermented food product of their choice. Credits: 1.00

FS 38100 - Industrial Fermentation Products

Credit Hours: 1.00. Industrial Fermentation Products introduces students to microbial fermentations employed in the biofuels and fine chemicals industry and their role in the larger bioeconomy. Students will be introduced to diverse final products, technical challenges in the sector, and the individuals and companies working to solve them. We end our five-week module with a field trip to a local biorefinery plant.

Learning Outcomes: 1. Identify the key products of industrial fermentations and their markets. 2. Articulate the major technical and economic challenges facing the industrial fermentations sector. 3. Research and understand fermentation production processes for a specific molecule of interest. 4. Interact with fermentation scientists in the biofuels, biochemicals, and polymers sector. Credits: 1.00

FS 38300 - Fermented Beverage Products

Credit Hours: 1.00. This course will allow students to learn and integrate concepts from microbiology, biochemistry, and processing used in the production of representative fermented beverages. Students will learn how to design and make specific fermented beverages. Must be 21 years of age or older. Permission of department required.

Learning Outcomes: 1. Explain the role of specific microorganisms (lactic acid bacteria, yeasts) in the transformation of specific substrates into fermented beverages. 2. Explain the chemical and biochemical changes whereby specific substrates are converted into fermented beverages. 3. Understand the interdisciplinary nature of fermentative processes by integrating food safety, nutrition, microbiology, economic, and regulatory considerations in process design. 4. Design a laboratory scale process to produce a fermented beverage of their choice. Credits: 1.00

FS 39000 - Food Science Cooperative Work Experience

Credit Hours: 0.00. Supervised professional experiences in the food science industry. Programs must be preplanned and conducted under the direction of the departmental coordinator with the cooperation of an employer. Students must submit a summary report. Permission of department required.

Credits: 0.00

FS 39399 - Cooperative Experience III

Credit Hours: 0.00. Professional experience in food science. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.

Learning Outcomes: 1. Apply knowledge to identifying and solving problems in the professional context. 2. Advance skills related to professional preparation, critical thinking, problem solving, communication, and team work. 3. Increase understanding of the profession and practice, basic industry principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

FS 39499 - Extensive Cooperative Experience IV

Credit Hours: 0.00. Professional experience in food science. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.

Learning Outcomes: 1. Apply knowledge to identifying and solving problems in the professional context. 2. Advance skills related to professional preparation, critical thinking, problem solving, communication, and team work. 3. Increase understanding of the profession and practice, basic industry principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

FS 39599 - Extensive Cooperative Experience V

Credit Hours: 0.00. Professional experience in food science. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.

Learning Outcomes: 1. Apply knowledge to identifying and solving problems in the professional context. 2. Advance skills related to professional preparation, critical thinking, problem solving, communication, and team work. 3. Increase understanding of the profession and practice, basic industry principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

FS 40000 - Food Science Study Abroad

Credit Hours: 0.00 to 8.00. Utilized to record credits earned

through participation in Purdue study abroad programs with cooperating foreign universities.

Credits: 0.00 to 8.00

FS 40100 - Fermentation Processing

Credit Hours: 2.00. The Integration of fermentation core concepts; the application of bioprocess engineering principles to biological systems; topics covering enzyme kinetics, fermentation, downstream processing, and integrated bioprocesses important to industries.

Learning Outcomes: 1. Understand applications and solve problems relating to the use of enzymes for industrial bioprocessing. 2. Apply engineering principles to address issues in fermentation processes. 3. Analyze and identify limiting factors in a bioprocess. 4. Explain and solve problems relating to mass and energy balances in biological reactors. 5. Explain how fermentation processing is used in various fields. Credits: 2.00

FS 40200 - Fermentation Processing Laboratory

Credit Hours: 1.00. The essential concepts of industrial bioprocessing with a focus on the physiology of fermentation; a series of laboratory experiments that follow value-adding processes from conception to completion.

Learning Outcomes: 1. Learn laboratory techniques, to design and conduct experiments, and to analyze and interpret data. 2. Design appropriate bioreactor models based upon bioproducts and other process criteria. 3. Conduct fermentation experiments with process optimization and scale-up. 4. Model the growth of microorganisms in batch, fed-batch, and continuous flow processes. 5. Gain an overview of the fermentation industry. Credits: 1.00

FS 43500 - Sensory Science

Credit Hours: 1.00. Introduction to the fundamental concepts and practices of sensory analysis of food products. Technical aspects of planning and conducting human sensory panels on food products including analysis and interpretation of collected data. Course meets weeks 1-8.

Learning Outcomes: 1. Solve typical sensory problems occurring in the food industry. 2. Conduct sensory testes, analyze and interpret the results. 3. Write a report and executive summary of the findings. Credits: 1.00

FS 44200 - Food Processing II

Credit Hours: 2.00. Study of food processing and preservation methods based on the integrated knowledge of microbiology, chemistry, and food engineering; emphasis will be on temperature reduction, water activity, concentration, dehydration, irradiation, and extrusion.

Learning Outcomes: 1. Have sufficient knowledge of food chemistry to control reactions in foods. 2. Understand the major chemical reactions that limit shelf-life of foods. 3. Identify the conditions under which the important pathogens are commonly inactivated, killed, or made harmless in foods. 4. Understand the principles involving food preservation via fermentation processes. 5. Be able to identify the conditions, including sanitation practices under which the important pathogens and spoilage microorganisms are commonly inactivated, killed, or made harmless in foods. 6. Explain the spoilage and deterioration mechanisms in foods and methods to control deterioration and spoilage. 7. Understand the principles that make a food product safe for consumption. 8. Be able to use mass and energy balances for a given food process. 9. Explain the unit operation required to produce a given food product. 10.Understand the principles and current practices of processing techniques and the effects of processing parameters on product quality. 11.Be able to apply and incorporate the principles of food science in practical, real-world situations. 12.Define a problem, identify causes and possible solutions, and make thoughtful recommendations. 13.Work effectively on a team project. Credits: 2.00

FS 44300 - Food Product Design (Capstone)

Credit Hours: 3.00. Teams develop a new product from concept through marketing. Final case study defense is presented to faculty and peers. Classes include guest lectures from the food industry.

Learning Outcomes: 1. Apply fundamental aspects of food chemistry, microbiology, food safety, nutrition, processing and packaging in the design and develop a new product from

market concepts to practical prototype. 2. Apply knowledge food ingredient sourcing and functionality to the product development process. 3. Understand the basics of project management in the context of group projects. 4. Develop insight into bench top to pilot scale prototyping of food products. 5. Apply statistical principles through process control, experimental design and assessment of experimental data. 6. Have an appreciation for factors impacting product shelf-life and methods to control spoilage. 7. Intelligently discuss current topics in food science and trends that impact the food industry. Credits: 3.00

FS 44400 - Statistical Process Control

Credit Hours: 1.00. Basic concepts and techniques of solving quality problems and assuring the quality of production processes; emphasis is on quality improvement programs, problem-solving tools, control charts for variables and attributes, process capability analysis, and sampling methods. Course meets during weeks 6-10.

Credits: 1.00

FS 44700 - Food Processing II Laboratory

Credit Hours: 1.00. This lab is designed to build upon fundamental concepts associated with the preservation and processing of various food products. Concepts to be covered include water activity, dehydration (drum, spray and freeze drying), frying, high pressure, microwave and ohmic heating. The focus of this lab will be hands-on production of various food products and the demonstration of fundamental food processing unit operations and calculations related to each preservation method.

Learning Outcomes: 1. Perform experiments using appropriate food processing unit operations to create various food products. 2. Write a lab report that includes analysis and interpretation of the results. 3. Work on a project team to duplicate a commercial food product and present the finding of the project in an oral and written report. Credits: 1.00

FS 45300 - Food Chemistry

Credit Hours: 3.00. Application of fundamental laws and concepts of chemistry, physics, and biology to the properties, composition, and storage of foods.

Learning Outcomes: 1. Understand the importance of food chemistry and the relationship of food chemistry to other food science areas. 2. Understand the structures and functions of major food components, including water, proteins, carbohydrates, lipids, vitamins, and minerals. 3. Understand major reactions occurring with macronutrients (water, proteins, carbohydrates, lipids) in foods and impacts on shelf-life. 4. Identify the major components and reactions occurring in major food groups, including fruits, vegetables, grains, legumes, red meats, poultry, eggs, fish, and shellfish. 5. Be able to describe types and uses of basic sensory tests. 6. Be able to identify functions of most or all ingredients listed on the ingredient label of a food product. 7. Be able to discuss alternative ingredient choices for food products. 8. Be able to write a scientific abstract using IFT formatting. Credits: 3.00

FS 45400 - Food Chemistry Laboratory

Credit Hours: 1.00. Laboratory to demonstrate application of fundamental laws and concepts of chemistry, physics, and biology to the properties, composition, and storage of foods.

Learning Outcomes: 1. Performance of the students' progress will be evaluated by 7 lab reports and 3 in-class problem solving activities. Credits: 1.00

FS 45500 - Cereal Chemistry And Processing

Credit Hours: 1.00. Cereal grain structure, chemical and functional properties, and nutritional aspects related to grain milling and processing. Cereal processing covers dry and wet milling, brewing, baked products, pasta, breakfast cereals, snack foods, and traditional cereal foods from other countries. (Offered in even-numbered years.)

Learning Outcomes: 1. To gain a fundamental knowledge and familiarity of the chemistry of cereal grain components and the major cereals processed to consumer products. 2. Have a working knowledge of the relationship between chemical structures, interactions and processing. Credits: 1.00

FS 46700 - Food Analysis

Credit Hours: 3.00. Application of quantitative and qualitative physical, chemical, and instrumental methods of analysis to the examination of food products; evaluation of methods for specific applications.

Learning Outcomes: 1. Describe the principles of the official and rapid methods of analysis for the following food components: moisture, ash, fat, and protein. 2. Select and justify the use of: (for any given food product) a) an official method, and b) a rapid method of analysis for the following food components: moisture, ash, fat, and protein. 3. Describe the principles of the method(s) of analysis for the following food components or properties: individual sugars, starch, total dietary fiber, individual minerals, oxygen demand, texture, color, lipid oxidation, lipid saturation, titratable acidity, extraneous matter, protein nutritional quality, protein functional properties. 4. Explain the principles and applications of the following techniques in food analysis: chromatography, electrophoresis, spectroscopy, spectrometry, immune-based assays, enzymatic assays, animal assays. 5. Identify government regulations that dictate industrial standard practices of food analysis. Credits: 3.00

FS 46900 - Food Analysis Laboratory

Credit Hours: 2.00. Practical laboratory applications of food analysis, including relevant calculations using data gathered and interpretation of data. (Intended for upper-division students.)

Learning Outcomes: 1. Demonstrate practical proficiency in a food analysis laboratory, including relevant calculations using data gathered. Credits: 2.00

FS 47000 - Wine Appreciation

Credit Hours: 3.00. A study of wine production and marketing principles with an emphasis upon consumption responsibility. Historical perspectives form the foundations for wine classification systems and traditional serving procedures. Cardinal scale sensory evaluations are conducted in relationship to various food pairings. Must be 21 years of age or older to register for this course. Permission of department required.

Learning Outcomes: 1. Understand the nature of wine - its production, history, uses and related responsibilities. 2. Develop the ability to recognize different classes, types, and origins of wines. 3. Learn proper etiquette and tasting techniques. 4. Gain direct experience, both individually and as part of a team, in adopting these manners and methods. Credits: 3.00

FS 47500 - Honors Course - Upper Division

Credit Hours: 1.00 to 4.00. Utilized to offer a new honors course for a maximum of three years. Variable title, credit, and instructional type. Course may be repeated for credit if content and titles are different. Offered primarily to third- and fourth-year students. Courses offered must be approved by instructor and College of Agriculture Honors Committee. Permission of instructor required.

Learning Outcomes: 1. Have critical thinking. 2. Have communication. 3. Have cultural understanding. 4. Know civic responsibilities. 5. Have professional preparation. 6. Know scientific principles. 7. Know social science principles. 8. Able to teamwork. Credits: 1.00 to 4.00

FS 48200 - Food Science Senior Seminar

Credit Hours: 1.00. Oral and written reports on selected food science topics.

Credits: 1.00

FS 48300 - Fermentation Capstone

Credit Hours: 3.00. The development of value-added fermentation processes requires a complex blend of technoeconomic and market awareness, resource gathering, strain selection and engineering, reactor optimization and operation, product recovery, and project management skills. Keeping these diverse aspects in balance while managing project timelines is essential to a successful fermentation process - that is, one that is both technically and economically successful. This course is organized to develop your knowledge of the diverse inputs into design of microbial fermentation and your ability to apply concepts learned in prior fermentation classes to the design of a fermentation process, integrating microbiology, chemistry, and processing with basic marketing and business concepts. Students will be organized into project teams for the semester and challenged to design, market, develop, prototype, and scale up a new fermentation. Classes will include guest lectures from experts in the fermentation industry and academia. Project teams will be organized and project leaders selected to manage communication between individual groups and the instructors. Final product concepts will be presented to faculty and peers for evaluation.

Learning Outcomes: 1. Apply and practically integrate fundamental aspect of fermentation microbiology, chemistry, and processing in the design and development of a new value-added

process. 2. Understand and navigate the challenges associated with scaling up a benchtop fermentation process. 3. Apply knowledge of factors impacting fermentation design, productivity, yield, and stability to optimize economic value of a process. 4. Generate an ""elevator speech"" to spur project investment. 5. Manage projects in group contexts. 6. Apply statistical principles in experimental design and assessment of experimental data as it relates to process control and product assessment. 7. Discuss current topics in fermentation science competently. Credits: 3.00

FS 49100 - Special Assignments In Food Science

Credit Hours: 1.00 to 3.00. Open primarily to qualified seniors who desire to study special problems in science not covered in regular coursework. Permission of instructor required.

Credits: 1.00 to 3.00

FS 49900 - Thesis Research

Credit Hours: 1.00 to 6.00. For honors students doing independent research. Permission of instructor required.

Credits: 1.00 to 6.00

FS 50200 - Sustainable Food Manufacturing Technologies

Credit Hours: 3.00. This comprehensive course covers the principles and practices fundamental to manufacturing and storage of foods. It provides an in-depth look at common unit operations-mechanical, thermal, mass transfer, and nonthermal-used in commercial food manufacturing to ensure consistent quality, safety, and supply chain sustainability. Students will also learn about by-product and waste handling and processing. Concepts are explored through digital lectures and virtual laboratory sessions.

Learning Outcomes: 1. Describe the unit operations used in food processing and their relationship to food safety, including principles and mechanisms of action. 2. Build and explain process flow diagrams and identify appropriate processing equipment used to manufacture various food products. 3. Apply thermal calculations and perform mass and heat balances to food manufacturing processes. 4. Identify and discuss critical current issues in food processing, emerging technologies, and waste handling/processing. 5. Communicate effectively on critical issues related to food processing. 6. Conduct specific tests to assess product quality and process data (in virtual labs). 7. Perform lab- and pilot-scale basic unit operations (in virtual labs). Credits: 3.00

FS 53000 - Food Ingredient Technology

Credit Hours: 1.00. Identifies functions of ingredients listed on ingredient labels of food products and discusses alternative ingredient choices for food products.

Credits: 1.00

FS 53100 - Science Of Experimental Cuisine

Credit Hours: 3.00. This course brings together culinary arts and the application of food chemistry and ingredient technology principles. Emphasis will be placed on food construction and deconstruction, using common food preparation and molecular gastronomy techniques.

Learning Outcomes: 1. Develop and use the vocabulary of a professional chef. 2. Understand and intelligently discuss how cooking works. 3. Demonstrate practical proficiency in food preparation skills. 4. Understand and experience food from farm to fork. 5. Compare and contrast home, culinary/food service, and large food industry food production practices. 6. Use common food preparation and molecular gastronomy techniques to manipulate the structure of food ingredients and finished food products. 7. Describe the fundamental structure-function relationships of food ingredients and how each of the applied techniques alters the ingredient structure and/or function. 8. Explore and control common food-related reactions/interactions including: emulsification, Maillard browning, caramelization, gelatinization, gelation, denaturation. 9. Exemplify the scientific process and inquiry driven research by designing, implementing, and analyzing experiments related to food construction and deconstruction. 10. Design and create food textures and products by manipulating fundamental structure-function relationships of food

ingredients, and explain the science of how the foods were constructed. Credits: 3.00

FS 53500 - Aseptic Processing Technologies

Credit Hours: 1.00. Overview of aseptic processing and packaging systems; thermal processing and fluid flow in continuous heat exchangers; food microbiology, chemistry, and packaging as applied to aseptic processing. Establishing processes for aseptic processing of liquid and particulate foods.

Learning Outcomes: 1. Describe the chemical reactions that most affect the quality, including how to control and monitor these. 2. Describe the microbiological concerns, and use this knowledge in problem solving. 3. Select appropriate packages and package integrity tests. 4. Understand the heat transfer principles, and calculate thermal processes, lethality flow rate characteristics, and residence time distribution. Credits: 1.00

FS 54100 - Postharvest Technology Of Fruits And Vegetables

Credit Hours: 1.00. (HORT 54100) Theoretical and applied aspects of methods being used for enhancing the quality and shelf life of harvested fruits and vegetables. Factors that affect the longevity of produce and technology used to control these factors and reduce deterioration of produce between harvest and consumption/processing will be emphasized. Meets during weeks 11-15.

Credits: 1.00

FS 55001 - Food Chemistry

Credit Hours: 1.00. Principles and concepts of the effects of heat, light, oxygen, and water activity on chemical reactions and physical events involved in processing, storage, and preparation of food products and their relationships to nutritional quality, organoleptic quality, stability, and safety. Class meets for 5 weeks.

Learning Outcomes: Students are expected to have a working knowledge of the following topics: 1. Structures and functions of major food components, including water, proteins, carbohydrates, and lipids; Major chemical reactions or structural changes occurring with macronutrients (water, proteins, carbohydrates, lipids) in foods and impacts on shelf-life. 2. Major components and reactions occurring in major food groups, including fruits, vegetables, grains, legumes, red meats, poultry, eggs, fish, and shellfish. 3. Examples of the effects of processing on food constituents and end product quality; Basic principles of dispersed systems: colloids, gels, emulsions, foams; Problem solving using basic food chemistry knowledge. Credits: 1.00

FS 55101 - Food Analysis

Credit Hours: 1.00. Principles and applications of chemical, physical, and sensory techniques to analyze foods. Class meets for 5 weeks.

Learning Outcomes: 1. Identify government regulations that dictate industrial standard practices of food analysis. 2. Describe the principles of the official and rapid methods of analysis of the following food components: moisture, ash, fat, protein. 3. For any given food product, select and justify the use of 1) an official, and 2) a rapid method of analysis for the following food components: moisture, ash, fat, protein. 4. Describe the principles of the methods of analysis for the following food components/properties: individual sugars, starch, total dietary fiber, vitamins, individual minerals, oxygen demand, texture, color, sensory evaluation, lipid oxidation, lipid saturation, titratable acidity, extraneous matter, protein nutritional and functional properties. 5. Relate the various analyses discussed in class to quality assurance of specific food products. 6. Explain the principles and applications of the following techniques in food analysis: chromatography, electrophoresis, spectroscopy (including mass spectroscopy and MALDI), enzymatic assays, immuno-based assays. Credits: 1.00

FS 55201 - Nutritional Sciences

Credit Hours: 1.00. Study of perspectives on established nutrition knowledge, concepts, and principles pertinent to the field of food science. Contemporary information about diet as it relates to health and safety issues. Controversies regarding nutrients and functional foods. Class meets 5 weeks.

Learning Outcomes: Students will learn about

the scientific principle relevant to: 1. Newly released dietary guideline for Americans 2010, & components in diets and foods. 2. Digestion, absorption and metabolism of macro-nutrients. 3. Digestion, absorption and metabolism of vitamins and minerals frequently used in food processing. 4. Influence of food components on energy balance and body weight management. Credits: 1.00

FS 55301 - Food Microbiology

Credit Hours: 1.00. Principles and applications of the microbiology of foods. Focuses on many of the important conditions that may lead to foodborne illness and food spoilage. Structured in three main sections related to foodborne hazards: 1) identification, 2) control and prevention, and 3) detection. Class meets weeks 1-5.

Learning Outcomes: 1. Identify the major components of food that affect microbial growth. 2. Explain major foodborne pathogens and under what conditions they thrive. 3. Use microbiological information and molecular techniques to solve practical problems of the food industry. Credits: 1.00

FS 55401 - Food Processing And Packaging

Credit Hours: 2.00. Covers relevant basic engineering concepts and their applications to solve food processing and packaging problems. Key unit operations and regulations or recommended practices for manufacture of a variety of foods also will be covered. Students work in teams on a project and present their findings to the entire class. Class meets weeks 6-15.

Learning Outcomes: 1. Understand the rationale and principle of operation behind common food processing operations. 2. Identify and explain the unit operations involved in the manufacture of specific food products. 3. Explain how processing parameters will affect quality and safety of processed products. 4. Communicate effectively with food technologists and engineers. Credits: 2.00

FS 55402 - Food Processing

Credit Hours: 1.00. The Food Processing course will present an overview of the basic food engineering concepts and unit operations involved in the manufacture of various food products. Students will be able to understand the food processing literature and to effectively communicate with food technologists and engineers. Topics to be covered include: physical properties of foods, unit operations commonly found in the food industry, and processing equipment. Permission of department required.

Learning Outcomes: 1. Understand the rationale and principle of operation behind common food processing operations. 2. Identify and explain the unit operations involved in the manufacture of specific food products. 3. Explain how processing parameters will affect quality and safety of processed products. 4. Communicate effectively with food technologists and engineers. 5. Work effectively with team members with various backgrounds. Credits: 1.00

FS 55501 - Case Study

Credit Hours: 1.00. A brief overview of problem-solving and teamwork concepts will be presented in class. A problem will be given by an industrial sponsor, and work groups (teams) will be assigned to solve the problem and present the findings.

Learning Outcomes: 1. Work to solve a defined technical problem in food technology. 2. Gain an experience for solving a problem by effective literature search and preliminary experimentation. 3. Analyze data and evaluate the outcome for solving a problem. 4. Coordinate personal contributions within the team. 5. Organize and communicate thoughts/data in a well-organized manner. 6. Present both written and oral reports outlining the approach, procedure, outcome, and recommendation to solve the stated problem. Credits: 1.00

FS 56000 - Food Science Graduate Cooperative Work Experience

Credit Hours: 0.00. Supervised professional experiences in the food science industry. Programs must be preplanned and conducted under the direction of the departmental coordinator with the cooperation of an employer. Students must submit a summary report. Permission of department required.

Learning Outcomes: 1. Think critically, creatively to solve problems in their field of study. Credits: 0.00

FS 56400 - Commercial Food And Beverage Fermentations

Credit Hours: 2.00. This course will provide a study of the

principles and practices of international food and beverage fermentations with emphasis on the microbiology, biochemistry and processing techniques used in commercial fermentations that utilize fruits, vegetables, grains, dairy, and meats. Instructional Format: This is a two-credit lecture that can be linked to a separate optional one credit hour laboratory combination. Students must be 21 years of age with ID check for proof of age. Permission of department required.

Learning Outcomes: 1. To gain a fundamental understanding of the principles and practices of traditional and novel fermentation techniques in the international food and beverage industries. 2. To acquire an advanced scientific knowledge in food microbiology, safety, biochemistry and processing. 3. To gain a learning experience with both production and sensory aspects of applied food and beverage fermentations. Credits: 2.00

FS 56500 - Microbial Foodborne Pathogens

Credit Hours: 3.00. The primary focus is to study the microbial pathogens involved with foodborne diseases. Course emphasis is on molecular and genetic basis of virulence of foodborne pathogens and host-parasite interactions. Topics include incidence and source of pathogens, immune response to infection, virulence factors, and mechanism of pathogenesis of specific infectious and intoxicating foodborne bacteria, mycotoxins, viruses and parasites. Typically offered odd years.

Credits: 3.00

FS 56600 - Microbial Techniques For Food Pathogens

Credit Hours: 2.00. Molecular biology, immunochemistry and tissue culture-based rapid and automated techniques currently used for detection and identification of foodborne pathogens. The techniques include metabolic fingerprinting identification system, enzyme immunoassay and dot blotting, lateral flow assay, polymerase chain reaction, genomic fingerprinting, cytotoxicity assays, and selected biosensor tools. Laboratory experiments are scheduled for four hours, with up to two additional hours of arranged time. Offered in even-numbered years. (Weeks 6-16).

Credits: 2.00

FS 58000 - Food And The Environment

Credit Hours: 1.00. This course is to provide information for students to understand the radical increase in food production and the associated environmental issues it has created. This course gives theoretical coverage of Life Cycle Assessment (LCA) methodology that will assist students in finding ways to evaluate the environmental sustainability of different food systems throughout their entire supply chains at local, national and global levels.

Learning Outcomes: 1. Understand the relationship between the food product life cycle and resource use and emissions generated. 2. Explain the principles of LCA and describe its content and purpose of each analytical step. 3. Interpret and evaluate food LCA studies and understand their strengths, weaknesses and appropriate use. 4. Perform a complete LCA to assess the environmental impact of a food product/system using publicly available data and software. 5. Identify the key factors impacting the environmental sustainability of food systems from farm-to-fork. Credits: 1.00

FS 58100 - Microbial Genomics And Metabolism

Credit Hours: 3.00. Microbial genomics and metabolism will introduce students to how genomes are assembled, how microbial functional predictions are made, and how systems biology techniques are used to query microbial function in diverse ecosystems. Students will participate in activities including classroom lecture, group discussion, reading of primary literature, hands-on computational assignments, exams, and student projects. Basic knowledge of microbiology and molecular biology is expected. Permission of department required.

Learning Outcomes: 1. Run various sequence and genome analysis programs from the command line. 2. Identify the important properties of sequencing technology and genome organization that underlie the genomics of bacteria, archaea, and microbial eukaryotes. 3. Predict gene function using bioinformatic tools and genome properties to annotate and curate microbial genomes. 4. Analyze genomes to predict metabolic pathways and compare related genomes to identify differences in microbial potential function. 5. Present and defend genome-based predictions of organismal metabolism both orally or in scientific writing. Credits: 3.00

FS 58200 - Emerging Food Technologies

Credit Hours: 1.00. This online multi-institutional course provides a broad perspective of innovation as applied to food engineering. The course constitutes weekly presentations from 12 speakers on topics in three thematic areas selected using a student survey (from 18 institutions), aiming to develop a

student-centered course. This course (1) provides a broad perspective of innovation as applied to food engineering; (2) provides a general overview and case studies of current and emerging research areas in food and agricultural engineering and processing by different research groups in the nation; and (3) demonstrates the efforts among food engineers and scientists in the nation to advance engineering knowledge and technologies for the purpose of improving food safety, quality and security, and enhance health benefits of food products through extensive research in focused areas. Permission of department required.

Learning Outcomes: 1. Become familiar with advances in thermal processing of food and biomaterials. 2. Become familiar with advances in nonthermal processing of food and biomaterials. 3. Learn recent developments in understanding and sensing food quality and safety. 4. Apply the insights gained from observing faculty presentations to improve writing and presentation skills. Credits: 1.00

FS 59000 - Special Problems

Credit Hours: 1.00 to 5.00. Specialized study in research laboratories, libraries, or computer laboratories for problems related to food science that are not taught in regular courses. Permission of instructor required.

Credits: 1.00 to 5.00

FS 59100 - Special Topics

Credit Hours: 1.00 to 3.00. Specialized topics not covered in other courses will be offered as one-credit minicourses. Topics, requirements, and credits will be determined yearly. Permission of instructor required.

Credits: 1.00 to 3.00

FS 62000 - Scientific Writing In Food Science

Credit Hours: 2.00. This course covers the essential elements of publishing original research at professional meetings (oral presentations and papers) and in peer-reviewed journals (original research manuscripts). Topics include: ethics in writing, effective reading of the literature, organizing research data, choosing a journal, writing the manuscript (results, materials and methods, introduction, discussion, title, abstract, references), publication process, revising and reviewing, poster presentation, and short oral presentations. Each student will write a paper, prepare a 12-minute oral presentation, and prepare a poster, based on data from his/her graduate research project. Permission of instructor required.

Credits: 2.00

FS 63000 - Carbohydrates

Credit Hours: 3.00. (NUTR 63000) Carbohydrates with an emphasis on those of low molecular weight in foods. Structures, reactions, and properties of mono- and oligosaccharides. Introduction to polysaccharides and food gums. Offered in alternate years. Prerequisite: 6 credit hours in Organic Chemistry. Prerequisite: Nine credits of chemistry.

Credits: 3.00

FS 66000 - Intestinal Microbiology And Immunology

Credit Hours: 1.00. (ANSC 66000) Discussion and critique of recent journal articles related to intestinal microbiology/immunology. The specific areas covered under this forum are: (1) intestinal microbiology, (2) food microbiology as it relates to gastrointestinal diseases, (3) probiotics and prebiotics-related to intestinal health or pathogen control, and (4) mucosal immunity with major emphasis on intestinal immunology.

Learning Outcomes: 1. Demonstrate effective oral and written communication skills. This includes such skills as writing technical reports and making formal presentations. 2. Apply critical thinking skills to new situations including critical evaluation of published papers. 3. Research independently: scientific and nonscientific information and use library resource. Credits: 1.00

FS 68400 - Food Science Seminar

Credit Hours: 1.00. Current topics in food science.

Credits: 1.00

FS 68500 - Food Science Seminar

Credit Hours: 0.00. Observe and critically evaluate presented content and presentation skills of graduate students that are offering seminars. Students will attend seminars during the course time by joining the online content that is simultaneously streamed during the seminar.

Learning Outcomes: 1. Describe science-based problems and technological solutions that are relevant to Food Industry and human nutrition. 2. Gain observational knowledge on valuable presentation practices. Credits: 0.00

FS 69000 - Special Topics In Food Science

Credit Hours: 1.00 to 3.00. Individual study of specialized materials. Permission of instructor required.

Credits: 1.00 to 3.00

FS 69700 - Supervised University Teaching In Food Science

Credit Hours: 1.00. Students assist a faculty member in teaching a food science course to obtain training and experience in various aspects of classroom and laboratory teaching. Permission of instructor required.

Credits: 1.00

FS 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required.

Credits: 1.00 to 18.00

FS 69900 - Research PhD Thesis

Credit Hours: 1.00 to 18.00. Research PhD Thesis. Permission of instructor required.

Credits: 1.00 to 18.00

Forestry and Natural Resources

FNR 12500 - Environmental Science And Conservation (UCC: STS)

Credit Hours: 3.00. (AGRY 12500, EAPS 12500, NRES 12500) Introduction to environmental science and conservation includes topics in ecological principles, conservation and natural resource management, human impacts on the environment, toxic waste disposal, climate change, energy, air and water pollution, environmental geology and geologic hazards.

University Core Curriculum (UCC): (UCC: STS) Learning Outcomes: 1. Describe the issues, facts and concepts central to a broad range of environmental and conservation topics. 2. Form opinions on controversial topics, explaining what they think we should do regarding topics in the news. 3. Describe the work done in five scientific disciplines, ecology, environmental science, resource management, conservation biology, and environmental geology. Credits: 3.00

FNR 15000 - The Nature Of Wild Things

Credit Hours: 1.00. This is the core course for "The Nature of Wild Things" learning community. The course focuses on the majors offered in the Department of Forestry and Natural Resources (FNR), and new student integration into the University and department. This course expands knowledge of academic programs and career options in FNR, and resources available on campus to facilitate student success in the first year. Permission of department required.

Learning Outcomes: 1. Understand the importance of being engaged in FNR as a new student. 2. Be familiar with many of the faculty and some of the staff in FNR. 3. Be familiar with many of the available resources offered by Purdue University, the College of Agriculture, and FNR that facilitate student success in the first year on campus. 4. Understand proper classroom etiquette, and how to conduct oneself appropriately when interacting with faculty, academic advisors, graduate students, upperclassmen, and other members of the campus community. 5. Feel a sense of community with others in his/her cohort. Credits: 1.00

FNR 19800 - Introductory Topics In Forestry And Natural Resources

Credit Hours: 1.00 to 3.00. Subjects and problems of interest to the student. Permission of instructor required.

Learning Outcomes: 1. Vary due to nature of the course. Credits: 1.00 to 3.00

FNR 20100 - Marine Biology

Credit Hours: 3.00. An introduction to the major groups of marine organisms and their habitats. Emphasis on application of ecological principles to the conservation of important marine species. Offered in even-numbered years.

Learning Outcomes: 1. Demonstrate use of the scientific method to identify problems, formulate hypothesis tests, conduct and analyze data, and derive conclusions. 2. Demonstrate critical thinking by using evidence-based information to develop sound responses to complex problems. 3. Demonstrate proficiency in their chosen discipline that incorporates knowledge, skills, technology, and ethics. Credits: 3.00

FNR 21000 - Natural Resource Information Management

Credit Hours: 3.00. Introduction to natural resource and land information systems and data management technologies. Principles of data storage, organization, and retrieval for both textual and spatial data (geographic information systems), data acquisition, accuracy assessment, mapping, and use of this data in natural resource management are presented.

Learning Outcomes: 1. Define basic spatial data concepts (GIS). 2. Create and use spatial and textual databases. 3. Develop spatial analysis abilities using ArcGIS Pro. 4. Contribute to the following: critical thinking, problem solving, quantitative reasoning, information literacy and written communication. Credits: 3.00

FNR 22310 - Introduction To Environmental Policy (UCC: STS)

Credit Hours: 3.00. (POL 22300) Study of decision making as modern societies attempt to cope with environmental and natural resources problems. Focuses on the American political

system, with some attention to the international dimension. Current policies and issues will be examined.

University Core Curriculum (UCC): (UCC: STS)

Learning Outcomes: 1. Learn fundamental principles, generalizations, and theories related to policy development, with a focus on environmental and natural resource policy. 2. Learn to apply course material to improve thinking, problem solving, and decisions relevant to natural resource and environmental issues. 3. Learn to analyze and critically evaluate ideas, arguments, and points of view. Credits: 3.00

FNR 22500 - Dendrology

Credit Hours: 3.00. Field identification, taxonomy, and ecological characteristics of trees, shrubs, and herbs found in forests, prairies, old fields, and wetlands.

Learning Outcomes: 1. Understand factors that control the distribution of major tree species that are native to forest regions of North America. 2. Gain exposure to silviculture, ecology, commercial, and wildlife uses of the tree species in various forest types. 3. Learn identifying characteristics of woody vegetation in North America, with emphasis on Indiana. Credits: 3.00

FNR 23000 - The World's Forests And Society (UCC: STS)

Credit Hours: 3.00. Examination of structure, function, and environmental and cultural significance of forest ecosystems throughout the world.

University Core Curriculum (UCC): (UCC: STS)

Learning Outcomes: 1. Comprehend the complexity of the forests worldwide and understand their variety, distribution, ecological functioning, and role in developing societies and communities. 2. Provide a global perspective of forests' social and economic values, their multiple uses, and the variety of products derived from them. 3. Understand the most critical factors threatening forests and related natural resources in developing and developed countries. 4. Understand the strong connection between forests and related natural resource fields (ecology, wildlife, forest products, sustainability, etc.). Credits: 3.00

FNR 24000 - Wildlife In America (UCC: STS)

Credit Hours: 3.00. History of the occurrence, exploitation, and management of North America's wildlife resources. Life histories, habitat relationships, and human impacts on selected species. Current conservation practices and future prospects.

University Core Curriculum (UCC): (UCC: STS)

Learning Outcomes: 1. Identify and describe the diversity of North American wildlife and their habitats in order to improve their ecological study and aid in their management and conservation. 2. Describe and explain fundamental concepts and theories in the field of ecology in order to inform different wildlife conservation and management strategies. 3. Compare and contrast the various anthropogenic threats to wildlife in order to synthesize and evaluate their impacts on wildlife. 4. Explain and apply approaches and tools used in wildlife conservation and management in order to address anthropogenic threats to wildlife. 5. Evaluate primary literature in order to analyze the merits and weaknesses of current research in the fields of ecology, conservation, and management as they relate to major wildlife groups. Credits: 3.00

FNR 24150 - Ecology And Systematics Of Fishes, Amphibians And Reptiles

Credit Hours: 3.00. Introduction to the ecology and systematics of Fish, Amphibians and Reptiles. Discuss the evolutionary adaptations and ecological processes of these vertebrate groups at the individual, population, and community levels. Examine the roles of phylogeny, physiology, morphology, and behavior in influencing organismal responses to the environment. Assess issues related to the conservation of fish, amphibians and reptiles.

Learning Outcomes: 1. Know about the evolutionary history of fishes, amphibians and reptiles. 2. Know the major taxa of fishes, amphibians and reptiles and the special anatomical, morphological, behavioral, and ecological features that characterize each group. 3. Be familiar with many of the techniques used to study the behavior and

ecology of fishes, amphibians and reptiles. 4. Be familiar with major threats facing these groups. Credits: 3.00

FNR 24250 - Laboratory In Ecology And Systematics Of Fishes, Amphibians And Reptiles

Credit Hours: 1.00. Basic anatomy, classification, and identification of fishes, amphibians and reptiles. Identification deals with representative species from selected phylogenetic and geographic groupings in North America.

Learning Outcomes: 1. Learn to identify important North American fish, amphibians, and reptile species, with an emphasis on species of the Midwestern U.S. 2. Be familar with the ecology, natural history, and systematics of the fish, amphibians, and reptiles. 3. Describe the characteristic features of some of the important North American vertebrates, using a combination of preserved specimens, photographic images, field guides, and taxomonic keys. Credits: 1.00

FNR 25150 - Ecology And Systematics Of Mammals And Birds

Credit Hours: 3.00. Introduction to the ecology and systematics of mammals and birds. Discuss the evolutionary adaptations and ecological processes of these vertebrate groups at the individual, population, and community levels. Examine the roles of phylogeny, physiology, morphology, and behavior in influencing organismal responses to the environment. Assess issues related to the conservation of mammals and birds.

Learning Outcomes: 1. Be familiar with the evolutionary origins of mammals and birds. 2. Know the major taxa of mammals and birds. 3. Be familiar with the behavioral and ecological characteristics of wild mammals and birds. 4. Be familiar with major threats facing wild mammal and bird populations. 5. Gain experience reading and summarizing primary literature on wild mammals and birds. Credits: 3.00

FNR 25250 - Laboratory In Ecology And Systematics Of Mammals And Birds

Credit Hours: 1.00. Basic anatomy, classification, and identification of mammals and birds. Identification deals with representative species from selected phylogenetic and geographic groupings in North America.

Learning Outcomes: 1. Identify important North American mammal and bird species, with an emphasis on species of the Midwestern U.S. 2. Be familiar with the ecology, natural history, and systematics of the mammals and birds. 3. Describe the characteristic features of some of the important North American vertebrates, using a combination of preserved specimens, photographic images, field guides, and taxonomic keys. Credits: 1.00

FNR 27000 - Landscape-Level Planning

Credit Hours: 1.00. The main objective of this course is to teach students about natural resources planning with an emphasis on critical skills for developing landscape-level management plans. This one credit course uses guest speakers, lectures, in-class activities, group presentations and take-home assignments to facilitate student learning.

Learning Outcomes: 1. Understand the role of planning in natural resource management. 2. Communicate the importance of landscape level planning. 3. Write the key elements in a natural resource management plan. 4. Understand planning tools such as zoning, conservation easements, and grant funding. 5. Think through how to evaluate a plan. Credits: 1.00

FNR 29199 - Cooperative Experience I

Credit Hours: 0.00. Professional experience in forestry & natural resources. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.

Learning Outcomes: 1. Apply knowledge to identifying and solving problems in the professional context. 2. Advance skills related to professional preparation, critical thinking, problem solving, communication, and team work. 3. Increase understanding of the profession and practice, basic industry principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

FNR 29299 - Cooperative Experience II

Credit Hours: 0.00. Professional experience in forestry & natural resources. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.

Learning Outcomes: 1. Apply knowledge to identifying and solving problems in the professional context. 2. Advance skills related to professional preparation, critical thinking, problem solving, communication, and team work. 3. Increase understanding of the profession and practice, basic industry principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

FNR 29800 - Topical Problems In Forestry And Natural Resources

Credit Hours: 0.00 to 4.00. The class will be used primarily for lower-level undergraduate research projects and for the development of new and/or temporary courses for lower-division students. The course also offered for 0 credit for training opportunities (e.g., first aid for undergraduates attending summer practicum).

Learning Outcomes: 1. Vary due to nature of the course. Credits: 0.00 to 4.00

FNR 30110 - Sustainable Wood Products Manufacturing

Credit Hours: 3.00. Sustainable wood processing methods for hardwood and softwood sawmilling; veneering; plywood; pallets; lumber drying; reconstituted products including particleboard, medium density fiberboard, and oriented strand board; wood preservation including lumber, crossties, poles, and piling; secondary products including furniture, cabinets, millwork; and others; wood residues, woody biomass and others as appropriate will be covered. In addition to processing methods, the grading of material, including logs, hardwood and softwood lumber and consideration of applicable standards, and sustainability initiatives will be covered.

Learning Outcomes: 1. Provide insight into the many products and processes which are used to sustainably convert round timber into consumer and industrial products, emphasis on the hardwood industry. 2. Provide adequate background in order to be employable by the wood manufacturing industry. Credits: 3.00

FNR 30200 - Global Sustainability Issues

Credit Hours: 2.00. This course explores global sustainability issues in natural resources with emphasis on forestry, wood products manufacturing, conservation, water management, energy and their impact on the targeted geographic location (such as Central America, Eastern Europe) and the rest of the world. The purpose of this course is to present students, regardless of their disciplinary background, with an overview of the interdisciplinary aspects of sustainable natural resource management. This colloquium course will examine global sustainable natural resources and related issues (including population, poverty, pollution, climate change, deforestation, invasive species, urbanization, habitat loss, cultural traditions, water management, energy, education, technology, and international collaboration).

Learning Outcomes: 1. Appraise the impact of natural resources in developing and developed economies. 2. Understand the most important factors that threaten natural resources in developing and developed economies. 3. Understand how developments in natural resources in foreign countries relate to similar developments in Indiana and the United States. 4. Comprehend the complexity of global natural resource issues and the role of sustainable natural resource management in sustainable development. Credits: 2.00

FNR 30500 - Conservation Genetics

Credit Hours: 3.00. Fundamentals and principles of genetics, including Mendelian inheritance, genetic mapping & linkage, DNA fingerprinting, phylogeography, and speciation. Topics cover the theoretical and empirical evidence illustrating how mutation, migration, drift, and natural selection influence the evolution of genes in natural populations. Designed for ecologists and natural resource professionals.

Learning Outcomes: 1. Develop conceptual understanding of modern genetics and the use of molecular markers in studies of wildlife/fisheries/forest management, ecology, and evolutionary biology. 2. Explore how genetic information is used in sportfish stockings, wildlife reintroductions, and selective harvest of native trees. 3. Recognize and predict the genetic ramifications of these artificial activities. 4. Compare these effects to the consequences of natural disturbances. (e.g., glaciations). Credits: 3.00

FNR 31110 - Identification And Basic Properties Of Wood

Credit Hours: 3.00. The identification of macro characteristics of North American wood species and discussion of their availability, distribution, and unique characteristics. Basic physical, mechanical and working properties of wood, including orthotropic nature of wood, grain, texture, moisture content, shrinking, specific gravity, machining, thermal properties, electrical properties, strength prosperities, natural

characteristics affecting mechanical properties, also the effect of manufacturing and service environment on mechanical properties through laboratory exercises and field trips. Students will study the cellular structure and arrangement of woody biomaterials, their manufacturing characteristics and uses.

Learning Outcomes: 1. Learn the identifying macro characteristics of commercially important woody biomaterials (color, odor, cellular arrangement, grain patterns, character marks, etc.) through laboratory exercises and field trips. 2. Learn the cellular structure and arrangement of woody biomaterials. 3. Know the manufacturing characteristics and uses of woody biomaterials. 4. Identify upon sight the major commercial hardwood and softwood species produced in North America. Credits: 3.00

FNR 31300 - Aquaponics

Credit Hours: 1.00. (SFS 31100) (HORT 31110) There has been a significant renewed interest in the investigation of integrated fish-food plant systems. Such systems have a long and rich history, particularly in Asia; and our impending food crisis has kindled an interest in developing aquaponics systems in Western countries. Many growers are turning to controlled environment and hydroponic production methods to produce high-value crops in tight quarters. The waste disposal problem of the fish can become the nutrient supply to the plants.

Learning Outcomes: 1. Understand the nature of interactions among organisms, in particular those involving plants: mutualism, commensalism, parasitism, herbivory. 2. Understand the relationships among host, environment and pathogen for development of plant disease. 3. Know principal pathogens of Midwestern crops. 4. Understand the pathways of nutrient cycling in the soil and the biosphere; e.g. N, P, C cycles. 5. Have a broad understanding of the principles of sustainability, including agricultural sustainability. 6. Understand the importance of energy in society and in agricultural production systems. 7. Understand the importance of natural resources in society and in agricultural production, and the principles of their conservation. 8. Have a broad awareness of the role of agriculture in global society. 9. Understand the advantages and disadvantages of different approaches to food production. 10. Understand the principles of food marketing and sales. 11. Understand the principles of postharvest food storage and pest management. 12. Be able to communicate effectively verbally, including being able to prepare and deliver effective scientific papers and presentations. 13. Be able to conduct a competent literature search, including a search for primary literature, and also including the ability to find and assimilate information that will broaden understanding of subject areas by accessing material that is not specifically taught in class. 14. Be able to handle multiple tasks and deadline pressures. 15. Be able to work effectively with individuals from diverse cultures. 16. Have strong professional ethics and integrity. 17. Understand the importance of developing leadership skills. 18. Be able to work effectively in teams. 19. Have a working knowledge of SI (metric) units. Credits: 1.00

FNR 33100 - Forest Ecosystems

Credit Hours: 3.00. Introduction to ecosystem processes, with emphasis on structural dynamics, energy flows, nutrient cycling, spatial patterns, classification and interaction of plant and animal populations. Processes will be related to human activities.

Learning Outcomes: 1. Understand the basic principles of ecology. 2. Understand the response to forest vegetation to environmental factors. 3. Understand the role of disturbance in driving community dynamics, stand development, and ecosystem function. 4. Understand primary productivity and nutrient cycling. 5. Understand plant-animal interactions. 6. Understand the influence of human activities on ecosystem processes. Credits: 3.00

FNR 33350 - Applied Fire Ecology

Credit Hours: 3.00. Fire, either as a natural disturbance or anthropogenically mediated disturbance, has been a feature of almost every major terrestrial ecosystem in North America. In this era of climate change, land management agencies are increasingly using fire both to manage terrestrial ecosystems

and to actively contain wildfire. This class will provide basic understanding to both fire behavior and its ecological impacts on terrestrial ecosystems, focusing on systems common to the Central Hardwood Region. Students will get experience conducting prescribed fire and take Firefighter Type II (FFT2) online training modules, in partial fulfillment of requirements of an Incident Qualification Card (i.e., "red card"). Students will learn how to develop a burn plan for a given property, including assessment of risks, prediction of fire behavior (i.e., BEHAVE model), and estimation of burn effects.

Learning Outcomes: 1. Explain the role of fire in the development of North American ecosystems. 2. Describe fire as a physical and ecological process. 3. Demonstrate the ability to utilize prescribed fire safely. 4. Develop a burn plan to complete a prescribed fire safely and effectively. 5. Evaluate the role of fire as a contemporary management tool. Credits: 3.00

FNR 33800 - Introduction To Silviculture

Credit Hours: 3.00. This course introduces the common silvicultural systems used in North American forests for forestry and wildlife habitat management objectives. Topics range from stand dynamics to thinning practices and regenerative harvest systems in naturally-regenerated forests. Lectures present theoretical concepts in order to allow students to understand forest management practices, while the recitation portion of this course reviews these concepts in light of wildlife habitat management, biodiversity, and other non-timber resources. The recitation is writing-intensive requiring several reflection papers on assigned readings and a semester-ending term paper on a subject of the student's choosing. Credit cannot be earned for both FNR 33800 and FNR 43900. Permission of department required.

Learning Outcomes: 1. Be familiar with technical silvicultural terminology. 2. Describe the effectiveness of alternative site preparation, regeneration, stand tending, and harvesting methods for natural stands. 3. Describe the impacts of silvicultural practices affect soil resources, forest health, timber production, wildlife habitat, biodiversity, aesthetics and other aspects in natural stands. 4. Locate, summarize and evaluate primary and selected secondary literature sources in regards to silvicultural effects on non-timber resources. Credits: 3.00

FNR 34100 - Wildlife Habitat Management

Credit Hours: 3.00. Principles, practices, and justification of the habitat management approach to the manipulation of wildlife populations.

Learning Outcomes: 1. Demonstrate use of the scientific method to identify problems, formulate hypothesis tests, conduct and analyze data, and derive conclusions. 2. Demonstrate critical thinking by using evidence-based information to develop sound responses to complex problems. 3. Demonstrate proficiency in their chosen discipline that incorporates knowledge, skills, technology, and ethics. Credits: 3.00

FNR 34800 - Wildlife Investigational Techniques

Credit Hours: 3.00. An introduction to current wildlife research techniques that are used in managing populations and habitats. Laboratory and field exercises are used to gather and analyze data; basic data analysis and written dissemination of results is emphasized.

Learning Outcomes: 1. Demonstrate use of the scientific method to identify problems, formulate hypothesis tests, conduct and analyze data, and derive conclusions. 2. Demonstrate critical thinking by using evidence-based information to develop sound responses to complex problems. 3. Demonstrate proficiency in their chosen discipline that incorporates knowledge, skills, technology, and ethics. Credits: 3.00

FNR 35100 - Aquatic Sampling Techniques

Credit Hours: 3.00. An introduction to laboratory and field sampling methods in aquaculture, limnology, and fisheries biology. Emphasis will be placed on the proper use of laboratory equipment and sampling gears, as well as the development of sampling protocols for collecting representative, non-biased fisheries and aquatic sciences data.

Learning Outcomes: 1. Demonstrate use of the scientific method to identify problems, formulate hypothesis tests, conduct and analyze data, and derive conclusions. 2. Demonstrate critical thinking by using evidence-based information to develop sound responses to complex problems. 3. Demonstrate proficiency in their chosen discipline that incorporates knowledge, skills, technology, and ethics. Credits: 3.00

FNR 35110 - Aquatic Sampling Techniques I

Credit Hours: 2.00. This course presents an introduction to field sampling methods used in aquaculture, aquatic ecology, and fisheries biology. The course emphasizes the proper care and

use of field sampling gears, as well as the development of sampling protocols for collecting representative, non-biased fisheries and aquatic sciences data.

Learning Outcomes: 1. Apply principles and techniques associated with assessing physical habitat, lower trophic levels, and fish populations in lentic and lotic environments. 2. Assess aquatic resources, including basic data analysis and decision-making as it pertains to the sampling and management of aquatic ecosystems. 3. Demonstrate improved critical thinking, written and oral communication, and professional skills relative to fisheries and aquatic science sampling considerations and issues. Credits: 2.00

FNR 35150 - Aquatic Sampling Techniques II

Credit Hours: 2.00. This course presents an introduction to laboratory and field sampling methods used in aquaculture, limnology, and fisheries biology. The course emphasizes the proper care and use of laboratory equipment and field sampling gears, as well as the analyses and reporting of fisheries and aquatic sciences data.

Learning Outcomes: 1. Apply principles and techniques associated with hatchery and freshwater and marine fish culture systems and assessment of fish health, fish diet and age, physical habitat, water quality and fish populations in lentic and lotic environments. 2. Assess aquatic resources, including data analysis, reporting, and decision-making as it pertains to the sampling and management of fish culture systems and aquatic ecosystems. 3. Advance critical thinking and written and oral communication, and professional skills relative to fisheries and aquatic science sampling considerations and issues. Credits: 2.00

FNR 35300 - Natural Resources Measurement

Credit Hours: 3.00. An introduction to sampling techniques and fundamental principles for measuring natural resources.

Learning Outcomes: 1. Demonstrate use of the scientific method to identify problems, formulate hypothesis tests, conduct and analyze data, and derive conclusions. 2. Demonstrate critical thinking by using evidence-based information to develop sound responses to complex problems. 3 . Demonstrate proficiency in their chosen discipline that incorporates knowledge, skills, technology, and ethics. Credits: 3.00

FNR 35500 - Quantitative Methods For Resource Management

Credit Hours: 3.00. Application of analytical and computational techniques for the purpose of making decisions regarding the management of forests.

Learning Outcomes: 1. Evaluate natural resources critically, discern the strength of evidence and arguments, determine credibility, and identify potential bias and overall quality. 2. Use simulation and optimization tools to address various natural resources management problems and challenges. 3. Appreciate the basics of computer simulation, visualization, and data management. Credits: 3.00

FNR 35700 - Fundamental Remote Sensing

Credit Hours: 3.00. Introduction to the principles of remote sensing, aerial photo interpretation, photogrammetry, geographic information systems, and global positioning systems. Primary applications of geospatial science and technology in forestry and natural resources.

Learning Outcomes: 1. Understand remote sensing fundamentals and gain knowledge about the applications of remotely sensed data in vegetation and land use. 2. Exercise relevant computer software (Erdas Imagine) for handling and aerial photographs and satellite imagery. 3. Use remote sensing skills to solve problems associated with agriculture, forestry, natural resources, and urban areas. Credits: 3.00

FNR 35910 - Spatial Ecology

Credit Hours: 2.00. Introduction to the principles of landscape ecology and biogeography. Landscape ecology focuses on the important relationships of landscape structure (pattern, heterogeneity) and ecological processes (movement of animals, hydrologic dynamics) and how this information is used for natural resource management. Biogeography examines ecological patterns and processes at larger scales (generally at subcontinental to global) for the purposes of managing plants and animals of global importance.

Learning Outcomes: 1. Able to understand the theory, applications (how theory is applied) can be used to study landscape and larger scale

problems related to natural resources. 2. Know what a landscape is. 3. Know the methods to quantify landscape pattern. 4. Understand important terms in landscape ecology and biogeography. 5. Understand the causes (natural and human) of landscape pattern. 6. Understand the threats to biodiversity locally and globally. 7. Able to explain the theory of island biogeography. 8. Define sustainability and know how to calculate an ecological footprint. Credits: 2.00

FNR 35950 - Spatial Ecology Laboratory

Credit Hours: 1.00. The lab will focus on the use and application of spatial databases that are common in natural resource management settings. Introduction to the principles of landscape ecology and biogeography with a laboratory devoted to the analysis of spatial data using geographic information systems and other database tools. Landscape ecology focuses on the important relationships of landscape structure (pattern, heterogeneity) and ecological processes (movement of animals, hydrologic dynamics) and how this information is used for natural resource management. Biogeography examines ecological patterns and processes at larger scales (generally at subcontinental to global) for the purposes of managing plants and animals of global importance. In the last 15 years, tremendous efforts have been made to create spatial databases that help support research and management of natural resources at various scales.

Learning Outcomes: 1. Know methods to quantify landscape pattern. 2. Use GIS to conduct simple and moderately complex analyses using common public domain databases. 3. Know where to get important geospatial data from the internet. 4. Work with US government data and understand the various levels of aggregation of spatial data. Credits: 1.00

FNR 37010 - Natural Resources Practicum

Credit Hours: 1.00. Specific field instruction in forestry, fisheries and aquatic sciences and wildlife. Students pay university tuition plus a fee for living facilities and subsistence.

Learning Outcomes: 1. Identify common local trees and shrubs. 2. Use aerial photos, topographic maps, magnetic compass and pacing to navigate on the landscape. 3. Use aerial photos and topgraphic maps to determine distance, area, landforms and cover types on the landscape. 4. Identify habitat types with aerial photos and define habitat boundaries on ground with hand-held GPS. 5. Delineate watershed boundaries with stereo aerial photos. 6. Locating land marks with Lat-Lon and UTM coordinates under different datum systems. Credits: 1.00

FNR 37050 - Forest Habitats And Communities Practicum

Credit Hours: 1.00. Specific field instruction in forestry and wildlife. Students pay university tuition plus a fee for living facilities and subsistence.

Learning Outcomes: 1. Use field classification keys to perform habitat typing of forest communities. 2. Collect and analyze field vegetation data to describe forest composition and structure. 3. Identify soil, site, and disturbance characteristics that determine the distribution and abundance of plant and animal species. 4. Describe the responsibilities, duties, and challenges of working as a professional forester or wildlife biologist. 5. Evaluate wildlife abundance using a variety of field methods and understand the differences between population estimates and indices. Credits: 1.00

FNR 37100 - Fisheries And Aquatic Sciences Practicum

Credit Hours: 5.00. Specific field instruction in fisheries and aquatic sciences. Students pay university tuition plus a fee for living facilities and subsistence.

Learning Outcomes: 1. Develop knowledge in the principles and techniques associated with sampling and assessing fish populations, aquatic habitats, and lower trophic levels (e.g.. zooplankton. benthic invertebrates, etc.) in stream/river (i.e.. lotic) and pond/lake (i.e.. lentic) ecosystems. 2. Develop practical, hands-on experience in aquatic resource assessment, data analysis, reporting, and decision-making as it pertains to sampling and management of aquatic ecosystems. 3. Sharpen critical thinking, written and oral communication, and

professional skills relative to fisheries and aquatic sciences as they apply to both basic and applied science. Credits: 5.00

FNR 37200 - Forestry Practicum

Credit Hours: 4.00. Specific field instruction in forestry. Students pay university tuition plus a fee for living facilities and subsistence.

Learning Outcomes: 1. Perform basic surveying skills. 2. Perform basic GIS/GPS operations. 3. Perform forest inventory and measurement techniques. 4. Utilize computer applications and analysis of inventory data. 5. Define silvicultural terminology. 6. Explain ecological concepts related to forest-stand development. 7. Explain how forest management affects various resources including: soil, water, timber, wildlife, biodiversity, aesthetics, and forest health. 8. Describe tree improvement, seedling production, and reforestation practices. 9. Plant a seedling properly and understand how to check planting quality of a planting crew. 10. Explain what management practices can be used to promote forest health. 11. Explain the differences in primary production processes for paper, dimensional lumber and engineered wood. 12. Explain the differences in primary production processes for OSB and paper. 13. Estimate the stumpage value of a stand. 14. Assess plant biodiversity of a stand. 15. Estimate recreational values of a national forest. 16. Describe flows of matter and energy in coupled human and natural systems. 17. Discuss how drivers of ecological processes change across an urban-rural gradient. 18. Compare and contrast forest ecosystem structure and function in urban and rural settings, including diversity and distribution of organisms, landcover types, and ecosystem services. 19. Discuss provisioning of ecosystem services in urban and rural ecosystems; compare and contrast green vs grey infrastructure; identify areas of traditionally grey infrastructure that have the potential to integrate green infrastructure. 20. Recognize the various types of nursery stock available for planting and their purpose. 21. Describe the best management practices for installing a landscape-scale tree in the urban environment. 22. Demonstrate proper technique for planting and transplanting trees by installing a tree using best management practices. 23. Explain why arborists climb trees. 24. Describe situational awareness of tree work aloft including H.O.P.E. 25. Recognize the basic equipment for ascending a tree and how they are applied in climbing operations. 26. Demonstrate basic ascending and descending techniques for access to the tree. 27. Explain the benefits of trees. 28. Describe tree value and how they contribute to ecosystem services. 29. Explain why trees should be assessed for risk. 30. Identify basic and advanced tools used in a risk assessment. 31. Recognize typical defects found in trees and their relative risk factor. 32. Demonstrate the principles of a basic risk assessment for trees. Credits: 4.00

FNR 37300 - Wildlife Practicum

Credit Hours: 4.00. Specific field instruction in wildlife science and management. Students pay university tuition plus a fee for living facilities and subsistence.

Learning Outcomes: 1. Able to identify the common birds seen and heard on the campus of Covenant Point and surrounding areas. 2. Able to set up mist nets, remove birds safely from the nets and take down and store the equipment properly. 3. Able to safely handle and measure birds, mark them with leg bands and record appropriate data. 4. Create and maintain a field notebook of their observations and activities during the week. 5. Able to lay out a small mammal trapping grid and properly place traps. 6. Able to remove small mammals from live traps, mark those animals, measure them for identification and release them. 7. Able

to operate a telemetry to receiver to estimate the location of a radio collar via triangulation and use homing technique to find that transmitter. 8. Able to identify bat roosting habitat, use acoustic recorders to detect bats and use software to identify bat species from recorded calls. 9. Able to track small mammals using both spool and line and fluorescent powder techniques. 10. Able to develop a null hypothesis about habitat selection and use a chi square test for independence to accept or reject that null hypothesis. 11. Perform current techniques for sampling herpetofanua and macroinvertebrates. 12. Describe and perform herpetofanual marking techniques. 13. Identify anuran species by call. 14. Identify and dissect larval amphibians. 15. Identify macroinvertebrate species in lentic and lotic habitats. 16. Describe common diseases of amphibians. Credits: 4.00

FNR 37500 - Human Dimensions Of Natural Resource Management

Credit Hours: 3.00. An introduction to the human dimensions of forestry, wildlife, and recreation; students will learn how values, attitudes, community, and behavior relate to natural resource management and decision-making; various natural resource management stakeholders such as private landowners, natural resource agencies, the judiciary, and environmental and natural resource interest groups will be discussed; course will utilize case studies specific to Indiana and the Midwest; course includes weekly discussions during recitations.

Learning Outcomes: 1. Become familiar with key concepts and theories related to the human dimensions of natural resource management. 2. Become familiar with key methods that can be used to collect and analyze human dimensions data to inform natural resource management and environmental conservation decisions. 3. Identify various social, economic, political, and cultural factors that influence how people (particularly individuals) think about and act towards natural resources and the environment. 4. Identify potential strategies for informing and influencing human behaviors towards a more sustainable future. 5. Examine current natural resource management and conservation approaches/programs from a human-dimensions perspective critically and suggest well-informed alternatives/changes/additions to enhance management and conservation outcomes. Credits: 3.00

FNR 37700 - Optimize Student Conference Attendance

Credit Hours: 1.00. Participation in this course will formalize the experience of attending a professional conference by training students to optimize their experience. Students will then attend a professional conference with mentoring from the course instructors. Permission of instructor required.

Learning Outcomes: 1. Attend a profession conference. 2. Gained an understanding of how to plan a personal conference schedule and maximize networking opportunities to gain the most out of the experience. 3. Develop critical evaluation skills that allow for assessment of the quality of research and what to expect from a conference presentation based on an abstract. 4. Broaden their understanding of career options available in their chose field and the training and experience necessary to be qualified for those careers. Credits: 1.00

FNR 37800 - Marine Biology Practicum

Credit Hours: 3.00. This course presents students with expanded opportunities to use field techniques to sample and report on marine habitats and organisms. The course emphasizes the proper care and use of field sampling gear and identification of fish and invertebrates samples from exposed shore, lagoon, and estuary habitats. A trip to the coast of either the Atlantic Ocean or Gulf of Mexico is a central component of this course; a course fee is required to cover the expenses of the trip.

Learning Outcomes: 1. Demonstrate enhanced knowledge of the basic principles and techniques associated with sampling organisms in coastal environments. 2. Demonstrate practical knowledge and skills in sampling, handling, identifying, and reporting on marine biological communities characteristic of several costal habitat types. 3. Demonstrate improved

critical thinking, written and oral communication, and professional skills related to marine biology. Credits: 3.00

FNR 38400 - Statistics For Natural Resources

Credit Hours: 3.00. Methods of statistical analysis and modeling for data and problems encountered in natural resources conservation, science and management. Emphasis is on application of methods and interpretation of results in the context of natural resource problems. Topics include introductory sampling design, exploratory analyses, general linear models, generalized linear models, introduction to resampling methods, likelihood-based model selection, and model goodness-of-fit.

Learning Outcomes: 1. Describe the importance of proper design and analysis when seeking answers/solutions to a broad array of natural resources issues. 2. Independently assess the relative merits of multiple analysis approaches when presented with data collected to improve our understanding of a particular process or pattern in natural resources. 3. Fit and evaluate regression models for quantitative and categorical response variables with an appropriate underlying probabilistic structure. Credits: 3.00

FNR 38500 - Fish Biology And Ecology

Credit Hours: 4.00. Advanced study of the biology and ecology of fishes. In particular, the course covers aspects of the morphology, physiology, development, behavior, evolution, and diversity of fishes throughout the world. The relationship of fishes to the physical, chemical, and biological features of the environment in both natural and perturbed aquatic ecosystems will be explored. An emphasis will be placed on diversity in morphology, behavior, feeding, and reproductive strategies as they relate to individual, population, community structure, and anthropogenic effects.

Learning Outcomes: 1. Know key primitive fish groups and understand how modern fishes evolved through time. 2. Develop skills in fish taxonomy and scientific nomenclature, including identification of a wide range of fish specimens. 3. Understand fish diversity in terms of morphology, behavior, feeding, reproduction and habitats. 4. Build fish laboratory skills, including fish dissection, data collection and data analysis. 5. Understand the broad ecological roles of fishes in freshwater and marine systems. 6. Understand the principles of fish population dynamics and how populations respond to various biotic and abiotic factors. 7. Develop an understanding of the scientific method and demonstrate the ability to solve. problems, think critically and write scientific reports. Credits: 4.00

FNR 39000 - Cooperative Professional Program

Credit Hours: 0.00. Supervised professional experience in forestry. Programs must be preplanned and conducted under the direction of a forestry faculty coordinator with the cooperation of an employer. Students must submit a summary report. Admission to forestry Co-op program.

Learning Outcomes: 1. Vary due to nature of the course. Credits: 0.00

FNR 39399 - Cooperative Experience III

Credit Hours: 0.00. Professional experience in forestry & natural resources. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.

Learning Outcomes: 1. Apply knowledge to identifying and solving problems in the professional context. 2. Advance skills related to professional preparation, critical thinking, problem solving, communication, and team work. 3. Increase understanding of the profession and practice, basic industry principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

FNR 39499 - Extensive Cooperative Experience IV

Credit Hours: 0.00. Professional experience in forestry & natural resources. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.

Learning Outcomes: 1. Apply knowledge to identifying and solving problems in the professional context. 2. Advance skills related to professional preparation, critical thinking, problem solving, communication, and team work. 3. Increase understanding of the profession and practice, basic industry

principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

FNR 39599 - Extensive Cooperative Experience V

Credit Hours: 0.00. Professional experience in forestry & natural resources. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.

Learning Outcomes: 1. Apply knowledge to identifying and solving problems in the professional context. 2. Advance skills related to professional preparation, critical thinking, problem solving, communication, and team work. 3. Increase understanding of the profession and practice, basic industry principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

FNR 40000 - Forestry And Natural Resources Study Abroad

Credit Hours: 0.00 to 8.00. Utilized to record credits earned through participation in Purdue study abroad programs with cooperating foreign universities.

Learning Outcomes: 1. Vary due to nature of the course. Credits: 0.00 to 8.00

FNR 40100 - Limnology

Credit Hours: 3.00. Limnology is the study of the chemical, physical, geological, biological, and ecological processes that influence the structure and function of freshwater ecosystems. The course will focus on developing the understanding of key terms and mechanisms related to the basic understanding of limnological processes. Moreover, various applications and management considerations related to freshwater ecosystems will be presented.

Learning Outcomes: 1. Practice and develop critical thinking skills through in-class discussions and presentations. 2. Learn how to read and interpret the scientific literature. 3. Broaden their understanding of freshwater ecosystems, through lectures. Credits: 3.00

FNR 40600 - Natural Resource And Environmental Economics

Credit Hours: 3.00. (AGEC 40600) Introduction to economic models of renewable and nonrenewable natural resources and the use of these models in the analysis of current resource use and environmental issues.

Learning Outcomes: 1. Define "social efficiency" and "cost-effectiveness" and discuss each concept's caveats in allocating environmental goods. 2. Identify externalities and understand the government's role in addressing them. 3. Apply basic cost-benefit analysis for environmental decision-making. 4. Understand the process of and justification for valuing environmental amenities. 5. Discuss the economic perspective on environmental sustainability. Credits: 3.00

FNR 40700 - Forest Economics

Credit Hours: 3.00. Implications of unique economic characteristics of forest resources, including a tree as both capital and output, high capital-to-output ratio, location utility of in-forest uses, long investment periods, and non-market outputs.

Learning Outcomes: 1. Describe the different approaches to forest management including the planning concepts. 2. Identify the ecological, social and economic objectives associated with management strategies. 3. Understand concepts related to forest sustainability and conservation. 4. Understand the management implications of contemporary issues. 5. Apply analytical tools of forest decision making. Credits: 3.00

FNR 40910 - Forest Resources Management

Credit Hours: 3.00. This course focuses on the long-term sustainable management of forests for the production of wood fiber, ecological services, and other market and non-market goods and services.

Learning Outcomes: 1. Describe the different approaches to forest management including: planning concepts; ecological, social and economic objectives; forest sustainability and regulation; certification programs; adaptive management; and forest decision analysis and tools (discounted cash flow, financial maturity, growth and yield estimates and projections, mathematical programming). 2. Confidently develop a management plan for a property including: defining and creating useful stand delineations; assessing the condition of the land and timber; establishing objectives including the goal of long-term sustainability; defining the

future forest conditions needed to achieve these objectives; creating alternative prescriptions to achieve the future conditions; and recommending a plan of action, while maintaining a record of alternatives considered, but not recommended. Credits: 3.00

FNR 41800 - Properties Of Wood Related To Manufacturing

Credit Hours: 3.00. Orthotopic nature of wood, grain, texture, moisture content, shrinking, swelling, specific gravity, machining, thermal properties, electrical properties, elastic properties, strength properties, vibration properties, bending, natural characteristics affecting mechanical properties, effect of manufacturing and service environment on mechanical properties, changing quality of available resources and implications of wood quality changes for manufacturing.

Learning Outcomes: 1. Familiarize the student with the basic physical, mechanical, and working properties of wood and wood composites. 2. Understand the effect of manufacturing and service environment on mechanical properties, changing quality of available resources, and implications of wood quality changes for manufacturing. Credits: 3.00

FNR 41910 - Furniture Product Development And Strength Design

Credit Hours: 3.00. Qualitative and quantitative principles of furniture construction, product development methodology and strength design principles, furniture performance testing, product sustainability and end of life options (LCA, computer-based applications and solutions). Course features laboratory evaluating, furniture joints and furniture structures.

Learning Outcomes: 1. Identify and specify appropriate furniture constructions. 2. Determine whether furniture has adequate strength, stiffness, and durability. 3. Determine whether furniture will meet existing performance standards. 4. Determine product sustainability. Credits: 3.00

FNR 42500 - Secondary Wood Products Manufacturing

Credit Hours: 3.00. Secondary wood products manufacturing; structure of the industry, organization of a furniture factory, raw materials, rough mill, finish mill, assembly, finishing, machinery, wood machining, plant layout, production methods, modern industrial engineering concepts; includes visits to manufacturing operations. Requires class trips. Students will pay individual lodging or meal expenses when necessary.

Learning Outcomes: 1. Familiarize the student with the basics of secondary hardwood products manufacturing: organization, raw materials, machinery, plant layout, production methods, machining, finishing, and CNC router operation. Credits: 3.00

FNR 43200 - Human-Wildlife Conflicts

Credit Hours: 3.00. Exploration of conflicts between human interests and wildlife and the regulations policies and legislation used to minimize conflicts. Negative interactions may be real or perceived, economic or aesthetic, social or political, and may pose risks to human health and safety. Emphasis on the causes of conflict and resolutions that seek to balance protection or conservation of wildlife with protection of other public resources and individual property owners. Prior knowledge of college-level general biology and ecology is expected.

Learning Outcomes: 1. Identify common causes of human-wildlife conflicts. 2. Evaluate the impacts of the conflict damage/threat. 3. Prescribe options for resolving the conflict. 4. Measure effectiveness of applied mitigation strategies. Credits: 3.00

FNR 43300 - Grand Challenges In Forest Management

Credit Hours: 3.00. This course will guide students through readings, discussions, and presentations of the grand challenges that face the field of forest management. These topics will vary with each iteration of the class but may include topics such as climate change, invasive species, pressure on forest lands from a growing population, altered disturbance regimes, development of new silvicultural techniques, economic pressure at multiple scales, and shifting public perceptions on the management of forests. Students will examine and discuss these challenges from the vantage points of multiple stakeholders to gain insight into their complexity and importance. Students will read and discuss on average 2-4 research or review articles, book chapters, or other sources per week.

Learning Outcomes: 1. Identify and discuss major challenges facing the field of forest management. 2. Describe how these challenges interact and develop an understanding of how these interactions may result in amplified effects on forests. 3. Understand how these challenges may be viewed from a variety of perspectives by different stakeholders. 4. Identify how forest management may be used to mitigate some of

the effects of these challenges. 5. Organize and present an oral and written case study of a forest management scenario that is linked to multiple challenges discussed in class. Credits: 3.00

FNR 43400 - Tree Physiology

Credit Hours: 3.00. Study of physiology of growth and development of woody plants. Emphasis on the structure and function of trees and their physiological response to environmental factors.

Learning Outcomes: 1. Explain the importance of the various physiological processes through which heredity and environment interact to influence tree growth. 2. Provide an overview of both the form and structure of trees. 3. Define patterns of vegetative growth for temperate-zone and tropical woody plants. 4. Describe the prominent features of the important physiological processes that affect plant growth and development, such as: photosynthesis; respiration; carbohydrate, nitrogen, and mineral nutrient relations; water absorption; transpiration; and plant hormones and other signaling molecules. Credits: 3.00

FNR 43900 - Silviculture

Credit Hours: 3.00. This course details common silvicultural systems used in North America for establishment and tending of forest stands for a variety of objectives. Topics range from stand dynamics to thinning practices and regenerative harvest systems in naturally-regenerated forests. Lectures focus is on theoretical concepts in order to allow students to apply their knowledge to North American forest ecosystems, while the laboratory portion of this course includes practical experience in marking silvicultural prescriptions and conducting silvicultural treatments. Lab projects emphasize critical thinking, data-driven decision-making (using growth and yield models), technical writing and oral communication. Permission of department required. Credit cannot be earned for both FNR 33800 and FNR 43900.

Learning Outcomes: 1. Be fluent in technical silvicultural terminology. 2. Develop and critically evaluate the effectiveness of alternative site preparation, regeneration, stand tending, and harvesting methods for natural stands. 3. Describe the impacts of silvicultural practices on soil resources, forest health, timber production, wildlife habitat, biodiversity, aesthetics and other aspects in natural stands. 4. Appraise the ecological and economic costs/benefits for various silvicultural treatments. 5. Use growth-and-yield models (i.e., FVS) to help predict future stand development and evaluate silvicultural alternatives (i.e., data-driven decision making). 6. Design silvicultural prescriptions that are applicable to Central Hardwood forests. Credits: 3.00

FNR 44400 - Arboricultural Practices

Credit Hours: 4.00. Course covers a broad spectrum of arboriculture principles and techniques, including pruning, transplanting, fertilization, climbing, rigging, removal, cabling, bracing, lightning protection, hazard tree evaluation, tree appraisal, and street tree inventory.

Learning Outcomes: 1. Recognize and explain the various arboricultural practices that enhance the sustainability of trees in the built environment. 2. Apply essential plant health care practices and arboricultural practices used in the cultivation and management of trees and other woody plants in the built environment including planting, pruning and pest management. Credits: 4.00

FNR 44500 - Urban Forest Issues

Credit Hours: 3.00. This course presents an array of topics germane to the management of trees in the urban environment. This includes the benefits of trees and general tree care, tree appraisal, tree ordinances, tree inventory and management plans, and tree preservation and construction.

Learning Outcomes: 1. Understand sustainable urban & community forestry and why it is important. 2. Recognize the numerous benefits of urban/community forests to society, and the ecosystem services provided. 3. Identify common issues, challenges and pressures which threaten the urban forest. 4. Recognize the unique features of urban forest systems and how to apply the principles of urban forest management to real-world cases. 5. Acquire an understanding of sustainability as it pertains to urban forests and urban forestry programs in

metropolitan regions, cities, towns, communities and neighborhoods. Credits: 3.00

FNR 44700 - Vertebrate Population Dynamics

Credit Hours: 4.00. Estimation and analysis of populations; computer modeling of sampling methods, population dynamics, population and habitat management. Knowledge of computer programming not required.

Learning Outcomes: 1. Demonstrate use of the scientific method to identify problems, formulate hypothesis tests, conduct and analyze data, and derive conclusions. 2. Demonstrate critical thinking by using evidence-based information to develop sound responses to complex problems. 3. Demonstrate proficiency in their chosen discipline that incorporates knowledge, skills, technology, and ethics. Credits: 4.00

FNR 45200 - Aquaculture

Credit Hours: 3.00. Historical perspectives and current practices in aquaculture, including production systems, feeds, water quality requirements, and diseases of commercially important species.

Learning Outcomes: 1. Demonstrate use of the scientific method to identify problems, formulate hypothesis tests, conduct and analyze data, and derive conclusions. 2. Demonstrate critical thinking by using evidence-based information to develop sound responses to complex problems. 3. Demonstrate proficiency in their chosen discipline that incorporates knowledge, skills, technology, and ethics. Credits: 3.00

FNR 45300 - Fish Physiology

Credit Hours: 3.00. Presentation and discussion of physiological mechanisms exhibited by freshwater and marine invertebrates and vertebrates. Primary materials used for class presentation and discussions will be examples from primary research literature. Topics include respiration, osmoregulation, stress physiology, absorption and metabolism of compounds, and hormonal control of selected physiological mechanisms. Offered in odd-numbered years.

Learning Outcomes: 1. Demonstrate use of the scientific method to identify problems, formulate hypothesis tests, conduct and analyze data, and derive conclusions. 2. Demonstrate critical thinking by using evidence-based information to develop sound responses to complex problems. 3. Demonstrate proficiency in their chosen discipline that incorporates knowledge, skills, technology, and ethics. Credits: 3.00

FNR 45500 - Fish Ecology

Credit Hours: 3.00. The relationship of fishes to the physical, chemical, and biological features of the environment in both natural and perturbed aquatic ecosystems. An emphasis will be placed on diversity in morphology, behavior, feeding, and reproductive strategies as they relate to individual and population adaptation, community structure, and anthropogenic effects. Offered in even-numbered years.

Learning Outcomes: 1. Demonstrate use of the scientific method to identify problems, formulate hypothesis tests, conduct and analyze data, and derive conclusions. 2. Demonstrate critical thinking by using evidence-based information to develop sound responses to complex problems. 3. Demonstrate proficiency in their chosen discipline that incorporates knowledge, skills, technology, and ethics. Credits: 3.00

FNR 45600 - Fish And Marine Population Dynamics

Credit Hours: 4.00. Theory of population dynamics of animal populations in freshwater and marine environments. Application of quantitative methodologies for the assessment and manipulation of aquatic habitats, marine and freshwater invertebrates, sport and commercial fish populations, and aquatic communities. Human resource users and non-users are considered.

Learning Outcomes: 1. Quantitatively assess the status of a fish population and develop considerations for management. 2. Practice and develop critical thinking skills through in-class discussions and a group research project. 3. Learn to interpret the scientific literature through reading of the primary literature. 4. Broaden understanding of fisheries and natural resource management. Credits: 4.00

FNR 45700 - Practical Fisheries Management

Credit Hours: 2.00. Theory and practice of fisheries management, with emphasis on strategies utilized for the management of freshwater and marine fisheries. Course content will include hands-on assessment of fish populations, as well as development of management plans and the setting of appropriate goals and objectives for effective, science-based management.

Learning Outcomes: 1. Develop understanding of the practical management of fisheries. 2.

Compare and contrast a variety of fisheries management techniques with an emphasis on local fisheries. 3. Demonstrate quantitative skills in population modeling and the writing of fisheries management plans. Credits: 2.00

FNR 45800 - Advanced Marine Biology

Credit Hours: 3.00. Focus is placed on the structure and function of major marine ecosystems, including estuarine, mangrove, coastal, coral reef, open ocean, and deep ocean environments. Course content will include rigorous treatment of the biogeochemical processes that support these ecosystems, as well as the biology and ecology of characteristic flora and fauna.

Learning Outcomes: 1. Demonstrate in-depth understanding of the structure and function of key marine ecosystems of the world. 2. Demonstrate thorough understanding of the major groups of organisms characteristic of key marine ecosystems of the world. 3. Demonstrate thorough understanding of the biogeochemical processes that sustain key marine ecosystems and their constituent taxa. 4. Understand major threats to sustainability of key marine ecosystems of the world. 5. Demonstrate improved critical thinking and scientific writing skills. Credits: 3.00

FNR 46000 - International Natural Resources Summer Program

Credit Hours: 3.00. A four-week, intensive program examining the management and conservation of natural resources in Europe and the United States. Jointly taught with faculty and students from the Swedish University of Agricultural Sciences. The program topic and venue change each year, but emphasis is placed on student interaction and internationalization as well as on cross-cultural communication skills within a natural resources framework. Offered in even-numbered years at Purdue University and in odd-numbered years at the Swedish University of Agricultural Sciences in Sweden.

Learning Outcomes: 1. Explain cultural differences in managing natural resources sustainably. 2. Evaluate natural resource use alternatives and policies. 3. Evaluate the sustainability of various landscapes and uses of natural resources. Credits: 3.00

FNR 46500 - History And Role Of Hunting In North American Wildlife Conservation

Credit Hours: 1.00. Introduction to the social, economic and wildlife management importance of hunting and how it relates to North American wildlife conservation. History of hunting and the North American Model of wildlife conservation, contrasted with those of European nations. Students will be required to participate in or observe hunting-related activities outside of class. This exercise is conducted off-campus on local Purdue-maintained properties.

Learning Outcomes: 1. Understand the history and role of hunting in North America. 2. Understand the economic impacts of hunting to wildlife conservation. 3. Examine how hunting influences wildlife management. 4. Examine the relationship of hunter demographics, ethics, public perception, and animal rights issues to hunting. 5. Apply the tenets of the North American Model of Wildlife Conservation to management and conservation challenges. 6. Experience hunting through first-hand activities. 7. Articulate the impacts of hunting to peers and constituents. Credits: 1.00

FNR 46600 - Costa Rica Natural History Study

Credit Hours: 2.00. This course is intended to introduce students to the natural history, ecology, and people of Costa Rica. Our purpose is to explore the region's diversity and contrast it with that of the United States. The course consists of excursions, field lectures, and discussions in a variety of ecosystems throughout the country. We will stay in facilities that allow close observation of a wide variety of Costa Rican fauna and flora.

Learning Outcomes: 1. Identify a wide variety of Costa Rican plants and animals with an appreciation of the biological diversity of the tropics. 2. Describe how conservation research and field implementation are done and appreciate common pitfalls in designing research on targets of conservation interest. 3. Appreciate Costa Rican attitudes and priorities regarding natural resources within a socio-economic framework specific to this society. 4. Weigh the balance between conservation and other priorities in land management, societal goals, and socio-political systems. Credits: 2.00

FNR 47100 - Environmental Sensors And Data

Credit Hours: 1.00. Environmental sensors and the data these devices generate are becoming increasingly central to routine

ecological and environmental science research and monitoring. This course introduces students to the function of a range of environmental sensors, operation of microcontrollers that control these sensors, and application of data produced by these sensors. This class emphasizes a practical approach with hands-on work with programming sensors and analyzing data.

Learning Outcomes: 1. Learn how to apply environmental sensors to research and monitoring efforts. 2. Visualize and model environmental data from sensors available on live streaming data portals. 3. Use embedded microcontrollers to collect data and stream those data to the web. 4. Learn how to problem solve using online resources and discussion forums (including Slack and Stackoverflow). Credits: 1.00

FNR 48410 - Sustainable Wood Products, Furniture Design And Manufacturing

Credit Hours: 3.00. This project-based course explains principles of product development, furniture construction, strength design, performance testing, and product sustainability (life cycle analysis and end-of-life options). The course familiarizes students with methods such as Computer-Aided Design (CAD), Computer-Aided Manufacturing (CAM), Computer Numerical Control (CNC) router operation, rapid prototyping, and basics of secondary wood products manufacturing, to build an actual product.

Learning Outcomes: 1. Understand Computer Aided Design (CAD). 2. Understand Computer Aided Manufacturing (CAM). 3. Understand CNC router operation. 4. Understand rapid prototyping. 5. Understand the basics of secondary wood products manufacturing. 6. Understand the principles of sustainable product development. Credits: 3.00

FNR 49800 - Special Assignments

Credit Hours: 1.00 to 3.00. Topics vary. Permission of instructor required.

Learning Outcomes: 1. Demonstrate ability to think critically regarding topic studied. 2. Use effective strategies to communicate knowledge regarding topic studied. Credits: 1.00 to 3.00

FNR 49900 - Thesis

Credit Hours: 1.00 to 6.00. Thesis. Permission of instructor required.

Learning Outcomes: 1. Write a research proposal describing a research initiative and explaining the scientific value in conducting the research. 2. Conduct research including forming the project scope, initiating and conducting the research, analyzing data and summarizing the results. 3. Present a summary of the research's findings in either oral or written format. Credits: 1.00 to 6.00

FNR 50600 - Theory And Application Of Natural Resource Extension Programming

Credit Hours: 1.00. This course will provide an opportunity for students to develop and implement extension activities based on their research interests. The course will focus on important natural resources issues, identify common target audiences, provide examples of extension programming, discuss outputs developed from various extension programs, and outline metrics used to evaluate program impact.

Learning Outcomes: 1. Be familiar with the breadth of natural resource extension programs. 2. Create a logic model based on student research and extension interests. 3. Develop a plan that outlines student extension goals. 4. Communicate technical information to non-scientific audiences. Credits: 1.00

FNR 52700 - Ecotoxicology

Credit Hours: 2.00. This course covers theoretical and applied approaches to the science of ecotoxicology, including application of the tools and procedures used to understand toxicant fate and effects in free-ranging animals and ecosystems. Students are expected to be knowledgeable in chemistry, biology, and animal physiology.

Learning Outcomes: 1. Review of basic ecotoxicological principles. 2. Know the various types, sources and environmental fate and effects of contaminants. 3. Know the modes of toxicant uptake, transformation, storage and depuration. 4. Know the dose/concentration-response, exposure routes. 5. Know the factors that influence toxicity. 6. Know the contaminant distribution, bioaccumulation, and biomagnifications. 7. Know the biomarkers of exposure and effects: Molecular to ecosystem-levels. 8. Know the basic principles in aquatic toxicity testing. 9. Know the common toxicity assays using invertebrates, fish, amphibians,

birds, and mammals (in vitro, in vivo, mesocosms, and in situ bioassays). 10. Know the field case studies: Complex effluents (sewage and paper mills); Persistent Bioaccumulative Toxicants (PCBs, PAHs, dioxins); Endocrine disrupting chemicals; Heavy metals; Nutrients and pathogens. 11.Statistical analyses of toxicity data. 12.Introduction to ecological risk assessment. Credits: 2.00

FNR 52800 - Wildlife And Environmental Forensics

Credit Hours: 2.00. Theoretical and applied approaches to the science of wildlife and environmental forensics. General introduction on environmental forensics followed by discussion of different types of investigations. Includes application of tools and procedures used to solve crimes, including morphological, chemical and biological analysis of evidence. All material will be discussed in relation to criminal investigation. (Offered in even-numbered years)

Learning Outcomes: 1. Explain the history and scope of environmental forensics. 2. Explain the critical steps needed during a crime scene investigation. 3. Apply field and laboratory techniques used for crime scene investigations. Credits: 2.00

FNR 52900 - Disease Ecology

Credit Hours: 3.00. Study of the ecological and evolutionary complexity inherent to host-pathogen interactions. Includes case studies from a diverse array of systems, including plants, animals, aquatic and terrestrial systems. Emphasis is on the interactions between multiple hosts and pathogens within complex, dynamic environments. Introduction to parasite and pathogen diversity, host-pathogen coevolution, community ecology and the importance of pathogens in conservation and management.

Learning Outcomes: 1. Evaluate the roles played by the diversity of parasites and pathogens found in complex natural systems. 2. Apply the foundational principles of disease ecology - the importance of hosts, pathogens, and the environment - to understanding disease dynamics in natural systems. 3. Evaluate the strengths and weaknesses of different modeling approaches in disease ecology. 4. Understand how disease models are used in management and conservation. 5. Apply both ecological and evolutionary theory to examine the impact of infectious disease on host populations, communities, and ecosystems. 6. Demonstrate an understanding of patterns in pathogen diversity and abundance across landscape to regional scales. 7. Articulate understanding of disease ecology through written and oral communication. 8. Demonstrate an understanding of the scientific literature and an ability to critically evaluate this research for an interdisciplinary topic. Credits: 3.00

FNR 53500 - Forest Regeneration And Restoration

Credit Hours: 3.00. An overview of the dynamics associated with the regeneration of forestlands in North America. Topics include: seed collection and handling, forest tree nursery operations, seedling quality, managing for environmental stresses, planting operations, early stand management, and natural regeneration. Permission of instructor required. Offered in odd-numbered years.

Learning Outcomes: 1. Apply the following activities common in forest regeneration and restoration projects: artificial and natural regeneration, tree seed, site preparation, seedling quality and assessment, seedling storage and handling, planting operations, vegetation management, managing stresses in the regeneration environment, early stand management, and regeneration planning. Credits: 3.00

FNR 53600 - Ecology Of Disturbance

Credit Hours: 2.00. Advanced lecture- and discussion-based class examining how disturbance shapes the composition and structure of communities and landscapes across major terrestrial biomes. Students will examine and discuss the relationships between disturbance intensity, frequency, and spatial extent and how these characteristics affect ecological processes and ecologically-based management of forest and grassland ecosystems. The class will also examine the synergistic effects of multiple disturbances and the restoration of endemic disturbance regimes in contemporary ecosystems. Course is reading intensive; students will read and discuss on average 3-8 journal articles per week.

Learning Outcomes: 1. Describe how disturbance shapes community composition and structure for several major terrestrial biomes. 2.

Understand how disturbance regulates biological diversity across terrestrial and aquatic ecosystems. 3. Understand the relationship between disturbance intensity, frequency, and spatial extent and how those factors affect management of forest and grassland ecosystems. 4. Describe the synergistic nature of disturbance and identify how disturbance factors interact across a landscape. 5. Describe how contemporary and restored disturbance regimes may facilitate or suppress the spread of invasive species. 6. Understand how management activities can mimic endemic disturbance regimes to promote biodiversity and sustainability. Credits: 2.00

FNR 53601 - Ecology Of Disturbance Practicum

Credit Hours: 1.00. This course is the practicum for FNR 53600 , hence enrollment is contingent upon enrollment in FNR 53600 . Course consists of a one or two-week long field trip to a remote site; prior trips have been taken to the Great Smokey National Park over spring break. Course requires an additional travel fee, depending on location visited.

Learning Outcomes: 1. How disturbance shapes community composition and the distribution of species across landscapes. 2. How alterations to endemic disturbance regimes affect the composition, structure, and function of ecosystems. 3. How interactions between natural disturbance and invasion of exotic species influence forest community development. 4. Management that uses natural disturbance to restore and maintain biotic communities and ecosystems. Credits: 1.00

FNR 54300 - Conservation Biology I

Credit Hours: 3.00. Introduction to conservation biology, including population dynamics and genetic structure of rare organisms. Recovery planning, restoration ecology, environmental policy making, and sustainable developments are considered, as is ethics in conservation of biological diversity. Offered in odd-numbered years. Permission of instructor required.

Learning Outcomes: 1. Read and interpret the scientific literature on conservation of natural resources with an awareness of the current status of what is known about biodiversity, endangered species and ecosystems, biological invasions, and the effects of climate change on natural communities. 2. Explain how conservation research is carried out, and appreciate common pitfalls in designing research for goals of conservation interest. 3. Consider and evaluate the balance between conservation goals and other priorities in land management, societal and economic goals, and socio-political systems. Credits: 3.00

FNR 55800 - Remote Sensing Analysis And Applications

Credit Hours: 3.00. Advanced course in the use of remote sensing techniques emphasizing the physical principles behind the remote sensing of vegetative features, present-day instrument technology, spatial data processing and analysis algorithms, error analysis and accuracy assessment procedures, and multi-source data integration. Provides hands-on experience with forest canopy modeling, atmospheric modeling, image processing, and GIS software on microcomputer and workstation platforms.

Learning Outcomes: 1. Improve their understanding of remote sensing principles and the use of remote sensing technologies. 2. Master operational procedures of Erdas Imagine or other remote sensing software for advanced image analysis and classification. 3. Use remote sensing applications accurately in natural resources, including but not limited to land use mapping, vegetation responses to weather variations, urban environment, and forest measurements. Credits: 3.00

FNR 56010 - Digital Data Acquisition Camp - UAS Field Operations

Credit Hours: 1.00. This class is the first course (of four) within the Digital Data Acquisition Camp (DDAC), a 3-week long intensive, in-person program. Students in this course learn best practice approaches concerning UAS operations and mapping missions, with both safety and effective data collection strategies in mind. Piloting, mission planning, and crew resource management fundamentals will have a primary focus in the curriculum. Other key foci will effectively apply core remote sensing, geospatial, and thermographic concepts to UAS workflows. Students learn how to effectively design and implement a safe and effective UAS operation through linking FAA policy toward Standard Operating Procedures, Crew Resource Management, and an overall Safety Management

System. Throughout the course, core geospatial concepts are applied to a UAS data strategy that stresses data collection from start to finish. Where weather conditions allow, the student will gather data using UAS platforms and sensors. Students should already have their FAA Part 107 license before enrolling in the class. Permission from the Department is required.

Learning Outcomes: 1. Identify, define, and relate FAA Part 107 Policies toward UAS data collection approaches. 2. Demonstrate an ability to create a Safety and Crew Resource Management System within a UAS operation effectively. 3. Identify and define best practices in UAS data acquisition in a forested environment. 4. Develop and engage in UAS mapping missions and effectively gather UAS imagery data in a forested environment. Credits: 1.00

FNR 56030 - Digital Data Acquisition Camp - LiDAR Mapping

Credit Hour: 1.00. This class is the third sequential course (of four) within the Digital Data Acquisition Camp, a 3 week-long intensive, in-person program. This class will cover the basic principles of deriving 3D information from LiDAR systems with special attention to acquired point clouds by LiDAR systems onboard UAS over forest environments. The concepts of laser ranging, LiDAR georeferencing, point cloud generation, data structuring, point cloud processing/visualization, and qualitative/quantitative evaluation of derived products will be explained. Theoretical aspects will be emphasized through the analysis of derived products from images of forest stand acquired during both leaf-on and leaf-off conditions. Permission from the Department is required.

Learning Outcomes: 1. Describe the principles of deriving 3D information from LiDAR systems. 2. Demonstrate LiDAR system calibration and describe its impact on derived point clouds. 3. Explain the concept of LiDAR georeferencing using navigation units onboard UAS. 4. Describe and apply the principles of LiDAR point cloud data processing. 5. Design a mission plan for a UAV-LiDAR system and process acquired data for forest inventory. Credits: 1.00

FNR 56040 - Digital Data Acquisition Camp - Sensor Arrays

Credit Hours: 1.00. This class is the last course (of four) within the Digital Data Acquisition Camp, a 3 week-long intensive, in-person program. Students will learn: the operating principles behind common environmental sensors, how to configure and deploy sensors, and practices for cleaning, processing, and analyzing sensor time series data. Learners will gain hands-on experience collecting data with environmental sensors. Students will work with large datasets to learn best practices for quality control. After processing their datasets, students will use common data processing and modeling techniques to extract meaningful information from sensor data streams. This course emphasizes both in situ and remote sensing techniques for analyzing soil, water, and air chemistry and physical properties and forestry and wildlife applications. Permission from the Department is required.

Learning Outcomes: 1. Understand and evaluate different sensor technology platforms and networks. 2. Deploy, calibrate and maintain sensor networks. 3. Process, clean and manage data collected from sensor networks. 4. Analyze simple data streams from sensor networks. Credits: 1.00

FNR 56600 - Digital Natural Resources Capstone

Credit Hours: 1.00 to 6.00. This course is the capstone project for the Digital Natural Resources Masters of Forestry program. The content will include one or more of the following phases of the project: 1) the proposal development, 2) data acquisition, 3) data analysis and synthesis, and/or 4) project presentation and defense. The course may be repeated for credit. Course will be an independently directed course designed for specific students. Permission of instructor is required.

Learning Outcomes: 1. Recognize attributes and objectives that may be addressed with digital tools and technologies. 2. Plan and conduct a data acquisition mission with digital tools and technologies. 3. Clean, proof, and analyze collected data to achieve mission objectives. 4. Archive data in appropriate formats and structures. 5. Synthesize results into both written and oral formats for further decision-making. Credits: 1.00 to 6.00

FNR 56700 - Advanced Mammalogy

Credit Hours: 3.00. The class explores approaches to mammalian research and wildlife management through readings, discussions, field, and laboratory exercises. Topics such as mammalian behavior, ecology, phylogeny, taxonomy, and conservation are emphasized. The intention of this class is to help students who have a sincere interest in mammalian research and management to progress beyond identification in their understanding of mammals.

Learning Outcomes: 1. Understand the diversity

of topics currently being examined using wild mammal populations and communities. 2. Integrate the results of published research into the design and exploration of research topics in which the students are interested. 3. Exhibit improved abilities in critical thinking, writing, and oral communication in discussing mammalian research and management topics. Credits: 3.00

FNR 57000 - Amphibian Ecology And Conservation

Credit Hours: 3.00. This course will address the ecology and conservation of amphibians at the global scale. Lectures will cover diversity and natural history, phylogenetic relationships, basic biology and ecology, and conservation concerns and strategies. Class materials come from a text and primary literature. Labs will focus on important characteristics of species, families and orders of amphibians, including both North American and non-North American species. Class will also discuss and debate conservation issues. Course will include guest lectures, potential field trips or a class project. Permission of department required.

Learning Outcomes: 1. Be familiar with the diversity and natural history of amphibians. 2. Know the basic biology of amphibians. 3. Be familiar with studies of behavior and community ecology. 4. Analyze research critically in amphibian ecology and conservation. 5. Be familiar with the current threats to amphibian populations as well as global conservation efforts. Credits: 3.00

FNR 57100 - Advanced Ornithology

Credit Hours: 3.00. Study of current avian research topics and techniques. Class discussion of recent scientific literature; field and laboratory exercises to illustrate approaches to ornithological research. One weekend field trip is offered. (Offered in even-numbered years.)

Learning Outcomes: 1. Read the scientific literature on birds with a greater awareness of the current status of what is known about birds. 2. Describe how avian research is done and appreciate common pitfalls in designing research on birds. 3. Understand the conservation and management implications of current avian knowledge. Credits: 3.00

FNR 57400 - Big Data, AI, And Forests

Credit Hours: 3.00. This course is focused on introductory big data analysis, artificial intelligence, and associated applications in large-scale forest research. The lecture will cover the challenges we encounter in big data ecological research, and the approaches to overcome these challenges. Real-time forest inventory and wildlife survey data at national and continental levels will be utilized in this course, and actual high-impact research projects will be introduced as case studies to inform students of the state-of-the-art in this subject area. High-performance computing clusters will be utilized for big data analysis. This course is also open to non-forestry majors. We will introduce basic machine learning techniques that are applicable to other subject areas. Guest lectures may cover big data analyses in different fields, internet-of-things, and/or data management and optimization/decimation for collaborative Virtual Reality experiences. The class will be evaluated through a final project, for which students will work independently or in a group setting to develop a 'mini' research manuscript with a title of their own selection. All the groups are encouraged to submit their manuscript for publication at peer-reviewed journals, and those whose manuscripts have passed the initial journal screening will get extra bonus points.

Learning Outcomes: 1. Equip themselves with critical thinking skills to evaluate big-data research topics and their potential alignment with top-tier journals such as Science, Nature, and PNAS. 2. Equip themselves with general problem-solving skills to overcome practical big-data challenges. 3. Equip themselves with a synthetic understanding of the strength and weakness of various big data tools and machine learning algorithms. Credits: 3.00

FNR 58000 - Research Methods For Natural Resource Social Science

Credit Hours: 3.00. This class covers basic elements of research design for social scientists, with an emphasis on issues pertinent to natural resource management. Topics to be covered include the role of theories and paradigms in designing sound research, writing research questions and hypotheses, and the importance of validity and reliability in research design. Qualitative, quantitative, and mixed methods designs are presented and discussed.

Learning Outcomes: 1. Understand fundamental concepts such as theories and paradigms that are essential precursors to designing sound research. 2. Able to articulate clear research questions and testable hypotheses. 3. Differentiate between different research designs and know which are appropriate under which circumstances. 4 Understand overarching

issues such as validity and reliability. 5. Know under which circumstances qualitative, quantitative or mixed methods are appropriate. 6. Demonstrate knowledge of a variety of commonly-used research methods. 7. Articulate basic steps involved in analyzing qualitative and quantitative data. 8. Demonstrate the ability to write a research proposal. Credits: 3.00

FNR 58600 - Urban Ecology

Credit Hours: 3.00. Urbanization is on the rise, transforming natural ecosystems into coupled human-natural ecosystems that encompass complex, novel functional and structural characteristics shaped by people and the inherent environment. Through local field trips and readings of the primary scientific literature, we examine the unique characteristics of coupled human-natural ecosystems. The course is designed to be broadly accessible to students from a variety of backgrounds, interests, and majors who are interested in environmental science and engineering and emphasizes the importance of incorporating an ecological perspective in environmental engineering and natural resource management. This course covers fundamental principles of ecology as applied in urban and other coupled human-natural systems with emphasis on the impacts of modern industrial society on ecosystem structure and function. Organizing themes addressed in this class include macroscale processes, systems thinking, and topics related to urban systems.

Learning Outcomes: 1. Describe and diagram flows of matter and energy in coupled human and natural systems. 2. Discuss how drivers in each cycle change across an urban-rural gradient. 3. Describe the changes to natural ecosystems imposed by urbanization and other forms of global change (climate change, altered biogeochemical cycling, invasive species, mass extinction, etc.). 4. Compare and contrast urban and rural ecosystem structure and function, including diversity and distribution of organisms, landcover types, and ecosystem services. 5. Discuss provisioning of ecosystem services in urban and rural ecosystems; compare and contrast green vs grey infrastructure; identify areas of traditionally grey infrastructure that have the potential to integrate green infrastructure. 6. Describe the key components of the following ecological concepts and apply them to an analysis of urban vs rural ecosystems: a. resistance and resilience b. dynamic equilibrium c. alternate stable states d. disturbance and succession Credits: 3.00

FNR 58700 - Advanced Spatial Ecology And GIS

Credit Hours: 3.00. Introduction to the principles of landscape ecology and biogeography with a laboratory devoted to the analysis of spatial data using geographic information systems and other database tools. Landscape ecology focuses on the important relationships of landscape structure (pattern, heterogeneity) and ecological processes (movement of animals, hydrologic dynamics) and how this information is used for natural resource management. Biogeography examines ecological patterns and processes at larger scales (generally at subcontinental to global) for the purposes of managing plants and animals of global importance. In the last 15 years, tremendous efforts have been made to create spatial databases that help support research and management of natural resources at various scales. The lab will focus on the use and application of these databases that are common in natural resource management settings.

Learning Outcomes: 1. Apply the principles of landscape ecology to the analysis of spatial change in urban, agricultural and forested landscapes for the purposes of natural resource management. 2. Calculate change in landscape patterns using a variety of geospatial tools such as geographic information systems, spatial models, and geostatistics. 3. Prepare reports using the traditional scientific journal article format, on the analysis of landscape-scale change, focusing on problems common to watershed management. 4. Compare and contrast the ways that biodiversity can be calculated using standard indices of organismal diversity. 5. Calculate ecological footprints and evaluate why these vary across geopolitical and/or ecological units. Credits: 3.00

FNR 59000 - Introduction To Teaching In Natural Resources

Credit Hours: 1.00. This applied course introduces topics related to teaching science courses to facilitate and support the success of teaching assistants in Forestry and Natural Resources. Students will read and review assigned readings and then participate in a discussion at a weekly class meeting. Students also will have an opportunity to practice and apply concepts through development and presentation of a lesson plan. Permission of instructor required.

Learning Outcomes: 1. Learn evaluated and applied methods to effectively engage and support diverse student populations in formal and informal classrooms. 2. Develop skills to communicate effectively while teaching natural resource topics. 3. Connect ethical teaching practices to teaching actions. 4. Develop a personal teaching philosophy and an associated formal statement. 5. Create materials for a 50 min lecture period lesson plan on a topic of their choice that incorporates concepts from the semester. Credits: 1.00

FNR 59100 - Teaching In Natural Resources Practicum

Credit Hours: 1.00 or 2.00. This practicum course provides students with an opportunity to gain teaching experience in natural resource courses. This course is only open to students that are not being paid as teaching assistants. Permission of Instructor required.

Learning Outcomes: 1. Gain classroom and or laboratory experience teaching, engaging, and supporting students in lecture and/or laboratory classrooms. 2. Improve their communication skills while teaching natural resource topics. Credits: 1.00 or 2.00

FNR 59800 - Topical Problems In Forestry And Natural Resources

Credit Hours: 1.00 to 3.00. Subjects and problems of interest to the student. Permission of instructor required.

Learning Outcomes: 1. Demonstrate ability to think critically regarding topic studied. Use effective strategies to communicate knowledge regarding topic studied. Credits: 1.00 to 3.00

FNR 64700 - Quantitative Methods For Ecologists

Credit Hours: 3.00. Examines the assumptions and utility of statistical and other data analytic techniques that are encountered commonly or increasingly being used in ecological research. Emphasis is placed on the potential applications of these quantitative methods in an ecological context. Topics include traditional multivariate methods (cluster analysis, principal components, factor analysis, discriminant analysis, multidimensional scaling, correspondence analysis), generalized linear models (logistic Poisson, and ordinal regression and derivatives), randomization methods, information-theoretic model selection and inference, and hierarchical models. An introduction to Bayesian analysis is provided for generalized linear (and mixed) models, with applications to (meta) population and (meta) community ecology. Prerequisite: BIOL 58210 or ENTM 64200 or STAT 51200 , or consent of instructor. Knowledge of linear algebra and experience with R is desirable but not essential.

Learning Outcomes: 1. Determine the appropriate statistical tool to use when confronted with most questions and data types. 2. Be familiar with the assumptions underlying these methods. 3. Have some familiarity with software required to apply the methods. 4. Offer a basic interpretation of results provided. Credits: 3.00

FNR 65000 - Individual-Based Ecology And Modelling

Credit Hours: 3.00. This course will provide graduate students with the opportunity to learn about the techniques and approaches used for individual-based modeling in ecological studies. Students will find relevant supplementary literature and lead class discussions on those topics as well as chapters from the course textbook and present case study examples of existing individual-based models (IBM) to the class. Students will develop individual-based models based on their own research project(s).

Learning Outcomes: 1. Explore the role that individual-based models (IBMs) can play in ecological research. 2. Develop a working knowledge of the nature of IBMs, their strengths, and weaknesses. 3. Become familiar with IBM programming concepts and NetLogo software. 4. Become able to incorporate individual-based modeling in the student's own research. Credits: 3.00

FNR 69100 - Topical Problems In Forestry

Credit Hours: 1.00 to 3.00. Subjects and problems of interest to the student. Permission of instructor required.

Learning Outcomes: 1. Analyze contemporary challenges in forestry critically; may include habitat loss, climate change, species conservation or management, ecosystem health, analysis methods, or new applying new conservation or management strategies. 2. Develop proficiency in the application of concepts, methods, or analyses related to forestry research. 3. Communicate complex scientific concepts related to forestry through

written reports, presentations, extension/outreach products, or other media formats. Credits: 1.00 to 3.00

FNR 69300 - Topical Problems In Wildlife Biology

Credit Hours: 1.00 to 3.00. Subjects and problems of interest to the student. Permission of instructor required.

Learning Outcomes: 1. Analyze contemporary challenges in wildlife biology critically; may include habitat loss, climate change, species conservation or management, ecosystem health, analysis methods, or new applying new conservation or management strategies. 2. Develop proficiency in the application of concepts, methods, or analyses related to wildlife research. 3. Communicate complex scientific concepts related to wildlife biology through written reports, presentations, extension/outreach products, or other media formats. Credits: 1.00 to 3.00

FNR 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required.

Learning Outcomes: 1. Integrate and synthesize relevant literature, theories, methods from their field of study into a cohesive thesis or manuscript framework that showcases their understanding of existing research and identifying gaps that would benefit from future studies or research. 2. Construct and articulate clear, coherent research objectives, hypotheses, and/or predictions and develop methods that will address these. 3. Conduct research and collect data on thesis topic. Credits: 1.00 to 18.00

FNR 69900 - Research PhD Thesis

Credit Hours: 1.00 to 18.00. Research PhD Thesis. Permission of instructor required.

Learning Outcomes: 1. Integrate and synthesize relevant literature, theories, methods from their field of study into a cohesive dissertation or manuscript framework that showcases their understanding of existing research and identifying gaps that would benefit from future studies or research. 2. Construct and articulate clear, coherent research objectives, hypotheses, and/or predictions and develop methods that will address these. 3. Conduct research and collect data on dissertation topic. Credits: 1.00 to 18.00

French

FR 10100 - French Level I (UCC: HUM)

Credit Hours: 3.00. A beginning French course with emphasis on communicative skills (listening and speaking), literacy skills (reading and writing) and culture. Permission of department required. CTL:IWL 1901 French Level I

University Core Curriculum (UCC): (UCC: HUM)

Learning Outcomes: 1. Explain and produce biographical information about themselves and others in the French language. 2. Identify necessary information by asking questions about people and things in the French language. 3. Solve a simple survival situation such as ordering food and beverages in the French language. 4. Compose with language by combining learned elements in the French language. Credits: 3.00

FR 10200 - French Level II (UCC: HUM)

Credit Hours: 3.00. Continuation of FR 10100 . CTL:IWL 1902 French Level II

University Core Curriculum (UCC): (UCC: HUM)

Credits: 3.00

FR 10500 - Accelerated Basic French (UCC: HUM)

Credit Hours: 3.00. This is an accelerated beginning-level course designed to develop language proficiency in French. The course will help students progress toward competence in speaking, listening, reading, and writing, as well as toward knowledge of French and Francophone cultures. The course focuses on active language use. Students will interact meaningfully with classmates and develop communicative strategies. Course will be taught in French. Permission of Department required.

University Core Curriculum (UCC): (UCC: HUM)

Learning Outcomes: 1. Identify appropriate use of French language in specific contexts by reading French texts. 2. Identify appropriate use of French language in specific contexts by listening to audio recordings and watching

videos of spoken French. 3. Compose French sentences by focusing on a set of grammatical rules and standards in the language. 4. Produce sentences in spoken French in the form of dialogues and presentations. Credits: 3.00

FR 11200 - Elementary French Conversation

Credit Hours: 1.00. Development of oral skills for self-expression. Guided practice to enhance communicative competence. Small group discussions in French on practical topics.

Learning Outcomes: 1. Develop elementary listening skills and improve oral French proficiency. 2. Acquire elementary vocabulary and grammar through discovery in various media and conversation. 3. Read, view, listen to and discuss assigned materials in French. Credits: 1.00

FR 20100 - French Level III (UCC: HUM)

Credit Hours: 3.00. A lower intermediate French course with emphasis on communicative skills (listening and speaking), literacy skills (reading and writing) and culture. CTL:IWL 1903 French Level III

University Core Curriculum (UCC): (UCC: HUM) Credits: 3.00

FR 20200 - French Level IV (UCC: HUM)

Credit Hours: 3.00. Continuation of FR 20100 . CTL:IWL 1904 French Level IV

University Core Curriculum (UCC): (UCC: HUM) Credits: 3.00

FR 20500 - Accelerated Intermediate French (UCC: HUM)

Credit Hours: 3.00. This course is an accelerated intermediate-level course designed to develop language proficiency in French. The course will help students progress toward competence in speaking, listening, reading and writing, as well as toward knowledge of French and Francophone cultures. The course focuses on active language use. Students will interact meaningfully with classmates and develop communicative strategies. Course will be taught in French.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Identify appropriate use of French language in specific contexts by reading French texts. 2. Identify appropriate use of French language in specific contexts by listening to audio recordings and watching videos of spoken French. 3. Compose French sentences by focusing on a set of grammatical rules and standards in the language. 4. Produce sentences in spoken French in the form of dialogues and presentations. Credits: 3.00

FR 21200 - Intermediate French Conversation

Credit Hours: 1.00. Development of oral skills for self-expression. Guided practice in conversation to enhance communicative competence. Small group discussions in French on practical topics. Not open to students enrolled in or having credit for FR 30100 or above.

Learning Outcomes: 1. Develop intermediate listening skills and improve oral French proficiency. 2. Acquire intermediate vocabulary and grammar through discovery in various media and conversation. 3. Read, view, listen to and discuss assigned materials in French. Credits: 1.00

FR 22400 - Professional French I

Credit Hours: 3.00. Practical reading, writing, speaking, and listening comprehension skills will be developed toward use of French for business purposes. Course materials cover daily business dealings as well as national and international trade.

Learning Outcomes: 1. Discuss the main aspects of the French professional world (hierarchy, professional versus personal relationships, etc.). 2. Accomplish simple administrative tasks in French such as give/answer a phone call, make an appointment. 3. Behave appropriately in a French professional context. Credits: 3.00

FR 23000 - French Literature In Translation

Credit Hours: 3.00. Reading and analysis of selected French writers and their works, with particular emphasis on the social, political, and intellectual climate of their times. The course content will change from semester to semester. Knowledge of French not required.

Learning Outcomes: 1. Student will gain practical experience in the language. Credits: 3.00

FR 24100 - Introduction To The Study Of French Literature

Credit Hours: 3.00. Reading and discussion of selected poetry, prose, and theatre from France and the Francophone world; introduction to critical discourse and basic concepts of literary theory. Texts, discussion, and written assignments in French.

Credits: 3.00

FR 28000 - Second-Year French: Special Topics
Credit Hours: 3.00. Selected topics on the civilization, culture, and literature of France. Lectures and readings primarily in English, but knowledge of French at the first-year level necessary.

Credits: 3.00

FR 30100 - French Level V (UCC: HUM)
Credit Hours: 3.00. Continued development of French speaking, listening, reading, and writing abilities, using materials dealing primarily with everyday life and civilization in France and the other French-speaking countries from various sources (e.g., newspapers, magazines, TV, recent literature, etc.). Conducted primarily in French.

University Core Curriculum (UCC): (UCC: HUM)

Learning Outcomes: 1. Analyze French language in specific contexts by reading French texts. 2. Analyze French language in specific contexts by listening to audio recordings and watching videos of spoken French. 3. Compose French texts by focusing on a set of grammatical rules and standards in the language. 4. Produce extended discourse in spoken French in the form of dialogues and presentations. 5. Compare and contrast French culture with other cultures through interaction with French oral and written texts. Credits: 3.00

FR 30200 - French Level VI (UCC: HUM)
Credit Hours: 3.00. Further work to develop speaking, listening, reading, and writing abilities in French on the basis of materials dealing with the ideas and events that have shaped present-day France and the other French-speaking countries. Conducted primarily in French.

University Core Curriculum (UCC): (UCC: HUM)

Credits: 3.00

FR 31200 - Advanced French Conversation
Credit Hours: 1.00. One credit hour advanced French conversation focused on the development of oral and aural skills for self-expression. Course provides students with guided practice in conversation to enhance communicative competence. Discussions in French on various topics. Course may be taken concurrently with FR 30100, 30200, 40100 or 40200.

Learning Outcomes: 1. Develop advanced listening skills and improve oral French proficiency. 2. Acquire advanced vocabulary and grammar through discovery in various media and conversation. 3. Read, view, listen to and discuss assigned materials in French.

Credits: 1.00

FR 32300 - French For Engineering
Credit Hours: 3.00. This course is an intermediate/advanced French course emphasizing vocabulary and structures necessary for communication within the context of the working world. In this course, students will further develop their speaking, listening, reading, and writing abilities through the study of specialized vocabulary from the engineering and technology sciences. Conducted in French.

Learning Outcomes: 1. Understand, explain, and apply a broad range of vocabulary related to engineering and technology. 2. Read, understand, and analyze specific engineering and technical topics in French. 3. Describe particular engineering problems in simple terms.

Credits: 3.00

FR 32400 - Professional French II
Credit Hours: 3.00. Practical reading, writing, speaking, and listening comprehension skills at an intermediate level will be developed toward the use of French for business purposes. Course materials cover daily business dealing as well as national and international trade.

Learning Outcomes: 1. Discuss specific aspects of the French professional world, such as the role of the French government in the economy. 2. Accomplish administrative tasks in French (write a professional letter, reports, etc.). 3. Behave appropriately in a French professional context. Credits: 3.00

FR 33000 - French Cinema (UCC: HUM)
Credit Hours: 3.00. A general survey of major French cinematic trends from the earliest examples (Melies, Lumiere) to the New Wave (Chabrol, Truffaut, Resnais, Godard, etc.), with a discussion of the historical, social, political, aesthetic, and literary contexts. The French film in relation to world cinema. The relationship between the French cinema and French literature. Reading and analysis of scripts and historical and critical materials. Knowledge of French not required.

University Core Curriculum (UCC): (UCC: HUM)

Credits: 3.00

FR 34100 - French Literature I: From The Middle Ages To The Enlightenment
Credit Hours: 3.00. Reading of selected poetry, prose, and theatre of France from the Middle Ages through the Enlightenment in historical and cultural context. Readings, discussion, and papers in French.

Credits: 3.00

FR 34200 - French Literature II: The 19th And 20th Centuries

Credit Hours: 3.00. Reading of selected French poetry, novels, theatre, and short fiction of the 19th and 20th centuries in historical and cultural context. Readings, discussion, and papers in French.

Credits: 3.00

FR 38000 - Special Topics In French Culture And Civilization

Credit Hours: 3.00. Selected topics on the contemporary civilization of the French-speaking world and on the development of its culture throughout history. Explores trends in society, daily life, the arts, ideas, and technology. Conducted in French.

Credits: 3.00

FR 39400 - Special Topics In French Literature

Credit Hours: 3.00. Studies a particular aspect in French literature (e.g., theme, device, character type, motif, place) by reading a varied selection of works of different genres, styles and/or periods. Readings, discussion, and papers in French.

Credits: 3.00

FR 39600 - Special Topics In French Language Science

Credit Hours: 3.00. Examines a particular aspect entailed in the study of French language, e.g., language acquisition and teaching, language in society, regional dialects of France, French around the world, French creoles. Conducted in French.

Credits: 3.00

FR 39900 - Special Study Abroad Credit In French

Credit Hours: 1.00 to 4.00. This course number is for assignment after the fact of credits in French earned while enrolled at a foreign university on a Study Abroad program which cannot be appropriately accommodated under an established Purdue course number. It is not for use for courses offered at or conducted by Purdue.

Credits: 1.00 to 4.00

FR 40100 - French Level VII (UCC: HUM)

Credit Hours: 3.00. Advanced work on development of French speaking, listening, reading, and writing abilities, focusing on materials dealing primarily with culture and the arts in France and the other French-speaking countries. Conducted primarily in French.

University Core Curriculum (UCC): (UCC: HUM)

Credits: 3.00

FR 40200 - French Level VIII (UCC: HUM)

Credit Hours: 3.00. Further advanced work on speaking, listening, reading, and writing abilities in French. Course materials will cover a variety of topics illustrated by film and other media, both print and nonprint. Conducted primarily in French.

University Core Curriculum (UCC): (UCC: HUM)

Credits: 3.00

FR 41200 - Advanced French Conversation II

Credit Hours: 1.00. This course is designed to help students build advanced listening skills and oral proficiency in French through classroom discussions. Students will be expected to actively participate in classroom discussions, prepare for class, and utilize the target language only. No textbook is needed.

Learning Outcomes: 1. Build French speaking and comprehension skills through classroom discussions. 2. Explain and assess relevant texts and audio materials in the target language. 3. Formulate ideas based on texts and audio materials as expressed in written and oral French. Credits: 1.00

FR 42400 - Professional French III

Credit Hours: 3.00. A study of the terminology and techniques used in commercial transactions, including the interpretation and writing of business materials. Development of the four language skills, with emphasis on writing and speaking.

Learning Outcomes: 1. Discuss the main aspects of the French professional world, notably the role of the French government. 2. Present professional interests verbally and in writing (such as conduct and have a job interview, compose resume and write a cover letter to answer a specific job offer). 3. Accomplish simple administrative tasks in French (write a professional letter, give/answer a phone call, make an appointment, etc.). 4. Behave appropriately in a French professional context. Credits: 3.00

FR 44300 - Introduction To Francophone Literature

Credit Hours: 3.00. The study of the most representative Francophone poets, playwrights, and novelists from various countries, such as Leopold Senghor, Aime Cesaire, Jacques Romain, Gabrielle Roy, Michel Tremblay, Mohamed Dib.

Credits: 3.00

FR 48000 - French Civilization

Credit Hours: 3.00. The study of modern French life, with special emphasis on the customs and daily life of the people. Lectures in French.

Credits: 3.00

FR 49100 - Special Topics In French

Credit Hours: 1.00 to 4.00. This course will be offered as a guided reading or independent study course on a topic of mutual interest in French or Francophone literature, culture, film, or linguistics, to the student and faculty. Permission of instructor required.

Learning Outcomes: 1. Learning objectives will vary due to the nature of the course. Credits: 1.00 to 4.00

FR 51900 - Teaching College French

Credit Hours: 3.00. A course designed to provide a forum for ideas connecting theory and research to teaching practice. Explores issues related to how learning and teaching can be enhanced and presents practical ideas that can be implemented in the classroom. Permission of department required.

Credits: 3.00

FR 52700 - Etudes de Style

Credit Hours: 3.00. Study of the expression of affective and artistic values in literary French. Detailed grammatical analyses and study of stylistic procedures. Comparison with English usage. Introduction to explication de texte as an approach to literature. Permission of department required.

Credits: 3.00

FR 54100 - Renaissance French Literature

Credit Hours: 3.00. Major works in verse and prose of the sixteenth century. Marot, du Bellay, Ronsard, Rabelais, Montaigne. Permission of department required.

Credits: 3.00

FR 54900 - French Literature And Film

Credit Hours: 3.00. An examination of the interrelationships of contemporary French literature and film. Discussion of the potential of each medium as an art form, problems of visual transposition of literary works, and extension of literary concepts such as Dadaism and Surrealism into cinema. Permission of department required.

Credits: 3.00

FR 55800 - French Novel Of The Twentieth Century

Credit Hours: 3.00. Consideration of the character, aesthetics, and evolution of the twentieth-century French novel. Readings from such representative novelists as Proust, Gide, Bernanos, Giono, Malraux, Camus, Robbe-Grillet, Saporta. Permission of department required.

Learning Outcomes: 1. Student will gain practical experience in the language. Credits: 3.00

FR 56100 - The Structure Of French I: Phonetics And Phonology

Credit Hours: 3.00. This course presents the sound system of French by examining descriptive and theoretical issues in the patterning of segments on various levels (phonetics, phonemics, morphology, etc.). Students will study current phonological and phonetic issues in recent literature. Credit will not be given for both FR 35100 and 56100.

Credits: 3.00

FR 56200 - The Structure Of French II: Syntax And Morphosyntax

Credit Hours: 3.00. This course presents descriptive and theoretical issues concerning the grammatical structure of French, dealing both with word-level phenomena (inflectional and derivational morphology, etc.) and with phrase-, sentence-, and discourse-level phenomena (syntactic structure, sentence constituents, word order, etc.). Credit will not be given for both FR 36200 and 56200.

Credits: 3.00

FR 56300 - History Of The French Language

Credit Hours: 3.00. A survey of the historical development of the French language from Vulgar Latin to the present and of the French language of today as a reflection of past cultural and socio-political conditions. Knowledge of a Romance language or of Latin is recommended but not required.

Credits: 3.00

FR 56400 - Introduction To Old French

Credit Hours: 3.00. Introduction to the study of Old French. Phonetic, syntactic, and stylistic questions will be addressed through the analysis of original texts.

Credits: 3.00

FR 58100 - French Culture

Credit Hours: 3.00. Development of the cultural life of the French people as reflected in architecture, art, history, literature, music, and philosophy. Lectures in French.

Learning Outcomes: 1. Student will gain practical experience in the language. Credits: 3.00

FR 58200 - Francophone Cultures

Credit Hours: 3.00. Examines at least three French-speaking regions outside of France (e.g., Caribbean, Maghreb, Quebec, West Africa), including contemporary civilization and the development of cultures throughout history. Explores trends in society, daily life, the arts, and the ideas. Lectures in French.

Credits: 3.00

FR 59000 - Directed Reading In French

Credit Hours: 1.00 to 4.00. Directed readings in French. Permission of instructor required.

Credits: 1.00 to 4.00

FR 59400 - Special Topics In French Literature

Credit Hours: 1.00 to 4.00. Special topics in French Literature. Permission of instructor required.

Credits: 1.00 to 4.00

FR 59600 - Special Topics In French Linguistics

Credit Hours: 1.00 to 4.00. Topics vary. Permission of instructor required.

Credits: 1.00 to 4.00

FR 63000 - Bibliography And Literary Criticism

Credit Hours: 3.00. The use of general and specific reference materials and bibliographical aids in literary research: the basic concepts and terminology of literary criticism. Required of all MA candidates in French.

Credits: 3.00

FR 65900 - Seminar In French Literature

Credit Hours: 3.00. Advanced study of special subjects. Topics to be announced in advance. Permission of instructor required.

Credits: 3.00

FR 67900 - Seminar In French Linguistics

Credit Hours: 3.00. Advanced study and research on a significant topic in French linguistics. Topic to be announced in advance. Permission of instructor required.

Credits: 3.00

FR 69800 - Research MA Thesis

Credit Hours: 1.00 to 18.00. Research MA Thesis. Permission of instructor required.

Credits: 1.00 to 18.00

FR 69900 - Research PhD Thesis

Credit Hours: 1.00 to 18.00. Research PhD Thesis. Permission of instructor required.

Credits: 1.00 to 18.00

General Science

SCI 10000 - Multicultural Leadership Seminar

Credit Hours: 1.00. Exposes students to career opportunities via presentations from corporate and academic representatives; provides an opportunity for minority science students to share concerns and to become aware of existing academic and non-academic support systems on campus. Provides an overview of the significant contributions to the sciences by minority groups; reinforces good study habits for academic success.

Credits: 1.00

SCI 19100 - Part-Time Curricular Practical Training

Credit Hours: 0.00. A part-time scientific work experience for Science majors. This internship experience is intended to complement the student's academic plan of study and help prepare for a future role as a practicing scientist. A letter from the prospective employer stating the period of employment, hours per week, job title, job qualifications, and job description must be provided to the Dean of Science's office for approval before registration will be permitted. A minimum period of employment is required. Permission of department required.

Credits: 0.00

SCI 19500 - Special Topics In Science

Credit Hours: 0.00 to 3.00. This is a special projects course that will be used for special circumstances with individual study or for experimental courses, pointed toward students who are first- or second-year students.

Credits: 0.00 to 3.00

SCI 20100 - Special Topics: Integrated Science And Engineering Learning Community

Credit Hours: 1.00. This course will expose students to interdisciplinary problems scientists and engineers routinely need to solve. Students will gain an appreciation for working with individuals from diverse disciplines and backgrounds. Participation in hands-on activities is a key component of the course.

Credits: 1.00

SCI 21000 - Teaming Principles

Credit Hours: 1.00. College of Science students will learn the principles and concepts involved in teaming, such as recognizing different learning styles, developing shared goals, addressing conflict, utilizing collaborative problem solving and utilizing strengths of team members. These foundations will allow students to enter collaborative situations, such as lab groups and study sections, fully prepared to maximize the value of their educational experiences as well as develop positive working relationships with their fellow students.

Learning Outcomes: 1. Demonstrate the ability to work on a team. 2. Learn the concepts involved in team building and collaboration, such as leadership, developing shared goals, and utilizing strengths of team members. These foundations will allow students to enter collaborative situations, such as lab groups, study sections and work environments, fully prepared to maximize the value of their educational experiences as well as develop positive working relationships with their fellow students. Credits: 1.00

SCI 29000 - Special Topics In Science

Credit Hours: 3.00. Introductory, integrated science course for engineering and science students. Beginning lectures will cover the basic chemistry of life, the organization of cells. This will be followed by more advanced topics such as photosynthesis. Each topic will emphasize how understanding the biological system requires concepts and tools from other disciplines such as chemistry and physics. Permission of instructor required.

Credits: 3.00

SCI 29199 - Cooperative Experience I

Credit Hours: 0.00. Professional experience in general sciences. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only.

Permission of department required.

Learning Outcomes: 1. Apply knowledge to identifying and solving problems in the professional context. 2. Advance skills related to professional preparation, critical thinking, problem solving, communication, and teamwork. 3. Increase understanding of the profession and practice, basic industry principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

SCI 29299 - Cooperative Experience II

Credit Hours: 0.00. Professional experience in general sciences. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.

Learning Outcomes: 1. Apply knowledge to identifying and solving problems in the professional context. 2. Advance skills related to professional preparation, critical thinking, problem solving, communication, and teamwork. 3. Increase understanding of the profession and practice, basic industry principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

SCI 29500 - Intercultural Leadership Seminar

Credit Hours: 0.00 to 3.00. This is a special projects course that will be used for special circumstances with individual study or for experimental courses, pointed toward students who are first- or second-year students. Permission of instructor required.

Learning Outcomes: 1. Vary due to nature of course. Credits: 0.00 to 3.00

SCI 39399 - Cooperative Experience III

Credit Hours: 0.00. Professional experience in general sciences. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.

Learning Outcomes: 1. Apply knowledge to identifying and solving problems in the professional context. 2. Advance skills related to professional preparation, critical thinking, problem solving, communication, and teamwork. 3. Increase understanding of the profession and practice, basic industry principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

SCI 39499 - Extensive Cooperative Experience IV

Credit Hours: 0.00. Professional experience in general sciences. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.

Learning Outcomes: 1. Apply knowledge to identifying and solving problems in the professional context. 2. Advance skills related to professional preparation, critical thinking, problem solving, communication, and teamwork. 3. Increase understanding of the profession and practice, basic industry principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

SCI 39500 - Special Topics In Science

Credit Hours: 0.00 to 3.00. This is a special topics course that will be used for special circumstances with individual study or for experimental courses.

Credits: 0.00 to 3.00

SCI 39599 - Extensive Cooperative Experience V

Credit Hours: 0.00. Professional experience in general sciences. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.

Learning Outcomes: 1. Apply knowledge to identifying and solving problems in the professional context. 2. Advance skills related to professional preparation, critical thinking, problem solving, communication, and teamwork. 3. Increase understanding of the profession and practice, basic industry principles, and principles and practice of ethical responsibility in professional work. Credits: 0.00

SCI 49000 - Topics In Science For Undergraduates

Credit Hours: 1.00 to 5.00. Selected interdisciplinary topics. Offered as a scheduled course when appropriate. Also available for supervised reading and reports of an interdisciplinary nature. Permission of instructor required.

Learning Outcomes: 1. Demonstrate the ability to communicate well, both orally and in writing. 2. Demonstrate the ability to work on a team.

Credits: 1.00 to 5.00

General Studies

GS 11900 - Introduction To Academic Programs At Purdue

Credit Hours: 1.00. To provide a comprehensive program describing each of the baccalaureate degree-granting schools at Purdue. The course is designed to assist students in the clarification of their degree objectives. Not open to students who have completed GS 115.

Credits: 1.00

GS 12000 - Summer Beginners Seminar I

Credit Hours: 1.00. Early Start students, as incoming freshmen, will learn the ins and outs of higher education - more specifically of Purdue University - and how to effectively manage their time and create successful personal habits. Whether it is learning the university course management system, understanding the bus routes, or navigating the world of financial aid, this seminar will prepare incoming students for success at Purdue's campus. Additionally, students will go through a series of lectures focused on creating successful habits, including, but not limited to: time management, study skills, cultural awareness, goal setting, and interpersonal communication.

Learning Outcomes: 1. Identify how to utilize extra- and co-curricular campus resources as related to personal and academic success. 2. Compare the unique nuances of the culture of a collegiate environment vs. high school environment. 3. Demonstrate effective communication skills with faculty, staff and peers. 4. Select strategies to aid in increasing their comfort as they navigate the transition between the cultures of a collegiate environment vs. high school environment.

Credits: 1.00

GS 12001 - Summer Beginners Seminar II

Credit Hours: 1.00. This seminar course is designed for students to reflect on the hopes, assumptions, and questions they bring with them as they begin their college experience at Purdue University. The class will support student success by introducing students to campus resources, establishing connections with the campus community, expanding study skills learned during high school, and implementing appropriate time management strategies.

Learning Outcomes: 1. Create and strengthen connections with the Purdue University community. 2. Describe appropriate study skills and time management strategies related to academic success. 3. Outline areas of growth in relation to student development. 4. Identify appropriate campus resources to support timely graduation. Credits: 1.00

GS 17500 - Information Strategies

Credit Hours: 0.00 or 1.00. Designed to build and sharpen students' information-gathering skills. Guides students in developing systematic methods for finding, evaluating, and presenting information. Organization and use of electronic and print tools will be explained through discussion, hands-on exercises, and homework assignments.

Credits: 0.00 or 1.00

GS 19501 - Preparing For Your Undergraduate Research Experience

Credit Hours: 1.00. This course is for prospective Purdue undergraduate researchers who are interested in conducting undergraduate research or creative endeavors. Purdue students who have not already started an independent research project with a research mentor will learn valuable skills to market themselves to individuals and research programs. Throughout the course, students will develop components for a final application packet to submit to a research team or program they choose.

Learning Outcomes: 1. Identify professional and personal goals sought from an undergraduate research experience. 2. Learn research skills such as assessing literature credibility and compiling a review of the topic important to all fields. 3. Utilize online and in person resources and programs to assist in locating and applying to undergraduate research experiences. 4. Evaluate research programs/projects to determine how they fit within personal and professional goals. 5. Create and submit an application/proposal including a resume and personal statement for research programs/projects. Credits: 1.00

GS 19505 - Introduction Of Research Essentials - Getting Started

Credit Hours: 1.00. This course is for prospective Purdue undergraduate researchers who are within their first two years at Purdue who are interested in conducting undergraduate research or creative endeavors. New Purdue Boilermakers who have not already started an independent research project with a research mentor will learn valuable skills to market themselves to individuals and research programs to prepare for a project in the following semester. Throughout the course, students will develop components for a final application packet to submit to a

research team or program they choose while focusing on the transition to college expectations regarding research-related topics. Must be a first-year or second-year student. Permission of instructor required.

Learning Outcomes: 1. Learn about the nature of research and how it can expand your undergraduate experience. 2. Develop a community of first-year and second-year Boilermakers interested in conducting research or creative endeavors. 3. Explore research opportunities available to undergraduate students by connecting with research faculty, professional staff, and active student researchers. 4. Learn research skills important to all disciplines such as accessing and assessing literature, recording research efforts, conducting ethical research, and communicating research. 5. Evaluate research programs/projects to determine how they fit within personal and professional goals. 6. Create and submit an application/proposal including a resume and personal statement for research programs/projects. 7. Present your research interests and an oral presentation. Credits: 1.00

GS 19700 - Purdue Promise First-Year Experience Course

Credit Hours: 1.00. A combined lecture and experiential seminar course for new Purdue Opportunity Awards scholars. The course will focus on the transition issues for these first-year students. Permission of instructor required.

Learning Outcomes: 1. Be introduced to Purdue resources such as MyPurdue, Blackboard, and Purdue University policies. 2. Learn and discuss topics pertaining to becoming a college student/young professional, such as email communication habits, appropriate class demeanor, and how to work best with instructors and advisors. 3. Learn about the available resources at Purdue, such as the Division of Financial Aid, Office of the Dean of Students, Writing Lab, Center for Career Opportunities, Student Wellness Office, etc. via presentations from the respective offices to become more confident in self-efficacy and self-advocacy as college students. Credits: 1.00

GS 19900 - Strategies For A Successful First Year

Credit Hours: 3.00. This course focuses on student adjustment to university life and development skills. Content includes testing to determine skills, attitudes, and interests; group activities to foster student adjustment; and training in computer usage, time management, and University policies. Open to Horizons students only.

Credits: 3.00

GS 20000 - Preparing Tomorrow's Leaders: Purpose And Connection

Credit Hours: 1.00. A one-credit course designed to provide Purdue Promise students with skills and connections to be successful at Purdue and post graduation. This course will provide Purdue Promise students in their second year with a foundation in leadership and career development skills.

Learning Outcomes: 1. Research/write and implement an academic and career plan. 2. Learn about emotional intelligence; thus taking greater responsibility for their own behaviors and learning. 3. Be exposed to and encouraged to Purdue avenues of leadership with the university. 4. Learn about work and internship opportunities. 5. Refine job search skills (resume, cover letters) and register with CCO Express. 6. Continue to explore and make connections with campus multicultural and diversity programs. Credits: 1.00

GS 21000 - Leadership Development Seminar

Credit Hours: 1.00. A one-credit course designed to provide Orientation Programs students with skills and connections to be successful leaders at Purdue and beyond. This course will provide students a foundation in leadership skills. Students must be selected as a Team Supervisor for Orientation Programs, and have permission of instructor, to enter the course.

Learning Outcomes: 1. Explore and identify leadership styles and competencies of successful college students and student leaders. 2. Analyze personal values and leadership styles to understand a student's growth and behavior as a leader. 3. Develop and enhance life skills, self-awareness, and personal strengths to become productive

individuals. 4. Recognize backgrounds and cultures different from their own and identify techniques for interaction. 5. Enhance preparation for the role as a Team Supervisor for Boiler Gold Rush. Credits: 1.00

GS 22000 - Summer Session Special Topics

Credit Hours: 1.00 to 6.00. This course is designated for a wide range of topics that stress interdisciplinary understanding, creative thought, and group discussion. Topics vary by semester. Permission of instructor required.

Learning Outcomes: 1. Vary due to nature of course. Credits: 1.00 to 6.00

GS 29000 - Study Skills Seminar

Credit Hours: 2.00 or 3.00. Designed to help students improve their college grades by learning to study more efficiently and effectively. Deals with improving study habits, such as time scheduling, attitudes, and specific study skills, such as note-taking, listening, test-taking, memory techniques, and reading skills.

Learning Outcomes: 1. Develop self-regulation skills around learning strategies. 2. Develop critical and creative skills. 3. Learn to apply strategies to other courses. Credits: 2.00 or 3.00

GS 29001 - Academics Success Skills

Credit Hours: 1.00. Designed to help students improve their college grades by learning to study more effectively.

Learning Outcomes: 1. Develop self-regulation skills around learning strategies. 2. Develop study habits and specific study skills. 3. Learn to apply strategies to other courses. Credits: 1.00

GS 29501 - Understanding Your Undergraduate Research Experience I

Credit Hours: 1.00. This course is for Purdue undergraduates who are part of an active research project and/or creative endeavor. Students will hone skills necessary for reflecting on and completing these experiences. During this course, students will utilize their research experience to apply skills including but not limited to: managing time with a research project, communicating research findings, using Purdue Libraries' resources, and providing constructive feedback to peer researchers. Students will deliver elevator pitches on their own research projects and critique pitches from their peers.

Learning Outcomes: 1. Communicate research to various audiences with an oral research elevator pitch and a written research abstract. 2. Provide constructive feedback, interact with peers, and incorporate feedback in your work. 3. Define skills and attributes you have developed and expanded as a result of your involvement in an undergraduate research experience. 4. Develop and expand your network of peer researchers within and across disciplines. 5. Reflect on and apply transferable skills necessary to be a successful undergraduate researcher. Credits: 1.00

GS 39501 - Understanding Your Undergraduate Research Experience II

Credit Hours: 1.00. This course is for current Purdue undergraduate researchers to build upon the previous course and focus on research data collection, analysis, and communication for current Purdue undergraduate researchers. During this course, students will learn and discuss various forms of data and collection practices. Students will develop their own academic poster to present their research project's data and implications.

Learning Outcomes: 1. Learn about quantitative and qualitative research methods and discuss how to utilize both in a research project. 2. Create and present an academic poster applying data visualization best practices. 3. Reflect on and apply transferable skills of an undergraduate researcher for future success. Credits: 1.00

GS 39505 - Research Peer Mentoring Training

Credit Hours: 1.00. This course is for current or past Purdue undergraduate researchers who want to learn how to serve as peer mentors to undergraduate researchers early in their careers. This course will train students on how to create mutually beneficial and productive mentorships. This course will provide research-based best practices for mentoring newer student researchers while developing as a cohort of new research mentors. This course is especially useful for those students who enjoy supporting peer researchers or plan to continue into more formal mentorship roles as a senior undergraduate researcher, graduate student, or research supervisor in academia or industry. Permission of instructor required.

Learning Outcomes: 1. Explore multiple strategies for effective mentoring with case studies, discussions, and readings. 2. Learn how to transition from a researcher to a peer mentor. 3. Create a mentoring philosophy statement and present your philosophy with

peers. 4. Develop preparatory steps for effective mentorship dissolution. Credits: 1.00

GS 40400 - Horizons Advanced Career Preparation

Credit Hours: 1.00. Horizons Advanced Career Preparation is designed to assist students in beginning their transition from college to the workforce or graduate school. The emphasis of the course is placed on self-exploration, career search skills, graduate school preparation, professional conduct, and financial planning.

Learning Outcomes: 1. Understand self-authorship through evaluation of strengths and talents. 2 Navigate a process of personal exploration focused on future career objectives. 3. Develop and refine resume or curriculum vitae. 4. Enhance skills as they relate to ongoing job search or graduate school preparation. 5. Educate navigating a professional setting. 6. Develop financial literacy as it relates to budgeting, loans, and savings. Credits: 1.00

GS 40500 - Advancing Tomorrow's Leaders: Preparing For Employment And Life After College

Credit Hours: 1.00. A one-credit course designed to prepare Purdue Promise students for the next chapter of their professional journey through the reflection of past experiences and the acquisition of new knowledge, expectations, and skills necessary to be successful citizens and employees post-graduation. This course is only for students in the Purdue Promise program. Permission of instructor required.

Learning Outcomes: 1. Identify expectations of post-graduation life. 2. Be informed of benefits, insurance, paycheck, and tax information. 3. Learn how to navigate their new positions and organizations-cultures, co-workers, supervisors, and workplace challenges. 4. Learn how to maintain marketability in the job market. 5. Learn the necessary life skills of living in a new town, with transitions, new financial obligations, and new responsibilities. 6. Reflect upon their college experience and how it has prepared them for their transition out of college. Credits: 1.00

GS 41000 - Advancing Tomorrow's Scholars: Graduate And Professional School Preparation

Credit Hours: 1.00. A one-credit course designed to prepare Purdue Promise students for a smooth transition into graduate or professional school. This course will inform Purdue Promise students of the necessary preparation, required paperwork, and skills needed to be successful in post-baccalaureate education. This course is only for students participating in the Purdue Promise program. Permission of instructor required.

Learning Outcomes: 1. Be informed of graduate school timelines, checklists, and necessary steps to apply. 2. Learn how to select a good graduate program for themselves. 3. Write a personal statement. 4. Learn ways to finance graduate school prior to starting and once in graduate school. 5. Learn the necessary life skills of living in a new town, with new transitions, and new responsibilities. 6. Reflect upon their college experience and how it has prepared them for their transition out of college. Credits: 1.00

GS 49000 - Directed Reading In General Studies

Credit Hours: 1.00 to 4.00. Reading to be done under the direction of the instructor in the particular field of specialization. Permission of instructor required.

Credits: 1.00 to 4.00

GS 49501 - Beyond Undergraduate Research

Credit Hours: 1.00. This course is for current Purdue undergraduate researchers to build on the previous courses (GS 29501, 39501) and focus on continuing their education in graduate or professional school. During this course, students will learn and discuss the various phases of identifying, selecting, applying to and funding graduate or professional school programs. Students will also gain a deeper comprehension of the qualities and skills that make research mentors effective while developing skills they will need to be successful mentees and peer mentors. Students will conduct research to identify potential programs of interest and develop a statement of purpose.

Learning Outcomes: 1. Categorize graduate or professional school qualities that fit skills and meet professional needs. 2. Identify qualities and skills necessary to act effectively as a research mentor and as a research mentee to a future graduate/professional advisor. 3. Create a statement of purpose to include in graduate/professional school applications. 4. Reflect on and apply transferable skills of an

undergraduate researcher for future success. Credits: 1.00

German

GER 10100 - German Level I (UCC: HUM)

Credit Hours: 3.00. A beginning course in German reserved exclusively for students who have had less than two years of German at the ninth-grade level or above. Students with two years or more of previous German study may not take this course for credit. Permission of department required. CTL:IWL 1920 German Level I

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Identify appropriate use of German language in specific contexts by reading German texts. 2. Identify appropriate use of German language in specific contexts by listening to audio recordings of spoken German. 3. Identify appropriate use of German language in specific contexts by watching videos of spoken German. 4. Compose German sentences by focusing on the set of grammatical rules and standards in the language. 5. Produce sentences in spoken German in the form of dialogues and presentations. Credits: 3.00

GER 10200 - German Level II (UCC: HUM)

Credit Hours: 3.00. Continuation of GER 10100 . CTL:IWL 1921 German Level II

University Core Curriculum (UCC): (UCC: HUM) Credits: 3.00

GER 10500 - Accelerated Basic German (UCC: HUM)

Credit Hours: 4.00. This course is a first-year course in German, which covers two semesters in one. The course is appropriate for students who would like to accelerate the process of learning German, including GEARE students, graduate students, and others. The course will be conducted primarily in German and will use all modes of communication: interpersonal, presentational, and interpretive. The course book facilitates learning in context through the use of an integrated video program. The students are trained in the audio-visual interpretive mode of communication that is essential to carry out daily activities in Germany, and to be able to read and react to a variety of German texts.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Identify appropriate use of German language in specific contexts by reading a variety of German texts and by listening to audio recordings of spoken German. 2. Identify German cultural aspects by watching videos in spoken German language integrated in the book. 3. Compose German sentences by focusing on a set of grammatical rules and standards in the language. 4. Produce sentences in spoken German in the form of dialogues and presentations and respond appropriately to questions and statements related to everyday life. Credits: 4.00

GER 11200 - Elementary German Conversation

Credit Hours: 1.00. Development of oral skills for self-expression. Guided practice in conversation to enhance communicative competence. Small group discussions in German on various topics.

Learning Outcomes: 1. Develop listening skills and improve oral German proficiency. 2. Acquire new vocabulary and grammar through discovery in various media and conversation. 3. Read, view, listen to and discuss relevant texts in the target language. Credits: 1.00

GER 20100 - German Level III (UCC: HUM)

Credit Hours: 3.00. A lower intermediate German course with emphasis on communicative skills (listening and speaking), literacy skills (reading and writing) and culture.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Identify appropriate use of German language in specific contexts by reading German texts, and listening to audio recordings, and watching videos of spoken German. 2. Compose German sentences by focusing on a set of grammatical rules and standards in the language. 3. Produce sentences in spoken German in the form of dialogues and presentations. Credits: 3.00

GER 20200 - German Level IV (UCC: HUM)

Credit Hours: 3.00. Continuation of GER 20100 . CTL:IWL 1923 German Level IV

University Core Curriculum (UCC): (UCC: HUM) Credits: 3.00

GER 20500 - Accelerated Intermediate German (UCC: HUM)

Credit Hours: 4.00. An accelerated intermediate level course in

German designed to achieve second year language proficiency in German. The course is appropriate for students who would like to accelerate the process of learning German.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Identify appropriate use of German language in specific contexts by reading a variety of German texts. 2. Identify German cultural aspects by watching videos in spoken German language integrated in the book. 3. Identify appropriate use of German language in specific contexts by listening to audio recordings of spoken German. 4. Compose grammatically correct German sentences by observing the norms and standards of the language. 5. Produce sentences in spoken German in the form of dialogues and presentations and respond appropriately to questions and statements related to everyday life. Credits: 4.00

GER 21200 - Intermediate German Conversation

Credit Hours: 1.00. Development of oral skills for self-expression. Guided practice in German conversation to enhance communicative competence. Small group discussions in German on various topics. Not open to students enrolled in or having credit for GER 30100 or above.

Learning Outcomes: 1. Develop intermediate listening skills and improve oral German proficiency. 2. Acquire new vocabulary and grammar through discovery in various media and conversation. 3. Read, view, listen, and discuss relevant intermediate texts in the target language. Credits: 1.00

GER 22300 - German Level IV: Science And Engineering

Credit Hours: 3.00. Practical reading, writing, speaking, and listening comprehension skills, directed toward use of German in science and technology. Work on grammar as needed. Use of materials from recent publications in science and technology. Introduction to general and technical vocabulary. Conducted primarily in German. Credit will not be given for both GER 20200 and 22300.

Learning Outcomes: 1. Identify appropriate use of German language in specific contexts by reading German texts about science, engineering, and business. 2. Identify appropriate use of German language in specific contexts by listening to audio recordings about science, engineering, and business in spoken German. 3. Identify appropriate use of German language in specific contexts by watching videos about science, engineering, and business in spoken German. 4. Compose German sentences about science, engineering, and business by focusing on a set of grammatical rules and standards in the language. 5. Produce sentences in spoken German in the form of dialogues and presentations that deal with science, engineering, and business. Credits: 3.00

GER 22400 - German Level IV: Business German

Credit Hours: 3.00. Practical reading, writing, speaking, and listening comprehension skills directed toward use of German for business purposes. Work on grammar as needed. Course materials cover daily business dealings as well as national and international trade, living conditions, environmental and social problems.

Credits: 3.00

GER 23000 - German Literature In Translation (UCC: HUM)

Credit Hours: 3.00. Reading and analysis of selected German writers and their works, with particular emphasis on the social, political, and intellectual climate of the times. The course content will change from semester to semester. Knowledge of German not required.

University Core Curriculum (UCC): (UCC: HUM) Credits: 3.00

GER 24100 - Introduction To The Study Of German Literature

Credit Hours: 3.00. An introduction to the study of German literature based on an overview of the formal elements of poetry, fiction, and drama as well as basic concepts of literary theory. Texts in German; conducted primarily in German.

Learning Outcomes: 1. Identify common characteristics of primary literary genres (e.g. prose, poetry, drama) as exhibited during one or more time periods in German-language cultures. 2. Discuss (in German) selected literary works that are written in German in respect to their main themes and to devices that help writers convey the texts' meaning, such as

symbolism, metaphor, irony, and allusion. 3. Compose (in German, with the aid of a dictionary) analytical essays that examine the relationship between the content, style, and sociohistorical context of selected literary texts. Credits: 3.00

GER 28000 - German Special Topics

Credit Hours: 3.00. Selected topics on the civilization and culture of German speaking countries. Lectures and readings all in English. No knowledge of German necessary.

Learning Outcomes: 1. Students will explore in depth a particular aspect of life in German-speaking countries, leading to their increased understanding not only of those cultures, but also, by comparison, of their own culture. Credits: 3.00

GER 28100 - Beer And Brewing In German Culture

Credit Hours: 3.00. Course about beer and brewing and its role as a cultural product in shaping the identity of regional areas in Germany, Austria, and Switzerland, and its influence on science, religion, economics, politics, and history. The course will give students an overview of the relationship between beer and brewing to other disciplines, allowing them to connect the topics covered to their own fields of study. Conducted in English.

Learning Outcomes: 1. Demonstrate an understanding of the central importance of beer and brewing in German-speaking culture and its relation to other fields of study. 2. Examine the representation of beer in German texts (in English) and other forms of art. 3. Analyze how beer and brewing contribute to the creation of national identities. 4. Identify historical, political, religious, societal, and economic issues as they pertain to beer and brewing in German-speaking culture. Credits: 3.00

GER 30100 - German Level V (UCC: HUM)

Credit Hours: 3.00. Continued development of German speaking, listening, reading, and writing abilities, using materials dealing primarily with everyday life and civilization in Germany from a variety of sources (e.g., newspapers, magazines, TV, recent literature, etc.). Conducted primarily in German.

University Core Curriculum (UCC): (UCC: HUM) Credits: 3.00

GER 30200 - German Level VI (UCC: HUM)

Credit Hours: 3.00. Further work to develop speaking, listening, reading, and writing abilities in German on the basis of materials dealing with the ideas and events that have shaped present-day Germany. Conducted primarily in German.

University Core Curriculum (UCC): (UCC: HUM) Credits: 3.00

GER 31200 - Advanced German Conversation

Credit Hours: 1.00. One credit hour advanced German conversation course focused on the development of oral and aural skills for self-expression. Course provides students with guided practice in conversation to enhance communicative competence. Discussions in German on various topics. Course may be taken concurrently with GER 30100, 30200, 40100 or 40200.

Learning Outcomes: 1. Develop intermediate listening skills and improve oral German proficiency. 2. Acquire advanced vocabulary and grammar through discovery in various media and conversation. 3. Read, view, listen, and discuss relevant intermediate texts in the target language. Credits: 1.00

GER 32300 - German Level VI: Science And Engineering

Credit Hours: 3.00. This is an alternative course to GER 30200. Continued development of German speaking, listening, reading, and writing abilities, using materials from recent publications in science and technology. Building of general and technical vocabulary. Conducted in German.

Learning Outcomes: 1. Identify and use science- and engineering-related German vocabulary. 2. Read, understand, and discuss specific articles about science and engineering In German. 3. Speak and write about specific topics in science and engineering Inn German. 4. Gain cultural knowledge and competence in the German business world, specifically the world of science and engineering. Credits: 3.00

GER 33000 - German Cinema (UCC: HUM)

Credit Hours: 3.00. Viewing and analysis of major German contributions to the cinema from the earliest period to the present. Emphasis on relevant aesthetic theories and on the schools of literature and painting that served as sources. Evaluation of the German film on the basis of social, artistic, and political criteria. Knowledge of German not required.

University Core Curriculum (UCC): (UCC: HUM)

Learning Outcomes: 1. Identify and describe the major movements and trends of German film

history of the 20th and 21st centuries. 2. Analyze the cinematography of representative German films. 3. Interpret the explicit and implicit meanings of representative German films. Credits: 3.00

GER 34100 - German Literature I: From The Middle Ages To The 18th Century

Credit Hours: 3.00. Reading and discussion of selected texts (poetry, prose, dramatic texts, cultural documents, and artworks) in German from the Middle Ages to the Eighteenth Century.

Credits: 3.00

GER 34200 - German Literature II: From The 18th Century To The 21st Century

Credit Hours: 3.00. Reading and discussion of selected texts in German with the dual context of literary movements and historical developments between the 18th and 21st centuries.

Credits: 3.00

GER 39900 - Special Study Abroad Credit In German

Credit Hours: 1.00 to 4.00. This course number is for assignment after the fact of credits in German earned while enrolled at a foreign university on a Study Abroad program which cannot be appropriately accommodated under an established Purdue course number. It is not for use for courses offered at or conducted by Purdue.

Credits: 1.00 to 4.00

GER 40100 - German Level VII (UCC: HUM)

Credit Hours: 3.00. Advanced work on development of German speaking, listening, reading, and writing abilities, focusing on materials dealing primarily with culture and the arts in Germany. Conducted in German.

University Core Curriculum (UCC): (UCC: HUM)

Credits: 3.00

GER 40200 - German Level VIII (UCC: HUM)

Credit Hours: 3.00. Further advanced work on speaking, listening, reading, and writing abilities in German. Course materials will cover a variety of topics illustrated by film and other media, both print and nonprint. Conducted in German.

University Core Curriculum (UCC): (UCC: HUM)

Learning Outcomes: 1. Compose essays in German after reading authentic German articles and books. 2. Discuss current events in German based on print and media sources from German-speaking countries. 3. Formulate arguments during debate in German through group discussion. 4. State their opinions in German on recordings, television shows, and texts. 5. Describe information in German from graphs, charts, diagrams, and pictures. Credits: 3.00

GER 42400 - Business German

Credit Hours: 3.00. A study of the terminology and techniques used in commercial transactions, including the interpretation and writing of business materials. Development of the four language skills, with emphasis on writing and speaking.

Learning Outcomes: 1. Learn and practice vocabulary and cultural knowledge that is applicable to business situations in German-speaking countries. 2. Compare business practices in German-speaking countries with those in the United States, and will be able to discuss the similarities and differences in German. Credits: 3.00

GER 48000 - German Civilization

Credit Hours: 3.00. The study of modern German life, with special emphasis on the daily life and customs of the people. Lectures in German.

Credits: 3.00

GER 49800 - Advanced Topics In German

Credit Hours: 3.00. Special topics on literature, linguistics and culture of contemporary German-speaking countries. Conducted in German.

Credits: 3.00

GER 51900 - Teaching College German

Credit Hours: 3.00. A course designed to provide a forum for ideas connecting theory and research to teaching practice. Explores issues related to how learning and teaching can be enhanced and presents practical ideas that can be implemented in the classroom. Permission of instructor required.

Credits: 3.00

GER 52400 - German For International Trade

Credit Hours: 3.00. A broad spectrum of business and cultural materials to prepare students for work in international firms. Intensive study of technical terminology used in business transactions; stylistics in business correspondence and report writing; training for accurate oral expression in business negotiations.

Credits: 3.00

GER 54200 - German Classicism

Credit Hours: 3.00. The study of the classical period in German literature as revealed in the works of Goethe and Schiller.

Credits: 3.00

GER 54300 - The Age Of Enlightenment And The Storm And Stress Movement

Credit Hours: 3.00. A study of the literature of the Age of Enlightenment, the cult of feeling, and the Storm and Stress works of Goethe and Schiller.

Credits: 3.00

GER 54400 - German Romanticism

Credit Hours: 3.00. A study of the rise and degeneration of the romantic ideal in German literature. Particular attention is paid to aesthetics, literary criticism, and the revival of a national heritage.

Credits: 3.00

GER 54500 - German Prose From Naturalism To The Present

Credit Hours: 3.00. Development of the novel and short story of the period, with special emphasis on the major authors.

Credits: 3.00

GER 54600 - German Literature Since 1945

Credit Hours: 3.00. Major literary movements and tendencies in East and West Germany, Austria, and Switzerland since 1945. Involves the close reading of literary texts, investigation of major problems addressed by literary criticism, and discussion of historical context.

Credits: 3.00

GER 55100 - Lyric Poetry From Romanticism To The Present

Credit Hours: 3.00. A study of the German lyric from Romanticism to the present. The study of motif, form, and style as reflections of the aesthetic ideals of their age.

Credits: 3.00

GER 55400 - German Drama Before Naturalism

Credit Hours: 3.00. German drama from its beginnings up to the advent of Naturalism. A study of the most significant German dramatists of the first part of the nineteenth century and earlier periods.

Learning Outcomes: 1. Students will be familiarized with drama theory, including the Aristotelian approach and the 18th century dramas that were created in response to it. 2. Students will learn about aesthetics and ethics in cultural history, explore the differences between such movements as Storm and Stress and Weimar Classicism, the Bourgeois play and the Brechtian drama and variations in between. 3. This course will enhance reading, writing, and speaking skills in the target language of German and will provide cultural knowledge and improve students' global competency. Credits: 3.00

GER 55500 - German Drama From Naturalism To The Present

Credit Hours: 3.00. Developments of the drama through the various literary movements of the period, including consideration of the underlying social and ideological forces.

Credits: 3.00

GER 56100 - The Structure Of German I: Phonology And Derivational Morphology

Credit Hours: 3.00. Linguistic analysis of German, focusing on phonetics, phonology, and word structure. The course will treat various problems of pronunciation, structural sound patterns, and word derivation. One weekly class is devoted to theoretical issues affecting German phonology and morphology. Credit will not be given for both GER 36100 and 56100.

Credits: 3.00

GER 56200 - The Structure Of German II: Inflectional Morphology And Syntax

Credit Hours: 3.00. Linguistic analysis of German, focusing on inflectional morphology, syntax, and semantics. The course will present the grammatical structure of German, dealing with word-level phenomena (inflectional morphology), and phrase- and sentence-level phenomena (constituents, word order, syntactic structure, etc.). Credit will not be given for both GER 36200 and 56200.

Credits: 3.00

GER 56300 - History Of The German Language

Credit Hours: 3.00. A survey of the development of the German language, with emphasis on the factors and events that brought about the ultimate unification of the major German dialects into the standard form of the present. The German language of today as a reflection of past cultural and sociopolitical conditions.

Credits: 3.00

GER 57500 - Theories Of German Language Acquisition

Credit Hours: 3.00. Advanced course designed to provide an overview of major theoretical issues in German language acquisition research. Permission of instructor required.

Credits: 3.00

GER 58100 - German Culture

Credit Hours: 3.00. The development of the cultural life in German-speaking lands as reflected in architecture, art, history, literature, music, and philosophy. Lectures in German.

Credits: 3.00

GER 59000 - Directed Reading In German

Credit Hours: 1.00 to 4.00. Directed readings in German. Permission of instructor required.

Credits: 1.00 to 4.00

GER 59400 - Special Topics In German Literature

Credit Hours: 1.00 to 4.00. Topics vary. Permission of instructor

required.

Credits: 1.00 to 4.00

GER 59600 - Special Topics In German Linguistics

Credit Hours: 1.00 to 4.00. Topics vary. Permission of instructor required.

Credits: 1.00 to 4.00

GER 60100 - First Course To Establish Reading Knowledge

Credit Hours: 3.00. First Course To Establish Reading Knowledge.

Credits: 3.00

GER 60300 - Second Course To Establish Reading Knowledge

Credit Hours: 3.00. Second Course To Establish Reading Knowledge. For those in the physical sciences, mathematics, and engineering. Prerequisite: GER 60100 .

Credits: 3.00

GER 60500 - Second Course To Establish Reading Knowledge

Credit Hours: 3.00. Second Course To Establish Reading Knowledge. For those in the humanities and social sciences. Prerequisite: GER 60100 .

Credits: 3.00

GER 63000 - Bibliography And Literary Criticism

Credit Hours: 3.00. The use of general and specific reference materials and bibliographical aids in literary research; the basic concepts and terminology of literary criticism. Required of all MA candidates in German.

Credits: 3.00

GER 64400 - Seminar In German Expressionism

Credit Hours: 3.00. The prose, drama, and poetry from 1910-1925. Will also examine selected political-literary essays as they relate to this artistic avant-garde generation.

Credits: 3.00

GER 65900 - Seminar In German Literature

Credit Hours: 3.00. Advanced study of special subjects. Topics to be announced in advance. Permission of instructor required.

Credits: 3.00

GER 66400 - Middle High German

Credit Hours: 3.00. This course introduces students to the Middle High German language, the language of medieval literary texts written in German between 1050 and 1350. The language of this period is significantly different in spelling, vocabulary, and grammar when compared to Modern Standard German. The course also provides an introduction to various genres of medieval German literary texts from this period. Many of the foundational works in the German tradition come from this period, including those of the so-called "golden age" of medieval German literature from 1170 to 1230.

Learning Outcomes: 1. Compare Middle High German vocabulary and grammar with Modern German. 2. Analyze Middle High German grammatical forms as they appear in literary texts. 3. Identify linguistic variation in Middle High German. 4. Apply linguistic knowledge by translating Middle High German texts. 5. Identify distinctions between genres of Middle High German literary texts. 6. Recognize major themes in Middle High German literary texts. 7. Write a paper that synthesizes information from class on genres and cultural/historical themes in Middle High German literary texts. Credits: 3.00

GER 67900 - Seminar In German Linguistics

Credit Hours: 3.00. Advanced study and research on a significant topic in German linguistics. Topic to be announced in advance. Permission of instructor required.

Credits: 3.00

GER 69800 - Research MA Thesis

Credit Hours: 1.00 to 18.00. Research MA Thesis. Permission of instructor required.

Credits: 1.00 to 18.00

GER 69900 - Research PhD Thesis

Credit Hours: 1.00 to 18.00. Research PhD Thesis. Permission of instructor required.

Credits: 1.00 to 18.00

Global Engineering Program

GEP 10000 - Global Design Team I

Credit Hours: 1.00. Global Design Team (GDT) brings together undergraduate and graduate students from different disciplines inside and outside of the College of Engineering, to design solutions to solve real-world problems over the course of one academic semester. Depending on the size and scope of the project, teams may range from one to twenty students under the advisement of a faculty member. GDTs partner student teams with non-governmental organizations, businesses, and/or other research institutions in international development projects. Approval for registration is granted based on an application process that takes into consideration previous design experience, level of interest in the topic, and GPA. Department approval required.

Learning Outcomes: 1. Real-world, full-cycle design experience in the context of a different culture and geographical region. 2. Increased global awareness and competence. 3. Global humanitarian impact. Credits: 1.00

GEP 20000 - Global Design Team II

Credit Hours: 0.00 to 2.00. Global Design Team (GDT) brings together undergraduate and graduate students from different disciplines inside and outside of the College of Engineering, to design solutions to solve real-world problems over the course of one academic semester. Depending on the size and scope of the project, teams may range from one to twenty students under the advisement of a faculty member. GDTs partner student teams with non-governmental organizations, businesses, and/or other research institutions in international development projects. Approval for registration is granted based on an application process that takes into consideration previous design experience, level of interest in the topic, and GPA. Department approval required.

Learning Outcomes: 1. Real-world, full-cycle design experience in the context of a different culture and geographical region. 2. Increased global awareness and competence. 3. Global humanitarian impact. Credits: 0.00 to 2.00

GEP 30000 - Global Design Team III

Credit Hours: 1.00 to 3.00. Global Design Team (GDT) brings together undergraduate and graduate students from different disciplines inside and outside of the College of Engineering, to design solutions to solve real-world problems over the course of one academic semester. Depending on the size and scope of the project, teams may range from one to twenty students under the advisement of a faculty member. GDTs partner student teams with non-governmental organizations, businesses, and/or other research institutions in international development projects. Approval for registration is granted based on an application process that takes into consideration previous design experience, level of interest in the topic, and GPA. Department approval required.

Learning Outcomes: 1. Real-world, full-cycle design experience in the context of a different culture and geographical region. 2. Increased global awareness and competence. 3. Global humanitarian impact. Credits: 1.00 to 3.00

GEP 40000 - Global Design Team IV

Credit Hours: 1.00 to 3.00. Global design Team (GDT) brings together undergraduate and graduate students from different disciplines inside and outside of the College of Engineering, to design solutions to solve real-world problems over the course of one academic semester. Depending on the size and scope of the project, teams may range from one to twenty students under the advisement of a faculty member. GDTs partner student teams with non-governmental organizations, businesses, and/or other research institutions in international development projects. Approval for registration is granted based on an application process that takes into consideration previous design experience, level of interest in the topic, and GPA. Department approval required.

Learning Outcomes: 1. Real-world, full-cycle design experience in the context of a different culture and geographical region. 2. Increased global awareness and competence. 3. Global humanitarian impact. Credits: 1.00 to 3.00

Global Studies Liberal Arts

GSLA 10100 - Global Awareness

Credit Hours: 3.00. This course surveys a range of global issues to develop an understanding and appreciation of the major geographical and cultural areas of the world and the issues that both unite and divide such areas and their people. The course will examine key political, economic, social, historical and cultural patterns that define our modern world. It encourages students to raise 'big' questions about what processes and institutions helped constitute the modern moment, as well as about the dynamic interactions between our social world and the natural one. This is a gateway course for prospective Global Studies Majors and Minors.

Learning Outcomes: 1. Develop critical thinking. 2. Develop cultural competence. 3. Understand communication across cultures. 4. Develop ethical decision making. Credits: 3.00

GSLA 30100 - Theories Of Global Studies (UCC: HUM)

Credit Hours: 3.00. The course is designed to introduce students to the major schools of thought in Global and International Studies. It provides students with critical tools to explore the interconnectedness of our world from multiple perspectives. The course will expose students to a variety of international scholars who have understood Global Studies to be more than globalization. Instead, it introduces contested issues and contradictory positions concerning the meaning and significance of globalization.

University Core Curriculum (UCC): (UCC: HUM)

Learning Outcomes: 1. Gain an understanding of key theoretical approaches to the question of globalization and its role in the discipline of Global Studies. 2. Learn how to evaluate competing and opposing analytical frameworks. 3. Apply a theoretical framework to a concrete problem or case. Credits: 3.00

GSLA 39100 - Special Topics In Global Studies

Credit Hours: 3.00. This variable title course deals with topics that explore a range of experiences and analytical perspectives clustered around the contemporary global experience. The course will vary in subject matter but focus on the challenges and rewards of a globalized world as articulated through topics such as cross-border histories, music, gender, racial formations,

film, and economic development. Content will vary with the instructors teaching the course.

Learning Outcomes: 1. Understand, by definition but also by analytical variation, the range of lived experiences and critical perspectives that encompass the contemporary global experience. 2. Recognize the cultural, economic, and political characteristics that define contemporary globalization. 3. Think and write analytically about contemporary globalization through topics such as national or regional histories, music, gender and/or racial formations, film, literature, politics, and economics. Credits: 3.00

GSLA 48000 - Senior Interdisciplinary Capstone Project In Global Studies I

Credit Hours: 3.00. The senior capstone course for Global Studies majors is designed to give students the chance to define and complete a research project of personal interest, and to integrate the interdisciplinary aspects of their entire curricula into one project. Students must complete GSLA 48000 and GSLA 48001. The capstone courses are offered to students in their senior year to be completed the final two semesters of their major. Students will assemble a committee of two or more faculty members willing to direct their work. The Director of Global Studies will be an ex-officio member of the committee. Students will incorporate their prior coursework (including foreign language training), study abroad, and/or internships into their final project. The capstone may be, but is not limited to, a senior honors project, a multimedia project, service learning, or directed research. Timeline for a successful capstone project: Spring of Sophomore year: After three semesters of coursework, the student will start defining an area of interest or passion that will form the basis of their capstone research. Junior Year: The student will select courses in their interest area. They will also start speaking to faculty members in the field in order to assemble their committee. Spring of Junior Year: Students will finalize their faculty committee to direct their research. Fall of Senior Year: Research Semester, as directed by the committee. GSLA 48000. Spring of Senior Year: Complete project. GSLA 48001.

Learning Outcomes: 1. Demonstrate an awareness of Global issues through academic inquiry and extracurricular engagement. 2. Critically apply multi-perspective research frameworks to a concrete problem or case. 3. Recognize historic roots of Global inequality. 4. Develop intercultural competence and demonstrate empathy for difference. Credits: 3.00

GSLA 48001 - Senior Interdisciplinary Capstone Project In Global Studies II

Credit Hours: 3.00. The senior capstone is a year-long course for which Global Studies majors enroll in consecutive semesters. Its primary goal is for students to define and complete a research project of personal, academic, and/or professional interest, as they integrate the interdisciplinary aspects of their entire curricula into one project. Students must complete GSLA 48000 and GSLA 48001 in order to complete the Global Studies major.

Learning Outcomes: 1. Varies per student project/ capstone. Credits: 3.00

Graduate Studies

GRAD 50100 - PULSe Scientific Communications

Credit Hours: 1.00. To begin to create an atmosphere in which students learn to communicate across disciplinary lines by providing the opportunity to develop skills in presenting and evaluating research results. Students will develop short scientific presentations, an abstract, and a poster and learn to present their findings to others and to ask and answer questions from their peers. Permission of department required.

Learning Outcomes: 1. To improve your ability to organize and present research presentation. 2. To gain experience with the skills required to prepare material for presentation. 3. To learn more about the faculty and students in PULSe. Credits: 1.00

GRAD 50200 - Interdisciplinary AI Fundamentals: Bridging Knowledge

Credit Hours: 1.00. This course provides foundational concepts for AI for those in both MSAI majors. This course covers the history of AI, the foundations of artificial reasoning and knowledge, and practical skills for communicating about AI technology, projects, and workflow. This graduate course, designed to be accessible to learners with diverse backgrounds, serves as a foundational introduction to the field of AI. Whether you come from a technical or non-technical background, this course will provide you with a solid grasp of AI concepts, principles, and their real-world applications. To be successful in this course, we encourage students to know math (e.g., algebra and calculus) and a basic understanding of programming (e.g., R, Python, or Java).

Learning Outcomes: 1. Describe the foundations of artificial reasoning, knowledge, and trace the historical development of AI. 2. Explain the basic concepts, terminologies, and applications of different AI algorithms,

developing a problem-solving mindset applicable to various domains. 3. Examine the diverse range of AI applications across varied industries. 4. Explain the role human factors and social context play in the development of artificial intelligence. Credits: 1.00

GRAD 50300 - AI Essentials: A Non-Technical Introduction

Credit Hours: 2.00. This course provides students on the translator track a foundation in the principles and methodologies of Artificial Intelligence (AI) to empower them to actively engage in interdisciplinary collaborations. With a focus on the essentials of AI, machine learning, and natural language processing, students will gain the knowledge and skills needed to bridge the gap between language and technology. Students will leverage AI tools and techniques to enhance translation efficiency, accuracy, and engagement in the ever-evolving digital landscape. Students will have a foundation in the methodology so they can effectively participate in interdisciplinary collaborations, serving as a valuable resource for industries where language and technology converge.

Learning Outcomes: 1. Explain the basic concepts and applications of different AI algorithms and how they apply for specific fields for application or research purposes. 2. Describe the types of data inputs and outputs used in different AI applications. 3. Define a project and apply basic AI approaches in a programming environment. 4. Communicate methods and results of an AI project to specialists and non-specialists. Credits: 2.00

GRAD 50400 - Advanced AI Fundamentals For Technical Professional

Credit Hours: 2.00. Artificial Intelligence (AI) is the driving force behind the transformation of industries, research, and technology. For students with a highly technical background, this 2-credit hour graduate course offers a deep dive into the fundamental principles, theories, and applications of AI. Specifically, this course will introduce students to the field of data mining and machine learning, which sits at the interface between statistics and computer science. Data mining and machine learning focus on developing algorithms to automatically discover patterns and learn models of large datasets. This course introduces students to the process and main techniques in data mining and machine learning, including exploratory data analysis, predictive modeling, descriptive modeling, and evaluation. To be successful in this course students should have experience with programming such as Python and R and have a background that includes calculus, linear algebra, algorithms, and probability theory.

Learning Outcomes: 1. Identify key elements of Artificial Intelligence (AI) and Machine Learning (ML) algorithms. 2. Understand how to choose AI/ML algorithms for different analysis tasks. 3. Analyze data in both an exploratory and targeted manner using AI and ML approaches. 4. Implement and apply basic AI/ML algorithms for supervised and unsupervised learning. 5. Accurately evaluate the performance of AI/ML algorithms, as well as formulate and test hypotheses. Credits: 2.00

GRAD 50500 - Foundations In Data Science

Credit Hours: 3.00. This course is the inaugural course in the Master of Science in Data Science program. Tailored for students with a technical background, this course provides a comprehensive introduction to key concepts, statistical techniques, and tools foundational to the field of data science. The syllabus integrates hands-on experience, ethical considerations, programming refresher, and agile project management principles to equip students with a robust foundation for their data science journey.

Learning Outcomes: 1. Demonstrate a comprehensive understanding of core data science concepts and articulate the significance of data in various domains. 2. Acquire skills to perform exploratory data analysis, identify patterns, and make informed decisions based on statistical inference. 3. Analyze ethical dilemmas arising in data-driven contexts, apply ethical decision-making models, and navigate the legal implications of data handling and analysis. 4. Demonstrate a comprehensive understanding of programming fundamentals and the application of agile methodologies to manage and execute data science projects. 5. Access, navigate, and employ Purdue's computing resources available through Purdue's Rosen Center for Advanced Computing (RCAC). Credits: 3.00

GRAD 50600 - Big Data Tools And Technologies

Credit Hours: 3.00. This course is designed to equip students with the essential skills to handle big data effectively. It covers proficiency in big data technologies, scalable data processing techniques, and the integration of big data tools into data

science workflows.

Learning Outcomes: 1. Demonstrate proficiency in big data technologies. 2. Apply scalable data processing techniques to handle large datasets. 3. Integrate big data tools into comprehensive data science workflows. 4. Demonstrate proficiency with cloud computing. Credits: 3.00

GRAD 50700 - Cross Domain Data Communication And Visualization

Credit Hours: 3.00. This course focuses on the proficient use of data communication strategies and competencies. The course will focus on identifying data narratives, generating stories from data, illustrating with powerful and self-explanatory visualization, and basic principles of ethical use of non-data narrative frames for data communication. Designed for students with a technical background pursuing a Master of Science in Data Science, this course aims to enhance students' ability to extract and communicate meaning and narratives from raw data and visually represent it.

Learning Outcomes: 1. Create effective and aesthetically pleasing data visualizations. 2. Communicate complex data findings clearly to diverse audiences. 3. Utilize interactive visualization techniques for dynamic exploration of datasets. 4. Develop the ability to integrate ethics and data privacy considerations effectively when communicating with data. Credits: 3.00

GRAD 50800 - Data Analytics

Credit Hours: 3.00. This course provides an in-depth exploration of advanced data analysis techniques, predictive modeling, ensemble methods, and proficiency in data manipulation and transformation. It is designed for students with a technical background pursuing a Master of Science in Data Science.

Learning Outcomes: 1. Apply advanced data analysis techniques to extract meaningful insights from complex datasets. 2. Implement predictive modeling and ensemble methods for accurate data-driven predictions. 3. Demonstrate proficiency in data manipulation and transformation techniques. Credits: 3.00

GRAD 50900 - Applied Machine Learning: From Foundations To Latest Advances

Credit Hours: 3.00. This course provides an in-depth exploration of machine learning algorithms and data mining techniques, building on the foundational concepts introduced in the Foundations of Data Science course. Students will develop a comprehensive understanding of various machine learning algorithms, focusing on practical applications and hands-on experience. Additionally, the course will cover data mining techniques for dimension reduction and pattern discovery.

Learning Outcomes: 1. Demonstrate a comprehensive understanding of popular machine learning algorithms, including supervised and unsupervised learning techniques. 2. Demonstrate the ability to analyze mathematical foundations and principles behind machine learning models. 3. Understand the nuances of applying various machine learning models, emphasizing the trade-offs between performance, computational complexity, and interpretability. 4. Students will actively explore unsupervised learning techniques, emphasizing clustering algorithms, and recognizing their vital role in solving real-world challenges. 5. Demonstrate proficiency into the fundamental principles of deep learning and investigate recent advancements, such as optimization using diffusion models, learning from unlabeled data using consistency models, and decentralized data processing through federated learning. Credits: 3.00

GRAD 51000 - ESE Colloquium/Seminar I

Credit Hours: 2.00. This 2-semester sequence (2 credits in fall and 1 credit in spring) is a first-year requirement of all ESE IGP students. The series is designed to build critical and resilience thinking skills, and improve oral and written communication through critique writing, panel forums, and mini, oral presentations while promoting camaraderie among the ESE IGP.

Learning Outcomes: 1. Identify your dogmas and recognize your biases towards learning how to remove your biases and learn how to minimize filtering readings and others' opinions through your own dogmas. 2. Gain a breadth of understanding on topics around sustainability and environmental challenges and different disciplinary approaches to a problem. 3. Increase your critical thinking skills, your ability to synthesize material, and improve your written

communication skills. 4. Increase your oral communication ability, your ability to process others' opinions, and build camaraderie. 5. Improve your ability to think independently, to re-evaluate your assessment through input of others, and the process for approaching complex problems. Credits: 2.00

GRAD 51100 - ESE Colloquium/Seminar II

Credit Hours: 1.00. This 2-semester sequence (2 credits in fall and 1 credit in spring) is a first-year requirement of all ESE IGP students. The series is designed to build critical and resilience thinking skills, and improve oral and written communication through critique writing, panel forums, and mini, oral presentations while promoting camaraderie among the ESE IGP.

Learning Outcomes: 1. Increase your ability to work together, synthesize information, and present orally as a team. 2. Increase your ability to work with others towards consensus, facilitate discussion towards a common goal, and to approach the challenges from marketing to implementation of a symposium event. Credits: 1.00

GRAD 55000 - Fellowship And Grant Application Writing

Credit Hours: 2.00. Fellowship Application Writing is open to any graduate student who is interested in applying for fellowships and other grant opportunities. Graduate students will be taught how to write personal statements, research statements, and extended research plans that they can submit for fellowship applications. Organization of research background, methods, and significance will be emphasized. Writing mechanics and addressing grant agency requirements and procedures will also be covered. Additionally, fellowship and grant opportunities will be discussed along with professional communication skills.

Learning Outcomes: 1. Analyze the different types of fellowship opportunities currently available to them as well as form broad knowledge of postdoc and faculty grants. 2. Practice and evaluate proofreading skills to gain experience in editing fellowship application writings and be able to apply advanced proofreading skills to future writing projects. 3. Compose persuasive documents using a grant proposal writing style with appropriate formatting and organization and analyze their writing with grant agency criteria. 4. Synthesize and refine competitive personal statements, research plans, and statements of previous research to use for various fellowship applications. Credits: 2.00

GRAD 58800 - Online Master Of Science In Data Science-Capstone

Credit Hours: 3.00. The capstone course aims to provide students with an opportunity to integrate their accumulated knowledge, technical, and social skills to identify and solve a real-world data science problem, with an emphasis on the application domain. The capstone course for the OMSDS provides students with practical experience applying the collective set of skills developed through the OMSDS program to complete a professional project in support of a private, public, or non-profit partner. Students, in teams of 3-5 students each, will work with a product owner to scope out the project via a project charter that will include a timeline, milestones, and metrics that will yield benefits and a strategy for measuring the outcome of the project compared to a baseline.

Learning Outcomes: 1. Identify the public, non-profit, or business objectives in a complex problem. 2. Evaluate and define an applied problem using data science that requires practical analysis and recommendations / and analytic output to a stakeholder. 3. Design a professional-level applied project that provides meaningful input to a targeted beneficiary. 4. Evaluate the proposed solution and interpret results concerning the "business" objectives. 5. Demonstrate an understanding of translational communication skills by communicating technical information to both technical and non-technical audiences. Credits: 3.00

GRAD 58900 - Master Of Science In Artificial Intelligence Capstone
