Credit Hours: 3.00. This course will be a broad-scaled analysis of animal communication. Topics will include the physics of sound- and light-signal production, propagation and reception of signals, the use of communication as a means of information transfer, and the evolution of signaling systems. Mathematical principles are covered (e.g. in the evolution of signals), so some background in mathematics (e.g. calculus or algebra and introductory physics) is helpful.

Learning Outcomes: 1. Understand ways in which organisms interact ecologically with each other and their environment. 2. Understand how evolutionary forces influence organisms to produce adaptations. 3. Acquire knowledge of the ways in which animals communicate with each other. 4. Exhibit proficiency in population and community ecology, animal behavior, and

evolutionary mechanisms. 5. Familiar with taxonomic and phylogenetic relationships among organisms. 6. Learn to efficiently communicate scientific information or results from biological investigations using both oral and written methods. 7. Use and understand the scientific method, including how to generate hypotheses and predictions, develop an experimental design, collect data, statistically analyze data, and interpret results. 8. Demonstrate an in dept knowledge of nervous system function at the systems, cellular and molecular level. Credits: 3.00

BIOL 59200 - The Evolution Of Behavior

Credit Hours: 3.00. An investigation of behaviors as adaptations: specializations of sensory and motor mechanisms involved in behavior; animal communication systems; behavioral ecology; patterns of social behavior as solutions to ecological problems, such as predator avoidance and resource exploitation. Emphasis will be on theoretical principles; examples will be broadly comparative, ranging from microorganisms to mammals. Offered in alternate years.

Credits: 3.00

BIOL 56310 - Protein Bioinformatics

Credit Hours: 3.00. Accumulation of biological data, such as genome sequences, protein structures and sequences, metabolic pathways, opened up a new way of research in biology-bioinformatics. Through the survey of the various active research topics in bioinformatics, in this course we will learn bioinformatics databases, tools, and algorithms behind these tools. Special emphasis is placed on protein sequence and structure analyses. Covered topics will include methods for protein sequence comparison, protein structure comparison, protein structure prediction/modeling, protein docking prediction, protein function prediction, and protein network analysis.

Learning Outcomes: 1. Utilize biological database searches including protein and nucleotide sequences, motifs, and structures, and interpret results in statistically correct fashion. 2. Develop bioinformatics analysis pipeline that apply a series of appropriate bioinformatics tools with proper setting for predicting protein function and structures and interpret results correctly by knowing algorithms, strengths, and limitations of the tools used. 3. Construct the tertiary structure models of protein and protein complexes with appropriate software and predict the accuracy of the models built. 4. Apply functional analysis of gene networks and compute the statistical significance of results. 5. Discuss appropriateness of bioinformatics analyses in biology literature and propose alternative approaches that may work better than ones used in the literature. Credits: 3.00

BIOL 58210 - Ecological Statistics

Credit Hours: 3.00. This course covers topics that are useful for successfully designing and analyzing statistically observational and experimental studies in ecology, animal behavior, evolutionary biology, forestry, wildlife sciences, fisheries, etc. Some topics are: differences between hypotheses and predictions, design of an ecological study, general linear models, assumptions, different types of designs (factorial, nested, repeated measures, blocks, split-plots, etc.), fitting models to data, etc. The course will focus on the conceptual understanding of these topics (e.g., interpreting the results of statistical tests) and practice with statistical programs and real datasets.

Learning Outcomes: 1. Pose scientific questions, hypotheses, and predictions. 2. Plan and design ecological research projects. 3. Determine sample size requirements. 4. Use and interpret descriptive statistics. 5. Use general linear models and interpret their results. 6. Check for the assumptions of general linear models. 7. Manage data. 8. Understand the potential and limitations of statistics in ecological research. Credits: 3.00

BIOL 53601 - Biological And Structural Aspects Of Drug Design And Action

Credit Hours: 3.00. (BCHM 53600) This course is aimed at expanding students' fundamental interests in biology, chemistry and biochemistry to how drugs work. The course will provide an overview of the modern day drug discovery pipeline and an in-depth look at the basic biology, structure, and mechanisms-of-action behind marketed therapeutics. The course will start with a historical account of the discovery of natural product drugs such as aspirin and penicillin and will then venture into the modern day era of drug discovery including structure-based drug design.

We will explore different classes of antibiotics, antiviral, and anti-cancer drugs and their targets including small molecule drugs and modern biologics-based drugs.

Learning Outcomes: 1. Understand and communicate the site and mechanism-of-action of a drug. 2. Understand and communicate the relationship between the pharmacologic mechanism and the therapeutic use of a drug. 3. Understand and communicate the scientific basis for the therapeutic use of a drug. 4. Predict, verbally or in writing, the biological response, if any, from a given chemical structure. 5. Understand and communicate the relationship between the structural features of a compound and the physicochemical properties that might influence biological response or the design of new agents. 6. Predict, verbally or in writing, the biochemical mechanism-of-action of a biologically active substrate or compound from its chemical structure. 7. Communicate and describe the relationship between the chemical structure of a biologically active compound and the receptor or active binding site, using enzyme or receptor models. 8. Predict, verbally or in writing, the biological response resulting from the chemical alteration or biochemical pathways. 9. Discuss the relationship between in vitro reaction mechanisms and the structural features that alter the in vivo biotransformation of a drug. 10. Understand and communicate the pathophysiologic processes associated with a particular disease state, and how they might be affected by drug therapy. Credits: 3.00

BCHM 43400 - Medical Topics In Biochemistry

Credit Hours: 3.00. This course applies the principles of biochemistry and metabolic regulation to understand the diagnosis and treatment of human disease. The course emphasizes the biochemistry relevant to diabetes, blood disorders and the medical consequences of liver disease and aging. Roughly half of the class time is focused on small group activities including team-based learning and problem-based learning using patient cases. Students will search authoritative sources to discover links between biochemistry and clinical symptoms and communicate that information to their peers.

Learning Outcomes: 1. Understand mechanisms that regulate metabolic pathways within individual cells, tissues and organ systems in healthy and disease patients. 2. Predict biochemical and clinical effects given specific defects in a pathway. 3. Appreciate ethical issues facing life science professionals who perform research involving humans or human tissues. 4. Communicate scientific knowledge effectively to non-scientists. Credits: 3.00

BCHM 52100 - Comparative Genomics

Credit Hours: 3.00. The course provides an understanding of the forces that act on genome content and organization, and the ability to interpret genetic variation between genomes. Students will acquire skills to utilize public genome databases, visualize genomic regions/features of interest using a genome browser, and perform phylogenetic analysis. The knowledge gained is central within the fields of genetics, bioinformatics, microbiology, and evolutionary biology and have important applications in numerous related fields including medicine, biotechnology, agriculture, and ecology.

Learning Outcomes: 1. Understand the composition, organization and structure of genomes. 2. Understand processes that cause these genome features to change over time. 3. Interpret gene and genome information in common display formats. 4. Evaluate common methods used to interpret genetic variation between genomes. 5. Perform, present and discuss a research project in comparative genomics. Credits: 3.00

BIOL 32101 - Experimental Design And Quantitative Analysis Honors

Credit Hours: 3.00. This course is aimed at preparing students in experimental design and quantitative analysis specifically as applied to Life Sciences in order to read the scientific literature critically, generate scientific questions, hypotheses and predictions, design research studies, analyze the data statistically, and communicate results. The course will use R and RStudio, which are open-source platforms that are increasingly used in the scientific community to analyze data quantitatively.

Learning Outcomes: 1. Understand the logic behind the scientific method in Life Sciences. 2. Be able to pose research questions, hypotheses, and predictions. 3. Understand the benefits and limitations of statistical testing. 4. Design a research study following experimental design principles. 5. Understand and critically assess data collection. 6. Interpret and visualize the results of statistical tests. 7. Communicate and present quantitative results effectively (i.e., writing the Results section of a scientific paper). 8. Run statistical analyses and generate publication quality figures in R. Credits: 3.00

BIOL 38700 - Macromolecules

Credit Hours: 2.00. The goal is to expose students to the world of macromolecules, their physicochemical properties, the influence of these properties on function and structure, and how these properties are determined and exploited. Permission of department required.

Learning Outcomes: 1. Describe the types of macromolecules. 2. Describe the biophysical and biochemical properties of macromolecules. 3. Describe how biophysical and biochemical properties are determined. 4. Describe how these physicochemical properties are exploited in various biotechniques. Credits: 2.00

BIOL 52905 - Disease Ecology

Credit Hours: 3.00. Study of the ecological and evolutionary complexity inherent to host-pathogen interactions. Includes case studies from a diverse array of systems, including plants, animals, aquatic and terrestrial systems. Emphasis is on the interactions between multiple hosts and pathogens within complex, dynamic environments. Introduction to parasite and pathogen diversity, host-pathogen coevolution, community ecology and the importance of pathogens in conservation and management.

Learning Outcomes: 1. Evaluate the roles played by the diversity of parasites and pathogens found in complex natural systems. 2. Apply the foundational principles of disease ecology - the importance of hosts, pathogens and the environment in disease dynamics - to understand disease dynamics in natural systems. 3. Evaluate the strengths and weaknesses of different modeling approaches in disease ecology. 4. Understand how disease models are used in management and conservation. 5. Apply both ecological and evolutionary theory to examine the impact of infectious disease on host populations, communities and ecosystems. 6. Demonstrate an understanding of patterns in pathogen diversity and abundance across landscape to regional scales. 7. Articulate understanding of disease ecology through written and oral communication. 8. Demonstrate an understanding of the scientific literature and an ability to critically evaluate this research for an interdisciplinary topic. Credits: 3.00

BIOL 55101 - Theory Of Molecular Methods

Credit Hours: 3.00. This course will introduce upper-level undergraduate students and graduate students to the theory and practice of many commonly used molecular biology methods. Emphasis will be placed on understanding the theoretical basis for these techniques, their utility in various circumstances, and their limitations. Although taught as a lecture, students should be able to take this knowledge back to the laboratory to help them in their research efforts. The course will be as close as possible to a laboratory experience without being in an actual laboratory setting. This course is designed to prepare students for other in-depth scientific courses, for graduate rotations, and for future laboratory work. Exams will be experimental in nature (e.g., design an experiment to do something or in this type of situation, which technique/vector/etc. would best be used, and why). Permission of instructor required.

Learning Outcomes: 1. Have knowledge about the uses and limitations of various molecular biology techniques. 2. Understand the techniques and how to choose the best technique for a given circumstance. 3. Understand how to interpret the experimental results emanating from each technique. Credits: 3.00

BIOL 58601 - Ecology

Credit Hours: 3.00. This is an advanced ecology course that examines the ecological process and dynamics of populations,

communities, and ecosystems. Topics include the physical, physiological, behavioral, and population genetic factors that influence how organisms interact with one another and their environment, the nature of population growth, and attributes of community structure. Course material integrates case studies from field and laboratory experiments, simulations, and theoretical models to understand life histories, species interactions, and community and ecosystem processes.

Learning Outcomes: 1. Apply ecological principles to interpret patterns of abundance and distribution of organisms in natural systems. 2. Use conceptual and mathematical models to predict the dynamics of populations and communities. 3. Critically evaluate the experimental design and data interpretation of ecological studies in the published literature. 4. Communicate scientific ideas and results through discussions and written assignments. Credits: 3.00

BIOL 51202 - Methods And Measures In Biophysical Chemistry

Credit Hours: 3.00. Biological applications of physical methods including absorption spectroscopy (UV-Vis, FTIR and Raman and CD spectroscopy), fluorescence spectroscopy and super high-resolution imaging, spin resonance methods (NMR and ESR spectroscopy), mass and thermodynamic based methods (thermophoresis, analytical ultracentrifugation, ITC and surface plasmon resonance) and diffraction/structural methods using NMR, cryo-EM and X-ray scattering/crystallography. Each topic is treated at an introductory level with examples from the literature. The course objective for students is to obtain a general understanding of the physical principles underlying each of the techniques, as well as the basic ability to apply the technique to biological systems of interest.

Learning Outcomes: 1. Understand basic biophysical principles and the biophysical approach to research. 2. Interpret biophysical data from real experimental examples in the literature. 3. Develop presentation skills. 4. Practice Team Cooperation. 5. Demonstrate an understanding of biophysical methods and how these are used in modern biological experiments. Credits: 3.00

BIOL 51606 - Pathways In Human Health And Disease

Credit Hours: 3.00. This course is intended for both upper-level undergraduate and graduate students. It will cover major intracellular signaling pathways in eukaryotes and their roles in human disease, with an emphasis on cancer but also touching on other major modern diseases such as COVID-19. We will explore avenues being pursued to target signaling mechanisms for therapeutic benefit. Topics include G protein-coupled receptors, receptor tyrosine kinases, nuclear hormone receptors, protein kinases and phosphatases, mTOR, the Wnt/β-catenin pathway, cell cycle control, DNA damage checkpoint control, regulated proteolysis, and programmed cell death. The course will be taught from current primary literature using a textbook as a background resource. Students will learn how to read and interpret scientific data through regular lectures, extramural seminars, in-class presentations, and take-home assignments.

Learning Outcomes: 1. Identify common molecular mechanisms in major signal transduction pathways. 2. Understand methods commonly used to analyze signal transduction processes. 3. Appreciate how protein domains within signaling proteins impart selectivity by building up signaling pathways via protein protein-interactions. 4. Evaluate and critique data in the scientific literature or in lectures in the signal transduction/cell cycle fields. 5. Exhibit improved oral and written communication skills in the area of signal transduction research. Credits: 3.00

BIOL 51101 - Intro To X-Ray Crystallography

Credit Hours: 3.00. This course will provide an introduction to structure determination of macromolecules using X-ray crystallography and will attempt to balance theory and practice, consisting of ~60% lectures and ~40% lab modules. The course is divided into five 3-week modules covering (i) Crystallization, (ii) Data Collection, (iii) Molecular Replacement, (iv) Experimental Phasing, and (v) Model Building and Refinement, Validation, and Visualization. The goal of the course is to equip students with the necessary tools to develop and execute an X-ray crystallography project, starting from construct design to publication. By the end of the course, students should be familiar with the (i) structure determination pipeline, (ii) theory behind X-ray diffraction methods, (iii) methods for crystallization, (iv) phasing options for solving a crystal structure, and (v) contemporary crystallography software.

Learning Outcomes: 1. Learn the theory behind X-ray crystallography. 2. Learn how to use contemporary software that is used to solve structures and what that software are doing. 3.

Gain hands-on experience in crystallization and handling crystals for data collection. 4. Gain hands-on experience collection data remotely from a synchrotron source and at a home source X-ray instrument. 5. Learn how to determine a structure using either molecular replacement and/or experimental phasing; and will learn how to prepare their results for a publication and deposition. Credits: 3.00

BIOL 41919 - Data Science For Biologists

Credit Hours: 3.00. All of us are drawn to real-world biological questions. Nevertheless, we might underestimate the hidden demand for computing skills to conduct the actual research. By nature, biological data is versatile, vast, complex, and noisy. Therefore, customized scripts are often needed for data processing, analyses, and visualization. Tools for data management and version control function as virtual lab books to ensure that the studies are 100% reproducible. This course is designed to equip students with practical programming skills via an array of biological case studies. Through hands-on computer labs, students will learn how to translate a biological question into logical thinking and write good code in R, perform scientific computing and visualization in R, and manage projects in an organized fashion. Permission from the department is required.

Learning Outcomes: 1. Understand basic computer programming knowledge and skills. 2. Manage and analyze common types of biological data. 3. Conduct reproducible research. 4. Perform data visualization in R, and design and test a hypothesis with a data-driven approach using provided datasets. Credits: 3.00

BIOL 57340 - Neurobiology Of Learning And Memory

Credit Hours: 3.00. How does our brain learn? How are our memories created? We will discuss a range of learning processes from cellular and molecular mechanisms to perception and behavior. We will look at the history of the key concepts and discoveries, including the technological advances, such as optogenetics. Most of the research discussed will be from animal studies.

Learning Outcomes: 1. Describe the cellular, molecular, and circuit-level mechanisms underlying learning and memory. 2. Evaluate critically primary literature on learning and memory, with a focus on findings from animal models. 3. Demonstrate an understanding of how tools like patch clamp, optogenetics have advanced the study of neural processes related to learning and memory. 4. Relate neural mechanisms to behavioral outcomes, including how learning influences perception and decision-making. 5. Outline the historical progression of major discoveries in the neurobiology of learning and memory. 6. Apply course concepts to different topics in neuroscience, such as the development of therapies for memory-related disorders. Credits: 3.00

BIOL 58215 - Building The Tree Of Life: Phylogenetic Methods And Applications

Credit Hours: 3.00. The Tree of Life represents Earth's biodiversity and its history and forms the basis of all biological knowledge. Phylogenetic methods allow us to reconstruct the Tree of Life and infer the evolutionary history and relationships of genes and organisms. This knowledge, in turn, can be used to address questions of organismal classification, biogeography, community assembly, and macroevolution. This jointly taught course introduces tree thinking and its underlying algorithms of inferring phylogenies, with an emphasis on the various applications of phylogenetic methods to such topics as those listed above. Through a combination of lectures, computer labs, and discussion of primary literature, the course will provide hands-on experience with commonly used tools and their applications in research for senior undergraduate and graduate students from relevant science backgrounds. Permission from department is required.

Learning Outcomes: 1. Build and visualize phylogenetic trees with commonly used scientific software. 2. Conduct scientific analyses using phylogenetic methods in R, ask testable scientific questions. 3. Perform data mining of phylogenetic resources and utilize the phylogenetic tools to address scientific questions. Credits: 3.00

Base Lab Requirement (0-4 credits)

Other Departmental/ Program Course Requirements (53-79 credits)

Chemistry (17 credits)

General Chemistry (5 credits)

CHM 12901 - General Chemistry With A Biological Focus (UCC: SCI)

Credit Hours: 5.00. An accelerated and comprehensive one-semester general chemistry course that emphasizes principles that are important in biological systems. This course is designed to cover the essential elements of general chemistry traditionally covered in a two semester series. Topics to be covered include: Stoichiometry and chemical equations; atomic theory and structure; periodic properties; electronegativity; ionic and covalent bonding; non-covalent forces; bond energies; Lewis structures; molecular geometry; gases, liquids, and solids; solutions, quantitative equilibria in aqueous solution; acid/base chemistry and buffers; introductory thermodynamics; oxidation-reduction; electrochemical and membrane potential; colligative properties; chemical and enzyme kinetics; nuclear chemistry; coordination chemistry. One year of high school chemistry is required.

University Core Curriculum (UCC): (UCC: SCI) Learning Outcomes: 1. Develop an understanding of universal physical laws as they apply in chemistry. 2. Develop an understanding of the scientific process. 3. Develop the ability to document scientific information and experimental data and to make quantitative/structural measurements and interpret results. Credits: 5.00

Organic Chemistry (8 credits)

CHM 25500 - Organic Chemistry For The Life Sciences I

Credit Hours: 3.00. A study of aliphatic and aromatic hydrocarbons and their simple derivatives in terms of (a) structure, bonding, etc.; (b) general syntheses and reactions; and (c) a logical modern rationale for fundamental phenomena as supported by reactivity orders, orientation effects, stereochemistry, and relative rates. Recommended for biology majors.

Learning Outcomes: 1. Gain understanding of the fundamental principles of organic chemistry and to apply those principles to solve problems. 2. Observe the world on a molecular level and to understand how organic chemistry applies to biology and everyday life. 3. Understand at a fundamental level how molecules look and behave. 4. Relate the structure and reactivity of molecules to observable physical/chemical properties. 5. Describe Life Processes in terms of molecular phenomena. Credits: 3.00

CHM 25501 - Organic Chemistry For The Life Sciences Laboratory I

Credit Hours: 1.00. Laboratory experiments to accompany CHM 25500, illustrating methods of separation, instrumental methods of analysis, and the more common techniques and methods for preparing various types of organic compounds.

Learning Outcomes: 1. Learn through practical experience the isolation, purification, and characterization of organic compounds through processes including liquid-liquid extraction, evaporation, solid-phase chromatography, distillation and infrared spectroscopy. 2. Learn through practical experience the use of simple methods to carry out reactions discussed in organic chemistry lectures and how to isolate and characterize the products. Credits: 1.00

CHM 25600 - Organic Chemistry For The Life Sciences II

Credit Hours: 3.00. A continuation of CHM 25500 with various functional groups such as the carboxyl, amino, etc., and including such polyfunctional natural products as carbohydrates and peptides.

Learning Outcomes: 1. Use theory to understand/predict experimental observations. 2. Demonstrate an understanding of the physical properties and a molecular understanding of chemical reactivity and materials. 3. Plan chemical transformations. 4. Recognize and understand chemical instrumentation and spectroscopy. Credits: 3.00

CHM 25601 - Organic Chemistry For The Life Sciences Laboratory II

Credit Hours: 1.00. A continuation of CHM 25501. Experiments are designed to illustrate principles discussed in CHM 25600.

Learning Outcomes: 1. Learn through practical experience the isolation, purification, and characterization of organic compounds through processes including liquid-liquid extraction, evaporation, solid-phase chromatography, distillation and infrared spectroscopy. 2. Learn through practical experience the use of simple methods to carry out reactions discussed in organic chemistry lectures and how to isolate and characterize the products. Credits: 1.00

Biochemistry (4 credits)

CHM 33900 - Biochemistry: A Molecular Approach

Credit Hours: 3.00. This is a comprehensive one-semester biochemistry course that emphasizes molecules and molecular reaction mechanisms, building upon the principles conveyed in general chemistry and organic chemistry. This course is designed to cover the essential elements of biochemistry traditionally covered in a two semester series. Topics to be covered include: Amino acids, peptides and proteins, molecular models and structure-function relationships, enzymes, enzyme kinetics and enzyme mechanisms, carbohydrates and carbohydrate metabolism, aerobic metabolism, lipids and membranes, lipid metabolism, nitrogen metabolism and integration and regulation of metabolism. Special emphasis will be placed on connections between biochemical principles and the fields of medicine, human health and disease, nutrition and biotechnology. This course should serve as excellent preparation for higher-level biochemistry courses as well as standardized pre-health professional exams. CHM 33900 was designed as the 4lh semester of the 1-2-1 competency-based curriculum transformation in chemistry as it applies to pre-health professional and life science students at Purdue. However, this course is open to other students who meet the prerequisites. Learning Outcomes: 1. Demonstrate the ability to think as a scientist. 2. Demonstrate the ability to communicate well in writing. 3. Apply knowledge of basic principles of chemistry and their applications to the understanding of biological systems. 4. Employ knowledge of the general components of prokaryotic and eukaryotic cells, such as molecular, microscopic, macroscopic, and three-dimensional structure, to explain how different components contribute to cellular and organismal function. 5. Demonstrate knowledge of how biomolecules contribute to the structure and function of cells.. 6. Demonstrate knowledge of molecular interactions and their importance in biological systems. 7. Demonstrate knowledge of the principles of chemical thermodynamics and kinetics that drive biological processes in the context of space (i.e., compartmentation) and time: enzyme-catalyzed reactions and metabolic pathways, regulation, integration, and the chemical logic of sequential reaction steps. 8. Recognize major types of functional groups and chemical reactions that occur in biological systems. 9. Apply understanding of the concepts of chemical reactivity and chemical kinetics to predict biochemical processes. 10. Apply knowledge of the chemistry of covalent carbon compounds to explain the molecular mechanisms of biochemical enzyme reactions. 11. Demonstrate knowledge of thermodynamic criteria for spontaneity of physical processes and chemical reactions and the relationship of thermodynamics to chemical equilibrium as they apply to biological systems. 12. Explain maintenance of homeostasis in living organisms by using principles of mass transport, energy balance, and feedback and control systems. Credits: 3.00

CHM 33901 - Biochemistry Laboratory

Credit Hours: 1.00. CHM 33901 is a laboratory course based on two modules from the Undergraduate Research Inspired Experimental Chemistry Alternatives (URIECA) developed at MIT that are designed to introduce students to cutting-edge research topics in biochemistry. The course provides students with a research-inspired laboratory experience that introduces standard biochemical techniques in the context of investigating a current research topic, for example, acquired resistance to cancer drugs. Techniques include protein expression, purification, and gel analysis, PCR, site-directed mutagenesis, kinase activity assays, and protein structure viewing. CHM 33901 was designed as the 4th semester of the 1-2-1 competency-based curriculum transformation in chemistry as it applies to pre-health professional and life science students at

Purdue. However, the course is open to other students who meet the prerequisites.

Learning Outcomes: 1. Demonstrate the ability to think and function as a scientist. 2. Develop an understanding of the scientific process. 3. Develop the ability to document scientific information and experimental data. 4. Demonstrate understanding of the process of scientific inquiry, and explain how scientific knowledge is discovered and validated. 5. Develop observational and interpretive skills through hands-on laboratory or field. 6. Demonstrate ability to measure with precision, accuracy, and safety. 7. Operate basic biochemistry laboratory instrumentation for scientific measurement. 8. Articulate scientific questions and hypotheses, design experiments, acquire data, perform data analysis, and present results in project-based research. 9. Apply knowledge of basic principles of chemistry and their applications to the understanding of biological systems. 10. Make quantitative/structural measurements and interpret results. 11. Demonstrate the ability to work on a team. 12. Demonstrate the ability to communicate well, both orally and in writing. Credits: 1.00

College of Science Additional Requirements

Computing (2-4 credits)

CS 15900 - C Programming

Credit Hours: 3.00. Fundamental principles, concepts, and methods of programming in C, with emphasis on applications in the physical sciences and engineering. Basic problem solving and programming techniques; fundamental algorithms and data structures; and use of programming logic in solving engineering problems. Students are expected to complete assignments in a collaborative learning environment. Credit cannot be obtained for both CS 15900 and any of CS 15600, CS 15800 and CS 18000.

Learning Outcomes: 1. Understand the fundamental principles, concepts and methods of computer programming. 2. Use the C programming language to developing solutions in the domains of physical sciences, mathematics, and engineering. 3. Demonstrate the ability to function as part of a technical team to generate a solution to a programming problem. 4. Analyze alternative algorithm designs to implement solutions that make efficient use of limited resources of the computer. Credits: 3.00

CS 17700 - Programming With Multimedia Objects

Credit Hours: 4.00. Introduction to computers and programming: number representations, primitive data types and operations, basic control structures, programming applets and applications using graphical user interfaces, programming for detecting events and performing actions, processing multimedia objects such as images and sounds. Throughout the course, examples are drawn from a variety of fields in the natural sciences. Not open to CS majors with a grade of C or better in CS 18000 . Not open to non-CS majors with a grade of C or better in any course in computer programming.

Credits: 4.00

CS 18000 - Problem Solving And Object-Oriented Programming

Credit Hours: 4.00. Problem solving and algorithms, implementation of algorithms in a high level programming language, conditionals, the iterative approach and debugging, collections of data, searching and sorting, solving problems by decomposition, the object-oriented approach, subclasses of existing classes, handling exceptions that occur when the program is running, graphical user interfaces (GUIs), data stored in files, abstract data types, a glimpse at topics from other CS courses. Intended primarily for students majoring in computer sciences. Credit cannot be obtained for both CS 18000 and any of 15600, 15800 and 15900. Not open to students with credit in CS 24000.

Learning Outcomes: 1. Understand solving problems by analyzing the problem, designing an algorithm, and programming the solution. Credits: 4.00

TDM 10100 - The Data Mine Seminar I (UCC: IL)

Credit Hours: 1.00. The Data Mine is a supportive environment

for students in any major from any background who want to learn some data science skills. Students will gain hands-on experience with computational tools for representing, extracting, manipulating, interpreting, transforming, and visualizing data, especially big data sets, and in effectively communicating insights about data. Topics include: the R environment, Python, visualizing data, UNIX, bash, regular expressions, SQL, XML and scraping data from the internet, as well as selected advanced topics, as time permits.

University Core Curriculum (UCC): (UCC: IL)

Learning Outcomes: 1. Discover data science and professional development opportunities in order to prepare for a career. 2. Explain the difference between research computing and basic personal computing data science capabilities in order to know which system is appropriate for a data science project. 3. Design efficient search strategies in order to acquire new data science skills. 4. Devise the most appropriate data science strategy in order to answer a research question. 5. Apply data science techniques in order to answer a research question about a big data set. Credits: 1.00

TDM 10200 - The Data Mine Seminar II

Credit Hours: 1.00. The Data Mine is a supportive environment for students in any major from any background who want to learn some data science skills. Students will gain hands-on experience with computational tools for representing, extracting, manipulating, interpreting, transforming, and visualizing data, especially big data sets, and in effectively communicating insights about data. Topics include: the R environment, Python, visualizing data, UNIX, bash, regular expressions, SQL, XML and scraping data from the internet, as well as selected advanced topics, as time permits.

Learning Outcomes: 1. Discover data science and professional development opportunities in order to prepare for a career. 2. Explain the difference between research computing and basic personal computing data science capabilities in order to know which system is appropriate for a data science project. 3. Design efficient search strategies in order to acquire new data science skills. 4. Devise the most appropriate data science strategy in order to answer a research question. 5. Apply data science techniques in order to answer a research question about a big data set. Credits: 1.00

CS 17600 - Data Engineering In Python

Credit Hours: 3.00. The course introduces students to programming fundamentals in Python, including loops, functions and different data types, and provides an introduction to data engineering including working with common data formats and learning the basics of data wrangling. Students will format, extract, clean, filter, transform, search, combine, summarize, aggregate, and visualize a diverse range of data sets. Python libraries including Matplotlib and Pandas are used.

Learning Outcomes: 1. Write Python code using loops, decision statements, and functions. 2. Explain how arguments are passed in Python functions and how the scope of variables impacts execution. 3. Use the operations on lists, tuples, and dictionaries to perform appropriate data manipulations. 4. Using Matplotlib, create informative plots and other data visualizations. Explain the key qualities of good visualizations. 5. Creating and manipulating DataFrames using Pandas. 6. Create Python code as well as methods in Pandas to select, search, change, and summarize data in tables. 7. Explain how to identify and fill in missing values in data. 8. Apply Pandas functions combine and merge datasets, perform a range of data aggregations, groupings and cross tabulations. 9. Given multiple data sets, demonstrate how to summarize, transform, combine the data sets, and aggregate and visualize the resulting data set. Credits: 3.00

Laboratory Science (8 credits)

Physics I

PHYS 17200 - Modern Mechanics (UCC: SCI)

Credit Hours: 4.00. Introductory calculus-based physics course using fundamental interactions between atoms to describe Newtonian mechanics, conservation laws, energy quantization, entropy, the kinetic theory of gases, and related topics in mechanics and thermodynamics. Emphasis is on using only a few fundamental principles to describe physical phenomena extending from nuclei to galaxies. 3-D graphical simulations and numerical problem solving by computer are employed by the student from the very beginning. CTL:IPS 1753 Calculus-based Physics I

University Core Curriculum (UCC): (UCC: SCI) Learning Outcomes: 1. Understand and describe a wide range of physical phenomena in mechanics and thermodynamics using only a few fundamental principles of physics. 2. Learn a unified approach that relates microscopic behavior to macroscopic behavior. 3. Model natural phenomena quantitatively. 4. Apply all this to a range of topics related to mechanics and thermodynamics. Credits: 4.00

PHYS 23300 - Physics For Life Sciences I

Credit Hours: 4.00. Physics For Life Sciences I builds upon prerequisite knowledge in college level biology, chemistry, and mathematics to present introductory physics that will be useful for applying physical principles, insights, and problem solving approaches for students with life science majors. Content will feature the Newtonian framework with emphasis on friction, drag and viscosity, random motion and diffusion, fluid flow, the Coulomb force, molecular forces and bonding, momentum, conservation of energy, entropy, and the first and second laws of thermodynamics.

Learning Outcomes: 1. Understand how motion in realistic biological systems (e.g. cells, biomolecules) is governed by forces. 2. Understand how molecular binding is described in terms of energy. 3. Understand how diffusion is governed on a microscopic level. 4. Have insight into how the first and second laws of thermodynamics constrain basic processes in living systems. Credits: 4.00

Physics II

PHYS 24100 - Electricity And Optics (UCC: SCI)

Credit Hours: 3.00. Electrostatics, current electricity, electromagnetism, magnetic properties of matter. Electromagnetic waves, geometrical and physical optics.

University Core Curriculum (UCC): (UCC: SCI) Credits: 3.00

PHYS 25200 - Electricity And Optics Laboratory

Credit Hours: 1.00. Selected experiments in electric fields, magnetic fields, steady-state and transient DC circuits, thermodynamics, and optics.

Learning Outcomes: 1. Demonstrate the ability to think and function as a scientist. 2. Demonstrate the ability to communicate well, both orally and in writing. 3. Demonstrate the ability to understand the role of scientific observation of Nature in uncovering the Laws of Physics. Credits: 1.00

PHYS 27200 - Electric And Magnetic Interactions (UCC: SCI)

Credit Hours: 4.00. Calculus-based physics course using concepts of electric and magnetic fields and an atomic description of matter to describe polarization, fields produced by charge distributions, potential, electrical circuits, magnetic forces, induction, and related topics, leading to Maxwell's equations and electromagnetic radiation and an introduction to waves and interference. 3-D graphical simulations and numerical problem solving by computer are employed throughout.

University Core Curriculum (UCC): (UCC: SCI) Learning Outcomes: 1. Understand and describe a wide range of physical phenomena in electricity and magnetism using only a few fundamental principles of physics. 2. Learn a unified approach that relates microscopic behavior to macroscopic behavior. 3. Model natural phenomena quantitatively. 4. Apply all this to a range of topics related to electricity and magnetism. Credits: 4.00

PHYS 23400 - Physics For Life Sciences II

Credit Hours: 4.00. Physics For Life Sciences II builds upon prerequisite knowledge in college level biology, chemistry, and mathematics, as well as on Physics For Life Sciences I, to develop an understanding of how energy, entropy, enthalpy, and Boltzmann distributions affect the dynamics of living systems, of how electric fields and potentials are applied to fluids and membranes, and how the physics of harmonic

oscillators, waves, sound, optics, photons, and quantized states are relevant to biological systems and the tools used for their study.

Learning Outcomes: 1. Understand the connection between microscopic phenomena and macroscopic consequences in terms of energy, entropy, and the laws of thermodynamics for biological systems. 2. Apply simple electrostatic principles to membrane potentials and other biological examples. 3. Understand how wave phenomena and quantized states are important for characterizing biomolecules. Credits: 4.00

Mathematics (6-10 credits)

Calculus I

MA 16010 - Applied Calculus I (UCC: QR)

Credit Hours: 3.00. Topics include trigonometric and exponential functions; limits and differentiation, rules of differentiation, maxima, minima and optimization; curve sketching, integration, anti-derivatives, fundamental theorem of calculus. Properties of definite integrals and numerical methods. Applications to life, managerial and social sciences. CTL:IMA 1604 Calculus - Short I

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. To create functional models and simplify difference quotients, compute limits of functions and apply limit laws. 2. To compute derivatives of elementary functions, including exponential, logarithmic and trigonometric functions, and apply rules of differentiation. 3. To sketch the graph of functions with the help of differentiation techniques, find maxima and minima of functions; optimization problems. 4. To computes integrals of some elementary functions and apply the Fundamental Theorem of Calculus. 5. Topics to be covered at a level required to perform standard applications related to life sciences, management and technology. Credits: 3.00

MA 16100 - Plane Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 5.00. Introduction to differential and integral calculus of one variable, with applications. Some schools or departments may allow only 4 credit hours toward graduation for this course. Designed for students who have not had at least a one-semester calculus course in high school, with a grade of "A" or "B". Not open to students with credit in MA 16500 . Demonstrated competence in college algebra and trigonometry.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions Credits: 5.00

MA 16500 - Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 4.00. Introduction to differential and integral calculus of one variable, with applications. Conic sections. Designed for students who have had at least a one-semester calculus course in high school, with a grade of "A" or "B", but are not qualified to enter MA 16200 or MA 16600 or the advanced placement courses MA 17300 or the honors calculus course MA 18100. Demonstrated competence in college algebra and trigonometry. CTL:IMA 1602 Calculus - Long I

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems. 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions. Credits: 4.00

Calculus II

MA 16020 - Applied Calculus II (UCC: QR)

Credit Hours: 3.00. This course covers techniques and applications of integration; infinite series; differentiation and integration of functions of several variables; maxima and minima, optimization; differential equations and initial value problems. CTL:IMA 1605 Calculus - Short II

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Use techniques of integration to find areas between curves and compute volumes of solids of revolution. 2. Analyze the convergence of infinite series and power series, Taylor series expansions. 3. Compute derivatives of functions of several variables and use them to find maxima and minima of functions. 4. Perform multiple iterated integration. 5. Use differential equations for modeling simple real-life situations. 6. Solve first order linear initial value problems and separable equations. 7. Topics to be covered at a level required to perform standard applications related to life sciences, management and technology. Credits: 3.00

MA 16200 - Plane Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 5.00. Continuation of MA 16100 . Vectors in two and three dimensions, techniques of integration, infinite series, conic sections, polar coordinates, surfaces in three dimensions. Some schools or departments may allow only 4 credit hours toward graduation for this course.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 5.00

MA 16600 - Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 4.00. Continuation of MA 16500 . Vectors in two and three dimensions. Techniques of integration, infinite series, polar coordinates, surfaces in three dimensions. Not open to students with credit in MA 16200 . CTL:IMA 1603 Calculus - Long II

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 4.00

Statistics (3 credits)

STAT 50300 - Statistical Methods For Biology

Credit Hours: 3.00. Introductory statistical methods, with emphasis on applications in biology. Topics include descriptive statistics, binomial and normal distributions, confidence interval estimation, hypothesis testing, analysis of variance, introduction to nonparametric testing, linear regression and correlation, goodness-of-fit tests, and contingency tables. Open only to majors related to the life sciences. For statistics majors and

minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100.

Learning Outcomes: 1. Students will be able to identify and choose appropriate ways to graphically and numerically summarize data. 2. Students will be able to use basic statistical methods to perform statistical inference and draw appropriate conclusions. 3. Students will understand the mathematical foundations of statistical inference for random samples so that they can study and utilize additional statistical methods. Credits: 3.00

Electives (3-35 credits)

GPA Requirements

Course Requirements and Notes

Sample 4-Year Plan

Fall 1st Year

BIOL 12100 - Biology I: Diversity, Ecology, And Behavior (UCC: SCI/STS)

Credit Hours: 2.00. Creates a framework for ordering biology by examining the unity and diversity of life on earth with an emphasis on ecology, genetics, population biology, evolution, and behavior.

University Core Curriculum (UCC): (UCC: SCI/STS) Credits: 2.00

BIOL 13500 - First Year Biology Laboratory (UCC: SCI)

Credit Hours: 2.00. Laboratory exercises emphasizing student mastery of basic laboratory skills needed to succeed in the biological sciences; intended for beginning (first-year) biology majors.

University Core Curriculum (UCC): (UCC: SCI) Learning Outcomes: 1. Demonstrate the ability to think and function as a scientist. 2. Demonstrate depth in major. Credits: 2.00

CHM 12901 - General Chemistry With A Biological Focus (UCC: SCI)

Credit Hours: 5.00. An accelerated and comprehensive one-semester general chemistry course that emphasizes principles that are important in biological systems. This course is designed to cover the essential elements of general chemistry traditionally covered in a two semester series. Topics to be covered include: Stoichiometry and chemical equations; atomic theory and structure; periodic properties; electronegativity; ionic and covalent bonding; non-covalent forces; bond energies; Lewis structures; molecular geometry; gases, liquids, and solids; solutions, quantitative equilibria in aqueous solution; acid/base chemistry and buffers; introductory thermodynamics; oxidation-reduction; electrochemical and membrane potential; colligative properties; chemical and enzyme kinetics; nuclear chemistry; coordination chemistry. One year of high school chemistry is required.

University Core Curriculum (UCC): (UCC: SCI) Learning Outcomes: 1. Develop an understanding of universal physical laws as they apply in chemistry. 2. Develop an understanding of the scientific process. 3. Develop the ability to document scientific information and experimental data and to make quantitative/structural measurements and interpret results. Credits: 5.00

MA 16010 - Applied Calculus I (UCC: QR)

Credit Hours: 3.00. Topics include trigonometric and exponential functions; limits and differentiation, rules of differentiation, maxima, minima and optimization; curve sketching, integration, anti-derivatives, fundamental theorem of calculus. Properties of definite integrals and numerical methods. Applications to life, managerial and social sciences. CTL:IMA 1604 Calculus - Short I

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To create functional models and simplify difference quotients, compute limits of functions and apply limit laws. 2. To compute derivatives of elementary functions, including exponential, logarithmic and trigonometric functions, and apply rules of differentiation. 3. To sketch the graph of functions with the help of differentiation techniques, find maxima and minima of

functions; optimization problems. 4. To computes integrals of some elementary functions and apply the Fundamental Theorem of Calculus. 5. Topics to be covered at a level required to perform standard applications related to life sciences, management and technology. Credits: 3.00

MA 16100 - Plane Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 5.00. Introduction to differential and integral calculus of one variable, with applications. Some schools or departments may allow only 4 credit hours toward graduation for this course. Designed for students who have not had at least a one-semester calculus course in high school, with a grade of "A" or "B". Not open to students with credit in MA 16500 . Demonstrated competence in college algebra and trigonometry.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions Credits: 5.00

MA 16500 - Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 4.00. Introduction to differential and integral calculus of one variable, with applications. Conic sections. Designed for students who have had at least a one-semester calculus course in high school, with a grade of "A" or "B", but are not qualified to enter MA 16200 or MA 16600 or the advanced placement courses MA 17300 or the honors calculus course MA 18100. Demonstrated competence in college algebra and trigonometry. CTL:IMA 1602 Calculus - Long I

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems. 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions. Credits: 4.00

16-19 Credits

Spring 1st Year

BIOL 13100 - Biology II: Development, Structure, And Function Of Organisms (UCC: SCI)

Credit Hours: 3.00. Principles of development of plants and animals and the relationship between the structure and function of selected systems of these organisms.

University Core Curriculum (UCC): (UCC: SCI) Credits: 3.00

CHM 25500 - Organic Chemistry For The Life Sciences I

Credit Hours: 3.00. A study of aliphatic and aromatic hydrocarbons and their simple derivatives in terms of (a) structure, bonding, etc.; (b) general syntheses and reactions; and (c) a logical modern rationale for fundamental phenomena as supported by reactivity orders, orientation effects, stereochemistry, and relative rates. Recommended for biology majors.

Learning Outcomes: 1. Gain understanding of the fundamental principles of organic chemistry and to apply those principles to solve problems. 2. Observe the world on a molecular level and to understand how organic chemistry applies to biology and everyday life. 3. Understand at a fundamental level how molecules look and behave. 4. Relate the structure and reactivity of molecules to observable physical/chemical properties. 5. Describe Life Processes in terms of molecular phenomena. Credits: 3.00

CHM 25501 - Organic Chemistry For The Life Sciences Laboratory I

Credit Hours: 1.00. Laboratory experiments to accompany CHM 25500, illustrating methods of separation, instrumental methods of analysis, and the more common techniques and

methods for preparing various types of organic compounds.

Learning Outcomes: 1. Learn through practical experience the isolation, purification, and characterization of organic compounds through processes including liquid-liquid extraction, evaporation, solid-phase chromatography, distillation and infrared spectroscopy. 2. Learn through practical experience the use of simple methods to carry out reactions discussed in organic chemistry lectures and how to isolate and characterize the products. Credits: 1.00

MA 16020 - Applied Calculus II (UCC: QR)

Credit Hours: 3.00. This course covers techniques and applications of integration; infinite series; differentiation and integration of functions of several variables; maxima and minima, optimization; differential equations and initial value problems. CTL:IMA 1605 Calculus - Short II

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Use techniques of integration to find areas between curves and compute volumes of solids of revolution. 2. Analyze the convergence of infinite series and power series, Taylor series expansions. 3. Compute derivatives of functions of several variables and use them to find maxima and minima of functions. 4. Perform multiple iterated integration. 5. Use differential equations for modeling simple real-life situations. 6. Solve first order linear initial value problems and separable equations. 7. Topics to be covered at a level required to perform standard applications related to life sciences, management and technology. Credits: 3.00

MA 16200 - Plane Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 5.00. Continuation of MA 16100 . Vectors in two and three dimensions, techniques of integration, infinite series, conic sections, polar coordinates, surfaces in three dimensions. Some schools or departments may allow only 4 credit hours toward graduation for this course.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 5.00

MA 16600 - Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 4.00. Continuation of MA 16500 . Vectors in two and three dimensions. Techniques of integration, infinite series, polar coordinates, surfaces in three dimensions. Not open to students with credit in MA 16200 . CTL:IMA 1603 Calculus - Long II

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 4.00

16-20 Credits

Fall 2nd Year

COM 21700 - Science Writing And Presentation (UCC: OC)

Credit Hours: 3.00. Students learn to effectively communicate scientific and technical information both verbally and in writing to a variety of audiences.

University Core Curriculum (UCC): (UCC: OC)
Learning Outcomes: Will update at a later date.
Credits: 3.00

BIOL 23100 - Biology III: Cell Structure And Function

Credit Hours: 3.00. An introduction to modern cell biology through an examination of the physical and chemical properties that lead to an understanding of the molecular basis for cell function.

Learning Outcomes: 1. Students demonstrate subject-matter competency, including the mastery of biological theories. 2. Students demonstrate skills in critical thinking. These skills include understanding scientific methods, solving biology-related problems, interpreting and analyzing primary literature in biology, and interpreting data in a meaningful way. 3. Students will understand how biochemistry contributes to improvements in human health, industry, and broader scientific understanding. 4. Students will be familiar with the biogenesis, structure, and chemistry of the basic types of macromolecules important in cells: nucleic acids, proteins, and membranes, and with the organic and inorganic molecules important in cellular metabolism. 5. Students will understand the role of macromolecules in cellular processes such as DNA replication, RNA transcription, protein translation, and metabolism. 6. Students will understand the principles of how energy is obtained, stored and used in biological processes. 7. Graduates will understand the chemical and physical principles that govern biochemical and physiological processes. 8. Students will understand the role of evolution of creating and modifying the macromolecular components of the cell, and in creating biological complexity and variability. 9. Graduates will understand how chemical and biochemical processes relate to biological function at the molecular, cellular, organismal, and higher levels. 10. Demonstrate proficiency with professional skills by practicing biologists including experimental design and execution, biological techniques, data collection and documentation, communication of results, and responsible conduct of science. 11. Students who complete the CMD BS program will have a broad understanding of the compositions and formations of cellular structures, the molecular basis underlying cellular processes, and the links between diseases and aberrant gene functions. Credits: 3.00

BIOL 23200 - Laboratory In Biology III: Cell Structure And Function

Credit Hours: 2.00. Laboratory exercises designed to illustrate the properties, functions, and growth of prokaryotic and eukaryotic cells and to introduce the student to modern experimental methods used to study cells and their separated components.

Credits: 2.00

CHM 25600 - Organic Chemistry For The Life Sciences II

Credit Hours: 3.00. A continuation of CHM 25500 with various functional groups such as the carboxyl, amino, etc., and including such polyfunctional natural products as carbohydrates and peptides.

Learning Outcomes: 1. Use theory to understand/predict experimental observations. 2. Demonstrate an understanding of the physical properties and a molecular understanding of chemical reactivity and materials. 3. Plan chemical transformations. 4. Recognize and understand chemical instrumentation and spectroscopy. Credits: 3.00

CHM 25601 - Organic Chemistry For The Life Sciences Laboratory II

Credit Hours: 1.00. A continuation of CHM 25501. Experiments are designed to illustrate principles discussed in CHM 25600.

Learning Outcomes: 1. Learn through practical experience the isolation, purification, and characterization of organic compounds through processes including liquid-liquid extraction, evaporation, solid-phase chromatography, distillation and infrared spectroscopy. 2. Learn through practical experience the use of simple methods to carry out reactions discussed in organic chemistry lectures and how to isolate and characterize the products. Credits: 1.00

15-16 Credits

Spring 2nd Year

BIOL 24100 - Biology IV: Genetics And Molecular Biology

Credit Hours: 3.00. An introduction to the principles of classical genetics and to molecular genetics. Topics covered are transmission of the genetic material (both in eukaryotes and prokaryotes); changes in the genetic material, structure, and function of the genetic material; and the manipulation of genetic material (recombinant DNA technology).

Learning Outcomes: 1. Students demonstrate subject-matter competency, including the mastery of biological theories. 2. Students will understand the role of macromolecules in cellular processes such as DNA replication, RNA transcription, protein translation, and metabolism. 3. Students will understand the role of evolution of creating and modifying the macromolecular components of the cell, and in creating biological complexity and variability. 4. Graduates will understand how chemical and biochemical processes relate to biological function at the molecular, cellular, organismal, and higher level. 5. Students who complete the CMB BS program will have a broad understanding of the compositions and formations of cellular structures, the molecular basis underlying cellular processes, and the links between diseases and aberrant gene functions. 6. Students who complete the CMB BS program will have a broad understanding of the principles governing the development of multi-cellular animals and plants. 7. Students will exhibit proficiency in population and quantitative genetics. 8. Students will demonstrate an understanding of concepts and theories of genetics. 9. Students will demonstrate an understanding of laboratory skills used in genetics. 10. Students will exhibit proficiency in the physiology, biochemistry, and genetics of bacteria including diversity, metabolism, and gene expression regulation as well as key metabolic control mechanisms. Credits: 3.00

BIOL 24200 - Laboratory In Biology IV: Genetics And Molecular Biology

Credit Hours: 2.00. Experiments in classical and modern genetics and exercises to acquaint the students with basic techniques in molecular biology.

Credits: 2.00

BIOL 28600 - Introduction To Ecology And Evolution

Credit Hours: 2.00. Evolutionary processes and ecological principles associated with individuals, populations, communities, and ecosystems. Topics include genetic drift, natural selection, adaptation, life tables, population dynamics, competition, predation, biodiversity, and ecological stability, with emphasis on natural systems.

Learning Outcomes: 1. Demonstrate subject-matter competency, including the mastery of biological theories. 2. Demonstrate proficiency with professional skills needed by practicing biologists, including experimental design and execution, biological techniques, data collection and documentation, communication of results, and responsible conduct of science. 3. Demonstrate the ability to discuss ethical issues in the application of biological sciences, and the impact of science on society. 4. Demonstrate

skills in critical thinking. These skills include understanding scientific methods, solving biology-related problems, interpreting and analyzing primary literature in biology, and interpreting data in a meaningful way. 5. Demonstrate knowledge of the path leading to specific careers in biology. 6. Understand how biochemistry contributes to improvements in human health, industry, and broader scientific understanding. 7. Understand the principles of how energy is obtained, stored and used in biological processes.8. Understand the chemical and physical principles that govern biochemical and physiological processes.9. Understand the role of evolution of creating and modifying the macromolecular components of the cell, and in creating biological complexity and variability.10. Understand how chemical and biochemical processes relate to biological function at the molecular, cellular, organismal, and higher levels.11. Demonstrate subject-matter competency, including the mastery of biological theories.12. Demonstrate proficiency with professional skills needed by practicing biologists, including experimental design and execution, biological techniques, data collection and documentation, communication of results, and responsible conduct of science.13. Demonstrate the ability to discuss ethical issues in the application of biological sciences, and the impact of science on society.14. Demonstrate skills in critical thinking. These skills include understanding scientific methods, solving biology-related problems, interpreting and analyzing primary literature in biology, and interpreting data in a meaningful way.15. Demonstrate knowledge of the path leading to specific careers in biology.16. Demonstrate subject-matter competency, including the mastery of biological theories.17. Demonstrate proficiency with professional skills needed by practicing biologists, including experimental design and execution, biological techniques, data collection and documentation, communication of results, and responsible conduct of science.18. Demonstrate the ability to discuss ethical issues in the application of biological sciences, and the impact of science on society.19. Demonstrate skills in critical thinking. These skills include understanding scientific methods, solving biology-related problems, interpreting and analyzing primary literature in biology, and interpreting data in a meaningful way.20. Demonstrate knowledge of the path leading to specific careers in biology.21. Understand ways in which organisms interact ecologically with each other and their environment. 22. Understand how evolutionary forces influence organisms to produce adaptations. 23. Acquire knowledge of the ways in which animals communicate with each other. 24. Exhibit proficiency in population and community ecology, animal behavior, and evolutionary mechanisms. 25. Exhibit proficiency in population and quantitative genetics. 26. Be familiar with taxonomic and phylogenetic relationships among organisms. 27. Extend basic ecological principles to species and ecosystem conservation. 28. Experience working with organisms in natural settings. 29. Learn to efficiently communicate scientific information or results from biological investigations using both oral and written methods. 30. Use and understand the scientific method, including how to generate hypotheses and predictions, develop an experimental design. Credits: 2.00

CHM 33900 - Biochemistry: A Molecular Approach

Credit Hours: 3.00. This is a comprehensive one-semester biochemistry course that emphasizes molecules and molecular reaction mechanisms, building upon the principles conveyed in general chemistry and organic chemistry. This course is

designed to cover the essential elements of biochemistry traditionally covered in a two semester series. Topics to be covered include: Amino acids, peptides and proteins, molecular models and structure-function relationships, enzymes, enzyme kinetics and enzyme mechanisms, carbohydrates and carbohydrate metabolism, aerobic metabolism, lipids and membranes, lipid metabolism, nitrogen metabolism and integration and regulation of metabolism. Special emphasis will be placed on connections between biochemical principles and the fields of medicine, human health and disease, nutrition and biotechnology. This course should serve as excellent preparation for higher-level biochemistry courses as well as standardized pre-health professional exams. CHM 33900 was designed as the 4lh semester of the 1-2-1 competency-based curriculum transformation in chemistry as it applies to pre-health professional and life science students at Purdue. However, this course is open to other students who meet the prerequisites.

Learning Outcomes: 1. Demonstrate the ability to think as a scientist. 2. Demonstrate the ability to communicate well in writing. 3. Apply knowledge of basic principles of chemistry and their applications to the understanding of biological systems. 4. Employ knowledge of the general components of prokaryotic and eukaryotic cells, such as molecular, microscopic, macroscopic, and three-dimensional structure, to explain how different components contribute to cellular and organismal function. 5. Demonstrate knowledge of how biomolecules contribute to the structure and function of cells.. 6. Demonstrate knowledge of molecular interactions and their importance in biological systems. 7. Demonstrate knowledge of the principles of chemical thermodynamics and kinetics that drive biological processes in the context of space (i.e., compartmentation) and time: enzyme-catalyzed reactions and metabolic pathways, regulation, integration, and the chemical logic of sequential reaction steps. 8. Recognize major types of functional groups and chemical reactions that occur in biological systems. 9. Apply understanding of the concepts of chemical reactivity and chemical kinetics to predict biochemical processes. 10. Apply knowledge of the chemistry of covalent carbon compounds to explain the molecular mechanisms of biochemical enzyme reactions. 11. Demonstrate knowledge of thermodynamic criteria for spontaneity of physical processes and chemical reactions and the relationship of thermodynamics to chemical equilibrium as they apply to biological systems. 12. Explain maintenance of homeostasis in living organisms by using principles of mass transport, energy balance, and feedback and control systems. Credits: 3.00

CHM 33901 - Biochemistry Laboratory

Credit Hours: 1.00. CHM 33901 is a laboratory course based on two modules from the Undergraduate Research Inspired Experimental Chemistry Alternatives (URIECA) developed at MIT that are designed to introduce students to cutting-edge research topics in biochemistry. The course provides students with a research-inspired laboratory experience that introduces standard biochemical techniques in the context of investigating a current research topic, for example, acquired resistance to cancer drugs. Techniques include protein expression, purification, and gel analysis, PCR, site-directed mutagenesis, kinase activity assays, and protein structure viewing. CHM 33901 was designed as the 4th semester of the 1-2-1 competency-based curriculum transformation in chemistry as it applies to pre-health professional and life science students at Purdue. However, the course is open to other students who meet the prerequisites.

Learning Outcomes: 1. Demonstrate the ability to think and function as a scientist. 2. Develop an understanding of the scientific process. 3. Develop the ability to document scientific information and experimental data. 4. Demonstrate understanding of the process of scientific inquiry, and explain how scientific knowledge is discovered and validated. 5. Develop observational and interpretive skills through hands-on laboratory or field. 6. Demonstrate ability to measure with precision, accuracy, and safety. 7. Operate basic biochemistry laboratory instrumentation for scientific measurement. 8. Articulate scientific questions and hypotheses, design experiments, acquire data, perform data analysis, and

present results in project-based research. 9. Apply knowledge of basic principles of chemistry and their applications to the understanding of biological systems. 10. Make quantitative/structural measurements and interpret results. 11. Demonstrate the ability to work on a team. 12. Demonstrate the ability to communicate well, both orally and in writing. Credits: 1.00

14-16 Credits

Fall 3rd Year

PHYS 17200 - Modern Mechanics (UCC: SCI)

Credit Hours: 4.00. Introductory calculus-based physics course using fundamental interactions between atoms to describe Newtonian mechanics, conservation laws, energy quantization, entropy, the kinetic theory of gases, and related topics in mechanics and thermodynamics. Emphasis is on using only a few fundamental principles to describe physical phenomena extending from nuclei to galaxies. 3-D graphical simulations and numerical problem solving by computer are employed by the student from the very beginning. CTL:IPS 1753 Calculus-based Physics I

University Core Curriculum (UCC): (UCC: SCI)
Learning Outcomes: 1. Understand and describe a wide range of physical phenomena in mechanics and thermodynamics using only a few fundamental principles of physics. 2. Learn a unified approach that relates microscopic behavior to macroscopic behavior. 3. Model natural phenomena quantitatively. 4. Apply all this to a range of topics related to mechanics and thermodynamics. Credits: 4.00

PHYS 23300 - Physics For Life Sciences I

Credit Hours: 4.00. Physics For Life Sciences I builds upon prerequisite knowledge in college level biology, chemistry, and mathematics to present introductory physics that will be useful for applying physical principles, insights, and problem solving approaches for students with life science majors. Content will feature the Newtonian framework with emphasis on friction, drag and viscosity, random motion and diffusion, fluid flow, the Coulomb force, molecular forces and bonding, momentum, conservation of energy, entropy, and the first and second laws of thermodynamics.

Learning Outcomes: 1. Understand how motion in realistic biological systems (e.g. cells, biomolecules) is governed by forces. 2. Understand how molecular binding is described in terms of energy. 3. Understand how diffusion is governed on a microscopic level. 4. Have insight into how the first and second laws of thermodynamics constrain basic processes in living systems. Credits: 4.00

12-16 Credits

Spring 3rd Year

PHYS 24100 - Electricity And Optics (UCC: SCI)

Credit Hours: 3.00. Electrostatics, current electricity, electromagnetism, magnetic properties of matter. Electromagnetic waves, geometrical and physical optics.

University Core Curriculum (UCC): (UCC: SCI)
Credits: 3.00

PHYS 27200 - Electric And Magnetic Interactions (UCC: SCI)

Credit Hours: 4.00. Calculus-based physics course using concepts of electric and magnetic fields and an atomic description of matter to describe polarization, fields produced by charge distributions, potential, electrical circuits, magnetic forces, induction, and related topics, leading to Maxwell's equations and electromagnetic radiation and an introduction to waves and interference. 3-D graphical simulations and numerical problem solving by computer are employed throughout.

University Core Curriculum (UCC): (UCC: SCI)
Learning Outcomes: 1. Understand and describe a wide range of physical phenomena in electricity and magnetism using only a few fundamental principles of physics. 2. Learn a unified approach that relates microscopic behavior to macroscopic behavior. 3. Model natural phenomena quantitatively. 4. Apply all this to a range of topics related to electricity and magnetism. Credits: 4.00

PHYS 23400 - Physics For Life Sciences II

Credit Hours: 4.00. Physics For Life Sciences II builds upon prerequisite knowledge in college level biology, chemistry, and mathematics, as well as on Physics For Life Sciences I, to develop an understanding of how energy, entropy, enthalpy, and Boltzmann distributions affect the dynamics of living systems, of how electric fields and potentials are applied to fluids and membranes, and how the physics of harmonic oscillators, waves, sound, optics, photons, and quantized states are relevant to biological systems and the tools used for their study.

Learning Outcomes: 1. Understand the connection between microscopic phenomena and macroscopic consequences in terms of energy, entropy, and the laws of thermodynamics for biological systems. 2. Apply simple electrostatic principles to membrane potentials and other biological examples. 3. Understand how wave phenomena and quantized states are important for characterizing biomolecules. Credits: 4.00

14-15 Credits

Fall 4th Year

STAT 50300 - Statistical Methods For Biology

Credit Hours: 3.00. Introductory statistical methods, with emphasis on applications in biology. Topics include descriptive statistics, binomial and normal distributions, confidence interval estimation, hypothesis testing, analysis of variance, introduction to nonparametric testing, linear regression and correlation, goodness-of-fit tests, and contingency tables. Open only to majors related to the life sciences. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100.

Learning Outcomes: 1. Students will be able to identify and choose appropriate ways to graphically and numerically summarize data. 2. Students will be able to use basic statistical methods to perform statistical inference and draw appropriate conclusions. 3. Students will understand the mathematical foundations of statistical inference for random samples so that they can study and utilize additional statistical methods. Credits: 3.00

13 Credits

Spring 4th Year

BIOL 51600 - Molecular Biology Of Cancer

Credit Hours: 3.00. A detailed course examining the molecular mechanisms controlling the growth of animal cells. Emphasis will be placed on current experimental approaches to defining the molecular basis of growth regulation in developing systems and the uncontrolled proliferation of cells in metabolic disorders, such as cancer.

Credits: 3.00

BIOL 55101 - Theory Of Molecular Methods

Credit Hours: 3.00. This course will introduce upper-level undergraduate students and graduate students to the theory and practice of many commonly used molecular biology methods. Emphasis will be placed on understanding the theoretical basis for these techniques, their utility in various circumstances, and their limitations. Although taught as a lecture, students should be able to take this knowledge back to the laboratory to help them in their research efforts. The course will be as close as possible to a laboratory experience without being in an actual laboratory setting. This course is designed to prepare students for other in-depth scientific courses, for graduate rotations, and for future laboratory work. Exams will be experimental in nature (e.g., design an experiment to do something or in this type of situation, which technique/vector/etc. would best be used, and why). Permission of instructor required.

Learning Outcomes: 1. Have knowledge about the uses and limitations of various molecular biology techniques. 2. Understand the techniques and how to choose the best technique for a given circumstance. 3. Understand how to interpret the experimental results emanating from each technique. Credits: 3.00

BIOL 51606 - Pathways In Human Health And Disease

Credit Hours: 3.00. This course is intended for both upper-level undergraduate and graduate students. It will cover major

intracellular signaling pathways in eukaryotes and their roles in human disease, with an emphasis on cancer but also touching on other major modern diseases such as COVID-19. We will explore avenues being pursued to target signaling mechanisms for therapeutic benefit. Topics include G protein-coupled receptors, receptor tyrosine kinases, nuclear hormone receptors, protein kinases and phosphatases, mTOR, the Wnt/β-catenin pathway, cell cycle control, DNA damage checkpoint control, regulated proteolysis, and programmed cell death. The course will be taught from current primary literature using a textbook as a background resource. Students will learn how to read and interpret scientific data through regular lectures, extramural seminars, in-class presentations, and take-home assignments.

Learning Outcomes: 1. Identify common molecular mechanisms in major signal transduction pathways. 2. Understand methods commonly used to analyze signal transduction processes. 3. Appreciate how protein domains within signaling proteins impart selectivity by building up signaling pathways via protein protein-interactions. 4. Evaluate and critique data in the scientific literature or in lectures in the signal transduction/cell cycle fields. 5. Exhibit improved oral and written communication skills in the area of signal transduction research. Credits: 3.00

12-13 Credits

Chemical Biology & Biochemistry, BS

About the Program

Degree Requirements

Departmental/Program Major Courses (64-65 credits)

Biology Core (19 credits)

BIOL 12100 - Biology I: Diversity, Ecology, And Behavior (UCC: SCI/STS)

Credit Hours: 2.00. Creates a framework for ordering biology by examining the unity and diversity of life on earth with an emphasis on ecology, genetics, population biology, evolution, and behavior.

University Core Curriculum (UCC): (UCC: SCI/STS) Credits: 2.00

BIOL 13100 - Biology II: Development, Structure, And Function Of Organisms (UCC: SCI)

Credit Hours: 3.00. Principles of development of plants and animals and the relationship between the structure and function of selected systems of these organisms.

University Core Curriculum (UCC): (UCC: SCI) Credits: 3.00

BIOL 13500 - First Year Biology Laboratory (UCC: SCI)

Credit Hours: 2.00. Laboratory exercises emphasizing student mastery of basic laboratory skills needed to succeed in the biological sciences; intended for beginning (first-year) biology majors.

University Core Curriculum (UCC): (UCC: SCI) Learning Outcomes: 1. Demonstrate the ability to think and function as a scientist. 2. Demonstrate depth in major. Credits: 2.00

BIOL 23100 - Biology III: Cell Structure And Function

Credit Hours: 3.00. An introduction to modern cell biology through an examination of the physical and chemical properties that lead to an understanding of the molecular basis for cell function.

Learning Outcomes: 1. Students demonstrate subject-matter competency, including the mastery of biological theories. 2. Students demonstrate skills in critical thinking. These skills include understanding scientific methods, solving biology-related problems, interpreting and analyzing primary literature in biology, and interpreting data in a meaningful way. 3. Students will understand how biochemistry contributes to improvements in human health, industry, and broader scientific understanding. 4. Students will be familiar with the biogenesis, structure, and chemistry of the basic types of

macromolecules important in cells: nucleic acids, proteins, and membranes, and with the organic and inorganic molecules important in cellular metabolism. 5. Students will understand the role of macromolecules in cellular processes such as DNA replication, RNA transcription, protein translation, and metabolism. 6. Students will understand the principles of how energy is obtained, stored and used in biological processes. 7. Graduates will understand the chemical and physical principles that govern biochemical and physiological processes. 8. Students will understand the role of evolution of creating and modifying the macromolecular components of the cell, and in creating biological complexity and variability. 9. Graduates will understand how chemical and biochemical processes relate to biological function at the molecular, cellular, organismal, and higher levels. 10. Demonstrate proficiency with professional skills by practicing biologists including experimental design and execution, biological techniques, data collection and documentation, communication of results, and responsible conduct of science. 11. Students who complete the CMD BS program will have a broad understanding of the compositions and formations of cellular structures, the molecular basis underlying cellular processes, and the links between diseases and aberrant gene functions. Credits: 3.00

BIOL 23200 - Laboratory In Biology III: Cell Structure And Function

Credit Hours: 2.00. Laboratory exercises designed to illustrate the properties, functions, and growth of prokaryotic and eukaryotic cells and to introduce the student to modern experimental methods used to study cells and their separated components.

Credits: 2.00

BIOL 24100 - Biology IV: Genetics And Molecular Biology

Credit Hours: 3.00. An introduction to the principles of classical genetics and to molecular genetics. Topics covered are transmission of the genetic material (both in eukaryotes and prokaryotes); changes in the genetic material, structure, and function of the genetic material; and the manipulation of genetic material (recombinant DNA technology).

Learning Outcomes: 1. Students demonstrate subject-matter competency, including the mastery of biological theories. 2. Students will understand the role of macromolecules in cellular processes such as DNA replication, RNA transcription, protein translation, and metabolism. 3. Students will understand the role of evolution of creating and modifying the macromolecular components of the cell, and in creating biological complexity and variability. 4. Graduates will understand how chemical and biochemical processes relate to biological function at the molecular, cellular, organismal, and higher level. 5. Students who complete the CMB BS program will have a broad understanding of the compositions and formations of cellular structures, the molecular basis underlying cellular processes, and the links between diseases and aberrant gene functions. 6. Students who complete the CMB BS program will have a broad understanding of the principles governing the development of multi-cellular animals and plants. 7. Students will exhibit proficiency in population and quantitative genetics. 8. Students will demonstrate an understanding of concepts and theories of genetics. 9. Students will demonstrate an understanding of laboratory skills used in genetics. 10. Students will exhibit proficiency in the physiology, biochemistry, and genetics of bacteria including diversity, metabolism, and gene expression regulation as well as key metabolic control mechanisms. Credits: 3.00

BIOL 24200 - Laboratory In Biology IV: Genetics And Molecular Biology

Credit Hours: 2.00. Experiments in classical and modern

genetics and exercises to acquaint the students with basic techniques in molecular biology.

Credits: 2.00

BIOL 28600 - Introduction To Ecology And Evolution

Credit Hours: 2.00. Evolutionary processes and ecological principles associated with individuals, populations, communities, and ecosystems. Topics include genetic drift, natural selection, adaptation, life tables, population dynamics, competition, predation, biodiversity, and ecological stability, with emphasis on natural systems.

Learning Outcomes: 1. Demonstrate subject-matter competency, including the mastery of biological theories. 2. Demonstrate proficiency with professional skills needed by practicing biologists, including experimental design and execution, biological techniques, data collection and documentation, communication of results, and responsible conduct of science. 3. Demonstrate the ability to discuss ethical issues in the application of biological sciences, and the impact of science on society. 4. Demonstrate skills in critical thinking. These skills include understanding scientific methods, solving biology-related problems, interpreting and analyzing primary literature in biology, and interpreting data in a meaningful way. 5. Demonstrate knowledge of the path leading to specific careers in biology. 6. Understand how biochemistry contributes to improvements in human health, industry, and broader scientific understanding. 7. Understand the principles of how energy is obtained, stored and used in biological processes.8. Understand the chemical and physical principles that govern biochemical and physiological processes.9. Understand the role of evolution of creating and modifying the macromolecular components of the cell, and in creating biological complexity and variability.10. Understand how chemical and biochemical processes relate to biological function at the molecular, cellular, organismal, and higher levels.11. Demonstrate subject-matter competency, including the mastery of biological theories.12. Demonstrate proficiency with professional skills needed by practicing biologists, including experimental design and execution, biological techniques, data collection and documentation, communication of results, and responsible conduct of science.13. Demonstrate the ability to discuss ethical issues in the application of biological sciences, and the impact of science on society.14. Demonstrate skills in critical thinking. These skills include understanding scientific methods, solving biology-related problems, interpreting and analyzing primary literature in biology, and interpreting data in a meaningful way.15. Demonstrate knowledge of the path leading to specific careers in biology.16. Demonstrate subject-matter competency, including the mastery of biological theories.17. Demonstrate proficiency with professional skills needed by practicing biologists, including experimental design and execution, biological techniques, data collection and documentation, communication of results, and responsible conduct of science.18. Demonstrate the ability to discuss ethical issues in the application of biological sciences, and the impact of science on society.19. Demonstrate skills in critical thinking. These skills include understanding scientific methods, solving biology-related problems, interpreting and analyzing primary literature in biology, and interpreting data in a meaningful way.20. Demonstrate knowledge of the path leading to specific careers in biology.21. Understand ways in which organisms interact ecologically with each other and their environment. 22. Understand how evolutionary forces influence organisms to produce adaptations. 23. Acquire knowledge of the ways in which animals communicate with each other. 24. Exhibit proficiency in population

and community ecology, animal behavior, and evolutionary mechanisms. 25. Exhibit proficiency in population and quantitative genetics. 26. Be familiar with taxonomic and phylogenetic relationships among organisms. 27. Extend basic ecological principles to species and ecosystem conservation. 28. Experience working with organisms in natural settings. 29. Learn to efficiently communicate scientific information or results from biological investigations using both oral and written methods. 30. Use and understand the scientific method, including how to generate hypotheses and predictions, develop an experimental design. Credits: 2.00

BIOL 14503 - First Year Biology Lab: Disease Ecology-Honors

Credit Hours: 2.00. The course will engage students in authentic research and acquiring the necessary skills and concepts to be a successful biology major. Our research topic will be disease ecology in freshwater systems. Disease ecology is a growing field investigating the causes and effects of pathogen transmission and epidemics, primarily in natural populations. We will begin with a series of skill and knowledge-building laboratories, and then transition into student-led research projects that culminate in a presentation of the results in a poster session. Students will learn the fundamentals of disease ecology, basic laboratory techniques, how to perform scientific experiments, and gain experience communicating findings to other scientists and the public.

Learning Outcomes: 1. Perform basic laboratory techniques needed to succeed as a Biology major. 2. Formulate a testable question and hypothesis. 3. Design and conduct a laboratory study to address a research question. 4. Read and critique scientific journal articles. 5. Communicate scientific ideas and results through oral and written formats. Credits: 2.00

BIOL 14505 - First Year Biology Lab: Phages To Folds-Honors

Credit Hours: 2.00. Students will learn how to use bioinformatics to study a gene sequence of their choice from the local SEA-PHAGES program. Students will then use molecular biology and biophysical techniques to characterize their gene product. The goal of each project will be to gain insight into the 3-dimensional fold of each of these mysterious novel phage genes. Students will work in teams but will have their own individual project such that each student will learn the necessary skills to perform scientific experiments starting from the bioinformatics to cloning to purification to structural characterization to communicating their findings to others.

Learning Outcomes: 1. Acquire the fundamental skills and concepts necessary to be successful as a biology major and as a research scientist. 2. Learn how to perform basic laboratory techniques. 3. Learn to work effectively as a team. 4. Design and execute experiments. 5. Evaluate and interpret data critically, read and discuss research articles, and to disseminate their research in written and oral formats. Credits: 2.00

BIOL 14504 - First Year Lab: Diet Disease And Immune System-Honors

Credit Hours: 2.00. We are what we eat! The food we put into our bodies not only gives us the nutrients, vitamins and minerals we need to live, but it can also influence other ways in which our bodies function, right down to how well our immune system works. The immune system plays a critical role in defending our body from infection, but can also contribute to autoimmune disease when the immune response becomes dysregulated. Importantly, autoimmune disease is currently skyrocketing in countries that consume a "Western Diet" (i.e., high salt, high sugar, low fiber), suggesting that these dietary components, or lack thereof, may contribute to dysregulation of the immune response. CD4+ T cells, a kind of immune cell, play an important role in the immune system as they control the balance between protective immunity and autoimmune disease. Recent evidence indicates a strong correlation between "Western Diet" and dysfunction of this important immune cell type. Therefore, our goal is to examine the effects of these dietary components on CD4+ T cell function and how this might contribute to autoimmune disease. Students will work in teams and cover a distinct subset of microbial or dietary components. As such, each student will learn the necessary skills to perform scientific experiments starting from the literature search, experimental design, carrying out controlled experiments, interpreting results and conveying the results to the greater scientific community.

Learning Outcomes: 1. Learn how to work in a real laboratory setting and acquire useful laboratory skills while learning how to develop a hypothesis, design experiments to test these hypotheses. 2. Learn how to present their findings to their peers and others in a written and oral format. 3. Develop skills to be able to

read scientific literature in their topic area and discuss these findings with their peers. Credits: 2.00

Chemistry Core (13 credits)

General Chemistry (5 credits)

CHM 12901 - General Chemistry With A Biological Focus (UCC: SCI)

Credit Hours: 5.00. An accelerated and comprehensive one-semester general chemistry course that emphasizes principles that are important in biological systems. This course is designed to cover the essential elements of general chemistry traditionally covered in a two semester series. Topics to be covered include: Stoichiometry and chemical equations; atomic theory and structure; periodic properties; electronegativity; ionic and covalent bonding; non-covalent forces; bond energies; Lewis structures; molecular geometry; gases, liquids, and solids; solutions, quantitative equilibria in aqueous solution; acid/base chemistry and buffers; introductory thermodynamics; oxidation-reduction; electrochemical and membrane potential; colligative properties; chemical and enzyme kinetics; nuclear chemistry; coordination chemistry. One year of high school chemistry is required.

University Core Curriculum (UCC): (UCC: SCI)
Learning Outcomes: 1. Develop an understanding of universal physical laws as they apply in chemistry. 2. Develop an understanding of the scientific process. 3. Develop the ability to document scientific information and experimental data and to make quantitative/structural measurements and interpret results. Credits: 5.00

Organic Chemistry (8 credits)

CHM 25500 - Organic Chemistry For The Life Sciences I

Credit Hours: 3.00. A study of aliphatic and aromatic hydrocarbons and their simple derivatives in terms of (a) structure, bonding, etc.; (b) general syntheses and reactions; and (c) a logical modern rationale for fundamental phenomena as supported by reactivity orders, orientation effects, stereochemistry, and relative rates. Recommended for biology majors.

Learning Outcomes: 1. Gain understanding of the fundamental principles of organic chemistry and to apply those principles to solve problems. 2. Observe the world on a molecular level and to understand how organic chemistry applies to biology and everyday life. 3. Understand at a fundamental level how molecules look and behave. 4. Relate the structure and reactivity of molecules to observable physical/chemical properties. 5. Describe Life Processes in terms of molecular phenomena. Credits: 3.00

CHM 25501 - Organic Chemistry For The Life Sciences Laboratory I

Credit Hours: 1.00. Laboratory experiments to accompany CHM 25500, illustrating methods of separation, instrumental methods of analysis, and the more common techniques and methods for preparing various types of organic compounds.

Learning Outcomes: 1. Learn through practical experience the isolation, purification, and characterization of organic compounds through processes including liquid-liquid extraction, evaporation, solid-phase chromatography, distillation and infrared spectroscopy. 2. Learn through practical experience the use of simple methods to carry out reactions discussed in organic chemistry lectures and how to isolate and characterize the products. Credits: 1.00

CHM 25600 - Organic Chemistry For The Life Sciences II

Credit Hours: 3.00. A continuation of CHM 25500 with various functional groups such as the carboxyl, amino, etc., and including such polyfunctional natural products as carbohydrates and peptides.

Learning Outcomes: 1. Use theory to understand/predict experimental observations. 2. Demonstrate an understanding of the physical properties and a molecular understanding of chemical reactivity and materials. 3. Plan chemical transformations. 4. Recognize and understand chemical instrumentation and spectroscopy. Credits: 3.00

CHM 25601 - Organic Chemistry For The Life Sciences Laboratory II

Credit Hours: 1.00. A continuation of CHM 25501. Experiments are designed to illustrate principles discussed in CHM 25600.

Learning Outcomes: 1. Learn through practical experience the isolation, purification, and characterization of organic compounds through processes including liquid-liquid extraction, evaporation, solid-phase chromatography, distillation and infrared spectroscopy. 2. Learn through practical experience the use of simple methods to carry out reactions discussed in organic chemistry lectures and how to isolate and characterize the products. Credits: 1.00

Upper-Level Biology and Chemistry Coursework (32-33 credits)

Intermediate Biology Selective (3 credits)

BIOL 41500 - Introduction To Molecular Biology

Credit Hours: 3.00. An introduction to modern molecular biology techniques and how they are used to address current topics in gene regulation. Emphasis will be placed on experimental procedures and model systems, such as site-directed mutagenesis of isolated genes and their subsequent introduction into prokaryotic and eukaryotic cells. Topics will address the molecular control mechanisms associated with DNA replication, RNA transcription, RNA processing, and differential gene expression.

Credits: 3.00

Required coursework (18 credits)

BIOL 42000 - Eukaryotic Cell Biology

Credit Hours: 3.00. Composition, structure, regulation, and growth of eukaryotic cells.

Learning Outcomes: 1. Students demonstrate subject-matter competency, including the mastery of biological theories. 2. Students demonstrate proficiency with professional skills needed by practicing biologists, including experimental design and execution, biological techniques, data collections and documentation, communication of results, and responsible conduct of science. 3. Students demonstrate the ability to discuss ethical issues in the application of biological sciences, and the impact of science on society. 4. Students demonstrate skills in critical thinking. These skills include understanding scientific methods, solving biology-related problems, interpreting and analyzing primary literature in biology, and interpreting data in a meaningful way. 5. Students demonstrate knowledge of the path leading to specific careers in biology. 6. Students will understand how biochemistry contributes to improvements in human health, industry, and broader scientific understanding. 7. Macromolecules: Students will be familiar with the biogenesis, structure, and chemistry of the basic types of macromolecules important in cells: nucleic acids, proteins, and membranes, and with the organic and inorganic molecules important in cellular metabolism. 8. Cellular Processes: Students will understand the role of macromolecules in cellular processes such as DNA replication, RNA transcription, protein translation, and metabolism. 9. Scope: graduates will understand the chemical and physical principles that govern biochemical and physiological process. 10. Scope: graduates will understand how chemical and biochemical processes relate to biological function at the molecular, cellular, organismal, and higher levels. 11. Students who complete the CMD BS program will have a broad understanding of the compositions and formations of cellular structures, the molecular basis underlying cellular processes, and the links between diseases and aberrant gene functions. Credits: 3.00

CHM 37200 - Physical Chemistry

Credit Hours: 4.00. Principles of physical chemistry with emphasis on chemical thermodynamics and kinetics, illustrated examples from the biological sciences. Intended primarily for

students in the life sciences. Other topics include physical and chemical equilibria, quantum mechanics, and spectroscopy. Learning Outcomes: 1. Use theory to understand/predict experimental observations. 2. Demonstrate an understanding of the physical properties and a molecular understanding of chemical reactivity and materials. 3. Understand the connections of different courses/subdisciplines in chemistry. 4. Understand the connections between chemistry and current events, everyday occurrences and other scientific disciplines. Credits: 4.00

CHM 33900 - Biochemistry: A Molecular Approach

Credit Hours: 3.00. This is a comprehensive one-semester biochemistry course that emphasizes molecules and molecular reaction mechanisms, building upon the principles conveyed in general chemistry and organic chemistry. This course is designed to cover the essential elements of biochemistry traditionally covered in a two semester series. Topics to be covered include: Amino acids, peptides and proteins, molecular models and structure-function relationships, enzymes, enzyme kinetics and enzyme mechanisms, carbohydrates and carbohydrate metabolism, aerobic metabolism, lipids and membranes, lipid metabolism, nitrogen metabolism and integration and regulation of metabolism. Special emphasis will be placed on connections between biochemical principles and the fields of medicine, human health and disease, nutrition and biotechnology. This course should serve as excellent preparation for higher-level biochemistry courses as well as standardized pre-health professional exams. CHM 33900 was designed as the 4lh semester of the 1-2-1 competency-based curriculum transformation in chemistry as it applies to pre-health professional and life science students at Purdue. However, this course is open to other students who meet the prerequisites. Learning Outcomes: 1. Demonstrate the ability to think as a scientist. 2. Demonstrate the ability to communicate well in writing. 3. Apply knowledge of basic principles of chemistry and their applications to the understanding of biological systems. 4. Employ knowledge of the general components of prokaryotic and eukaryotic cells, such as molecular, microscopic, macroscopic, and three-dimensional structure, to explain how different components contribute to cellular and organismal function. 5. Demonstrate knowledge of how biomolecules contribute to the structure and function of cells.. 6. Demonstrate knowledge of molecular interactions and their importance in biological systems. 7. Demonstrate knowledge of the principles of chemical thermodynamics and kinetics that drive biological processes in the context of space (i.e., compartmentation) and time: enzyme-catalyzed reactions and metabolic pathways, regulation, integration, and the chemical logic of sequential reaction steps. 8. Recognize major types of functional groups and chemical reactions that occur in biological systems. 9. Apply understanding of the concepts of chemical reactivity and chemical kinetics to predict biochemical processes. 10. Apply knowledge of the chemistry of covalent carbon compounds to explain the molecular mechanisms of biochemical enzyme reactions. 11. Demonstrate knowledge of thermodynamic criteria for spontaneity of physical processes and chemical reactions and the relationship of thermodynamics to chemical equilibrium as they apply to biological systems. 12. Explain maintenance of homeostasis in living organisms by using principles of mass transport, energy balance, and feedback and control systems. Credits: 3.00

CHM 33901 - Biochemistry Laboratory

Credit Hours: 1.00. CHM 33901 is a laboratory course based on two modules from the Undergraduate Research Inspired Experimental Chemistry Alternatives (URIECA) developed at MIT that are designed to introduce students to cutting-edge research topics in biochemistry. The course provides students with a research-inspired laboratory experience that introduces standard biochemical techniques in the context of investigating a current research topic, for example, acquired resistance to cancer drugs. Techniques include protein expression, purification, and gel analysis, PCR, site-directed mutagenesis, kinase activity assays, and protein structure viewing. CHM 33901 was designed as the 4th semester of the 1-2-1 competency-based curriculum transformation in chemistry as it applies to pre-health professional and life science students at Purdue. However, the course is open to other students who

meet the prerequisites.

Learning Outcomes: 1. Demonstrate the ability to think and function as a scientist. 2. Develop an understanding of the scientific process. 3. Develop the ability to document scientific information and experimental data. 4. Demonstrate understanding of the process of scientific inquiry, and explain how scientific knowledge is discovered and validated. 5. Develop observational and interpretive skills through hands-on laboratory or field. 6. Demonstrate ability to measure with precision, accuracy, and safety. 7. Operate basic biochemistry laboratory instrumentation for scientific measurement. 8. Articulate scientific questions and hypotheses, design experiments, acquire data, perform data analysis, and present results in project-based research. 9. Apply knowledge of basic principles of chemistry and their applications to the understanding of biological systems. 10. Make quantitative/structural measurements and interpret results. 11. Demonstrate the ability to work on a team. 12. Demonstrate the ability to communicate well, both orally and in writing. Credits: 1.00

CHM 34800 - Bioinorganic Chemistry

Credit Hours: 3.00. The fundamentals and applications of metals in biology.

Learning Outcomes: 1. Learn the basics of metal-ligand bonding. 2. Gain an understanding of the interplay between metals and biological molecules. 3. Learn how metals and biomolecules work together to bring about chemistry that either component can achieve alone. 4. Be introduced to the places that metals exist in natural systems. 5. Learn the role of metals in biology. 6. Solve problems involving the role of inorganic chemistry in biological systems using knowledge of the relevant chemistry. Credits: 3.00

CHM 32700 - Bioanalytical Chemistry

Credit Hours: 4.00. This course focuses on the detection, quantification, and characterization of proteins, nucleic acids, lipids, carbohydrates, and small bioactive molecules. Principles and applications of various analytical techniques, including spectroscopy, chromatography and mass spectrometry, will also be discussed.

Learning Outcomes: 1. Know standard methods to detect and quantify biomolecules. 2. Understand the mechanism of standard bioanalytical measurements and evaluate their relative precision, accuracy, and ease of use. 3. Choose an appropriate analytical method for detection or quantification of a biological molecule in a given situation and adapt or design components. Credits: 4.00

BIOL 32701 - Bioanalytical Chemistry

Credit Hours: 4.00. This course focuses on the detection, quantification, and characterization of proteins, nucleic acids, lipids, carbohydrates, and small bioactive molecules. Principles and applications of various analytical techniques, including spectroscopy, chromatography and mass spectrometry, will also be discussed.

Learning Outcomes: 1. Know standard methods to detect and quantify biomolecules. 2. Understand the mechanism of standard bioanalytical measurements and evaluate their relative precision, accuracy, and ease of use. 3. Choose an appropriate analytical method for detection or quantification of a biological molecule in a given situation and adapt or design components. Credits: 4.00

CBB Selective I (3 credits)

CHM 56000 - Organic Spectroscopic Analysis

Credit Hours: 3.00. Identification of organic compounds and characteristic groups by the use of mass spectrometry, infrared, nuclear magnetic resonance, and ultraviolet spectroscopy.

Credits: 3.00

BIOL 51202 - Methods And Measures In Biophysical Chemistry

Credit Hours: 3.00. Biological applications of physical methods including absorption spectroscopy (UV-Vis, FTIR and Raman and CD spectroscopy), fluorescence spectroscopy and super high-resolution imaging, spin resonance methods (NMR and ESR spectroscopy), mass and thermodynamic based methods (thermophoresis, analytical ultracentrifugation, ITC and surface plasmon resonance) and diffraction/structural methods using NMR, cryo-EM and X-ray scattering/crystallography. Each topic is treated at an introductory level with examples from the literature. The course objective for students is to obtain a general understanding of the physical principles underlying each of the techniques, as well as the basic ability to apply the technique to biological systems of interest.

Learning Outcomes: 1. Understand basic biophysical principles and the biophysical approach to research. 2. Interpret biophysical data from real experimental examples in the literature. 3. Develop presentation skills. 4. Practice Team Cooperation. 5. Demonstrate an understanding of biophysical methods and how these are used in modern biological experiments. Credits: 3.00

CBB Selective II: BIOL 500-level (3 credits)

BIOL 53601 - Biological And Structural Aspects Of Drug Design And Action

Credit Hours: 3.00. (BCHM 53600) This course is aimed at expanding students' fundamental interests in biology, chemistry and biochemistry to how drugs work. The course will provide an overview of the modern day drug discovery pipeline and an in-depth look at the basic biology, structure, and mechanisms-of-action behind marketed therapeutics. The course will start with a historical account of the discovery of natural product drugs such as aspirin and penicillin and will then venture into the modern day era of drug discovery including structure-based drug design. We will explore different classes of antibiotics, antiviral, and anti-cancer drugs and their targets including small molecule drugs and modern biologics-based drugs.

Learning Outcomes: 1. Understand and communicate the site and mechanism-of-action of a drug. 2. Understand and communicate the relationship between the pharmacologic mechanism and the therapeutic use of a drug. 3. Understand and communicate the scientific basis for the therapeutic use of a drug. 4. Predict, verbally or in writing, the biological response, if any, from a given chemical structure. 5. Understand and communicate the relationship between the structural features of a compound and the physicochemical properties that might influence biological response or the design of new agents. 6. Predict, verbally or in writing, the biochemical mechanism-of-action of a biologically active substrate or compound from its chemical structure. 7. Communicate and describe the relationship between the chemical structure of a biologically active compound and the receptor or active binding site, using enzyme or receptor models. 8. Predict, verbally or in writing, the biological response resulting from the chemical alteration or biochemical pathways. 9. Discuss the relationship between in vitro reaction mechanisms and the structural features that alter the in vivo biotransformation of a drug. 10. Understand and communicate the pathophysiologic processes associated with a particular disease state, and how they might be affected by drug therapy. Credits: 3.00

CHM 43800 - Introduction To Molecular Biotechnology

Credit Hours: 3.00. An examination of modern tools for the characterization, manipulation, and design of nucleic acids and proteins. Topics include DNA technology, recombinant proteins, bioinformatics, genetic modifications, gene expression and the interactions between nucleic acids and proteins.

Learning Outcomes: 1. Understand basics of DNA technology: isolation, amplification, synthesis, sequencing, and cloning. 2. Understand basics of recombinant protein: expressing in prokaryotic and eukaryotic cells, introducing mutations. 3. Understand bioinformatics. 4. Understand introducing genetic modifications to plants and animals and stem cells. 5. Control gene expression and genome editing. 6. Examine nucleic acid interactions and protein interactions, and their application in diagnosis. Credits: 3.00

BIOL 51101 - Intro To X-Ray Crystallography

Credit Hours: 3.00. This course will provide an introduction to structure determination of macromolecules using X-ray crystallography and will attempt to balance theory and practice, consisting of ~60% lectures and ~40% lab modules. The course is divided into five 3-week modules covering (i) Crystallization, (ii) Data Collection, (iii) Molecular Replacement, (iv) Experimental Phasing, and (v) Model Building and Refinement, Validation, and Visualization. The goal of the course is to equip students with the necessary tools to develop and execute an X-ray crystallography project, starting from construct design to publication. By the end of the course, students should be familiar with the (i) structure determination pipeline, (ii) theory behind X-ray diffraction methods, (iii) methods for crystallization, (iv) phasing options for solving a crystal structure, and (v) contemporary crystallography software.

Learning Outcomes: 1. Learn the theory behind X-ray crystallography. 2. Learn how to use contemporary software that is used to solve structures and what that software are doing. 3. Gain hands-on experience in crystallization and handling crystals for data collection. 4. Gain hands-on experience collection data remotely from a synchrotron source and at a home source X-ray instrument. 5. Learn how to determine a structure using either molecular replacement and/or experimental phasing; and will learn how to prepare their results for a publication and deposition. Credits: 3.00

CBB-Related Research (2-3 credits, across 2+ semesters)

CBB Research Capstone (3 credits)

CHM 49900 - Special Assignments

Credit Hours: 1.00 to 5.00. Undergraduate research. Individual research projects undertaken under faculty direction. Permission of instructor required.

Learning Outcomes: 1. Provide students with an official record of participation in undergraduate research. 2. Provide a practical means for professional training beyond regular coursework. 3. Learn research methodologies, build analytical thinking and problem-solving skills. 4. Develop technical and professional written and verbal communication skills. 5. Develop team building and research project management skills. Credits: 1.00 to 5.00

Other Departmental/ Program Course Requirements (38-62 credits)

College of Science Additional Requirements

Computing (2-4 credits)

CS 15900 - C Programming

Credit Hours: 3.00. Fundamental principles, concepts, and methods of programming in C, with emphasis on applications in the physical sciences and engineering. Basic problem solving and programming techniques; fundamental algorithms and data structures; and use of programming logic in solving engineering problems. Students are expected to complete assignments in a collaborative learning environment. Credit cannot be obtained for both CS 15900 and any of CS 15600, CS 15800 and CS 18000.

Learning Outcomes: 1. Understand the fundamental principles, concepts and methods of computer programming. 2. Use the C programming language to developing solutions in the domains of physical sciences, mathematics, and engineering. 3. Demonstrate the ability to function as part of a technical team to generate a solution to a programming problem. 4. Analyze alternative algorithm designs to implement solutions that make efficient use of limited resources of the computer. Credits: 3.00

CS 17700 - Programming With Multimedia Objects

Credit Hours: 4.00. Introduction to computers and programming: number representations, primitive data types and operations, basic control structures, programming applets and applications using graphical user interfaces, programming for detecting events and performing actions, processing multimedia

objects such as images and sounds. Throughout the course, examples are drawn from a variety of fields in the natural sciences. Not open to CS majors with a grade of C or better in CS 18000 . Not open to non-CS majors with a grade of C or better in any course in computer programming.

Credits: 4.00

CS 18000 - Problem Solving And Object-Oriented Programming

Credit Hours: 4.00. Problem solving and algorithms, implementation of algorithms in a high level programming language, conditionals, the iterative approach and debugging, collections of data, searching and sorting, solving problems by decomposition, the object-oriented approach, subclasses of existing classes, handling exceptions that occur when the program is running, graphical user interfaces (GUIs), data stored in files, abstract data types, a glimpse at topics from other CS courses. Intended primarily for students majoring in computer sciences. Credit cannot be obtained for both CS 18000 and any of 15600, 15800 and 15900. Not open to students with credit in CS 24000.

Learning Outcomes: 1. Understand solving problems by analyzing the problem, designing an algorithm, and programming the solution. Credits: 4.00

TDM 10100 - The Data Mine Seminar I (UCC: IL)

Credit Hours: 1.00. The Data Mine is a supportive environment for students in any major from any background who want to learn some data science skills. Students will gain hands-on experience with computational tools for representing, extracting, manipulating, interpreting, transforming, and visualizing data, especially big data sets, and in effectively communicating insights about data. Topics include: the R environment, Python, visualizing data, UNIX, bash, regular expressions, SQL, XML and scraping data from the internet, as well as selected advanced topics, as time permits.

University Core Curriculum (UCC): (UCC: IL)
Learning Outcomes: 1. Discover data science and professional development opportunities in order to prepare for a career. 2. Explain the difference between research computing and basic personal computing data science capabilities in order to know which system is appropriate for a data science project. 3. Design efficient search strategies in order to acquire new data science skills. 4. Devise the most appropriate data science strategy in order to answer a research question. 5. Apply data science techniques in order to answer a research question about a big data set. Credits: 1.00

TDM 10200 - The Data Mine Seminar II

Credit Hours: 1.00. The Data Mine is a supportive environment for students in any major from any background who want to learn some data science skills. Students will gain hands-on experience with computational tools for representing, extracting, manipulating, interpreting, transforming, and visualizing data, especially big data sets, and in effectively communicating insights about data. Topics include: the R environment, Python, visualizing data, UNIX, bash, regular expressions, SQL, XML and scraping data from the internet, as well as selected advanced topics, as time permits.

Learning Outcomes: 1. Discover data science and professional development opportunities in order to prepare for a career. 2. Explain the difference between research computing and basic personal computing data science capabilities in order to know which system is appropriate for a data science project. 3. Design efficient search strategies in order to acquire new data science skills. 4. Devise the most appropriate data science strategy in order to answer a research question. 5. Apply data science techniques in order to answer a research question about a big data set. Credits: 1.00

CS 17600 - Data Engineering In Python

Credit Hours: 3.00. The course introduces students to programming fundamentals in Python, including loops, functions and different data types, and provides an introduction to data engineering including working with common data formats and learning the basics of data wrangling. Students will format, extract, clean, filter, transform, search, combine, summarize, aggregate, and visualize a diverse range of data sets. Python libraries including Matplotlib and Pandas are used.

Learning Outcomes: 1. Write Python code using loops, decision statements, and functions. 2. Explain how arguments are passed in Python functions and how the scope of variables impacts execution. 3. Use the operations on lists, tuples, and dictionaries to perform

appropriate data manipulations. 4. Using Matplotlib, create informative plots and other data visualizations. Explain the key qualities of good visualizations. 5. Creating and manipulating DataFrames using Pandas. 6. Create Python code as well as methods in Pandas to select, search, change, and summarize data in tables. 7. Explain how to identify and fill in missing values in data. 8. Apply Pandas functions combine and merge datasets, perform a range of data aggregations, groupings and cross tabulations. 9. Given multiple data sets, demonstrate how to summarize, transform, combine the data sets, and aggregate and visualize the resulting data set. Credits: 3.00

Laboratory Science (8 credits)

Physics I

PHYS 17200 - Modern Mechanics (UCC: SCI)

Credit Hours: 4.00. Introductory calculus-based physics course using fundamental interactions between atoms to describe Newtonian mechanics, conservation laws, energy quantization, entropy, the kinetic theory of gases, and related topics in mechanics and thermodynamics. Emphasis is on using only a few fundamental principles to describe physical phenomena extending from nuclei to galaxies. 3-D graphical simulations and numerical problem solving by computer are employed by the student from the very beginning. CTL:IPS 1753 Calculus-based Physics I

University Core Curriculum (UCC): (UCC: SCI)

Learning Outcomes: 1. Understand and describe a wide range of physical phenomena in mechanics and thermodynamics using only a few fundamental principles of physics. 2. Learn a unified approach that relates microscopic behavior to macroscopic behavior. 3. Model natural phenomena quantitatively. 4. Apply all this to a range of topics related to mechanics and thermodynamics. Credits: 4.00

PHYS 23300 - Physics For Life Sciences I

Credit Hours: 4.00. Physics For Life Sciences I builds upon prerequisite knowledge in college level biology, chemistry, and mathematics to present introductory physics that will be useful for applying physical principles, insights, and problem solving approaches for students with life science majors. Content will feature the Newtonian framework with emphasis on friction, drag and viscosity, random motion and diffusion, fluid flow, the Coulomb force, molecular forces and bonding, momentum, conservation of energy, entropy, and the first and second laws of thermodynamics.

Learning Outcomes: 1. Understand how motion in realistic biological systems (e.g. cells, biomolecules) is governed by forces. 2. Understand how molecular binding is described in terms of energy. 3. Understand how diffusion is governed on a microscopic level. 4. Have insight into how the first and second laws of thermodynamics constrain basic processes in living systems. Credits: 4.00

Physics II

PHYS 24100 - Electricity And Optics (UCC: SCI)

Credit Hours: 3.00. Electrostatics, current electricity, electromagnetism, magnetic properties of matter. Electromagnetic waves, geometrical and physical optics.

University Core Curriculum (UCC): (UCC: SCI) Credits: 3.00

PHYS 25200 - Electricity And Optics Laboratory

Credit Hours: 1.00. Selected experiments in electric fields, magnetic fields, steady-state and transient DC circuits, thermodynamics, and optics.

Learning Outcomes: 1. Demonstrate the ability to think and function as a scientist. 2. Demonstrate the ability to communicate well, both orally and in writing. 3. Demonstrate the ability to understand the role of scientific observation of Nature in uncovering the Laws of Physics. Credits: 1.00

PHYS 27200 - Electric And Magnetic Interactions (UCC: SCI)

Credit Hours: 4.00. Calculus-based physics course using

concepts of electric and magnetic fields and an atomic description of matter to describe polarization, fields produced by charge distributions, potential, electrical circuits, magnetic forces, induction, and related topics, leading to Maxwell's equations and electromagnetic radiation and an introduction to waves and interference. 3-D graphical simulations and numerical problem solving by computer are employed throughout.

University Core Curriculum (UCC): (UCC: SCI) Learning Outcomes: 1. Understand and describe a wide range of physical phenomena in electricity and magnetism using only a few fundamental principles of physics. 2. Learn a unified approach that relates microscopic behavior to macroscopic behavior. 3. Model natural phenomena quantitatively. 4. Apply all this to a range of topics related to electricity and magnetism. Credits: 4.00

PHYS 23400 - Physics For Life Sciences II

Credit Hours: 4.00. Physics For Life Sciences II builds upon prerequisite knowledge in college level biology, chemistry, and mathematics, as well as on Physics For Life Sciences I, to develop an understanding of how energy, entropy, enthalpy, and Boltzmann distributions affect the dynamics of living systems, of how electric fields and potentials are applied to fluids and membranes, and how the physics of harmonic oscillators, waves, sound, optics, photons, and quantized states are relevant to biological systems and the tools used for their study.

Learning Outcomes: 1. Understand the connection between microscopic phenomena and macroscopic consequences in terms of energy, entropy, and the laws of thermodynamics for biological systems. 2. Apply simple electrostatic principles to membrane potentials and other biological examples. 3. Understand how wave phenomena and quantized states are important for characterizing biomolecules. Credits: 4.00

Mathematics (8-10 credits)

Calculus I

MA 16100 - Plane Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 5.00. Introduction to differential and integral calculus of one variable, with applications. Some schools or departments may allow only 4 credit hours toward graduation for this course. Designed for students who have not had at least a one-semester calculus course in high school, with a grade of "A" or "B". Not open to students with credit in MA 16500 . Demonstrated competence in college algebra and trigonometry.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions Credits: 5.00

MA 16500 - Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 4.00. Introduction to differential and integral calculus of one variable, with applications. Conic sections. Designed for students who have had at least a one-semester calculus course in high school, with a grade of "A" or "B", but are not qualified to enter MA 16200 or MA 16600 or the advanced placement courses MA 17300 or the honors calculus course MA 18100. Demonstrated competence in college algebra and trigonometry. CTL:IMA 1602 Calculus - Long I

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems. 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions. Credits: 4.00

Calculus II

MA 16200 - Plane Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 5.00. Continuation of MA 16100 . Vectors in two and three dimensions, techniques of integration, infinite series, conic sections, polar coordinates, surfaces in three dimensions. Some schools or departments may allow only 4 credit hours toward graduation for this course.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 5.00

MA 16600 - Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 4.00. Continuation of MA 16500 . Vectors in two and three dimensions. Techniques of integration, infinite series, polar coordinates, surfaces in three dimensions. Not open to students with credit in MA 16200 . CTL:IMA 1603 Calculus - Long II

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 4.00

Statistics (3 credits)

STAT 50300 - Statistical Methods For Biology

Credit Hours: 3.00. Introductory statistical methods, with emphasis on applications in biology. Topics include descriptive statistics, binomial and normal distributions, confidence interval estimation, hypothesis testing, analysis of variance, introduction to nonparametric testing, linear regression and correlation, goodness-of-fit tests, and contingency tables. Open only to majors related to the life sciences. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100.

Learning Outcomes: 1. Students will be able to identify and choose appropriate ways to graphically and numerically summarize data. 2. Students will be able to use basic statistical methods to perform statistical inference and draw appropriate conclusions. 3. Students will understand the mathematical foundations of statistical inference for random samples so that they can study and utilize additional statistical methods. Credits: 3.00

Electives (0-18 credits)

GPA Requirements

Course Requirements and Notes

Sample 4-Year Plan

Fall 1st Year

BIOL 12100 - Biology I: Diversity, Ecology, And Behavior (UCC: SCI/STS)

Credit Hours: 2.00. Creates a framework for ordering biology by examining the unity and diversity of life on earth with an emphasis on ecology, genetics, population biology, evolution, and behavior.

University Core Curriculum (UCC): (UCC: SCI/STS) Credits: 2.00

CHM 12901 - General Chemistry With A Biological Focus (UCC: SCI)

Credit Hours: 5.00. An accelerated and comprehensive one-semester general chemistry course that emphasizes principles that are important in biological systems. This course is designed to cover the essential elements of general chemistry traditionally covered in a two semester series. Topics to be covered include: Stoichiometry and chemical equations; atomic theory and structure; periodic properties; electronegativity; ionic and covalent bonding; non-covalent forces; bond energies; Lewis structures; molecular geometry; gases, liquids, and solids; solutions, quantitative equilibria in aqueous solution; acid/base chemistry and buffers; introductory thermodynamics; oxidation-reduction; electrochemical and membrane potential; colligative properties; chemical and enzyme kinetics; nuclear chemistry; coordination chemistry. One year of high school chemistry is required.

University Core Curriculum (UCC): (UCC: SCI) Learning Outcomes: 1. Develop an understanding of universal physical laws as they apply in chemistry. 2. Develop an understanding of the scientific process. 3. Develop the ability to document scientific information and experimental data and to make quantitative/structural measurements and interpret results. Credits: 5.00

MA 16100 - Plane Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 5.00. Introduction to differential and integral calculus of one variable, with applications. Some schools or departments may allow only 4 credit hours toward graduation for this course. Designed for students who have not had at least a one-semester calculus course in high school, with a grade of "A" or "B". Not open to students with credit in MA 16500 . Demonstrated competence in college algebra and trigonometry.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions Credits: 5.00

MA 16500 - Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 4.00. Introduction to differential and integral calculus of one variable, with applications. Conic sections. Designed for students who have had at least a one-semester calculus course in high school, with a grade of "A" or "B", but are not qualified to enter MA 16200 or MA 16600 or the advanced placement courses MA 17300 or the honors calculus course MA 18100. Demonstrated competence in college algebra and trigonometry. CTL:IMA 1602 Calculus - Long I

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems. 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions. Credits: 4.00

15-17 Credits

Spring 1st Year

BIOL 13100 - Biology II: Development, Structure, And Function Of Organisms (UCC: SCI)

Credit Hours: 3.00. Principles of development of plants and animals and the relationship between the structure and function of selected systems of these organisms.

University Core Curriculum (UCC): (UCC: SCI) Credits: 3.00

BIOL 13500 - First Year Biology Laboratory (UCC: SCI)

Credit Hours: 2.00. Laboratory exercises emphasizing student mastery of basic laboratory skills needed to succeed in the biological sciences; intended for beginning (first-year) biology majors.

University Core Curriculum (UCC): (UCC: SCI) Learning Outcomes: 1. Demonstrate the ability to think and function as a scientist. 2. Demonstrate depth in major. Credits: 2.00

CHM 25500 - Organic Chemistry For The Life Sciences I

Credit Hours: 3.00. A study of aliphatic and aromatic hydrocarbons and their simple derivatives in terms of (a) structure, bonding, etc.; (b) general syntheses and reactions; and (c) a logical modern rationale for fundamental phenomena as supported by reactivity orders, orientation effects, stereochemistry, and relative rates. Recommended for biology majors.

Learning Outcomes: 1. Gain understanding of the fundamental principles of organic chemistry and to apply those principles to solve problems. 2. Observe the world on a molecular level and to understand how organic chemistry applies to biology and everyday life. 3. Understand at a fundamental level how molecules look and behave. 4. Relate the structure and reactivity of molecules to observable physical/chemical properties. 5. Describe Life Processes in terms of molecular phenomena. Credits: 3.00

CHM 25501 - Organic Chemistry For The Life Sciences Laboratory I

Credit Hours: 1.00. Laboratory experiments to accompany CHM 25500, illustrating methods of separation, instrumental methods of analysis, and the more common techniques and methods for preparing various types of organic compounds.

Learning Outcomes: 1. Learn through practical experience the isolation, purification, and characterization of organic compounds through processes including liquid-liquid extraction, evaporation, solid-phase chromatography, distillation and infrared spectroscopy. 2. Learn through practical experience the use of simple methods to carry out reactions discussed in organic chemistry lectures and how to isolate and characterize the products. Credits: 1.00

MA 16200 - Plane Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 5.00. Continuation of MA 16100 . Vectors in two and three dimensions, techniques of integration, infinite series, conic sections, polar coordinates, surfaces in three dimensions. Some schools or departments may allow only 4 credit hours toward graduation for this course.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 5.00

MA 16600 - Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 4.00. Continuation of MA 16500 . Vectors in two and three dimensions. Techniques of integration, infinite series, polar coordinates, surfaces in three dimensions. Not open to students with credit in MA 16200 . CTL:IMA 1603 Calculus - Long II

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of

integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 4.00

16-17 Credits

Fall 2nd Year

BIOL 23100 - Biology III: Cell Structure And Function

Credit Hours: 3.00. An introduction to modern cell biology through an examination of the physical and chemical properties that lead to an understanding of the molecular basis for cell function.

Learning Outcomes: 1. Students demonstrate subject-matter competency, including the mastery of biological theories. 2. Students demonstrate skills in critical thinking. These skills include understanding scientific methods, solving biology-related problems, interpreting and analyzing primary literature in biology, and interpreting data in a meaningful way. 3. Students will understand how biochemistry contributes to improvements in human health, industry, and broader scientific understanding. 4. Students will be familiar with the biogenesis, structure, and chemistry of the basic types of macromolecules important in cells: nucleic acids, proteins, and membranes, and with the organic and inorganic molecules important in cellular metabolism. 5. Students will understand the role of macromolecules in cellular processes such as DNA replication, RNA transcription, protein translation, and metabolism. 6. Students will understand the principles of how energy is obtained, stored and used in biological processes. 7. Graduates will understand the chemical and physical principles that govern biochemical and physiological processes. 8. Students will understand the role of evolution of creating and modifying the macromolecular components of the cell, and in creating biological complexity and variability. 9. Graduates will understand how chemical and biochemical processes relate to biological function at the molecular, cellular, organismal, and higher levels. 10. Demonstrate proficiency with professional skills by practicing biologists including experimental design and execution, biological techniques, data collection and documentation, communication of results, and responsible conduct of science. 11. Students who complete the CMD BS program will have a broad understanding of the compositions and formations of cellular structures, the molecular basis underlying cellular processes, and the links between diseases and aberrant gene functions. Credits: 3.00

BIOL 23200 - Laboratory In Biology III: Cell Structure And Function

Credit Hours: 2.00. Laboratory exercises designed to illustrate the properties, functions, and growth of prokaryotic and eukaryotic cells and to introduce the student to modern experimental methods used to study cells and their separated components.

Credits: 2.00

CHM 25600 - Organic Chemistry For The Life Sciences II

Credit Hours: 3.00. A continuation of CHM 25500 with various functional groups such as the carboxyl, amino, etc., and including such polyfunctional natural products as carbohydrates and peptides.

Learning Outcomes: 1. Use theory to understand/predict experimental observations. 2. Demonstrate an understanding of the physical properties and a molecular understanding of chemical reactivity and materials. 3. Plan chemical transformations. 4. Recognize and understand chemical instrumentation and spectroscopy. Credits: 3.00

CHM 25601 - Organic Chemistry For The Life Sciences Laboratory II

Credit Hours: 1.00. A continuation of CHM 25501. Experiments are designed to illustrate principles discussed in CHM 25600.

Learning Outcomes: 1. Learn through practical experience the isolation, purification, and characterization of organic compounds through processes including liquid-liquid extraction, evaporation, solid-phase chromatography, distillation and infrared spectroscopy. 2. Learn through practical experience the use of simple methods to carry out reactions discussed in organic chemistry lectures and how to isolate and characterize the products. Credits: 1.00

15-16 Credits

Spring 2nd Year

BIOL 24100 - Biology IV: Genetics And Molecular Biology

Credit Hours: 3.00. An introduction to the principles of classical genetics and to molecular genetics. Topics covered are transmission of the genetic material (both in eukaryotes and prokaryotes); changes in the genetic material, structure, and function of the genetic material; and the manipulation of genetic material (recombinant DNA technology).

Learning Outcomes: 1. Students demonstrate subject-matter competency, including the mastery of biological theories. 2. Students will understand the role of macromolecules in cellular processes such as DNA replication, RNA transcription, protein translation, and metabolism. 3. Students will understand the role of evolution of creating and modifying the macromolecular components of the cell, and in creating biological complexity and variability. 4. Graduates will understand how chemical and biochemical processes relate to biological function at the molecular, cellular, organismal, and higher level. 5. Students who complete the CMB BS program will have a broad understanding of the compositions and formations of cellular structures, the molecular basis underlying cellular processes, and the links between diseases and aberrant gene functions. 6. Students who complete the CMB BS program will have a broad understanding of the principles governing the development of multi-cellular animals and plants. 7. Students will exhibit proficiency in population and quantitative genetics. 8. Students will demonstrate an understanding of concepts and theories of genetics. 9. Students will demonstrate an understanding of laboratory skills used in genetics. 10. Students will exhibit proficiency in the physiology, biochemistry, and genetics of bacteria including diversity, metabolism, and gene expression regulation as well as key metabolic control mechanisms. Credits: 3.00

BIOL 24200 - Laboratory In Biology IV: Genetics And Molecular Biology

Credit Hours: 2.00. Experiments in classical and modern genetics and exercises to acquaint the students with basic techniques in molecular biology.

Credits: 2.00

BIOL 28600 - Introduction To Ecology And Evolution

Credit Hours: 2.00. Evolutionary processes and ecological principles associated with individuals, populations, communities, and ecosystems. Topics include genetic drift, natural selection, adaptation, life tables, population dynamics, competition, predation, biodiversity, and ecological stability, with emphasis on natural systems.

Learning Outcomes: 1. Demonstrate subject-matter competency, including the mastery of biological theories. 2. Demonstrate proficiency

with professional skills needed by practicing biologists, including experimental design and execution, biological techniques, data collection and documentation, communication of results, and responsible conduct of science. 3. Demonstrate the ability to discuss ethical issues in the application of biological sciences, and the impact of science on society. 4. Demonstrate skills in critical thinking. These skills include understanding scientific methods, solving biology-related problems, interpreting and analyzing primary literature in biology, and interpreting data in a meaningful way. 5. Demonstrate knowledge of the path leading to specific careers in biology. 6. Understand how biochemistry contributes to improvements in human health, industry, and broader scientific understanding. 7. Understand the principles of how energy is obtained, stored and used in biological processes.8. Understand the chemical and physical principles that govern biochemical and physiological processes.9. Understand the role of evolution of creating and modifying the macromolecular components of the cell, and in creating biological complexity and variability.10. Understand how chemical and biochemical processes relate to biological function at the molecular, cellular, organismal, and higher levels.11. Demonstrate subject-matter competency, including the mastery of biological theories.12. Demonstrate proficiency with professional skills needed by practicing biologists, including experimental design and execution, biological techniques, data collection and documentation, communication of results, and responsible conduct of science.13. Demonstrate the ability to discuss ethical issues in the application of biological sciences, and the impact of science on society.14. Demonstrate skills in critical thinking. These skills include understanding scientific methods, solving biology-related problems, interpreting and analyzing primary literature in biology, and interpreting data in a meaningful way.15. Demonstrate knowledge of the path leading to specific careers in biology.16. Demonstrate subject-matter competency, including the mastery of biological theories.17. Demonstrate proficiency with professional skills needed by practicing biologists, including experimental design and execution, biological techniques, data collection and documentation, communication of results, and responsible conduct of science.18. Demonstrate the ability to discuss ethical issues in the application of biological sciences, and the impact of science on society.19. Demonstrate skills in critical thinking. These skills include understanding scientific methods, solving biology-related problems, interpreting and analyzing primary literature in biology, and interpreting data in a meaningful way.20. Demonstrate knowledge of the path leading to specific careers in biology.21. Understand ways in which organisms interact ecologically with each other and their environment. 22. Understand how evolutionary forces influence organisms to produce adaptations. 23. Acquire knowledge of the ways in which animals communicate with each other. 24. Exhibit proficiency in population and community ecology, animal behavior, and evolutionary mechanisms. 25. Exhibit proficiency in population and quantitative genetics. 26. Be familiar with taxonomic and phylogenetic relationships among organisms. 27. Extend basic ecological principles to species and ecosystem conservation. 28. Experience working with organisms in natural settings. 29. Learn to efficiently communicate scientific information or results from biological investigations using both oral and written methods. 30. Use and understand the scientific

method, including how to generate hypotheses and predictions, develop an experimental design. Credits: 2.00

CHM 33900 - Biochemistry: A Molecular Approach

Credit Hours: 3.00. This is a comprehensive one-semester biochemistry course that emphasizes molecules and molecular reaction mechanisms, building upon the principles conveyed in general chemistry and organic chemistry. This course is designed to cover the essential elements of biochemistry traditionally covered in a two semester series. Topics to be covered include: Amino acids, peptides and proteins, molecular models and structure-function relationships, enzymes, enzyme kinetics and enzyme mechanisms, carbohydrates and carbohydrate metabolism, aerobic metabolism, lipids and membranes, lipid metabolism, nitrogen metabolism and integration and regulation of metabolism. Special emphasis will be placed on connections between biochemical principles and the fields of medicine, human health and disease, nutrition and biotechnology. This course should serve as excellent preparation for higher-level biochemistry courses as well as standardized pre-health professional exams. CHM 33900 was designed as the 4lh semester of the 1-2-1 competency-based curriculum transformation in chemistry as it applies to pre-health professional and life science students at Purdue. However, this course is open to other students who meet the prerequisites.

Learning Outcomes: 1. Demonstrate the ability to think as a scientist. 2. Demonstrate the ability to communicate well in writing. 3. Apply knowledge of basic principles of chemistry and their applications to the understanding of biological systems. 4. Employ knowledge of the general components of prokaryotic and eukaryotic cells, such as molecular, microscopic, macroscopic, and three-dimensional structure, to explain how different components contribute to cellular and organismal function. 5. Demonstrate knowledge of how biomolecules contribute to the structure and function of cells.. 6. Demonstrate knowledge of molecular interactions and their importance in biological systems. 7. Demonstrate knowledge of the principles of chemical thermodynamics and kinetics that drive biological processes in the context of space (i.e., compartmentation) and time: enzyme-catalyzed reactions and metabolic pathways, regulation, integration, and the chemical logic of sequential reaction steps. 8. Recognize major types of functional groups and chemical reactions that occur in biological systems. 9. Apply understanding of the concepts of chemical reactivity and chemical kinetics to predict biochemical processes. 10. Apply knowledge of the chemistry of covalent carbon compounds to explain the molecular mechanisms of biochemical enzyme reactions. 11. Demonstrate knowledge of thermodynamic criteria for spontaneity of physical processes and chemical reactions and the relationship of thermodynamics to chemical equilibrium as they apply to biological systems. 12. Explain maintenance of homeostasis in living organisms by using principles of mass transport, energy balance, and feedback and control systems. Credits: 3.00

CHM 33901 - Biochemistry Laboratory

Credit Hours: 1.00. CHM 33901 is a laboratory course based on two modules from the Undergraduate Research Inspired Experimental Chemistry Alternatives (URIECA) developed at MIT that are designed to introduce students to cutting-edge research topics in biochemistry. The course provides students with a research-inspired laboratory experience that introduces standard biochemical techniques in the context of investigating a current research topic, for example, acquired resistance to cancer drugs. Techniques include protein expression, purification, and gel analysis, PCR, site-directed mutagenesis, kinase activity assays, and protein structure viewing. CHM 33901 was designed as the 4th semester of the 1-2-1 competency-based curriculum transformation in chemistry as it applies to pre-health professional and life science students at Purdue. However, the course is open to other students who meet the prerequisites.

Learning Outcomes: 1. Demonstrate the ability to think and function as a scientist. 2. Develop an understanding of the scientific process. 3. Develop the ability to document scientific information and experimental data. 4. Demonstrate understanding of the process of scientific inquiry, and explain how scientific

knowledge is discovered and validated. 5. Develop observational and interpretive skills through hands-on laboratory or field. 6. Demonstrate ability to measure with precision, accuracy, and safety. 7. Operate basic biochemistry laboratory instrumentation for scientific measurement. 8. Articulate scientific questions and hypotheses, design experiments, acquire data, perform data analysis, and present results in project-based research. 9. Apply knowledge of basic principles of chemistry and their applications to the understanding of biological systems. 10. Make quantitative/structural measurements and interpret results. 11. Demonstrate the ability to work on a team. 12. Demonstrate the ability to communicate well, both orally and in writing. Credits: 1.00

14-15 Credits

Fall 3rd Year

BIOL 42000 - Eukaryotic Cell Biology

Credit Hours: 3.00. Composition, structure, regulation, and growth of eukaryotic cells.

Learning Outcomes: 1. Students demonstrate subject-matter competency, including the mastery of biological theories. 2. Students demonstrate proficiency with professional skills needed by practicing biologists, including experimental design and execution, biological techniques, data collections and documentation, communication of results, and responsible conduct of science. 3. Students demonstrate the ability to discuss ethical issues in the application of biological sciences, and the impact of science on society. 4. Students demonstrate skills in critical thinking. These skills include understanding scientific methods, solving biology-related problems, interpreting and analyzing primary literature in biology, and interpreting data in a meaningful way. 5. Students demonstrate knowledge of the path leading to specific careers in biology. 6. Students will understand how biochemistry contributes to improvements in human health, industry, and broader scientific understanding. 7. Macromolecules: Students will be familiar with the biogenesis, structure, and chemistry of the basic types of macromolecules important in cells: nucleic acids, proteins, and membranes, and with the organic and inorganic molecules important in cellular metabolism. 8. Cellular Processes: Students will understand the role of macromolecules in cellular processes such as DNA replication, RNA transcription, protein translation, and metabolism. 9. Scope: graduates will understand the chemical and physical principles that govern biochemical and physiological process. 10. Scope: graduates will understand how chemical and biochemical processes relate to biological function at the molecular, cellular, organismal, and higher levels. 11. Students who complete the CMD BS program will have a broad understanding of the compositions and formations of cellular structures, the molecular basis underlying cellular processes, and the links between diseases and aberrant gene functions. Credits: 3.00

CHM 32700 - Bioanalytical Chemistry

Credit Hours: 4.00. This course focuses on the detection, quantification, and characterization of proteins, nucleic acids, lipids, carbohydrates, and small bioactive molecules. Principles and applications of various analytical techniques, including spectroscopy, chromatography and mass spectrometry, will also be discussed.

Learning Outcomes: 1. Know standard methods to detect and quantify biomolecules. 2. Understand the mechanism of standard bioanalytical measurements and evaluate their relative precision, accuracy, and ease of use. 3.

Choose an appropriate analytical method for detection or quantification of a biological molecule in a given situation and adapt or design components. Credits: 4.00

15-17 Credits

Spring 3rd Year

BIOL 41500 - Introduction To Molecular Biology

Credit Hours: 3.00. An introduction to modern molecular biology techniques and how they are used to address current topics in gene regulation. Emphasis will be placed on experimental procedures and model systems, such as site-directed mutagenesis of isolated genes and their subsequent introduction into prokaryotic and eukaryotic cells. Topics will address the molecular control mechanisms associated with DNA replication, RNA transcription, RNA processing, and differential gene expression.

Credits: 3.00

STAT 50300 - Statistical Methods For Biology

Credit Hours: 3.00. Introductory statistical methods, with emphasis on applications in biology. Topics include descriptive statistics, binomial and normal distributions, confidence interval estimation, hypothesis testing, analysis of variance, introduction to nonparametric testing, linear regression and correlation, goodness-of-fit tests, and contingency tables. Open only to majors related to the life sciences. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100.

Learning Outcomes: 1. Students will be able to identify and choose appropriate ways to graphically and numerically summarize data. 2. Students will be able to use basic statistical methods to perform statistical inference and draw appropriate conclusions. 3. Students will understand the mathematical foundations of statistical inference for random samples so that they can study and utilize additional statistical methods. Credits: 3.00

14 Credits

Fall 4th Year

CHM 56000 - Organic Spectroscopic Analysis

Credit Hours: 3.00. Identification of organic compounds and characteristic groups by the use of mass spectrometry, infrared, nuclear magnetic resonance, and ultraviolet spectroscopy.

Credits: 3.00

CHM 34800 - Bioinorganic Chemistry

Credit Hours: 3.00. The fundamentals and applications of metals in biology.

Learning Outcomes: 1. Learn the basics of metal-ligand bonding. 2. Gain an understanding of the interplay between metals and biological molecules. 3. Learn how metals and biomolecules work together to bring about chemistry that either component can achieve alone. 4. Be introduced to the places that metals exist in natural systems. 5. Learn the role of metals in biology. 6. Solve problems involving the role of inorganic chemistry in biological systems using knowledge of the relevant chemistry. Credits: 3.00

BIOL 51202 - Methods And Measures In Biophysical Chemistry

Credit Hours: 3.00. Biological applications of physical methods including absorption spectroscopy (UV-Vis, FTIR and Raman and CD spectroscopy), fluorescence spectroscopy and super high-resolution imaging, spin resonance methods (NMR and ESR spectroscopy), mass and thermodynamic based methods (thermophoresis, analytical ultracentrifugation, ITC and surface plasmon resonance) and diffraction/structural methods using NMR, cryo-EM and X-ray scattering/crystallography. Each topic is treated at an introductory level with examples from the literature. The course objective for students is to obtain a general understanding of the physical principles underlying each of the techniques, as well as the basic ability to apply the technique to biological systems of interest.

Learning Outcomes: 1. Understand basic biophysical principles and the biophysical approach to research. 2. Interpret biophysical data from real experimental examples in the literature. 3. Develop presentation skills. 4. Practice Team Cooperation. 5. Demonstrate an

understanding of biophysical methods and how these are used in modern biological experiments. Credits: 3.00

12-13 Credits

Spring 4th Year

CHM 37200 - Physical Chemistry

Credit Hours: 4.00. Principles of physical chemistry with emphasis on chemical thermodynamics and kinetics, illustrated examples from the biological sciences. Intended primarily for students in the life sciences. Other topics include physical and chemical equilibria, quantum mechanics, and spectroscopy.

Learning Outcomes: 1. Use theory to understand/predict experimental observations. 2. Demonstrate an understanding of the physical properties and a molecular understanding of chemical reactivity and materials. 3. Understand the connections of different courses/subdisciplines in chemistry. 4. Understand the connections between chemistry and current events, everyday occurrences and other scientific disciplines. Credits: 4.00

CHM 49000 - Selected Topics In Chemistry For Upper-Division Students

Credit Hours: 1.00 to 4.00. Topics vary.

Learning Outcomes: 1. Vary due to nature of the course. Credits: 1.00 to 4.00

15 Credits

Chemical Engineering, BSCHE

About the Program

Degree Requirements

Major Required Courses (46 credits)

CHE 20000 - Chemical Engineering Seminar

Credit Hours: 1.00. An orientation course to inform students of the various areas in chemical engineering, to assist them in selection of electives suited to their particular abilities and interest, and to instill a sense of professional ethics and responsibility. Lectures drawn from all fields of chemical engineering.

Learning Outcomes: 1. Demonstrate an understanding of the need for academic and professional integrity and ethical behavior. 2. Demonstrate an understanding of contemporary issues encountered in the professional practice of chemical engineering including business practices, environmental, health, and safety issues and other public interests. 3. Demonstrate an appreciation of the need for engaging in life-long learning to maintain and enhance the professional practice of chemical engineering. Credits: 1.00

CHE 20500 - Chemical Engineering Calculations

Credit Hours: 4.00. Quantitative applications of steady-state mass and energy balances to solve problems involving multi-component systems and multi-unit chemical processes. Single-component and multi-component phase equilibria, single-reaction and multiple-reaction stoichiometry, coupled mass and energy balances, chemical processes involving bypass and recycle streams.

Learning Outcomes: 1. Estimate physical properties of real chemical systems. 2. Evaluate introductory single-component and multi-component phase equilibria and incorporate these concepts into solutions of mass and energy balance problems. 3. Solve steady state and transient mass and energy balance problems for both reacting and non-reacting systems with or without recycle using analytical and computational methods. 4. Work professionally and ethically in teams to solve new mass and energy balance problems. 5. Identify contemporary chemical engineering problems, including their societal, environmental, and global impacts. Credits:

4.00

CHE 21100 - Introductory Chemical Engineering Thermodynamics

Credit Hours: 4.00. Basic principles and concepts of thermodynamics applied to chemical engineering problems; use of basic thermodynamic functions of enthalpy, entropy, free energy to solutions, phase equilibria, and chemical equilibria; thermodynamic processes and efficiencies; equations of state; and relation of macroscopic to molecular properties.

Learning Outcomes: 1. Apply the First Law of thermodynamics in the analysis of closed and open systems. 2. Apply the Second Law of thermodynamics in the analysis of closed and open systems, and reversible and irreversible processes, including power cycles. 3. Derive and apply thermodynamic relations and relationships between thermodynamic potentials. 4. Estimate the physical properties of ideal and non-ideal fluids. 5. Use chemical potentials, fugacities and activity coefficients to analyze the phase equilibrium behavior of ideal and non-ideal fluids. 6. Use chemical potentials, fugacities and activity coefficients to evaluate single and multi-component chemical reaction equilibria for ideal and non-ideal fluids. 7. Utilize computational tools in the solution of thermodynamics problems. Credits: 4.00

CHE 30000 - Chemical Engineering Seminar

Credit Hours: 1.00. Continuation of CHE 20000. Lectures to acquaint the junior students with professional ethics, career choices, including graduate studies, and services of professional societies.

Learning Outcomes: 1. Identify the wide range of career opportunities offered by the Bachelor in Chemical Engineering degree. 2. Demonstrate an understanding of the need for developing leadership skills, professional integrity and ethical decision making in the professional practice of chemical engineering. 3. Demonstrate an understanding of contemporary issues encountered in the professional practice of chemical engineering including business practices, environmental, health, and safety issues and other public interests. 4. Demonstrate an appreciation of the need for engaging in life-long learning to maintain and enhance the professional practice of chemical engineering. Credits: 1.00

CHE 30600 - Design Of Staged Separation Processes

Credit Hours: 3.00. The application of equilibria and mass and energy balances for the design of staged separation processes. Use of various equilibrium data and thermodynamic principles for the design of batch and continuous distillation, absorption, stripping, and extraction systems. Stagewise calculations and graphical methods for design of binary systems. Design of multicomponent separators. Determination of stage efficiency and column size.

Learning Outcomes: 1. Utilize the concepts and relations of phase equilibria, particularly VLE, in the analysis, design, and simulation of separation processes. 2. Use mass and energy balances in the analysis of separation processes. 3. Use the McCabe-Thiele diagram for the solution of problems in binary separations. 4. Use reflux and multi-stage cascades to increase separation of a given component. 5. Use process simulators for binary and multi-component systems to solve, understand, and design separation processes. 6. Apply the basic principles of distillation, absorption/stripping, extraction and other unit operations for the solution of problems in separations. 7. Identify the safety aspects of various separation processes. 8. Communicate effectively the results of a designed separation process in writing. Credits: 3.00

CHE 32000 - Statistical Modeling And Quality Enhancement

Credit Hours: 3.00. Statistical modeling methods, design of experiments, error analysis, curve fitting and regression, analysis of variance, confidence intervals, quality control and enhancement: emphasizes preparation for designing chemical engineering laboratory experiments and analyzing data.

Learning Outcomes: 1. Utilize the concepts of probability for use with the normal and t

distributions, confidence intervals, and hypothesis testing. 2. Apply least squares fitting of data by use of linear algebra with computers. 3. Apply regression and model building from data with experimental error obtained with replicates to establish an adequate model. 4. Design experiments for single and multiple factors and apply regression to model the results. 5. Apply propagation of error and sources of variation or variance components. 6. Apply statistical quality control and improvement with various charts such as average, range, and cusum (concepts of consumer and producer risk and capability index are included). Credits: 3.00

CHE 34800 - Chemical Reaction Engineering

Credit Hours: 4.00. Application of kinetic rate equations, mass balances and energy balances to the analysis and design of chemical reactors involving homogeneous and heterogeneous chemical reactions. Chemical equilibria, kinetic rate equations for homogeneous and heterogeneously catalyzed reactions, design of ideal isothermal reactors, effects of non-isothermal operation, effects of diffusion in porous catalysts and non-ideal mixing in continuous flow reactors.

Learning Outcomes: 1. Apply fundamental material balances to derive the design equations for CSTR, PFR, PBR, and batch reactors. 2. Derive rate expressions from both elementary steps and reaction kinetics data for both homogeneous and heterogeneous reactions. 3. Use material and energy balances with kinetic data for both single and multiple reactions to design and analyze the behavior of isothermal and non-isothermal reactors. 4. Utilize effectiveness factors governing the coupling of reaction and diffusion in the description of heterogeneously catalyzed reactions. 5. Work professionally and ethically in teams to conduct reaction-based laboratory experiments. 6. Effectively report results in written form and practice safety as an integral part of laboratory work. 7. Apply appropriate computational tools for the solution of chemical reaction engineering problems. Credits: 4.00

CHE 37700 - Momentum Transfer

Credit Hours: 4.00. Differential (microscopic) and integral (macroscopic) mass, momentum, and energy balances. Newtonian and non-Newtonian fluids. Fluid statics. One-dimensional steady and transient laminar flows. Turbulence. Dimensional analysis and similarity. Friction factors and drag coefficients. Applications to engineering analysis of practical problems. Introduction to numerical analysis and visualization of flows.

Learning Outcomes: 1. Explain the physical properties of a fluid and the consequences of such properties on fluid flow. 2. Apply momentum and/or force balances to the analysis of problems in hydrostatics. 3. Apply mass, momentum and energy balances for the solution of problems involving inviscid, steady flow. 4. Use appropriate macroscopic and microscopic mass, momentum, and energy balances to analyze steady laminar and turbulent flow of incompressible fluids in conduits and past submerged bodies. 5. Apply dimensional analysis and kinematic similarity for the interpretation of experimental fluid flow data and the design of fluid transfer equipment. 6. Utilize appropriate mass, momentum and energy balances for the design of fluid transfer equipment (pipelines, agitated vessels, pumps, etc.) and to analyze its operation. 7. Work professionally and ethically in teams to conduct fluid mechanics-based laboratory experiments. 8. Effectively report results in written form and practice safety as an integral part of laboratory work. Credits: 4.00

CHE 37800 - Heat And Mass Transfer

Credit Hours: 4.00. Macroscopic and differential energy balances. Heat transfer coefficients for free and forced convection and phase change. Conductive and radiative heat transfer. Applications to heat transfer equipment design and compressible fluid flow. Macroscopic and differential species balances. Mass transfer coefficients and analogies. Mass transfer with and without chemical reaction. Mass transfer equipment design.

Learning Outcomes: 1. Identify and explain the three mechanisms of heat transfer: conduction, convection, and radiation. 2. Apply microscopic and macroscopic thermal energy balances incorporating Fourier's Law for the solution of problems describing steady-state and transient conduction, including convective heat transfer. 3. Utilize mass and thermal energy balances for the design of heat transfer equipment and the analysis of its operation. 4. Identify and explain the two main mechanisms of mass transfer: convection and diffusion. 5. Apply microscopic and macroscopic species mass balances incorporating Fick's Law for the solution of problems describing steady-state and transient diffusion, including relevant rate equations and convective mass transfer. 6. Identify and apply the analogies between momentum, heat, and mass transfer. 7. Utilize mass balances and appropriate phase equilibrium relations for the design of continuous mass transfer equipment and the analysis of its operation. 8. Work professionally and ethically in teams to conduct heat and mass transfer-based laboratory experiments. 9. Effectively report results in written form and practice safety as an integral part of laboratory work. Credits: 4.00

CHE 40000 - Chemical Engineering Seminar

Credit Hours: 1.00. Continuation of CHE 30000. Lectures to acquaint the senior students with professional ethics, services of professional societies, and help them in the transition from being an undergraduate student to becoming a successful professional or graduate student.

Learning Outcomes: 1. Demonstrate an understanding of the need for developing leadership skills, professional integrity and ethical decision making in the professional practice of chemical engineering. 2. Demonstrate an understanding of contemporary issues encountered in the professional practice of chemical engineering including business practices, environmental, health, and safety issues and other public interests. 3. Identify the wide-reaching effects that engineering decisions have on society, our global community and our natural environment. 4. Demonstrate an appreciation of for engaging in life-long learning to maintain and enhance the professional practice of chemical engineering. Credits: 1.00

CHE 42000 - Process Safety Management And Analysis

Credit Hours: 3.00. Develop knowledge of process safety management and analysis in the process industries, including hazard identification, hazard analysis and risk management.

Learning Outcomes: 1. Demonstrate knowledge and understanding of the elements of process safety management. 2. Apply the techniques, analytical skills, and modern computational tools necessary for performing process safety calculations in the design of safety. 3. Demonstrate an understanding and appreciation of the need for professional integrity and ethical decision making to promote safety in the workplace. 4. Be able to pro-actively identify and analyze safety hazards. 5. Demonstrate an understanding of the detrimental effects of the unsafe operation of chemical facilities on environmental, health, and safety issues and other public interests. Our graduate will be aware of the wide-reaching effects that engineering decisions have on society, our global community and our natural environment. 6. Demonstrate knowledge and understanding of risk management tools, programs and processes associated with process safety. Credits: 3.00

CHE 43500 - Chemical Engineering Laboratory

Credit Hours: 4.00. Quantitative experimental study of projects involving problems in fluid mechanics and heat and mass transfer or operation and evaluation of equipment; projects include analysis and data-based design of operations involving mass transfer such as distillation, absorption, drying, humidification, etc; study of rates and equilibria in simple chemical reaction systems; study of chemical processes;

application of methods of data analysis in practice; some library work; emphasis on group work, report writing, and oral communication.

Learning Outcomes: 1. Determine the intrinsic performance data required to complete the design of a given process or process equipment. 2. Design and conduct an experimental program to determine the required performance data. 3. Use the requisite performance data to obtain a technically feasible and economical design to meet desired needs. 4. Effectively report experimental results, performance data analyses and process designs both orally and in writing. 5. Use appropriate analytical and computational tools for the analysis and design of experiments. 6. Work effectively as a member of an engineering team in a professional and ethical manner, including different team roles. 7. Practice appropriate experimental safety measures. Credits: 4.00

CHE 45600 - Process Dynamics And Control

Credit Hours: 3.00. Dynamic response and control of chemical processing equipment, such as heat exchangers, chemical reactors, and absorption towers. Use is made of fundamental techniques of servomechanism theory, such as block diagrams, transfer functions, and frequency response. Introduction to advanced control techniques.

Learning Outcomes: 1. Develop a physically relevant mathematical model as a surrogate for a chemical process. 2. Apply appropriate analytical and computer packages for analyzing the process control behavior based on the developed model. 3. Design, model, and test a hierarchical control system on a complex process. 4. Describe the role of process control in meeting stringent safety, economic, environmental, societal, and corporate goals. 5. Describe the building blocks of process control and their synthesis for providing complete process control solutions. 6. Work effectively in a team to execute process control computer-based assignments in a professional and ethical manner. Credits: 3.00

CHE 45000 - Design And Analysis Of Processing Systems

Credit Hours: 4.00. Use of process synthesis methods and concepts; detailed design of unit operation equipment, the economics of chemical plants and flow sheet optimization methods. Synthesize, develop, and evaluate a preliminary design of a chemical process that meets market requirements for a specific product. Analysis of design alternatives using case studies and optimization methods.

Learning Outcomes: 1. Apply systematic strategies for synthesizing chemical process designs that involve conventional unit operations. 2. Describe both the difference between steady state and batch chemical processes and the implications on their design and operation. 3. Demonstrate the ability to obtain reliable information on industrial chemical processes, process operating parameters, equipment costs, cost of chemicals and materials, and associated safety and environmental hazards. 4. Describe the role of physical property estimates on process design and be able to use appropriate physical property estimation methods in unit operations design. 5. Estimate the capital and operating cost of a process and to assess its profitability. 6. Use process simulators and other tools to perform detailed analyses for the successful design of a chemical plant. 7. Communicate effectively project progress and final results in a professional manner both orally and in writing. 8. Work effectively in a team to execute open-ended design projects with time-bound deliverables in a professional and ethical manner, including different team roles. Credits: 4.00

Other Departmental/Program Requirements (87-97 credits)

First-Year Engineering Requirements (29-39 credits)

Other Departmental Courses (36-40 credits)

CHM 26100 - Organic Chemistry I

Credit Hours: 3.00. A comprehensive study of the chemical principles underlying aliphatic and aromatic compounds. The syntheses and reactions of these materials are discussed. Modern theory and stereochemistry are stressed to illustrate the logic inherent in the subject matter and to demonstrate the predictability of many chemical transformations. Recommended for students majoring in chemical engineering. If not a chemical engineering major, see CHM 26505 Organic Chemistry.

Learning Outcomes: 1. Draw the structures (geometries and structures) of carbon-based molecules) using acceptable representations and identify common classes of organic compounds. 2. Draw and recognize resonance forms of a structure (resonance structures) and assess their importance. 3. Determine the name of organic compounds by using the IUPAC naming system. Predict the structure when given the name. Recognize its common name. 4. Recognize the 3-dimensional shapes of molecules, as determined by structural conformation and stereochemistry. 5. Use mass spectrometry and IR and NMR spectroscopy to determine the structures of organic molecules. 6. Describe chemical processes with energy diagrams and apply thermodynamics and kinetics toward understanding reactions and mechanisms. 7. Compare the differences between substitution (SN 1, SN2) and elimination (E1, E2) reactions. 8. Describe the important reactions of alkenes and alkynes and the mechanisms by which they occur. Credits: 3.00

CHM 26200 - Organic Chemistry II

Credit Hours: 3.00. A continuation of CHM 26100, but a broader scope. The chemistry of a variety of functional groups is discussed. Theory is employed extensively to demonstrate the coherence underlying seemingly diverse transformations. Qualitative organic analysis is introduced, with particular emphasis on spectroscopic methods.

Learning Outcomes: 1. Learn to recognize recurring themes and patterns of reactivity of functional groups. 2. Develop an understanding of organic structure-property relationships. 3. Use spectrometric and spectroscopic techniques to determine the structures of organic molecules. 4. Apply an understanding of reaction mechanisms to new transformations of organic molecules. 5. Recognize different classes of biomacromolecules, lipids, and synthetic polymers. 6. Recognize the role that organic chemistry plays as an enabling science in pharmaceutical, agricultural, electronic/photonic materials and commodity chemical industries. Credits: 3.00

CHM 26300 - Organic Chemistry Laboratory I

Credit Hours: 1.00. Laboratory experiments designed to illustrate the lecture material of CHM 26100. Elementary laboratory techniques essential to organic chemistry are introduced, followed by the actual syntheses and purification of compounds discussed in CHM 26100.

Learning Outcomes: 1. Use theory to understand/predict experimental observations. 2. Demonstrate an understanding of the physical properties and a molecular understanding of chemical reactivity and materials. 3. Document scientific information and experimental data and write scientific reports, with graphical presentation of data. 4. Plan and perform chemical transformations. 5. Recognize and use chemical instrumentation and spectroscopy. 6. Identify and handle hazardous materials. Credits: 1.00

CHM 26400 - Organic Chemistry Laboratory II

Credit Hours: 1.00. A continuation of CHM 26300 in that the experiments are designed to illustrate principles discussed in

CHM 26200. A major portion of the course is devoted to methods employed in organic qualitative analysis. The student is expected to identify several unknown compounds and mixtures.

Learning Outcomes: 1. Use theory to understand/predict experimental observations. 2. Demonstrate an understanding of the physical properties and a molecular understanding of chemical reactivity and materials. 3. Document scientific information and experimental data and write scientific reports, with graphical presentation of data. 4. Plan and perform chemical transformations. 5. Recognize and use chemical instrumentation and spectroscopy. 6. Identify and handle hazardous materials. Credits: 1.00

CHM 37000 - Topics In Physical Chemistry

Credit Hours: 3.00. Kinetic theory of gases; statistical thermodynamics; quantum mechanics; atomic and molecular structure and spectroscopy; properties of ionic phases. May not be used to satisfy requirements for graduation in chemistry.

Credits: 3.00

MA 26100 - Multivariate Calculus (UCC: QR)

Credit Hours: 4.00. Planes, lines, and curves in three dimensions. Differential calculus of several variables; multiple integrals. Introduction to vector calculus. Not open to students with credit in MA 17400 or 27100.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Know the equations for lines, planes and quadric surfaces in three dimensional space, and understand how these equations relate to the geometry. 2. Understand the relationship between vector functions and parametrized motion; know how to calculate velocity, acceleration, arc length and curvature. 3. Know the meaning of partial derivatives and how to calculate them. Know the multivariable chain rule. 4. Know the meaning of the gradient, how to calculate it, and how to apply it to directional derivatives and maximum and minimum values. 5. Understand the meaning of double and triple integrals; know how to compute them and how to apply them. 6. Understand the meaning of vector fields and line integrals. Know Green's theorem and be able to apply it. 7. Understand the meaning of surface integrals and know how to calculate them. Know Stokes' theorem and be able to apply it. Credits: 4.00

PHYS 24100 - Electricity And Optics (UCC: SCI)

Credit Hours: 3.00. Electrostatics, current electricity, electromagnetism, magnetic properties of matter. Electromagnetic waves, geometrical and physical optics.

University Core Curriculum (UCC): (UCC: SCI)

Credits: 3.00

CHM 11610 - General Chemistry II

Credit Hours: 3.00. A continuation of CHM 11510 (General Chemistry I). Topics covered can include solutions, quantitative equilibria in aqueous solutions, thermodynamics, oxidation-reduction and electrochemistry, chemical kinetics, qualitative analysis, and further descriptive chemistry of metals and nonmetals.

Learning Outcomes: 1. Use theory to understand/predict experimental observations. 2. Demonstrate and understand key concepts and principles in chemistry, including the basic theory involved in chemical reactions, thermodynamics, equilibrium, and kinetics. Credits: 3.00

CHM 11620 - General Chemistry II - Laboratory (UCC: SCI)

Credit Hours: 1.00. In-person laboratory class to accompany CHM 11610. Topics covered can include chemical reactions, thermodynamics, equilibrium, rates, kinetics, quantitative analysis, and acid-base equilibria.

University Core Curriculum (UCC): (UCC: SCI)

Learning Outcomes: 1. Understand how scientific equipment and analog and/or digital instruments are used to obtain data measurements. 2. Understand safe laboratory practices and proper chemical hygiene methods associated with an experiment. 3. Develop observational skills during experiments to collect quality data and articulate observations

in their laboratory reports. 4. Maintain ethical and trustworthy recordkeeping and reporting methods: recording data precisely, deciding on when a data set is kept or discarded for the experiments performed. 5. Analyze experimentally obtained data by using calculations and mathematical analysis techniques, such as graphical analysis of data sets. 6. Interpret experimental data and analyze this data using scientific models, concepts, representations, and equations. 7. Use evidenced-based reasoning to make claims and critique results. Make connections between lab results and the theories/concepts learned in lecture. 8. Use safe practices, proper chemical hygiene, and standard protocols while in a laboratory. 9. Collect and record digital data sets using modern data collection techniques including wireless data collection and cloud-based data storage. 10. Work with a partner(s) to accomplish laboratory work. 11. Experience chemistry in-person through direct use of chemicals, laboratory equipment, and instrumentation to complete a laboratory experiment. Credits: 1.00

CHM 11630 - General Chemistry II - Virtual Laboratory (UCC: SCI)

Credit Hours: 1.00. Online laboratory class to accompany CHM 11610. Topics covered can include chemical reactions, thermodynamics, equilibrium, rates, kinetics, quantitative analysis, and acid-base equilibrium.

University Core Curriculum (UCC): (UCC: SCI) Learning Outcomes: 1. Understand how scientific equipment and analog and/or digital instruments are used to obtain data measurements. 2. Understand safe laboratory practices and proper chemical hygiene methods associated with an experiment. 3. Develop observational skills during experiments to collect quality data and articulate observations in their laboratory reports. 4. Maintain ethical and trustworthy recordkeeping and reporting methods: recording data precisely, deciding on when a data set is kept or discarded for the experiments performed. 5. Analyze experimentally obtained data by using calculations and mathematical analysis techniques, such as graphical analysis of data sets. 6. Interpret experimental data and analyze this data using scientific models, concepts, representations, and equations. 7. Use evidenced-based reasoning to make claims and critique results. Make connections between lab results and the theories/concepts learned in lecture. Credits: 1.00

General Education Requirements (18 credits)

Electives - Credit Hours: 0.00-12.00

Supplemental List

Optional Concentrations

Grade Requirements

GPA Requirements

Course Requirements and Notes

Pass/No Pass Policy

Sample Chemical Engineering Plan of Study

Fall 2nd Year

CHE 20000 - Chemical Engineering Seminar

Credit Hours: 1.00. An orientation course to inform students of the various areas in chemical engineering, to assist them in selection of electives suited to their particular abilities and interest, and to instill a sense of professional ethics and responsibility. Lectures drawn from all fields of chemical engineering.

Learning Outcomes: 1. Demonstrate an understanding of the need for academic and professional integrity and ethical behavior. 2. Demonstrate an understanding of contemporary issues encountered in the professional practice of chemical engineering including business practices, environmental, health, and safety issues and other public interests. 3. Demonstrate an appreciation of the need for engaging in life-long learning to maintain and enhance the professional practice of chemical engineering. Credits: 1.00

CHE 20500 - Chemical Engineering Calculations

Credit Hours: 4.00. Quantitative applications of steady-state mass and energy balances to solve problems involving multi-component systems and multi-unit chemical processes. Single-component and multi-component phase equilibria, single-reaction and multiple-reaction stoichiometry, coupled mass and energy balances, chemical processes involving bypass and recycle streams.

Learning Outcomes: 1. Estimate physical properties of real chemical systems. 2. Evaluate introductory single-component and multi-component phase equilibria and incorporate these concepts into solutions of mass and energy balance problems. 3. Solve steady state and transient mass and energy balance problems for both reacting and non-reacting systems with or without recycle using analytical and computational methods. 4. Work professionally and ethically in teams to solve new mass and energy balance problems. 5. Identify contemporary chemical engineering problems, including their societal, environmental, and global impacts. Credits: 4.00

CHM 26100 - Organic Chemistry I

Credit Hours: 3.00. A comprehensive study of the chemical principles underlying aliphatic and aromatic compounds. The syntheses and reactions of these materials are discussed. Modern theory and stereochemistry are stressed to illustrate the logic inherent in the subject matter and to demonstrate the predictability of many chemical transformations. Recommended for students majoring in chemical engineering. If not a chemical engineering major, see CHM 26505 Organic Chemistry.

Learning Outcomes: 1. Draw the structures (geometries and structures) of carbon-based molecules) using acceptable representations and identify common classes of organic compounds. 2. Draw and recognize resonance forms of a structure (resonance structures) and assess their importance. 3. Determine the name of organic compounds by using the IUPAC naming system. Predict the structure when given the name. Recognize its common name. 4. Recognize the 3-dimensional shapes of molecules, as determined by structural conformation and stereochemistry. 5. Use mass spectrometry and IR and NMR spectroscopy to determine the structures of organic molecules. 6. Describe chemical processes with energy diagrams and apply thermodynamics and kinetics toward understanding reactions and mechanisms. 7. Compare the differences between substitution (SN 1, SN2) and elimination (E1, E2) reactions. 8. Describe the important reactions of alkenes and alkynes and the mechanisms by which they occur. Credits: 3.00

CHM 26300 - Organic Chemistry Laboratory I

Credit Hours: 1.00. Laboratory experiments designed to illustrate the lecture material of CHM 26100. Elementary laboratory techniques essential to organic chemistry are introduced, followed by the actual syntheses and purification of compounds discussed in CHM 26100.

Learning Outcomes: 1. Use theory to understand/predict experimental observations.

2. Demonstrate an understanding of the physical properties and a molecular understanding of chemical reactivity and materials. 3. Document scientific information and experimental data and write scientific reports, with graphical presentation of data. 4. Plan and perform chemical transformations. 5. Recognize and use chemical instrumentation and spectroscopy. 6. Identify and handle hazardous materials. Credits: 1.00

MA 26100 - Multivariate Calculus (UCC: QR)

Credit Hours: 4.00. Planes, lines, and curves in three dimensions. Differential calculus of several variables; multiple integrals. Introduction to vector calculus. Not open to students with credit in MA 17400 or 27100.

University Core Curriculum (UCC): (UCC: QR)
Learning Outcomes: 1. Know the equations for lines, planes and quadric surfaces in three dimensional space, and understand how these equations relate to the geometry. 2. Understand the relationship between vector functions and parametrized motion; know how to calculate velocity, acceleration, arc length and curvature. 3. Know the meaning of partial derivatives and how to calculate them. Know the multivariable chain rule. 4. Know the meaning of the gradient, how to calculate it, and how to apply it to directional derivatives and maximum and minimum values. 5. Understand the meaning of double and triple integrals; know how to compute them and how to apply them. 6. Understand the meaning of vector fields and line integrals. Know Green's theorem and be able to apply it. 7. Understand the meaning of surface integrals and know how to calculate them. Know Stokes' theorem and be able to apply it. Credits: 4.00

PHYS 24100 - Electricity And Optics (UCC: SCI)

Credit Hours: 3.00. Electrostatics, current electricity, electromagnetism, magnetic properties of matter. Electromagnetic waves, geometrical and physical optics.

University Core Curriculum (UCC): (UCC: SCI)
Credits: 3.00

16 Credits

Spring 2nd Year

CHE 21100 - Introductory Chemical Engineering Thermodynamics

Credit Hours: 4.00. Basic principles and concepts of thermodynamics applied to chemical engineering problems; use of basic thermodynamic functions of enthalpy, entropy, free energy to solutions, phase equilibria, and chemical equilibria; thermodynamic processes and efficiencies; equations of state; and relation of macroscopic to molecular properties.

Learning Outcomes: 1. Apply the First Law of thermodynamics in the analysis of closed and open systems. 2. Apply the Second Law of thermodynamics in the analysis of closed and open systems, and reversible and irreversible processes, including power cycles. 3. Derive and apply thermodynamic relations and relationships between thermodynamic potentials. 4. Estimate the physical properties of ideal and non-ideal fluids. 5. Use chemical potentials, fugacities and activity coefficients to analyze the phase equilibrium behavior of ideal and non-ideal fluids. 6. Use chemical potentials, fugacities and activity coefficients to evaluate single and multi-component chemical reaction equilibria for ideal and non-ideal fluids. 7. Utilize computational tools in the solution of thermodynamics problems. Credits: 4.00

CHE 32000 - Statistical Modeling And Quality Enhancement

Credit Hours: 3.00. Statistical modeling methods, design of experiments, error analysis, curve fitting and regression, analysis of variance, confidence intervals, quality control and enhancement: emphasizes preparation for designing chemical engineering laboratory experiments and analyzing data.

Learning Outcomes: 1. Utilize the concepts of probability for use with the normal and t distributions, confidence intervals, and

hypothesis testing. 2. Apply least squares fitting of data by use of linear algebra with computers. 3. Apply regression and model building from data with experimental error obtained with replicates to establish an adequate model. 4. Design experiments for single and multiple factors and apply regression to model the results. 5. Apply propagation of error and sources of variation or variance components. 6. Apply statistical quality control and improvement with various charts such as average, range, and cusum (concepts of consumer and producer risk and capability index are included). Credits: 3.00

CHM 26200 - Organic Chemistry II

Credit Hours: 3.00. A continuation of CHM 26100, but a broader scope. The chemistry of a variety of functional groups is discussed. Theory is employed extensively to demonstrate the coherence underlying seemingly diverse transformations. Qualitative organic analysis is introduced, with particular emphasis on spectroscopic methods.

Learning Outcomes: 1. Learn to recognize recurring themes and patterns of reactivity of functional groups. 2. Develop an understanding of organic structure-property relationships. 3. Use spectrometric and spectroscopic techniques to determine the structures of organic molecules. 4. Apply an understanding of reaction mechanisms to new transformations of organic molecules. 5. Recognize different classes of biomacromolecules, lipids, and synthetic polymers. 6. Recognize the role that organic chemistry plays as an enabling science in pharmaceutical, agricultural, electronic/photonic materials and commodity chemical industries. Credits: 3.00

CHM 26400 - Organic Chemistry Laboratory II

Credit Hours: 1.00. A continuation of CHM 26300 in that the experiments are designed to illustrate principles discussed in CHM 26200. A major portion of the course is devoted to methods employed in organic qualitative analysis. The student is expected to identify several unknown compounds and mixtures.

Learning Outcomes: 1. Use theory to understand/predict experimental observations. 2. Demonstrate an understanding of the physical properties and a molecular understanding of chemical reactivity and materials. 3. Document scientific information and experimental data and write scientific reports, with graphical presentation of data. 4. Plan and perform chemical transformations. 5. Recognize and use chemical instrumentation and spectroscopy. 6. Identify and handle hazardous materials. Credits: 1.00

17 Credits

Fall 3rd Year

CHE 30600 - Design Of Staged Separation Processes

Credit Hours: 3.00. The application of equilibria and mass and energy balances for the design of staged separation processes. Use of various equilibrium data and thermodynamic principles for the design of batch and continuous distillation, absorption, stripping, and extraction systems. Stagewise calculations and graphical methods for design of binary systems. Design of multicomponent separators. Determination of stage efficiency and column size.

Learning Outcomes: 1. Utilize the concepts and relations of phase equilibria, particularly VLE, in the analysis, design, and simulation of separation processes. 2. Use mass and energy balances in the analysis of separation processes. 3. Use the McCabe-Thiele diagram for the solution of problems in binary separations. 4. Use reflux and multi-stage cascades to increase separation of a given component. 5. Use process simulators for binary and multi-component systems to solve, understand, and design separation processes. 6. Apply the basic principles of distillation, absorption/stripping, extraction and other unit operations for the solution of problems in

separations. 7. Identify the safety aspects of various separation processes. 8. Communicate effectively the results of a designed separation process in writing. Credits: 3.00

CHE 37700 - Momentum Transfer

Credit Hours: 4.00. Differential (microscopic) and integral (macroscopic) mass, momentum, and energy balances. Newtonian and non-Newtonian fluids. Fluid statics. One-dimensional steady and transient laminar flows. Turbulence. Dimensional analysis and similarity. Friction factors and drag coefficients. Applications to engineering analysis of practical problems. Introduction to numerical analysis and visualization of flows.

Learning Outcomes: 1. Explain the physical properties of a fluid and the consequences of such properties on fluid flow. 2. Apply momentum and/or force balances to the analysis of problems in hydrostatics. 3. Apply mass, momentum and energy balances for the solution of problems involving inviscid, steady flow. 4. Use appropriate macroscopic and microscopic mass, momentum, and energy balances to analyze steady laminar and turbulent flow of incompressible fluids in conduits and past submerged bodies. 5. Apply dimensional analysis and kinematic similarity for the interpretation of experimental fluid flow data and the design of fluid transfer equipment. 6. Utilize appropriate mass, momentum and energy balances for the design of fluid transfer equipment (pipelines, agitated vessels, pumps, etc.) and to analyze its operation. 7. Work professionally and ethically in teams to conduct fluid mechanics-based laboratory experiments. 8. Effectively report results in written form and practice safety as an integral part of laboratory work. Credits: 4.00

CHM 37000 - Topics In Physical Chemistry

Credit Hours: 3.00. Kinetic theory of gases; statistical thermodynamics; quantum mechanics; atomic and molecular structure and spectroscopy; properties of ionic phases. May not be used to satisfy requirements for graduation in chemistry. Credits: 3.00

16 Credits

Spring 3rd Year

CHE 30000 - Chemical Engineering Seminar

Credit Hours: 1.00. Continuation of CHE 20000. Lectures to acquaint the junior students with professional ethics, career choices, including graduate studies, and services of professional societies.

Learning Outcomes: 1. Identify the wide range of career opportunities offered by the Bachelor in Chemical Engineering degree. 2. Demonstrate an understanding of the need for developing leadership skills, professional integrity and ethical decision making in the professional practice of chemical engineering. 3. Demonstrate an understanding of contemporary issues encountered in the professional practice of chemical engineering including business practices, environmental, health, and safety issues and other public interests. 4. Demonstrate an appreciation of the need for engaging in life-long learning to maintain and enhance the professional practice of chemical engineering. Credits: 1.00

CHE 34800 - Chemical Reaction Engineering

Credit Hours: 4.00. Application of kinetic rate equations, mass balances and energy balances to the analysis and design of chemical reactors involving homogeneous and heterogeneous chemical reactions. Chemical equilibria, kinetic rate equations for homogeneous and heterogeneously catalyzed reactions, design of ideal isothermal reactors, effects of non-isothermal operation, effects of diffusion in porous catalysts and non-ideal mixing in continuous flow reactors.

Learning Outcomes: 1. Apply fundamental material balances to derive the design equations for CSTR, PFR, PBR, and batch reactors. 2. Derive rate expressions from both elementary steps and reaction kinetics data for both homogeneous and heterogeneous

reactions. 3. Use material and energy balances with kinetic data for both single and multiple reactions to design and analyze the behavior of isothermal and non-isothermal reactors. 4. Utilize effectiveness factors governing the coupling of reaction and diffusion in the description of heterogeneously catalyzed reactions. 5. Work professionally and ethically in teams to conduct reaction-based laboratory experiments. 6. Effectively report results in written form and practice safety as an integral part of laboratory work. 7. Apply appropriate computational tools for the solution of chemical reaction engineering problems. Credits: 4.00

CHE 37800 - Heat And Mass Transfer

Credit Hours: 4.00. Macroscopic and differential energy balances. Heat transfer coefficients for free and forced convection and phase change. Conductive and radiative heat transfer. Applications to heat transfer equipment design and compressible fluid flow. Macroscopic and differential species balances. Mass transfer coefficients and analogies. Mass transfer with and without chemical reaction. Mass transfer equipment design.

Learning Outcomes: 1. Identify and explain the three mechanisms of heat transfer: conduction, convection, and radiation. 2. Apply microscopic and macroscopic thermal energy balances incorporating Fourier's Law for the solution of problems describing steady-state and transient conduction, including convective heat transfer. 3. Utilize mass and thermal energy balances for the design of heat transfer equipment and the analysis of its operation. 4. Identify and explain the two main mechanisms of mass transfer: convection and diffusion. 5. Apply microscopic and macroscopic species mass balances incorporating Fick's Law for the solution of problems describing steady-state and transient diffusion, including relevant rate equations and convective mass transfer. 6. Identify and apply the analogies between momentum, heat, and mass transfer. 7. Utilize mass balances and appropriate phase equilibrium relations for the design of continuous mass transfer equipment and the analysis of its operation. 8. Work professionally and ethically in teams to conduct heat and mass transfer-based laboratory experiments. 9. Effectively report results in written form and practice safety as an integral part of laboratory work. Credits: 4.00

18 Credits

Fall 4th Year

CHE 40000 - Chemical Engineering Seminar

Credit Hours: 1.00. Continuation of CHE 30000. Lectures to acquaint the senior students with professional ethics, services of professional societies, and help them in the transition from being an undergraduate student to becoming a successful professional or graduate student.

Learning Outcomes: 1. Demonstrate an understanding of the need for developing leadership skills, professional integrity and ethical decision making in the professional practice of chemical engineering. 2. Demonstrate an understanding of contemporary issues encountered in the professional practice of chemical engineering including business practices, environmental, health, and safety issues and other public interests. 3. Identify the wide-reaching effects that engineering decisions have on society, our global community and our natural environment. 4. Demonstrate an appreciation of for engaging in life-long learning to maintain and enhance the professional practice of chemical engineering. Credits: 1.00

CHE 42000 - Process Safety Management And Analysis

Credit Hours: 3.00. Develop knowledge of process safety management and analysis in the process industries, including hazard identification, hazard analysis and risk management.

Learning Outcomes: 1. Demonstrate knowledge and understanding of the elements of process

safety management. 2. Apply the techniques, analytical skills, and modern computational tools necessary for performing process safety calculations in the design of safety. 3. Demonstrate an understanding and appreciation of the need for professional integrity and ethical decision making to promote safety in the workplace. 4. Be able to pro-actively identify and analyze safety hazards. 5. Demonstrate an understanding of the detrimental effects of the unsafe operation of chemical facilities on environmental, health, and safety issues and other public interests. Our graduate will be aware of the wide-reaching effects that engineering decisions have on society, our global community and our natural environment. 6. Demonstrate knowledge and understanding of risk management tools, programs and processes associated with process safety. Credits: 3.00

CHE 43500 - Chemical Engineering Laboratory

Credit Hours: 4.00. Quantitative experimental study of projects involving problems in fluid mechanics and heat and mass transfer or operation and evaluation of equipment; projects include analysis and data-based design of operations involving mass transfer such as distillation, absorption, drying, humidification, etc; study of rates and equilibria in simple chemical reaction systems; study of chemical processes; application of methods of data analysis in practice; some library work; emphasis on group work, report writing, and oral communication.

Learning Outcomes: 1. Determine the intrinsic performance data required to complete the design of a given process or process equipment. 2. Design and conduct an experimental program to determine the required performance data. 3. Use the requisite performance data to obtain a technically feasible and economical design to meet desired needs. 4. Effectively report experimental results, performance data analyses and process designs both orally and in writing. 5. Use appropriate analytical and computational tools for the analysis and design of experiments. 6. Work effectively as a member of an engineering team in a professional and ethical manner, including different team roles. 7. Practice appropriate experimental safety measures. Credits: 4.00

CHE 45600 - Process Dynamics And Control

Credit Hours: 3.00. Dynamic response and control of chemical processing equipment, such as heat exchangers, chemical reactors, and absorption towers. Use is made of fundamental techniques of servomechanism theory, such as block diagrams, transfer functions, and frequency response. Introduction to advanced control techniques.

Learning Outcomes: 1. Develop a physically relevant mathematical model as a surrogate for a chemical process. 2. Apply appropriate analytical and computer packages for analyzing the process control behavior based on the developed model. 3. Design, model, and test a hierarchical control system on a complex process. 4. Describe the role of process control in meeting stringent safety, economic, environmental, societal, and corporate goals. 5. Describe the building blocks of process control and their synthesis for providing complete process control solutions. 6. Work effectively in a team to execute process control computer-based assignments in a professional and ethical manner. Credits: 3.00

15-18 Credits

Spring 4th Year

CHE 45000 - Design And Analysis Of Processing Systems

Credit Hours: 4.00. Use of process synthesis methods and concepts; detailed design of unit operation equipment, the economics of chemical plants and flow sheet optimization methods. Synthesize, develop, and evaluate a preliminary design of a chemical process that meets market requirements for a specific product. Analysis of design alternatives using case studies and optimization methods.

Learning Outcomes: 1. Apply systematic strategies for synthesizing chemical process designs that involve conventional unit operations. 2. Describe both the difference between steady state and batch chemical processes and the implications on their design and operation. 3. Demonstrate the ability to obtain reliable information on industrial chemical processes, process operating parameters, equipment costs, cost of chemicals and materials, and associated safety and environmental hazards. 4. Describe the role of physical property estimates on process design and be able to use appropriate physical property estimation methods in unit operations design. 5. Estimate the capital and operating cost of a process and to assess its profitability. 6. Use process simulators and other tools to perform detailed analyses for the successful design of a chemical plant. 7. Communicate effectively project progress and final results in a professional manner both orally and in writing. 8. Work effectively in a team to execute open-ended design projects with time-bound deliverables in a professional and ethical manner, including different team roles. Credits: 4.00

16 Credits

Chemistry (ACS), BSCH

About the Program

Degree Requirements

Departmental/Program Major Courses (68-75 credits)

Required Major Courses (42-44 credits)

CHM 12500 - Introduction To Chemistry I (UCC: SCI)

Credit Hours: 5.00. Principles of chemistry including stoichiometry; atomic structure and chemical bonding; properties of gases, liquids, and solids; thermochemistry; descriptive inorganic chemistry. Recommended for entering students intending to major in chemistry. One year of high school chemistry or one semester of college chemistry required.

University Core Curriculum (UCC): (UCC: SCI) Learning Outcomes: 1. Demonstrate competency of chemistry concepts through solving of numerical-based chemistry problems. 2. Demonstrate a mastery of concepts, theories, and ideas of chemistry topics specific to this course. 3. Connect chemistry topics in this course to real-world problems and solutions that you and others experience. 4. Meet laboratory learning objectives. Credits: 5.00

CHM 12600 - Introduction To Chemistry II (UCC: SCI)

Credit Hours: 5.00. A continuation of CHM 12500 . Properties of solutions; chemical equilibrium calculations; elementary thermodynamics; oxidation-reduction reactions and electrochemical cells; rates of reaction; qualitative analysis; descriptive chemistry.

University Core Curriculum (UCC): (UCC: SCI) Credits: 5.00

CHM 19400 - Freshman Chemistry Orientation

Credit Hours: 1.00. Designed to provide incoming chemistry majors with the academic, survival, and computational skills to make a successful transition from high school to college. Discussion of opportunities within the chemistry department including degree options, co-op program, undergraduate research, careers in chemistry, use of spreadsheet software, graphing packages, and drawing programs for chemical structures. Attendance and performance on assigned projects are the basis of the assigned grades.

Credits: 1.00

CHM 24100 - Introductory Inorganic Chemistry

Credit Hours: 4.00. Descriptive inorganic chemistry dealing in a systematic way with the elements and the structures, properties,

and reactions of their compounds. Required of students majoring in chemistry.

Credits: 4.00

CHM 26500 - Organic Chemistry Laboratory I

Credit Hours: 2.00. Similar to CHM 26300 except that a larger number and more sophisticated organic syntheses are required. The preparations are designed not only to illustrate the classical reactions discussed in CHM 26100 or 26505, but to allow for an extrapolation of the principles involved to other systems.

Learning Outcomes: 1. Use theory to understand/predict experimental observations. 2. Demonstrate an understanding of the physical properties and a molecular understanding of chemical reactivity and materials. 3. Document scientific information and experimental data and write scientific reports, with graphical presentation of data. 4. Plan and perform chemical transformations. 5. Recognize and use chemical instrumentation and spectroscopy. 6. Identify and handle hazardous materials. Credits: 2.00

CHM 26505 - Organic Chemistry I

Credit Hours: 3.00. A comprehensive study of the chemical principles underlying aliphatic and aromatic compounds. The syntheses and reactions of these materials are discussed. Modern theory and stereochemistry are stressed to illustrate the logic inherent in the subject matter and to demonstrate the predictability of many chemical transformations. Recommended for students majoring in chemistry.

Learning Outcomes: 1. Draw the structures (geometries and structures) of carbon-based molecules) using acceptable representations and identify common classes of organic compounds. 2. Draw and recognize resonance forms of a structure (resonance structures) and assess their importance. 3. Determine the name of organic compounds by using the IUPAC naming system. Predict the structure when given the name. Recognize its common name. 4. Recognize the 3-dimensional shapes of molecules, as determined by structural conformation and stereochemistry. 5. Use mass spectrometry and IR and NMR spectroscopy to determine the structures of organic molecules. 6. Describe chemical processes with energy diagrams, and apply thermodynamics and kinetics toward understanding reactions and mechanisms. 7. Compare the differences between substitution (SN 1, SN2) and elimination (E1,E2) reactions. 8. Describe the important reactions of alkenes and alkynes and the mechanisms by which they occur. Credits: 3.00

CHM 26605 - Organic Chemistry II

Credit Hours: 3.00. A continuation of CHM 26505, but a broader scope. The chemistry of a variety of functional groups is discussed. Theory is employed extensively to demonstrate the coherence underlying seemingly diverse transformations. Qualitative organic analysis is introduced, with particular emphasis on spectroscopic methods.

Learning Outcomes: 1. Learn to recognize recurring themes and patterns of reactivity of functional groups. 2. Develop an understanding of organic structure-property relationships. 3. Use spectrometric and spectroscopic techniques to determine the structures of organic molecules. 4. Apply an understanding of reaction mechanisms to new transformations of organic molecules. 5. Recognize different classes of biomacromolecules, lipids, and synthetic polymers. 6. Recognize the role that organic chemistry plays as an enabling science in pharmaceutical, agricultural, electronic/photonic materials and commodity chemical industries. Credits: 3.00

CHM 26700 - Organic Chemistry Laboratory I Honors

Credit Hours: 2.00. Laboratory experiments designed to accompany the lecture material of CHM 26505, but at an advanced level. Modern instrumentation is introduced to supplement the usual elementary laboratory techniques of organic chemistry. Multistep syntheses are employed to illustrate and supplement the reactions discussed in CHM 26505.

Learning Outcomes: 1. Able to use theory to

understand/predict experimental observations. 2. Able to demonstrate an understanding of the physical properties and a molecular understanding of chemical reactivity and materials. 3. Able to document scientific information and experimental data and write scientific reports, with graphical presentation of data. 4. Able to plan and perform chemical transformations. 5. Able to recognize and use chemical instrumentation and spectroscopy. 6. Able to identify and handle hazardous materials. Credits: 2.00

CHM 29400 - Sophomore Chemistry Seminar

Credit Hours: 1.00. Discussion of undergraduate research opportunities, upper-division courses, career opportunities, laboratory safety, use of the library and chemical information, and topics of current interest in chemistry. Required of sophomores majoring in any chemistry curriculum.

Credits: 1.00

CHM 37300 - Physical Chemistry I

Credit Hours: 3.00. Physical chemistry of matter. Properties of gases, liquids, and solids; equations of state; thermodynamics; energy, heat, and work; entropy; spontaneity and equilibrium; chemical potential; chemical equilibrium; phase diagrams; colligative properties.

Learning Outcomes: 1. Understand universal physical laws as they apply to chemistry. 2. Use theory to understand/predict experimental observations. 3. Demonstrate an understanding of the physical properties and a molecular understanding of chemical reactivity and materials. 4. Develop problem-solving skills: identifying the objective. 5. Carry out calculations related to specific chemistry topics. 6. Understand energetics and kinetics of chemical transformations. 7. Reduce complex problems into simpler components. Credits: 3.00

CHM 37301 - Physical Chemistry Laboratory I

Credit Hours: 1.00. A physical chemistry laboratory course that will provide students with hands-on experience that illustrates the core concepts presented in the associated physical chemistry lecture course CHM 37300.

Learning Outcomes: 1. Gain some familiarity with modern instrumentation methods in Physical Chemistry, including UV/Vis spectroscopy and pressure-detected chemical kinetics. 2. Learn Python programming syntax for reading, plotting, and fitting experimental data. 3. Understand how the abstract principles described in CHM 37300 show up in the real world. 4. Learn good laboratory notebook habits for recording and organizing experimental data. Credits: 1.00

CHM 37400 - Physical Chemistry II

Credit Hours: 3.00. Physical chemistry of molecules. Wave properties of matter; quantum mechanics of translation, rotation, and vibration; atomic structure; molecular orbitals; quantum states; statistical mechanics; chemical kinetics; collision theory; transition state theory.

Learning Outcomes: 1. Give examples that demonstrate the fundamental principles in quantum mechanics. 2. Apply simple quantum mechanical models such as particle-in-a-box to atomic and molecular structures to predict wave functions and calculate energy levels. 3. Interpret simple optical spectroscopy of atoms and molecules based on quantum mechanical principles. Credits: 3.00

CHM 49400 - Junior-Senior Chemistry Seminar

Credit Hours: 1.00. Major emphasis on developing skills in oral and written presentations by students. The subject matter can be library material and/or accomplishments in undergraduate or co-op research. Department permission required.

Credits: 1.00

CHM 43300 - Biochemistry

Credit Hours: 3.00. A rigorous one-semester introduction to biochemistry, with in-depth coverage of biology at a molecular level. Topics covered include the classes of biological macromolecules, enzyme kinetics and inhibition, and significant metabolic pathways.

Learning Outcomes: 1. Understand the defining features of all four classes of macromolecules

(Nucleic acids, Proteins, Lipids and carbohydrates) in detail. 2. Understand enzyme kinetics and various classes of inhibitors. 3. Develop an understanding for various metabolic pathways including glycolysis, gluconeogenesis, the citric acid cycle, electron transport chain, oxidative phosphorylation, glycogen metabolism, glycogen metabolism at a cellular level in healthy and diseased patients. 4. Able to predict biochemical outcome in case of specific defect in a pathway. 5. Develop an in depth understanding of central foundations of biology at a molecular level. Credits: 3.00

CHM 11510 - General Chemistry I

Credit Hours: 3.00. The foundational general chemistry course for engineering, science, and some agricultural majors. Prior knowledge of chemistry is strongly suggested. Topics covered can include thermochemistry, nuclear chemistry, quantum theory and atomic structure, periodic trends, models in bonding, shapes of molecules, intermolecular forces, organic chemistry, synthetic and biological polymers, and phase changes.

Learning Outcomes: 1. Use theory to understand/predict experimental observations. 2. Demonstrate and understand key concepts and principles in chemistry, including the basic theory involved in chemical bonding, structure, reactions, and thermodynamics. Credits: 3.00

CHM 11520 - General Chemistry I - Laboratory (UCC: SCI)

Credit Hours: 1.00. In-person laboratory class to accompany CHM 11510. Topics covered can include lab safety, measurement, thermodynamics, quantitative analysis, stoichiometry, chromatography, and crystallography.

University Core Curriculum (UCC): (UCC: SCI)

Learning Outcomes: 1. Understand how scientific equipment and analog and/or digital instruments are used to obtain data measurements. 2. Understand safe laboratory practices and proper chemical hygiene methods associated with an experiment. 3. Develop observational skills during experiments to collect quality data and articulate observations in their laboratory reports. 4. Maintain ethical and trustworthy recordkeeping and reporting methods: recording data precisely, deciding on when a data set is kept or discarded for the experiments performed. 5. Analyze experimentally obtained data by using calculations and mathematical analysis techniques, such as graphical analysis of data sets. 6. Interpret experimental data and analyze this data using scientific models, concepts, representations, and equations. 7. Use evidenced-based reasoning to make claims and critique results. Make connections between lab results and the theories/concepts learned in lecture. 8. Use safe practices, proper chemical hygiene, and standard protocols while in a laboratory. 9. Collect and record digital data sets using modern data collection techniques including wireless data collection and cloud-based data storage. 10. Work with a partner(s) to accomplish laboratory work. 11. Experience chemistry in-person through direct use of chemicals, laboratory equipment, and instrumentation to complete a laboratory experiment. Credits: 1.00

CHM 11530 - General Chemistry I - Virtual Laboratory (UCC: SCI)

Credit Hours: 1.00. Online laboratory class to accompany CHM 11510. Topics covered can include safety, measurement, thermodynamics, quantitative analysis, stoichiometry, chromatography, and crystallography.

University Core Curriculum (UCC): (UCC: SCI)

Learning Outcomes: 1. Understand how scientific equipment and analog and/or digital instruments are used to obtain data measurements. 2. Understand safe laboratory practices and proper chemical hygiene methods associated with an experiment. 3. Develop observational skills during experiments to collect quality data and articulate observations in their laboratory reports. 4. Maintain ethical and trustworthy recordkeeping and reporting methods: recording data precisely, deciding on

when a data set is kept or discarded for the experiments performed. 5. Analyze experimentally obtained data by using calculations and mathematical analysis techniques, such as graphical analysis of data sets. 6. Interpret experimental data and analyze this data using scientific models, concepts, representations, and equations. 7. Use evidenced-based reasoning to make claims and critique results. Making connections between lab results and the theories/concepts learned in lecture. Credits: 1.00

CHM 11610 - General Chemistry II

Credit Hours: 3.00. A continuation of CHM 11510 (General Chemistry I). Topics covered can include solutions, quantitative equilibria in aqueous solutions, thermodynamics, oxidation-reduction and electrochemistry, chemical kinetics, qualitative analysis, and further descriptive chemistry of metals and nonmetals.

Learning Outcomes: 1. Use theory to understand/predict experimental observations. 2. Demonstrate and understand key concepts and principles in chemistry, including the basic theory involved in chemical reactions, thermodynamics, equilibrium, and kinetics. Credits: 3.00

CHM 11620 - General Chemistry II - Laboratory (UCC: SCI)

Credit Hours: 1.00. In-person laboratory class to accompany CHM 11610. Topics covered can include chemical reactions, thermodynamics, equilibrium, rates, kinetics, quantitative analysis, and acid-base equilibria.

University Core Curriculum (UCC): (UCC: SCI)
Learning Outcomes: 1. Understand how scientific equipment and analog and/or digital instruments are used to obtain data measurements. 2. Understand safe laboratory practices and proper chemical hygiene methods associated with an experiment. 3. Develop observational skills during experiments to collect quality data and articulate observations in their laboratory reports. 4. Maintain ethical and trustworthy recordkeeping and reporting methods: recording data precisely, deciding on when a data set is kept or discarded for the experiments performed. 5. Analyze experimentally obtained data by using calculations and mathematical analysis techniques, such as graphical analysis of data sets. 6. Interpret experimental data and analyze this data using scientific models, concepts, representations, and equations. 7. Use evidenced-based reasoning to make claims and critique results. Make connections between lab results and the theories/concepts learned in lecture. 8. Use safe practices, proper chemical hygiene, and standard protocols while in a laboratory. 9. Collect and record digital data sets using modern data collection techniques including wireless data collection and cloud-based data storage. 10. Work with a partner(s) to accomplish laboratory work. 11. Experience chemistry in-person through direct use of chemicals, laboratory equipment, and instrumentation to complete a laboratory experiment. Credits: 1.00

CHM 11630 - General Chemistry II - Virtual Laboratory (UCC: SCI)

Credit Hours: 1.00. Online laboratory class to accompany CHM 11610. Topics covered can include chemical reactions, thermodynamics, equilibrium, rates, kinetics, quantitative analysis, and acid-base equilibrium.

University Core Curriculum (UCC): (UCC: SCI)
Learning Outcomes: 1. Understand how scientific equipment and analog and/or digital instruments are used to obtain data measurements. 2. Understand safe laboratory practices and proper chemical hygiene methods associated with an experiment. 3. Develop observational skills during experiments to collect quality data and articulate observations in their laboratory reports. 4. Maintain ethical and trustworthy recordkeeping and reporting methods: recording data precisely, deciding on when a data set is kept or discarded for the

experiments performed. 5. Analyze experimentally obtained data by use calculations and mathematical analysis techniques, such as graphical analysis of data sets. 6. Interpret experimental data and analyze this data using scientific models, concepts, representations, and equations. 7. Use evidenced-based reasoning to make claims and critique results. Make connections between lab results and the theories/concepts learned in lecture. Credits: 1.00

CHM 22404 - Quantitative Analysis

Credit Hours: 3.00. Introduction to approaches analytical chemists use to analyze the composition of matter, including statistics, calibration, and understanding chemical equilibrium (acid/base, complexation, solubility, polyprotic acid treatment, acid/base/redox/precipitation titrations); general approaches to analysis at the trace level; recognition and evaluation of possible sources of error and how error propagates; introduction to how light interacts with matter (and how analytical chemists can take advantage of this).

Learning Outcomes: 1. Understand the fundamentals and figures of merit of different analytical techniques. 2. Learn how to properly select an analytical technique for accurate quantitative determination. 3. Perform accurate quantitative measurements. 4. Use Excel or Google Sheets or Python for data analysis and plotting. 5. Analyze the results and determine the experimental uncertainty. 6. Report the experimental data properly. 7. Perform statistical analysis. Credits: 3.00

Analytical Selective (4 credits)

CHM 32100 - Analytical Chemistry I

Credit Hours: 4.00. Quantitative measurements on complex chemical systems that show matrix effects or require isolation of a component prior to its determination; general approaches to quantitative problems at the trace level; critical comparisons of competitive procedures with emphasis on principles of separation processes, including chromatography; recognition and evaluation of possible sources of error; approaches for optimizing conditions so as to minimize time and/or effort required to attain prescribed levels of accuracy and precision. Required of students majoring in chemistry.

Credits: 4.00

CHM 32300 - Analytical Chemistry I Honors

Credit Hours: 4.00. Open to students in the chemistry honors program. Topical coverage similar to CHM 32100. Laboratory will include a group of core experiments plus special experiments designed by students and staff to study original problems related to analytical chemistry.

Credits: 4.00

CHM 42400 - Instrumental Analysis

Credit Hours: 4.00. Principles and application of optical and electrical methods of chemical analysis, including topics in instrumentation.

Learning Outcomes: 1. Able to write scientific reports, with graphical representation of data. 2. Able to document scientific information and experimental data. 3. Able to use theory to understand/predict experimental observations. 4. Able to demonstrate an understanding of the physical properties and a molecular understanding of chemical reactivity and materials. 5. Able to develop problem-solving skills: identifying the objective. 6. Able to make quantitative/structural measurements and interpret results; evaluate data for quality and reliability. 7. Able to recognize and use chemical instrumentation and spectroscopic methods. 8. Able to organize data for meaningful interpretation, including causes of experimental error, limitations of data. 9. Able to use statistics to judge limitation of data; use math to understand data. 10. Able to reduce complex problems into simpler components. 11. Able to practice professional behavior: reliability, punctuality, efficiency. Credits: 4.00

Upper Level Selective (3 credits)

CHM 34200 - Inorganic Chemistry

Credit Hours: 3.00. Interpretation and correlation of the

reactions and properties of inorganic compounds in terms of their electronic and molecular structures. A survey of the preparations and reactivities of important compounds of the representative elements, with an emphasis on group trends. The elementary chemistry of the transition metals, including magnetic and spectral properties of coordination compounds.

Learning Outcomes: 1. Able to use theory to understand universal physical laws as they apply to chemistry. 2. Able to demonstrate an understanding of the physical properties and a molecular understanding of chemical reactivity and materials. 3. Able to develop problem-solving skills: identifying the objective. 4. Able to plan and perform chemical transformations. 5. Able to carry out calculation related to specific chemistry topics. 6. Able to make connections between different courses/subdisciplines in chemistry. Credits: 3.00

CHM 46200 - Intermediate Organic Chemistry

Credit Hours: 3.00. Theory and application of organic chemistry and reaction mechanisms to organic synthesis and contemporary research topics in closely related areas. Topics include stereochemistry, reactive organic intermediates, molecular orbital theory, photochemistry, organic materials chemistry, and chemical biology.

Learning Outcomes: 1. Able to use theory to understand/predict experimental observations. 2. Able to demonstrate an understanding of the physical properties and a molecular understanding of chemical reactivity and materials. 3. Able to plan and perform chemical transformations. 4. Able to present a formal oral summary of a topic in organic chemistry and receive feedback. 5. Able to write a scientific report using the format of the Chemical Society. 6. Able to practice computer literacy: use available online and database tools, especially in the Organic Chemistry field. Credits: 3.00

CHM 49900 - Special Assignments

Credit Hours: 1.00 to 5.00. Undergraduate research. Individual research projects undertaken under faculty direction. Permission of instructor required.

Learning Outcomes: 1. Provide students with an official record of participation in undergraduate research. 2. Provide a practical means for professional training beyond regular coursework. 3. Learn research methodologies, build analytical thinking and problem-solving skills. 4. Develop technical and professional written and verbal communication skills. 5. Develop team building and research project management skills. Credits: 1.00 to 5.00

CHM 43800 - Introduction To Molecular Biotechnology

Credit Hours: 3.00. An examination of modern tools for the characterization, manipulation, and design of nucleic acids and proteins. Topics include DNA technology, recombinant proteins, bioinformatics, genetic modifications, gene expression and the interactions between nucleic acids and proteins.

Learning Outcomes: 1. Understand basics of DNA technology: isolation, amplification, synthesis, sequencing, and cloning. 2. Understand basics of recombinant protein: expressing in prokaryotic and eukaryotic cells, introducing mutations. 3. Understand bioinformatics. 4. Understand introducing genetic modifications to plants and animals and stem cells. 5. Control gene expression and genome editing. 6. Examine nucleic acid interactions and protein interactions, and their application in diagnosis. Credits: 3.00

Laboratory Selectives (3-6 credits)

Area 1

CHM 26600 - Organic Chemistry Laboratory II

Credit Hours: 2.00. A continuation of CHM 26500. All experiments are designed to illustrate the principles discussed in CHM 26200 or 26605. A major portion of the course is devoted to the methods employed in organic qualitative analysis. The student is expected to identify unknowns and mixtures and is introduced to some modern instrumental techniques.

Learning Outcomes: 1. Use theory to understand/predict experimental observations.

2. Demonstrate an understanding of the physical properties and a molecular understanding of chemical reactivity and materials. 3. Document scientific information and experimental data and write scientific reports, with graphical presentation of data. 4. Plan and perform chemical transformations. 5. Recognize and use chemical instrumentation and spectroscopy. 6. Identify and handle hazardous materials. Credits: 2.00

CHM 26800 - Organic Chemistry Laboratory II Honors

Credit Hours: 2.00. A continuation of CHM 26700. Experiments, more sophisticated than those in CHM 26600, are designed to illustrate and extend the concepts presented in CHM 26605. A major portion of the course is devoted to organic qualitative analysis. The student is expected to identify unknown compounds by classical methods as well as by the use of modern instrumentation like infrared gas chromatography and nuclear magnetic resonance.

Learning Outcomes: 1. Use theory to understand/predict experimental observations. 2. Demonstrate an understanding of the physical properties and a molecular understanding of chemical reactivity and materials. 3. Document scientific information and experimental data and write scientific reports, with graphical presentation of data. 4. Plan and perform chemical transformations. 5. Recognize and use chemical instrumentation and spectroscopy. 6. Identify and handle hazardous materials. Credits: 2.00

CHM 32100 - Analytical Chemistry I

Credit Hours: 4.00. Quantitative measurements on complex chemical systems that show matrix effects or require isolation of a component prior to its determination; general approaches to quantitative problems at the trace level; critical comparisons of competitive procedures with emphasis on principles of separation processes, including chromatography; recognition and evaluation of possible sources of error; approaches for optimizing conditions so as to minimize time and/or effort required to attain prescribed levels of accuracy and precision. Required of students majoring in chemistry.

Credits: 4.00

CHM 32300 - Analytical Chemistry I Honors

Credit Hours: 4.00. Open to students in the chemistry honors program. Topical coverage similar to CHM 32100. Laboratory will include a group of core experiments plus special experiments designed by students and staff to study original problems related to analytical chemistry.

Credits: 4.00

CHM 34201 - Inorganic Chemistry Laboratory

Credit Hours: 1.00. Laboratory work to accompany CHM 34200 .

Credits: 1.00

CHM 42400 - Instrumental Analysis

Credit Hours: 4.00. Principles and application of optical and electrical methods of chemical analysis, including topics in instrumentation.

Learning Outcomes: 1. Able to write scientific reports, with graphical representation of data. 2. Able to document scientific information and experimental data. 3. Able to use theory to understand/predict experimental observations. 4. Able to demonstrate an understanding of the physical properties and a molecular understanding of chemical reactivity and materials. 5. Able to develop problem-solving skills: identifying the objective. 6. Able to make quantitative/structural measurements and interpret results; evaluate data for quality and reliability. 7. Able to recognize and use chemical instrumentation and spectroscopic methods. 8. Able to organize data for meaningful interpretation, including causes of experimental error, limitations of data. 9. Able to use statistics to judge limitation of data; use math to understand data. 10. Able to reduce complex problems into simpler components. 11. Able to practice professional behavior: reliability, punctuality, efficiency. Credits: 4.00

CHM 49900 - Special Assignments

Credit Hours: 1.00 to 5.00. Undergraduate research. Individual research projects undertaken under faculty direction.

Permission of instructor required.

Learning Outcomes: 1. Provide students with an official record of participation in undergraduate research. 2. Provide a practical means for professional training beyond regular coursework. 3. Learn research methodologies, build analytical thinking and problem-solving skills. 4. Develop technical and professional written and verbal communication skills. 5. Develop team building and research project management skills. Credits: 1.00 to 5.00

CHM 33901 - Biochemistry Laboratory

Credit Hours: 1.00. CHM 33901 is a laboratory course based on two modules from the Undergraduate Research Inspired Experimental Chemistry Alternatives (URIECA) developed at MIT that are designed to introduce students to cutting-edge research topics in biochemistry. The course provides students with a research-inspired laboratory experience that introduces standard biochemical techniques in the context of investigating a current research topic, for example, acquired resistance to cancer drugs. Techniques include protein expression, purification, and gel analysis, PCR, site-directed mutagenesis, kinase activity assays, and protein structure viewing. CHM 33901 was designed as the 4th semester of the 1-2-1 competency-based curriculum transformation in chemistry as it applies to pre-health professional and life science students at Purdue. However, the course is open to other students who meet the prerequisites.

Learning Outcomes: 1. Demonstrate the ability to think and function as a scientist. 2. Develop an understanding of the scientific process. 3. Develop the ability to document scientific information and experimental data. 4. Demonstrate understanding of the process of scientific inquiry, and explain how scientific knowledge is discovered and validated. 5. Develop observational and interpretive skills through hands-on laboratory or field. 6. Demonstrate ability to measure with precision, accuracy, and safety. 7. Operate basic biochemistry laboratory instrumentation for scientific measurement. 8. Articulate scientific questions and hypotheses, design experiments, acquire data, perform data analysis, and present results in project-based research. 9. Apply knowledge of basic principles of chemistry and their applications to the understanding of biological systems. 10. Make quantitative/structural measurements and interpret results. 11. Demonstrate the ability to work on a team. 12. Demonstrate the ability to communicate well, both orally and in writing. Credits: 1.00

CHM 37401 - Physical Chemistry Laboratory II

Credit Hours: 1.00. A physical chemistry laboratory course that will provide students with hands-on experience that illustrates the core concepts presented in the associated physical chemistry lecture course CHM 37400.

Learning Outcomes: 1. Use modern physical chemistry instrumentation. 2. Collect and analyze data with Python. 3. Interpret data and uncertainties. 4. Demonstrate fundamental principles experimentally of quantum mechanics. 5. Perform Raman spectroscopy to identify various materials. 6. Perform a quantum chemistry simulation with Gaussian software. Credits: 1.00

Area 2

CHM 32100 - Analytical Chemistry I

Credit Hours: 4.00. Quantitative measurements on complex chemical systems that show matrix effects or require isolation of a component prior to its determination; general approaches to quantitative problems at the trace level; critical comparisons of competitive procedures with emphasis on principles of separation processes, including chromatography; recognition and evaluation of possible sources of error; approaches for optimizing conditions so as to minimize time and/or effort required to attain prescribed levels of accuracy and precision. Demonstrate fundamental principles experimentally of quantum mechanics. 5. Perform Raman spectroscopy to identify various materials. 6. Perform a quantum chemistry simulation with Gaussian software. Credits: 1.00

Required Calculus and Physics Courses (16-18 credits)

MA 16100 - Plane Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 5.00. Introduction to differential and integral calculus of one variable, with applications. Some schools or departments may allow only 4 credit hours toward graduation for this course. Designed for students who have not had at least a one-semester calculus course in high school, with a grade of "A" or "B". Not open to students with credit in MA 16500 . Demonstrated competence in college algebra and trigonometry.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions Credits: 5.00

MA 16200 - Plane Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 5.00. Continuation of MA 16100 . Vectors in two and three dimensions, techniques of integration, infinite series, conic sections, polar coordinates, surfaces in three dimensions. Some schools or departments may allow only 4 credit hours toward graduation for this course.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 5.00

MA 16500 - Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 4.00. Introduction to differential and integral calculus of one variable, with applications. Conic sections. Designed for students who have had at least a one-semester calculus course in high school, with a grade of "A" or "B", but are not qualified to enter MA 16200 or MA 16600 or the advanced placement courses MA 17300 or the honors calculus course MA 18100. Demonstrated competence in college algebra and trigonometry. CTL:IMA 1602 Calculus - Long I

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems. 5. To compute

integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions. Credits: 4.00

MA 16600 - Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 4.00. Continuation of MA 16500 . Vectors in two and three dimensions. Techniques of integration, infinite series, polar coordinates, surfaces in three dimensions. Not open to students with credit in MA 16200 . CTL:IMA 1603 Calculus - Long II

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 4.00

PHYS 17200 - Modern Mechanics (UCC: SCI)

Credit Hours: 4.00. Introductory calculus-based physics course using fundamental interactions between atoms to describe Newtonian mechanics, conservation laws, energy quantization, entropy, the kinetic theory of gases, and related topics in mechanics and thermodynamics. Emphasis is on using only a few fundamental principles to describe physical phenomena extending from nuclei to galaxies. 3-D graphical simulations and numerical problem solving by computer are employed by the student from the very beginning. CTL:IPS 1753 Calculus-based Physics I

University Core Curriculum (UCC): (UCC: SCI) Learning Outcomes: 1. Understand and describe a wide range of physical phenomena in mechanics and thermodynamics using only a few fundamental principles of physics. 2. Learn a unified approach that relates microscopic behavior to macroscopic behavior. 3. Model natural phenomena quantitatively. 4. Apply all this to a range of topics related to mechanics and thermodynamics. Credits: 4.00

PHYS 24100 - Electricity And Optics (UCC: SCI)

Credit Hours: 3.00. Electrostatics, current electricity, electromagnetism, magnetic properties of matter. Electromagnetic waves, geometrical and physical optics.

University Core Curriculum (UCC): (UCC: SCI) Credits: 3.00

PHYS 25200 - Electricity And Optics Laboratory

Credit Hours: 1.00. Selected experiments in electric fields, magnetic fields, steady-state and transient DC circuits, thermodynamics, and optics.

Learning Outcomes: 1. Demonstrate the ability to think and function as a scientist. 2. Demonstrate the ability to communicate well, both orally and in writing. 3. Demonstrate the ability to understand the role of scientific observation of Nature in uncovering the Laws of Physics. Credits: 1.00

PHYS 27200 - Electric And Magnetic Interactions (UCC: SCI)

Credit Hours: 4.00. Calculus-based physics course using concepts of electric and magnetic fields and an atomic description of matter to describe polarization, fields produced by charge distributions, potential, electrical circuits, magnetic forces, induction, and related topics, leading to Maxwell's equations and electromagnetic radiation and an introduction to waves and interference. 3-D graphical simulations and numerical problem solving by computer are employed throughout.

University Core Curriculum (UCC): (UCC: SCI) Learning Outcomes: 1. Understand and describe a wide range of physical phenomena in electricity and magnetism using only a few fundamental principles of physics. 2. Learn a unified approach that relates microscopic behavior to macroscopic behavior. 3. Model natural phenomena quantitatively. 4. Apply all this to a range of topics related to electricity and

magnetism. Credits: 4.00

Other Departmental /Program Course Requirements (17-37 credits)

College of Science Additional Requirements

Computing (2-4 credits)

CS 15900 - C Programming

Credit Hours: 3.00. Fundamental principles, concepts, and methods of programming in C, with emphasis on applications in the physical sciences and engineering. Basic problem solving and programming techniques; fundamental algorithms and data structures; and use of programming logic in solving engineering problems. Students are expected to complete assignments in a collaborative learning environment. Credit cannot be obtained for both CS 15900 and any of CS 15600, CS 15800 and CS 18000.

Learning Outcomes: 1. Understand the fundamental principles, concepts and methods of computer programming. 2. Use the C programming language to developing solutions in the domains of physical sciences, mathematics, and engineering. 3. Demonstrate the ability to function as part of a technical team to generate a solution to a programming problem. 4. Analyze alternative algorithm designs to implement solutions that make efficient use of limited resources of the computer. Credits: 3.00

CS 17700 - Programming With Multimedia Objects

Credit Hours: 4.00. Introduction to computers and programming: number representations, primitive data types and operations, basic control structures, programming applets and applications using graphical user interfaces, programming for detecting events and performing actions, processing multimedia objects such as images and sounds. Throughout the course, examples are drawn from a variety of fields in the natural sciences. Not open to CS majors with a grade of C or better in CS 18000 . Not open to non-CS majors with a grade of C or better in any course in computer programming.

Credits: 4.00

CS 18000 - Problem Solving And Object-Oriented Programming

Credit Hours: 4.00. Problem solving and algorithms, implementation of algorithms in a high level programming language, conditionals, the iterative approach and debugging, collections of data, searching and sorting, solving problems by decomposition, the object-oriented approach, subclasses of existing classes, handling exceptions that occur when the program is running, graphical user interfaces (GUIs), data stored in files, abstract data types, a glimpse at topics from other CS courses. Intended primarily for students majoring in computer sciences. Credit cannot be obtained for both CS 18000 and any of 15600, 15800 and 15900. Not open to students with credit in CS 24000.

Learning Outcomes: 1. Understand solving problems by analyzing the problem, designing an algorithm, and programming the solution. Credits: 4.00

TDM 10100 - The Data Mine Seminar I (UCC: IL)

Credit Hours: 1.00. The Data Mine is a supportive environment for students in any major from any background who want to learn some data science skills. Students will gain hands-on experience with computational tools for representing, extracting, manipulating, interpreting, transforming, and visualizing data, especially big data sets, and in effectively communicating insights about data. Topics include: the R environment, Python, visualizing data, UNIX, bash, regular expressions, SQL, XML and scraping data from the internet, as well as selected advanced topics, as time permits.

University Core Curriculum (UCC): (UCC: IL)
Learning Outcomes: 1. Discover data science and professional development opportunities in order to prepare for a career. 2. Explain the difference between research computing and basic personal computing data science capabilities in order to know which system is appropriate for a data science project. 3. Design efficient search strategies in order to acquire new data science skills. 4. Devise the most appropriate data science strategy in order to answer a research question. 5. Apply data science techniques in order to answer a research question about a big data set. Credits: 1.00

TDM 10200 - The Data Mine Seminar II

Credit Hours: 1.00. The Data Mine is a supportive environment for students in any major from any background who want to learn some data science skills. Students will gain hands-on experience with computational tools for representing, extracting, manipulating, interpreting, transforming, and visualizing data, especially big data sets, and in effectively communicating insights about data. Topics include: the R environment, Python, visualizing data, UNIX, bash, regular expressions, SQL, XML and scraping data from the internet, as well as selected advanced topics, as time permits.

Learning Outcomes: 1. Discover data science and professional development opportunities in order to prepare for a career. 2. Explain the difference between research computing and basic personal computing data science capabilities in order to know which system is appropriate for a data science project. 3. Design efficient search strategies in order to acquire new data science skills. 4. Devise the most appropriate data science strategy in order to answer a research question. 5. Apply data science techniques in order to answer a research question about a big data set. Credits: 1.00

CS 17600 - Data Engineering In Python

Credit Hours: 3.00. The course introduces students to programming fundamentals in Python, including loops, functions and different data types, and provides an introduction to data engineering including working with common data formats and learning the basics of data wrangling. Students will format, extract, clean, filter, transform, search, combine, summarize, aggregate, and visualize a diverse range of data sets. Python libraries including Matplotlib and Pandas are used.

Learning Outcomes: 1. Write Python code using loops, decision statements, and functions. 2. Explain how arguments are passed in Python functions and how the scope of variables impacts execution. 3. Use the operations on lists, tuples, and dictionaries to perform appropriate data manipulations. 4. Using Matplotlib, create informative plots and other data visualizations. Explain the key qualities of good visualizations. 5. Creating and manipulating DataFrames using Pandas. 6. Create Python code as well as methods in Pandas to select, search, change, and summarize data in tables. 7. Explain how to identify and fill in missing values in data. 8. Apply Pandas functions combine and merge datasets, perform a range of data aggregations, groupings and cross tabulations. 9. Given multiple data sets, demonstrate how to summarize, transform, combine the data sets, and aggregate and visualize the resulting data set. Credits: 3.00

Laboratory Science (6-8 credits)

Mathematics (8-10 credits)

Statistics (3 credits)

STAT 30100 - Elementary Statistical Methods (UCC: IL)

Credit Hours: 3.00. Introduction to statistical methods with applications to diverse fields. Emphasis on understanding and interpreting standard techniques. Data analysis for one and several variables, design of samples and experiments, basic probability, sampling distributions, confidence intervals and significance tests for means and proportions, correlation and regression. Software is used throughout. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, 35000, 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: college algebra.

University Core Curriculum (UCC): (UCC: IL)

Learning Outcomes: 1. Students will be introduced to statistical methods and be able to apply them to multiple fields of study. 2. Students will be able to understand, interpret standard statistical techniques, analyze data for one variable and for several variables, calculate and use confidence intervals and significance test for means and proportions, understand the design of samples and experiments, perform and understand basic probability calculations, perform simple and multiple regression

procedures, and understand correlation. Credits: 3.00

STAT 35000 - Introduction To Statistics

Credit Hours: 3.00. This course provides a data-oriented introduction to applied statistics, covering exploratory data analysis, experimental design, probability distributions, simulation, sampling distributions, and the Central Limit Theorem. Students will learn the fundamentals of statistical inference, including confidence intervals and hypothesis tests for population means, paired and independent comparisons of means, analysis of variance, and regression. The course emphasizes hands-on experience with statistical software and is primarily intended for students majoring in the mathematical sciences. Prerequisite: two semesters of college calculus.

Learning Outcomes: 1. Understand basic terms, graphs, and symbols and be able to interpret statistics in the media. 2. Understand and be able to explain statistical processes and be able to fully interpret statistical results. 3. Understand why and how statistical investigations are conducted and the "big ideas" that underlie statistical investigations. 4. Be able to use a statistical package (R or SAS) to analyze data and interpret result. 5. Big Ideas in Statistics: variability, distributions, and models; causation vs correlation; practical significance vs statistical significance, etc. Credits: 3.00

Electives (8-35 credits)

GPA Requirements

Course Requirements and Notes

Sample 4-Year Plan

Fall 1st Year

CHM 12500 - Introduction To Chemistry I (UCC: SCI)

Credit Hours: 5.00. Principles of chemistry including stoichiometry; atomic structure and chemical bonding; properties of gases, liquids, and solids; thermochemistry; descriptive inorganic chemistry. Recommended for entering students intending to major in chemistry. One year of high school chemistry or one semester of college chemistry required.

University Core Curriculum (UCC): (UCC: SCI)

Learning Outcomes: 1. Demonstrate competency of chemistry concepts through solving of numerical-based chemistry problems. 2. Demonstrate a mastery of concepts, theories, and ideas of chemistry topics specific to this course. 3. Connect chemistry topics in this course to real-world problems and solutions that you and others experience. 4. Meet laboratory learning objectives. Credits: 5.00

CHM 19400 - Freshman Chemistry Orientation

Credit Hours: 1.00. Designed to provide incoming chemistry majors with the academic, survival, and computational skills to make a successful transition from high school to college. Discussion of opportunities within the chemistry department including degree options, co-op program, undergraduate research, careers in chemistry, use of spreadsheet software, graphing packages, and drawing programs for chemical structures. Attendance and performance on assigned projects are the basis of the assigned grades.

Credits: 1.00

MA 16100 - Plane Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 5.00. Introduction to differential and integral calculus of one variable, with applications. Some schools or departments may allow only 4 credit hours toward graduation for this course. Designed for students who have not had at least a one-semester calculus course in high school, with a grade of "A" or "B". Not open to students with credit in MA 16500 . Demonstrated competence in college algebra and trigonometry.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems 5. To compute

integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions Credits: 5.00

MA 16500 - Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 4.00. Introduction to differential and integral calculus of one variable, with applications. Conic sections. Designed for students who have had at least a one-semester calculus course in high school, with a grade of "A" or "B", but are not qualified to enter MA 16200 or MA 16600 or the advanced placement courses MA 17300 or the honors calculus course MA 18100. Demonstrated competence in college algebra and trigonometry. CTL:IMA 1602 Calculus - Long I

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems. 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions. Credits: 4.00

CHM 11510 - General Chemistry I

Credit Hours: 3.00. The foundational general chemistry course for engineering, science, and some agricultural majors. Prior knowledge of chemistry is strongly suggested. Topics covered can include thermochemistry, nuclear chemistry, quantum theory and atomic structure, periodic trends, models in bonding, shapes of molecules, intermolecular forces, organic chemistry, synthetic and biological polymers, and phase changes.

Learning Outcomes: 1. Use theory to understand/predict experimental observations. 2. Demonstrate and understand key concepts and principles in chemistry, including the basic theory involved in chemical bonding, structure, reactions, and thermodynamics. Credits: 3.00

CHM 11520 - General Chemistry I - Laboratory (UCC: SCI)

Credit Hours: 1.00. In-person laboratory class to accompany CHM 11510. Topics covered can include lab safety, measurement, thermodynamics, quantitative analysis, stoichiometry, chromatography, and crystallography.

University Core Curriculum (UCC): (UCC: SCI) Learning Outcomes: 1. Understand how scientific equipment and analog and/or digital instruments are used to obtain data measurements. 2. Understand safe laboratory practices and proper chemical hygiene methods associated with an experiment. 3. Develop observational skills during experiments to collect quality data and articulate observations in their laboratory reports. 4. Maintain ethical and trustworthy recordkeeping and reporting methods: recording data precisely, deciding on when a data set is kept or discarded for the experiments performed. 5. Analyze experimentally obtained data by using calculations and mathematical analysis techniques, such as graphical analysis of data sets. 6. Interpret experimental data and analyze this data using scientific models, concepts, representations, and equations. 7. Use evidenced-based reasoning to make claims and critique results. Make connections between lab results and the theories/concepts learned in lecture. 8. Use safe practices, proper chemical hygiene, and standard protocols while in a laboratory. 9. Collect and record digital data sets using modern data collection techniques including wireless data collection and cloud-based data storage. 10. Work with a partner(s) to accomplish laboratory work. 11. Experience chemistry in-person through direct use of chemicals, laboratory equipment, and instrumentation to complete a laboratory experiment. Credits: 1.00

CHM 11530 - General Chemistry I - Virtual Laboratory (UCC: SCI)

Credit Hours: 1.00. Online laboratory class to accompany CHM 11510. Topics covered can include safety, measurement, thermodynamics, quantitative analysis, stoichiometry, chromatography, and crystallography.

University Core Curriculum (UCC): (UCC: SCI) Learning Outcomes: 1. Understand how scientific equipment and analog and/or digital instruments are used to obtain data measurements. 2. Understand safe laboratory practices and proper chemical hygiene methods associated with an experiment. 3. Develop observational skills during experiments to collect quality data and articulate observations in their laboratory reports. 4. Maintain ethical and trustworthy recordkeeping and reporting methods: recording data precisely, deciding on when a data set is kept or discarded for the experiments performed. 5. Analyze experimentally obtained data by using calculations and mathematical analysis techniques, such as graphical analysis of data sets. 6. Interpret experimental data and analyze this data using scientific models, concepts, representations, and equations. 7. Use evidenced-based reasoning to make claims and critique results. Making connections between lab results and the theories/concepts learned in lecture. Credits: 1.00

12-18 Credits

Spring 1st Year

CHM 12600 - Introduction To Chemistry II (UCC: SCI)

Credit Hours: 5.00. A continuation of CHM 12500 . Properties of solutions; chemical equilibrium calculations; elementary thermodynamics; oxidation-reduction reactions and electrochemical cells; rates of reaction; qualitative analysis; descriptive chemistry.

University Core Curriculum (UCC): (UCC: SCI) Credits: 5.00

MA 16200 - Plane Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 5.00. Continuation of MA 16100 . Vectors in two and three dimensions, techniques of integration, infinite series, conic sections, polar coordinates, surfaces in three dimensions. Some schools or departments may allow only 4 credit hours toward graduation for this course.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 5.00

MA 16600 - Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 4.00. Continuation of MA 16500 . Vectors in two and three dimensions. Techniques of integration, infinite series, polar coordinates, surfaces in three dimensions. Not open to students with credit in MA 16200 . CTL:IMA 1603 Calculus - Long II

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary

approximation methods of integration. Credits: 4.00

PHYS 17200 - Modern Mechanics (UCC: SCI)

Credit Hours: 4.00. Introductory calculus-based physics course using fundamental interactions between atoms to describe Newtonian mechanics, conservation laws, energy quantization, entropy, the kinetic theory of gases, and related topics in mechanics and thermodynamics. Emphasis is on using only a few fundamental principles to describe physical phenomena extending from nuclei to galaxies. 3-D graphical simulations and numerical problem solving by computer are employed by the student from the very beginning. CTL:IPS 1753 Calculus-based Physics I

University Core Curriculum (UCC): (UCC: SCI)

Learning Outcomes: 1. Understand and describe a wide range of physical phenomena in mechanics and thermodynamics using only a few fundamental principles of physics. 2. Learn a unified approach that relates microscopic behavior to macroscopic behavior. 3. Model natural phenomena quantitatively. 4. Apply all this to a range of topics related to mechanics and thermodynamics. Credits: 4.00

CHM 11610 - General Chemistry II

Credit Hours: 3.00. A continuation of CHM 11510 (General Chemistry I). Topics covered can include solutions, quantitative equilibria in aqueous solutions, thermodynamics, oxidation-reduction and electrochemistry, chemical kinetics, qualitative analysis, and further descriptive chemistry of metals and nonmetals.

Learning Outcomes: 1. Use theory to understand/predict experimental observations. 2. Demonstrate and understand key concepts and principles in chemistry, including the basic theory involved in chemical reactions, thermodynamics, equilibrium, and kinetics. Credits: 3.00

CHM 11620 - General Chemistry II - Laboratory (UCC: SCI)

Credit Hours: 1.00. In-person laboratory class to accompany CHM 11610. Topics covered can include chemical reactions, thermodynamics, equilibrium, rates, kinetics, quantitative analysis, and acid-base equilibria.

University Core Curriculum (UCC): (UCC: SCI)

Learning Outcomes: 1. Understand how scientific equipment and analog and/or digital instruments are used to obtain data measurements. 2. Understand safe laboratory practices and proper chemical hygiene methods associated with an experiment. 3. Develop observational skills during experiments to collect quality data and articulate observations in their laboratory reports. 4. Maintain ethical and trustworthy recordkeeping and reporting methods: recording data precisely, deciding on when a data set is kept or discarded for the experiments performed. 5. Analyze experimentally obtained data by using calculations and mathematical analysis techniques, such as graphical analysis of data sets. 6. Interpret experimental data and analyze this data using scientific models, concepts, representations, and equations. 7. Use evidenced-based reasoning to make claims and critique results. Make connections between lab results and the theories/concepts learned in lecture. 8. Use safe practices, proper chemical hygiene, and standard protocols while in a laboratory. 9. Collect and record digital data sets using modern data collection techniques including wireless data collection and cloud-based data storage. 10. Work with a partner(s) to accomplish laboratory work. 11. Experience chemistry in-person through direct use of chemicals, laboratory equipment, and instrumentation to complete a laboratory experiment. Credits: 1.00

CHM 11630 - General Chemistry II - Virtual Laboratory (UCC: SCI)

Credit Hours: 1.00. Online laboratory class to accompany CHM 11610. Topics covered can include chemical reactions, thermodynamics, equilibrium, rates, kinetics, quantitative analysis, and acid-base equilibrium.

University Core Curriculum (UCC): (UCC: SCI)

Learning Outcomes: 1. Understand how scientific equipment and analog and/or digital

instruments are used to obtain data measurements. 2. Understand safe laboratory practices and proper chemical hygiene methods associated with an experiment. 3. Develop observational skills during experiments to collect quality data and articulate observations in their laboratory reports. 4. Maintain ethical and trustworthy recordkeeping and reporting methods: recording data precisely, deciding on when a data set is kept or discarded for the experiments performed. 5. Analyze experimentally obtained data by use calculations and mathematical analysis techniques, such as graphical analysis of data sets. 6. Interpret experimental data and analyze this data using scientific models, concepts, representations, and equations. 7. Use evidenced-based reasoning to make claims and critique results. Make connections between lab results and the theories/concepts learned in lecture. Credits: 1.00

15-17 Credits

Fall 2nd Year

CHM 26500 - Organic Chemistry Laboratory I

Credit Hours: 2.00. Similar to CHM 26300 except that a larger number and more sophisticated organic syntheses are required. The preparations are designed not only to illustrate the classical reactions discussed in CHM 26100 or 26505, but to allow for an extrapolation of the principles involved to other systems.

Learning Outcomes: 1. Use theory to understand/predict experimental observations. 2. Demonstrate an understanding of the physical properties and a molecular understanding of chemical reactivity and materials. 3. Document scientific information and experimental data and write scientific reports, with graphical presentation of data. 4. Plan and perform chemical transformations. 5. Recognize and use chemical instrumentation and spectroscopy. 6. Identify and handle hazardous materials. Credits: 2.00

CHM 26505 - Organic Chemistry I

Credit Hours: 3.00. A comprehensive study of the chemical principles underlying aliphatic and aromatic compounds. The syntheses and reactions of these materials are discussed. Modern theory and stereochemistry are stressed to illustrate the logic inherent in the subject matter and to demonstrate the predictability of many chemical transformations. Recommended for students majoring in chemistry.

Learning Outcomes: 1. Draw the structures (geometries and structures) of carbon-based molecules) using acceptable representations and identify common classes of organic compounds. 2. Draw and recognize resonance forms of a structure (resonance structures) and assess their importance. 3. Determine the name of organic compounds by using the IUPAC naming system. Predict the structure when given the name. Recognize its common name. 4. Recognize the 3-dimensional shapes of molecules, as determined by structural conformation and stereochemistry. 5. Use mass spectrometry and IR and NMR spectroscopy to determine the structures of organic molecules. 6. Describe chemical processes with energy diagrams, and apply thermodynamics and kinetics toward understanding reactions and mechanisms. 7. Compare the differences between substitution (SN 1, SN2) and elimination (E1,E2) reactions. 8. Describe the important reactions of alkenes and alkynes and the mechanisms by which they occur. Credits: 3.00

CHM 26700 - Organic Chemistry Laboratory I Honors

Credit Hours: 2.00. Laboratory experiments designed to accompany the lecture material of CHM 26505, but at an advanced level. Modern instrumentation is introduced to supplement the usual elementary laboratory techniques of organic chemistry. Multistep syntheses are employed to illustrate and supplement the reactions discussed in CHM 26505.

Learning Outcomes: 1. Able to use theory to understand/predict experimental observations. 2. Able to demonstrate an understanding of the physical properties and a molecular understanding of chemical reactivity and materials. 3. Able to document scientific information and experimental data and write scientific reports, with graphical presentation of data. 4. Able to plan and perform chemical transformations. 5. Able to recognize and use chemical instrumentation and spectroscopy. 6. Able to identify and handle hazardous materials. Credits: 2.00

CHM 29400 - Sophomore Chemistry Seminar

Credit Hours: 1.00. Discussion of undergraduate research opportunities, upper-division courses, career opportunities, laboratory safety, use of the library and chemical information, and topics of current interest in chemistry. Required of sophomores majoring in any chemistry curriculum.

Credits: 1.00

PHYS 24100 - Electricity And Optics (UCC: SCI)

Credit Hours: 3.00. Electrostatics, current electricity, electromagnetism, magnetic properties of matter. Electromagnetic waves, geometrical and physical optics.

University Core Curriculum (UCC): (UCC: SCI)
Credits: 3.00

PHYS 25200 - Electricity And Optics Laboratory

Credit Hours: 1.00. Selected experiments in electric fields, magnetic fields, steady-state and transient DC circuits, thermodynamics, and optics.

Learning Outcomes: 1. Demonstrate the ability to think and function as a scientist. 2. Demonstrate the ability to communicate well, both orally and in writing. 3. Demonstrate the ability to understand the role of scientific observation of Nature in uncovering the Laws of Physics. Credits: 1.00

PHYS 27200 - Electric And Magnetic Interactions (UCC: SCI)

Credit Hours: 4.00. Calculus-based physics course using concepts of electric and magnetic fields and an atomic description of matter to describe polarization, fields produced by charge distributions, potential, electrical circuits, magnetic forces, induction, and related topics, leading to Maxwell's equations and electromagnetic radiation and an introduction to waves and interference. 3-D graphical simulations and numerical problem solving by computer are employed throughout.

University Core Curriculum (UCC): (UCC: SCI)
Learning Outcomes: 1. Understand and describe a wide range of physical phenomena in electricity and magnetism using only a few fundamental principles of physics. 2. Learn a unified approach that relates microscopic behavior to macroscopic behavior. 3. Model natural phenomena quantitatively. 4. Apply all this to a range of topics related to electricity and magnetism. Credits: 4.00

14-16 Credits

Spring 2nd Year

CHM 26605 - Organic Chemistry II

Credit Hours: 3.00. A continuation of CHM 26505, but a broader scope. The chemistry of a variety of functional groups is discussed. Theory is employed extensively to demonstrate the coherence underlying seemingly diverse transformations. Qualitative organic analysis is introduced, with particular emphasis on spectroscopic methods.

Learning Outcomes: 1. Learn to recognize recurring themes and patterns of reactivity of functional groups. 2. Develop an understanding of organic structure-property relationships. 3. Use spectrometric and spectroscopic techniques to determine the structures of organic molecules. 4. Apply an understanding of reaction mechanisms to new transformations of organic molecules. 5. Recognize different classes of biomacromolecules, lipids, and synthetic polymers. 6. Recognize the role that organic chemistry plays as an enabling science in pharmaceutical, agricultural, electronic/photonic

materials and commodity chemical industries. Credits: 3.00

STAT 30100 - Elementary Statistical Methods (UCC: IL)

Credit Hours: 3.00. Introduction to statistical methods with applications to diverse fields. Emphasis on understanding and interpreting standard techniques. Data analysis for one and several variables, design of samples and experiments, basic probability, sampling distributions, confidence intervals and significance tests for means and proportions, correlation and regression. Software is used throughout. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, 35000, 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: college algebra.

University Core Curriculum (UCC): (UCC: IL) Learning Outcomes: 1. Students will be introduced to statistical methods and be able to apply them to multiple fields of study. 2. Students will be able to understand, interpret standard statistical techniques, analyze data for one variable and for several variables, calculate and use confidence intervals and significance test for means and proportions, understand the design of samples and experiments, perform and understand basic probability calculations, perform simple and multiple regression procedures, and understand correlation. Credits: 3.00

STAT 35000 - Introduction To Statistics

Credit Hours: 3.00. This course provides a data-oriented introduction to applied statistics, covering exploratory data analysis, experimental design, probability distributions, simulation, sampling distributions, and the Central Limit Theorem. Students will learn the fundamentals of statistical inference, including confidence intervals and hypothesis tests for population means, paired and independent comparisons of means, analysis of variance, and regression. The course emphasizes hands-on experience with statistical software and is primarily intended for students majoring in the mathematical sciences. Prerequisite: two semesters of college calculus.

Learning Outcomes: 1. Understand basic terms, graphs, and symbols and be able to interpret statistics in the media. 2. Understand and be able to explain statistical processes and be able to fully interpret statistical results. 3. Understand why and how statistical investigations are conducted and the "big ideas" that underlie statistical investigations. 4. Be able to use a statistical package (R or SAS) to analyze data and interpret result. 5. Big Ideas in Statistics: variability, distributions, and models; causation vs correlation; practical significance vs statistical significance, etc. Credits: 3.00

CHM 22404 - Quantitative Analysis

Credit Hours: 3.00. Introduction to approaches analytical chemists use to analyze the composition of matter, including statistics, calibration, and understanding chemical equilibrium (acid/base, complexation, solubility, polyprotic acid treatment, acid/base/redox/precipitation titrations); general approaches to analysis at the trace level; recognition and evaluation of possible sources of error and how error propagates; introduction to how light interacts with matter (and how analytical chemists can take advantage of this).

Learning Outcomes: 1. Understand the fundamentals and figures of merit of different analytical techniques. 2. Learn how to properly select an analytical technique for accurate quantitative determination. 3. Perform accurate quantitative measurements. 4. Use Excel or Google Sheets or Python for data analysis and plotting. 5. Analyze the results and determine the experimental uncertainty. 6. Report the experimental data properly. 7. Perform statistical analysis. Credits: 3.00

15-17 Credits

Fall 3rd Year

CHM 24100 - Introductory Inorganic Chemistry

Credit Hours: 4.00. Descriptive inorganic chemistry dealing in a systematic way with the elements and the structures, properties, and reactions of their compounds. Required of students majoring in chemistry.

Credits: 4.00

CHM 37300 - Physical Chemistry I

Credit Hours: 3.00. Physical chemistry of matter. Properties of gases, liquids, and solids; equations of state; thermodynamics; energy, heat, and work; entropy; spontaneity and equilibrium; chemical potential; chemical equilibrium; phase diagrams; colligative properties.

Learning Outcomes: 1. Understand universal physical laws as they apply to chemistry. 2. Use theory to understand/predict experimental observations. 3. Demonstrate an understanding of the physical properties and a molecular understanding of chemical reactivity and materials. 4. Develop problem-solving skills: identifying the objective. 5. Carry out calculations related to specific chemistry topics. 6. Understand energetics and kinetics of chemical transformations. 7. Reduce complex problems into simpler components. Credits: 3.00

CHM 37301 - Physical Chemistry Laboratory I

Credit Hours: 1.00. A physical chemistry laboratory course that will provide students with hands-on experience that illustrates the core concepts presented in the associated physical chemistry lecture course CHM 37300.

Learning Outcomes: 1. Gain some familiarity with modern instrumentation methods in Physical Chemistry, including UV/Vis spectroscopy and pressure-detected chemical kinetics. 2. Learn Python programming syntax for reading, plotting, and fitting experimental data. 3. Understand how the abstract principles described in CHM 37300 show up in the real world. 4. Learn good laboratory notebook habits for recording and organizing experimental data. Credits: 1.00

14 Credits

Spring 3rd Year

CHM 37400 - Physical Chemistry II

Credit Hours: 3.00. Physical chemistry of molecules. Wave properties of matter; quantum mechanics of translation, rotation, and vibration; atomic structure; molecular orbitals; quantum states; statistical mechanics; chemical kinetics; collision theory; transition state theory.

Learning Outcomes: 1. Give examples that demonstrate the fundamental principles in quantum mechanics. 2. Apply simple quantum mechanical models such as particle-in-a-box to atomic and molecular structures to predict wave functions and calculate energy levels. 3. Interpret simple optical spectroscopy of atoms and molecules based on quantum mechanical principles. Credits: 3.00

12 Credits

Fall 4th Year

CHM 49400 - Junior-Senior Chemistry Seminar

Credit Hours: 1.00. Major emphasis on developing skills in oral and written presentations by students. The subject matter can be library material and/or accomplishments in undergraduate or co-op research. Department permission required.

Credits: 1.00

CHM 43300 - Biochemistry

Credit Hours: 3.00. A rigorous one-semester introduction to biochemistry, with in-depth coverage of biology at a molecular level. Topics covered include the classes of biological macromolecules, enzyme kinetics and inhibition, and significant metabolic pathways.

Learning Outcomes: 1. Understand the defining features of all four classes of macromolecules (Nucleic acids, Proteins, Lipids and carbohydrates) in detail. 2. Understand enzyme kinetics and various classes of inhibitors. 3. Develop an understanding for various metabolic pathways including glycolysis, gluconeogenesis, the citric acid cycle, electron transport chain, oxidative phosphorylation, glycogen metabolism, glycogen metabolism at a cellular level in healthy and diseased patients. 4. Able to predict biochemical outcome in case of specific defect in a pathway. 5. Develop an in

depth understanding of central foundations of biology at a molecular level. Credits: 3.00

14 Credits

Spring 4th Year

13 Credits

Chemistry, BS

About the Program

Degree Requirements

Departmental/Program Major Courses (61-69 credits)

Required Major Courses (35-37 credits)

CHM 12500 - Introduction To Chemistry I (UCC: SCI)

Credit Hours: 5.00. Principles of chemistry including stoichiometry; atomic structure and chemical bonding; properties of gases, liquids, and solids; thermochemistry; descriptive inorganic chemistry. Recommended for entering students intending to major in chemistry. One year of high school chemistry or one semester of college chemistry required.

University Core Curriculum (UCC): (UCC: SCI) Learning Outcomes: 1. Demonstrate competency of chemistry concepts through solving of numerical-based chemistry problems. 2. Demonstrate a mastery of concepts, theories, and ideas of chemistry topics specific to this course. 3. Connect chemistry topics in this course to real-world problems and solutions that you and others experience. 4. Meet laboratory learning objectives. Credits: 5.00

CHM 12600 - Introduction To Chemistry II (UCC: SCI)

Credit Hours: 5.00. A continuation of CHM 12500 . Properties of solutions; chemical equilibrium calculations; elementary thermodynamics; oxidation-reduction reactions and electrochemical cells; rates of reaction; qualitative analysis; descriptive chemistry.

University Core Curriculum (UCC): (UCC: SCI) Credits: 5.00

CHM 19400 - Freshman Chemistry Orientation

Credit Hours: 1.00. Designed to provide incoming chemistry majors with the academic, survival, and computational skills to make a successful transition from high school to college. Discussion of opportunities within the chemistry department including degree options, co-op program, undergraduate research, careers in chemistry, use of spreadsheet software, graphing packages, and drawing programs for chemical structures. Credits: 1.00

CHM 24100 - Introductory Inorganic Chemistry

Credit Hours: 4.00. Descriptive inorganic chemistry dealing in a systematic way with the elements and the structures, properties, and reactions of their compounds. Required of students majoring in chemistry.

Credits: 4.00

CHM 26505 - Organic Chemistry I

Credit Hours: 3.00. A comprehensive study of the chemical principles underlying aliphatic and aromatic compounds. The syntheses and reactions of these materials are discussed. Modern theory and stereochemistry are stressed to illustrate the logic inherent in the subject matter and to demonstrate the predictability of many chemical transformations. Recommended for students majoring in chemistry.

Learning Outcomes: 1. Draw the structures (geometries and structures) of carbon-based molecules) using acceptable representations and identify common classes of organic compounds. 2. Draw and recognize resonance forms of a structure (resonance structures) and assess their importance. 3. Determine the name of organic compounds by using the IUPAC naming system. Predict the structure when given the name. Recognize its common name. 4. Recognize the 3-dimensional shapes of molecules, as determined by structural

conformation and stereochemistry. 5. Use mass spectrometry and IR and NMR spectroscopy to determine the structures of organic molecules. 6. Describe chemical processes with energy diagrams, and apply thermodynamics and kinetics toward understanding reactions and mechanisms. 7. Compare the differences between substitution (SN 1, SN2) and elimination (E1,E2) reactions. 8. Describe the important reactions of alkenes and alkynes and the mechanisms by which they occur. Credits: 3.00

CHM 26605 - Organic Chemistry II

Credit Hours: 3.00. A continuation of CHM 26505, but a broader scope. The chemistry of a variety of functional groups is discussed. Theory is employed extensively to demonstrate the coherence underlying seemingly diverse transformations. Qualitative organic analysis is introduced, with particular emphasis on spectroscopic methods.

Learning Outcomes: 1. Learn to recognize recurring themes and patterns of reactivity of functional groups. 2. Develop an understanding of organic structure-property relationships. 3. Use spectrometric and spectroscopic techniques to determine the structures of organic molecules. 4. Apply an understanding of reaction mechanisms to new transformations of organic molecules. 5. Recognize different classes of biomacromolecules, lipids, and synthetic polymers. 6. Recognize the role that organic chemistry plays as an enabling science in pharmaceutical, agricultural, electronic/photonic materials and commodity chemical industries. Credits: 3.00

CHM 29400 - Sophomore Chemistry Seminar

Credit Hours: 1.00. Discussion of undergraduate research opportunities, upper-division courses, career opportunities, laboratory safety, use of the library and chemical information, and topics of current interest in chemistry. Required of sophomores majoring in any chemistry curriculum.

Credits: 1.00

CHM 37300 - Physical Chemistry I

Credit Hours: 3.00. Physical chemistry of matter. Properties of gases, liquids, and solids; equations of state; thermodynamics; energy, heat, and work; entropy; spontaneity and equilibrium; chemical potential; chemical equilibrium; phase diagrams; colligative properties.

Learning Outcomes: 1. Understand universal physical laws as they apply to chemistry. 2. Use theory to understand/predict experimental observations. 3. Demonstrate an understanding of the physical properties and a molecular understanding of chemical reactivity and materials. 4. Develop problem-solving skills: identifying the objective. 5. Carry out calculations related to specific chemistry topics. 6. Understand energetics and kinetics of chemical transformations. 7. Reduce complex problems into simpler components. Credits: 3.00

CHM 37301 - Physical Chemistry Laboratory I

Credit Hours: 1.00. A physical chemistry laboratory course that will provide students with hands-on experience that illustrates the core concepts presented in the associated physical chemistry lecture course CHM 37300.

Learning Outcomes: 1. Gain some familiarity with modern instrumentation methods in Physical Chemistry, including UV/Vis spectroscopy and pressure-detected chemical kinetics. 2. Learn Python programming syntax for reading, plotting, and fitting experimental data. 3. Understand how the abstract principles described in CHM 37300 show up in the real world. 4. Learn good laboratory notebook habits for recording and organizing experimental data. Credits: 1.00

CHM 37400 - Physical Chemistry II

Credit Hours: 3.00. Physical chemistry of molecules. Wave properties of matter; quantum mechanics of translation, rotation, and vibration; atomic structure; molecular orbitals; quantum states; statistical mechanics; chemical kinetics; collision theory; transition state theory.

Learning Outcomes: 1. Give examples that demonstrate the fundamental principles in quantum mechanics. 2. Apply simple quantum mechanical models such as particle-in-a-box to atomic and molecular structures to predict wave functions and calculate energy levels. 3. Interpret simple optical spectroscopy of atoms and molecules based on quantum mechanical principles. Credits: 3.00

CHM 49400 - Junior-Senior Chemistry Seminar

Credit Hours: 1.00. Major emphasis on developing skills in oral and written presentations by students. The subject matter can be library material and/or accomplishments in undergraduate or co-op research. Department permission required.

Credits: 1.00

CHM 11510 - General Chemistry I

Credit Hours: 3.00. The foundational general chemistry course for engineering, science, and some agricultural majors. Prior knowledge of chemistry is strongly suggested. Topics covered can include thermochemistry, nuclear chemistry, quantum theory and atomic structure, periodic trends, models in bonding, shapes of molecules, intermolecular forces, organic chemistry, synthetic and biological polymers, and phase changes.

Learning Outcomes: 1. Use theory to understand/predict experimental observations. 2. Demonstrate and understand key concepts and principles in chemistry, including the basic theory involved in chemical bonding, structure, reactions, and thermodynamics. Credits: 3.00

CHM 11520 - General Chemistry I - Laboratory (UCC: SCI)

Credit Hours: 1.00. In-person laboratory class to accompany CHM 11510. Topics covered can include lab safety, measurement, thermodynamics, quantitative analysis, stoichiometry, chromatography, and crystallography.

University Core Curriculum (UCC): (UCC: SCI)

Learning Outcomes: 1. Understand how scientific equipment and analog and/or digital instruments are used to obtain data measurements. 2. Understand safe laboratory practices and proper chemical hygiene methods associated with an experiment. 3. Develop observational skills during experiments to collect quality data and articulate observations in their laboratory reports. 4. Maintain ethical and trustworthy recordkeeping and reporting methods: recording data precisely, deciding on when a data set is kept or discarded for the experiments performed. 5. Analyze experimentally obtained data by using calculations and mathematical analysis techniques, such as graphical analysis of data sets. 6. Interpret experimental data and analyze this data using scientific models, concepts, representations, and equations. 7. Use evidenced-based reasoning to make claims and critique results. Make connections between lab results and the theories/concepts learned in lecture. 8. Use safe practices, proper chemical hygiene, and standard protocols while in a laboratory. 9. Collect and record digital data sets using modern data collection techniques including wireless data collection and cloud-based data storage. 10. Work with a partner(s) to accomplish laboratory work. 11. Experience chemistry in-person through direct use of chemicals, laboratory equipment, and instrumentation to complete a laboratory experiment. Credits: 1.00

CHM 11530 - General Chemistry I - Virtual Laboratory (UCC: SCI)

Credit Hours: 1.00. Online laboratory class to accompany CHM 11510. Topics covered can include safety, measurement, thermodynamics, quantitative analysis, stoichiometry, chromatography, and crystallography.

University Core Curriculum (UCC): (UCC: SCI)

Learning Outcomes: 1. Understand how scientific equipment and analog and/or digital instruments are used to obtain data measurements. 2. Understand safe laboratory practices and proper chemical hygiene methods associated with an experiment. 3. Develop observational skills during experiments to collect quality data and articulate observations in their laboratory reports. 4. Maintain ethical

and trustworthy recordkeeping and reporting methods: recording data precisely, deciding on when a data set is kept or discarded for the experiments performed. 5. Analyze experimentally obtained data by using calculations and mathematical analysis techniques, such as graphical analysis of data sets. 6. Interpret experimental data and analyze this data using scientific models, concepts, representations, and equations. 7. Use evidenced-based reasoning to make claims and critique results. Making connections between lab results and the theories/concepts learned in lecture. Credits: 1.00

CHM 11610 - General Chemistry II

Credit Hours: 3.00. A continuation of CHM 11510 (General Chemistry I). Topics covered can include solutions, quantitative equilibria in aqueous solutions, thermodynamics, oxidation-reduction and electrochemistry, chemical kinetics, qualitative analysis, and further descriptive chemistry of metals and nonmetals.

Learning Outcomes: 1. Use theory to understand/predict experimental observations. 2. Demonstrate and understand key concepts and principles in chemistry, including the basic theory involved in chemical reactions, thermodynamics, equilibrium, and kinetics. Credits: 3.00

CHM 11620 - General Chemistry II - Laboratory (UCC: SCI)

Credit Hours: 1.00. In-person laboratory class to accompany CHM 11610. Topics covered can include chemical reactions, thermodynamics, equilibrium, rates, kinetics, quantitative analysis, and acid-base equilibria.

University Core Curriculum (UCC): (UCC: SCI)

Learning Outcomes: 1. Understand how scientific equipment and analog and/or digital instruments are used to obtain data measurements. 2. Understand safe laboratory practices and proper chemical hygiene methods associated with an experiment. 3. Develop observational skills during experiments to collect quality data and articulate observations in their laboratory reports. 4. Maintain ethical and trustworthy recordkeeping and reporting methods: recording data precisely, deciding on when a data set is kept or discarded for the experiments performed. 5. Analyze experimentally obtained data by using calculations and mathematical analysis techniques, such as graphical analysis of data sets. 6. Interpret experimental data and analyze this data using scientific models, concepts, representations, and equations. 7. Use evidenced-based reasoning to make claims and critique results. Make connections between lab results and the theories/concepts learned in lecture. 8. Use safe practices, proper chemical hygiene, and standard protocols while in a laboratory. 9. Collect and record digital data sets using modern data collection techniques including wireless data collection and cloud-based data storage. 10. Work with a partner(s) to accomplish laboratory work. 11. Experience chemistry in-person through direct use of chemicals, laboratory equipment, and instrumentation to complete a laboratory experiment. Credits: 1.00

CHM 11630 - General Chemistry II - Virtual Laboratory (UCC: SCI)

Credit Hours: 1.00. Online laboratory class to accompany CHM 11610. Topics covered can include chemical reactions, thermodynamics, equilibrium, rates, kinetics, quantitative analysis, and acid-base equilibrium.

University Core Curriculum (UCC): (UCC: SCI)

Learning Outcomes: 1. Understand how scientific equipment and analog and/or digital instruments are used to obtain data measurements. 2. Understand safe laboratory practices and proper chemical hygiene methods associated with an experiment. 3. Develop observational skills during experiments to collect quality data and articulate observations in their laboratory reports. 4. Maintain ethical and trustworthy recordkeeping and reporting

methods: recording data precisely, deciding on when a data set is kept or discarded for the experiments performed. 5. Analyze experimentally obtained data by use calculations and mathematical analysis techniques, such as graphical analysis of data sets. 6. Interpret experimental data and analyze this data using scientific models, concepts, representations, and equations. 7. Use evidenced-based reasoning to make claims and critique results. Make connections between lab results and the theories/concepts learned in lecture. Credits: 1.00

CHM 22404 - Quantitative Analysis

Credit Hours: 3.00. Introduction to approaches analytical chemists use to analyze the composition of matter, including statistics, calibration, and understanding chemical equilibrium (acid/base, complexation, solubility, polyprotic acid treatment, acid/base/redox/precipitation titrations); general approaches to analysis at the trace level; recognition and evaluation of possible sources of error and how error propagates; introduction to how light interacts with matter (and how analytical chemists can take advantage of this).

Learning Outcomes: 1. Understand the fundamentals and figures of merit of different analytical techniques. 2. Learn how to properly select an analytical technique for accurate quantitative determination. 3. Perform accurate quantitative measurements. 4. Use Excel or Google Sheets or Python for data analysis and plotting. 5. Analyze the results and determine the experimental uncertainty. 6. Report the experimental data properly. 7. Perform statistical analysis. Credits: 3.00

Analytical Selective (4 credits)

CHM 32100 - Analytical Chemistry I

Credit Hours: 4.00. Quantitative measurements on complex chemical systems that show matrix effects or require isolation of a component prior to its determination; general approaches to quantitative problems at the trace level; critical comparisons of competitive procedures with emphasis on principles of separation processes, including chromatography; recognition and evaluation of possible sources of error; approaches for optimizing conditions so as to minimize time and/or effort required to attain prescribed levels of accuracy and precision. Required of students majoring in chemistry.

Credits: 4.00

CHM 32300 - Analytical Chemistry I Honors

Credit Hours: 4.00. Open to students in the chemistry honors program. Topical coverage similar to CHM 32100. Laboratory will include a group of core experiments plus special experiments designed by students and staff to study original problems related to analytical chemistry.

Credits: 4.00

CHM 42400 - Instrumental Analysis

Credit Hours: 4.00. Principles and application of optical and electrical methods of chemical analysis, including topics in instrumentation.

Learning Outcomes: 1. Able to write scientific reports, with graphical representation of data. 2. Able to document scientific information and experimental data. 3. Able to use theory to understand/predict experimental observations. 4. Able to demonstrate an understanding of the physical properties and a molecular understanding of chemical reactivity and materials. 5. Able to develop problem-solving skills: identifying the objective. 6. Able to make quantitative/structural measurements and interpret results; evaluate data for quality and reliability. 7. Able to recognize and use chemical instrumentation and spectroscopic methods. 8. Able to organize data for meaningful interpretation, including causes of experimental error, limitations of data. 9. Able to use statistics to judge limitation of data; use math to understand data. 10. Able to reduce complex problems into simpler components. 11. Able to practice professional behavior: reliability, punctuality, efficiency. Credits: 4.00

Upper Level Selective (3-4 credits)

CHM 34200 - Inorganic Chemistry

Credit Hours: 3.00. Interpretation and correlation of the reactions and properties of inorganic compounds in terms of their electronic and molecular structures. A survey of the preparations and reactivities of important compounds of the representative elements, with an emphasis on group trends. The elementary chemistry of the transition metals, including magnetic and spectral properties of coordination compounds.

Learning Outcomes: 1. Able to use theory to understand universal physical laws as they apply to chemistry. 2. Able to demonstrate an understanding of the physical properties and a molecular understanding of chemical reactivity and materials. 3. Able to develop problem-solving skills: identifying the objective. 4. Able to plan and perform chemical transformations. 5. Able to carry out calculation related to specific chemistry topics. 6. Able to make connections between different courses/subdisciplines in chemistry. Credits: 3.00

CHM 42400 - Instrumental Analysis

Credit Hours: 4.00. Principles and application of optical and electrical methods of chemical analysis, including topics in instrumentation.

Learning Outcomes: 1. Able to write scientific reports, with graphical representation of data. 2. Able to document scientific information and experimental data. 3. Able to use theory to understand/predict experimental observations. 4. Able to demonstrate an understanding of the physical properties and a molecular understanding of chemical reactivity and materials. 5. Able to develop problem-solving skills: identifying the objective. 6. Able to make quantitative/structural measurements and interpret results; evaluate data for quality and reliability. 7. Able to recognize and use chemical instrumentation and spectroscopic methods. 8. Able to organize data for meaningful interpretation, including causes of experimental error, limitations of data. 9. Able to use statistics to judge limitation of data; use math to understand data. 10. Able to reduce complex problems into simpler components. 11. Able to practice professional behavior: reliability, punctuality, efficiency. Credits: 4.00

CHM 46200 - Intermediate Organic Chemistry

Credit Hours: 3.00. Theory and application of organic chemistry and reaction mechanisms to organic synthesis and contemporary research topics in closely related areas. Topics include stereochemistry, reactive organic intermediates, molecular orbital theory, photochemistry, organic materials chemistry, and chemical biology.

Learning Outcomes: 1. Able to use theory to understand/predict experimental observations. 2. Able to demonstrate an understanding of the physical properties and a molecular understanding of chemical reactivity and materials. 3. Able to plan and perform chemical transformations. 4. Able to present a formal oral summary of a topic in organic chemistry and receive feedback. 5. Able to write a scientific report using the format of the Chemical Society. 6. Able to practice computer literacy: use available online and database tools, especially in the Organic Chemistry field. Credits: 3.00

CHM 43300 - Biochemistry

Credit Hours: 3.00. A rigorous one-semester introduction to biochemistry, with in-depth coverage of biology at a molecular level. Topics covered include the classes of biological macromolecules, enzyme kinetics and inhibition, and significant metabolic pathways.

Learning Outcomes: 1. Understand the defining features of all four classes of macromolecules (Nucleic acids, Proteins, Lipids and carbohydrates) in detail. 2. Understand enzyme kinetics and various classes of inhibitors. 3. Develop an understanding for various metabolic pathways including glycolysis, gluconeogenesis, the citric acid cycle, electron transport chain, oxidative phosphorylation, glycogen metabolism, glycogen metabolism at a cellular level in healthy and diseased patients. 4. Able to predict biochemical outcome in case of

specific defect in a pathway. 5. Develop an in depth understanding of central foundations of biology at a molecular level. Credits: 3.00

CHM 43800 - Introduction To Molecular Biotechnology

Credit Hours: 3.00. An examination of modern tools for the characterization, manipulation, and design of nucleic acids and proteins. Topics include DNA technology, recombinant proteins, bioinformatics, genetic modifications, gene expression and the interactions between nucleic acids and proteins.

Learning Outcomes: 1. Understand basics of DNA technology: isolation, amplification, synthesis, sequencing, and cloning. 2. Understand basics of recombinant protein: expressing in prokaryotic and eukaryotic cells, introducing mutations. 3. Understand bioinformatics. 4. Understand introducing genetic modifications to plants and animals and stem cells. 5. Control gene expression and genome editing. 6. Examine nucleic acid interactions and protein interactions, and their application in diagnosis. Credits: 3.00

Required Laboratory Selectives (3-6 credits)

Area 1

CHM 26500 - Organic Chemistry Laboratory I

Credit Hours: 2.00. Similar to CHM 26300 except that a larger number and more sophisticated organic syntheses are required. The preparations are designed not only to illustrate the classical reactions discussed in CHM 26100 or 26505, but to allow for an extrapolation of the principles involved to other systems.

Learning Outcomes: 1. Use theory to understand/predict experimental observations. 2. Demonstrate an understanding of the physical properties and a molecular understanding of chemical reactivity and materials. 3. Document scientific information and experimental data and write scientific reports, with graphical presentation of data. 4. Plan and perform chemical transformations. 5. Recognize and use chemical instrumentation and spectroscopy. 6. Identify and handle hazardous materials. Credits: 2.00

CHM 26600 - Organic Chemistry Laboratory II

Credit Hours: 2.00. A continuation of CHM 26500. All experiments are designed to illustrate the principles discussed in CHM 26200 or 26605. A major portion of the course is devoted to the methods employed in organic qualitative analysis. The student is expected to identify unknowns and mixtures and is introduced to some modern instrumental techniques.

Learning Outcomes: 1. Use theory to understand/predict experimental observations. 2. Demonstrate an understanding of the physical properties and a molecular understanding of chemical reactivity and materials. 3. Document scientific information and experimental data and write scientific reports, with graphical presentation of data. 4. Plan and perform chemical transformations. 5. Recognize and use chemical instrumentation and spectroscopy. 6. Identify and handle hazardous materials. Credits: 2.00

CHM 26700 - Organic Chemistry Laboratory I Honors

Credit Hours: 2.00. Laboratory experiments designed to accompany the lecture material of CHM 26505, but at an advanced level. Modern instrumentation is introduced to supplement the usual elementary laboratory techniques of organic chemistry. Multistep syntheses are employed to illustrate and supplement the reactions discussed in CHM 26505.

Learning Outcomes: 1. Able to use theory to understand/predict experimental observations. 2. Able to demonstrate an understanding of the physical properties and a molecular understanding of chemical reactivity and materials. 3. Able to document scientific information and experimental data and write scientific reports, with graphical presentation of data. 4. Able to plan and perform chemical transformations. 5. Able to recognize and use chemical instrumentation and spectroscopy. 6. Able to identify and handle hazardous materials.

Credits: 2.00

CHM 26800 - Organic Chemistry Laboratory II Honors

Credit Hours: 2.00. A continuation of CHM 26700. Experiments, more sophisticated than those in CHM 26600, are designed to illustrate and extend the concepts presented in CHM 26605. A major portion of the course is devoted to organic qualitative analysis. The student is expected to identify unknown compounds by classical methods as well as by the use of modern instrumentation like infrared gas chromatography and nuclear magnetic resonance.

Learning Outcomes: 1. Use theory to understand/predict experimental observations. 2. Demonstrate an understanding of the physical properties and a molecular understanding of chemical reactivity and materials. 3. Document scientific information and experimental data and write scientific reports, with graphical presentation of data. 4. Plan and perform chemical transformations. 5. Recognize and use chemical instrumentation and spectroscopy. 6. Identify and handle hazardous materials. Credits: 2.00

Area 2

CHM 26400 - Organic Chemistry Laboratory II

Credit Hours: 1.00. A continuation of CHM 26300 in that the experiments are designed to illustrate principles discussed in CHM 26200. A major portion of the course is devoted to methods employed in organic qualitative analysis. The student is expected to identify several unknown compounds and mixtures.

Learning Outcomes: 1. Use theory to understand/predict experimental observations. 2. Demonstrate an understanding of the physical properties and a molecular understanding of chemical reactivity and materials. 3. Document scientific information and experimental data and write scientific reports, with graphical presentation of data. 4. Plan and perform chemical transformations. 5. Recognize and use chemical instrumentation and spectroscopy. 6. Identify and handle hazardous materials. Credits: 1.00

CHM 26500 - Organic Chemistry Laboratory I

Credit Hours: 2.00. Similar to CHM 26300 except that a larger number and more sophisticated organic syntheses are required. The preparations are designed not only to illustrate the classical reactions discussed in CHM 26100 or 26505, but to allow for an extrapolation of the principles involved to other systems.

Learning Outcomes: 1. Use theory to understand/predict experimental observations. 2. Demonstrate an understanding of the physical properties and a molecular understanding of chemical reactivity and materials. 3. Document scientific information and experimental data and write scientific reports, with graphical presentation of data. 4. Plan and perform chemical transformations. 5. Recognize and use chemical instrumentation and spectroscopy. 6. Identify and handle hazardous materials. Credits: 2.00

CHM 26700 - Organic Chemistry Laboratory I Honors

Credit Hours: 2.00. Laboratory experiments designed to accompany the lecture material of CHM 26505, but at an advanced level. Modern instrumentation is introduced to supplement the usual elementary laboratory techniques of organic chemistry. Multistep syntheses are employed to illustrate and supplement the reactions discussed in CHM 26505.

Learning Outcomes: 1. Able to use theory to understand/predict experimental observations. 2. Able to demonstrate an understanding of the physical properties and a molecular understanding of chemical reactivity and materials. 3. Able to document scientific information and experimental data and write scientific reports, with graphical presentation of data. 4. Able to plan and perform chemical transformations. 5. Able to recognize and use chemical instrumentation and spectroscopy. 6. Able to identify and handle hazardous materials. Credits: 2.00

CHM 34201 - Inorganic Chemistry Laboratory

Credit Hours: 1.00. Laboratory work to accompany CHM 34200 .

Credits: 1.00

CHM 49900 - Special Assignments

Credit Hours: 1.00 to 5.00. Undergraduate research. Individual research projects undertaken under faculty direction. Permission of instructor required.

Learning Outcomes: 1. Provide students with an official record of participation in undergraduate research. 2. Provide a practical means for professional training beyond regular coursework. 3. Learn research methodologies, build analytical thinking and problem-solving skills. 4. Develop technical and professional written and verbal communication skills. 5. Develop team building and research project management skills. Credits: 1.00 to 5.00

CHM 33901 - Biochemistry Laboratory

Credit Hours: 1.00. CHM 33901 is a laboratory course based on two modules from the Undergraduate Research Inspired Experimental Chemistry Alternatives (URIECA) developed at MIT that are designed to introduce students to cutting-edge research topics in biochemistry. The course provides students with a research-inspired laboratory experience that introduces standard biochemical techniques in the context of investigating a current research topic, for example, acquired resistance to cancer drugs. Techniques include protein expression, purification, and gel analysis, PCR, site-directed mutagenesis, kinase activity assays, and protein structure viewing. CHM 33901 was designed as the 4th semester of the 1-2-1 competency-based curriculum transformation in chemistry as it applies to pre-health professional and life science students at Purdue. However, the course is open to other students who meet the prerequisites.

Learning Outcomes: 1. Demonstrate the ability to think and function as a scientist. 2. Develop an understanding of the scientific process. 3. Develop the ability to document scientific information and experimental data. 4. Demonstrate understanding of the process of scientific inquiry, and explain how scientific knowledge is discovered and validated. 5. Develop observational and interpretive skills through hands-on laboratory or field. 6. Demonstrate ability to measure with precision, accuracy, and safety. 7. Operate basic biochemistry laboratory instrumentation for scientific measurement. 8. Articulate scientific questions and hypotheses, design experiments, acquire data, perform data analysis, and present results in project-based research. 9. Apply knowledge of basic principles of chemistry and their applications to the understanding of biological systems. 10. Make quantitative/structural measurements and interpret results. 11. Demonstrate the ability to work on a team. 12. Demonstrate the ability to communicate well, both orally and in writing. Credits: 1.00

Area 3

CHM 26300 - Organic Chemistry Laboratory I

Credit Hours: 1.00. Laboratory experiments designed to illustrate the lecture material of CHM 26100. Elementary laboratory techniques essential to organic chemistry are introduced, followed by the actual syntheses and purification of compounds discussed in CHM 26100.

Learning Outcomes: 1. Use theory to understand/predict experimental observations. 2. Demonstrate an understanding of the physical properties and a molecular understanding of chemical reactivity and materials. 3. Document scientific information and experimental data and write scientific reports, with graphical presentation of data. 4. Plan and perform chemical transformations. 5. Recognize and use chemical instrumentation and spectroscopy. 6. Identify and handle hazardous materials. Credits: 1.00

CHM 26400 - Organic Chemistry Laboratory II

Credit Hours: 1.00. A continuation of CHM 26300 in that the experiments are designed to illustrate principles discussed in CHM 26200. A major portion of the course is devoted to methods employed in organic qualitative analysis. The student is expected to identify several unknown compounds and

mixtures.

Learning Outcomes: 1. Use theory to understand/predict experimental observations. 2. Demonstrate an understanding of the physical properties and a molecular understanding of chemical reactivity and materials. 3. Document scientific information and experimental data and write scientific reports, with graphical presentation of data. 4. Plan and perform chemical transformations. 5. Recognize and use chemical instrumentation and spectroscopy. 6. Identify and handle hazardous materials. Credits: 1.00

CHM 32100 - Analytical Chemistry I

Credit Hours: 4.00. Quantitative measurements on complex chemical systems that show matrix effects or require isolation of a component prior to its determination; general approaches to quantitative problems at the trace level; critical comparisons of competitive procedures with emphasis on principles of separation processes, including chromatography; recognition and evaluation of possible sources of error; approaches for optimizing conditions so as to minimize time and/or effort required to attain prescribed levels of accuracy and precision. Required of students majoring in chemistry.

Credits: 4.00

CHM 32300 - Analytical Chemistry I Honors

Credit Hours: 4.00. Open to students in the chemistry honors program. Topical coverage similar to CHM 32100. Laboratory will include a group of core experiments plus special experiments designed by students and staff to study original problems related to analytical chemistry.

Credits: 4.00

CHM 34201 - Inorganic Chemistry Laboratory

Credit Hours: 1.00. Laboratory work to accompany CHM 34200 .

Credits: 1.00

CHM 42400 - Instrumental Analysis

Credit Hours: 4.00. Principles and application of optical and electrical methods of chemical analysis, including topics in instrumentation.

Learning Outcomes: 1. Able to write scientific reports, with graphical representation of data. 2. Able to document scientific information and experimental data. 3. Able to use theory to understand/predict experimental observations. 4. Able to demonstrate an understanding of the physical properties and a molecular understanding of chemical reactivity and materials. 5. Able to develop problem-solving skills: identifying the objective. 6. Able to make quantitative/structural measurements and interpret results; evaluate data for quality and reliability. 7. Able to recognize and use chemical instrumentation and spectroscopic methods. 8. Able to organize data for meaningful interpretation, including causes of experimental error, limitations of data. 9. Able to use statistics to judge limitation of data; use math to understand data. 10. Able to reduce complex problems into simpler components. 11. CHM 49900 - Special Assignments

Credit Hours: 1.00 to 5.00. Undergraduate research. Individual research projects undertaken under faculty direction. Permission of instructor required.

Learning Outcomes: 1. Provide students with an official record of participation in undergraduate research. 2. Provide a practical means for professional training beyond regular coursework. 3. Learn research methodologies, build analytical thinking and problem-solving skills. 4. Develop technical and professional written and verbal communication skills. 5. Develop team building and research project management skills. Credits: 1.00 to 5.00

CHM 33900 - Biochemistry: A Molecular Approach

Credit Hours: 3.00. This is a comprehensive one-semester biochemistry course that emphasizes molecules and molecular reaction mechanisms, building upon the principles conveyed in general chemistry and organic chemistry. This course is designed to cover the essential elements of biochemistry traditionally covered in a two semester series. Topics to be covered include: Amino acids, peptides and proteins, molecular

models and structure-function relationships, enzymes, enzyme kinetics and enzyme mechanisms, carbohydrates and carbohydrate metabolism, aerobic metabolism, lipids and membranes, lipid metabolism, nitrogen metabolism and integration and regulation of metabolism. Special emphasis will be placed on connections between biochemical principles and the fields of medicine, human health and disease, nutrition and biotechnology. This course should serve as excellent preparation for higher-level biochemistry courses as well as standardized pre-health professional exams. CHM 33900 was designed as the 4lh semester of the 1-2-1 competency-based curriculum transformation in chemistry as it applies to pre-health professional and life science students at Purdue. However, this course is open to other students who meet the prerequisites.

Learning Outcomes: 1. Demonstrate the ability to think as a scientist. 2. Demonstrate the ability to communicate well in writing. 3. Apply knowledge of basic principles of chemistry and their applications to the understanding of biological systems. 4. Employ knowledge of the general components of prokaryotic and eukaryotic cells, such as molecular, microscopic, macroscopic, and three-dimensional structure, to explain how different components contribute to cellular and organismal function. 5. Demonstrate knowledge of how biomolecules contribute to the structure and function of cells.. 6. Demonstrate knowledge of molecular interactions and their importance in biological systems. 7. Demonstrate knowledge of the principles of chemical thermodynamics and kinetics that drive biological processes in the context of space (i.e., compartmentation) and time: enzyme-catalyzed reactions and metabolic pathways, regulation, integration, and the chemical logic of sequential reaction steps. 8. Recognize major types of functional groups and chemical reactions that occur in biological systems. 9. Apply understanding of the concepts of chemical reactivity and chemical kinetics to predict biochemical processes. 10. Apply knowledge of the chemistry of covalent carbon compounds to explain the molecular mechanisms of biochemical enzyme reactions. 11. Demonstrate knowledge of thermodynamic criteria for spontaneity of physical processes and chemical reactions and the relationship of thermodynamics to chemical equilibrium as they apply to biological systems. 12. Explain maintenance of homeostasis in living organisms by using principles of mass transport, energy balance, and feedback and control systems. Credits: 3.00

CHM 33901 - Biochemistry Laboratory

Credit Hours: 1.00. CHM 33901 is a laboratory course based on two modules from the Undergraduate Research Inspired Experimental Chemistry Alternatives (URIECA) developed at MIT that are designed to introduce students to cutting-edge research topics in biochemistry. The course provides students with a research-inspired laboratory experience that introduces standard biochemical techniques in the context of investigating a current research topic, for example, acquired resistance to cancer drugs. Techniques include protein expression, purification, and gel analysis, PCR, site-directed mutagenesis, kinase activity assays, and protein structure viewing. CHM 33901 was designed as the 4th semester of the 1-2-1 competency-based curriculum transformation in chemistry as it applies to pre-health professional and life science students at Purdue. However, the course is open to other students who meet the prerequisites.

Learning Outcomes: 1. Demonstrate the ability to think and function as a scientist. 2. Develop an understanding of the scientific process. 3. Develop the ability to document scientific information and experimental data. 4. Demonstrate understanding of the process of scientific inquiry, and explain how scientific knowledge is discovered and validated. 5. Develop observational and interpretive skills through hands-on laboratory or field. 6. Demonstrate ability to measure with precision, accuracy, and safety. 7. Operate basic biochemistry laboratory instrumentation for scientific measurement. 8. Articulate scientific questions and hypotheses, design experiments, acquire data, perform data analysis, and present results in project-based research. 9. Apply knowledge of basic principles of

chemistry and their applications to the understanding of biological systems. 10. Make quantitative/structural measurements and interpret results. 11. Demonstrate the ability to work on a team. 12. Demonstrate the ability to communicate well, both orally and in writing. Credits: 1.00

CHM 43300 - Biochemistry

Credit Hours: 3.00. A rigorous one-semester introduction to biochemistry, with in-depth coverage of biology at a molecular level. Topics covered include the classes of biological macromolecules, enzyme kinetics and inhibition, and significant metabolic pathways.

Learning Outcomes: 1. Understand the defining features of all four classes of macromolecules (Nucleic acids, Proteins, Lipids and carbohydrates) in detail. 2. Understand enzyme kinetics and various classes of inhibitors. 3. Develop an understanding for various metabolic pathways including glycolysis, gluconeogenesis, the citric acid cycle, electron transport chain, oxidative phosphorylation, glycogen metabolism, glycogen metabolism at a cellular level in healthy and diseased patients. 4. Able to predict biochemical outcome in case of specific defect in a pathway. 5. Develop an in depth understanding of central foundations of biology at a molecular level. Credits: 3.00

Required Calculus and Physics Courses (16-18 credits)

MA 16100 - Plane Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 5.00. Introduction to differential and integral calculus of one variable, with applications. Some schools or departments may allow only 4 credit hours toward graduation for this course. Designed for students who have not had at least a one-semester calculus course in high school, with a grade of "A" or "B". Not open to students with credit in MA 16500 . Demonstrated competence in college algebra and trigonometry.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions Credits: 5.00

MA 16200 - Plane Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 5.00. Continuation of MA 16100 . Vectors in two and three dimensions, techniques of integration, infinite series, conic sections, polar coordinates, surfaces in three dimensions. Some schools or departments may allow only 4 credit hours toward graduation for this course.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 5.00

MA 16500 - Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 4.00. Introduction to differential and integral calculus of one variable, with applications. Conic sections. Designed for students who have had at least a one-semester calculus course in high school, with a grade of "A" or "B", but are not qualified to enter MA 16200 or MA 16600 or the advanced placement courses MA 17300 or the honors calculus course MA 18100. Demonstrated competence in college

algebra and trigonometry. CTL:IMA 1602 Calculus - Long I

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems. 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions. Credits: 4.00

MA 16600 - Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 4.00. Continuation of MA 16500 . Vectors in two and three dimensions. Techniques of integration, infinite series, polar coordinates, surfaces in three dimensions. Not open to students with credit in MA 16200 . CTL:IMA 1603 Calculus - Long II

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 4.00

PHYS 17200 - Modern Mechanics (UCC: SCI)

Credit Hours: 4.00. Introductory calculus-based physics course using fundamental interactions between atoms to describe Newtonian mechanics, conservation laws, energy quantization, entropy, the kinetic theory of gases, and related topics in mechanics and thermodynamics. Emphasis is on using only a few fundamental principles to describe physical phenomena extending from nuclei to galaxies. 3-D graphical simulations and numerical problem solving by computer are employed by the student from the very beginning. CTL:IPS 1753 Calculus-based Physics I

University Core Curriculum (UCC): (UCC: SCI) Learning Outcomes: 1. Understand and describe a wide range of physical phenomena in mechanics and thermodynamics using only a few fundamental principles of physics. 2. Learn a unified approach that relates microscopic behavior to macroscopic behavior. 3. Model natural phenomena quantitatively. 4. Apply all this to a range of topics related to mechanics and thermodynamics. Credits: 4.00

PHYS 22000 - General Physics (UCC: SCI)

Credit Hours: 4.00. Mechanics, heat, and sound, for students not specializing in physics. CTL:IPS 1751 Algebra-based Physics I

University Core Curriculum (UCC): (UCC: SCI) Learning Outcomes: 1. Be familiar with the important modes of human thought that are the foundations of science. 2. Possess effective foundation skills: read, write, and speak with comprehension, clarity and precision; identify substantive knowledge and disciplinary methods; develop information literacy skills; reason quantitatively as means of gaining and creating knowledge and drawing reliable conclusions. 3. Demonstrate the ability to think critically and to solve problems using the foundation skills: evaluate their ideas and the ideas of others based upon disciplined reasoning; understand the traditions that have formed one's own and other cultures; be able to articulate their ideas in appropriate media. Credits: 4.00

PHYS 22100 - General Physics (UCC: SCI)

Credit Hours: 4.00. Electricity, light, and modern physics, for students not specializing in physics. CTL:IPS 1752 Algebra-based Physics II

University Core Curriculum (UCC): (UCC: SCI)
Credits: 4.00

PHYS 24100 - Electricity And Optics (UCC: SCI)

Credit Hours: 3.00. Electrostatics, current electricity, electromagnetism, magnetic properties of matter. Electromagnetic waves, geometrical and physical optics.

University Core Curriculum (UCC): (UCC: SCI)
Credits: 3.00

PHYS 25200 - Electricity And Optics Laboratory

Credit Hours: 1.00. Selected experiments in electric fields, magnetic fields, steady-state and transient DC circuits, thermodynamics, and optics.

Learning Outcomes: 1. Demonstrate the ability to think and function as a scientist. 2. Demonstrate the ability to communicate well, both orally and in writing. 3. Demonstrate the ability to understand the role of scientific observation of Nature in uncovering the Laws of Physics. Credits: 1.00

PHYS 27200 - Electric And Magnetic Interactions (UCC: SCI)

Credit Hours: 4.00. Calculus-based physics course using concepts of electric and magnetic fields and an atomic description of matter to describe polarization, fields produced by charge distributions, potential, electrical circuits, magnetic forces, induction, and related topics, leading to Maxwell's equations and electromagnetic radiation and an introduction to waves and interference. 3-D graphical simulations and numerical problem solving by computer are employed throughout.

University Core Curriculum (UCC): (UCC: SCI)
Learning Outcomes: 1. Understand and describe a wide range of physical phenomena in electricity and magnetism using only a few fundamental principles of physics. 2. Learn a unified approach that relates microscopic behavior to macroscopic behavior. 3. Model natural phenomena quantitatively. 4. Apply all this to a range of topics related to electricity and magnetism. Credits: 4.00

Other Departmental /Program Course Requirements (22-38 credits)

College of Science Additional Requirements

Computing (2-4 credits)

CS 15900 - C Programming

Credit Hours: 3.00. Fundamental principles, concepts, and methods of programming in C, with emphasis on applications in the physical sciences and engineering. Basic problem solving and programming techniques; fundamental algorithms and data structures; and use of programming logic in solving engineering problems. Students are expected to complete assignments in a collaborative learning environment. Credit cannot be obtained for both CS 15900 and any of CS 15600, CS 15800 and CS 18000.

Learning Outcomes: 1. Understand the fundamental principles, concepts and methods of computer programming. 2. Use the C programming language to developing solutions in the domains of physical sciences, mathematics, and engineering. 3. Demonstrate the ability to function as part of a technical team to generate a solution to a programming problem. 4. Analyze alternative algorithm designs to implement solutions that make efficient use of limited resources of the computer. Credits: 3.00

CS 17700 - Programming With Multimedia Objects

Credit Hours: 4.00. Introduction to computers and programming: number representations, primitive data types and operations, basic control structures, programming applets and applications using graphical user interfaces, programming for detecting events and performing actions, processing multimedia objects such as images and sounds. Throughout the course, examples are drawn from a variety of fields in the natural sciences. Not open to CS majors with a grade of C or better in CS 18000 . Not open to non-CS majors with a grade of C or better in any course in computer programming.

Credits: 4.00

CS 18000 - Problem Solving And Object-Oriented Programming

Credit Hours: 4.00. Problem solving and algorithms, implementation of algorithms in a high level programming language, conditionals, the iterative approach and debugging, collections of data, searching and sorting, solving problems by decomposition, the object-oriented approach, subclasses of existing classes, handling exceptions that occur when the program is running, graphical user interfaces (GUIs), data stored in files, abstract data types, a glimpse at topics from other CS courses. Intended primarily for students majoring in computer sciences. Credit cannot be obtained for both CS 18000 and any of 15600, 15800 and 15900. Not open to students with credit in CS 24000.

Learning Outcomes: 1. Understand solving problems by analyzing the problem, designing an algorithm, and programming the solution. Credits: 4.00

TDM 10100 - The Data Mine Seminar I (UCC: IL)

Credit Hours: 1.00. The Data Mine is a supportive environment for students in any major from any background who want to learn some data science skills. Students will gain hands-on experience with computational tools for representing, extracting, manipulating, interpreting, transforming, and visualizing data, especially big data sets, and in effectively communicating insights about data. Topics include: the R environment, Python, visualizing data, UNIX, bash, regular expressions, SQL, XML and scraping data from the internet, as well as selected advanced topics, as time permits.

University Core Curriculum (UCC): (UCC: IL)
Learning Outcomes: 1. Discover data science and professional development opportunities in order to prepare for a career. 2. Explain the difference between research computing and basic personal computing data science capabilities in order to know which system is appropriate for a data science project. 3. Design efficient search strategies in order to acquire new data science skills. 4. Devise the most appropriate data science strategy in order to answer a research question. 5. Apply data science techniques in order to answer a research question about a big data set. Credits: 1.00

TDM 10200 - The Data Mine Seminar II

Credit Hours: 1.00. The Data Mine is a supportive environment for students in any major from any background who want to learn some data science skills. Students will gain hands-on experience with computational tools for representing, extracting, manipulating, interpreting, transforming, and visualizing data, especially big data sets, and in effectively communicating insights about data. Topics include: the R environment, Python, visualizing data, UNIX, bash, regular expressions, SQL, XML and scraping data from the internet, as well as selected advanced topics, as time permits.

Learning Outcomes: 1. Discover data science and professional development opportunities in order to prepare for a career. 2. Explain the difference between research computing and basic personal computing data science capabilities in order to know which system is appropriate for a data science project. 3. Design efficient search strategies in order to acquire new data science skills. 4. Devise the most appropriate data science strategy in order to answer a research question. 5. Apply data science techniques in order to answer a research question about a big data set. Credits: 1.00

CS 17600 - Data Engineering In Python

Credit Hours: 3.00. The course introduces students to programming fundamentals in Python, including loops, functions and different data types, and provides an introduction to data engineering including working with common data formats and learning the basics of data wrangling. Students will format, extract, clean, filter, transform, search, combine, summarize, aggregate, and visualize a diverse range of data sets. Python libraries including Matplotlib and Pandas are used.

Learning Outcomes: 1. Write Python code using loops, decision statements, and functions. 2. Explain how arguments are passed in Python functions and how the scope of variables impacts execution. 3. Use the operations on lists, tuples, and dictionaries to perform appropriate data manipulations. 4. Using Matplotlib, create informative plots and other data visualizations. Explain the key qualities of good visualizations. 5. Creating and

manipulating DataFrames using Pandas. 6. Create Python code as well as methods in Pandas to select, search, change, and summarize data in tables. 7. Explain how to identify and fill in missing values in data. 8. Apply Pandas functions combine and merge datasets, perform a range of data aggregations, groupings and cross tabulations. 9. Given multiple data sets, demonstrate how to summarize, transform, combine the data sets, and aggregate and visualize the resulting data set. Credits: 3.00

Laboratory Science (6-8 credits)

Mathematics (8-10 credits)

Statistics (3 credits)

STAT 30100 - Elementary Statistical Methods (UCC: IL)

Credit Hours: 3.00. Introduction to statistical methods with applications to diverse fields. Emphasis on understanding and interpreting standard techniques. Data analysis for one and several variables, design of samples and experiments, basic probability, sampling distributions, confidence intervals and significance tests for means and proportions, correlation and regression. Software is used throughout. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, 35000, 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: college algebra.
University Core Curriculum (UCC): (UCC: IL)
Learning Outcomes: 1. Students will be introduced to statistical methods and be able to apply them to multiple fields of study. 2. Students will be able to understand, interpret standard statistical techniques, analyze data for one variable and for several variables, calculate and use confidence intervals and significance test for means and proportions, understand the design of samples and experiments, perform and understand basic probability calculations, perform simple and multiple regression procedures, and understand correlation. Credits: 3.00

STAT 35000 - Introduction To Statistics

Credit Hours: 3.00. This course provides a data-oriented introduction to applied statistics, covering exploratory data analysis, experimental design, probability distributions, simulation, sampling distributions, and the Central Limit Theorem. Students will learn the fundamentals of statistical inference, including confidence intervals and hypothesis tests for population means, paired and independent comparisons of means, analysis of variance, and regression. The course emphasizes hands-on experience with statistical software and is primarily intended for students majoring in the mathematical sciences. Prerequisite: two semesters of college calculus.
Learning Outcomes: 1. Understand basic terms, graphs, and symbols and be able to interpret statistics in the media. 2. Understand and be able to explain statistical processes and be able to fully interpret statistical results. 3. Understand why and how statistical investigations are conducted and the "big ideas" that underlie statistical investigations. 4. Be able to use a statistical package (R or SAS) to analyze data and interpret result. 5. Big Ideas in Statistics: variability, distributions, and models; causation vs correlation; practical significance vs statistical significance, etc. Credits: 3.00

Electives (13-37 credits)

GPA Requirements

Course Requirements and Notes

Sample 4-Year Plan

Fall 1st Year

CHM 12500 - Introduction To Chemistry I (UCC: SCI)

Credit Hours: 5.00. Principles of chemistry including

stoichiometry; atomic structure and chemical bonding; properties of gases, liquids, and solids; thermochemistry; descriptive inorganic chemistry. Recommended for entering students intending to major in chemistry. One year of high school chemistry or one semester of college chemistry required.

University Core Curriculum (UCC): (UCC: SCI) Learning Outcomes: 1. Demonstrate competency of chemistry concepts through solving of numerical-based chemistry problems. 2. Demonstrate a mastery of concepts, theories, and ideas of chemistry topics specific to this course. 3. Connect chemistry topics in this course to real-world problems and solutions that you and others experience. 4. Meet laboratory learning objectives. Credits: 5.00

CHM 19400 - Freshman Chemistry Orientation

Credit Hours: 1.00. Designed to provide incoming chemistry majors with the academic, survival, and computational skills to make a successful transition from high school to college. Discussion of opportunities within the chemistry department including degree options, co-op program, undergraduate research, careers in chemistry, use of spreadsheet software, graphing packages, and drawing programs for chemical structures. Attendance and performance on assigned projects are the basis of the assigned grades.

Credits: 1.00

MA 16100 - Plane Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 5.00. Introduction to differential and integral calculus of one variable, with applications. Some schools or departments may allow only 4 credit hours toward graduation for this course. Designed for students who have not had at least a one-semester calculus course in high school, with a grade of "A" or "B". Not open to students with credit in MA 16500 . Demonstrated competence in college algebra and trigonometry.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions Credits: 5.00

MA 16500 - Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 4.00. Introduction to differential and integral calculus of one variable, with applications. Conic sections. Designed for students who have had at least a one-semester calculus course in high school, with a grade of "A" or "B", but are not qualified to enter MA 16200 or MA 16600 or the advanced placement courses MA 17300 or the honors calculus course MA 18100. Demonstrated competence in college algebra and trigonometry. CTL:IMA 1602 Calculus - Long I

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems. 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions. Credits: 4.00

CHM 11510 - General Chemistry I

Credit Hours: 3.00. The foundational general chemistry course for engineering, science, and some agricultural majors. Prior knowledge of chemistry is strongly suggested. Topics covered can include thermochemistry, nuclear chemistry, quantum theory and atomic structure, periodic trends, models in bonding, shapes of molecules, intermolecular forces, organic chemistry, synthetic and biological polymers, and phase changes.

Learning Outcomes: 1. Use theory to understand/predict experimental observations. 2. Demonstrate and understand key concepts and principles in chemistry, including the basic theory involved in chemical bonding, structure, reactions, and thermodynamics. Credits: 3.00

CHM 11520 - General Chemistry I - Laboratory (UCC: SCI)

Credit Hours: 1.00. In-person laboratory class to accompany CHM 11510. Topics covered can include lab safety,

measurement, thermodynamics, quantitative analysis, stoichiometry, chromatography, and crystallography.

University Core Curriculum (UCC): (UCC: SCI) Learning Outcomes: 1. Understand how scientific equipment and analog and/or digital instruments are used to obtain data measurements. 2. Understand safe laboratory practices and proper chemical hygiene methods associated with an experiment. 3. Develop observational skills during experiments to collect quality data and articulate observations in their laboratory reports. 4. Maintain ethical and trustworthy recordkeeping and reporting methods: recording data precisely, deciding on when a data set is kept or discarded for the experiments performed. 5. Analyze experimentally obtained data by using calculations and mathematical analysis techniques, such as graphical analysis of data sets. 6. Interpret experimental data and analyze this data using scientific models, concepts, representations, and equations. 7. Use evidenced-based reasoning to make claims and critique results. Make connections between lab results and the theories/concepts learned in lecture. 8. Use safe practices, proper chemical hygiene, and standard protocols while in a laboratory. 9. Collect and record digital data sets using modern data collection techniques including wireless data collection and cloud-based data storage. 10. Work with a partner(s) to accomplish laboratory work. 11. Experience chemistry in-person through direct use of chemicals, laboratory equipment, and instrumentation to complete a laboratory experiment. Credits: 1.00

CHM 11530 - General Chemistry I - Virtual Laboratory (UCC: SCI)

Credit Hours: 1.00. Online laboratory class to accompany CHM 11510. Topics covered can include safety, measurement, thermodynamics, quantitative analysis, stoichiometry, chromatography, and crystallography.

University Core Curriculum (UCC): (UCC: SCI) Learning Outcomes: 1. Understand how scientific equipment and analog and/or digital instruments are used to obtain data measurements. 2. Understand safe laboratory practices and proper chemical hygiene methods associated with an experiment. 3. Develop observational skills during experiments to collect quality data and articulate observations in their laboratory reports. 4. Maintain ethical and trustworthy recordkeeping and reporting methods: recording data precisely, deciding on when a data set is kept or discarded for the experiments performed. 5. Analyze experimentally obtained data by using calculations and mathematical analysis techniques, such as graphical analysis of data sets. 6. Interpret experimental data and analyze this data using scientific models, concepts, representations, and equations. 7. Use evidenced-based reasoning to make claims and critique results. Making connections between lab results and the theories/concepts learned in lecture. Credits: 1.00

12-18 Credits

Spring 1st Year

CHM 12600 - Introduction To Chemistry II (UCC: SCI)

Credit Hours: 5.00. A continuation of CHM 12500 . Properties of solutions; chemical equilibrium calculations; elementary thermodynamics; oxidation-reduction reactions and electrochemical cells; rates of reaction; qualitative analysis; descriptive chemistry.

University Core Curriculum (UCC): (UCC: SCI) Credits: 5.00

MA 16200 - Plane Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 5.00. Continuation of MA 16100 . Vectors in two and three dimensions, techniques of integration, infinite series, conic sections, polar coordinates, surfaces in three dimensions.

Some schools or departments may allow only 4 credit hours toward graduation for this course.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 5.00

MA 16600 - Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 4.00. Continuation of MA 16500 . Vectors in two and three dimensions. Techniques of integration, infinite series, polar coordinates, surfaces in three dimensions. Not open to students with credit in MA 16200 . CTL:IMA 1603 Calculus - Long II

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 4.00

CHM 11610 - General Chemistry II

Credit Hours: 3.00. A continuation of CHM 11510 (General Chemistry I). Topics covered can include solutions, quantitative equilibria in aqueous solutions, thermodynamics, oxidation-reduction and electrochemistry, chemical kinetics, qualitative analysis, and further descriptive chemistry of metals and nonmetals.

Learning Outcomes: 1. Use theory to understand/predict experimental observations. 2. Demonstrate and understand key concepts and principles in chemistry, including the basic theory involved in chemical reactions, thermodynamics, equilibrium, and kinetics. Credits: 3.00

CHM 11620 - General Chemistry II - Laboratory (UCC: SCI)

Credit Hours: 1.00. In-person laboratory class to accompany CHM 11610. Topics covered can include chemical reactions, thermodynamics, equilibrium, rates, kinetics, quantitative analysis, and acid-base equilibria.

University Core Curriculum (UCC): (UCC: SCI)

Learning Outcomes: 1. Understand how scientific equipment and analog and/or digital instruments are used to obtain data measurements. 2. Understand safe laboratory practices and proper chemical hygiene methods associated with an experiment. 3. Develop observational skills during experiments to collect quality data and articulate observations in their laboratory reports. 4. Maintain ethical and trustworthy recordkeeping and reporting methods: recording data precisely, deciding on when a data set is kept or discarded for the experiments performed. 5. Analyze experimentally obtained data by using calculations and mathematical analysis techniques, such as graphical analysis of data sets. 6. Interpret experimental data and analyze this data using scientific models, concepts, representations, and equations. 7. Use evidenced-based reasoning to make claims and

critique results. Make connections between lab results and the theories/concepts learned in lecture. 8. Use safe practices, proper chemical hygiene, and standard protocols while in a laboratory. 9. Collect and record digital data sets using modern data collection techniques including wireless data collection and cloud-based data storage. 10. Work with a partner(s) to accomplish laboratory work. 11. Experience chemistry in-person through direct use of chemicals, laboratory equipment, and instrumentation to complete a laboratory experiment. Credits: 1.00

CHM 11630 - General Chemistry II - Virtual Laboratory (UCC: SCI)

Credit Hours: 1.00. Online laboratory class to accompany CHM 11610. Topics covered can include chemical reactions, thermodynamics, equilibrium, rates, kinetics, quantitative analysis, and acid-base equilibrium.

University Core Curriculum (UCC): (UCC: SCI) Learning Outcomes: 1. Understand how scientific equipment and analog and/or digital instruments are used to obtain data measurements. 2. Understand safe laboratory practices and proper chemical hygiene methods associated with an experiment. 3. Develop observational skills during experiments to collect quality data and articulate observations in their laboratory reports. 4. Maintain ethical and trustworthy recordkeeping and reporting methods: recording data precisely, deciding on when a data set is kept or discarded for the experiments performed. 5. Analyze experimentally obtained data by use calculations and mathematical analysis techniques, such as graphical analysis of data sets. 6. Interpret experimental data and analyze this data using scientific models, concepts, representations, and equations. 7. Use evidenced-based reasoning to make claims and critique results. Make connections between lab results and the theories/concepts learned in lecture. Credits: 1.00

14-16 Credits

Fall 2nd Year

CHM 26505 - Organic Chemistry I

Credit Hours: 3.00. A comprehensive study of the chemical principles underlying aliphatic and aromatic compounds. The syntheses and reactions of these materials are discussed. Modern theory and stereochemistry are stressed to illustrate the logic inherent in the subject matter and to demonstrate the predictability of many chemical transformations. Recommended for students majoring in chemistry.

Learning Outcomes: 1. Draw the structures (geometries and structures) of carbon-based molecules) using acceptable representations and identify common classes of organic compounds. 2. Draw and recognize resonance forms of a structure (resonance structures) and assess their importance. 3. Determine the name of organic compounds by using the IUPAC naming system. Predict the structure when given the name. Recognize its common name. 4. Recognize the 3-dimensional shapes of molecules, as determined by structural conformation and stereochemistry. 5. Use mass spectrometry and IR and NMR spectroscopy to determine the structures of organic molecules. 6. Describe chemical processes with energy diagrams, and apply thermodynamics and kinetics toward understanding reactions and mechanisms. 7. Compare the differences between substitution (SN 1, SN2) and elimination (E1,E2) reactions. 8. Describe the important reactions of alkenes and alkynes and the mechanisms by which they occur. Credits: 3.00

CHM 29400 - Sophomore Chemistry Seminar

Credit Hours: 1.00. Discussion of undergraduate research opportunities, upper-division courses, career opportunities, laboratory safety, use of the library and chemical information,

and topics of current interest in chemistry. Required of sophomores majoring in any chemistry curriculum.

Credits: 1.00

PHYS 17200 - Modern Mechanics (UCC: SCI)

Credit Hours: 4.00. Introductory calculus-based physics course using fundamental interactions between atoms to describe Newtonian mechanics, conservation laws, energy quantization, entropy, the kinetic theory of gases, and related topics in mechanics and thermodynamics. Emphasis is on using only a few fundamental principles to describe physical phenomena extending from nuclei to galaxies. 3-D graphical simulations and numerical problem solving by computer are employed by the student from the very beginning. CTL:IPS 1753 Calculus-based Physics I

University Core Curriculum (UCC): (UCC: SCI)

Learning Outcomes: 1. Understand and describe a wide range of physical phenomena in mechanics and thermodynamics using only a few fundamental principles of physics. 2. Learn a unified approach that relates microscopic behavior to macroscopic behavior. 3. Model natural phenomena quantitatively. 4. Apply all this to a range of topics related to mechanics and thermodynamics. Credits: 4.00

PHYS 22000 - General Physics (UCC: SCI)

Credit Hours: 4.00. Mechanics, heat, and sound, for students not specializing in physics. CTL:IPS 1751 Algebra-based Physics I

University Core Curriculum (UCC): (UCC: SCI)

Learning Outcomes: 1. Be familiar with the important modes of human thought that are the foundations of science. 2. Possess effective foundation skills: read, write, and speak with comprehension, clarity and precision; identify substantive knowledge and disciplinary methods; develop information literacy skills; reason quantitatively as means of gaining and creating knowledge and drawing reliable conclusions. 3. Demonstrate the ability to think critically and to solve problems using the foundation skills: evaluate their ideas and the ideas of others based upon disciplined reasoning; understand the traditions that have formed one's own and other cultures; be able to articulate their ideas in appropriate media.

Credits: 4.00

STAT 30100 - Elementary Statistical Methods (UCC: IL)

Credit Hours: 3.00. Introduction to statistical methods with applications to diverse fields. Emphasis on understanding and interpreting standard techniques. Data analysis for one and several variables, design of samples and experiments, basic probability, sampling distributions, confidence intervals and significance tests for means and proportions, correlation and regression. Software is used throughout. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, 35000, 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: college algebra.

University Core Curriculum (UCC): (UCC: IL)

Learning Outcomes: 1. Students will be introduced to statistical methods and be able to apply them to multiple fields of study. 2. Students will be able to understand, interpret standard statistical techniques, analyze data for one variable and for several variables, calculate and use confidence intervals and significance test for means and proportions, understand the design of samples and experiments, perform and understand basic probability calculations, perform simple and multiple regression procedures, and understand correlation.

Credits: 3.00

STAT 35000 - Introduction To Statistics

Credit Hours: 3.00. This course provides a data-oriented introduction to applied statistics, covering exploratory data analysis, experimental design, probability distributions, simulation, sampling distributions, and the Central Limit Theorem. Students will learn the fundamentals of statistical inference, including confidence intervals and hypothesis tests for population means, paired and independent comparisons of means, analysis of variance, and regression. The course emphasizes hands-on experience with statistical software and is primarily intended for students majoring in the mathematical sciences. Prerequisite: two semesters of college calculus.

Learning Outcomes: 1. Understand basic terms, graphs, and symbols and be able to interpret statistics in the media. 2. Understand and be able to explain statistical processes and be able

to fully interpret statistical results. 3. Understand why and how statistical investigations are conducted and the "big ideas" that underlie statistical investigations. 4. Be able to use a statistical package (R or SAS) to analyze data and interpret result. 5. Big Ideas in Statistics: variability, distributions, and models; causation vs correlation; practical significance vs statistical significance, etc. Credits: 3.00

15-17 Credits

Spring 2nd Year

CHM 26605 - Organic Chemistry II

Credit Hours: 3.00. A continuation of CHM 26505, but a broader scope. The chemistry of a variety of functional groups is discussed. Theory is employed extensively to demonstrate the coherence underlying seemingly diverse transformations. Qualitative organic analysis is introduced, with particular emphasis on spectroscopic methods.

Learning Outcomes: 1. Learn to recognize recurring themes and patterns of reactivity of functional groups. 2. Develop an understanding of organic structure-property relationships. 3. Use spectrometric and spectroscopic techniques to determine the structures of organic molecules. 4. Apply an understanding of reaction mechanisms to new transformations of organic molecules. 5. Recognize different classes of biomacromolecules, lipids, and synthetic polymers. 6. Recognize the role that organic chemistry plays as an enabling science in pharmaceutical, agricultural, electronic/photonic materials and commodity chemical industries. Credits: 3.00

PHYS 22100 - General Physics (UCC: SCI)

Credit Hours: 4.00. Electricity, light, and modern physics, for students not specializing in physics. CTL:IPS 1752 Algebra-based Physics II

University Core Curriculum (UCC): (UCC: SCI) Credits: 4.00

PHYS 24100 - Electricity And Optics (UCC: SCI)

Credit Hours: 3.00. Electrostatics, current electricity, electromagnetism, magnetic properties of matter. Electromagnetic waves, geometrical and physical optics.

University Core Curriculum (UCC): (UCC: SCI) Credits: 3.00

PHYS 25200 - Electricity And Optics Laboratory

Credit Hours: 1.00. Selected experiments in electric fields, magnetic fields, steady-state and transient DC circuits, thermodynamics, and optics.

Learning Outcomes: 1. Demonstrate the ability to think and function as a scientist. 2. Demonstrate the ability to communicate well, both orally and in writing. 3. Demonstrate the ability to understand the role of scientific observation of Nature in uncovering the Laws of Physics. Credits: 1.00

PHYS 27200 - Electric And Magnetic Interactions (UCC: SCI)

Credit Hours: 4.00. Calculus-based physics course using concepts of electric and magnetic fields and an atomic description of matter to describe polarization, fields produced by charge distributions, potential, electrical circuits, magnetic forces, induction, and related topics, leading to Maxwell's equations and electromagnetic radiation and an introduction to waves and interference. 3-D graphical simulations and numerical problem solving by computer are employed throughout.

University Core Curriculum (UCC): (UCC: SCI)

Learning Outcomes: 1. Understand and describe a wide range of physical phenomena in electricity and magnetism using only a few fundamental principles of physics. 2. Learn a unified approach that relates microscopic behavior to macroscopic behavior. 3. Model natural phenomena quantitatively. 4. Apply all this to a range of topics related to electricity and magnetism. Credits: 4.00

CHM 22404 - Quantitative Analysis

Credit Hours: 3.00. Introduction to approaches analytical

chemists use to analyze the composition of matter, including statistics, calibration, and understanding chemical equilibrium (acid/base, complexation, solubility, polyprotic acid treatment, acid/base/redox/precipitation titrations); general approaches to analysis at the trace level; recognition and evaluation of possible sources of error and how error propagates; introduction to how light interacts with matter (and how analytical chemists can take advantage of this).

Learning Outcomes: 1. Understand the fundamentals and figures of merit of different analytical techniques. 2. Learn how to properly select an analytical technique for accurate quantitative determination. 3. Perform accurate quantitative measurements. 4. Use Excel or Google Sheets or Python for data analysis and plotting. 5. Analyze the results and determine the experimental uncertainty. 6. Report the experimental data properly. 7. Perform statistical analysis. Credits: 3.00

13-15 Credits

Fall 3rd Year

CHM 24100 - Introductory Inorganic Chemistry

Credit Hours: 4.00. Descriptive inorganic chemistry dealing in a systematic way with the elements and the structures, properties, and reactions of their compounds. Required of students majoring in chemistry.

Credits: 4.00

13-17 Credits

Spring 3rd Year

CHM 34200 - Inorganic Chemistry

Credit Hours: 3.00. Interpretation and correlation of the reactions and properties of inorganic compounds in terms of their electronic and molecular structures. A survey of the preparations and reactivities of important compounds of the representative elements, with an emphasis on group trends. The elementary chemistry of the transition metals, including magnetic and spectral properties of coordination compounds.

Learning Outcomes: 1. Able to use theory to understand universal physical laws as they apply to chemistry. 2. Able to demonstrate an understanding of the physical properties and a molecular understanding of chemical reactivity and materials. 3. Able to develop problem-solving skills: identifying the objective. 4. Able to plan and perform chemical transformations. 5. Able to carry out calculation related to specific chemistry topics. 6. Able to make connections between different courses/subdisciplines in chemistry. Credits: 3.00

CHM 46200 - Intermediate Organic Chemistry

Credit Hours: 3.00. Theory and application of organic chemistry and reaction mechanisms to organic synthesis and contemporary research topics in closely related areas. Topics include stereochemistry, reactive organic intermediates, molecular orbital theory, photochemistry, organic materials chemistry, and chemical biology.

Learning Outcomes: 1. Able to use theory to understand/predict experimental observations. 2. Able to demonstrate an understanding of the physical properties and a molecular understanding of chemical reactivity and materials. 3. Able to plan and perform chemical transformations. 4. Able to present a formal oral summary of a topic in organic chemistry and receive feedback. 5. Able to write a scientific report using the format of the Chemical Society. 6. Able to practice computer literacy: use available online and database tools, especially in the Organic Chemistry field. Credits: 3.00

CHM 43800 - Introduction To Molecular Biotechnology

Credit Hours: 3.00. An examination of modern tools for the characterization, manipulation, and design of nucleic acids and proteins. Topics include DNA technology, recombinant proteins, bioinformatics, genetic modifications, gene expression and the interactions between nucleic acids and proteins.

Learning Outcomes: 1. Understand basics of DNA technology: isolation, amplification, synthesis, sequencing, and cloning. 2. Understand basics of recombinant protein: expressing in prokaryotic and eukaryotic cells,

introducing mutations. 3. Understand bioinformatics. 4. Understand introducing genetic modifications to plants and animals and stem cells. 5. Control gene expression and genome editing. 6. Examine nucleic acid interactions and protein interactions, and their application in diagnosis. Credits: 3.00

12-16 Credits

Fall 4th Year

COM 21700 - Science Writing And Presentation (UCC: OC)

Credit Hours: 3.00. Students learn to effectively communicate scientific and technical information both verbally and in writing to a variety of audiences.

University Core Curriculum (UCC): (UCC: OC)
Learning Outcomes: Will update at a later date.
Credits: 3.00

CHM 37300 - Physical Chemistry I

Credit Hours: 3.00. Physical chemistry of matter. Properties of gases, liquids, and solids; equations of state; thermodynamics; energy, heat, and work; entropy; spontaneity and equilibrium; chemical potential; chemical equilibrium; phase diagrams; colligative properties.

Learning Outcomes: 1. Understand universal physical laws as they apply to chemistry. 2. Use theory to understand/predict experimental observations. 3. Demonstrate an understanding of the physical properties and a molecular understanding of chemical reactivity and materials. 4. Develop problem-solving skills: identifying the objective. 5. Carry out calculations related to specific chemistry topics. 6. Understand energetics and kinetics of chemical transformations. 7. Reduce complex problems into simpler components. Credits: 3.00

CHM 37301 - Physical Chemistry Laboratory I

Credit Hours: 1.00. A physical chemistry laboratory course that will provide students with hands-on experience that illustrates the core concepts presented in the associated physical chemistry lecture course CHM 37300.

Learning Outcomes: 1. Gain some familiarity with modern instrumentation methods in Physical Chemistry, including UV/Vis spectroscopy and pressure-detected chemical kinetics. 2. Learn Python programming syntax for reading, plotting, and fitting experimental data. 3. Understand how the abstract principles described in CHM 37300 show up in the real world. 4. Learn good laboratory notebook habits for recording and organizing experimental data. Credits: 1.00

CHM 49400 - Junior-Senior Chemistry Seminar

Credit Hours: 1.00. Major emphasis on developing skills in oral and written presentations by students. The subject matter can be library material and/or accomplishments in undergraduate or co-op research. Department permission required.

Credits: 1.00

16-18 Credits

Spring 4th Year

CHM 37400 - Physical Chemistry II

Credit Hours: 3.00. Physical chemistry of molecules. Wave properties of matter; quantum mechanics of translation, rotation, and vibration; atomic structure; molecular orbitals; quantum states; statistical mechanics; chemical kinetics; collision theory; transition state theory.

Learning Outcomes: 1. Give examples that demonstrate the fundamental principles in quantum mechanics. 2. Apply simple quantum mechanical models such as particle-in-a-box to atomic and molecular structures to predict wave functions and calculate energy levels. 3. Interpret simple optical spectroscopy of atoms and molecules based on quantum mechanical principles. Credits: 3.00

15-16 Credits

Chinese Studies, BA (Language & Culture Track)

About the Program

Degree Requirements

Departmental/Program Major Courses (33 credits)

Pre-requisite Language Courses

CHNS 10200 - Chinese Level II (UCC: HUM)

Credit Hours: 4.00. A continuation of the study of elementary Mandarin. Students will complete study of basic syntactical patterns. Character recognition will be built to 500.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Understand sentence-length utterances which consist of recombinations of learned elements in a limited number of content areas, particularly if strongly supported by the situational context. 2. Ask and answer questions, initiate and respond to simple statements and maintain face-to-face conversation. 3. Read, for basic survival and social needs, simple connected specially prepared material and can puzzle out pieces of some authentic material as it reflects similarity to specially prepared material and/or high-frequency oral vocabulary and structure. 4. Read for instructional and directional purposes, standardized messages, such as some prices in stores, time/date on schedules, etc. 5. Meet limited practical writing needs. Credits: 4.00

CHNS 20100 - Chinese Level III (UCC: HUM)

Credit Hours: 4.00. A course in intermediate Mandarin, with integrated spoken and written tracks emphasizing the cultural contexts of usage. Mastery of more advanced syntactic patterns, with enriched vocabulary. Character recognition built to 800. Introduction to Chinese dictionaries.

University Core Curriculum (UCC): (UCC: HUM) Credits: 4.00

CHNS 20200 - Chinese Level IV (UCC: HUM)

Credit Hours: 4.00. A continuation of the study of intermediate Mandarin. Development of enhanced oral narrative skills and listening comprehension skills through audio-visual supplements. Short exercises in expository composition. Character recognition built to 1,100-plus. Introduction to Chinese newspaper.

University Core Curriculum (UCC): (UCC: HUM) Credits: 4.00

CHNS 10100 - Chinese Level I (UCC: HUM)

Credit Hours: 4.00. A comprehensive course in elementary Mandarin, designed to develop basic proficiency in listening, speaking, reading, and writing. Systematic coverage of syntactical patterns. After oral foundation work, 20 characters are introduced each lesson in unsimplified and simplified forms.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Understand sentence-length utterances which consist of recombinations of learned elements in a limited number of content areas, particularly if strongly supported by the situational context. 2. Make short statement and ask simple questions, primarily by relying on memorized utterances but occasionally by expanding these through simple recommendations of those elements. 3. Identify a limited number of character components and high-frequency characters in areas of immediate need. 4. Read for instructional and directional purposes, standardized messages, such as some prices in stores, time/date on schedules, etc. 5. Write simple fixed expressions and limited memorized material and some recombination thereof. Credits: 4.00

Chinese Studies Major

A. Chinese Language (6 credits)

CHNS 30100 - Chinese Level V (UCC: HUM)

Credit Hours: 3.00. Continued development of Chinese speaking, listening, reading, and writing abilities, using materials dealing primarily with everyday life and civilization from a variety of sources, e.g., newspapers, magazines, television, recent literature, etc.

University Core Curriculum (UCC): (UCC: HUM)
Credits: 3.00

CHNS 30200 - Chinese Level VI (UCC: HUM)

Credit Hours: 3.00. Continued development of Chinese speaking, listening, reading, and writing abilities, using materials dealing primarily with everyday life and civilization from a variety of sources with stronger emphasis on authentic texts, e.g., newspapers, magazines, television, recent literature, etc.

University Core Curriculum (UCC): (UCC: HUM)
Credits: 3.00

Chinese Studies Language & Culture Track

B. Advanced Chinese Language (9 credits)

CHNS 31300 - Reading And Writing Practice

Credit Hours: 3.00. Concentration on further development of reading and writing abilities for students with conversational proficiency, using materials primarily from modern social and cultural studies, including annotated literary texts. Conducted in Chinese.

Credits: 3.00

CHNS 40100 - Chinese Level VII (UCC: HUM)

Credit Hours: 3.00. Continued development of Mandarin Chinese speaking, listening, reading, and writing skills. Emphasis will be upon modern, everyday language and culture (with some introduction to traditional culture) using various sources such as textbooks, newspapers, and literary works.

University Core Curriculum (UCC): (UCC: HUM)
Credits: 3.00

CHNS 40200 - Chinese Level VIII (UCC: HUM)

Credit Hours: 3.00. Further development of Mandarin Chinese speaking, listening, reading, and writing skills. Materials will include advanced textbooks and original texts such as newspapers and literary works.

University Core Curriculum (UCC): (UCC: HUM)
Credits: 3.00

C. Chinese Culture - Choose Two (6 credits)

CHNS 28000 - Topics In Chinese Civilization And Culture (UCC: HUM)

Credit Hours: 3.00. Selected topics on Chinese civilization and culture including history and geography, Confucianism, contemporary China, education, family, international cultural and economic cooperation. Course materials also cover most current issues on and in Chinese-speaking communities. Lectures in English.

University Core Curriculum (UCC): (UCC: HUM)
Credits: 3.00

CHNS 28500 - Chinese Calligraphy

Credit Hours: 1.00. Principles and techniques of writing Chinese characters. The aesthetics of Chinese calligraphy, its function as an art form, and its role in Chinese culture. Emphasis on training and practice in calligraphic writing. Conducted in English.

Credits: 1.00

CHNS 49000 - Special Topics In Chinese Language

Credit Hours: 1.00 to 3.00. Topics vary. Permission of instructor required.

Credits: 1.00 to 3.00

CHNS 28100 - Introduction To Chinese Food Culture

Credit Hours: 3.00. Selected topics on Chinese food history, production, preparation, festivals, as well as food in literature, film, business and folk beliefs. Discussion will also include civilization and food as cultural diplomacy. Lectures in English.

Learning Outcomes: 1. Knowledge of evolution of Chinese food history. 2. Learn main concepts of Chinese cooking and gastronomy. 3. Acquire appreciation of the important food-related works in Chinese literature. 4. Learn current trend of food culture in China. 5. Acquire appreciation and understand cultural and historical aspects on major Chinese teas, wines, and snacks in association with their respective geographic features; folk beliefs on medicinal usages of

Chinese teas and wines; and the etiquette regarding tea art, wine drinking, drinker's wager game, and snack serving. Credits: 3.00

D. Chinese Literature and Film - Choose Two (6 credits)

CHNS 24100 - Introduction To The Study Of Chinese Literature (UCC: HUM)

Credit Hours: 3.00. Class reading and discussion of selected Chinese poetry, prose, and drama; introduction to the methods of literary criticism, applied to the reading of Chinese literary discourse. Texts, discussion, and written assignments primarily in Chinese. Permission of instructor required.

University Core Curriculum (UCC): (UCC: HUM)

Credits: 3.00

CHNS 34100 - Chinese Literature I: Traditional Chinese Literature

Credit Hours: 3.00. Reading and discussion of selected classical Chinese texts from major writers and genres. Introduction to methods of literary criticism as applied to Chinese literature. Texts, discussion, and written assignments are largely in Chinese.

Credits: 3.00

CHNS 34200 - Chinese Literature II: Modern Chinese Literature

Credit Hours: 3.00. Study of selected poetry, drama, and fiction from the twentieth century. Students will read and discuss major authors and texts and will write critical essays on literary topics. Texts, discussion, and written assignments are largely in Chinese.

Credits: 3.00

LC 23500 - East Asian Literature In Translation

Credit Hours: 3.00. Reading and discussion of selected East Asian poetry, prose, and drama. Focus will be on the traditions of China and Japan, but may include works of other cultures such as Korea. Emphasis may vary yearly, stressing traditional or modern literatures.

Credits: 3.00

CHNS 59400 - Special Topics In Chinese Literature

Credit Hours: 1.00 to 4.00. Special topics in Chinese Literature. Permission of instructor required.

Credits: 1.00 to 4.00

CHNS 33000 - Introduction To Chinese Cinema (UCC: HUM)

Credit Hours: 3.00. This course surveys the development of the Chinese cinema from its beginning to the present. Films from the mainland as well as Taiwan and Hong Kong will be examined in-depth for their aesthetic quality and techniques, and equally important, against their socio-historical, political, economic and cultural contexts. The class is conducted in English. Films are all in Chinese with English subtitles.

University Core Curriculum (UCC): (UCC: HUM)

Learning Outcomes: 1. Become familiar with the cinema syntax. 2. Understand the development of Chinese cinema in a global context. 3. Understand modern Chinese society and culture through cinema. 4. Develop a critical mind over the political, social and cultural issues presented in cinema. Credits: 3.00

E. Other Requirements (6 credits)

HIST 33900 - Traditional China

Credit Hours: 3.00. Chinese civilization from its origins to the end of the Ming Dynasty. Attention is divided equally between political and cultural history, giving emphasis to the development of traditional institutions in Chinese society as well as to art, literature, religion, and philosophy.

Credits: 3.00

HIST 34000 - Modern China (UCC: HUM)

Credit Hours: 3.00. Chinese history from the Qing Dynasty (1644) to the present, with emphasis on the period since 1800. Attention given to internal developments and China's response to Western thought and material accomplishments. Nationalism and communism in the twentieth century are examined.

University Core Curriculum (UCC): (UCC: HUM)

Credits: 3.00

HIST 43900 - Communist China

Credit Hours: 3.00. The evolution of the Communist movement (1921-1949) and the development of the Communist government (since 1949) in China. Attention is given to political, economic, social, and cultural changes.

Credits: 3.00

LC 49000 - Special Topics In Foreign Languages And Literatures

Credit Hours: 1.00 to 4.00. Topics vary. Permission of instructor required.

Credits: 1.00 to 4.00

REL 23000 - Religions Of The East (UCC: HUM)

Credit Hours: 3.00. (PHIL 33000) A study of the history, teaching, and present institutions of the religions of India, Southeast Asia, China, and Japan. This will include Hinduism, Jainism, Sikhism, Buddhism, Confucianism, Taoism, Shintoism, and Zoroastrianism.

University Core Curriculum (UCC): (UCC: HUM)
Credits: 3.00

CHNS 40200 - Chinese Level VIII (UCC: HUM)

Credit Hours: 3.00. Further development of Mandarin Chinese speaking, listening, reading, and writing skills. Materials will include advanced textbooks and original texts such as newspapers and literary works.

University Core Curriculum (UCC): (UCC: HUM)

Credits: 3.00

HIST 33900 - Traditional China

Credit Hours: 3.00. Chinese civilization from its origins to the end of the Ming Dynasty. Attention is divided equally between political and cultural history, giving emphasis to the development of traditional institutions in Chinese society as well as to art, literature, religion, and philosophy.

Credits: 3.00

HIST 34000 - Modern China (UCC: HUM)

Credit Hours: 3.00. Chinese history from the Qing Dynasty (1644) to the present, with emphasis on the period since 1800. Attention given to internal developments and China's response to Western thought and material accomplishments. Nationalism and communism in the twentieth century are examined.

University Core Curriculum (UCC): (UCC: HUM)

Credits: 3.00

HIST 43900 - Communist China

Credit Hours: 3.00. The evolution of the Communist movement (1921-1949) and the development of the Communist government (since 1949) in China. Attention is given to political, economic, social, and cultural changes.

Credits: 3.00

LC 49000 - Special Topics In Foreign Languages And Literatures

Credit Hours: 1.00 to 4.00. Topics vary. Permission of instructor required.

Credits: 1.00 to 4.00

REL 23000 - Religions Of The East (UCC: HUM)

Credit Hours: 3.00. (PHIL 33000) A study of the history, teaching, and present institutions of the religions of India, Southeast Asia, China, and Japan. This will include Hinduism, Jainism, Sikhism, Buddhism, Confucianism, Taoism, Shintoism, and Zoroastrianism.

University Core Curriculum (UCC): (UCC: HUM)

Departmental/Program Major Courses

Pre-requisite Language Courses

CHNS 10200 - Chinese Level II (UCC: HUM)

Credit Hours: 4.00. A continuation of the study of elementary Mandarin. Students will complete study of basic syntactical patterns. Character recognition will be built to 500.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Understand sentence-length utterances which consist of recombinations of learned elements in a limited number of content areas, particularly if strongly supported by the situational context. 2. Ask and answer questions, initiate and respond to simple statements and maintain face-to-face conversation. 3. Read, for basic survival and social needs, simple connected specially prepared material and can puzzle out pieces of some authentic material as it reflects similarity to specially prepared material and/or high-frequency oral vocabulary and structure. 4. Read for instructional and directional purposes, standardized messages, such as some prices in stores, time/date on schedules, etc. 5. Meet limited practical writing needs. Credits: 4.00

CHNS 20100 - Chinese Level III (UCC: HUM)

Credit Hours: 4.00. A course in intermediate Mandarin, with integrated spoken and written tracks emphasizing the cultural contexts of usage. Mastery of more advanced syntactic patterns, with enriched vocabulary. Character recognition built to 800. Introduction to Chinese dictionaries.

University Core Curriculum (UCC): (UCC: HUM) Credits: 4.00

CHNS 20200 - Chinese Level IV (UCC: HUM)

Credit Hours: 4.00. A continuation of the study of intermediate Mandarin. Development of enhanced oral narrative skills and listening comprehension skills through audio-visual supplements. Short exercises in expository composition. Character recognition built to 1,100-plus. Introduction to Chinese newspaper.

University Core Curriculum (UCC): (UCC: HUM) Credits: 4.00

CHNS 10100 - Chinese Level I (UCC: HUM)

Credit Hours: 4.00. A comprehensive course in elementary Mandarin, designed to develop basic proficiency in listening, speaking, reading, and writing. Systematic coverage of syntactical patterns. After oral foundation work, 20 characters are introduced each lesson in unsimplified and simplified forms.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Understand sentence-length utterances which consist of recombinations of learned elements in a limited number of content areas, particularly if strongly supported by the situational context. 2. Make short statement and ask simple questions, primarily by relying on memorized utterances but occasionally by expanding these through simple recommendations of those elements. 3. Identify a limited number of character components and high-frequency characters in areas of immediate need. 4. Read for instructional and directional purposes, standardized messages, such as some prices in stores, time/date on schedules, etc. 5. Write simple fixed expressions and limited memorized material and some recombination thereof. Credits: 4.00

Chinese Studies Major (33 credits)

A. Chinese Language (6 credits)

CHNS 30100 - Chinese Level V (UCC: HUM)

Credit Hours: 3.00. Continued development of Chinese speaking, listening, reading, and writing abilities, using materials dealing primarily with everyday life and civilization from a variety of sources, e.g., newspapers, magazines, television, recent literature, etc.

University Core Curriculum (UCC): (UCC: HUM) Credits: 3.00

CHNS 30200 - Chinese Level VI (UCC: HUM)

Credit Hours: 3.00. Continued development of Chinese speaking, listening, reading, and writing abilities, using materials dealing primarily with everyday life and civilization from a variety of sources with stronger emphasis on authentic texts, e.g., newspapers, magazines, television, recent literature, etc.

University Core Curriculum (UCC): (UCC: HUM)
Credits: 3.00

Education Track

B. Advanced Chinese Language (3 credits)

CHNS 40100 - Chinese Level VII (UCC: HUM)

Credit Hours: 3.00. Continued development of Mandarin Chinese speaking, listening, reading, and writing skills. Emphasis will be upon modern, everyday language and culture (with some introduction to traditional culture) using various sources such as textbooks, newspapers, and literary works.

University Core Curriculum (UCC): (UCC: HUM)
Credits: 3.00

C. Introduction to Chinese Literature (3 credits)

CHNS 24100 - Introduction To The Study Of Chinese Literature (UCC: HUM)

Credit Hours: 3.00. Class reading and discussion of selected Chinese poetry, prose, and drama; introduction to the methods of literary criticism, applied to the reading of Chinese literary discourse. Texts, discussion, and written assignments primarily in Chinese. Permission of instructor required.

University Core Curriculum (UCC): (UCC: HUM)
Credits: 3.00

D. Advanced Chinese Literature I (3 credits)

CHNS 34100 - Chinese Literature I: Traditional Chinese Literature

Credit Hours: 3.00. Reading and discussion of selected classical Chinese texts from major writers and genres. Introduction to methods of literary criticism as applied to Chinese literature. Texts, discussion, and written assignments are largely in Chinese.

Credits: 3.00

CHNS 34200 - Chinese Literature II: Modern Chinese Literature

Credit Hours: 3.00. Study of selected poetry, drama, and fiction from the twentieth century. Students will read and discuss major authors and texts and will write critical essays on literary topics. Texts, discussion, and written assignments are largely in Chinese.

Credits: 3.00

E. Advanced Chinese Literature II (3 credits)

CHNS 59400 - Special Topics In Chinese Literature

Credit Hours: 1.00 to 4.00. Special topics in Chinese Literature. Permission of instructor required.

Credits: 1.00 to 4.00

F. Chinese Selectives (15 credits)

CHNS 28000 - Topics In Chinese Civilization And Culture (UCC: HUM)

Credit Hours: 3.00. Selected topics on Chinese civilization and culture including history and geography, Confucianism, contemporary China, education, family, international cultural and economic cooperation. Course materials also cover most current issues on and in Chinese-speaking communities. Lectures in English.

University Core Curriculum (UCC): (UCC: HUM)
Credits: 3.00

CHNS 28500 - Chinese Calligraphy

Credit Hours: 1.00. Principles and techniques of writing Chinese characters. The aesthetics of Chinese calligraphy, its function as an art form, and its role in Chinese culture. Emphasis on training and practice in calligraphic writing. Conducted in English.

Credits: 1.00

CHNS 31300 - Reading And Writing Practice

Credit Hours: 3.00. Concentration on further development of reading and writing abilities for students with conversational proficiency, using materials primarily from modern social and cultural studies, including annotated literary texts. Conducted in Chinese.

Credits: 3.00

CHNS 34100 - Chinese Literature I: Traditional Chinese Literature

Credit Hours: 3.00. Reading and discussion of selected classical Chinese texts from major writers and genres. Introduction to methods of literary criticism as applied to Chinese literature. Texts, discussion, and written assignments are largely in Chinese.

Credits: 3.00

CHNS 34200 - Chinese Literature II: Modern Chinese Literature

Credit Hours: 3.00. Study of selected poetry, drama, and fiction from the twentieth century. Students will read and discuss major authors and texts and will write critical essays on literary topics. Texts, discussion, and written assignments are largely in Chinese.

Credits: 3.00

CHNS 39900 - Special Study Abroad Credit In Chinese

Credit Hours: 1.00 to 4.00. This course number is for assignment after the fact of credits in Chinese earned while enrolled at a foreign university on a Study Abroad program which cannot be appropriately accommodated under an established Purdue course number. It is not for use for courses offered at or conducted by Purdue.

Credits: 1.00 to 4.00

CHNS 40200 - Chinese Level VIII (UCC: HUM)

Credit Hours: 3.00. Further development of Mandarin Chinese speaking, listening, reading, and writing skills. Materials will include advanced textbooks and original texts such as newspapers and literary works.

University Core Curriculum (UCC): (UCC: HUM)
Credits: 3.00

CHNS 49000 - Special Topics In Chinese Language

Credit Hours: 1.00 to 3.00. Topics vary. Permission of instructor required.

Credits: 1.00 to 3.00

CHNS 28100 - Introduction To Chinese Food Culture

Credit Hours: 3.00. Selected topics on Chinese food history, production, preparation, festivals, as well as food in literature, film, business and folk beliefs. Discussion will also include civilization and food as cultural diplomacy. Lectures in English.

Learning Outcomes: 1. Knowledge of evolution of Chinese food history. 2. Learn main concepts of Chinese cooking and gastronomy. 3. Acquire appreciation of the important food-related works in Chinese literature. 4. Learn current trend of food culture in China. 5. Acquire appreciation and understand cultural and historical aspects on major Chinese teas, wines, and snacks in association with their respective geographic features; folk beliefs on medicinal usages of Chinese teas and wines; and the etiquette regarding tea art, wine drinking, drinker's wager game, and snack serving. Credits: 3.00

CHNS 33000 - Introduction To Chinese Cinema (UCC: HUM)

Credit Hours: 3.00. This course surveys the development of the Chinese cinema from its beginning to the present. Films from the mainland as well as Taiwan and Hong Kong will be examined in-depth for their aesthetic quality and techniques, and equally important, against their socio-historical, political, economic and cultural contexts. The class is conducted in English. Films are all in Chinese with English subtitles.

University Core Curriculum (UCC): (UCC: HUM)
Learning Outcomes: 1. Become familiar with the cinema syntax. 2. Understand the development of Chinese cinema in a global context. 3. Understand modern Chinese society and culture through cinema. 4. Develop a critical mind over the political, social and cultural issues presented in cinema. Credits: 3.00

Fall 1st Year

EDCI 20500 - Exploring Teaching As A Career (UCC: WC)

Credit Hours: 0.00 to 3.00. Students will become familiar with the work of teachers and begin to develop their educational philosophies through examining what it means to teach and to learn and the nature and purpose of schools. Students will critically evaluate teaching as their chosen profession. This course includes a required weekly field-based experience in an elementary, middle, or high school classroom.

University Core Curriculum (UCC): (UCC: WC)
Learning Outcomes: 1. Learn what it means to teach as they reflect on why, whom, and how they will teach. 2. Learn to shift from a student perspective to a teacher perspective through the examination of teaching, learning, and schools. 3. Learn that teaching is affected by socio-political, community and school contexts.
Credits: 0.00 to 3.00

EDST 20010 - Educational Policies And Laws

Credit Hours: 1.00 to 3.00. The interactive course will provide an understanding of the history of schooling in the United States. A special emphasis will be placed on reviewing historical and contemporary educational policies and educational laws as each subject is critical to understanding social, historical, and cultural issues in the United States. Focus will also be on contemporary applications of historical ideas in the classroom and in school systems.

Learning Outcomes: 1. Know how education laws and policies influenced the American education system and vice versa. 2. Understand how race, ethnicity, gender, and social class have affected schooling experiences. 3. Evaluate how schools reflect societal, political, and cultural values historically. 4. Link these larger issues to reflective teaching practices.
Credits: 1.00 to 3.00

CHNS 10100 - Chinese Level I (UCC: HUM)

Credit Hours: 4.00. A comprehensive course in elementary Mandarin, designed to develop basic proficiency in listening, speaking, reading, and writing. Systematic coverage of syntactical patterns. After oral foundation work, 20 characters are introduced each lesson in unsimplified and simplified forms.

University Core Curriculum (UCC): (UCC: HUM)
Learning Outcomes: 1. Understand sentence-length utterances which consist of recombinations of learned elements in a limited number of content areas, particularly if strongly supported by the situational context. 2. Make short statement and ask simple questions, primarily by relying on memorized utterances but occasionally by expanding these through simple recommendations of those elements. 3. Identify a limited number of character components and high-frequency characters in areas of immediate need. 4. Read for instructional and directional purposes, standardized messages, such as some prices in stores, time/date on schedules, etc. 5. Write simple fixed expressions and limited memorized material and some recombination thereof.
Credits: 4.00

LC 23700 - Our Common Bond: Languages And Cultures In A Global Context

Credit Hours: 3.00. (CMPL 23700) Students learn what lies behind the concept of Liberal Arts: the capabilities, insights and skills of individuals who think critically and freely. It exposes students from across the university to the ideas, skill-set and inspiration that emanates from the liberal arts. They will be introduced to the discipline of Comparative Literature by examining the specific roles that languages and cultures play in the globalized world. The course also demonstrates how a Language and Cultures degree will put students at a greater advantage in career opportunities.

Learning Outcomes: 1. Trace how various cultures have shaped our contemporary models of higher education through written and oral

assignments. 2. Describe how literary texts from various cultures provided the catalyst for major political and social events throughout history. 3. Identify the impact that literary endeavors have in the development of scientific, medical, corporate, environmental and political ideas. 4. Articulate clearly why a Liberal Arts education that focuses on languages and intercultural competency is both valuable and marketable in today's global context. Credits: 3.00

15 Credits

Spring 1st Year

CHNS 10200 - Chinese Level II (UCC: HUM)

Credit Hours: 4.00. A continuation of the study of elementary Mandarin. Students will complete study of basic syntactical patterns. Character recognition will be built to 500.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Understand sentence-length utterances which consist of recombinations of learned elements in a limited number of content areas, particularly if strongly supported by the situational context. 2. Ask and answer questions, initiate and respond to simple statements and maintain face-to-face conversation. 3. Read, for basic survival and social needs, simple connected specially prepared material and can puzzle out pieces of some authentic material as it reflects similarity to specially prepared material and/or high-frequency oral vocabulary and structure. 4. Read for instructional and directional purposes, standardized messages, such as some prices in stores, time/date on schedules, etc. 5. Meet limited practical writing needs. Credits: 4.00

EDCI 28550 - Foundations Of Multicultural Education And Community (UCC: BSS)

Credit Hours: 3.00. The purpose of this course is to give students an opportunity to explore various facets of multiculturalism within their communities. We will examine the influence of social group identities on teaching, learning, and communities as they relate to contexts both in and out of schools. While this course is broad in scope, the primary aim is to assist you in exploring what it means to be an educator and/or concerned citizen in a society that is multicultural.

University Core Curriculum (UCC): (UCC: BSS) Learning Outcomes: 1. Understand and describe the impact of diversity on American schools and classrooms. 2. Understand and describe how their own views and perspectives have been shaped by their backgrounds and identities. 3. Understand and describe the challenges of teaching and communicating in diverse and multicultural schools and communities. 4. Demonstrate the awareness, knowledge, skills, and actions needed for teaching in diverse and multicultural schools and communities. 5. Identify strengths as a community volunteer and collaborate with local organizations to identify community needs. 6. Recognize the needs of community stakeholders through formal and informal conversations. Credits: 3.00

15 Credits

Fall 2nd Year

CHNS 20100 - Chinese Level III (UCC: HUM)

Credit Hours: 4.00. A course in intermediate Mandarin, with integrated spoken and written tracks emphasizing the cultural contexts of usage. Mastery of more advanced syntactic patterns, with enriched vocabulary. Character recognition built to 800. Introduction to Chinese dictionaries.

University Core Curriculum (UCC): (UCC: HUM) Credits: 4.00

EDPS 36201 - Positive Behavioral Supports

Credit Hours: 0.00 to 3.00. This course provides an overview of the theory, principles, and application of applied behavior analysis within positive behavior interventions and support. The course focuses on pre-service teacher preparation in designing and implementing group and individual behavior supports.

Emphasis is on universal supports, targeted interventions, and data-driven decision-making.

Learning Outcomes: 1. Identify the basic principles of behavior and provide real-world examples. 2. Create behavioral expectations and design a corresponding behavior matrix. 3. Design class-wide reinforcement systems. 4. Identify interventions to promote social emotional learning for all learners. 5. Apply data-driven decision making to provide and evaluate a multi-tiered systems of support. 6. Design tier-two targeted supports to teach appropriate behavior. 7. Define behavior. 8. Select appropriate behavior measurement system. 9. Measure and graph behavior to assist in data-driven decision making. Credits: 0.00 to 3.00

EDCI 37001 - Teaching And Learning English As A New Language

Credit Hours: 0.00 to 3.00. This course builds foundational knowledge on the theories and practices related to the English language development of English language learners in the P-12 contexts. Particular attention is given to the current issues as well as on techniques for instructing and assessing students at different stages of English language development in the school context. Students will learn to identify students' strengths and current needs in English, to design classroom experiences across the curriculum, and to assess student performance using current WIDA standards.

Learning Outcomes: 1. Develop understanding of the English language and literacy development process of English language learners. 2. Instruct and assess students who are at different stages of English language development. 3. Identify English Learners' strengths and needs in English. 4. Practice in designing classroom experiences across the curriculum on the basis of these strengths and needs. 5. Learn background in WIDA and practice in designing Model Performance Indicators in connection with teaching experiences in the field for English Learners. 6. Develop understanding of their roles as ELL teachers and professionals in advocating on behalf of their ELLs. Credits: 0.00 to 3.00

15 Credits

Spring 2nd Year

EDPS 23500 - Learning And Motivation (UCC: BSS)

Credit Hours: 0.00 to 3.00. Introduction to concepts of learning and motivation in educational contexts (i.e., Educational Psychology). Influence of development, culture, and individual differences on learning and motivation. Uses of assessment and technology in promoting learning and motivation. A field-based experiential component is included.

University Core Curriculum (UCC): (UCC: BSS)

Learning Outcomes: 1. Understanding of the learning processes including the role of previous experiences and the constructive nature of learning, cognitive constraints, and the role of the social environment. 2. Understanding of the principles of cognitive, personal, social, and moral development. 3. Understanding of principles of motivation including how to initiate and maintain student engagement. 4. Understand the fundamental assessment concepts including the purpose of assessment, the importance of alignment to instructional goals, and the interpretation and use of data. 5. Understanding of the creation of environments conducive for learning. Credits: 0.00 to 3.00

CHNS 20200 - Chinese Level IV (UCC: HUM)

Credit Hours: 4.00. A continuation of the study of intermediate Mandarin. Development of enhanced oral narrative skills and listening comprehension skills through audio-visual supplements. Short exercises in expository composition. Character recognition built to 1,100-plus. Introduction to Chinese newspaper.

University Core Curriculum (UCC): (UCC: HUM)

Credits: 4.00

EDPS 26501 - The Inclusive Classroom

Credit Hours: 2.00. This course is designed to provide an overview of the characteristics of children (birth through age 21) with disabilities, causes of disability, assessment techniques,

and instructional strategies. Emphasis is placed upon the development of an inclusive lesson plan based on student needs in the field experience classroom. Characteristics addressed include learning, behavioral, social-emotional, and communicative abilities and needs for students with mild and intense support needs. Issues related to cultural differences and family impact will also be addressed. A field-based component is included.

Learning Outcomes: 1. Know theoretical and historical perspectives of special education. 2. Demonstrate knowledge of both legal (Federal and State) and ethical guidelines as it relates to education and services for individuals with disabilities including the Individuals with Disabilities Education Act (IDEA), Section 504 and Americans with Disabilities Act (ADA). 3. Identify the academic, behavioral, social-emotional, cognitive, communication, and motor/physical characteristics of students with disabilities including etiologies and outcomes. 4. Know the importance of the role of families as it relates to special education and the potential impact of language, culture, and family background have on the delivery of special education services. 5. Know the educators' role (special education and general education) in assessing, collaborating and teaching individual academic, social, communication, daily living, and employment goals for individuals from birth to 21. 6. Learn strategies for creating an inclusive learning environment that includes individualized instructional strategies/supports for one or more individuals with disabilities. 7. Learn how to select and use appropriate formal and informal assessments that minimize bias. 8. Justify how planned strategies/supports address the learning needs of one or more individuals with disabilities. 9. Learn technologies to support instruction for students with disabilities. Credits: 2.00

EDPS 20001 - Special Populations Seminar: Focus On Students With Disabilities And Differentiation Approaches

Credit Hours: 1.00. (EDCI 20001) This seminar is focused on special populations of learners for teacher education majors with an emphasis on exceptional students and approaches to curricular differentiation. Students will engage in mentoring activities and ongoing support in their development as a professional. The goal of the seminar is to connect theory to practice by engaging in an immersive field experience that connects to content and courses taken concurrently. The seminar provides an environment conducive to fostering rich relationships with schools and communities, pursuing common inquiry, thinking critically about theory, content and practice and advocating for equitable schooling. This seminar includes a field experience targeting schools and classrooms including exceptional students. This seminar is intended to be taken concurrently with EDPS 24800 and EDPS 26501.

Learning Outcomes: 1. Identify key educational theories and describe practices for implementation across various educational field placements. 2. Discuss and use culturally responsive teaching and communication practices. 3. Reflect on their own learning and the learning of others, gaining insight into themselves, into teaching/learning, and into issues of diversity, equity and social justice. 4. Complete a minimum of 30 hours in the required field experience setting. 5. Demonstrate professional attitudes and conduct that facilitate learning and convey a positive image of the education profession. Credits: 1.00

EDPS 24001 - Foundations Of Gifted Education And Differentiated Instruction

Credit Hours: 2.00. This course is an introduction to the intellectual, social, and emotional characteristics of gifted youth; philosophies of gifted education; and programmatic and classroom approaches for supporting gifted students generally and within different domains (e.g., intellectual, academic, creative, artistic, leadership). This course will also help you learn and apply various research-based strategies and curriculum models aligned with gifted education pedagogy. Through readings, in-person small group discussions, and direct application, you will establish the groundwork for differentiated instruction for all students.

Learning Outcomes: 1. Describe the history, philosophical traditions, paradigms, and policies of gifted education. [NAGC-CEC Standards (2013): 6.2] 2. Describe giftedness, creativity, and talented development related to students in school settings. [NAGC-CEC Standards (2013):

1.2, 1.2, 2.1, 5.4, 6.1] 3. Develop awareness of the diversity that exists within the gifted, creative, and talented population. [NAGCCEC Standards (2013): 1.1; 6.3] 4. Apply specific differentiation models and strategies as a response to the needs, interests, and abilities of learners by modifying curriculum, instruction, learning environment, and/or affect. [NAGCCEC Standards (2013): 3.3; 5.1] 5. Create and justify differentiated lessons that utilize instructional strategies and technologies to engage high-potential, gifted, and multi-exceptional students. [NAGC-CEC Standards (2013): 3.1-3.4, 4.2, 4.4, 5.1] 6. Evaluate curriculum and program model(s) would work best at the elementary, middle, and high school levels in your school district. [NAGC-CEC Standards (2013): 3.1, 5.1, 5.2, 6.1] Credits: 2.00

16 Credits

Fall 3rd Year

EDCI 27000 - Introduction To Educational Technology And Computing (UCC: IL)

Credit Hours: 1.00 to 3.00. Addresses fundamentals of educational technology, including the integration of instructional design, media, computers and related technologies within the classroom setting.

University Core Curriculum (UCC): (UCC: IL) Learning Outcomes: 1. Demonstrate the ability to use various forms of technology to access, generate, and manipulate information; as well as to present and communicate results. 2. Given the background information and resources for a potential lesson, identify the instructional activities, methods, and media that should optimally be selected, implemented and evaluated within the lesson. 3. Apply educational technology to plan and deliver instructional lessons that integrate a variety of software, applications, and learning tools. 4. Identify issues (e.g. equity, privacy, security, plagiarism, isolationism) that have been produced or enhanced because of the integration of technology and describe how these issues can be effectively addressed. Credits: 1.00 to 3.00

EDCI 30900 - Reading In Middle And Secondary Schools: Methods And Problems

Credit Hours: 1.00 to 3.00. For prospective teachers at junior and senior high schools. An overview of reading processes, fundamentals of reading instruction, factors that influence the ability to read text materials, strategies and materials for identifying and reducing reading problems, school resources, and programs for normal and deficient readers. Concurrent enrollment with program-specified methods course.

Learning Outcomes: 1. Explore multiple, diverse, research-based instructional strategies and materials to support the teaching of content-area literacy. 2. Support the development of pedagogical competency through continued work with issues of teaching and learning in secondary literacy. Credits: 1.00 to 3.00

CHNS 24100 - Introduction To The Study Of Chinese Literature (UCC: HUM)

Credit Hours: 3.00. Class reading and discussion of selected Chinese poetry, prose, and drama; introduction to the methods of literary criticism, applied to the reading of Chinese literary discourse. Texts, discussion, and written assignments primarily in Chinese. Permission of instructor required.

University Core Curriculum (UCC): (UCC: HUM) Credits: 3.00

CHNS 30100 - Chinese Level V (UCC: HUM)

Credit Hours: 3.00. Continued development of Chinese speaking, listening, reading, and writing abilities, using materials dealing primarily with everyday life and civilization from a variety of sources, e.g., newspapers, magazines, television, recent literature, etc.

University Core Curriculum (UCC): (UCC: HUM) Credits: 3.00

14 Credits

Spring 3rd Year

CHNS 30200 - Chinese Level VI (UCC: HUM)

Credit Hours: 3.00. Continued development of Chinese speaking, listening, reading, and writing abilities, using materials dealing primarily with everyday life and civilization from a variety of sources with stronger emphasis on authentic texts, e.g., newspapers, magazines, television, recent literature, etc.

University Core Curriculum (UCC): (UCC: HUM)
Credits: 3.00

CHNS 34100 - Chinese Literature I: Traditional Chinese Literature

Credit Hours: 3.00. Reading and discussion of selected classical Chinese texts from major writers and genres. Introduction to methods of literary criticism as applied to Chinese literature. Texts, discussion, and written assignments are largely in Chinese.

Credits: 3.00

CHNS 34200 - Chinese Literature II: Modern Chinese Literature

Credit Hours: 3.00. Study of selected poetry, drama, and fiction from the twentieth century. Students will read and discuss major authors and texts and will write critical essays on literary topics. Texts, discussion, and written assignments are largely in Chinese.

Credits: 3.00

CHNS 59400 - Special Topics In Chinese Literature

Credit Hours: 1.00 to 4.00. Special topics in Chinese Literature. Permission of instructor required.

Credits: 1.00 to 4.00

LC 47500 - Theories Of Teaching World Languages

Credit Hours: 3.00. This course is designed to assist you in the process of becoming a skilled professional who can teach world language(s). You will gain experiential hours in the secondary classroom. You will also develop an understanding of the connection between effective language teaching and successful language learning, be able to think critically about your own teaching and teaching materials and gain an understanding of various theories, methods, approaches, and techniques in world language teaching. Areas of emphasis include the nature of language learning theories, early approaches to language pedagogy, communicative language teaching methodology, the relationship between theory and practice, aspects of the interaction between speakers in the classroom, skills-based theories, sociocultural perspectives, individual differences between learners, and usage-based approaches to second language acquisition.

Learning Outcomes: 1. Identify various theories of foreign language learning. 2. Describe various theories of foreign language teaching. 3. Analyze how student learning is influenced by different types of instructional practices. 4. Recognize how theories of individual and collaborative learning strategies affect student engagement. 5. Compare and contrast how diverse learners process information and develop language learning skills. Credits: 3.00

15 Credits

Fall 4th Year

EDCI 42700 - Teaching Of World Languages

Credit Hours: 3.00. This is one of the two methods courses required for World Language Teaching major. While LC 47500 is a theoretical course, this course is a practical course on world language teaching in secondary school.

Learning Outcomes: 1. Design lesson plans that draw on knowledge of content areas. 2. Write language learning assessment documents (diagnostic formative, and summative). 3. Design language assessment rubrics. 4. Evaluate their own and others' teaching effectiveness. 5. Plan lessons that incorporate strategies to monitor student learning. 6. Build collaborative relationships with other language teaching professionals. 7. Identify resources for the developing foreign language teaching, including textbooks, scholarly journals, pedagogy associations and conferences.
Credits: 3.00

CHNS 40100 - Chinese Level VII (UCC: HUM)

Credit Hours: 3.00. Continued development of Mandarin Chinese speaking, listening, reading, and writing skills. Emphasis will be upon modern, everyday language and culture (with some introduction to traditional culture) using various

sources such as textbooks, newspapers, and literary works.
University Core Curriculum (UCC): (UCC: HUM) Credits: 3.00

EDPS 32700 - Classroom Assessment

Credit Hours: 1.00 to 3.00. Evaluating the impact of instruction on student performance is one of the most important skills for an educator. Effective teachers ask themselves, "How do I know if students are truly learning? Are they meeting educational objectives in the content area?" Using well-chosen assessment approaches, teachers can address these questions. In this course, students will acquire assessment literacy: the ability to gather accurate information about student achievement, and use that information to make instructional decisions that will improve learning. Course activities will focus on assessment tasks relevant to P- 12 classroom settings.
Learning Outcomes: 1. Create a long -term assessment plan. 2. Develop constructed-response tasks with scoring rubrics that are clearly written, aligned with content-area performance goals, and free of bias. 3. Make reasonable interpretations of classroom and large-scale assessment results for individual learners and use these interpretations to inform instructional plans. 4. Provide informative feedback to learners about their assessment results. Credits: 1.00 to 3.00

EDPS 43010 - Secondary Creating And Managing Learning Environments

Credit Hours: 1.00 to 3.00. This course is designed to develop advanced pre-service teachers' skills in recognizing classroom processes and understanding how teachers' beliefs and practices affect secondary students' engagement, learning, and motivation. It focuses on Effective Teaching - what it is, what it looks like, and different ways to enact it in the classroom.
Learning Outcomes: 1. Develop skills for building classroom communities. 2. Analyze different approaches to classroom discipline and the effects of those approaches on the cognitive, social, and emotional development of diverse students. 3. Develop a personal philosophy of classroom discipline. 4. Understand how student diversity, developmental levels, technology, instructional design, room arrangement, and assessment techniques influence the classroom community and climate. 5. Develop strategies for effective management of professional time and tasks. 6. Learn how to collaborate with colleagues and parents to enhance student learning and development. 7. Develop a comprehensive plan for creating and managing the learning environment in a real or simulated teaching situation. Credits: 1.00 to 3.00

18 Credits

Spring 4th Year

EDCI 49800 - Supervised Teaching (UCC: OC)

Credit Hours: 6.00 to 16.00. Teaching full-time in a school classroom under the supervision of the teacher in charge of the class and a University supervisor. Completion of education methods courses and other Gate requirements for the major area and admittance to teacher education required.
University Core Curriculum (UCC): (UCC: OC)
Learning Outcomes: 1. Understand and address each student's development and learning needs. 2. Understand and apply content and curricular knowledge for teaching. 3. Assess, plan, and design contexts for learning. 4. Support each student's learning using effective instruction. 5. Develop as a professional. Credits: 6.00 to 16.00

12 Credits

Civil Engineering, BSCE

About the Program

Degree Requirements

Departmental/Program Major Courses (65 credits)

Civil Engineering Required Courses (35 credits)

CE 20300 - Principles And Practice Of Geomatics

Credit Hours: 4.00. This course provides a broad overview of geomatics engineering including fundamental principles required for practical geomatics applications. This course includes subjects in traditional surveying, GPS surveying, remote sensing, photogrammetry, laser scanning, and Geographic Information Systems (GIS). Basic concepts on these subjects are applied to solve practical problems in various civil engineering applications; including computations for engineering project control and construction layout; theory of error propagation; fundamental concepts of horizontal and vertical curves; topographic mapping using various geospatial data acquisition technologies from ground, air, and space; GIS for visualization and analysis of geospatial data.

Learning Outcomes: 1. Design and execute a leveling survey. 2. Design and execute a traverse survey. 3. Use survey data to produce a topographic map. 4. Perform horizontal and vertical curve computations. 5. Collect GPS/RTK/RTN data with survey grade accuracy. 6. Perform remote sensing image classification. 7. Measure digital photographs and perform camera calibration. 8. Use software to generate 3D point cloud from digital imagery. 9. Perform multi-image bundle block adjustment. 10. Manipulate 3D point cloud data from a laser scanner, and extract engineering parameters. 11. Select appropriate geodetic references and map projections for geomatics applications. 12. Collect and register geospatial data from multiple sources for engineering applications. 13. Map and visualize collected geospatial data. Credits: 4.00

CE 27000 - Introductory Structural Mechanics

Credit Hours: 4.00. Loads; structural forms; analysis of axially loaded members, flexural members, torsional members; combined loading conditions; buckling. Basic behavioral characteristics of structural elements and systems illustrated by laboratory experiments.

Credits: 4.00

CE 29202 - Contemporary Issues In Civil Engineering

Credit Hours: 2.00. This course provides a forum on issues in the civil engineering profession in a contemporary context. Topics include professionalism and ethics, entrepreneurship, cultural differences, and collaborating globally. Students have interactions with engineering faculty and professionals outside the University. Guidance on the preparation of individual plans of study and information on civil engineering career options are provided. Students learn and apply fundamental aspects of written communication in professional settings. Emphasis is placed on delivery of technical and managerial content. Students will compile a professional portfolio of communication assignments, including lab reports prepared in other CE courses.

Learning Outcomes: 1. Ability to communicate effectively. 2. Ability to understand the impact of engineering solutions in a global and societal context. 3. Knowledge of contemporary issues, particularly with respect to nuclear topics. 4. Understanding of professional and ethical responsibility. Credits: 2.00

CE 29700 - Basic Mechanics I (Statics)

Credit Hours: 3.00. Statics of particles. Rigid bodies: equivalent systems of forces, equilibrium. Centroids and centers of gravity. Static analysis of trusses, frames, and machines. Friction. Area moments of inertia.

Learning Outcomes: 1. Utilize fundamental vector mechanics concepts to understand, explain, and describe the behavior of particle and rigid-body equilibrium. 2. Determine centroids and moments of inertia of areas. 3. Analyze the behavior of typical engineering components using force and moment equilibrium. Credits: 3.00

CE 29800 - Basic Mechanics II Dynamics

Credit Hours: 3.00. Kinematics of particles. Kinetics of particles and systems of particles. Kinematics of rigid bodies. Mass moments of inertia. Kinetics of rigid bodies. Mechanical vibrations.

Credits: 3.00

CE 34000 - Hydraulics

Credit Hours: 3.00. Fluid properties; hydrostatics; kinematics and dynamics of fluid flows; conservation of mass, energy, and

momentum; flows in pipes and open channels. Formal laboratory experiments.

Credits: 3.00

CE 34300 - Elementary Hydraulics Laboratory

Credit Hours: 1.00. The laboratory covers basic concepts in analysis of experimental data and methods in hydraulic measurements. A variety of simple laboratory experiments illustrating the principles of hydraulics are performed.

Credits: 1.00

CE 39201 - Technical Communication In Civil Engineering

Credit Hours: 2.00. This course will build upon the technical communication components of CE 29202 , adding instruction in oral communication, projects, and working in teams. This course involves both individual and team assignments intended to offer students the opportunity to practice preparing and delivering written correspondence and reports, as well as oral presentations. These activities may be coordinated with other CE courses being taken by students in CE 39201.

Learning Outcomes: 1. Know the value of clear and concise communication. 2. Understand the audience and structuring of communications. 3. Employ the forms of arguments/reasoning. 4. Apply knowledge of scientific vocabulary and technical data-driven communication. 5. Work effectively in teams. 6. Employ issue analysis to plan team project work. 7. Understanding of good listening; oral communications. 8. Employ PowerPoint and visual communications effectively. 9. Deliver team technical presentations. 10. Develop and present lab reports. 11. Knowledge to prepare ""How-To"" video project. 12. Conduct meetings; running brainstorming sessions. 13. Develop persuasive presentations. 14. Prepare effective resumes, cover letters, and job searches. 15. Employ job interview skills. Credits: 2.00

CE 39800 - Introduction To Civil Engineering Systems Design

Credit Hours: 3.00. An introduction to engineering economy and systems analysis. A systematic approach to the engineering method of design and problem solving.

Credits: 3.00

CE 49800 - Civil Engineering Design Project

Credit Hours: 3.00. Planning, design, and analysis of a civil project; an integrated and realistic group project involves as much as possible all major aspects of the civil engineering profession.

Credits: 3.00

CE 21101 - Thermal And Energy Sciences

Credit Hours: 3.00. This course includes applications of thermal science and energy fundamentals to civil engineering topics. Emphasis is placed on fundamental concepts of properties of materials, work, heat, internal energy, entropy, equilibrium, and relations derived from the first and second laws of thermodynamics. Example applications include: power plants; fluid flow in ducts/pipes; thermal properties of building/construction materials and processes; geothermal systems; heating, ventilation, and air conditioning (HVAC) processes; energy balances in buildings; refrigeration; hydroelectric power; contaminant transport in air, water, and soil; climate change; the urban heat island effect; and energy use in the transportation sector.

Learning Outcomes: 1. Explain the principles of mass and energy conservation and their use in civil engineering applications. 2. Evaluate thermodynamic systems and several forms of work, energy, and heat transfer. 3. Apply conservation of mass and energy for closed systems and control volume processes. 4. Explain the second law of thermodynamics, entropy changes, and device efficiencies.

Credits: 3.00

CE 33500 - Civil Engineering Materials

Credit Hours: 4.00. An introduction to the relationships between fundamental structure of materials and their properties presented through a combination of materials science and engineering approaches. Emphasis on materials of particular interest for civil engineering applications, including metals, aggregates, portland cement concrete, bituminous materials, asphalt binders, asphalt mixtures, wood, polymers, composites, and masonry. Laboratory exercises illustrate atomic

structure, elastic and inelastic properties, and demonstrate applications of selected principle of mechanics, testing of aggregates, as well as designing and testing of asphalt and concrete mixtures.
Learning Outcomes: 1. Formulate equations that describe the properties of composite materials based on boundary conditions, assumptions and constituent properties. 2. Design and conduct experiments, as well as to analyze and interpret data. 3. Use non-destructive tests to estimate material properties. 4. Use non-destructive test to locate flaws in engineering systems. 5. Compare and contrast strength of materials and fracture mechanics solutions. 6. Use mathematics, science and engineering principles to estimate the influence of cracks on the mechanical response of engineering materials. 7. Use scientific and engineering principles to predict the elastic and viscoelastic of a material. 8. Interpret engineering properties from test data. 9. Use standardized test procedures to describe the properties of engineering materials. 10. Use mathematical, scientific and engineering principles to compute the influence of material proportions on the structure property relationships for concrete materials. 11. Design the proportions for a concrete mixture. 12. Explain the relationship between the properties of an asphalt mixture and its performance. 13. Select engineering materials for specific applications. 14. Communicate effectively using graphs. 15. Communicate effectively using an executive summary. 16. Communicate effectively using an engineering report. 17. Communicate the expected accuracy obtained from engineering data. Credits: 4.00

Technical Electives (30 credits)

Other Departmental/Program Course Requirements (65-72 credits)

Engineering Requirements for First Year (29-39 credits)

Other Departmental/Program Course Requirements (21-28 credits)

CS 15900 - C Programming

Credit Hours: 3.00. Fundamental principles, concepts, and methods of programming in C, with emphasis on applications in the physical sciences and engineering. Basic problem solving and programming techniques; fundamental algorithms and data structures; and use of programming logic in solving engineering problems. Students are expected to complete assignments in a collaborative learning environment. Credit cannot be obtained for both CS 15900 and any of CS 15600, CS 15800 and CS 18000.
Learning Outcomes: 1. Understand the fundamental principles, concepts and methods of computer programming. 2. Use the C programming language to developing solutions in the domains of physical sciences, mathematics, and engineering. 3. Demonstrate the ability to function as part of a technical team to generate a solution to a programming problem. 4. Analyze alternative algorithm designs to implement solutions that make efficient use of limited resources of the computer. Credits: 3.00

MA 26100 - Multivariate Calculus (UCC: QR)

Credit Hours: 4.00. Planes, lines, and curves in three dimensions. Differential calculus of several variables; multiple integrals. Introduction to vector calculus. Not open to students with credit in MA 17400 or 27100.
University Core Curriculum (UCC): (UCC: QR)
Learning Outcomes: 1. Know the equations for lines, planes and quadric surfaces in three dimensional space, and understand how these equations relate to the geometry. 2. Understand

the relationship between vector functions and parametrized motion; know how to calculate velocity, acceleration, arc length and curvature. 3. Know the meaning of partial derivatives and how to calculate them. Know the multivariable chain rule. 4. Know the meaning of the gradient, how to calculate it, and how to apply it to directional derivatives and maximum and minimum values. 5. Understand the meaning of double and triple integrals; know how to compute them and how to apply them. 6. Understand the meaning of vector fields and line integrals. Know Green's theorem and be able to apply it. 7. Understand the meaning of surface integrals and know how to calculate them. Know Stokes' theorem and be able to apply it. Credits: 4.00

MA 26500 - Linear Algebra (UCC: QR)

Credit Hours: 3.00. Introduction to linear algebra. Systems of linear equations, matrix algebra, vector spaces, determinants, eigenvalues and eigenvectors, diagonalization of matrices, applications. Not open to students with credit in MA 26200, 27200, 35000 or 35100.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Learn the basic properties of matrices. 2. Learn how to solve systems of linear equations. 3. Learn the basic properties of determinants. 4. Learn about linear independence, spanning sets and bases in the context of vector spaces. 5. Learn the theory of inner product spaces and how it applies to least-squares approximations. 6. Learn the theory of eigenvalues and eigenvectors and how it applies to systems of differential equations. Credits: 3.00

MA 26600 - Ordinary Differential Equations (UCC: QR)

Credit Hours: 3.00. First order equations, second and n'th order linear equations, series solutions, solution by Laplace transform, systems of linear equations. It is preferable but not required to take MA 26500 either first or concurrently. Not open to students with credit in MA 26200, 27200, 36000, 36100, or 36600.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Understand the properties of and able to solve first-order differential equations, linear differential equations of second and higher orders, and linear systems of differential equations. 2. Understand and able to apply basic numerical methods for solving initial value problems. 3. Understand the properties of Laplace transforms and able to apply to solving differential equations and initial value problems. 4. Apply differential equations to mechanical, physical, and biological models. Credits: 3.00

PHYS 24100 - Electricity And Optics (UCC: SCI)

Credit Hours: 3.00. Electrostatics, current electricity, electromagnetism, magnetic properties of matter. Electromagnetic waves, geometrical and physical optics.

University Core Curriculum (UCC): (UCC: SCI) Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5.

Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

CM 16400 - Graphics For Civil Engineering And Construction

Credit Hours: 2.00. This course introduces the fundamentals of construction engineering graphics and computer-aided documentation, focusing on their application in civil engineering and construction-related professions. Emphasizing the future of digital communication in the industry, students will explore advanced visualization and analysis techniques through the integration of sketching, computer-aided design (CAD), and emerging technologies. The course covers industry-standard graphic conventions, database management strategies, and methods for generating, interpreting, and sharing precise geometric models. Students will develop skills in creating, manipulating, and analyzing 2D and 3D visualizations to effectively communicate and solve complex construction problems in a dynamic, technology-driven environment.

Learning Outcomes: 1. Understand the Role of Construction Graphics: Demonstrate knowledge of the history, theories, and importance of engineering design processes and graphics in construction, including their role in real-world problem-solving and communication. 2. Apply Geometric and Graphic Standards: Develop proficiency in creating and solving 2D and 3D geometric forms and applying construction graphic standards and codes to engineering problems. 3. Utilize Computer Graphics and Visualization: Effectively use computer-aided design (CAD) tools and 3D visualization skills to analyze, solve, and communicate construction challenges. 4. Enhance Communication Through Graphic Conventions: Present solutions clearly and accurately using appropriate 2D and 3D graphical communication standards and conventions. Credits: 2.00

CHM 11610 - General Chemistry II

Credit Hours: 3.00. A continuation of CHM 11510 (General Chemistry I). Topics covered can include solutions, quantitative equilibria in aqueous solutions, thermodynamics, oxidation-reduction and electrochemistry, chemical kinetics, qualitative analysis, and further descriptive chemistry of metals and nonmetals.

Learning Outcomes: 1. Use theory to understand/predict experimental observations. 2. Demonstrate and understand key concepts and principles in chemistry, including the basic theory involved in chemical reactions, thermodynamics, equilibrium, and kinetics. Credits: 3.00

CHM 11620 - General Chemistry II - Laboratory (UCC: SCI)

Credit Hours: 1.00. In-person laboratory class to accompany CHM 11610. Topics covered can include chemical reactions, thermodynamics, equilibrium, rates, kinetics, quantitative analysis, and acid-base equilibria.

University Core Curriculum (UCC): (UCC: SCI)

Learning Outcomes: 1. Understand how scientific equipment and analog and/or digital instruments are used to obtain data measurements. 2. Understand safe laboratory practices and proper chemical hygiene methods associated with an experiment. 3. Develop observational skills during experiments to collect quality data and articulate observations in their laboratory reports. 4. Maintain ethical and trustworthy recordkeeping and reporting methods: recording data precisely, deciding on when a data set is kept or discarded for the experiments performed. 5. Analyze experimentally obtained data by using calculations and mathematical analysis techniques, such as graphical analysis of data sets. 6. Interpret experimental data and analyze this data using scientific models, concepts, representations, and equations. 7. Use evidenced-based reasoning to make claims and

critique results. Make connections between lab results and the theories/concepts learned in lecture. 8. Use safe practices, proper chemical hygiene, and standard protocols while in a laboratory. 9. Collect and record digital data sets using modern data collection techniques including wireless data collection and cloud-based data storage. 10. Work with a partner(s) to accomplish laboratory work. 11. Experience chemistry in-person through direct use of chemicals, laboratory equipment, and instrumentation to complete a laboratory experiment. Credits: 1.00

CHM 11630 - General Chemistry II - Virtual Laboratory (UCC: SCI)

Credit Hours: 1.00. Online laboratory class to accompany CHM 11610. Topics covered can include chemical reactions, thermodynamics, equilibrium, rates, kinetics, quantitative analysis, and acid-base equilibrium.

University Core Curriculum (UCC): (UCC: SCI) Learning Outcomes: 1. Understand how scientific equipment and analog and/or digital instruments are used to obtain data measurements. 2. Understand safe laboratory practices and proper chemical hygiene methods associated with an experiment. 3. Develop observational skills during experiments to collect quality data and articulate observations in their laboratory reports. 4. Maintain ethical and trustworthy recordkeeping and reporting methods: recording data precisely, deciding on when a data set is kept or discarded for the experiments performed. 5. Analyze experimentally obtained data by use calculations and mathematical analysis techniques, such as graphical analysis of data sets. 6. Interpret experimental data and analyze this data using scientific models, concepts, representations, and equations. 7. Use evidenced-based reasoning to make claims and critique results. Make connections between lab results and the theories/concepts learned in lecture. Credits: 1.00

Fall 2nd Year

CE 20300 - Principles And Practice Of Geomatics

Credit Hours: 4.00. This course provides a broad overview of geomatics engineering including fundamental principles required for practical geomatics applications. This course includes subjects in traditional surveying, GPS surveying, remote sensing, photogrammetry, laser scanning, and Geographic Information Systems (GIS). Basic concepts on these subjects are applied to solve practical problems in various civil engineering applications; including computations for engineering project control and construction layout; theory of error propagation; fundamental concepts of horizontal and vertical curves; topographic mapping using various geospatial data acquisition technologies from ground, air, and space; GIS for visualization and analysis of geospatial data.

Learning Outcomes: 1. Design and execute a

leveling survey. 2. Design and execute a traverse survey. 3. Use survey data to produce a topographic map. 4. Perform horizontal and vertical curve computations. 5. Collect GPS/RTK/RTN data with survey grade accuracy. 6. Perform remote sensing image classification. 7. Measure digital photographs and perform camera calibration. 8. Use software to generate 3D point cloud from digital imagery. 9. Perform multi-image bundle block adjustment. 10. Manipulate 3D point cloud data from a laser scanner, and extract engineering parameters. 11. Select appropriate geodetic references and map projections for geomatics applications. 12. Collect and register geospatial data from multiple sources for engineering applications. 13. Map and visualize collected geospatial data. Credits: 4.00

CE 29202 - Contemporary Issues In Civil Engineering

Credit Hours: 2.00. This course provides a forum on issues in the civil engineering profession in a contemporary context. Topics include professionalism and ethics, entrepreneurship, cultural differences, and collaborating globally. Students have interactions with engineering faculty and professionals outside the University. Guidance on the preparation of individual plans of study and information on civil engineering career options are provided. Students learn and apply fundamental aspects of written communication in professional settings. Emphasis is placed on delivery of technical and managerial content. Students will compile a professional portfolio of communication assignments, including lab reports prepared in other CE courses.

Learning Outcomes: 1. Ability to communicate effectively. 2. Ability to understand the impact of engineering solutions in a global and societal context. 3. Knowledge of contemporary issues, particularly with respect to nuclear topics. 4. Understanding of professional and ethical responsibility. Credits: 2.00

CE 29700 - Basic Mechanics I (Statics)

Credit Hours: 3.00. Statics of particles. Rigid bodies: equivalent systems of forces, equilibrium. Centroids and centers of gravity. Static analysis of trusses, frames, and machines. Friction. Area moments of inertia.

Learning Outcomes: 1. Utilize fundamental vector mechanics concepts to understand, explain, and describe the behavior of particle and rigid-body equilibrium. 2. Determine centroids and moments of inertia of areas. 3. Analyze the behavior of typical engineering components using force and moment equilibrium. Credits: 3.00

MA 26100 - Multivariate Calculus (UCC: QR)

Credit Hours: 4.00. Planes, lines, and curves in three dimensions. Differential calculus of several variables; multiple integrals. Introduction to vector calculus. Not open to students with credit in MA 17400 or 27100.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Know the equations for lines, planes and quadric surfaces in three dimensional space, and understand how these equations relate to the geometry. 2. Understand the relationship between vector functions and parametrized motion; know how to calculate velocity, acceleration, arc length and curvature. 3. Know the meaning of partial derivatives and how to calculate them. Know the multivariable chain rule. 4. Know the meaning of the gradient, how to calculate it, and how to apply it to directional derivatives and maximum and minimum values. 5. Understand the meaning of double and triple integrals; know how to compute them and how to apply them. 6. Understand the meaning of vector fields and line integrals. Know Green's theorem and be able to apply it. 7. Understand the meaning of surface integrals and know how to calculate them. Know Stokes' theorem and be able to apply it. Credits: 4.00

PHYS 24100 - Electricity And Optics (UCC: SCI)

Credit Hours: 3.00. Electrostatics, current electricity, electromagnetism, magnetic properties of matter. Electromagnetic waves, geometrical and physical optics.

University Core Curriculum (UCC): (UCC: SCI)

Credits: 3.00

CM 16400 - Graphics For Civil Engineering And Construction

Credit Hours: 2.00. This course introduces the fundamentals of construction engineering graphics and computer-aided documentation, focusing on their application in civil engineering and construction-related professions. Emphasizing the future of digital communication in the industry, students will explore advanced visualization and analysis techniques through the integration of sketching, computer-aided design (CAD), and emerging technologies. The course covers industry-standard graphic conventions, database management strategies, and methods for generating, interpreting, and sharing precise geometric models. Students will develop skills in creating, manipulating, and analyzing 2D and 3D visualizations to effectively communicate and solve complex construction problems in a dynamic, technology-driven environment.

Learning Outcomes: 1. Understand the Role of Construction Graphics: Demonstrate knowledge of the history, theories, and importance of engineering design processes and graphics in construction, including their role in real-world problem-solving and communication. 2. Apply Geometric and Graphic Standards: Develop proficiency in creating and solving 2D and 3D geometric forms and applying construction graphic standards and codes to engineering problems. 3. Utilize Computer Graphics and Visualization: Effectively use computer-aided design (CAD) tools and 3D visualization skills to analyze, solve, and communicate construction challenges. 4. Enhance Communication Through Graphic Conventions: Present solutions clearly and accurately using appropriate 2D and 3D graphical communication standards and conventions. Credits: 2.00

18 Credits

Spring 2nd Year

CE 27000 - Introductory Structural Mechanics

Credit Hours: 4.00. Loads; structural forms; analysis of axially loaded members, flexural members, torsional members; combined loading conditions; buckling. Basic behavioral characteristics of structural elements and systems illustrated by laboratory experiments.

Credits: 4.00

CE 29800 - Basic Mechanics II Dynamics

Credit Hours: 3.00. Kinematics of particles. Kinetics of particles and systems of particles. Kinematics of rigid bodies. Mass moments of inertia. Kinetics of rigid bodies. Mechanical vibrations.

Credits: 3.00

MA 26500 - Linear Algebra (UCC: QR)

Credit Hours: 3.00. Introduction to linear algebra. Systems of linear equations, matrix algebra, vector spaces, determinants, eigenvalues and eigenvectors, diagonalization of matrices, applications. Not open to students with credit in MA 26200, 27200, 35000 or 35100.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Learn the basic properties of matrices. 2. Learn how to solve systems of linear equations. 3. Learn the basic properties of determinants. 4. Learn about linear independence, spanning sets and bases in the context of vector spaces. 5. Learn the theory of inner product spaces and how it applies to least-squares approximations. 6. Learn the theory of eigenvalues and eigenvectors and how it applies to systems of differential equations. Credits: 3.00

CE 21101 - Thermal And Energy Sciences

Credit Hours: 3.00. This course includes applications of thermal science and energy fundamentals to civil engineering topics. Emphasis is placed on fundamental concepts of properties of materials, work, heat, internal energy, entropy, equilibrium, and relations derived from the first and second laws of thermodynamics. Example applications include: power plants; fluid flow in ducts/pipes; thermal properties of building/construction materials and processes; geothermal systems; heating, ventilation, and air conditioning (HVAC) processes; energy balances in buildings; refrigeration; hydroelectric power; contaminant transport in air, water, and soil; climate change; the urban heat island effect; and energy use in the transportation sector.

Learning Outcomes: 1. Explain the principles of

mass and energy conservation and their use in civil engineering applications. 2. Evaluate thermodynamic systems and several forms of work, energy, and heat transfer. 3. Apply conservation of mass and energy for closed systems and control volume processes. 4. Explain the second law of thermodynamics, entropy changes, and device efficiencies.
Credits: 3.00

16 Credits

Fall 3rd Year

CE 34000 - Hydraulics

Credit Hours: 3.00. Fluid properties; hydrostatics; kinematics and dynamics of fluid flows; conservation of mass, energy, and momentum; flows in pipes and open channels. Formal laboratory experiments.
Credits: 3.00

CE 34300 - Elementary Hydraulics Laboratory

Credit Hours: 1.00. The laboratory covers basic concepts in analysis of experimental data and methods in hydraulic measurements. A variety of simple laboratory experiments illustrating the principles of hydraulics are performed.
Credits: 1.00

MA 26600 - Ordinary Differential Equations (UCC: QR)

Credit Hours: 3.00. First order equations, second and n'th order linear equations, series solutions, solution by Laplace transform, systems of linear equations. It is preferable but not required to take MA 26500 either first or concurrently. Not open to students with credit in MA 26200, 27200, 36000, 36100, or 36600.
University Core Curriculum (UCC): (UCC: QR)
Learning Outcomes: 1. Understand the properties of and able to solve first-order differential equations, linear differential equations of second and higher orders, and linear systems of differential equations. 2. Understand and able to apply basic numerical methods for solving initial value problems. 3. Understand the properties of Laplace transforms and able to apply to solving differential equations and initial value problems. 4. Apply differential equations to mechanical, physical, and biological models. Credits: 3.00

CE 33500 - Civil Engineering Materials

Credit Hours: 4.00. An introduction to the relationships between fundamental structure of materials and their properties presented through a combination of materials science and engineering approaches. Emphasis on materials of particular interest for civil engineering applications, including metals, aggregates, portland cement concrete, bituminous materials, asphalt binders, asphalt mixtures, wood, polymers, composites, and masonry. Laboratory exercises illustrate atomic structure, elastic and inelastic properties, and demonstrate applications of selected principle of mechanics, testing of aggregates, as well as designing and testing of asphalt and concrete mixtures.
Learning Outcomes: 1. Formulate equations that describe the properties of composite materials based on boundary conditions, assumptions and constituent properties. 2. Design and conduct experiments, as well as to analyze and interpret data. 3. Use non-destructive tests to estimate material properties. 4. Use non-destructive test to locate flaws in engineering systems. 5. Compare and contrast strength of materials and fracture mechanics solutions. 6. Use mathematics, science and engineering principles to estimate the influence of cracks on the mechanical response of engineering materials. 7. Use scientific and engineering principles to predict the elastic and viscoelastic of a material. 8. Interpret engineering properties from test data. 9. Use standardized test procedures to describe the properties of engineering materials. 10. Use

mathematical, scientific and engineering principles to compute the influence of material proportions on the structure property relationships for concrete materials. 11. Design the proportions for a concrete mixture. 12. Explain the relationship between the properties of an asphalt mixture and its performance. 13. Select engineering materials for specific applications. 14. Communicate effectively using graphs. 15. Communicate effectively using an executive summary. 16. Communicate effectively using an engineering report. 17. Communicate the expected accuracy obtained from engineering data. Credits: 4.00

17 Credits

Spring 3rd Year

CE 39201 - Technical Communication In Civil Engineering

Credit Hours: 2.00. This course will build upon the technical communication components of CE 29202 , adding instruction in oral communication, projects, and working in teams. This course involves both individual and team assignments intended to offer students the opportunity to practice preparing and delivering written correspondence and reports, as well as oral presentations. These activities may be coordinated with other CE courses being taken by students in CE 39201.

Learning Outcomes: 1. Know the value of clear and concise communication. 2. Understand the audience and structuring of communications. 3. Employ the forms of arguments/reasoning. 4. Apply knowledge of scientific vocabulary and technical data-driven communication. 5. Work effectively in teams. 6. Employ issue analysis to plan team project work. 7. Understanding of good listening; oral communications. 8. Employ PowerPoint and visual communications effectively. 9. Deliver team technical presentations. 10. Develop and present lab reports. 11. Knowledge to prepare ""How-To"" video project. 12. Conduct meetings; running brainstorming sessions. 13. Develop persuasive presentations. 14. Prepare effective resumes, cover letters, and job searches. 15. Employ job interview skills. Credits: 2.00

CE 39800 - Introduction To Civil Engineering Systems Design

Credit Hours: 3.00. An introduction to engineering economy and systems analysis. A systematic approach to the engineering method of design and problem solving.

Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with

emphasis on the difference between causation and relationships. Credits: 3.00

17 Credits

Fall 4th Year

18 Credits

Spring 4th Year

CE 49800 - Civil Engineering Design Project

Credit Hours: 3.00. Planning, design, and analysis of a civil project; an integrated and realistic group project involves as much as possible all major aspects of the civil engineering profession.

Credits: 3.00

12-15 Credits

Combined Degree Information

Classical Studies, BA (Classical Languages Track)

About the Program

Degree Requirements

Departmental/Program Major Courses (33 credits)

A. Classical Studies Foundational Courses - Choose Two (6 Credits)

CLCS 18100 - Classical World Civilizations (UCC: BSS)

Credit Hours: 3.00. Course introduces students to "Classical" civilizations on three continents (Europe, Africa, and Asia) demonstrably interconnected by an ancient world system. Course focuses on essential themes of past civilization: religion, philosophy, surviving texts, gender relations, urbanism, technology, social and political formations.

University Core Curriculum (UCC): (UCC: BSS) Credits: 3.00

CLCS 23010 - Survey Of Greek Literature In Translation (UCC: HUM)

Credit Hours: 3.00. Introduction to Ancient Greek literature from homer to Plato. All readings in English.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Have broader and more detailed grasp of the history of ancient Greek literature, including the development of specific genres (epic, lyric, choral, tragedy, comedy, historical and philosophical prose); 2. Be able to appreciate the place and role of literature within the shifting historical, political and social contexts of the ancient Greek world; and 3. Be equipped to trace the influences of ancient Greek literature on the literatures of the later western world. Credits: 3.00

CLCS 23100 - Survey Of Latin Literature (UCC: HUM)

Credit Hours: 3.00. Highlights of literature written in Ancient Rome at times of political, social, and intellectual turbulence. Reading (all in English) includes Vergil's Aeneid, as well as selections from other influential Latin texts.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Have broader and more detailed grasp of the history of ancient Latin literature, including the development of specific genres (epic, lyric, choral, tragedy, comedy, historical and philosophical prose); 2. Be able to appreciate the place and role of literature within the shifting historical, political and social contexts of the ancient Roman world; and 3. Be equipped to trace the influences of Latin literature on the literatures of the later western world. Credits: 3.00

CLCS 23500 - Introduction To Classical Mythology (UCC: HUM)

Credit Hours: 3.00. Study of the myths of western antiquity, as

represented in ancient Greek and Latin texts and images.
University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Have a detailed grasp of the principal characters, narratives, and themes of Greek mythology; 2. Be able to appreciate the many functions of myths within ancient Greek society, namely to explain natural events, support religious practices, and underwrite social and political power; and 3. Be able to identify modern myths and appreciate the role they continue to play within all societies. Credits: 3.00

CLCS 23700 - Gender And Sexuality In Greek And Roman Antiquity (UCC: HUM)

Credit Hours: 3.00. How identities based on gender, sexual behavior and sexual desire, and socio-economic status are established in ancient Greece and Rome. Exploration of why these ancient views of gender and sexuality remain of continuing importance in the 21st century. All readings in English.
University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Learn core information about ancient Greek and/or Roman cultures. 2. Learn to analyze gender identities and conventions surrounding sexuality in various communities with different socio-political structures. 3. Develop methods for historically sensitive investigation of materials (literary and/or visual) from ancient cultures. 4. Systematically improve analytical skills as writers, readers, and speakers. Credits: 3.00

Classical Languages Concentration (27 credits)

B. Greek and Latin Language and Literature (18 credits)

CLCS 23200 - Classical Roots Of English Words (UCC: HUM)

Credit Hours: 3.00. This is an introduction to English etymology with emphasis on building vocabulary. Students will learn English derivatives from both classical Greek and Latin. All texts to be read in English.
University Core Curriculum (UCC): (UCC: HUM) Credits: 3.00

GREK 10100 - Ancient Greek Level I (UCC: HUM)

Credit Hours: 3.00. Introduction to the grammar of Attic Greek of the Classical period, and first forays into the reading of connected prose. Emphasis on accidence, syntax, and vocabulary building.
University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Explain foundational Ancient Greek grammar and demonstrate familiarity with core vocabulary. 2. Bring together their knowledge of Ancient Greek grammar and vocabulary, creating clear English translations by analyzing basic texts adapted from Ancient Greek literature. 3. Apply this knowledge of grammar and vocabulary to writing simple sentences in Ancient Greek, and translating from English to Ancient Greek. Credits: 3.00

GREK 10200 - Ancient Greek Level II (UCC: HUM)

Credit Hours: 3.00. Continuation of the study of Attic Greek grammar and reading of connected prose of the Classical period.
University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Learn basics of reading and translating ancient Greek, completing their introduction to core vocabulary, grammar, and syntax. 2. Improve understanding of English through increased sensitivity to grammatical structures and stylistic choices and by extending their vocabulary through etymological connections. Credits: 3.00

GREK 20100 - Ancient Greek Level III (UCC: HUM)

Credit Hours: 3.00. Intermediate reading course in New Testament Greek, designed to strengthen students' grasp of grammar and syntax, broaden vocabulary, and develop skills in reading and translation.
University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Learn how to apply foundational knowledge of ancient Greek grammar and syntax to readings in the New

Testament. 2. Improve understanding of English through increased sensitivity to grammatical structures and stylistic choices and by extending vocabulary through etymological connections. Credits: 3.00

GREK 20200 - Ancient Greek Level IV (UCC: HUM)

Credit Hours: 3.00. Upper intermediate reading course in ancient Greek, designed to consolidate students' knowledge of grammar and syntax, broaden vocabulary, and develop precision and confidence in reading and translation.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Reinforce and extend skills as readers and translators by studying archaic, classical or post-classical Greek literature. 2. Improve understanding of English through increased sensitivity to grammatical structures and stylistic choices and by extending vocabulary through etymological connections. Credits: 3.00

GREK 34300 - Greek Oratory

Credit Hours: 3.00. A study of ancient Greek (Attic) orators from textual, historical, and social perspectives.

Credits: 3.00

GREK 34400 - Greek Epic

Credit Hours: 3.00. Readings and discussion of the Greek epic, including selected passages from Homer and Hesiod.

Credits: 3.00

GREK 35300 - Greek Tragedy

Credit Hours: 3.00. Reading and discussion of selected Greek tragedies of the 5th century BCE.

Credits: 3.00

GREK 35400 - Greek Comedy

Credit Hours: 3.00. Readings and discussion of selected Greek comedies of the 4th and 5th centuries BCE.

Credits: 3.00

GREK 44600 - Greek Historians

Credit Hours: 3.00. A study of the writings of the classical historians in the original Greek.

Credits: 3.00

GREK 49000 - Directed Reading In Classical Greek

Credit Hours: 1.00 to 3.00. Directs the reading of students with special interests. Guides students in profitable reading in subjects of their own choice. Permission of instructor required.

Credits: 1.00 to 3.00

LATN 10100 - Latin Level I (UCC: HUM)

Credit Hours: 3.00. Introduction to classical Latin language. Focus on grammar, syntax, vocabulary, and elementary readings.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Learn the basics of reading and translating Latin, including the first half of the core grammar syntax. 2. Improve understanding of English by enriching their vocabulary through etymological connections and through sensitivity to grammatical structures and stylistic choices. Credits: 3.00

LATN 10200 - Latin Level II (UCC: HUM)

Credit Hours: 3.00. Second semester introduction to Latin. Focus on grammar, syntax, vocabulary, and elementary readings in classical Latin and the language of the Vulgate.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Continue to learn the basic grammar, vocabulary, and syntax needed for reading and translating Latin. 2. Improve their understanding of English by enriching their vocabulary through etymological connections and by increasing their awareness of grammatical structures and stylistic choices. Credits: 3.00

LATN 20100 - Latin Level III (UCC: HUM)

Credit Hours: 3.00. Intermediate reading course in Latin, designed to strengthen students' grasp of grammar and syntax, broaden vocabulary, and develop foundational skills in reading and translation.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Reinforce knowledge of the basic grammar, vocabulary, and syntax needed for reading and translating Latin. 2.

Read and translate simple Latin literature independently and read and translate more complex literature with suitable help from commentaries and instructor. 3. Improve understanding of English through increased sensitivity to grammatical structures and stylistic choices and by extending their vocabulary through etymological connections. Credits: 3.00

LATN 20200 - Latin Level IV (UCC: HUM)

Credit Hours: 3.00. Upper intermediate reading course in Latin prose and poetry, designed to consolidate students' grasp of grammar and syntax, broaden vocabulary, and develop precision and confidence in reading and translation.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Continue to reinforce knowledge of the basic grammar, vocabulary, and syntax needed for reading and translating Latin. 2. Apply foundational knowledge to selections from complex and stylistically sophisticated Latin literature. 3. Improve understanding of English by enriching their vocabulary and through increased sensitivity to grammar and style. Credits: 3.00

LATN 34300 - Roman Oratory (UCC: HUM)

Credit Hours: 3.00. Development of advanced Latin reading skills, alongside exploration of social, political, and rhetorical issues raised by the published versions of speeches performed in ancient Rome.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Improve skills as readers and translators of Latin. 2. Discover the importance of oratory in Roman politics and culture. 3. Develop understanding and enjoyment of Latin prose style. Credits: 3.00

LATN 34400 - Roman Epic (UCC: HUM)

Credit Hours: 3.00. Development of advanced Latin reading skills, alongside exploration of social, political, and rhetorical issues raised by epics such as Vergil's Aeneid, Ovid's Metamorphoses, or other hexameter poetry.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Improve skills as readers and translators of Latin poetry. 2. Increase understanding of the importance of hexameter poetry in Roman culture and subsequent literary tradition. Credits: 3.00

LATN 34500 - Roman Elegy (UCC: HUM)

Credit Hours: 3.00. Readings and discussion of selections from Roman Elegy, including selected passages from such authors as Catullus, Tibullus, Propertius, and Ovid.

University Core Curriculum (UCC): (UCC: HUM) Credits: 3.00

LATN 34600 - Roman Rhetoric (UCC: HUM)

Credit Hours: 3.00. Development of advanced Latin reading skills, alongside exploration of the social, political and literary questions raised by Roman rhetorical theory.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Develop more advanced skills as readers and translators of Latin literature. 2. Analyze Roman perspectives on communication and will discover how influential thinkers assessed the role of literature and speech in Roman society. Credits: 3.00

LATN 34700 - Roman Comedy (UCC: HUM)

Credit Hours: 3.00. Readings and discussion of Roman comedy, including selected works of Plautus and Terence.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Have a greater facility in translating Latin in general, and Latin verse in particular. 2. Study of texts representative of this genre will enhance their understanding and appreciation not simply of other pieces of Roman literature, but also of western comedy as a whole, whose roots are in the comedies of Plautus and Terence. 3. Focus on the background of Roman comedy will also enable students to recognize important connections between literature and its social contexts. Credits: 3.00

LATN 44200 - Roman Lyric Poetry (UCC: HUM)

Credit Hours: 3.00. Readings and discussion of selections from

Roman lyric poetry, with special attention to Catullus and Horace.

University Core Curriculum (UCC): (UCC: HUM) Credits: 3.00

LATN 44300 - Roman Satire (UCC: HUM)

Credit Hours: 3.00. Readings and discussion of Roman satire, including selected passages from Horace, Juvenal, Petronius, and Seneca.

University Core Curriculum (UCC): (UCC: HUM) Credits: 3.00

LATN 44400 - Roman Philosophers (UCC: HUM)

Credit Hours: 3.00. Readings and discussion of Roman philosophical texts.

University Core Curriculum (UCC): (UCC: HUM) Credits: 3.00

LATN 44500 - Roman Encyclopedists (UCC: HUM)

Credit Hours: 3.00. Readings and discussion of texts representative of Roman encyclopedism, including selected passages from Pliny the Elder, Aulus Gellius, and Nonius Marcellus.

University Core Curriculum (UCC): (UCC: HUM) Credits: 3.00

LATN 44600 - Roman Historians (UCC: HUM)

Credit Hours: 3.00. Readings and discussion of Roman historical texts.

University Core Curriculum (UCC): (UCC: HUM) Credits: 3.00

LATN 49000 - Directed Reading In Latin

Credit Hours: 1.00 to 3.00. Directs the reading of students with special interests. Guides students in profitable reading in subjects of their own choice. Permission of instructor required.

Credits: 1.00 to 3.00

GREK 59000 - Directed Reading In Classical Greek

Credit Hours: 1.00 to 4.00. Directed Reading In Classical Greek. Permission of instructor required.

Credits: 1.00 to 4.00

CLCS 23400 - Medical And Scientific Terminology From Greek And Latin Roots

Credit Hours: 3.00. Ninety to ninety-five percent of scientific technical vocabulary and medical terminology come from Latin and Greek roots and affixes. This course will enable students in scientific and medical disciplines to develop a foundational core of Greek and Latin roots and affixes from which they will be able to decipher and easily commit to memory the core terminology in the various sciences and medicine.

Learning Outcomes: 1. Know the foundational core of Greek and Latin roots and affixes from which medical and scientific terminology has been derived. 2. Decipher complex and specialized scientific and medical terms based on the knowledge of their Greek and Latin roots. 3. Decipher unfamiliar terminology in their fields by learning how the roots combine dynamically to form words as scientific and medical innovation requires an ever-increasing need for new terms. 4. Enable students to absorb information in their fields more easily by demystifying the complexities of their specialized vocabularies used in their disciplines. Credits: 3.00

LATN 31500 - Latin Paleography I

Credit Hours: 3.00. This course gives students the opportunity to work with original medieval Latin manuscripts, involving transcription and translation, as well as study of the creation, care, and preservation of rare manuscripts.

Learning Outcomes: 1. Work with unedited and as yet untranslated Latin texts. 2. Transcribe Latin documents and produce original translations. 3. Address and solve complex syntactical challenges. 4. Identify fields tangential to Latin and Classics discipline, such as mediaeval history, art history, religious and biblical studies, music, etc. 5. Demonstrate an understanding of digital humanities. Credits: 3.00

LATN 10500 - Accelerated Basic Latin

Credit Hours: 4.00. Foundational Latin grammar course designed to prepare students to read classical and post-classical Latin in a single intensive semester. Focus on grammar, syntax, vocabulary, and elementary readings. The accelerated Latin course assumes *no* previous knowledge of Latin and makes it possible for the diligent student to be able to

read *any* Latin prose or poetry (with a dictionary) after a single semester. (Upon completion students will be prepared to enroll in Latin 201.)

Learning Outcomes: 1. Recite Latin texts aloud (with accurate pronunciation, meaningful phrase grouping, and appropriate voice inflection) by imitating models they have heard in class. 2. Analyze Latin texts by identifying and describing the basic elements of Latin grammar, sentence structure, and style. 3. Translate intermediate level un-adapted Latin texts into English. 4. Compose complex sentences while writing a short story in Latin. Credits: 4.00

GREK 10500 - Accelerated Introductory Ancient Greek

Credit Hours: 4.00. This course is an accelerated beginning-level course designed to develop language proficiency in Ancient Greek. The course will help students progress toward competence in reading and writing, as well as toward knowledge of Ancient Greek culture. The course focuses on developing deep understanding of Greek syntax and morphology and building strategies for fluent and accurate reading of ancient texts. Primary language of instruction is English.

Learning Outcomes: 1. Differentiate the syntactic structures used in Ancient Greek sentences and longer texts based on the study of model sentences. 2. Compose sentences in Ancient Greek by focusing on a set of grammatical rules and standards in the language. 3. Recite Ancient Greek aloud with accuracy and fluency and demonstrate their ability in in-class text readings and recordings. 4. Infer the meaning of unknown vocabulary in context by reading stories. 5. Identify and analyze grammatical forms in the Greek contexts in which they are used. 6. Generate smooth-flowing and elegant English translations of the Greek, attending to inherent differences in style and structure. Credits: 4.00

C. General Studies Courses (3 credits)

ANTH 42500 - Archaeological Method And Theory

Credit Hours: 3.00. Introduction to the theory and methods of contemporary American archaeology. Basic field and laboratory methods are placed in the context of theoretical viewpoints and problems. Major theoretical issues in the field are explored, showing the integration of American archaeology with anthropology.

Learning Outcomes: 1. Summarize the history of archaeology and theoretical frameworks used in interpreting the past. 2. Discuss field and laboratory techniques that archaeologists use to analyze material remains from the archaeological record and reconstruct past human behavior. 3. Describe prehistoric cultural practices including diet and subsistence, migrations, social and political organization. 4. Identify the contributions of archaeology to today's society through various professions inside and outside academic settings. Credits: 3.00

AD 31100 - Ancient Greek Art

Credit Hours: 3.00. The great variety of Greek art, which helped lay the foundation of Western artistic tradition, is presented in several different media and over a period of several centuries. The social context and cultural context of Greek art, especially its humanistic values, is emphasized. Offered every two years.

Learning Outcomes: 1. Learn how Greek art was formed and how it developed over a period of centuries from its origins in the Geometric period to its climax in the Hellenistic era. 2. Gain a broad historical perspective and learn how to evaluate individual works of art, and to view them within a larger cultural and social context. 3. Develop writing proficiency. Credits: 3.00

AD 31200 - Ancient Roman Art

Credit Hours: 3.00. The history of Roman art in several different media is studied, from its origins to the end of the Empire, stressing the social and historical content of this art and its legacy to the modern world. Architecture, sculpture, painting and mosaics are emphasized along with small-scale arts such as jewelry, ceramics, and glass. Offered every two years.

Learning Outcomes: 1. Gain a broad perspective on the history of Roman art, viewing it in relation to Roman society as a whole and

seeing how it reflects Roman cultural values. 2. Evaluate individual works of Roman art for both their style and content, and to see how they fit into the historical development of Roman art over a period of centuries. 3. Improve writing ability. Credits: 3.00

AD 38000 - Baroque Art

Credit Hours: 3.00. A survey of European art and architecture during the 17th century, focused on Italy and the Netherlands, and emphasizing some of their leading painters. Works of art are seen in a broad social and cultural context, including the Counter-Reformation and the rise of capitalism.

Learning Outcomes: 1. Identify individuals who have made a major contribution to a style or period. 2. Compare artworks by identifying their differences and similarities. 3. Define terms and concepts in relation to a particular style, artist, or artwork. 4. Discuss historical events, social forces and cultural trends that have had an influence on a particular style, artist, or artwork. 5. Develop analytical and writing skills through textual studies of primary and secondary sources as well as writing exercises. Credits: 3.00

CLCS 18100 - Classical World Civilizations (UCC: BSS)

Credit Hours: 3.00. Course introduces students to "Classical" civilizations on three continents (Europe, Africa, and Asia) demonstrably interconnected by an ancient world system. Course focuses on essential themes of past civilization: religion, philosophy, surviving texts, gender relations, urbanism, technology, social and political formations.

University Core Curriculum (UCC): (UCC: BSS) Credits: 3.00

CLCS 22000 - Topics In Classical Literature

Credit Hours: 3.00. Selected topics in Greek and Roman literature. All readings in English translation.

Learning Outcomes: 1. Gain a detailed historical understanding of the development of a specific genre or topic within ancient Greek and Roman literature. 2. Ability to appreciate and intelligently discuss major themes in ancient Greek and Roman literature through close reading of representative texts. 3. Ability to identify specific examples of the influence of the ancient Greek and Roman literature on the literature of the later western world. Credits: 3.00

CLCS 23010 - Survey Of Greek Literature In Translation (UCC: HUM)

Credit Hours: 3.00. Introduction to Ancient Greek literature from homer to Plato. All readings in English.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Have broader and more detailed grasp of the history of ancient Greek literature, including the development of specific genres (epic, lyric, choral, tragedy, comedy, historical and philosophical prose); 2. Be able to appreciate the place and role of literature within the shifting historical, political and social contexts of the ancient Greek world; and 3. Be equipped to trace the influences of ancient Greek literature on the literatures of the later western world. Credits: 3.00

CLCS 23100 - Survey Of Latin Literature (UCC: HUM)

Credit Hours: 3.00. Highlights of literature written in Ancient Rome at times of political, social, and intellectual turbulence. Reading (all in English) includes Vergil's Aeneid, as well as selections from other influential Latin texts.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Have broader and more detailed grasp of the history of ancient Latin literature, including the development of specific genres (epic, lyric, choral, tragedy, comedy, historical and philosophical prose); 2. Be able to appreciate the place and role of literature within the shifting historical, political and social contexts of the ancient Roman world; and 3. Be equipped to trace the influences of Latin literature on the literatures of the later western world. Credits: 3.00

CLCS 23300 - Comparative Mythology (UCC: HUM)

Credit Hours: 3.00. Comparative study of the myths of major ancient cultures, with emphasis on shared typological features.

University Core Curriculum (UCC): (UCC: HUM)

Learning Outcomes: 1. Have a detailed grasp of principal characters, narratives, and themes in the myths of a number of representative ancient world cultures (Mesopotamian, Egyptian, Celtic, Aztec, Mayan, East Asian, African); 2. Be able to appreciate the many functions of myths within ancient societies, namely to explain natural events, support religious practices, and underwrite social and political power; and 3. Be able to identify recurrent patterns and themes in the myths of historically disparate ancient and modern cultures. Credits: 3.00

CLCS 23500 - Introduction To Classical Mythology (UCC: HUM)

Credit Hours: 3.00. Study of the myths of western antiquity, as represented in ancient Greek and Latin texts and images.

University Core Curriculum (UCC): (UCC: HUM)

Learning Outcomes: 1. Have a detailed grasp of the principal characters, narratives, and themes of Greek mythology; 2. Be able to appreciate the many functions of myths within ancient Greek society, namely to explain natural events, support religious practices, and underwrite social and political power; and 3. Be able to identify modern myths and appreciate the role they continue to play within all societies. Credits: 3.00

CLCS 23600 - Ancient World Onscreen

Credit Hours: 3.00. How film represents ancient Mediterranean civilizations and retells ancient myths; how cinematic renderings of ancient history shape views of the past and how these are affected by contemporary sensibilities. No knowledge of Greek or Latin required.

Learning Outcomes: 1. Have a detailed historical grasp of the ways in which the ancient Greek and Roman worlds have found expression in modern cinema; 2. Be able to appreciate how ancient texts fare when translated into the radically different artistic medium of film; and 3. Be able to discuss intelligently what forces influence how we choose to see and represent the ancient western world. Credits: 3.00

CLCS 23700 - Gender And Sexuality In Greek And Roman Antiquity (UCC: HUM)

Credit Hours: 3.00. How identities based on gender, sexual behavior and sexual desire, and socio-economic status are established in ancient Greece and Rome. Exploration of why these ancient views of gender and sexuality remain of continuing importance in the 21st century. All readings in English.

University Core Curriculum (UCC): (UCC: HUM)

Learning Outcomes: 1. Learn core information about ancient Greek and/or Roman cultures. 2. Learn to analyze gender identities and conventions surrounding sexuality in various communities with different socio-political structures. 3. Develop methods for historically sensitive investigation of materials (literary and/or visual) from ancient cultures. 4. Systematically improve analytical skills as writers, readers, and speakers. Credits: 3.00

CLCS 23800 - The Tragic Vision (UCC: HUM)

Credit Hours: 3.00. Greek and Roman tragedy from their beginnings until today. Readings in English from representative authors such as Aeschylus, Sophocles, Euripides, and Seneca; later receptions of ancient tragedy in drama and other media. Course may include performance, theories of comedy and tragedy, or recent and current expressions of the tragic in film and other media.

University Core Curriculum (UCC): (UCC: HUM)

Learning Outcomes: 1. Understand a detailed historical development of ancient Greek tragic through close reading of representative samples of the genre. 2. Appreciate and intelligently discuss major themes in Greek tragedy as they relate to both ancient and modern views of what is "tragic". 3. Identify specific examples of the influence of ancient Greek tragedy on the drama of the later western world. Credits: 3.00

CLCS 28000 - Topics In Classical Civilization

Credit Hours: 3.00. Selected topics in Ancient Civilization.

Learning Outcomes: 1. Students will have a broader and more detailed grasp of issues that relate to the social, economic, and political institutions that structured ancient communities throughout Asia Minor and the Mediterranean basin. This will allow them to appreciate the confluences of factors and forces that contribute to the formation of cultures and civilizations in the ancient world. Credits: 3.00

CLCS 33700 - The Ancient Epic

Credit Hours: 3.00. Study of the epic in four ancient cultures, with emphasis on its structure, nature, and social functions. Readings may include Gilgamesh, Iliad, Odyssey, Aeneid, Beowulf, Tain, Mahabharata, and others.

Learning Outcomes: 1. Gain an enhanced understanding of the nature and development of the genre of epic through close reading of representative samples of the genre from different ancient cultures. 2. Ability to appreciate and intelligently discuss major themes in epic as they relate to both ancient and modern views of the heroic. 3. Ability to identify specific examples of the influence of ancient epic on the literature of the later western world. Credits: 3.00

CLCS 38000 - Alexander The Great And Hellenistic World (UCC: HUM)

Credit Hours: 3.00. Course examines the career of Alexander the Great and the rise of Macedonia in the Hellenistic Era. Topics include the emergence of Macedonia under Philip II; the achievements of Alexander the Great; and the wars of succession following his demise.

University Core Curriculum (UCC): (UCC: HUM)
Credits: 3.00

CLCS 38100 - Julius Caesar: Statesman, Soldier, Citizen

Credit Hours: 3.00. Course Examines the career of Julius Caesar by focusing on events from Caesar's birth (100 BCE) through his assassination in 44 BCE. Course places Caesar's complex personality within the context of political, military, economic, social, and cultural upheaval during the Late Roman Republic.

Credits: 3.00

CLCS 38300 - The Roman Empire

Credit Hours: 3.00. Course examines developments from the Augustan Settlement to the end of the Roman Empire (27 BCE - 476 CE), along with aspects of religious, social, sexual and material culture throughout the Mediterranean at that time.

Credits: 3.00

CLCS 38500 - Science, Medicine And Magic In The Ancient West (UCC: HUM)

Credit Hours: 3.00. Study of the development of the idea of rationality in the West through examination of the evolution of Greek and Roman sciences, with emphasis on medicine and astronomy.

University Core Curriculum (UCC): (UCC: HUM)
Learning Outcomes: 1. Gain a detailed historical understanding of the development of ancient Greek and Roman science, especially medicine and astronomy, against the background of traditional beliefs in magic. 2. Ability to appreciate and intelligently discuss major issues in ancient science as they relate to both ancient and modern views of what is "rational" and "scientific". 3. Ability to identify specific examples of the influence of ancient science on later western scientific theory and practice.
Credits: 3.00

CLCS 38600 - Ancient Greek Religion

Credit Hours: 3.00. Study of the religious beliefs and practices of ancient Greece, based on written, artistic, and archaeological evidence of their forms and functions.

Learning Outcomes: 1. Have a broader and more detailed grasp of belief systems and religious behaviors of the ancient Greek world from the Mycenaean to the Hellenistic period. 2. Be better able to assess the representation of religious experience in other religious traditions with greater historical perspective and methodological sophistication. 3. Be able to express themselves on issues of religion more clearly and with more understanding, both orally and in writing. Credits: 3.00

CLCS 38700 - Roman Religion

Credit Hours: 3.00. Study of the religious beliefs and practices of ancient Rome, based on written, artistic, and archaeological evidence of their forms and functions.

Learning Outcomes: 1. Have a broader and more detailed grasp of belief systems and religious behaviors of the Roman world from the earliest sources to the third century CE. 2. Be better able to assess the representation of religious experience in other religious traditions with greater historical perspective and methodological sophistication. 3. Be able to express themselves on issues of religion more clearly and with more understanding, both orally and in writing. Credits: 3.00

CLCS 48000 - Potters And Society In Antiquity

Credit Hours: 3.00. Course covers the range of eastern Mediterranean ceramics encountered in Rough Cilicia Archaeological Survey Project from the Bronze Age to the Later Roman Empire. Course also explores strategies employed by archaeologists and historians to exploit ceramics as research materials.

Credits: 3.00

CLCS 48100 - Culture And Society In The Age Of Pericles

Credit Hours: 3.00. Course explores interrelationships between the emergence of Greek democracy and the cultural, political, social, and economic rise of Athens in the fifth century BCE. More broadly, course surveys history of the Greek world from the Late Bronze Age to 362 BCE.

Credits: 3.00

CLCS 48300 - Republican Rome

Credit Hours: 3.00. Course examines the military, political, economic, and social developments that enabled the Roman people to expand from an Italian city-state to a trans-Mediterranean empire, and the consequences that initiated the decline and transition in their republican form of government.

Credits: 3.00

CLCS 49900 - Special Topics In Classics

Credit Hours: 1.00 to 4.00. Special Topics in Classics. Permission of instructor required.

Credits: 1.00 to 4.00

ENGL 26600 - World Literature: From The Beginnings To 1700 A.D. (UCC: HUM)

Credit Hours: 3.00. (CMPL 26600) World literature in translation. A comparative and chronological survey of the masterpieces of Eastern and Western literature. CCN: IEL 1250 World Literature 1

University Core Curriculum (UCC): (UCC: HUM)

Learning Outcomes: 1. Demonstrate knowledge of a range of genres, topics, and literary conventions characteristic of world literatures. 2. Discuss those genres, topics, and conventions in relation to their diverse historical, cultural, and aesthetic contexts. 3. Produce well-reasoned written arguments about the literature they study based on appropriate use of textual evidence. Credits: 3.00

HEBR 28400 - Ancient Near Eastern History And Culture

Credit Hours: 3.00. This course is a survey of the development of the ancient Near East, from its pre-history to Alexander the Great. It emphasizes the evolutions of various Near Eastern cultures in their many manifestations; art, government, agriculture, economics, philosophy, religion, ethics, and science. Taught in English.

Learning Outcomes: 1. Understand the difference between pre-history and history. 2. Understand various ancient and modern ideas of the purpose of writing history. 3. Understand how the invention of writing and the origins of cities were coordinate developments. 4. Understand something of the flow of empires that succeeded each other, eventually displaced by the empire of Alexander the Great, whose conquests shaped the contours of the world much as we know it. 5. Become aware how art reflects the development of thought and idealism; how ideas of human government evolved; how religion, science, agriculture, and much else developed as empires built onto those they displaced. Credits: 3.00

ITAL 28100 - The Italian Renaissance And Its Scientific And Cultural Impact On Western Civilization (UCC: HUM)

Credit Hours: 3.00. This course introduces students to the most

important cultural and scientific writings of the Italian Renaissance, and shows the pivotal influence of the Renaissance on the development of Western civilization as a whole. Classes and readings entirely in English; no knowledge of Italian needed.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Become acquainted with the canonical works of the Italian Renaissance that have had a major influence on modern Western thought and will develop a broad understanding of the Renaissance. 2. Become familiar with different literary genres such as poetry, comedy, novellas, treatises and dialogues, and will develop the tools necessary to approach them critically within the cultural and political context that produced them. 3. Improve their critical and writing skills. Credits: 3.00

JWST 33000 - Introduction To Jewish Studies (UCC: HUM)

Credit Hours: 3.00. An interdisciplinary course touching on the full range of Jewish experience from antiquity to the present. Several members of the Jewish Studies faculty and guest lecturers participate, representing such fields as anthropology, history, language, literature, philosophy, politics, religion, and sociology.

University Core Curriculum (UCC): (UCC: HUM) Credits: 3.00

PHIL 30100 - History Of Ancient Philosophy (UCC: HUM)

Credit Hours: 3.00. A survey of Greek philosophy from its beginning in the Milesian school through the Presocratics to Plato and Aristotle.

University Core Curriculum (UCC): (UCC: HUM) Credits: 3.00

WGSS 48000 - Feminist Theory

Credit Hours: 3.00. Intensive study of a variety of contemporary and international feminist theories from an interdisciplinary perspective. Provides an overview of major trends, critical approaches, and diverse viewpoints in the field of feminist theory.

Credits: 3.00

WGSS 28200 - Introduction To LGBTQ Studies (UCC: BSS)

Credit Hours: 3.00. (ANTH 28200) This course offers students an introduction to the interdisciplinary study of lesbian, gay, bisexual, transgender and queer lives. It provides a basic grounding in theories of sexuality and LGBT histories, identities and movements in the U.S. and globally.

University Core Curriculum (UCC): (UCC: BSS) Learning Outcomes: 1. Students will gain a broad overview of the cultural history of sexualities both in the West and globally from the pre-modern era to the contemporary period. They will grasp the way sexual and gender identities change over time and across space. They will analyze how sexual identity intersects with gender, race, and class. They will develop a theoretical understanding of the social construction of sexuality, sexual identities and transgender identities. Credits: 3.00

CLCS 59000 - Directed Reading In Classics

Credit Hours: 1.00 to 4.00. Directed readings in Classics. Permission of instructor required.

Credits: 1.00 to 4.00

CLCS 23900 - The Comic Vision (UCC: HUM)

Credit Hours: 3.00. This course investigates Greek and Roman comedy from their beginnings until today. The course will feature readings in English from representative authors such as Aristophanes, Menander, Plautus, and Terence, as well as later receptions of ancient comedy in drama and other media. This course may include performance, theories of comedy and tragedy, theories of humor, or recent and current expressions of the comic in film and other media.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Have a detailed historical understanding of the development and evolution of ancient Greek and Roman comedy. 2. Be able to appreciate and intelligently discuss major themes in Greek and Roman comedy as they relate to both ancient and modern views of what is "comic" or humorous. 3. Be able to identify specific examples of the influence of ancient Greek and Roman comedy on the drama of the later western world. Credits: 3.00

CLCS 38400 - Ancient Western Medicine

Credit Hours: 3.00. Historical and cultural study of Western

medicine, from Mesopotamian origins to the late Roman Empire, based on written texts and archaeological evidence. Addresses the development of rational medical frameworks against the background traditional beliefs about illness as a sign of demonic possession, and charts the growth of the medical profession from individual avocation to institutional practice.

Learning Outcomes: 1. Summarize the key forces affecting the development of Western medicine from its origins to late antiquity in the form of an extended essay or paper. 2. Create a compelling, original argument that relates habits of rational thinking about the human body in antiquity to the conceptual frameworks used to diagnose its behaviors. 3. Respond critically to a representative medical text from antiquity in a capstone research project. Credits: 3.00

Sample 4-Year Plan

Fall 1st Year

15-16 Credits

Spring 1st Year

CLCS 18100 - Classical World Civilizations (UCC: BSS)

Credit Hours: 3.00. Course introduces students to "Classical" civilizations on three continents (Europe, Africa, and Asia) demonstrably interconnected by an ancient world system. Course focuses on essential themes of past civilization: religion, philosophy, surviving texts, gender relations, urbanism, technology, social and political formations.

University Core Curriculum (UCC): (UCC: BSS) Credits: 3.00

CLCS 23010 - Survey Of Greek Literature In Translation (UCC: HUM)

Credit Hours: 3.00. Introduction to Ancient Greek literature from homer to Plato. All readings in English.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Have broader and more detailed grasp of the history of ancient Greek literature, including the development of specific genres (epic, lyric, choral, tragedy, comedy, historical and philosophical prose); 2. Be able to appreciate the place and role of literature within the shifting historical, political and social contexts of the ancient Greek world; and 3. Be equipped to trace the influences of ancient Greek literature on the literatures of the later western world. Credits: 3.00

CLCS 23100 - Survey Of Latin Literature (UCC: HUM)

Credit Hours: 3.00. Highlights of literature written in Ancient Rome at times of political, social, and intellectual turbulence. Reading (all in English) includes Vergil's Aeneid, as well as selections from other influential Latin texts.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Have broader and more detailed grasp of the history of ancient Latin literature, including the development of specific genres (epic, lyric, choral, tragedy, comedy, historical and philosophical prose); 2. Be able to appreciate the place and role of literature within the shifting historical, political and social contexts of the ancient Roman world; and 3. Be equipped to trace the influences of Latin literature on the literatures of the later western

world. Credits: 3.00

CLCS 23500 - Introduction To Classical Mythology (UCC: HUM)

Credit Hours: 3.00. Study of the myths of western antiquity, as represented in ancient Greek and Latin texts and images.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Have a detailed grasp of the principal characters, narratives, and themes of Greek mythology; 2. Be able to appreciate the many functions of myths within ancient Greek society, namely to explain natural events, support religious practices, and underwrite social and political power; and 3. Be able to identify modern myths and appreciate the role they continue to play within all societies. Credits: 3.00

CLCS 23700 - Gender And Sexuality In Greek And Roman Antiquity (UCC: HUM)

Credit Hours: 3.00. How identities based on gender, sexual behavior and sexual desire, and socio-economic status are established in ancient Greece and Rome. Exploration of why these ancient views of gender and sexuality remain of continuing importance in the 21st century. All readings in English.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Learn core information about ancient Greek and/or Roman cultures. 2. Learn to analyze gender identities and conventions surrounding sexuality in various communities with different socio-political structures. 3. Develop methods for historically sensitive investigation of materials (literary and/or visual) from ancient cultures. 4. Systematically improve analytical skills as writers, readers, and speakers. Credits: 3.00

Be able to appreciate the place and role of literature within the shifting historical, political and social contexts of the ancient Roman world; and 3. Be equipped to trace the influences of Latin literature on the literatures of the later western world. Credits: 3.00

CLCS 23200 - Classical Roots Of English Words (UCC: HUM)

Credit Hours: 3.00. This is an introduction to English etymology with emphasis on building vocabulary. Students will learn English derivatives from both classical Greek and Latin. All texts to be read in English.

University Core Curriculum (UCC): (UCC: HUM) Credits: 3.00

CLCS 23300 - Comparative Mythology (UCC: HUM)

Credit Hours: 3.00. Comparative study of the myths of major ancient cultures, with emphasis on shared typological features.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Have a detailed grasp of principal characters, narratives, and themes in the myths of a number of representative ancient world cultures (Mesopotamian, Egyptian, Celtic, Aztec, Mayan, East Asian, African); 2. Be able to appreciate the many functions of myths within ancient societies, namely to explain natural events, support religious practices, and underwrite social and political power; and 3. Be able to identify recurrent patterns and themes in the myths of historically disparate ancient and modern cultures. Credits: 3.00

CLCS 23500 - Introduction To Classical Mythology (UCC: HUM)

Credit Hours: 3.00. Study of the myths of western antiquity, as represented in ancient Greek and Latin texts and images.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Have a detailed grasp of the principal characters, narratives, and themes of Greek mythology; 2. Be able to appreciate the many functions of myths within ancient Greek society, namely to explain natural events, support religious practices, and underwrite social and political power; and 3. Be able to identify modern myths and appreciate the role they continue to play within all societies. Credits: 3.00

CLCS 23600 - Ancient World Onscreen

Credit Hours: 3.00. How film represents ancient Mediterranean civilizations and retells ancient myths; how cinematic renderings of ancient history shape views of the past and how these are

affected by contemporary sensibilities. No knowledge of Greek or Latin required.

Learning Outcomes: 1. Have a detailed historical grasp of the ways in which the ancient Greek and Roman worlds have found expression in modern cinema; 2. Be able to appreciate how ancient texts fare when translated into the radically different artistic medium of film; and 3. Be able to discuss intelligently what forces influence how we choose to see and represent the ancient western world. Credits: 3.00

CLCS 23700 - Gender And Sexuality In Greek And Roman Antiquity (UCC: HUM)

Credit Hours: 3.00. How identities based on gender, sexual behavior and sexual desire, and socio-economic status are established in ancient Greece and Rome. Exploration of why these ancient views of gender and sexuality remain of continuing importance in the 21st century. All readings in English.

University Core Curriculum (UCC): (UCC: HUM)

Learning Outcomes: 1. Learn core information about ancient Greek and/or Roman cultures. 2. Learn to analyze gender identities and conventions surrounding sexuality in various communities with different socio-political structures. 3. Develop methods for historically sensitive investigation of materials (literary and/or visual) from ancient cultures. 4. Systematically improve analytical skills as writers, readers, and speakers. Credits: 3.00

CLCS 23800 - The Tragic Vision (UCC: HUM)

Credit Hours: 3.00. Greek and Roman tragedy from their beginnings until today. Readings in English from representative authors such as Aeschylus, Sophocles, Euripides, and Seneca; later receptions of ancient tragedy in drama and other media. Course may include performance, theories of comedy and tragedy, or recent and current expressions of the tragic in film and other media.

University Core Curriculum (UCC): (UCC: HUM)

Learning Outcomes: 1. Understand a detailed historical development of ancient Greek tragic through close reading of representative samples of the genre. 2. Appreciate and intelligently discuss major themes in Greek tragedy as they relate to both ancient and modern views of what is "tragic". 3. Identify specific examples of the influence of ancient Greek tragedy on the drama of the later western world. Credits: 3.00

CLCS 28000 - Topics In Classical Civilization

Credit Hours: 3.00. Selected topics in Ancient Civilization.

Learning Outcomes: 1. Students will have a broader and more detailed grasp of issues that relate to the social, economic, and political institutions that structured ancient communities throughout Asia Minor and the Mediterranean basin. This will allow them to appreciate the confluences of factors and forces that contribute to the formation of cultures and civilizations in the ancient world. Credits: 3.00

CLCS 33700 - The Ancient Epic

Credit Hours: 3.00. Study of the epic in four ancient cultures, with emphasis on its structure, nature, and social functions. Readings may include Gilgamesh, Iliad, Odyssey, Aeneid, Beowulf, Tain, Mahabharata, and others.

Learning Outcomes: 1. Gain an enhanced understanding of the nature and development of the genre of epic through close reading of representative samples of the genre from different ancient cultures. 2. Ability to appreciate and intelligently discuss major themes in epic as they relate to both ancient and modern views of the heroic. 3. Ability to identify specific examples of the influence of ancient epic on the literature of the later western world. Credits: 3.00

CLCS 49900 - Special Topics In Classics

Credit Hours: 1.00 to 4.00. Special Topics in Classics. Permission of instructor required.

Credits: 1.00 to 4.00

ENGL 26600 - World Literature: From The Beginnings To 1700 A.D. (UCC: HUM)

Credit Hours: 3.00. (CMPL 26600) World literature in translation. A comparative and chronological survey of the masterpieces of Eastern and Western literature. CCN: IEL 1250 World Literature 1

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Demonstrate knowledge of a range of genres, topics, and literary conventions characteristic of world literatures. 2. Discuss those genres, topics, and conventions in relation to their diverse historical, cultural, and aesthetic contexts. 3. Produce well-reasoned written arguments about the literature they study based on appropriate use of textual evidence. Credits: 3.00

GREK 10100 - Ancient Greek Level I (UCC: HUM)

Credit Hours: 3.00. Introduction to the grammar of Attic Greek of the Classical period, and first forays into the reading of connected prose. Emphasis on accidence, syntax, and vocabulary building.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Explain foundational Ancient Greek grammar and demonstrate familiarity with core vocabulary. 2. Bring together their knowledge of Ancient Greek grammar and vocabulary, creating clear English translations by analyzing basic texts adapted from Ancient Greek literature. 3. Apply this knowledge of grammar and vocabulary to writing simple sentences in Ancient Greek, and translating from English to Ancient Greek. Credits: 3.00

GREK 10200 - Ancient Greek Level II (UCC: HUM)

Credit Hours: 3.00. Continuation of the study of Attic Greek grammar and reading of connected prose of the Classical period.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Learn basics of reading and translating ancient Greek, completing their introduction to core vocabulary, grammar, and syntax. 2. Improve understanding of English through increased sensitivity to grammatical structures and stylistic choices and by extending their vocabulary through etymological connections. Credits: 3.00

GREK 20100 - Ancient Greek Level III (UCC: HUM)

Credit Hours: 3.00. Intermediate reading course in New Testament Greek, designed to strengthen students' grasp of grammar and syntax, broaden vocabulary, and develop skills in reading and translation.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Learn how to apply foundational knowledge of ancient Greek grammar and syntax to readings in the New Testament. 2. Improve understanding of English through increased sensitivity to grammatical structures and stylistic choices and by extending vocabulary through etymological connections. Credits: 3.00

GREK 20200 - Ancient Greek Level IV (UCC: HUM)

Credit Hours: 3.00. Upper intermediate reading course in ancient Greek, designed to consolidate students' knowledge of grammar and syntax, broaden vocabulary, and develop precision and confidence in reading and translation.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Reinforce and extend skills as readers and translators by studying archaic, classical or post-classical Greek literature. 2. Improve understanding of English through increased sensitivity to grammatical structures and stylistic choices and by extending vocabulary through etymological connections. Credits: 3.00

GREK 34300 - Greek Oratory

Credit Hours: 3.00. A study of ancient Greek (Attic) orators from textual, historical, and social perspectives.

Credits: 3.00

GREK 34400 - Greek Epic

Credit Hours: 3.00. Readings and discussion of the Greek epic, including selected passages from Homer and Hesiod.

Credits: 3.00

GREK 35300 - Greek Tragedy

Credit Hours: 3.00. Reading and discussion of selected Greek tragedies of the 5th century BCE.

Credits: 3.00

GREK 35400 - Greek Comedy

Credit Hours: 3.00. Readings and discussion of selected Greek comedies of the 4th and 5th centuries BCE.

Credits: 3.00

GREK 44600 - Greek Historians

Credit Hours: 3.00. A study of the writings of the classical historians in the original Greek.

Credits: 3.00

JWST 33000 - Introduction To Jewish Studies (UCC: HUM)

Credit Hours: 3.00. An interdisciplinary course touching on the full range of Jewish experience from antiquity to the present. Several members of the Jewish Studies faculty and guest lecturers participate, representing such fields as anthropology, history, language, literature, philosophy, politics, religion, and sociology.

University Core Curriculum (UCC): (UCC: HUM)
Credits: 3.00

LATN 10100 - Latin Level I (UCC: HUM)

Credit Hours: 3.00. Introduction to classical Latin language. Focus on grammar, syntax, vocabulary, and elementary readings.

University Core Curriculum (UCC): (UCC: HUM)
Learning Outcomes: 1. Learn the basics of reading and translating Latin, including the first half of the core grammar syntax. 2. Improve understanding of English by enriching their vocabulary through etymological connections and through sensitivity to grammatical structures and stylistic choices. Credits: 3.00

LATN 10200 - Latin Level II (UCC: HUM)

Credit Hours: 3.00. Second semester introduction to Latin. Focus on grammar, syntax, vocabulary, and elementary readings in classical Latin and the language of the Vulgate.

University Core Curriculum (UCC): (UCC: HUM)
Learning Outcomes: 1. Continue to learn the basic grammar, vocabulary, and syntax needed for reading and translating Latin. 2. Improve their understanding of English by enriching their vocabulary through etymological connections and by increasing their awareness of grammatical structures and stylistic choices.
Credits: 3.00

LATN 20100 - Latin Level III (UCC: HUM)

Credit Hours: 3.00. Intermediate reading course in Latin, designed to strengthen students' grasp of grammar and syntax, broaden vocabulary, and develop foundational skills in reading and translation.

University Core Curriculum (UCC): (UCC: HUM)
Learning Outcomes: 1. Reinforce knowledge of the basic grammar, vocabulary, and syntax needed for reading and translating Latin. 2. Read and translate simple Latin literature independently and read and translate more complex literature with suitable help from commentaries and instructor. 3. Improve understanding of English through increased sensitivity to grammatical structures and stylistic choices and by extending their vocabulary through etymological connections. Credits: 3.00

LATN 20200 - Latin Level IV (UCC: HUM)

Credit Hours: 3.00. Upper intermediate reading course in Latin prose and poetry, designed to consolidate students' grasp of grammar and syntax, broaden vocabulary, and develop precision and confidence in reading and translation.

University Core Curriculum (UCC): (UCC: HUM)
Learning Outcomes: 1. Continue to reinforce knowledge of the basic grammar, vocabulary, and syntax needed for reading and translating Latin. 2. Apply foundational knowledge to selections from complex and stylistically sophisticated Latin literature. 3. Improve understanding of English by enriching their vocabulary and through increased sensitivity to grammar and style. Credits: 3.00

LATN 34300 - Roman Oratory (UCC: HUM)

Credit Hours: 3.00. Development of advanced Latin reading skills, alongside exploration of social, political, and rhetorical issues raised by the published versions of speeches performed

in ancient Rome.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Improve skills as readers and translators of Latin. 2. Discover the importance of oratory in Roman politics and culture. 3. Develop understanding and enjoyment of Latin prose style. Credits: 3.00

LATN 34400 - Roman Epic (UCC: HUM)

Credit Hours: 3.00. Development of advanced Latin reading skills, alongside exploration of social, political, and rhetorical issues raised by epics such as Vergil's Aeneid, Ovid's Metamorphoses, or other hexameter poetry.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Improve skills as readers and translators of Latin poetry. 2. Increase understanding of the importance of hexameter poetry in Roman culture and subsequent literary tradition. Credits: 3.00

LATN 34500 - Roman Elegy (UCC: HUM)

Credit Hours: 3.00. Readings and discussion of selections from Roman Elegy, including selected passages from such authors as Catullus, Tibullus, Propertius, and Ovid.

University Core Curriculum (UCC): (UCC: HUM) Credits: 3.00

LATN 34600 - Roman Rhetoric (UCC: HUM)

Credit Hours: 3.00. Development of advanced Latin reading skills, alongside exploration of the social, political and literary questions raised by Roman rhetorical theory.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Develop more advanced skills as readers and translators of Latin literature. 2. Analyze Roman perspectives on communication and will discover how influential thinkers assessed the role of literature and speech in Roman society. Credits: 3.00

LATN 34700 - Roman Comedy (UCC: HUM)

Credit Hours: 3.00. Readings and discussion of Roman comedy, including selected works of Plautus and Terence.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Have a greater facility in translating Latin in general, and Latin verse in particular. 2. Study of texts representative of this genre will enhance their understanding and appreciation not simply of other pieces of Roman literature, but also of western comedy as a whole, whose roots are in the comedies of Plautus and Terence. 3. Focus on the background of Roman comedy will also enable students to recognize important connections between literature and its social contexts. Credits: 3.00

LATN 44200 - Roman Lyric Poetry (UCC: HUM)

Credit Hours: 3.00. Readings and discussion of selections from Roman lyric poetry, with special attention to Catullus and Horace.

University Core Curriculum (UCC): (UCC: HUM) Credits: 3.00

LATN 44300 - Roman Satire (UCC: HUM)

Credit Hours: 3.00. Readings and discussion of Roman satire, including selected passages from Horace, Juvenal, Petronius, and Seneca.

University Core Curriculum (UCC): (UCC: HUM) Credits: 3.00

LATN 44400 - Roman Philosophers (UCC: HUM)

Credit Hours: 3.00. Readings and discussion of Roman philosophical texts.

University Core Curriculum (UCC): (UCC: HUM) Credits: 3.00

LATN 44500 - Roman Encyclopedists (UCC: HUM)

Credit Hours: 3.00. Readings and discussion of texts representative of Roman encyclopedism, including selected passages from Pliny the Elder, Aulus Gellius, and Nonius Marcellus.

University Core Curriculum (UCC): (UCC: HUM) Credits: 3.00

LATN 44600 - Roman Historians (UCC: HUM)

Credit Hours: 3.00. Readings and discussion of Roman historical texts.

University Core Curriculum (UCC): (UCC: HUM)

Credits: 3.00

LATN 49000 - Directed Reading In Latin

Credit Hours: 1.00 to 3.00. Directs the reading of students with special interests. Guides students in profitable reading in subjects of their own choice. Permission of instructor required.

Credits: 1.00 to 3.00

CLCS 59000 - Directed Reading In Classics

Credit Hours: 1.00 to 4.00. Directed readings in Classics. Permission of instructor required.

Credits: 1.00 to 4.00

CLCS 23900 - The Comic Vision (UCC: HUM)

Credit Hours: 3.00. This course investigates Greek and Roman comedy from their beginnings until today. The course will feature readings in English from representative authors such as Aristophanes, Menander, Plautus, and Terence, as well as later receptions of ancient comedy in drama and other media. This course may include performance, theories of comedy and tragedy, theories of humor, or recent and current expressions of the comic in film and other media.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Have a detailed historical understanding of the development and evolution of ancient Greek and Roman comedy. 2. Be able to appreciate and intelligently discuss major themes in Greek and Roman comedy as they relate to both ancient and modern views of what is "comic" or humorous. 3. Be able to identify specific examples of the influence of ancient Greek and Roman comedy on the drama of the later western world. Credits: 3.00

LATN 31500 - Latin Paleography I

Credit Hours: 3.00. This course gives students the opportunity to work with original medieval Latin manuscripts, involving transcription and translation, as well as study of the creation, care, and preservation of rare manuscripts.

Learning Outcomes: 1. Work with unedited and as yet untranslated Latin texts. 2. Transcribe Latin documents and produce original translations. 3. Address and solve complex syntactical challenges. 4. Identify fields tangential to Latin and Classics discipline, such as mediaeval history, art history, religious and biblical studies, music, etc. 5. Demonstrate an understanding of digital humanities. Credits: 3.00

LATN 10500 - Accelerated Basic Latin

Credit Hours: 4.00. Foundational Latin grammar course designed to prepare students to read classical and post-classical Latin in a single intensive semester. Focus on grammar, syntax, vocabulary, and elementary readings. The accelerated Latin course assumes *no* previous knowledge of Latin and makes it possible for the diligent student to be able to read *any* Latin prose or poetry (with a dictionary) after a single semester. (Upon completion students will be prepared to enroll in Latin 201.)

Learning Outcomes: 1. Recite Latin texts aloud (with accurate pronunciation, meaningful phrase grouping, and appropriate voice inflection) by imitating models they have heard in class. 2. Analyze Latin texts by identifying and describing the basic elements of Latin grammar, sentence structure, and style. 3. Translate intermediate level un-adapted Latin texts into English. 4. Compose complex sentences while writing a short story in Latin. Credits: 4.00

GREK 10500 - Accelerated Introductory Ancient Greek

Credit Hours: 4.00. This course is an accelerated beginning-level course designed to develop language proficiency in Ancient Greek. The course will help students progress toward competence in reading and writing, as well as toward knowledge of Ancient Greek culture. The course focuses on developing deep understanding of Greek syntax and morphology and building strategies for fluent and accurate reading of ancient texts. Primary language of instruction is English.

Learning Outcomes: 1. Differentiate the syntactic structures used in Ancient Greek sentences and longer texts based on the study of model sentences. 2. Compose sentences in Ancient Greek by focusing on a set of grammatical rules and standards in the language. 3. Recite Ancient Greek aloud with accuracy and fluency and demonstrate their ability in in-class text readings and recordings. 4. Infer the meaning of unknown vocabulary in

context by reading stories. 5. Identify and analyze grammatical forms in the Greek contexts in which they are used. 6. Generate smooth-flowing and elegant English translations of the Greek, attending to inherent differences in style and structure. Credits: 4.00

C. General Studies Courses (3 credits)

ANTH 42500 - Archaeological Method And Theory

Credit Hours: 3.00. Introduction to the theory and methods of contemporary American archaeology. Basic field and laboratory methods are placed in the context of theoretical viewpoints and problems. Major theoretical issues in the field are explored, showing the integration of American archaeology with anthropology.

Learning Outcomes: 1. Summarize the history of archaeology and theoretical frameworks used in interpreting the past. 2. Discuss field and laboratory techniques that archaeologists use to analyze material remains from the archaeological record and reconstruct past human behavior. 3. Describe prehistoric cultural practices including diet and subsistence, migrations, social and political organization. 4. Identify the contributions of archaeology to today's society through various professions inside and outside academic settings. Credits: 3.00

AD 31100 - Ancient Greek Art

Credit Hours: 3.00. The great variety of Greek art, which helped lay the foundation of Western artistic tradition, is presented in several different media and over a period of several centuries. The social context and cultural context of Greek art, especially its humanistic values, is emphasized. Offered every two years.

Learning Outcomes: 1. Learn how Greek art was formed and how it developed over a period of centuries from its origins in the Geometric period to its climax in the Hellenistic era. 2. Gain a broad historical perspective and learn how to evaluate individual works of art, and to view them within a larger cultural and social context. 3. Develop writing proficiency. Credits: 3.00

AD 31200 - Ancient Roman Art

Credit Hours: 3.00. The history of Roman art in several different media is studied, from its origins to the end of the Empire, stressing the social and historical content of this art and its legacy to the modern world. Architecture, sculpture, painting and mosaics are emphasized along with small-scale arts such as jewelry, ceramics, and glass. Offered every two years.

Learning Outcomes: 1. Gain a broad perspective on the history of Roman art, viewing it in relation to Roman society as a whole and seeing how it reflects Roman cultural values. 2. Evaluate individual works of Roman art for both their style and content, and to see how they fit into the historical development of Roman art over a period of centuries. 3. Improve writing ability. Credits: 3.00

AD 38000 - Baroque Art

Credit Hours: 3.00. A survey of European art and architecture during the 17th century, focused on Italy and the Netherlands, and emphasizing some of their leading painters. Works of art are seen in a broad social and cultural context, including the Counter-Reformation and the rise of capitalism.

Learning Outcomes: 1. Identify individuals who have made a major contribution to a style or period. 2. Compare artworks by identifying their differences and similarities. 3. Define terms and concepts in relation to a particular style, artist, or artwork. 4. Discuss historical events, social forces and cultural trends that have had an influence on a particular style, artist, or artwork. 5. Develop analytical and writing skills through textual studies of primary and secondary sources as well as writing exercises. Credits: 3.00

CLCS 18100 - Classical World Civilizations (UCC: BSS)

Credit Hours: 3.00. Course introduces students to "Classical" civilizations on three continents (Europe, Africa, and Asia) demonstrably interconnected by an ancient world system. Course focuses on essential themes of past civilization: religion, philosophy, surviving texts, gender relations, urbanism, technology, social and political formations.

University Core Curriculum (UCC): (UCC: BSS) Credits: 3.00

CLCS 28000 - Topics In Classical Civilization

Credit Hours: 3.00. Selected topics in Ancient Civilization.

Learning Outcomes: 1. Students will have a broader and more detailed grasp of issues that relate to the social, economic, and political institutions that structured ancient communities throughout Asia Minor and the Mediterranean basin. This will allow them to appreciate the confluences of factors and forces that contribute to the formation of cultures and civilizations in the ancient world. Credits: 3.00

CLCS 38000 - Alexander The Great And Hellenistic World (UCC: HUM)

Credit Hours: 3.00. Course examines the career of Alexander the Great and the rise of Macedonia in the Hellenistic Era. Topics include the emergence of Macedonia under Philip II; the achievements of Alexander the Great; and the wars of succession following his demise.

University Core Curriculum (UCC): (UCC: HUM) Credits: 3.00

CLCS 38100 - Julius Caesar: Statesman, Soldier, Citizen

Credit Hours: 3.00. Course Examines the career of Julius Caesar by focusing on events from Caesar's birth (100 BCE) through his assassination in 44 BCE. Course places Caesar's complex personality within the context of political, military, economic, social, and cultural upheaval during the Late Roman Republic.

Credits: 3.00

CLCS 38300 - The Roman Empire

Credit Hours: 3.00. Course examines developments from the Augustan Settlement to the end of the Roman Empire (27 BCE - 476 CE), along with aspects of religious, social, sexual and material culture throughout the Mediterranean at that time.

Credits: 3.00

CLCS 38500 - Science, Medicine And Magic In The Ancient West (UCC: HUM)

Credit Hours: 3.00. Study of the development of the idea of rationality in the West through examination of the evolution of Greek and Roman sciences, with emphasis on medicine and astronomy.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Gain a detailed historical understanding of the development of ancient Greek and Roman science, especially medicine and astronomy, against the background of traditional beliefs in magic. 2. Ability to appreciate and intelligently discuss major issues in ancient science as they relate to both ancient and modern views of what is "rational" and "scientific". 3. Ability to identify specific examples of the influence of ancient science on later western scientific theory and practice. Credits: 3.00

CLCS 38600 - Ancient Greek Religion

Credit Hours: 3.00. Study of the religious beliefs and practices of ancient Greece, based on written, artistic, and archaeological evidence of their forms and functions.

Learning Outcomes: 1. Have a broader and more detailed grasp of belief systems and religious behaviors of the ancient Greek world from the Mycenaean to the Hellenistic period. 2. Be better able to assess the representation of religious experience in other religious traditions with greater historical perspective and methodological sophistication. 3. Be able to express themselves on issues of religion more clearly and with more understanding, both orally and in writing. Credits: 3.00

CLCS 38700 - Roman Religion

Credit Hours: 3.00. Study of the religious beliefs and practices of ancient Rome, based on written, artistic, and archaeological evidence of their forms and functions.

Learning Outcomes: 1. Have a broader and more detailed grasp of belief systems and religious behaviors of the Roman world from the earliest sources to the third century CE. 2. Be better able to assess the representation of religious experience in other religious traditions with greater historical perspective and methodological sophistication. 3. Be able to express themselves on issues of religion more

clearly and with more understanding, both orally and in writing. Credits: 3.00

CLCS 48000 - Potters And Society In Antiquity

Credit Hours: 3.00. Course covers the range of eastern Mediterranean ceramics encountered in Rough Cilicia Archaeological Survey Project from the Bronze Age to the Later Roman Empire. Course also explores strategies employed by archaeologists and historians to exploit ceramics as research materials.

Credits: 3.00

CLCS 48100 - Culture And Society In The Age Of Pericles

Credit Hours: 3.00. Course explores interrelationships between the emergence of Greek democracy and the cultural, political, social, and economic rise of Athens in the fifth century BCE. More broadly, course surveys history of the Greek world from the Late Bronze Age to 362 BCE.

Credits: 3.00

CLCS 48300 - Republican Rome

Credit Hours: 3.00. Course examines the military, political, economic, and social developments that enabled the Roman people to expand from an Italian city-state to a trans-Mediterranean empire, and the consequences that initiated the decline and transition in their republican form of government.

Credits: 3.00

CLCS 49900 - Special Topics In Classics

Credit Hours: 1.00 to 4.00. Special Topics in Classics. Permission of instructor required.

Credits: 1.00 to 4.00

HEBR 28400 - Ancient Near Eastern History And Culture

Credit Hours: 3.00. This course is a survey of the development of the ancient Near East, from its pre-history to Alexander the Great. It emphasizes the evolutions of various Near Eastern cultures in their many manifestations; art, government, agriculture, economics, philosophy, religion, ethics, and science. Taught in English.

Learning Outcomes: 1. Understand the difference between pre-history and history. 2. Understand various ancient and modern ideas of the purpose of writing history. 3. Understand how the invention of writing and the origins of cities were coordinate developments. 4. Understand something of the flow of empires that succeeded each other, eventually displaced by the empire of Alexander the Great, whose conquests shaped the contours of the world much as we know it. 5. Become aware how art reflects the development of thought and idealism; how ideas of human government evolved; how religion, science, agriculture, and much else developed as empires built onto those they displaced. Credits: 3.00

ITAL 28100 - The Italian Renaissance And Its Scientific And Cultural Impact On Western Civilization (UCC: HUM)

Credit Hours: 3.00. This course introduces students to the most important cultural and scientific writings of the Italian Renaissance, and shows the pivotal influence of the Renaissance on the development of Western civilization as a whole. Classes and readings entirely in English; no knowledge of Italian needed.

University Core Curriculum (UCC): (UCC: HUM)

Learning Outcomes: 1. Become acquainted with the canonical works of the Italian Renaissance that have had a major influence on modern Western thought and will develop a broad understanding of the Renaissance. 2. Become familiar with different literary genres such as poetry, comedy, novellas, treatises and dialogues, and will develop the tools necessary to approach them critically within the cultural and political context that produced them. 3. Improve their critical and writing skills. Credits: 3.00

PHIL 30100 - History Of Ancient Philosophy (UCC: HUM)

Credit Hours: 3.00. A survey of Greek philosophy from its beginning in the Milesian school through the Presocratics to Plato and Aristotle.

University Core Curriculum (UCC): (UCC: HUM)

Credits: 3.00

WGSS 48000 - Feminist Theory

Credit Hours: 3.00. Intensive study of a variety of contemporary and international feminist theories from an interdisciplinary perspective. Provides an overview of major trends, critical approaches, and diverse viewpoints in the field of feminist theory.

Credits: 3.00

WGSS 28200 - Introduction To LGBTQ Studies (UCC: BSS)

Credit Hours: 3.00. (ANTH 28200) This course offers students an introduction to the interdisciplinary study of lesbian, gay, bisexual, transgender and queer lives. It provides a basic grounding in theories of sexuality and LGBT histories, identities and movements in the U.S. and globally.

University Core Curriculum (UCC): (UCC: BSS) Learning Outcomes: 1. Students will gain a broad overview of the cultural history of sexualities both in the West and globally from the pre-modern era to the contemporary period. They will grasp the way sexual and gender identities change over time and across space. They will analyze how sexual identity intersects with gender, race, and class. They will develop a theoretical understanding of the social construction of sexuality, sexual identities and transgender identities. Credits: 3.00

PHIL 50100 - Studies In Greek Philosophy

Credit Hours: 3.00. The subject matter will alternate between the intensive study of some fairly specific topic in Greek philosophy (e.g., Plato's theory of knowledge, Aristotle's ethics, etc.) and a general study of either the philosophy of Plato or the philosophy of Aristotle.

Credits: 3.00

CLCS 59000 - Directed Reading In Classics

Credit Hours: 1.00 to 4.00. Directed readings in Classics. Permission of instructor required.

Credits: 1.00 to 4.00

CLCS 23400 - Medical And Scientific Terminology From Greek And Latin Roots

Credit Hours: 3.00. Ninety to ninety-five percent of scientific technical vocabulary and medical terminology come from Latin and Greek roots and affixes. This course will enable students in scientific and medical disciplines to develop a foundational core of Greek and Latin roots and affixes from which they will be able to decipher and easily commit to memory the core terminology in the various sciences and medicine.

Learning Outcomes: 1. Know the foundational core of Greek and Latin roots and affixes from which medical and scientific terminology has been derived. 2. Decipher complex and specialized scientific and medical terms based on the knowledge of their Greek and Latin roots. 3. Decipher unfamiliar terminology in their fields by learning how the roots combine dynamically to form words as scientific and medical innovation requires an ever-increasing need for new terms. 4. Enable students to absorb information in their fields more easily by demystifying the complexities of their specialized vocabularies used in their disciplines. Credits: 3.00

CLCS 38400 - Ancient Western Medicine

Credit Hours: 3.00. Historical and cultural study of Western medicine, from Mesopotamian origins to the late Roman Empire, based on written texts and archaeological evidence. Addresses the development of rational medical frameworks against the background traditional beliefs about illness as a sign of demonic possession, and charts the growth of the medical profession from individual avocation to institutional practice.

Learning Outcomes: 1. Summarize the key forces affecting the development of Western medicine from its origins to late antiquity in the form of an extended essay or paper. 2. Create a compelling, original argument that relates habits of rational thinking about the human body in antiquity to the conceptual frameworks used to diagnose its behaviors. 3. Respond critically to a representative medical text from antiquity in a capstone research project. Credits: 3.00

CLCS 18100 - Classical World Civilizations (UCC: BSS)

Credit Hours: 3.00. Course introduces students to "Classical" civilizations on three continents (Europe, Africa, and Asia) demonstrably interconnected by an ancient world system. Course focuses on essential themes of past civilization: religion, philosophy, surviving texts, gender relations, urbanism, technology, social and political formations.

University Core Curriculum (UCC): (UCC: BSS) Credits: 3.00

CLCS 23010 - Survey Of Greek Literature In Translation (UCC: HUM)

Credit Hours: 3.00. Introduction to Ancient Greek literature from homer to Plato. All readings in English.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Have broader and more detailed grasp of the history of ancient Greek literature, including the development of specific genres (epic, lyric, choral, tragedy, comedy, historical and philosophical prose); 2. Be able to appreciate the place and role of literature within the shifting historical, political and social contexts of the ancient Greek world; and 3. Be equipped to trace the influences of ancient Greek literature on the literatures of the later western world. Credits: 3.00

CLCS 23100 - Survey Of Latin Literature (UCC: HUM)

Credit Hours: 3.00. Highlights of literature written in Ancient Rome at times of political, social, and intellectual turbulence. Reading (all in English) includes Vergil's Aeneid, as well as selections from other influential Latin texts.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Have broader and more detailed grasp of the history of ancient Latin literature, including the development of specific genres (epic, lyric, choral, tragedy, comedy, historical and philosophical prose); 2. Be able to appreciate the place and role of literature within the shifting historical, political and social contexts of the ancient Roman world; and 3. Be equipped to trace the influences of Latin literature on the literatures of the later western world. Credits: 3.00

CLCS 23500 - Introduction To Classical Mythology (UCC: HUM)

Credit Hours: 3.00. Study of the myths of western antiquity, as represented in ancient Greek and Latin texts and images.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Have a detailed grasp of the principal characters, narratives, and themes of Greek mythology; 2. Be able to appreciate the many functions of myths within ancient Greek society, namely to explain natural events, support religious practices, and underwrite social and political power; and 3. Be able to identify modern myths and appreciate the role they continue to play within all societies. Credits: 3.00

CLCS 23700 - Gender And Sexuality In Greek And Roman Antiquity (UCC: HUM)

Credit Hours: 3.00. How identities based on gender, sexual behavior and sexual desire, and socio-economic status are established in ancient Greece and Rome. Exploration of why these ancient views of gender and sexuality remain of continuing importance in the 21st century. All readings in English.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Learn core information

about ancient Greek and/or Roman cultures. 2. Learn to analyze gender identities and conventions surrounding sexuality in various communities with different socio-political structures. 3. Develop methods for historically sensitive investigation of materials (literary and/or visual) from ancient cultures. 4. Systematically improve analytical skills as writers, readers, and speakers. Credits: 3.00

CLCS 23700 - Gender And Sexuality In Greek And Roman Antiquity (UCC: HUM)

Credit Hours: 3.00. How identities based on gender, sexual behavior and sexual desire, and socio-economic status are established in ancient Greece and Rome. Exploration of why these ancient views of gender and sexuality remain of continuing importance in the 21st century. All readings in English.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Learn core information about ancient Greek and/or Roman cultures. 2. Learn to analyze gender identities and conventions surrounding sexuality in various communities with different socio-political structures. 3. Develop methods for historically sensitive investigation of materials (literary and/or visual) from ancient cultures. 4. Systematically improve analytical skills as writers, readers, and speakers. Credits: 3.00

Concentration in Material Culture & History (27 credits)

B. Historical and Archaeological Studies Courses (9 credits)

ANTH 20100 - Introduction To Archaeology And World Prehistory (UCC: BSS)

Credit Hours: 3.00. Introduction to the ideas and practices of archaeology that are used in the contemporary study of human prehistory. Emphasis is placed on the social and technological changes that accompanied major turning points in the human past, including the earliest stone tools, the development of farming, through the advent of writing and monumental architecture among ancient states.

University Core Curriculum (UCC): (UCC: BSS) Learning Outcomes: 1. Recognize the principles of archaeology and how we study the ancient past. 2. Describe and analyze archaeological phenomenon using archaeological terms. 3. Relate dates, places, and significance of major cultural and technical transformations in prehistory. 4. Evaluate how archaeology is represented in popular media. Credits: 3.00

ANTH 20400 - Human Origins (UCC: SCI)

Credit Hours: 3.00. Surveys our evolutionary journey, from fossil primates to modern humans, through a review of evolutionary theory and genetics, the fossil evidence for current theories in human evolution with insight from modern non-human primates, and the influence of environmental stressors on modern human biological variation.

University Core Curriculum (UCC): (UCC: SCI) Learning Outcomes: 1. Define and explain the mechanisms of evolution and genetic inheritance. 2. Identify the characteristics of non-human primates and describe their behavior, ecology, and evolutionary relationships to humans. 3. Describe primate and human evolution as seen in the fossil record. 4. Explain how evolutionary processes have led to contemporary human variation and

behavior. Credits: 3.00

ANTH 31000 - Mortuary Practices Across Cultures

Credit Hours: 3.00. Explores how death is treated or has been treated in diverse world cultures and time periods. Death is viewed as an expression of social behavior and as an expression of symbolic meaning.

Credits: 3.00

ANTH 31200 - The Archaeology Of Ancient Egypt And The Near East

Credit Hours: 3.00. Selected topics on the archaeology of ancient Near Eastern cultures in Mesopotamia, the circum-Mediterranean area, Egypt, and the Nile Valley, emphasizing an anthropological interpretation of the political, social, religious, and economic systems that contributed to their development.

Learning Outcomes: 1. Summarize the rise and development of civilization in the Near East and North Africa from 10,000 years ago to 331 BC. 2. Distinguish the emergence and strategies of governance between these neighboring regions. 3. Recognize the historical and cultural context that gave rise to the Great Pyramids, cuneiform writing, and other significant achievements in the region. 4. Interpret the Near East and North Africa within Western historical narratives and popular imaginings. Credits: 3.00

ANTH 42500 - Archaeological Method And Theory

Credit Hours: 3.00. Introduction to the theory and methods of contemporary American archaeology. Basic field and laboratory methods are placed in the context of theoretical viewpoints and problems. Major theoretical issues in the field are explored, showing the integration of American archaeology with anthropology.

Learning Outcomes: 1. Summarize the history of archaeology and theoretical frameworks used in interpreting the past. 2. Discuss field and laboratory techniques that archaeologists use to analyze material remains from the archaeological record and reconstruct past human behavior. 3. Describe prehistoric cultural practices including diet and subsistence, migrations, social and political organization. 4. Identify the contributions of archaeology to today's society through various professions inside and outside academic settings. Credits: 3.00

ANTH 42800 - Field Methods In Archaeology

Credit Hours: 1.00 to 9.00. Introduces basic field and laboratory methods in contemporary archaeology: methods of site survey, mapping, and excavation through the excavation of archaeological sites; the basics of archaeological data analysis and classification, and the computer-based analysis of archaeological data. Permission of instructor required.

Learning Outcomes: 1. Describe, document, and record archaeological data and their spatial relationships in the field. 2. Apply basic archaeological field methods, including excavation, mapping, and data recording. 3. Practice database management, including sorting and labeling artifacts and samples, and maintaining a catalog of data. Credits: 1.00 to 9.00

AD 31100 - Ancient Greek Art

Credit Hours: 3.00. The great variety of Greek art, which helped lay the foundation of Western artistic tradition, is presented in several different media and over a period of several centuries. The social context and cultural context of Greek art, especially its humanistic values, is emphasized. Offered every two years.

Learning Outcomes: 1. Learn how Greek art was formed and how it developed over a period of centuries from its origins in the Geometric period to its climax in the Hellenistic era. 2. Gain a broad historical perspective and learn how to evaluate individual works of art, and to view them within a larger cultural and social context. 3. Develop writing proficiency. Credits: 3.00

AD 31200 - Ancient Roman Art

Credit Hours: 3.00. The history of Roman art in several different media is studied, from its origins to the end of the Empire, stressing the social and historical content of this art and its legacy to the modern world. Architecture, sculpture, painting and mosaics are emphasized along with small-scale arts such as jewelry, ceramics, and glass. Offered every two years.

Learning Outcomes: 1. Gain a broad perspective on the history of Roman art, viewing

it in relation to Roman society as a whole and seeing how it reflects Roman cultural values. 2. Evaluate individual works of Roman art for both their style and content, and to see how they fit into the historical development of Roman art over a period of centuries. 3. Improve writing ability. Credits: 3.00

CLCS 18100 - Classical World Civilizations (UCC: BSS)

Credit Hours: 3.00. Course introduces students to "Classical" civilizations on three continents (Europe, Africa, and Asia) demonstrably interconnected by an ancient world system. Course focuses on essential themes of past civilization: religion, philosophy, surviving texts, gender relations, urbanism, technology, social and political formations.

University Core Curriculum (UCC): (UCC: BSS)
Credits: 3.00

CLCS 22000 - Topics In Classical Literature

Credit Hours: 3.00. Selected topics in Greek and Roman literature. All readings in English translation.

Learning Outcomes: 1. Gain a detailed historical understanding of the development of a specific genre or topic within ancient Greek and Roman literature. 2. Ability to appreciate and intelligently discuss major themes in ancient Greek and Roman literature through close reading of representative texts. 3. Ability to identify specific examples of the influence of the ancient Greek and Roman literature on the literature of the later western world. Credits: 3.00

CLCS 28000 - Topics In Classical Civilization

Credit Hours: 3.00. Selected topics in Ancient Civilization.

Learning Outcomes: 1. Students will have a broader and more detailed grasp of issues that relate to the social, economic, and political institutions that structured ancient communities throughout Asia Minor and the Mediterranean basin. This will allow them to appreciate the confluences of factors and forces that contribute to the formation of cultures and civilizations in the ancient world. Credits: 3.00

CLCS 38000 - Alexander The Great And Hellenistic World (UCC: HUM)

Credit Hours: 3.00. Course examines the career of Alexander the Great and the rise of Macedonia in the Hellenistic Era. Topics include the emergence of Macedonia under Philip II; the achievements of Alexander the Great; and the wars of succession following his demise.

University Core Curriculum (UCC): (UCC: HUM)
Credits: 3.00

CLCS 38100 - Julius Caesar: Statesman, Soldier, Citizen

Credit Hours: 3.00. Course Examines the career of Julius Caesar by focusing on events from Caesar's birth (100 BCE) through his assassination in 44 BCE. Course places Caesar's complex personality within the context of political, military, economic, social, and cultural upheaval during the Late Roman Republic.

Credits: 3.00

CLCS 38300 - The Roman Empire

Credit Hours: 3.00. Course examines developments from the Augustan Settlement to the end of the Roman Empire (27 BCE - 476 CE), along with aspects of religious, social, sexual and material culture throughout the Mediterranean at that time.

Credits: 3.00

CLCS 38500 - Science, Medicine And Magic In The Ancient West (UCC: HUM)

Credit Hours: 3.00. Study of the development of the idea of rationality in the West through examination of the evolution of Greek and Roman sciences, with emphasis on medicine and astronomy.

University Core Curriculum (UCC): (UCC: HUM)
Learning Outcomes: 1. Gain a detailed historical understanding of the development of ancient Greek and Roman science, especially medicine and astronomy, against the background of traditional beliefs in magic. 2. Ability to appreciate and intelligently discuss major issues in ancient science as they relate to both ancient and modern views of what is "rational" and "scientific". 3. Ability to identify specific examples of the influence of ancient science on later western scientific theory and practice.
Credits: 3.00

CLCS 38600 - Ancient Greek Religion

Credit Hours: 3.00. Study of the religious beliefs and practices of ancient Greece, based on written, artistic, and archaeological evidence of their forms and functions.

Learning Outcomes: 1. Have a broader and more detailed grasp of belief systems and religious behaviors of the ancient Greek world from the Mycenaean to the Hellenistic period. 2. Be better able to assess the representation of religious experience in other religious traditions with greater historical perspective and methodological sophistication. 3. Be able to express themselves on issues of religion more clearly and with more understanding, both orally and in writing. Credits: 3.00

CLCS 38700 - Roman Religion

Credit Hours: 3.00. Study of the religious beliefs and practices of ancient Rome, based on written, artistic, and archaeological evidence of their forms and functions.

Learning Outcomes: 1. Have a broader and more detailed grasp of belief systems and religious behaviors of the Roman world from the earliest sources to the third century CE. 2. Be better able to assess the representation of religious experience in other religious traditions with greater historical perspective and methodological sophistication. 3. Be able to express themselves on issues of religion more clearly and with more understanding, both orally and in writing. Credits: 3.00

CLCS 48000 - Potters And Society In Antiquity

Credit Hours: 3.00. Course covers the range of eastern Mediterranean ceramics encountered in Rough Cilicia Archaeological Survey Project from the Bronze Age to the Later Roman Empire. Course also explores strategies employed by archaeologists and historians to exploit ceramics as research materials.

Credits: 3.00

CLCS 48100 - Culture And Society In The Age Of Pericles

Credit Hours: 3.00. Course explores interrelationships between the emergence of Greek democracy and the cultural, political, social, and economic rise of Athens in the fifth century BCE. More broadly, course surveys history of the Greek world from the Late Bronze Age to 362 BCE.

Credits: 3.00

CLCS 48300 - Republican Rome

Credit Hours: 3.00. Course examines the military, political, economic, and social developments that enabled the Roman people to expand from an Italian city-state to a trans-Mediterranean empire, and the consequences that initiated the decline and transition in their republican form of government.

Credits: 3.00

CLCS 49900 - Special Topics In Classics

Credit Hours: 1.00 to 4.00. Special Topics in Classics. Permission of instructor required.

Credits: 1.00 to 4.00

GREK 34300 - Greek Oratory

Credit Hours: 3.00. A study of ancient Greek (Attic) orators from textual, historical, and social perspectives.

Credits: 3.00

GREK 44600 - Greek Historians

Credit Hours: 3.00. A study of the writings of the classical historians in the original Greek.

Credits: 3.00

HEBR 28400 - Ancient Near Eastern History And Culture

Credit Hours: 3.00. This course is a survey of the development of the ancient Near East, from its pre-history to Alexander the Great. It emphasizes the evolutions of various Near Eastern cultures in their many manifestations; art, government, agriculture, economics, philosophy, religion, ethics, and science. Taught in English.

Learning Outcomes: 1. Understand the difference between pre-history and history. 2. Understand various ancient and modern ideas of the purpose of writing history. 3. Understand how the invention of writing and the origins of cities were coordinate developments. 4. Understand something of the flow of empires that succeeded each other, eventually displaced by the empire of Alexander the Great, whose conquests shaped the contours of the world

much as we know it. 5. Become aware how art reflects the development of thought and idealism; how ideas of human government evolved; how religion, science, agriculture, and much else developed as empires built onto those they displaced. Credits: 3.00

HIST 31700 - A History Of The Christian Church And The Expansion Of Christianity I

Credit Hours: 3.00. A history of the emergence of Christianity, the development of the Christian church, and the impact of Christian thought and institutions upon western Europe prior to the Reformation.

Credits: 3.00

LATN 34300 - Roman Oratory (UCC: HUM)

Credit Hours: 3.00. Development of advanced Latin reading skills, alongside exploration of social, political, and rhetorical issues raised by the published versions of speeches performed in ancient Rome.

University Core Curriculum (UCC): (UCC: HUM)
Learning Outcomes: 1. Improve skills as readers and translators of Latin. 2. Discover the importance of oratory in Roman politics and culture. 3. Develop understanding and enjoyment of Latin prose style. Credits: 3.00

LATN 44300 - Roman Satire (UCC: HUM)

Credit Hours: 3.00. Readings and discussion of Roman satire, including selected passages from Horace, Juvenal, Petronius, and Seneca.

University Core Curriculum (UCC): (UCC: HUM)
Credits: 3.00

LATN 44600 - Roman Historians (UCC: HUM)

Credit Hours: 3.00. Readings and discussion of Roman historical texts.

University Core Curriculum (UCC): (UCC: HUM)
Credits: 3.00

CLCS 59000 - Directed Reading In Classics

Credit Hours: 1.00 to 4.00. Directed readings in Classics. Permission of instructor required.

Credits: 1.00 to 4.00

CLCS 38400 - Ancient Western Medicine

Credit Hours: 3.00. Historical and cultural study of Western medicine, from Mesopotamian origins to the late Roman Empire, based on written texts and archaeological evidence. Addresses the development of rational medical frameworks against the background traditional beliefs about illness as a sign of demonic possession, and charts the growth of the medical profession from individual avocation to institutional practice.

Learning Outcomes: 1. Summarize the key forces affecting the development of Western medicine from its origins to late antiquity in the form of an extended essay or paper. 2. Create a compelling, original argument that relates habits of rational thinking about the human body in antiquity to the conceptual frameworks used to diagnose its behaviors. 3. Respond critically to a representative medical text from antiquity in a capstone research project. Credits: 3.00

C. General Studies Courses (3 credits)

AD 38000 - Baroque Art

Credit Hours: 3.00. A survey of European art and architecture during the 17th century, focused on Italy and the Netherlands, and emphasizing some of their leading painters. Works of art are seen in a broad social and cultural context, including the Counter-Reformation and the rise of capitalism.

Learning Outcomes: 1. Identify individuals who have made a major contribution to a style or period. 2. Compare artworks by identifying their differences and similarities. 3. Define terms and concepts in relation to a particular style, artist, or artwork. 4. Discuss historical events, social forces and cultural trends that have had an influence on a particular style, artist, or artwork. 5. Develop analytical and writing skills through textual studies of primary and secondary sources as well as writing exercises. Credits: 3.00

CLCS 23010 - Survey Of Greek Literature In Translation (UCC: HUM)

Credit Hours: 3.00. Introduction to Ancient Greek literature from homer to Plato. All readings in English.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Have broader and more detailed grasp of the history of ancient Greek literature, including the development of specific genres (epic, lyric, choral, tragedy, comedy, historical and philosophical prose); 2. Be able to appreciate the place and role of literature within the shifting historical, political and social contexts of the ancient Greek world; and 3. Be equipped to trace the influences of ancient Greek literature on the literatures of the later western world. Credits: 3.00

CLCS 23100 - Survey Of Latin Literature (UCC: HUM)

Credit Hours: 3.00. Highlights of literature written in Ancient Rome at times of political, social, and intellectual turbulence. Reading (all in English) includes Vergil's Aeneid, as well as selections from other influential Latin texts.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Have broader and more detailed grasp of the history of ancient Latin literature, including the development of specific genres (epic, lyric, choral, tragedy, comedy, historical and philosophical prose); 2. Be able to appreciate the place and role of literature within the shifting historical, political and social contexts of the ancient Roman world; and 3. Be equipped to trace the influences of Latin literature on the literatures of the later western world. Credits: 3.00

CLCS 23200 - Classical Roots Of English Words (UCC: HUM)

Credit Hours: 3.00. This is an introduction to English etymology with emphasis on building vocabulary. Students will learn English derivatives from both classical Greek and Latin. All texts to be read in English.

University Core Curriculum (UCC): (UCC: HUM) Credits: 3.00

CLCS 23300 - Comparative Mythology (UCC: HUM)

Credit Hours: 3.00. Comparative study of the myths of major ancient cultures, with emphasis on shared typological features.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Have a detailed grasp of principal characters, narratives, and themes in the myths of a number of representative ancient world cultures (Mesopotamian, Egyptian, Celtic, Aztec, Mayan, East Asian, African); 2. Be able to appreciate the many functions of myths within ancient societies, namely to explain natural events, support religious practices, and underwrite social and political power; and 3. Be able to identify recurrent patterns and themes in the myths of historically disparate ancient and modern cultures. Credits: 3.00

CLCS 23500 - Introduction To Classical Mythology (UCC: HUM)

Credit Hours: 3.00. Study of the myths of western antiquity, as represented in ancient Greek and Latin texts and images.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Have a detailed grasp of the principal characters, narratives, and themes of Greek mythology; 2. Be able to appreciate the many functions of myths within ancient Greek society, namely to explain natural events, support religious practices, and underwrite social and political power; and 3. Be able to identify modern myths and appreciate the role they continue to play within all societies. Credits: 3.00

CLCS 23600 - Ancient World Onscreen

Credit Hours: 3.00. How film represents ancient Mediterranean civilizations and retells ancient myths; how cinematic renderings of ancient history shape views of the past and how these are affected by contemporary sensibilities. No knowledge of Greek or Latin required.

Learning Outcomes: 1. Have a detailed historical grasp of the ways in which the ancient Greek and Roman worlds have found expression in modern cinema; 2. Be able to appreciate how ancient texts fare when translated into the radically different artistic medium of film; and 3. Be able to discuss intelligently what forces influence how we

choose to see and represent the ancient western world. Credits: 3.00

CLCS 23700 - Gender And Sexuality In Greek And Roman Antiquity (UCC: HUM)

Credit Hours: 3.00. How identities based on gender, sexual behavior and sexual desire, and socio-economic status are established in ancient Greece and Rome. Exploration of why these ancient views of gender and sexuality remain of continuing importance in the 21st century. All readings in English.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Learn core information about ancient Greek and/or Roman cultures. 2. Learn to analyze gender identities and conventions surrounding sexuality in various communities with different socio-political structures. 3. Develop methods for historically sensitive investigation of materials (literary and/or visual) from ancient cultures. 4. Systematically improve analytical skills as writers, readers, and speakers. Credits: 3.00

CLCS 23800 - The Tragic Vision (UCC: HUM)

Credit Hours: 3.00. Greek and Roman tragedy from their beginnings until today. Readings in English from representative authors such as Aeschylus, Sophocles, Euripides, and Seneca; later receptions of ancient tragedy in drama and other media. Course may include performance, theories of comedy and tragedy, or recent and current expressions of the tragic in film and other media.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Understand a detailed historical development of ancient Greek tragic through close reading of representative samples of the genre. 2. Appreciate and intelligently discuss major themes in Greek tragedy as they relate to both ancient and modern views of what is "tragic". 3. Identify specific examples of the influence of ancient Greek tragedy on the drama of the later western world. Credits: 3.00

CLCS 28000 - Topics In Classical Civilization

Credit Hours: 3.00. Selected topics in Ancient Civilization.

Learning Outcomes: 1. Students will have a broader and more detailed grasp of issues that relate to the social, economic, and political institutions that structured ancient communities throughout Asia Minor and the Mediterranean basin. This will allow them to appreciate the confluences of factors and forces that contribute to the formation of cultures and civilizations in the ancient world. Credits: 3.00

CLCS 33700 - The Ancient Epic

Credit Hours: 3.00. Study of the epic in four ancient cultures, with emphasis on its structure, nature, and social functions. Readings may include Gilgamesh, Iliad, Odyssey, Aeneid, Beowulf, Tain, Mahabharata, and others.

Learning Outcomes: 1. Gain an enhanced understanding of the nature and development of the genre of epic through close reading of representative samples of the genre from different ancient cultures. 2. Ability to appreciate and intelligently discuss major themes in epic as they relate to both ancient and modern views of the heroic. 3. Ability to identify specific examples of the influence of ancient epic on the literature of the later western world. Credits: 3.00

CLCS 49900 - Special Topics In Classics

Credit Hours: 1.00 to 4.00. Special Topics in Classics. Permission of instructor required.

Credits: 1.00 to 4.00

ENGL 26600 - World Literature: From The Beginnings To 1700 A.D. (UCC: HUM)

Credit Hours: 3.00. (CMPL 26600) World literature in translation. A comparative and chronological survey of the masterpieces of Eastern and Western literature. CCN: IEL 1250 World Literature 1

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Demonstrate knowledge of a range of genres, topics, and literary conventions characteristic of world literatures. 2. Discuss those genres, topics, and conventions in relation to their diverse historical, cultural, and aesthetic contexts. 3. Produce well-

reasoned written arguments about the literature they study based on appropriate use of textual evidence. Credits: 3.00

GREK 10100 - Ancient Greek Level I (UCC: HUM)

Credit Hours: 3.00. Introduction to the grammar of Attic Greek of the Classical period, and first forays into the reading of connected prose. Emphasis on accidence, syntax, and vocabulary building.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Explain foundational Ancient Greek grammar and demonstrate familiarity with core vocabulary. 2. Bring together their knowledge of Ancient Greek grammar and vocabulary, creating clear English translations by analyzing basic texts adapted from Ancient Greek literature. 3. Apply this knowledge of grammar and vocabulary to writing simple sentences in Ancient Greek, and translating from English to Ancient Greek. Credits: 3.00

GREK 10200 - Ancient Greek Level II (UCC: HUM)

Credit Hours: 3.00. Continuation of the study of Attic Greek grammar and reading of connected prose of the Classical period.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Learn basics of reading and translating ancient Greek, completing their introduction to core vocabulary, grammar, and syntax. 2. Improve understanding of English through increased sensitivity to grammatical structures and stylistic choices and by extending their vocabulary through etymological connections. Credits: 3.00

GREK 20100 - Ancient Greek Level III (UCC: HUM)

Credit Hours: 3.00. Intermediate reading course in New Testament Greek, designed to strengthen students' grasp of grammar and syntax, broaden vocabulary, and develop skills in reading and translation.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Learn how to apply foundational knowledge of ancient Greek grammar and syntax to readings in the New Testament. 2. Improve understanding of English through increased sensitivity to grammatical structures and stylistic choices and by extending vocabulary through etymological connections. Credits: 3.00

GREK 20200 - Ancient Greek Level IV (UCC: HUM)

Credit Hours: 3.00. Upper intermediate reading course in ancient Greek, designed to consolidate students' knowledge of grammar and syntax, broaden vocabulary, and develop precision and confidence in reading and translation.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Reinforce and extend skills as readers and translators by studying archaic, classical or post-classical Greek literature. 2. Improve understanding of English through increased sensitivity to grammatical structures and stylistic choices and by extending vocabulary through etymological connections. Credits: 3.00

GREK 34300 - Greek Oratory

Credit Hours: 3.00. A study of ancient Greek (Attic) orators from textual, historical, and social perspectives.

Credits: 3.00

GREK 34400 - Greek Epic

Credit Hours: 3.00. Readings and discussion of the Greek epic, including selected passages from Homer and Hesiod.

Credits: 3.00

GREK 35300 - Greek Tragedy

Credit Hours: 3.00. Reading and discussion of selected Greek tragedies of the 5th century BCE.

Credits: 3.00

GREK 35400 - Greek Comedy

Credit Hours: 3.00. Readings and discussion of selected Greek comedies of the 4th and 5th centuries BCE.

Credits: 3.00

GREK 44600 - Greek Historians

Credit Hours: 3.00. A study of the writings of the classical

historians in the original Greek.

Credits: 3.00

ITAL 28100 - The Italian Renaissance And Its Scientific And Cultural Impact On Western Civilization (UCC: HUM)

Credit Hours: 3.00. This course introduces students to the most important cultural and scientific writings of the Italian Renaissance, and shows the pivotal influence of the Renaissance on the development of Western civilization as a whole. Classes and readings entirely in English; no knowledge of Italian needed.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Become acquainted with the canonical works of the Italian Renaissance that have had a major influence on modern Western thought and will develop a broad understanding of the Renaissance. 2. Become familiar with different literary genres such as poetry, comedy, novellas, treatises and dialogues, and will develop the tools necessary to approach them critically within the cultural and political context that produced them. 3. Improve their critical and writing skills. Credits: 3.00

JWST 33000 - Introduction To Jewish Studies (UCC: HUM)

Credit Hours: 3.00. An interdisciplinary course touching on the full range of Jewish experience from antiquity to the present. Several members of the Jewish Studies faculty and guest lecturers participate, representing such fields as anthropology, history, language, literature, philosophy, politics, religion, and sociology.

University Core Curriculum (UCC): (UCC: HUM) Credits: 3.00

LATN 10100 - Latin Level I (UCC: HUM)

Credit Hours: 3.00. Introduction to classical Latin language. Focus on grammar, syntax, vocabulary, and elementary readings.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Learn the basics of reading and translating Latin, including the first half of the core grammar syntax. 2. Improve understanding of English by enriching their vocabulary through etymological connections and through sensitivity to grammatical structures and stylistic choices. Credits: 3.00

LATN 10200 - Latin Level II (UCC: HUM)

Credit Hours: 3.00. Second semester introduction to Latin. Focus on grammar, syntax, vocabulary, and elementary readings in classical Latin and the language of the Vulgate.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Continue to learn the basic grammar, vocabulary, and syntax needed for reading and translating Latin. 2. Improve their understanding of English by enriching their vocabulary through etymological connections and by increasing their awareness of grammatical structures and stylistic choices. Credits: 3.00

LATN 20100 - Latin Level III (UCC: HUM)

Credit Hours: 3.00. Intermediate reading course in Latin, designed to strengthen students' grasp of grammar and syntax, broaden vocabulary, and develop foundational skills in reading and translation.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Reinforce knowledge of the basic grammar, vocabulary, and syntax needed for reading and translating Latin. 2. Read and translate simple Latin literature independently and read and translate more complex literature with suitable help from commentaries and instructor. 3. Improve understanding of English through increased sensitivity to grammatical structures and stylistic choices and by extending their vocabulary through etymological connections. Credits: 3.00

LATN 20200 - Latin Level IV (UCC: HUM)

Credit Hours: 3.00. Upper intermediate reading course in Latin prose and poetry, designed to consolidate students' grasp of grammar and syntax, broaden vocabulary, and develop precision and confidence in reading and translation.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Continue to reinforce knowledge of the basic grammar, vocabulary, and syntax needed for reading and translating

Latin. 2. Apply foundational knowledge to selections from complex and stylistically sophisticated Latin literature. 3. Improve understanding of English by enriching their vocabulary and through increased sensitivity to grammar and style. Credits: 3.00

LATN 34300 - Roman Oratory (UCC: HUM)

Credit Hours: 3.00. Development of advanced Latin reading skills, alongside exploration of social, political, and rhetorical issues raised by the published versions of speeches performed in ancient Rome.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Improve skills as readers and translators of Latin. 2. Discover the importance of oratory in Roman politics and culture. 3. Develop understanding and enjoyment of Latin prose style. Credits: 3.00

LATN 34400 - Roman Epic (UCC: HUM)

Credit Hours: 3.00. Development of advanced Latin reading skills, alongside exploration of social, political, and rhetorical issues raised by epics such as Vergil's Aeneid, Ovid's Metamorphoses, or other hexameter poetry.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Improve skills as readers and translators of Latin poetry. 2. Increase understanding of the importance of hexameter poetry in Roman culture and subsequent literary tradition. Credits: 3.00

LATN 34500 - Roman Elegy (UCC: HUM)

Credit Hours: 3.00. Readings and discussion of selections from Roman Elegy, including selected passages from such authors as Catullus, Tibullus, Propertius, and Ovid.

University Core Curriculum (UCC): (UCC: HUM) Credits: 3.00

LATN 34600 - Roman Rhetoric (UCC: HUM)

Credit Hours: 3.00. Development of advanced Latin reading skills, alongside exploration of the social, political and literary questions raised by Roman rhetorical theory.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Develop more advanced skills as readers and translators of Latin literature. 2. Analyze Roman perspectives on communication and will discover how influential thinkers assessed the role of literature and speech in Roman society. Credits: 3.00

LATN 34700 - Roman Comedy (UCC: HUM)

Credit Hours: 3.00. Readings and discussion of Roman comedy, including selected works of Plautus and Terence.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Have a greater facility in translating Latin in general, and Latin verse in particular. 2. Study of texts representative of this genre will enhance their understanding and appreciation not simply of other pieces of Roman literature, but also of western comedy as a whole, whose roots are in the comedies of Plautus and Terence. 3. Focus on the background of Roman comedy will also enable students to recognize important connections between literature and its social contexts. Credits: 3.00

LATN 44200 - Roman Lyric Poetry (UCC: HUM)

Credit Hours: 3.00. Readings and discussion of selections from Roman lyric poetry, with special attention to Catullus and Horace.

University Core Curriculum (UCC): (UCC: HUM) Credits: 3.00

LATN 44300 - Roman Satire (UCC: HUM)

Credit Hours: 3.00. Readings and discussion of Roman satire, including selected passages from Horace, Juvenal, Petronius, and Seneca.

University Core Curriculum (UCC): (UCC: HUM) Credits: 3.00

LATN 44400 - Roman Philosophers (UCC: HUM)

Credit Hours: 3.00. Readings and discussion of Roman philosophical texts.

University Core Curriculum (UCC): (UCC: HUM) Credits: 3.00

LATN 44500 - Roman Encyclopedists (UCC: HUM)

Credit Hours: 3.00. Readings and discussion of texts representative of Roman encyclopedism, including selected passages from Pliny the Elder, Aulus Gellius, and Nonius Marcellus.

University Core Curriculum (UCC): (UCC: HUM) Credits: 3.00

LATN 44600 - Roman Historians (UCC: HUM)

Credit Hours: 3.00. Readings and discussion of Roman historical texts.

University Core Curriculum (UCC): (UCC: HUM) Credits: 3.00

LATN 49000 - Directed Reading In Latin

Credit Hours: 1.00 to 3.00. Directs the reading of students with special interests. Guides students in profitable reading in subjects of their own choice. Permission of instructor required.

Credits: 1.00 to 3.00

PHIL 30100 - History Of Ancient Philosophy (UCC: HUM)

Credit Hours: 3.00. A survey of Greek philosophy from its beginning in the Milesian school through the Presocratics to Plato and Aristotle.

University Core Curriculum (UCC): (UCC: HUM) Credits: 3.00

CLCS 59000 - Directed Reading In Classics

Credit Hours: 1.00 to 4.00. Directed readings in Classics. Permission of instructor required.

Credits: 1.00 to 4.00

CLCS 23900 - The Comic Vision (UCC: HUM)

Credit Hours: 3.00. This course investigates Greek and Roman comedy from their beginnings until today. The course will feature readings in English from representative authors such as Aristophanes, Menander, Plautus, and Terence, as well as later receptions of ancient comedy in drama and other media. This course may include performance, theories of comedy and tragedy, theories of humor, or recent and current expressions of the comic in film and other media.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Have a detailed historical understanding of the development and evolution of ancient Greek and Roman comedy. 2. Be able to appreciate and intelligently discuss major themes in Greek and Roman comedy as they relate to both ancient and modern views of what is "comic" or humorous. 3. Be able to identify specific examples of the influence of ancient Greek and Roman comedy on the drama of the later western world. Credits: 3.00

CLCS 23400 - Medical And Scientific Terminology From Greek And Latin Roots

Credit Hours: 3.00. Ninety to ninety-five percent of scientific technical vocabulary and medical terminology come from Latin and Greek roots and affixes. This course will enable students in scientific and medical disciplines to develop a foundational core of Greek and Latin roots and affixes from which they will be able to decipher and easily commit to memory the core terminology in the various sciences and medicine.

Learning Outcomes: 1. Know the foundational core of Greek and Latin roots and affixes from which medical and scientific terminology has been derived. 2. Decipher complex and specialized scientific and medical terms based on the knowledge of their Greek and Latin roots. 3. Decipher unfamiliar terminology in their fields by learning how the roots combine dynamically to form words as scientific and medical innovation requires an ever-increasing need for new terms. 4. Enable students to absorb information in their fields more easily by demystifying the complexities of their specialized vocabularies used in their disciplines. Credits: 3.00

LATN 31500 - Latin Paleography I

Credit Hours: 3.00. This course gives students the opportunity to work with original medieval Latin manuscripts, involving transcription and translation, as well as study of the creation, care, and preservation of rare manuscripts.

Learning Outcomes: 1. Work with unedited and as yet untranslated Latin texts. 2. Transcribe Latin documents and produce original translations. 3. Address and solve complex syntactical challenges. 4. Identify fields tangential to Latin and Classics discipline, such

as mediaeval history, art history, religious and biblical studies, music, etc. 5. Demonstrate an understanding of digital humanities. Credits: 3.00

LATN 10500 - Accelerated Basic Latin

Credit Hours: 4.00. Foundational Latin grammar course designed to prepare students to read classical and post-classical Latin in a single intensive semester. Focus on grammar, syntax, vocabulary, and elementary readings. The accelerated Latin course assumes *no* previous knowledge of Latin and makes it possible for the diligent student to be able to read *any* Latin prose or poetry (with a dictionary) after a single semester. (Upon completion students will be prepared to enroll in Latin 201.)

Learning Outcomes: 1. Recite Latin texts aloud (with accurate pronunciation, meaningful phrase grouping, and appropriate voice inflection) by imitating models they have heard in class. 2. Analyze Latin texts by identifying and describing the basic elements of Latin grammar, sentence structure, and style. 3. Translate intermediate level un-adapted Latin texts into English. 4. Compose complex sentences while writing a short story in Latin. Credits: 4.00

GREK 10500 - Accelerated Introductory Ancient Greek

Credit Hours: 4.00. This course is an accelerated beginning-level course designed to develop language proficiency in Ancient Greek. The course will help students progress toward competence in reading and writing, as well as toward knowledge of Ancient Greek culture. The course focuses on developing deep understanding of Greek syntax and morphology and building strategies for fluent and accurate reading of ancient texts. Primary language of instruction is English.

Learning Outcomes: 1. Differentiate the syntactic structures used in Ancient Greek sentences and longer texts based on the study of model sentences. 2. Compose sentences in Ancient Greek by focusing on a set of grammatical rules and standards in the language. 3. Recite Ancient Greek aloud with accuracy and fluency and demonstrate their ability in in-class text readings and recordings. 4. Infer the meaning of unknown vocabulary in context by reading stories. 5. Identify and analyze grammatical forms in the Greek contexts in which they are used. 6. Generate smooth-flowing and elegant English translations of the Greek, attending to inherent differences in style and structure. Credits: 4.00

CLCS 18100 - Classical World Civilizations (UCC: BSS)

Credit Hours: 3.00. Course introduces students to "Classical" civilizations on three continents (Europe, Africa, and Asia) demonstrably interconnected by an ancient world system. Course focuses on essential themes of past civilization: religion, philosophy, surviving texts, gender relations, urbanism, technology, social and political formations.

University Core Curriculum (UCC): (UCC: BSS) Credits: 3.00

15 Credits

Fall 2nd Year

CLCS 23010 - Survey Of Greek Literature In Translation (UCC: HUM)

Credit Hours: 3.00. Introduction to Ancient Greek literature from homer to Plato. All readings in English.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Have broader and more detailed grasp of the history of ancient Greek literature, including the development of specific genres (epic, lyric, choral, tragedy, comedy, historical and philosophical prose); 2. Be able to appreciate the place and role of literature within the shifting historical, political and social contexts of the ancient Greek world; and 3. Be equipped to trace the influences of ancient Greek literature on the literatures of the later western world. Credits: 3.00

CLCS 23100 - Survey Of Latin Literature (UCC: HUM)

Credit Hours: 3.00. Highlights of literature written in Ancient Rome at times of political, social, and intellectual turbulence. Reading (all in English) includes Vergil's Aeneid, as well as selections from other influential Latin texts.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Have broader and more detailed grasp of the history of ancient Latin literature, including the development of specific genres (epic, lyric, choral, tragedy, comedy, historical and philosophical prose); 2. Be able to appreciate the place and role of literature within the shifting historical, political and social contexts of the ancient Roman world; and 3. Be equipped to trace the influences of Latin literature on the literatures of the later western world. Credits: 3.00

CLCS 23500 - Introduction To Classical Mythology (UCC: HUM)

Credit Hours: 3.00. Study of the myths of western antiquity, as represented in ancient Greek and Latin texts and images.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Have a detailed grasp of the principal characters, narratives, and themes of Greek mythology; 2. Be able to appreciate the many functions of myths within ancient Greek society, namely to explain natural events, support religious practices, and underwrite social and political power; and 3. Be able to identify modern myths and appreciate the role they continue to play within all societies. Credits: 3.00

CLCS 23700 - Gender And Sexuality In Greek And Roman Antiquity (UCC: HUM)

Credit Hours: 3.00. How identities based on gender, sexual behavior and sexual desire, and socio-economic status are established in ancient Greece and Rome. Exploration of why these ancient views of gender and sexuality remain of continuing importance in the 21st century. All readings in English.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Learn core information about ancient Greek and/or Roman cultures. 2. Learn to analyze gender identities and conventions surrounding sexuality in various communities with different socio-political structures. 3. Develop methods for historically sensitive investigation of materials (literary and/or visual) from ancient cultures. 4. Systematically improve analytical skills as writers, readers, and speakers. Departmental/Program Major Courses (71 credits)

Pre-Requisite Languages Courses

LATN 10100 - Latin Level I (UCC: HUM)

Credit Hours: 3.00. Introduction to classical Latin language. Focus on grammar, syntax, vocabulary, and elementary readings.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Learn the basics of reading and translating Latin, including the first half of the core grammar syntax. 2. Improve understanding of English by enriching their vocabulary through etymological connections and through sensitivity to grammatical structures and stylistic choices. Credits: 3.00

LATN 10200 - Latin Level II (UCC: HUM)

Credit Hours: 3.00. Second semester introduction to Latin. Focus on grammar, syntax, vocabulary, and elementary readings in classical Latin and the language of the Vulgate.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Continue to learn the basic grammar, vocabulary, and syntax needed for reading and translating Latin. 2. Improve their understanding of English by enriching their vocabulary through etymological connections and by increasing their awareness of grammatical structures and stylistic choices. Credits: 3.00

LATN 20100 - Latin Level III (UCC: HUM)

Credit Hours: 3.00. Intermediate reading course in Latin, designed to strengthen students' grasp of grammar and syntax, broaden vocabulary, and develop foundational skills in reading and translation.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Reinforce knowledge of the basic grammar, vocabulary, and syntax needed for reading and translating Latin. 2. Read and translate simple Latin literature independently and read and translate more complex literature with suitable help from commentaries and instructor. 3. Improve understanding of English through increased sensitivity to grammatical structures and stylistic choices and by extending their vocabulary through etymological connections. Credits: 3.00

LATN 20200 - Latin Level IV (UCC: HUM)

Credit Hours: 3.00. Upper intermediate reading course in Latin prose and poetry, designed to consolidate students' grasp of grammar and syntax, broaden vocabulary, and develop precision and confidence in reading and translation.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Continue to reinforce

knowledge of the basic grammar, vocabulary, and syntax needed for reading and translating Latin. 2. Apply foundational knowledge to selections from complex and stylistically sophisticated Latin literature. 3. Improve understanding of English by enriching their vocabulary and through increased sensitivity to grammar and style. Credits: 3.00

Education Track (18 credits)

B. Culture and Civilization (3 credits)

CLCS 18100 - Classical World Civilizations (UCC: BSS)

Credit Hours: 3.00. Course introduces students to "Classical" civilizations on three continents (Europe, Africa, and Asia) demonstrably interconnected by an ancient world system. Course focuses on essential themes of past civilization: religion, philosophy, surviving texts, gender relations, urbanism, technology, social and political formations.

University Core Curriculum (UCC): (UCC: BSS)

Credits: 3.00

CLCS 38300 - The Roman Empire

Credit Hours: 3.00. Course examines developments from the Augustan Settlement to the end of the Roman Empire (27 BCE - 476 CE), along with aspects of religious, social, sexual and material culture throughout the Mediterranean at that time.

Credits: 3.00

C. Etymology Course (3 credits)

CLCS 23200 - Classical Roots Of English Words (UCC: HUM)

Credit Hours: 3.00. This is an introduction to English etymology with emphasis on building vocabulary. Students will learn English derivatives from both classical Greek and Latin. All texts to be read in English.

University Core Curriculum (UCC): (UCC: HUM)
Credits: 3.00

D. Latin Literature Courses (9 credits)

CLCS 38700 - Roman Religion

Credit Hours: 3.00. Study of the religious beliefs and practices of ancient Rome, based on written, artistic, and archaeological evidence of their forms and functions.

Learning Outcomes: 1. Have a broader and more detailed grasp of belief systems and religious behaviors of the Roman world from the earliest sources to the third century CE. 2. Be better able to assess the representation of religious experience in other religious traditions with greater historical perspective and methodological sophistication. 3. Be able to express themselves on issues of religion more clearly and with more understanding, both orally and in writing. Credits: 3.00

LATN 34300 - Roman Oratory (UCC: HUM)

Credit Hours: 3.00. Development of advanced Latin reading skills, alongside exploration of social, political, and rhetorical issues raised by the published versions of speeches performed in ancient Rome.

University Core Curriculum (UCC): (UCC: HUM)
Learning Outcomes: 1. Improve skills as readers and translators of Latin. 2. Discover the importance of oratory in Roman politics and culture. 3. Develop understanding and enjoyment of Latin prose style. Credits: 3.00

LATN 34400 - Roman Epic (UCC: HUM)

Credit Hours: 3.00. Development of advanced Latin reading skills, alongside exploration of social, political, and rhetorical issues raised by epics such as Vergil's Aeneid, Ovid's Metamorphoses, or other hexameter poetry.

University Core Curriculum (UCC): (UCC: HUM)
Learning Outcomes: 1. Improve skills as readers and translators of Latin poetry. 2. Increase understanding of the importance of hexameter poetry in Roman culture and subsequent literary tradition. Credits: 3.00

LATN 34500 - Roman Elegy (UCC: HUM)

Credit Hours: 3.00. Readings and discussion of selections from Roman Elegy, including selected passages from such authors as Catullus, Tibullus, Propertius, and Ovid.

University Core Curriculum (UCC): (UCC: HUM)
Credits: 3.00

LATN 34600 - Roman Rhetoric (UCC: HUM)

Credit Hours: 3.00. Development of advanced Latin reading skills, alongside exploration of the social, political and literary questions raised by Roman rhetorical theory.

University Core Curriculum (UCC): (UCC: HUM)
Learning Outcomes: 1. Develop more advanced skills as readers and translators of Latin literature. 2. Analyze Roman perspectives on communication and will discover how influential thinkers assessed the role of literature and speech in Roman society. Credits: 3.00

LATN 34700 - Roman Comedy (UCC: HUM)

Credit Hours: 3.00. Readings and discussion of Roman comedy, including selected works of Plautus and Terence.

University Core Curriculum (UCC): (UCC: HUM)
Learning Outcomes: 1. Have a greater facility in translating Latin in general, and Latin verse in particular. 2. Study of texts representative of this genre will enhance their understanding and

appreciation not simply of other pieces of Roman literature, but also of western comedy as a whole, whose roots are in the comedies of Plautus and Terence. 3. Focus on the background of Roman comedy will also enable students to recognize important connections between literature and its social contexts. Credits: 3.00

LATN 44200 - Roman Lyric Poetry (UCC: HUM)

Credit Hours: 3.00. Readings and discussion of selections from Roman lyric poetry, with special attention to Catullus and Horace.

University Core Curriculum (UCC): (UCC: HUM) Credits: 3.00

LATN 44300 - Roman Satire (UCC: HUM)

Credit Hours: 3.00. Readings and discussion of Roman satire, including selected passages from Horace, Juvenal, Petronius, and Seneca.

University Core Curriculum (UCC): (UCC: HUM) Credits: 3.00

LATN 44400 - Roman Philosophers (UCC: HUM)

Credit Hours: 3.00. Readings and discussion of Roman philosophical texts.

University Core Curriculum (UCC): (UCC: HUM) Credits: 3.00

LATN 44500 - Roman Encyclopedists (UCC: HUM)

Credit Hours: 3.00. Readings and discussion of texts representative of Roman encyclopedism, including selected passages from Pliny the Elder, Aulus Gellius, and Nonius Marcellus.

University Core Curriculum (UCC): (UCC: HUM) Credits: 3.00

LATN 44600 - Roman Historians (UCC: HUM)

Credit Hours: 3.00. Readings and discussion of Roman historical texts.

University Core Curriculum (UCC): (UCC: HUM) Credits: 3.00

LATN 31500 - Latin Paleography I

Credit Hours: 3.00. This course gives students the opportunity to work with original medieval Latin manuscripts, involving transcription and translation, as well as study of the creation, care, and preservation of rare manuscripts.

Learning Outcomes: 1. Work with unedited and as yet untranslated Latin texts. 2. Transcribe Latin documents and produce original translations. 3. Address and solve complex syntactical challenges. 4. Identify fields tangential to Latin and Classics discipline, such as mediaeval history, art history, religious and biblical studies, music, etc. 5. Demonstrate an understanding of digital humanities. Credits: 3.00

E. Classics Selective (3 credits)

CLCS 18100 - Classical World Civilizations (UCC: BSS)

Credit Hours: 3.00. Course introduces students to "Classical" civilizations on three continents (Europe, Africa, and Asia) demonstrably interconnected by an ancient world system. Course focuses on essential themes of past civilization: religion, philosophy, surviving texts, gender relations, urbanism, technology, social and political formations.

University Core Curriculum (UCC): (UCC: BSS) Credits: 3.00

CLCS 23500 - Introduction To Classical Mythology (UCC: HUM)

Credit Hours: 3.00. Study of the myths of western antiquity, as represented in ancient Greek and Latin texts and images.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Have a detailed grasp of the principal characters, narratives, and themes of Greek mythology; 2. Be able to appreciate the many functions of myths within ancient Greek society, namely to explain natural events, support religious practices, and underwrite social and political power; and 3. Be able to identify modern myths and appreciate the role they continue to play within all societies. Credits: 3.00

CLCS 23700 - Gender And Sexuality In Greek And Roman Antiquity (UCC: HUM)

Credit Hours: 3.00. How identities based on gender, sexual behavior and sexual desire, and socio-economic status are established in ancient Greece and Rome. Exploration of why these ancient views of gender and sexuality remain of continuing importance in the 21st century. All readings in English.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Learn core information about ancient Greek and/or Roman cultures. 2. Learn to analyze gender identities and conventions surrounding sexuality in various communities with different socio-political structures. 3. Develop methods for historically sensitive investigation of materials (literary and/or visual) from ancient cultures. 4. Systematically improve analytical skills as writers, readers, and speakers. Credits: 3.00

CLCS 23800 - The Tragic Vision (UCC: HUM)

Credit Hours: 3.00. Greek and Roman tragedy from their beginnings until today. Readings in English from representative authors such as Aeschylus, Sophocles, Euripides, and Seneca; later receptions of ancient tragedy in drama and other media. Course may include performance, theories of comedy and tragedy, or recent and current expressions of the tragic in film and other media.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Understand a detailed historical development of ancient Greek tragic through close reading of representative samples of the genre. 2. Appreciate and intelligently discuss major themes in Greek tragedy as they relate to both ancient and modern views of what is "tragic". 3. Identify specific examples of the influence of ancient Greek tragedy on the drama of the later western world. Credits: 3.00

CLCS 38100 - Julius Caesar: Statesman, Soldier, Citizen

Credit Hours: 3.00. Course Examines the career of Julius Caesar by focusing on events from Caesar's birth (100 BCE) through his assassination in 44 BCE. Course places Caesar's complex personality within the context of political, military, economic, social, and cultural upheaval during the Late Roman Republic.

Credits: 3.00

CLCS 38300 - The Roman Empire

Credit Hours: 3.00. Course examines developments from the Augustan Settlement to the end of the Roman Empire (27 BCE - 476 CE), along with aspects of religious, social, sexual and material culture throughout the Mediterranean at that time.

Credits: 3.00

CLCS 38700 - Roman Religion

Credit Hours: 3.00. Study of the religious beliefs and practices of ancient Rome, based on written, artistic, and archaeological evidence of their forms and functions.

Learning Outcomes: 1. Have a broader and more detailed grasp of belief systems and religious behaviors of the Roman world from the earliest sources to the third century CE. 2. Be better able to assess the representation of religious experience in other religious traditions with greater historical perspective and methodological sophistication. 3. Be able to express themselves on issues of religion more clearly and with more understanding, both orally and in writing. Credits: 3.00

CLCS 23900 - The Comic Vision (UCC: HUM)

Sample 4-Year Plan

Fall 1st Year

EDCI 20500 - Exploring Teaching As A Career (UCC: WC)

Credit Hours: 0.00 to 3.00. Students will become familiar with the work of teachers and begin to develop their educational philosophies through examining what it means to teach and to learn and the nature and purpose of schools. Students will critically evaluate teaching as their chosen profession. This course includes a required weekly field-based experience in an elementary, middle, or high school classroom.

University Core Curriculum (UCC): (UCC: WC) Learning Outcomes: 1. Learn what it means to teach as they reflect on why, whom, and how they will teach. 2. Learn to shift from a student perspective to a teacher perspective through the examination of teaching, learning, and schools. 3. Learn that teaching is affected by socio-political, community and school contexts. Credits: 0.00 to 3.00

LATN 10100 - Latin Level I (UCC: HUM)

Credit Hours: 3.00. Introduction to classical Latin language. Focus on grammar, syntax, vocabulary, and elementary readings.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Learn the basics of reading and translating Latin, including the first half of the core grammar syntax. 2. Improve understanding of English by enriching their vocabulary through etymological connections and through sensitivity to grammatical structures and stylistic choices. Credits: 3.00

EDST 20010 - Educational Policies And Laws

Credit Hours: 1.00 to 3.00. The interactive course will provide an understanding of the history of schooling in the United States. A special emphasis will be placed on reviewing historical and contemporary educational policies and educational laws as each subject is critical to understanding social, historical, and cultural issues in the United States. Focus will also be on contemporary applications of historical ideas in the classroom and in school systems.

Learning Outcomes: 1. Know how education laws and policies influenced the American education system and vice versa. 2. Understand how race, ethnicity, gender, and social class have affected schooling experiences. 3. Evaluate how schools reflect societal, political, and cultural values historically. 4. Link these larger issues to reflective teaching practices. Credits: 1.00 to 3.00

LC 23700 - Our Common Bond: Languages And Cultures In A Global Context

Credit Hours: 3.00. (CMPL 23700) Students learn what lies behind the concept of Liberal Arts: the capabilities, insights and skills of individuals who think critically and freely. It exposes

students from across the university to the ideas, skill-set and inspiration that emanates from the liberal arts. They will be introduced to the discipline of Comparative Literature by examining the specific roles that languages and cultures play in the globalized world. The course also demonstrates how a Language and Cultures degree will put students at a greater advantage in career opportunities.

Learning Outcomes: 1. Trace how various cultures have shaped our contemporary models of higher education through written and oral assignments. 2. Describe how literary texts from various cultures provided the catalyst for major political and social events throughout history. 3. Identify the impact that literary endeavors have in the development of scientific, medical, corporate, environmental and political ideas. 4. Articulate clearly why a Liberal Arts education that focuses on languages and intercultural competency is both valuable and marketable in today's global context. Credits: 3.00

15 Credits

Spring 1st Year

EDCI 35000 - Community Issues & Applications For Educators

Credit Hours: 1.00 to 3.00. This course is an examination of diverse individual, family, and community characteristics and issues, and potential impacts on teaching and learning processes. Includes service learning with human service agencies and personnel in the school and community. As part of this course, students complete certification to meet the Indiana Department of Education suicide prevention training requirement for teacher licensure.

Learning Outcomes: 1. Become a more effective teacher by developing greater awareness about, caring and respect for, and ability to relate with people (particularly students and their families) whose backgrounds, life experiences, perspectives, and values are different from one's own. 2. Demonstrate responsiveness to students' diverse backgrounds, life experiences, perspectives, and values through WHAT you teach (curriculum topics, content, and processes), HOW you teach (formal and informal interactions with students, inside and outside of classroom), and WHO you are (personally/professional values and commitments). 3. Examine community human service agencies in terms of (a) ways to contribute as a community volunteer, either individually or with students; (b) ways to interact with agencies on behalf of students; and (c) future career opportunities. Credits: 1.00 to 3.00

CLCS 18100 - Classical World Civilizations (UCC: BSS)

Credit Hours: 3.00. Course introduces students to "Classical" civilizations on three continents (Europe, Africa, and Asia) demonstrably interconnected by an ancient world system. Course focuses on essential themes of past civilization: religion, philosophy, surviving texts, gender relations, urbanism, technology, social and political formations.

University Core Curriculum (UCC): (UCC: BSS) Credits: 3.00

CLCS 23500 - Introduction To Classical Mythology (UCC: HUM)

Credit Hours: 3.00. Study of the myths of western antiquity, as represented in ancient Greek and Latin texts and images.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Have a detailed grasp of the principal characters, narratives, and themes of Greek mythology; 2. Be able to appreciate the many functions of myths within ancient Greek society, namely to explain natural events, support religious practices, and underwrite social and political power; and 3. Be able to identify modern myths and appreciate the role they continue to play within all societies. Credits: 3.00

CLCS 23700 - Gender And Sexuality In Greek And Roman Antiquity (UCC: HUM)

Credit Hours: 3.00. How identities based on gender, sexual behavior and sexual desire, and socio-economic status are established in ancient Greece and Rome. Exploration of why these ancient views of gender and sexuality remain of continuing importance in the 21st century. All readings in

English.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Learn core information about ancient Greek and/or Roman cultures. 2. Learn to analyze gender identities and conventions surrounding sexuality in various communities with different socio-political structures. 3. Develop methods for historically sensitive investigation of materials (literary and/or visual) from ancient cultures. 4. Systematically improve analytical skills as writers, readers, and speakers. Credits: 3.00

LATN 10200 - Latin Level II (UCC: HUM)

Credit Hours: 3.00. Second semester introduction to Latin. Focus on grammar, syntax, vocabulary, and elementary readings in classical Latin and the language of the Vulgate.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Continue to learn the basic grammar, vocabulary, and syntax needed for reading and translating Latin. 2. Improve their understanding of English by enriching their vocabulary through etymological connections and by increasing their awareness of grammatical structures and stylistic choices. Credits: 3.00

EDCI 28500 - Multiculturalism And Education (UCC: BSS)

Credit Hours: 2.00 to 3.00. This course integrates an understanding of multiculturalism with principles of democratic education. Historical, sociological, cultural, political, philosophical, and pedagogical foundations of multiculturalism are explored and related to issues of pedagogy in a pluralistic society.

University Core Curriculum (UCC): (UCC: BSS) Learning Outcomes: 1. Develop awareness of issues and concerns related to multicultural education. 2. Develop knowledge of how multiculturalism impacts teachers, schools, classrooms, and society. 3. Develop skills of critical thinking and reflection that will enable educators to contribute to meeting the needs of students in a multicultural and global world. Credits: 2.00 to 3.00

15 Credits

Fall 2nd Year

CLCS 23100 - Survey Of Latin Literature (UCC: HUM)

Credit Hours: 3.00. Highlights of literature written in Ancient Rome at times of political, social, and intellectual turbulence. Reading (all in English) includes Vergil's Aeneid, as well as selections from other influential Latin texts.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Have broader and more detailed grasp of the history of ancient Latin literature, including the development of specific genres (epic, lyric, choral, tragedy, comedy, historical and philosophical prose); 2. Be able to appreciate the place and role of literature within the shifting historical, political and social contexts of the ancient Roman world; and 3. Be equipped to trace the influences of Latin literature on the literatures of the later western world. Credits: 3.00

LATN 20100 - Latin Level III (UCC: HUM)

Credit Hours: 3.00. Intermediate reading course in Latin, designed to strengthen students' grasp of grammar and syntax, broaden vocabulary, and develop foundational skills in reading and translation.

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Reinforce knowledge of the basic grammar, vocabulary, and syntax needed for reading and translating Latin. 2. Read and translate simple Latin literature independently and read and translate more complex literature with suitable help from commentaries and instructor. 3. Improve understanding of English through increased sensitivity to grammatical structures and stylistic choices and by extending their vocabulary through etymological connections. Credits: 3.00

EDPS 36201 - Positive Behavioral Supports

Credit Hours: 0.00 to 3.00. This course provides an overview of the theory, principles, and application of applied behavior analysis within positive behavior interventions and support. The course focuses on pre-service teacher preparation in designing and implementing group and individual behavior supports. Emphasis is on universal supports, targeted interventions, and data-driven decision-making.

Learning Outcomes: 1. Identify the basic principles of behavior and provide real-world examples. 2. Create behavioral expectations and design a corresponding behavior matrix. 3. Design class-wide reinforcement systems. 4. Identify interventions to promote social emotional learning for all learners. 5. Apply data-driven decision making to provide and evaluate a multi-tiered systems of support. 6. Design tier-two targeted supports to teach appropriate behavior. 7. Define behavior. 8. Select appropriate behavior measurement system. 9. Measure and graph behavior to assist in data-driven decision making. Credits: 0.00 to 3.00

EDCI 37001 - Teaching And Learning English As A New Language

Credit Hours: 0.00 to 3.00. This course builds foundational knowledge on the theories and practices related to the English language development of English language learners in the P-12 contexts. Particular attention is given to the current issues as well as on techniques for instructing and assessing students at different stages of English language development in the school context. Students will learn to identify students' strengths and current needs in English, to design classroom experiences across the curriculum, and to assess student performance using current WIDA standards.

Learning Outcomes: 1. Develop understanding of the English language and literacy development process of English language learners. 2. Instruct and assess students who are at different stages of English language development. 3. Identify English Learners' strengths and needs in English. 4. Practice in designing classroom experiences across the curriculum on the basis of these strengths and needs. 5. Learn background in WIDA and practice in designing Model Performance Indicators in connection with teaching experiences in the field for English Learners. 6. Develop understanding of their roles as ELL teachers and professionals in advocating on behalf of their ELLs. Credits: 0.00 to 3.00

EDPS 24000 - Children With Gifts, Creativity, And Talents

Credit Hours: 1.00. This course is an introduction to the intellectual, social, and emotional characteristics of gifted children youth; philosophies of gifted education; and programmatic and classroom approaches for supporting gifted students generally and within different domains (e.g., intellectual, academic, creative, artistic, leadership). Cannot be taken concurrently with EDPS 24800.

Learning Outcomes: 1. Understand who gifted, creative and talented children are and how their talent development needs can be met in the school setting. 2. Recognize the diversity that exists within the gifted, creative, and talented population. 3. Understand the history, philosophical traditions, and paradigms of practice in gifted education. 4. Develop awareness of specific strategies for supporting gifted, creative and talented students within the school context. 5. Develop awareness of key professional resources in the field of gifted education and talent development. 6. Develop a personal identity as a practitioner of gifted education. Credits: 1.00

EDCI 20002 - Special Populations Seminar: English Language Learners And Students With Gifts And Talents

Credit Hours: 1.00. (EDCI 20002) This seminar is focused on special populations of learners for teacher education majors with an emphasis on students who are English learners and students with gifts, talents, and creativity. Students will engage in mentoring activities and ongoing support in their development as a professional. The goal of the seminar is to connect theory to practice by engaging in an immersive field experience that connects to content and courses taken concurrently. The seminar provides an environment conducive to fostering rich relationships with schools and communities, pursuing common inquiry, thinking critically about theory, content and practice and advocating for equitable schooling. This seminar includes a field experience targeting schools and classrooms with ELLs and students with gifts, creativity, and talents. This seminar is intended to be taken concurrently with EDPS 24000 and EDCI

37001.

Learning Outcomes: 1. Identify connections between educational theory to educational practice as related to ELLs and students with GCT. 2. Demonstrate active listening and constructive peer feedback during seminar sessions and in the field. 3. Engage in mentoring activities related to teaching and learning in a community of peers and professionals. 4. Reflect on their own learning, gaining insight into themselves and their interactions with the classroom as teachers of ELLs and students with GCTs. 5. Complete a minimum of 30 hours in a school-based clinical experience including classroom observations, tutoring, assisting teachers, small and large group instruction and practicing the duties of a teacher who works well with ELLs and students with GCTs. 6. Demonstrate the professional attitudes and conduct that facilitate learning and convey a positive image of the education profession. Credits: 1.00

16 Credits

Spring 2nd Year

EDPS 23500 - Learning And Motivation (UCC: BSS)

Credit Hours: 0.00 to 3.00. Introduction to concepts of learning and motivation in educational contexts (i.e., Educational Psychology). Influence of development, culture, and individual differences on learning and motivation. Uses of assessment and technology in promoting learning and motivation. A field-based experiential component is included.

University Core Curriculum (UCC): (UCC: BSS)

Learning Outcomes: 1. Understanding of the learning processes including the role of previous experiences and the constructive nature of learning, cognitive constraints, and the role of the social environment. 2. Understanding of the principles of cognitive, personal, social, and moral development. 3. Understanding of principles of motivation including how to initiate and maintain student engagement. 4. Understand the fundamental assessment concepts including the purpose of assessment, the importance of alignment to instructional goals, and the interpretation and use of data. 5. Understanding of the creation of environments conducive for learning. Credits: 0.00 to 3.00

LATN 20200 - Latin Level IV (UCC: HUM)

Credit Hours: 3.00. Upper intermediate reading course in Latin prose and poetry, designed to consolidate students' grasp of grammar and syntax, broaden vocabulary, and develop precision and confidence in reading and translation.

University Core Curriculum (UCC): (UCC: HUM)

Learning Outcomes: 1. Continue to reinforce knowledge of the basic grammar, vocabulary, and syntax needed for reading and translating Latin. 2. Apply foundational knowledge to selections from complex and stylistically sophisticated Latin literature. 3. Improve understanding of English by enriching their vocabulary and through increased sensitivity to grammar and style. Credits: 3.00

EDPS 26501 - The Inclusive Classroom

Credit Hours: 2.00. This course is designed to provide an overview of the characteristics of children (birth through age 21) with disabilities, causes of disability, assessment techniques, and instructional strategies. Emphasis is placed upon the development of an inclusive lesson plan based on student needs in the field experience classroom. Characteristics addressed include learning, behavioral, social-emotional, and communicative abilities and needs for students with mild and intense support needs. Issues related to cultural differences and family impact will also be addressed. A field-based component is included.

Learning Outcomes: 1. Know theoretical and historical perspectives of special education. 2. Demonstrate knowledge of both legal (Federal and State) and ethical guidelines as it relates to education and services for individuals with disabilities including the Individuals with Disabilities Education Act (IDEA), Section 504 and Americans with Disabilities Act (ADA). 3.

Identify the academic, behavioral, social-emotional, cognitive, communication, and motor/physical characteristics of students with disabilities including etiologies and outcomes. 4. Know the importance of the role of families as it relates to special education and the potential impact of language, culture, and family background have on the delivery of special education services. 5. Know the educators' role (special education and general education) in assessing, collaborating and teaching individual academic, social, communication, daily living, and employment goals for individuals from birth to 21. 6. Learn strategies for creating an inclusive learning environment that includes individualized instructional strategies/supports for one or more individuals with disabilities. 7. Learn how to select and use appropriate formal and informal assessments that minimize bias. 8. Justify how planned strategies/supports address the learning needs of one or more individuals with disabilities. 9. Learn technologies to support instruction for students with disabilities. Credits: 2.00

EDPS 24800 - Differentiating Curriculum And Instruction

Credit Hours: 1.00. This course provides a solid foundation and set of principles for differentiating curriculum and instruction in any classroom at any grade level. Students will explore a variety of evidence-based strategies, tools, and curriculum models that effectively meet the diverse needs of all learners. Through readings, online classroom meetings and discussions, case studies, differentiated instruction examples, direct application and reflection, students will deepen their understanding and need to differentiate. With an overarching goal of increasing achievement and developing student talents, this course includes the following major components: creating positive learning environments that support a) high-quality curriculum; b) diagnostic, formative and summative assessments to inform instructional decision-making; and c) flexible grouping addressing student differences in readiness, interest, and learning profile (including learning preference, intelligence preference, gender, culture, language preference, locale, and opportunities to learn) and appreciating how these differences influence the ways in which students learn. Understanding that process of differentiation involves modifying content, process, product, learning environment, and/or affect incorporating higher-order thinking skills, creative problem solving, project-based learning, authentic/respectful tasks, collaborative learning, and other evidence-based strategies to promote student achievement and talent development understanding how differentiation of curriculum and instruction fits within specific educational interventions and models, such as scaffolding, flexible grouping, Response to Intervention (Rtl), and Multi-Tiered System of Support(MTSS). Effective teachers do more than teach content; they teach unique individuals who enter classrooms with various levels of expertise, skills, abilities, social-emotional needs, and learning expectations. Effective teachers differentiate curriculum by personalizing content based on the particular needs and interests of their students. Effective teachers differentiate instruction by applying various grouping strategies, technology applications and thinking skills. The goal of every effective teacher is that every child learns something new every day. Cannot be taken concurrently with EDPS 24000. Learning Outcomes: 1. Describe and implement the concept of differentiation as a response to the needs, interests and abilities of learners by modifying curriculum, instruction, learning environment, and/or affect. 2. Demonstrate proficiency in assessing students readiness, interests, and learning profiles and in creating differentiated lessons that utilize instructional strategies and technologies to engage special populations of students in learning. 3. Develop, implement, and evaluate various differentiated instructional plans designed to maximize learning and demonstrate proficiency in analyzing and evaluating differentiated lessons taught by other teachers. 4. Evaluate and reflect upon your course experience and plan for your future use of knowledge and skills gained in this course. Credits: 1.00

EDPS 20001 - Special Populations Seminar: Focus On Students With Disabilities And Differentiation Approaches

Credit Hours: 1.00. (EDCI 20001) This seminar is focused on special populations of learners for teacher education majors with an emphasis on exceptional students and approaches to curricular differentiation. Students will engage in mentoring activities and ongoing support in their development as a professional. The goal of the seminar is to connect theory to practice by engaging in an immersive field experience that connects to content and courses taken concurrently. The seminar provides an environment conducive to fostering rich relationships with schools and communities, pursuing common

inquiry, thinking critically about theory, content and practice and advocating for equitable schooling. This seminar includes a field experience targeting schools and classrooms including exceptional students. This seminar is intended to be taken concurrently with EDPS 24800 and EDPS 26501.

Learning Outcomes: 1. Identify key educational theories and describe practices for implementation across various educational field placements. 2. Discuss and use culturally responsive teaching and communication practices. 3. Reflect on their own learning and the learning of others, gaining insight into themselves, into teaching/learning, and into issues of diversity, equity and social justice. 4. Complete a minimum of 30 hours in the required field experience setting. 5. Demonstrate professional attitudes and conduct that facilitate learning and convey a positive image of the education profession. Credits: 1.00

15 Credits

Fall 3rd Year

EDCI 27000 - Introduction To Educational Technology And Computing (UCC: IL)

Credit Hours: 1.00 to 3.00. Addresses fundamentals of educational technology, including the integration of instructional design, media, computers and related technologies within the classroom setting.

University Core Curriculum (UCC): (UCC: IL)

Learning Outcomes: 1. Demonstrate the ability to use various forms of technology to access, generate, and manipulate information; as well as to present and communicate results. 2. Given the background information and resources for a potential lesson, identify the instructional activities, methods, and media that should optimally be selected, implemented and evaluated within the lesson. 3. Apply educational technology to plan and deliver instructional lessons that integrate a variety of software, applications, and learning tools. 4. Identify issues (e.g. equity, privacy, security, plagiarism, isolationism) that have been produced or enhanced because of the integration of technology and describe how these issues can be effectively addressed. Credits: 1.00 to 3.00

EDCI 30900 - Reading In Middle And Secondary Schools: Methods And Problems

Credit Hours: 1.00 to 3.00. For prospective teachers at junior and senior high schools. An overview of reading processes, fundamentals of reading instruction, factors that influence the ability to read text materials, strategies and materials for identifying and reducing reading problems, school resources, and programs for normal and deficient readers. Concurrent enrollment with program-specified methods course.

Learning Outcomes: 1. Explore multiple, diverse, research-based instructional strategies and materials to support the teaching of content-area literacy. 2. Support the development of pedagogical competency through continued work with issues of teaching and learning in secondary literacy. Credits: 1.00 to 3.00

CLCS 23200 - Classical Roots Of English Words (UCC: HUM)

Credit Hours: 3.00. This is an introduction to English etymology with emphasis on building vocabulary. Students will learn English derivatives from both classical Greek and Latin. All texts to be read in English.

University Core Curriculum (UCC): (UCC: HUM) Credits: 3.00

17 Credits

Spring 3rd Year

LC 47500 - Theories Of Teaching World Languages

Credit Hours: 3.00. This course is designed to assist you in the process of becoming a skilled professional who can teach world language(s). You will gain experiential hours in the secondary classroom. You will also develop an understanding of the connection between effective language teaching and successful language learning, be able to think critically about your own teaching and teaching materials and gain an understanding of

various theories, methods, approaches, and techniques in world language teaching. Areas of emphasis include the nature of language learning theories, early approaches to language pedagogy, communicative language teaching methodology, the relationship between theory and practice, aspects of the interaction between speakers in the classroom, skills-based theories, sociocultural perspectives, individual differences between learners, and usage-based approaches to second language acquisition.

Learning Outcomes: 1. Identify various theories of foreign language learning. 2. Describe various theories of foreign language teaching. 3. Analyze how student learning is influenced by different types of instructional practices. 4. Recognize how theories of individual and collaborative learning strategies affect student engagement. 5. Compare and contrast how diverse learners process information and develop language learning skills. Credits: 3.00

15 Credits

Fall 4th Year

EDCI 42700 - Teaching Of World Languages

Credit Hours: 3.00. This is one of the two methods courses required for World Language Teaching major. While LC 47500 is a theoretical course, this course is a practical course on world language teaching in secondary school.

Learning Outcomes: 1. Design lesson plans that draw on knowledge of content areas. 2. Write language learning assessment documents (diagnostic formative, and summative). 3. Design language assessment rubrics. 4. Evaluate their own and others' teaching effectiveness. 5. Plan lessons that incorporate strategies to monitor student learning. 6. Build collaborative relationships with other language teaching professionals. 7. Identify resources for the developing foreign language teaching, including textbooks, scholarly journals, pedagogy associations and conferences. Credits: 3.00

EDPS 32700 - Classroom Assessment

Credit Hours: 1.00 to 3.00. Evaluating the impact of instruction on student performance is one of the most important skills for an educator. Effective teachers ask themselves, "How do I know if students are truly learning? Are they meeting educational objectives in the content area?" Using well-chosen assessment approaches, teachers can address these questions. In this course, students will acquire assessment literacy: the ability to gather accurate information about student achievement, and use that information to make instructional decisions that will improve learning. Course activities will focus on assessment tasks relevant to P- 12 classroom settings.

Learning Outcomes: 1. Create a long -term assessment plan. 2. Develop constructed-response tasks with scoring rubrics that are clearly written, aligned with content-area performance goals, and free of bias. 3. Make reasonable interpretations of classroom and large-scale assessment results for individual learners and use these interpretations to inform instructional plans. 4. Provide informative feedback to learners about their assessment results. Credits: 1.00 to 3.00

EDPS 43010 - Secondary Creating And Managing Learning Environments

Credit Hours: 1.00 to 3.00. This course is designed to develop advanced pre-service teachers' skills in recognizing classroom processes and understanding how teachers' beliefs and practices affect secondary students' engagement, learning, and motivation. It focuses on Effective Teaching - what it is, what it looks like, and different ways to enact it in the classroom.

Learning Outcomes: 1. Develop skills for building classroom communities. 2. Analyze different approaches to classroom discipline and the effects of those approaches on the cognitive, social, and emotional development of diverse students. 3. Develop a personal philosophy of classroom discipline. 4. Understand how student diversity, developmental levels, technology, instructional design, room arrangement, and assessment techniques influence the classroom community and climate. 5. Develop strategies for effective management of professional time and tasks. 6.

Learn how to collaborate with colleagues and parents to enhance student learning and development. 7. Develop a comprehensive plan for creating and managing the learning environment in a real or simulated teaching situation. Credits: 1.00 to 3.00

15 Credits

Spring 4th Year

EDCI 49800 - Supervised Teaching (UCC: OC)

Credit Hours: 6.00 to 16.00. Teaching full-time in a school classroom under the supervision of the teacher in charge of the class and a University supervisor. Completion of education methods courses and other Gate requirements for the major area and admittance to teacher education required.

University Core Curriculum (UCC): (UCC: OC)
Learning Outcomes: 1. Understand and address each student's development and learning needs. 2. Understand and apply content and curricular knowledge for teaching. 3. Assess, plan, and design contexts for learning. 4. Support each student's learning using effective instruction. 5. Develop as a professional. Credits: 6.00 to 16.00

12 Credits

Communication: Business Communication Concentration, BA

About the Program

Degree Requirements

Communication: Business Communication Concentration (15 credits)

Required Course (3 credits)

COM 32400 - Introduction To Organizational Communication

Credit Hours: 3.00. An introduction to fundamental concepts and basic research related to communication behavior in organizational settings. Units cover message processing, leadership communication, communication climates, communication training, and communication audits. Students participate in an organizational simulation in some sections.

Learning Outcomes: 1. Use the vocabulary of concepts and theories related to organizational communication. 2. List historical, current, and future communication issues facing organizations. 3. Apply theoretical perspectives and concepts to organizational communication situations and settings. 4. Reflect on their own experience with organizations. Credits: 3.00

Concentration Selectives (12 credits)

COM 22400 - Communicating In The Global Workplace (UCC: BSS)

Credit Hours: 3.00. This introductory course explores communication issues that arise in the global workplace. The course develops an appreciation of the relationship among culture, communication, and ways of organizing and doing business.

University Core Curriculum (UCC): (UCC: BSS)
Learning Outcomes: 1. Critically analyze communication issues arising in culturally diverse organizations in the global environment by utilizing conceptual and theoretical frameworks. 2. Develop intercultural competencies for better managing communication issues in the global workplace by developing practical strategies for contemporary organizations operating in multiple cultures. 3. Explain macro social trends

that are impacting global organizations by illustrating current examples. Credits: 3.00

COM 31200 - Rhetoric In The Western World

Credit Hours: 3.00. An explanation of major theoretical and philosophical concepts concerning rhetoric; the relationships between rhetoric and political, social, and personal decisions are explored. Ancient and modern authors will be read.

Credits: 3.00

COM 32000 - Small Group Communication

Credit Hours: 3.00. A study of group thinking and problem-solving methods; participation in, and evaluation of, committee, and informal discussion groups. Focus on the roles, networks, and messages employed by small group communicators.

Credits: 3.00

COM 32500 - Interviewing: Principles And Practice

Credit Hours: 3.00. Theory and practice of methods in selected interview settings: informational, employment, and persuasive. Emphasis on communication between two persons, questioning techniques, and the logical and psychological bases of interpersonal persuasion.

Credits: 3.00

COM 32800 - Diversity At Work: A Rhetorical Approach

Credit Hours: 3.00. Introduces students to theories and experiences related to issues dealing with both diversity in the workplace and diversity at work to change or influence the world.

Credits: 3.00

COM 37400 - Social Interaction Skills: Assessment And Development

Credit Hours: 3.00. An examination of several major communication skills and procedures for their development. Focus is on skill measurement, methods of enhancement, assessment of training programs, and personal skill development. Skills examined include those for conversing, managing conflict, providing support, and influencing.

Credits: 3.00

COM 41100 - Communication And Social Networks

Credit Hours: 3.00. This course explores the growing area of networks. The class focuses on understanding how social structure influences our everyday life by examining the ways individuals, groups, and entities are tied together. Permission of instructor required.

Learning Outcomes: 1. Understand the foundation of social network theory and analysis. 2. Read work in the area of networks. 3. Learn how networks are related to the social phenomena of your own personal interest. 4. Gather basic understanding of gathering network data. Credits: 3.00

COM 41900 - Judgment And Decision Making

Credit Hours: 3.00. This course is designed to foster an understanding, critique and analysis on issues related to judgment and decision processes. Permission of instructor required.

Learning Outcomes: 1. Encourage the application of theories of judgment and decision making to applied decision contexts. 2. Explore the interplay between communication and decision-making theories. 3. Acquire some practical, general skills for decision-making that are useful in everyday life and work contexts. Credits: 3.00

COM 43500 - Communication And Emerging Technologies

Credit Hours: 3.00. Both historical and contemporary perspectives of the reciprocal influence of new and changing technologies and the processes and practices of communication. The impact of print, telegraph, telephone, radio, and television will be surveyed, along with cable systems, direct broadcast satellites, and videotext.

Credits: 3.00

COM 49600 - Special Topics In Corporate Communication

Credit Hours: 3.00. This course offers students the opportunity to explore in-depth, thorough readings, lectures and written assignments on current issue in corporate communication. Topics may include diversity in the workplace, organizational assessments, or spirituality in organizations. Permission of instructor required.

Credits: 3.00

MGMT 21200 - Business Accounting

Credit Hours: 3.00. The two primary objectives are to teach the skills to produce financial information-to send the relevant signals to decision makers; and to teach the skills to interpret the financial report-to receive the signals. To meet these objectives the students will gain an understanding of the

reasoning behind the processes used to record financial information and the manner in which it is reported to external decision makers; gain an understanding of the four basic statements; and an understanding of the importance of financial statement information in interpreting the performance of organizations.

Learning Outcomes: 1. Teach basics of accounting to students as future business owners and employees. 2. Establish communications with accountants and financial advisors when entering the workforce. Credits: 3.00

MGMT 20000 - Introductory Accounting

Credit Hours: 3.00. The objectives of the course are to help students: (1) understand what is in financial statements and what the statements say about a business, (2) identify the business activities that caused the amounts that appear in the statements, and (3) understand how, when, and at what amount the effects of manager and employee actions will appear in the statements. CTL:IPO 1801 Accounting I

Learning Outcomes: 1. Gain an understanding of accounting terminology, principles and concepts. 2. Learn how business events and transactions are reported in financial statements. 3. Prepare basic financial statements for a business. 4. Analyze financial statements to assess the performance and risk of a business. 5. Learn how financial information is utilized in the decision-making process. Credits: 3.00

COM 44400 - Introduction To Communication And Social Entrepreneurship

Credit Hours: 3.00. This class introduces students to the roles that communication and innovation play in social entrepreneurship. It explores activities of entrepreneurs, ethics and skill development at the individual and organizational levels, and communication functions in not-for-profit and social venture space.

Learning Outcomes: 1. Identify the major components of communication and social change. 2. Describe the social economy. 3. Articulate how both social entrepreneurship and social innovation benefit society. 4. Describe the difference between nonprofit organizations (NPs), social action efforts, NGOs and social enterprises, as well as traditional entrepreneurship, social entrepreneurship, social intrapreneurship and social innovation. 5. Explain how social enterprises function in different sectors and regions, of various sizes, with vastly different missions. 6. Articulate the challenges social entrepreneurs face as they startup, develop, and communicate with various publics. 7. Identify the best approaches and communication tools that can be deployed to assist in ""getting out the message"" about NP goals and objectives. Credits: 3.00

COM 28500 - Introduction To Publication Design

Credit Hours: 3.00. Introduction to pre-press production of professional-quality publications. Emphasis on computer applications for publication layout, design and production. Topics include composition, readability, typography, graphic resolution, and color management systems.

Learning Outcomes: 1. Demonstrate knowledge of graphic composition and layout principles when designing publications. 2. Use industry-standard computer software accomplish basic and advanced pre- press publication design and production tasks. 3. Solve common design and production problems encountered in the communication workplace, including those related to readability, resolution, color and composition. 4. Use appropriate professional terminology when communicating with editors, designers, printers and other vendors on particular projects. 5. Seek bids that result in reliable cost estimates from printers and other vendors. 6. Consider ethical implications and professional communication responsibilities when making editorial and design decisions. Credits: 3.00

COM 49507 - Executive Communication

Credit Hours: 3.00. This course defines executive communication, offers a rationale for its importance, provides a catalog of deliverables (or tactics) involved in the practice,

teaches students how to create those deliverables, and provides students with the tools to serve as strategic advisors to senior leaders. The ultimate goal of the course is to help students become more well-rounded and successful communication professionals.

Learning Outcomes: 1. Describe the breadth, depth and nuance of executive communication. 2. Create various internal and external executive communication deliverables. 3. Conduct a SWOT (strengths, weaknesses, opportunities, threats) analysis of an executive's communication. 4. Define and execute the role of serving as a strategic communication advisor to an executive. 5. Learn from and connect with established communication professionals. Credits: 3.00

COM 47900 - Introduction To Risk Communication

Credit Hours: 3.00. This course introduces students to theories that show how people express, perceive, exchange, and deliberate information about risk as well as how this understanding can be used to improve risk communication practice. This course examines risk communication theory and practice from multiple perspectives including social, psychological, cultural, and communicative.

Learning Outcomes: 1. Describe how and why major approaches to risk communication have shifted over time. 2. Explain cognitive and affective processes involved in individuals' risk perception in domains of science, health, and environmental issues. 3. Analyze different communication models and theories applicable to risk communication. 4. Discuss alternative interpersonal communicative public participation practices for deliberating risk information. Credits: 3.00

Required Course (3 credits)

COM 32400 - Introduction To Organizational Communication

Credit Hours: 3.00. An introduction to fundamental concepts and basic research related to communication behavior in organizational settings. Units cover message processing, leadership communication, communication climates, communication training, and communication audits. Students participate in an organizational simulation in some sections.

Learning Outcomes: 1. Use the vocabulary of concepts and theories related to organizational communication. 2. List historical, current, and future communication issues facing organizations. 3. Apply theoretical perspectives and concepts to organizational communication situations and settings. 4. Reflect on their own experience with organizations. Credits: 3.00

Electives (4-41 credits)

Additional Information

Sample 4-Year Plan

Fall 1st Year

COM 10000 - Introduction To Communication Studies

Credit Hours: 1.00. This semester-long course will introduce students to many opportunities offered by the Brian Lamb School of Communication. Permission of department required.

Learning Outcomes: 1. Engage with curriculum resources to create a plan of study that satisfies university, college and departmental requirements and complements their academic and professional goals. 2. Describe the field of communication to a person not engaged in the field. 3. Identify and use university, college and school resources applicable to their academic and professional goals. Credits: 1.00

COM 11400 - Fundamentals Of Speech Communication (UCC: OC)

Credit Hours: 3.00. A study of communication theories as applied to speech; practical communicative experiences ranging from interpersonal communication and small group process through problem identification and solution in discussion to informative and persuasive speaking in standard speaker-audience situations. NOTE: Concurrent registration is not permitted for ENGL 10600 and COM 11400. CTL:ICM 1103 Fundamentals Of Public Speaking

University Core Curriculum (UCC): (UCC: OC)
Credits: 3.00

SCLA 30000 - Liberal Arts Influentials

Credit Hours: 1.00. As a lecture/discussion course, Liberal Arts Influentials features speakers from a diverse range of Liberal Arts majors and introduces students to the myriad career opportunities available to Liberal Arts graduates. Speakers represent careers in the arts, media, industry, politics and more. Students are encouraged to initiate dialogue with working professionals. Only students enrolled in the College of Liberal Arts may register for GS 30000: LA Influentials.

Learning Outcomes: 1. Identify how the liberal arts influence and contribute to society, globalization, and world issues and how the liberal arts prepare students for meaningful and satisfying career. 2. Develop a better understanding of how these influences and contributions can be applied to their professional and personal development. 3. Network with key Liberal Arts alumni. Credits: 1.00

COM 21000 - Addressing Public Issues

Credit Hours: 3.00. Survey of argumentation and persuasion theories addressing contemporary public issues. Readings and discussions on cultural norms, audience reasoning, civic discourse, and constructing appeals addressing policies and practices. Preparation of appeals for public campaigns and social movements.

Learning Outcomes: 1. Describe argumentation and persuasion theories as applied to contemporary public issues. 2. Identify cultural norms, values, and beliefs of diverse communities contribute to civic discourse and audience reasoning. 3. Construct written and oral appeals addressing public issues, policies, and practices. Credits: 3.00

COM 25000 - Mass Communication And Society

Credit Hours: 3.00. A survey of the print, broadcast, and film media in their relationship and influence on society. Study topics include: mass communication theories, documentaries, commercialism, news media, media effects and control, feedback, educational broadcasting, and audience analysis. CTL:ICM 1102 Introduction To Mass Communication

Credits: 3.00

COM 25100 - Communication, Information, And Society (UCC: IL/STS)

Credit Hours: 3.00. This course provides an introduction to information and communication technologies, including media and computer-related technologies. Basic information and technical literacy skills are developed, while discussing fundamental concepts of mediated communication in 21st century contexts.

University Core Curriculum (UCC): (UCC: IL/STS) Learning Outcomes: 1. Discuss implications of new technologies for individuals, institutions, and society. 2. Exercise basic information literacy skills through hands-on exercises involving new technologies. 3. Analyze impact of media technologies on communication behavior. 4. Write and make presentations that include new media technologies. Credits: 3.00

COM 31400 - Advanced Presentational Speaking

Credit Hours: 3.00. Development of a marked degree of skill in the composition and delivery of various types of speeches including presentations in corporate board rooms, orientation meetings, banquet halls, public forms. Special emphasis on speeches related to the student's major vocational area.

Credits: 3.00

COM 31500 - Speech Communication Of Technical Information

Credit Hours: 3.00. The organization and presentation of information of a practical technical nature. Emphasis is placed upon the study, preparation, and use of audiovisual materials in such presentations.

Credits: 3.00

COM 32500 - Interviewing: Principles And Practice

Credit Hours: 3.00. Theory and practice of methods in selected interview settings: informational, employment, and persuasive. Emphasis on communication between two persons, questioning techniques, and the logical and psychological bases of interpersonal persuasion.

Credits: 3.00

COM 41100 - Communication And Social Networks

Credit Hours: 3.00. This course explores the growing area of networks. The class focuses on understanding how social structure influences our everyday life by examining the ways individuals, groups, and entities are tied together. Permission of instructor required.

Learning Outcomes: 1. Understand the foundation of social network theory and analysis. 2. Read work in the area of networks. 3. Learn how networks are related to the social phenomena of your own personal interest. 4. Gather basic understanding of gathering network data. Credits: 3.00

COM 41500 - Discussion Of Technical Problems

Credit Hours: 3.00. Principles of speech communication related to interpersonal and group discussions on technical topics and problems; practice in using these modes in situations typically encountered by technologists.

Credits: 3.00

COM 43500 - Communication And Emerging Technologies

Credit Hours: 3.00. Both historical and contemporary perspectives of the reciprocal influence of new and changing technologies and the processes and practices of communication. The impact of print, telegraph, telephone, radio, and television will be surveyed, along with cable systems, direct broadcast satellites, and videotext.

Credits: 3.00

ENGL 43400 - Science And Medical Writing

Credit Hours: 3.00. Science and Medical Writing is a professional writing workshop that teaches students how to write in medical and scientific fields. Students will learn the genres and conventions that are used by medical writers and science writers, as well as editors in these fields.

Learning Outcomes: 1. Analyze rhetorical situations to determine needs of readers and contexts. 2. Identify the appropriate genre for a writing project. 3. Edit and proofread scientific and medical documents. 4. Design documents that pertain specifically to medical and scientific texts. 5. Create and effectively use tables, charts, and graphics common in the sciences and medicine. 6. Develop skills for working with authors and publishers in scientific and medical fields. Credits: 3.00

COM 49702 - Video Games And Society

Credit Hours: 3.00. This course focuses on video games as a form of mass communication. Primarily, this focus entails understanding how video games communicate to mass audiences, using features distinctive to video games, and how that communication might impact game players (i.e., media psychology). There is a secondary focus on how game players communicate with each other. The course will primarily examine these issues from social scientific perspectives. Topics include the influence of society on game creation, the impact of games on players, gaming cultures, and game industries.

Learning Outcomes: 1. Identify and apply key communication concepts and theories that inform video game creation and consumption. 2. Compare video game features and creation processes. 3. Evaluate positive and negative effects of video games. 4. Describe the video game industry and surrounding culture. Credits: 3.00

COM 47900 - Introduction To Risk Communication

Credit Hours: 3.00. This course introduces students to theories that show how people express, perceive, exchange, and deliberate information about risk as well as how this understanding can be used to improve risk communication practice. This course examines risk communication theory and practice from multiple perspectives including social, psychological, cultural, and communicative.

Learning Outcomes: 1. Describe how and why major approaches to risk communication have shifted over time. 2. Explain cognitive and affective processes involved in individuals' risk perception in domains of science, health, and environmental issues. 3. Analyze different communication models and theories applicable to risk communication. 4. Discuss alternative interpersonal communicative public participation practices for deliberating risk information. Credits: 3.00

Electives (4-41 credits)

Topics may include diversity in the workplace, organizational assessments, or spirituality in organizations. Permission of instructor required.

Credits: 3.00

COM 49700 - Special Topics In Mass Communication

Credit Hours: 3.00. Offers students the opportunity to explore in-depth, thorough readings, lectures and written assignments, a current topic or trend in Media, Technology and Society. Possible offerings include Media and Social Change, Online Communities, and Technology and International Communication.

Credits: 3.00

COM 46400 - American Political Communication

Credit Hours: 3.00. This course examines the content, processes, and effects of communication within the American political system. Designed for students to experience the breadth of the field of political communication, the course emphasizes relevant theories and practical skills.

Learning Outcomes: 1. Acquire an awareness and understanding of how and why institutions and agents in American politics communicate as well as use media. 2. Apply theoretical approaches to media effects, journalism, political campaigns, and critical issues of race and gender to practical political communication situations. Credits: 3.00

COM 44400 - Introduction To Communication And Social Entrepreneurship

Credit Hours: 3.00. This class introduces students to the roles that communication and innovation play in social entrepreneurship. It explores activities of entrepreneurs, ethics and skill development at the individual and organizational levels, and communication functions in not-for-profit and social venture space.

Learning Outcomes: 1. Identify the major components of communication and social change. 2. Describe the social economy. 3. Articulate how both social entrepreneurship and social innovation benefit society. 4. Describe the difference between nonprofit organizations (NPs), social action efforts, NGOs and social enterprises, as well as traditional entrepreneurship, social entrepreneurship, social intrapreneurship and social innovation. 5. Explain how social enterprises function in different sectors and regions, of various sizes, with vastly different missions. 6. Articulate the challenges social entrepreneurs face as they startup, develop, and communicate with various publics. 7. Identify the best approaches and communication tools that can be deployed to assist in ""getting out the message"" about NP goals and objectives. Credits: 3.00

COM 37800 - Introduction To Health Communication

Credit Hours: 3.00. This course will serve as an introduction to the many ways that communication shapes health and health practices. Course content includes: 1) current healthcare structure in the United States; 2) communication in the healthcare organization; 3) provider-patient communication; 4) patient-support provider communication; 5) models of health behavior change and campaigns; and 6) crisis communication and health.

Learning Outcomes: 1. Identify and apply theories relevant to health communication. 2. Identify how communication practices shape and affect health. 3. Provide a comparative analysis of issues of diversity in healthcare. 4. Tailor health communication materials to improve health literacy. 5. Design and implement health campaign. Credits: 3.00

COM 47800 - Health Communication Campaigns

Credit Hours: 3.00. This course is an introduction to the processes and theories that are used to design both

informational and persuasive health communication campaigns. The course will also introduce students to proper evaluation procedures to determine a campaign's efficacy. Students will be able to contribute to their portfolios by applying theory and primary research in the construction of a health communication campaign plan for a client.

Learning Outcomes: 1. Identify and perform the various stages of implementing a health communication campaign through course readings, discussions, and the creation of their final projects. 2. Apply formative research techniques and analyze relevant data in the creation of their final projects. 3. Identify the major theories and their essential components used in building health communication campaigns, and apply their components in course assignments. 4. Assess prior and current campaign efforts to understand their effectiveness and also recognize their limitations. Credits: 3.00

COM 49101 - Boiler Communication

Credit Hours: 1.00. This course provides a practical, hands-on approach to public relations by working in student-led teams to produce comprehensive, strategic communication campaigns for actual clients. The course also includes many opportunities for professional development and portfolio building.

Learning Outcomes: 1. Experience a real public relations campaign. 2. Develop professionally to be able to start a public relations career. 3. Use creativity and critical thinking to help clients with public relations needs while engaging in social responsibility. Credits: 1.00

COM 49501 - Sports Media Relations

Credit Hours: 3.00. This course examines the role of public relations and mass media in sports communication. It provides an understanding of the operation of sports media and communication and how sports information departments perform their functions. Emphasis is on written communication from athletics communication perspective.

Learning Outcomes: 1. Develop a clear understanding of the day to day responsibilities of sports public relations professionals. 2. Develop attention-grabbing writing skills that reflect an understanding of news judgment. 3. Learn about press box and game-management operations at a sports event, including news conference set-up and execution, coordination of interview requests, quote-gathering, and information and statistics updates and distribution. 4. Create promotional, multimedia content at a sports event, including written features, press releases, social media, video and infographics. 5. Explore communication strategies used by sports media relations professionals in breaking-news situations. 6. Study the evolution of the relationship between media and sports organizations. 7. Learn about the scope of responsibilities of sports media relations professionals, including the coordination of managed news events and special events, the production of media guides, the execution of publicity campaigns, and crisis communications. 8. Understand the effects of evolving technology and social media on sports media relations. Credits: 3.00

COM 49502 - Travel Writing

Credit Hours: 3.00. Travel writing is writing about places, persons, and things in other places-also writing about how to travel, when to travel, and advice on traveling-all with the reader in mind. It's about relaying your travel experiences to others so that they may emulate them or at the very least not make the same mistakes you did. And it's writing about things in your own back yard that are exotic to everyone else-a local farmer's market, historic site, restaurant, museum. In this class, you will explore the various ways travel writers can excite and assist readers.

Learning Outcomes: 1. Gain experience in writing effectively. 2. Identify typical features of travel writing genres. 3. Use research and observation as building blocks for travel writing. 4. Produce a variety of articles within this genre. 5. Understand the "business" of travel writing. Credits: 3.00

COM 33701 - Producing Digital Advertising

Credit Hours: 3.00. This course is designed as an advanced

level production course. Through lectures, discussions, critiques, screenings, and various exercises, you will gain experience designing video advertisements. You will develop and refine critical viewing/listening abilities to effectively analyze video content for aesthetic elements and overall message. Additionally, you will apply production techniques pertaining to producing, directing, shooting and editing in the creation of projects for real clients. The coursework consists of three major video projects, and a series of assignments organized under the corporate role that would be performing those tasks.

Learning Outcomes: 1. Work with a client in the development of a digital media advertisement. 2. Develop the concept for a digital media advertisement. 3. Pitch the idea for a digital media advertisement. 4. Write the script for a digital media advertisement. 5. Coordinate the production schedule for a digital media advertisement project. 6. Supervise videography for a digital media advertisement. 7. Complete post-production for a digital media advertisement. 8. Critique the final edit of a digital media advertisement. Credits: 3.00

COM 49503 - Public Relations For Social Change

Credit Hours: 3.00. The overarching goal of this course is for students to work cooperatively with a community partner to identify, define and address that organization's PR problems and opportunities from a long-term, in-house perspective, building on the work of previous students and incorporating social change theory from a relationship management perspective of PR. The applied work of this course will have the dual benefit of providing students the opportunity to gain contextualized, real-world experience at PR problem-solving and advancing the mission of a nonprofit organization that is important to the wellbeing of the Greater Lafayette community as a whole.

Learning Outcomes: 1. Construct and devise a strategic and mission-focused PR plan and critically evaluate its effects. 2. Explain and demonstrate how storytelling and community relations PR strategies can be used as tools for social change. 3. Describe how their own PR skillsets can be means for future civic engagement. 4. Develop an increased sense of efficacy when it comes to matters of civic engagement and PR practice. 5. Develop a broader view of how PR as a discipline can be applied within a community. Credits: 3.00

COM 49505 - Sports Communication

Credit Hours: 3.00. This class will help students learn to think critically about sports communication, but it will also help students learn to do sports communication. Through the use of sports books and movies, guest speakers, field trips, and case studies, students will learn not only about sports communication as a field of study and a profession, but also how they can be more thoughtful consumers of sports communication in its various forms.

Learning Outcomes: 1. Describe multiple ways that sports communication constructs and maintains culture. 2. Explain changes in sports communication related to race and gender. 3. List five key events in the last 100 years of sports communication. 4. List and analyze issues related to naming in sports. 5. Create a basic sports crisis communication plan. 6. Frame labor-management sports communication issues from both perspectives. Credits: 3.00

COM 33200 - Television Production

Credit Hours: 3.00. Basic principles of producing, writing, and directing for television. Treats program types and television criticism, and explores creative treatment of visual, artistic, and nonverbal elements of communication in television. Permission of department required.

Learning Outcomes: 1. Utilize the terminology used in studio production settings. 2. Conceptualize a studio production. 3. Script a studio production using correct industry format. 4. Develop critical viewing/listening skills and analytical abilities necessary to evaluate the content of video productions. 5. Demonstrate the proper operation of studio production equipment. 6. Work constructively as a member of a production team. 7. Produce a television studio program. 8. Direct a television studio program from a prewritten script. Credits: 3.00

COM 27100 - Podcasting

Credit Hours: 3.00. This directed study is designed as an introduction to podcasting. Students in the course will learn

about the structure and development of podcasting campaigns, then create their own weekly recording. Recording begins in the third week of classes, giving students 14 opportunities to develop their program.

Learning Outcomes: 1. Develop an idea for a podcast. 2. Write a treatment for a podcast. 3. Pitch the idea for a podcast to an audience. 4. Create a production outline. 5. Produce a budget for the work produced and identify potential funding sources for the project. 6. Execute an advertising campaign for a podcast. 7. Coordinate a schedule for a podcast recording. 8. Evaluate the finished production and the experience of creating that work. Credits: 3.00

COM 36100 - Multiplatform Journalism

Credit Hours: 3.00. This course is an introduction to video journalism, including critical examination of various styles of video journalism from news websites to local TV news to national/international television news programs. Students will produce video stories using video cameras and audio equipment to record interviews and natural sound, learn professional lighting techniques, find stories, interview for video, write scripts, review video journalism ethics, and related content.

Learning Outcomes: 1. Demonstrate a working knowledge of camera/audio recording and editing for video journalism stories. 2. Define and describe basic television/digital terms and concepts. 3. Gather, write and produce news content for television and digital platforms. 4. Demonstrate a working knowledge of journalism ethics and news-media literacy. Credits: 3.00

COM 49504 - Social Media For Social Good

Credit Hours: 3.00. Nonprofit organizations advance their missions through communication. This course is designed to introduce students to the use of social media by nonprofit organizations to create their brand and reach stakeholders. It will focus on best practices and critically assess local nonprofits return on social media investment.

Learning Outcomes: 1. Discuss the importance of social media to nonprofits for communicating, marketing, public relations, and fundraising. 2. Discuss the measurement of social media effectiveness in communicating messages and in fundraising. 3. Conduct a social media audit. 4. Develop a nonprofit social media strategy. Credits: 3.00

Credit Hours: 3.00. Introduction to pre-press production of professional-quality publications. Emphasis on computer applications for publication layout, design and production. Topics include composition, readability, typography, graphic resolution, and color management systems.

Learning Outcomes: 1. Demonstrate knowledge of graphic composition and layout principles when designing publications. 2. Use industry-standard computer software accomplish basic and advanced pre- press publication design and production tasks. 3. Solve common design and production problems encountered in the communication workplace, including those related to readability, resolution, color and composition. 4. Use appropriate professional terminology when communicating with editors, designers, printers and other vendors on particular projects. 5. Seek bids that result in reliable cost estimates from printers and other vendors. 6. Consider ethical implications and professional communication responsibilities when making editorial and design decisions. Credits: 3.00

COM 49701 - Live Sports Broadcasting Summer

Credit Hours: 1.00. In this experiential Live Sports Broadcasting course in partnership with the Lafayette Aviators, students will have the opportunity to work in the studio at Loeb Stadium in Lafayette, operate cameras on the field, produce promotional material to be used before, during, and after games, and interview players for segments on The Purdue Channel. The class spans the home season of the Aviators. Students are expected to register for all 3 1-credit modules in a summer. Permission of instructor required.

Learning Outcomes: 1. Demonstrate live sports broadcasting techniques including: studio operation, camera operation, play-by-play and commentary. 2. Interview athletes and staff for broadcast. 3. Develop promotional videos for

The Purdue Channel and/or the Aviators. Credits: 1.00

COM 49507 - Executive Communication

Credit Hours: 3.00. This course defines executive communication, offers a rationale for its importance, provides a catalog of deliverables (or tactics) involved in the practice, teaches students how to create those deliverables, and provides students with the tools to serve as strategic advisors to senior leaders. The ultimate goal of the course is to help students become more well-rounded and successful communication professionals.

Learning Outcomes: 1. Describe the breadth, depth and nuance of executive communication. 2. Create various internal and external executive communication deliverables. 3. Conduct a SWOT (strengths, weaknesses, opportunities, threats) analysis of an executive's communication. 4. Define and execute the role of serving as a strategic communication advisor to an executive. 5. Learn from and connect with established communication professionals. Credits: 3.00

COM 49702 - Video Games And Society

Credit Hours: 3.00. This course focuses on video games as a form of mass communication. Primarily, this focus entails understanding how video games communicate to mass audiences, using features distinctive to video games, and how that communication might impact game players (i.e., media psychology). There is a secondary focus on how game players communicate with each other. The course will primarily examine these issues from social scientific perspectives. Topics include the influence of society on game creation, the impact of games on players, gaming cultures, and game industries.

Learning Outcomes: 1. Identify and apply key communication concepts and theories that inform video game creation and consumption. 2. Compare video game features and creation processes. 3. Evaluate positive and negative effects of video games. 4. Describe the video game industry and surrounding culture. Credits: 3.00

COM 47900 - Introduction To Risk Communication

Credit Hours: 3.00. This course introduces students to theories that show how people express, perceive, exchange, and deliberate information about risk as well as how this understanding can be used to improve risk communication practice. This course examines risk communication theory and practice from multiple perspectives including social, psychological, cultural, and communicative.

Learning Outcomes: 1. Describe how and why major approaches to risk communication have shifted over time. 2. Explain cognitive and affective processes involved in individuals' risk perception in domains of science, health, and environmental issues. 3. Analyze different communication models and theories applicable to risk communication. 4. Discuss alternative interpersonal communicative public participation practices for deliberating risk information. Credits: 3.00

Electives (4-41 credits)

Credit Hours: 3.00. This course applies rhetorical principles to the writing of health, hospitality, nutrition and other related fields. It will prepare students to write in diverse modalities for technical, professional and lay audiences.

Learning Outcomes: 1. Use theories of rhetoric to develop texts, think critically, solve problems, and engage with the needs of diverse audiences. 2. Apply data-driven approaches to specific rhetorical contexts, problems, and situations. 3. Employ theories and approaches of medical and science writing to adapt to the rapidly changing industries of healthcare and public health. 4. Compose effective healthcare and public health documents with an awareness of the accessibility and usability needs of patients, providers and caregivers. 5. Communicate complex healthcare and public health information while writing both individually and in teams. Credits: 3.00

ENGL 43400 - Science And Medical Writing

Credit Hours: 3.00. Science and Medical Writing is a professional writing workshop that teaches students how to write in medical and scientific fields. Students will learn the genres and conventions that are used by medical writers and science writers, as well as editors in these fields.

Learning Outcomes: 1. Analyze rhetorical situations to determine needs of readers and contexts. 2. Identify the appropriate genre for a writing project. 3. Edit and proofread scientific and medical documents. 4. Design documents that pertain specifically to medical and scientific texts. 5. Create and effectively use tables, charts, and graphics common in the sciences and medicine. 6. Develop skills for working with authors and publishers in scientific and medical fields. Credits: 3.00

COM 47800 - Health Communication Campaigns

Credit Hours: 3.00. This course is an introduction to the processes and theories that are used to design both informational and persuasive health communication campaigns. The course will also introduce students to proper evaluation procedures to determine a campaign's efficacy. Students will be able to contribute to their portfolios by applying theory and primary research in the construction of a health communication campaign plan for a client.

Learning Outcomes: 1. Identify and perform the various stages of implementing a health communication campaign through course readings, discussions, and the creation of their final projects. 2. Apply formative research techniques and analyze relevant data in the creation of their final projects. 3. Identify the major theories and their essential components used in building health communication campaigns, and apply their components in course assignments. 4. Assess prior and current campaign efforts to understand their effectiveness and also recognize their limitations. Credits: 3.00

COM 49507 - Executive Communication

Credit Hours: 3.00. This course defines executive communication, offers a rationale for its importance, provides a catalog of deliverables (or tactics) involved in the practice, teaches students how to create those deliverables, and provides students with the tools to serve as strategic advisors to senior leaders. The ultimate goal of the course is to help students become more well-rounded and successful communication professionals.

Learning Outcomes: 1. Describe the breadth, depth and nuance of executive communication. 2. Create various internal and external

executive communication deliverables. 3. Conduct a SWOT (strengths, weaknesses, opportunities, threats) analysis of an executive's communication. 4. Define and execute the role of serving as a strategic communication advisor to an executive. 5. Learn from and connect with established communication professionals. Credits: 3.00

COM 47900 - Introduction To Risk Communication

Credit Hours: 3.00. This course introduces students to theories that show how people express, perceive, exchange, and deliberate information about risk as well as how this understanding can be used to improve risk communication practice. This course examines risk communication theory and practice from multiple perspectives including social, psychological, cultural, and communicative.

Learning Outcomes: 1. Describe how and why major approaches to risk communication have shifted over time. 2. Explain cognitive and affective processes involved in individuals' risk perception in domains of science, health, and environmental issues. 3. Analyze different communication models and theories applicable to risk communication. 4. Discuss alternative interpersonal communicative public participation practices for deliberating risk information. Credits: 3.00

Electives (4-41 credits)

Sample 4-Year Plan

Fall 1st Year

COM 10000 - Introduction To Communication Studies

Credit Hours: 1.00. This semester-long course will introduce students to many opportunities offered by the Brian Lamb School of Communication. Permission of department required.

Learning Outcomes: 1. Engage with curriculum resources to create a plan of study that satisfies university, college and departmental requirements and complements their academic and professional goals. 2. Describe the field of communication to a person not engaged in the field. 3. Identify and use university, college and school resources applicable to their academic and professional goals. Credits: 1.00

COM 11400 - Fundamentals Of Speech Communication (UCC: OC)

Credit Hours: 3.00. A study of communication theories as applied to speech; practical communicative experiences ranging from interpersonal communication and small group process through problem identification and solution in discussion to informative and persuasive speaking in standard speaker-audience situations. NOTE: Concurrent registration is not permitted for ENGL 10600 and COM 11400. CTL:ICM 1103 Fundamentals Of Public Speaking

University Core Curriculum (UCC): (UCC: OC) Credits: 3.00

SCLA 30000 - Liberal Arts Influentials

Credit Hours: 1.00. As a lecture/discussion course, Liberal Arts Influentials features speakers from a diverse range of Liberal Arts majors and introduces students to the myriad career opportunities available to Liberal Arts graduates. Speakers represent careers in the arts, media, industry, politics and more. Students are encouraged to initiate dialogue with working professionals. Only students enrolled in the College of Liberal Arts may register for GS 30000: LA Influentials.

Learning Outcomes: 1. Identify how the liberal arts influence and contribute to society, globalization, and world issues and how the liberal arts prepare students for meaningful and satisfying career. 2. Develop a better understanding of how these influences and contributions can be applied to their professional and personal development. 3. Network with key Liberal Arts alumni. Credits: 1.00

Spring 2nd Year

15 Credits

Fall 3rd Year

COM 25200 - Writing For Mass Media

Credit Hours: 3.00. Labor intensive course teaches basics of newspaper writing, broadcast writing, news releases, and online journalism.

Credits: 3.00

COM 25700 - Public Relations Techniques

Credit Hours: 3.00. This class introduces students to a range of public relations techniques, with a focus on writing. From press releases to new media, this class offers practice and feedback on how to use common public relations tools.

Learning Outcomes: 1. Match appropriate PR techniques to a given situation. 2. Write a press release correct in form, content, grammar and spelling. 3. Compose a SWOT analysis for an actual organization. 4. Use at least two new media technologies to create PR messages.
Credits: 3.00

COM 30400 - Quantitative Methods For Communication Research

Credit Hours: 3.00. Introduction to the development and application of quantitative research methods pertinent to communication problems. Fundamental concepts of problem identification, reliability and validity of both measurement and research design, and statistical analyses of data.

Credits: 3.00

COM 31100 - Copy Editing

Credit Hours: 3.00. Study of, and practice in, copyreading and headline writing. Laboratory practice includes copy editing on video-display terminals.

Credits: 3.00

COM 40700 - Social Media And News Organizations

Credit Hours: 3.00. An exploration of how traditional news providers use social media to disseminate information to mass audiences and correct practices using such technologies.

Learning Outcomes: 1. Produce professional journalistic stories using alternate formats. 2. Choose appropriate social media to adapt to different audiences for optimal news dissemination. 3. Create social media content by applying basic mobile audio and video editing skills. Credits: 3.00

COM 36100 - Multiplatform Journalism

Credit Hours: 3.00. This course is an introduction to video journalism, including critical examination of various styles of video journalism from news websites to local TV news to national/international television news programs. Students will produce video stories using video cameras and audio equipment to record interviews and natural sound, learn professional lighting techniques, find stories, interview for video, write scripts, review video journalism ethics, and related content.

Learning Outcomes: 1. Demonstrate a working knowledge of camera/audio recording and editing for video journalism stories. 2. Define and describe basic television/digital terms and concepts. 3. Gather, write and produce news content for television and digital platforms. 4. Demonstrate a working knowledge of journalism ethics and news-media literacy. Credits: 3.00

15 Credits

Spring 3rd Year

COM 21200 - Approaches To The Study Of Interpersonal Communication (UCC: BSS)

Credit Hours: 3.00. A study of the basic characteristics of human communication and the theoretical and practical implications of these characteristics for various forms of oral communication. CTL:ICM 1101 Interpersonal Communication

University Core Curriculum (UCC): (UCC: BSS) Credits: 3.00

COM 31400 - Advanced Presentational Speaking

Credit Hours: 3.00. Development of a marked degree of skill in the composition and delivery of various types of speeches including presentations in corporate board rooms, orientation meetings, banquet halls, public forms. Special emphasis on speeches related to the student's major vocational area.

Credits: 3.00

COM 37800 - Introduction To Health Communication

Credit Hours: 3.00. This course will serve as an introduction to the many ways that communication shapes health and health practices. Course content includes: 1) current healthcare structure in the United States; 2) communication in the healthcare organization; 3) provider-patient communication; 4) patient-support provider communication; 5) models of health behavior change and campaigns; and 6) crisis communication and health.

Learning Outcomes: 1. Identify and apply theories relevant to health communication. 2. Identify how communication practices shape and affect health. 3. Provide a comparative analysis of issues of diversity in healthcare. 4. Tailor health communication materials to improve health literacy. 5. Design and implement health campaign. Credits: 3.00

COM 22400 - Communicating In The Global Workplace (UCC: BSS)

Credit Hours: 3.00. This introductory course explores communication issues that arise in the global workplace. The course develops an appreciation of the relationship among culture, communication, and ways of organizing and doing business.

University Core Curriculum (UCC): (UCC: BSS)

Learning Outcomes: 1. Critically analyze communication issues arising in culturally diverse organizations in the global environment by utilizing conceptual and theoretical frameworks. 2. Develop intercultural competencies for better managing communication issues in the global workplace by developing practical strategies for contemporary organizations operating in multiple cultures. 3. Explain macro social trends that are impacting global organizations by illustrating current examples. Credits: 3.00

COM 32000 - Small Group Communication

Credit Hours: 3.00. A study of group thinking and problem-solving methods; participation in, and evaluation of, committee, and informal discussion groups. Focus on the roles, networks, and messages employed by small group communicators.

Credits: 3.00

COM 37200 - Communication In Relationships

Credit Hours: 3.00. An examination of communication in personal relationships (including dating and marital relationships, friendships, and families) and professional relationships (including co-worker and supervisor-supervisee relationships and relationships in specific professions, such as doctor-patient and attorney-client).

Credits: 3.00

COM 37400 - Social Interaction Skills: Assessment And Development

Credit Hours: 3.00. An examination of several major communication skills and procedures for their development. Focus is on skill measurement, methods of enhancement, assessment of training programs, and personal skill development. Skills examined include those for conversing, managing conflict, providing support, and influencing.

Credits: 3.00

COM 37600 - Communication And Gender

Credit Hours: 3.00. Course is based on the assumption that studies of gender and communication are intertwined. Focus is on communication processes that create symbols of gender and how those processes recreate the meanings of gender in the lives of individuals and groups.

Credits: 3.00

COM 41100 - Communication And Social Networks

Credit Hours: 3.00. This course explores the growing area of networks. The class focuses on understanding how social structure influences our everyday life by examining the ways individuals, groups, and entities are tied together. Permission of instructor required.

Learning Outcomes: 1. Understand the foundation of social network theory and analysis. 2. Read work in the area of networks. 3. Learn how networks are related to the social phenomena of your own personal interest. 4. Gather basic understanding of gathering network data. Credits: 3.00

COM 41900 - Judgment And Decision Making

Credit Hours: 3.00. This course is designed to foster an understanding, critique and analysis on issues related to judgment and decision processes. Permission of instructor required.

Learning Outcomes: 1. Encourage the

application of theories of judgment and decision making to applied decision contexts. 2. Explore the interplay between communication and decision-making theories. 3. Acquire some practical, general skills for decision-making that are useful in everyday life and work contexts. Credits: 3.00

COM 49100 - Special Topics In Communication

Credit Hours: 1.00 to 3.00. Intensive study of selected topics, varying from semester to semester, from the literature or practice of communication. Course content will be drawn from areas not dealt with in the regular curriculum and may include such topics as photojournalism, economic reporting, and campaign communication. Permission of instructor required.

Learning Outcomes: 1. Develop understanding of a specialized area of communication and its common applications. Credits: 1.00 to 3.00

Electives (25-49 credits)

COM 40800 - News Magazine Production

Credit Hours: 3.00. Students plan, write and produce a weekly video news magazine to be aired on Boiler TV.

Learning Outcomes: 1. Discover, conceptualize, shoot and edit stories appropriate for a news magazine. 2. Define and describe basic television terms and concepts and apply them in a production environment. 3. Evaluate the content, production elements and overall effectiveness of television news scripts. 4. Operate basic digital electronic newsgathering equipment provided for this course. 5. Write scripts, shoot and edit non-linear basic television news stories on digital equipment using Final Cut Pro. 6. Demonstrate a working knowledge of television production terms and procedures. 7. Submit usable video and sound bites to professional newscasts. 8. Create a professional-quality resume reel necessary for gaining employment as a TV journalist. Credits: 3.00

COM 40900 - Video Journalism

Credit Hours: 3.00. Students plan, write and produce a weekly news magazine to be aired on Boiler TV.

Learning Outcomes: 1. Discover, conceptualize, shoot and edit stories appropriate for a news magazine. 2. Define and describe basic television terms and concepts and apply them in a production environment. 3. Evaluate the content, production elements and overall effectiveness of television news scripts. 4. Operate basic digital electronic newsgathering equipment provided for this course. 5. Write scripts, shoot and edit non-linear basic television news stories on digital equipment using Final Cut Pro. 6. Demonstrate a working knowledge of television production terms and procedures. 7. Submit usable video and sound bites to professional newscasts. 8. Create a professional-quality resume reel necessary for gaining employment as a TV journalist. Credits: 3.00

COM 41100 - Communication And Social Networks

Credit Hours: 3.00. This course explores the growing area of networks. The class focuses on understanding how social structure influences our everyday life by examining the ways individuals, groups, and entities are tied together. Permission of instructor required.

Learning Outcomes: 1. Understand the foundation of social network theory and analysis. 2. Read work in the area of networks. 3. Learn how networks are related to the social phenomena of your own personal interest. 4. Gather basic understanding of gathering network data. Credits: 3.00

COM 43500 - Communication And Emerging Technologies

Credit Hours: 3.00. Both historical and contemporary perspectives of the reciprocal influence of new and changing technologies and the processes and practices of communication. The impact of print, telegraph, telephone, radio, and television will be surveyed, along with cable systems, direct broadcast satellites, and videotext.

Credits: 3.00

COM 44700 - The Television Documentary

Credit Hours: 3.00. Study and application of principles of documentary television formats. Students will research an appropriate topic for documentary treatment and produce that program during the semester. Documentary formats examined include news, biographical, ethnographic, and documentary drama.

Credits: 3.00

COM 49700 - Special Topics In Mass Communication

Credit Hours: 3.00. Offers students the opportunity to explore in-depth, thorough readings, lectures and written assignments, a current topic or trend in Media, Technology and Society. Possible offerings include Media and Social Change, Online Communities, and Technology and International Communication.

Credits: 3.00

COM 46400 - American Political Communication

Credit Hours: 3.00. This course examines the content, processes, and effects of communication within the American political system. Designed for students to experience the breadth of the field of political communication, the course emphasizes relevant theories and practical skills.

Learning Outcomes: 1. Acquire an awareness and understanding of how and why institutions and agents in American politics communicate as well as use media. 2. Apply theoretical approaches to media effects, journalism, political campaigns, and critical issues of race and gender to practical political communication situations. Credits: 3.00

COM 49501 - Sports Media Relations

Credit Hours: 3.00. This course examines the role of public relations and mass media in sports communication. It provides an understanding of the operation of sports media and communication and how sports information departments perform their functions. Emphasis is on written communication from athletics communication perspective.

Learning Outcomes: 1. Develop a clear understanding of the day to day responsibilities of sports public relations professionals. 2. Develop attention-grabbing writing skills that reflect an understanding of news judgment. 3. Learn about press box and game-management operations at a sports event, including news conference set-up and execution, coordination

of interview requests, quote-gathering, and information and statistics updates and distribution. 4. Create promotional, multimedia content at a sports event, including written features, press releases, social media, video and infographics. 5. Explore communication strategies used by sports media relations professionals in breaking-news situations. 6. Study the evolution of the relationship between media and sports organizations. 7. Learn about the scope of responsibilities of sports media relations professionals, including the coordination of managed news events and special events, the production of media guides, the execution of publicity campaigns, and crisis communications. 8. Understand the effects of evolving technology and social media on sports media relations. Credits: 3.00

COM 49502 - Travel Writing

Credit Hours: 3.00. Travel writing is writing about places, persons, and things in other places-also writing about how to travel, when to travel, and advice on traveling-all with the reader in mind. It's about relaying your travel experiences to others so that they may emulate them or at the very least not make the same mistakes you did. And it's writing about things in your own back yard that are exotic to everyone else-a local farmer's market, historic site, restaurant, museum. In this class, you will explore the various ways travel writers can excite and assist readers.

Learning Outcomes: 1. Gain experience in writing effectively. 2. Identify typical features of travel writing genres. 3. Use research and observation as building blocks for travel writing. 4. Produce a variety of articles within this genre. 5. Understand the "business" of travel writing. Credits: 3.00

COM 44900 - Media Management

Credit Hours: 3.00. An introduction to management for mass media outlets. The course will explore management styles and techniques in a variety of media situations, including radio, television, and internet-based business models. Topics such as business structure, advertising and promotion, programming, and leadership style will be included in the discussion. This class is designed as both a philosophical and practical model. Students will discover the theories and principles behind the structure of media businesses, as well as put those ideas into practice in real world situations. Students in the course will be responsible for the programming and promotion of the Brian Lamb School of Communication's channel space on Boiler TV. A mini internship experience is introduced in the second half of the semester, giving the student an opportunity to sample what these opportunities are like.

Learning Outcomes: 1. Define the roles of a media manager. 2. Program a media outlet's weekly schedule. 3. Promote a media outlet's programming to a target audience. 4. Produce a case study of an active media outlet. 5. Identify the characteristics of an effective media manager. 6. Work constructively as a member of a management team. 7. Create a long-range plan of operation for a media outlet. 8. Present findings from a media case study. 9. Conduct a programming and promotion meeting with a team. Credits: 3.00

COM 33701 - Producing Digital Advertising

Credit Hours: 3.00. This course is designed as an advanced level production course. Through lectures, discussions, critiques, screenings, and various exercises, you will gain experience designing video advertisements. You will develop and refine critical viewing/listening abilities to effectively analyze video content for aesthetic elements and overall message. Additionally, you will apply production techniques pertaining to producing, directing, shooting and editing in the creation of projects for real clients. The coursework consists of three major video projects, and a series of assignments organized under the corporate role that would be performing those tasks.

Learning Outcomes: 1. Work with a client in the development of a digital media advertisement. 2. Develop the concept for a digital media advertisement. 3. Pitch the idea for a digital media advertisement. 4. Write the script for a digital media advertisement. 5. Coordinate the production schedule for a digital media advertisement project. 6. Supervise videography for a digital media advertisement. 7. Complete post-production for a digital media advertisement. 8. Critique the final edit of a digital media advertisement. Credits: 3.00

COM 33200 - Television Production

Credit Hours: 3.00. Basic principles of producing, writing, and directing for television. Treats program types and television criticism, and explores creative treatment of visual, artistic, and nonverbal elements of communication in television. Permission of department required.

Learning Outcomes: 1. Utilize the terminology used in studio production settings. 2. Conceptualize a studio production. 3. Script a studio production using correct industry format. 4. Develop critical viewing/listening skills and analytical abilities necessary to evaluate the content of video productions. 5. Demonstrate the proper operation of studio production equipment. 6. Work constructively as a member of a production team. 7. Produce a television studio program. 8. Direct a television studio program from a prewritten script. Credits: 3.00

COM 27100 - Podcasting

Credit Hours: 3.00. This directed study is designed as an introduction to podcasting. Students in the course will learn about the structure and development of podcasting campaigns, then create their own weekly recording. Recording begins in the third week of classes, giving students 14 opportunities to develop their program.

Learning Outcomes: 1. Develop an idea for a podcast. 2. Write a treatment for a podcast. 3. Pitch the idea for a podcast to an audience. 4. Create a production outline. 5. Produce a budget for the work produced and identify potential funding sources for the project. 6. Execute an advertising campaign for a podcast. 7. Coordinate a schedule for a podcast recording. 8. Evaluate the finished production and the experience of creating that work. Credits: 3.00

COM 36100 - Multiplatform Journalism

Credit Hours: 3.00. This course is an introduction to video journalism, including critical examination of various styles of video journalism from news websites to local TV news to national/international television news programs. Students will produce video stories using video cameras and audio equipment to record interviews and natural sound, learn professional lighting techniques, find stories, interview for video, write scripts, review video journalism ethics, and related content.

Learning Outcomes: 1. Demonstrate a working knowledge of camera/audio recording and editing for video journalism stories. 2. Define and describe basic television/digital terms and concepts. 3. Gather, write and produce news content for television and digital platforms. 4. Demonstrate a working knowledge of journalism ethics and news-media literacy. Credits: 3.00

COM 49504 - Social Media For Social Good

Credit Hours: 3.00. Nonprofit organizations advance their missions through communication. This course is designed to introduce students to the use of social media by nonprofit organizations to create their brand and reach stakeholders. It will focus on best practices and critically assess local nonprofits return on social media investment.

Learning Outcomes: 1. Discuss the importance of social media to nonprofits for communicating, marketing, public relations, and fundraising. 2. Discuss the measurement of social media effectiveness in communicating messages and in fundraising. 3. Conduct a social media audit. 4. Develop a nonprofit social media strategy. Credits: 3.00

COM 28500 - Introduction To Publication Design

Credit Hours: 3.00. Introduction to pre-press production of professional-quality publications. Emphasis on computer applications for publication layout, design and production. Topics include composition, readability, typography, graphic resolution, and color management systems.

Learning Outcomes: 1. Demonstrate knowledge of graphic composition and layout principles when designing publications. 2. Use industry-standard computer software accomplish basic and advanced pre- press publication design and production tasks. 3. Solve common design and production problems encountered in the communication workplace, including those related to readability, resolution, color and composition. 4. Use

appropriate professional terminology when communicating with editors, designers, printers and other vendors on particular projects. 5. Seek bids that result in reliable cost estimates from printers and other vendors. 6. Consider ethical implications and professional communication responsibilities when making editorial and design decisions. Credits: 3.00

COM 49701 - Live Sports Broadcasting Summer

Credit Hours: 1.00. In this experiential Live Sports Broadcasting course in partnership with the Lafayette Aviators, students will have the opportunity to work in the studio at Loeb Stadium in Lafayette, operate cameras on the field, produce promotional material to be used before, during, and after games, and interview players for segments on The Purdue Channel. The class spans the home season of the Aviators. Students are expected to register for all 3 1-credit modules in a summer. Permission of instructor required.

Learning Outcomes: 1. Demonstrate live sports broadcasting techniques including: studio operation, camera operation, play-by-play and commentary. 2. Interview athletes and staff for broadcast. 3. Develop promotional videos for The Purdue Channel and/or the Aviators. Credits: 1.00

COM 49507 - Executive Communication

Credit Hours: 3.00. This course defines executive communication, offers a rationale for its importance, provides a catalog of deliverables (or tactics) involved in the practice, teaches students how to create those deliverables, and provides students with the tools to serve as strategic advisors to senior leaders. The ultimate goal of the course is to help students become more well-rounded and successful communication professionals.

Learning Outcomes: 1. Describe the breadth, depth and nuance of executive communication. 2. Create various internal and external executive communication deliverables. 3. Conduct a SWOT (strengths, weaknesses, opportunities, threats) analysis of an executive's communication. 4. Define and execute the role of serving as a strategic communication advisor to an executive. 5. Learn from and connect with established communication professionals. Credits: 3.00

COM 36200 - Broadcast Performance

Credit Hours: 3.00. This course will immerse students in both the foundational concepts of broadcasting and nuanced performance techniques necessary to take the craft to the next level as on-camera/on-air presenters. Through hands-on, experiential learning, students will refine existing journalistic and creative skills (such as prior reporting, video production, hosting, anchoring, or online media experience) and also develop new talents and portfolio pieces.

Learning Outcomes: 1. Produce on-camera segments that tell stories via studio, field, and social media. 2. Apply technical and creative skills necessary to produce and air basic broadcast programming by completing assigned class projects. 3. Comprehend, define, and analyze essential studio and broadcasting concepts by writing scripts to use in class practicals. Credits: 3.00

COM 49702 - Video Games And Society

Credit Hours: 3.00. This course focuses on video games as a form of mass communication. Primarily, this focus entails understanding how video games communicate to mass audiences, using features distinctive to video games, and how that communication might impact game players (i.e., media psychology). There is a secondary focus on how game players communicate with each other. The course will primarily examine these issues from social scientific perspectives. Topics include the influence of society on game creation, the impact of games on players, gaming cultures, and game industries.

Learning Outcomes: 1. Identify and apply key communication concepts and theories that inform video game creation and consumption. 2. Compare video game features and creation processes. 3. Evaluate positive and negative effects of video games. 4. Describe the video game industry and surrounding culture. Credits: 3.00

COM 47900 - Introduction To Risk Communication

Credit Hours: 3.00. This course introduces students to theories that show how people express, perceive, exchange, and deliberate information about risk as well as how this

understanding can be used to improve risk communication practice. This course examines risk communication theory and practice from multiple perspectives including social, psychological, cultural, and communicative.

Learning Outcomes: 1. Describe how and why major approaches to risk communication have shifted over time. 2. Explain cognitive and affective processes involved in individuals' risk perception in domains of science, health, and environmental issues. 3. Analyze different communication models and theories applicable to risk communication. 4. Discuss alternative interpersonal communicative public participation practices for deliberating risk information. Credits: 3.00

Electives (4-41credits)

This course provides a practical, hands-on approach to public relations by working in student-led teams to produce comprehensive, strategic communication campaigns for actual clients. The course also includes many opportunities for professional development and portfolio building.

Learning Outcomes: 1. Experience a real public relations campaign. 2. Develop professionally to be able to start a public relations career. 3. Use creativity and critical thinking to help clients with public relations needs while engaging in social responsibility. Credits: 1.00

COM 49501 - Sports Media Relations

Credit Hours: 3.00. This course examines the role of public relations and mass media in sports communication. It provides an understanding of the operation of sports media and communication and how sports information departments perform their functions. Emphasis is on written communication from athletics communication perspective.

Learning Outcomes: 1. Develop a clear understanding of the day to day responsibilities of sports public relations professionals. 2. Develop attention-grabbing writing skills that reflect an understanding of news judgment. 3. Learn about press box and game-management operations at a sports event, including news conference set-up and execution, coordination of interview requests, quote-gathering, and information and statistics updates and distribution. 4. Create promotional, multimedia content at a sports event, including written features, press releases, social media, video and infographics. 5. Explore communication strategies used by sports media relations professionals in breaking-news situations. 6. Study the evolution of the relationship between media and sports organizations. 7. Learn about the scope of responsibilities of sports media relations professionals, including the coordination of managed news events and special events, the production of media guides, the execution of publicity campaigns, and crisis communications. 8. Understand the effects of evolving technology and social media on sports media relations. Credits: 3.00

COM 49502 - Travel Writing

Credit Hours: 3.00. Travel writing is writing about places, persons, and things in other places-also writing about how to travel, when to travel, and advice on traveling-all with the reader in mind. It's about relaying your travel experiences to others so that they may emulate them or at the very least not make the same mistakes you did. And it's writing about things in your own back yard that are exotic to everyone else-a local farmer's market, historic site, restaurant, museum. In this class, you will explore the various ways travel writers can excite and assist readers.

Learning Outcomes: 1. Gain experience in writing effectively. 2. Identify typical features of travel writing genres. 3. Use research and observation as building blocks for travel writing. 4. Produce a variety of articles within this genre. 5. Understand the "business" of travel writing.

Credits: 3.00

COM 33701 - Producing Digital Advertising

Credit Hours: 3.00. This course is designed as an advanced level production course. Through lectures, discussions, critiques, screenings, and various exercises, you will gain experience designing video advertisements. You will develop and refine critical viewing/listening abilities to effectively analyze video content for aesthetic elements and overall message. Additionally, you will apply production techniques pertaining to producing, directing, shooting and editing in the creation of projects for real clients. The coursework consists of three major video projects, and a series of assignments organized under the corporate role that would be performing those tasks.

Learning Outcomes: 1. Work with a client in the development of a digital media advertisement. 2. Develop the concept for a digital media advertisement. 3. Pitch the idea for a digital media advertisement. 4. Write the script for a digital media advertisement. 5. Coordinate the production schedule for a digital media advertisement project. 6. Supervise videography for a digital media advertisement. 7. Complete post-production for a digital media advertisement. 8. Critique the final edit of a digital media advertisement. Credits: 3.00

COM 49503 - Public Relations For Social Change

Credit Hours: 3.00. The overarching goal of this course is for students to work cooperatively with a community partner to identify, define and address that organization's PR problems and opportunities from a long-term, in-house perspective, building on the work of previous students and incorporating social change theory from a relationship management perspective of PR. The applied work of this course will have the dual benefit of providing students the opportunity to gain contextualized, real-world experience at PR problem-solving and advancing the mission of a nonprofit organization that is important to the wellbeing of the Greater Lafayette community as a whole.

Learning Outcomes: 1. Construct and devise a strategic and mission-focused PR plan and critically evaluate its effects. 2. Explain and demonstrate how storytelling and community relations PR strategies can be used as tools for social change. 3. Describe how their own PR skillsets can be means for future civic engagement. 4. Develop an increased sense of efficacy when it comes to matters of civic engagement and PR practice. 5. Develop a broader view of how PR as a discipline can be applied within a community. Credits: 3.00

COM 49505 - Sports Communication

Credit Hours: 3.00. This class will help students learn to think critically about sports communication, but it will also help students learn to do sports communication. Through the use of sports books and movies, guest speakers, field trips, and case studies, students will learn not only about sports communication as a field of study and a profession, but also how they can be more thoughtful consumers of sports communication in its various forms.

Learning Outcomes: 1. Describe multiple ways that sports communication constructs and maintains culture. 2. Explain changes in sports communication related to race and gender. 3. List five key events in the last 100 years of sports communication. 4. List and analyze issues related to naming in sports. 5. Create a basic sports crisis communication plan. 6. Frame labor-management sports communication issues from both perspectives. Credits: 3.00

COM 27100 - Podcasting

Credit Hours: 3.00. This directed study is designed as an introduction to podcasting. Students in the course will learn about the structure and development of podcasting campaigns, then create their own weekly recording. Recording begins in the third week of classes, giving students 14 opportunities to develop their program.

Learning Outcomes: 1. Develop an idea for a podcast. 2. Write a treatment for a podcast. 3. Pitch the idea for a podcast to an audience. 4. Create a production outline. 5. Produce a budget for the work produced and identify potential funding sources for the project. 6. Execute an advertising campaign for a podcast. 7. Coordinate a schedule for a podcast recording. 8. Evaluate the finished production and the experience of creating that work. Credits: 3.00

COM 49504 - Social Media For Social Good

Credit Hours: 3.00. Nonprofit organizations advance their missions through communication. This course is designed to introduce students to the use of social media by nonprofit organizations to create their brand and reach stakeholders. It will focus on best practices and critically assess local nonprofits return on social media investment.

Learning Outcomes: 1. Discuss the importance of social media to nonprofits for communicating, marketing, public relations, and fundraising. 2. Discuss the measurement of social media effectiveness in communicating messages and in fundraising. 3. Conduct a social media audit. 4. Develop a nonprofit social media strategy. Credits: 3.00

COM 28500 - Introduction To Publication Design

Credit Hours: 3.00. Introduction to pre-press production of professional-quality publications. Emphasis on computer applications for publication layout, design and production. Topics include composition, readability, typography, graphic resolution, and color management systems.

Learning Outcomes: 1. Demonstrate knowledge of graphic composition and layout principles when designing publications. 2. Use industry-standard computer software accomplish basic and advanced pre- press publication design and production tasks. 3. Solve common design and production problems encountered in the communication workplace, including those related to readability, resolution, color and composition. 4. Use appropriate professional terminology when communicating with editors, designers, printers and other vendors on particular projects. 5. Seek bids that result in reliable cost estimates from printers and other vendors. 6. Consider ethical implications and professional communication responsibilities when making editorial and design decisions. Credits: 3.00

Electives (4-41 credits)

Sample 4-Year Plan

Fall 1st Year

COM 10000 - Introduction To Communication Studies

Credit Hours: 1.00. This semester-long course will introduce students to many opportunities offered by the Brian Lamb School of Communication. Permission of department required.

Learning Outcomes: 1. Engage with curriculum resources to create a plan of study that satisfies university, college and departmental requirements and complements their academic and professional goals. 2. Describe the field of communication to a person not engaged in the field. 3. Identify and use university, college and school resources applicable to their academic and professional goals. Credits: 1.00

COM 11400 - Fundamentals Of Speech Communication (UCC: OC)

Credit Hours: 3.00. A study of communication theories as applied to speech; practical communicative experiences ranging from interpersonal communication and small group process through problem identification and solution in discussion to informative and persuasive speaking in standard speaker-audience situations. NOTE: Concurrent registration is not permitted for ENGL 10600 and COM 11400. CTL:ICM 1103 Fundamentals Of Public Speaking

University Core Curriculum (UCC): (UCC: OC) Credits: 3.00

SCLA 30000 - Liberal Arts Influentials

Credit Hours: 1.00. As a lecture/discussion course, Liberal Arts Influentials features speakers from a diverse range of Liberal Arts majors and introduces students to the myriad career opportunities available to Liberal Arts graduates. Speakers represent careers in the arts, media, industry, politics and more. Students are encouraged to initiate dialogue with working professionals. Only students enrolled in the College of Liberal Arts may register for GS 30000: LA Influentials.

Learning Outcomes: 1. Identify how the liberal arts influence and contribute to society, globalization, and world issues and how the liberal arts prepare students for meaningful and

satisfying career. 2. Develop a better understanding of how these influences and contributions can be applied to their professional and personal development. 3. Network with key Liberal Arts alumni. Credits: 1.00

16 Credits

Spring 1st Year

COM 10200 - Introduction To Communication Theory

Credit Hours: 3.00. Overview of approaches treating communication as an individual, functional activity and as a social, structuring activity. Covers definitions and models of communication, core processes (interpretations, sending, receiving), structures (language, nonverbal behavior), and key contexts (personal, organizational, public).

Credits: 3.00

15 Credits

Fall 2nd Year

COM 20400 - Critical Perspectives On Communication (UCC: WC)

Credit Hours: 3.00. Introduction to critical thinking and writing about communication. Draws on humanistic and qualitative traditions to help students learn and apply critical approaches to understanding communication.

University Core Curriculum (UCC): (UCC: WC)
Credits: 3.00

COM 31800 - Principles Of Persuasion

Credit Hours: 3.00. Persuasion and its effects, ranging from individual influences to societal impacts. Various perspectives and models of persuasion are examined, including classical and modern approaches. Both theoretical and pragmatic considerations are introduced.

Learning Outcomes: 1. List the major areas of study in the field of persuasion. 2. Analyze and critique persuasive techniques. 3. Apply theories of persuasion to explain everyday circumstances. Credits: 3.00

15 Credits

Spring 2nd Year

15 Credits

Fall 3rd Year

COM 25200 - Writing For Mass Media

Credit Hours: 3.00. Labor intensive course teaches basics of newspaper writing, broadcast writing, news releases, and online journalism.

Credits: 3.00

COM 25700 - Public Relations Techniques

Credit Hours: 3.00. This class introduces students to a range of public relations techniques, with a focus on writing. From press releases to new media, this class offers practice and feedback on how to use common public relations tools.

Learning Outcomes: 1. Match appropriate PR techniques to a given situation. 2. Write a press release correct in form, content, grammar and spelling. 3. Compose a SWOT analysis for an actual organization. 4. Use at least two new media technologies to create PR messages.
Credits: 3.00

COM 30400 - Quantitative Methods For Communication Research

Credit Hours: 3.00. Introduction to the development and application of quantitative research methods pertinent to communication problems. Fundamental concepts of problem identification, reliability and validity of both measurement and research design, and statistical analyses of data.

Credits: 3.00

COM 31100 - Copy Editing

Credit Hours: 3.00. Study of, and practice in, copyreading and headline writing. Laboratory practice includes copy editing on video-display terminals.

Credits: 3.00

COM 40700 - Social Media And News Organizations

Credit Hours: 3.00. An exploration of how traditional news providers use social media to disseminate information to mass audiences and correct practices using such technologies.

Learning Outcomes: 1. Produce professional journalistic stories using alternate formats. 2. Choose appropriate social media to adapt to different audiences for optimal news dissemination. 3. Create social media content by applying basic mobile audio and video editing skills. Credits: 3.00

COM 36100 - Multiplatform Journalism

Credit Hours: 3.00. This course is an introduction to video journalism, including critical examination of various styles of video journalism from news websites to local TV news to national/international television news programs. Students will produce video stories using video cameras and audio equipment to record interviews and natural sound, learn professional lighting techniques, find stories, interview for video, write scripts, review video journalism ethics, and related content.

Learning Outcomes: 1. Demonstrate a working knowledge of camera/audio recording and editing for video journalism stories. 2. Define and describe basic television/digital terms and concepts. 3. Gather, write and produce news content for television and digital platforms. 4. Demonstrate a working knowledge of journalism ethics and news-media literacy. Credits: 3.00

15 Credits

Spring 3rd Year

COM 21200 - Approaches To The Study Of Interpersonal Communication (UCC: BSS)

Credit Hours: 3.00. A study of the basic characteristics of human communication and the theoretical and practical implications of these characteristics for various forms of oral communication. CTL:ICM 1101 Interpersonal Communication

University Core Curriculum (UCC): (UCC: BSS) Credits: 3.00

COM 25300 - Introduction To Public Relations

Credit Hours: 3.00. An analysis of public relations theory and practice from their origins to the present. From a communication perspective, the course examines public relations environments, audiences, and message strategies.

Credits: 3.00

COM 25600 - Introduction To Advertising

Credit Hours: 3.00. An analysis of commercial persuasion from colonial times to the era of mass communication. The course examines the structure of advertising messages, how they are adapted to specific audiences, and the social settings in which they occur.

Credits: 3.00

COM 31400 - Advanced Presentational Speaking

Credit Hours: 3.00. Development of a marked degree of skill in the composition and delivery of various types of speeches including presentations in corporate board rooms, orientation meetings, banquet halls, public forms. Special emphasis on speeches related to the student's major vocational area.

Gateway Course (3 credits)

LC 23700 - Our Common Bond: Languages And Cultures In A Global Context

Credit Hours: 3.00. (CMPL 23700) Students learn what lies behind the concept of Liberal Arts: the capabilities, insights and skills of individuals who think critically and freely. It exposes students from across the university to the ideas, skill-set and inspiration that emanates from the liberal arts. They will be introduced to the discipline of Comparative Literature by examining the specific roles that languages and cultures play in the globalized world. The course also demonstrates how a Language and Cultures degree will put students at a greater advantage in career opportunities.

Learning Outcomes: 1. Trace how various cultures have shaped our contemporary models of higher education through written and oral assignments. 2. Describe how literary texts from various cultures provided the catalyst for major political and social events throughout history. 3. Identify the impact that literary endeavors have in the development of scientific, medical, corporate, environmental and political ideas. 4. Articulate clearly why a Liberal Arts education that focuses on languages and intercultural competency is both valuable and marketable in today's global context. Credits: 3.00

World Literature Surveys (6 credits)

CMPL 26700 - World Literature: From 1700 A D To The Present (UCC: HUM)

Credit Hours: 3.00. (ENGL 26700) World literature in translation. A comparative and chronological survey of the masterpieces of Eastern and Western literature.

University Core Curriculum (UCC): (UCC: HUM)
Learning Outcomes: 1. Demonstrate knowledge of a range of genres, topics, and literary conventions characteristic of world literatures. 2. Discuss those genres, topics, and conventions in relation to their diverse historical, cultural, and aesthetic contexts. 3. Produce well-reasoned written arguments about the literature they study based on appropriate use of textual evidence. Credits: 3.00

CMPL 26600 - World Literature: From The Beginnings To 1700 A D (UCC: HUM)

Credit Hours: 3.00. (ENGL 26600) World literature in translation. A comparative and chronological survey of the masterpieces of Eastern and Western literature.

University Core Curriculum (UCC): (UCC: HUM)
Learning Outcomes: 1. Demonstrate knowledge of a range of genres, topics, and literary conventions characteristic of world literatures. 2. Discuss those genres, topics, and conventions in relation to their diverse historical, cultural,

and aesthetic contexts. 3. Produce well-reasoned written arguments about the literature they study based on appropriate use of textual evidence. Credits: 3.00

ENGL 26600 - World Literature: From The Beginnings To 1700 A.D. (UCC: HUM)

Credit Hours: 3.00. (CMPL 26600) World literature in translation. A comparative and chronological survey of the masterpieces of Eastern and Western literature. CCN: IEL 1250 World Literature 1

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Demonstrate knowledge of a range of genres, topics, and literary conventions characteristic of world literatures. 2. Discuss those genres, topics, and conventions in relation to their diverse historical, cultural, and aesthetic contexts. 3. Produce well-reasoned written arguments about the literature they study based on appropriate use of textual evidence. Credits: 3.00

ENGL 26700 - World Literature: From 1700 A.D. To The Present (UCC: HUM)

Credit Hours: 3.00. (CMPL 26700) World literature in translation. A comparative and chronological survey of the masterpieces of Eastern and Western literature. Typically offered Summer Fall Spring. CCN: IEL 1251 World Literature 2

University Core Curriculum (UCC): (UCC: HUM) Learning Outcomes: 1. Demonstrate knowledge of a range of genres, topics, and literary conventions characteristic of world literatures. 2. Discuss those genres, topics, and conventions in relation to their diverse historical, cultural, and aesthetic contexts. 3. SCLA 10200 - Transformative Texts, Critical Thinking And Communication II: Modern World (UCC: OC)

Credit Hours: 3.00. The primary goal of the course is to provide students with a foundational knowledge of transformative literature from around the world as well as fundamental reading, writing, speaking and analytical skills. This second course in the sequence introduces students to great texts from the modern era. Its goal is to create life-long learners, open to the world,

and sensitive to other points of view. It exposes students from across the university to the ideas, skill-set and inspiration that animates from the liberal arts, and it also introduces them to liberal arts faculty.

University Core Curriculum (UCC): (UCC: OC) Learning Outcomes: 1. Demonstrate effective, professional delivery, designing and adapting appropriate verbal appeals through vocal intonation and non-verbal cues. 2. Distinguish and apply appropriate informative, persuasive, explanatory, interrogatory and argumentative strategies and techniques in the discussions and in formal presentations. 3. Organize presentations with effective supporting materials. 4. Locate and evaluate effective sources of information. 5. Engage critically with transformative texts, drawing on multiple perspectives, including the individual, the historical, and the contemporary. Credits: 3.00

About the Program

Degree Requirements

Departmental/Program Major Courses (51 credits)

Computer and Information Technology Required Major Courses (30 credits)

CNIT 15501 - Introduction To Software Development Concepts

Credit Hours: 3.00. This course introduces fundamental software development concepts common to most programming languages. Topics include problem solving and algorithm development, debugging, programming standards, variables, data types, operators, decisions, repetitive structures, modularity, arrays, user interface construction, software testing and debugging. A broad range of examples will be used throughout the course to show how each programming concept applies to real life problems.

Learning Outcomes: 1. Define key application development terms. 2. Explain the importance of programming to different domain areas. 3. Identify advantages and disadvantages of using an IDE to write program code. 4. Use debugging tools to find program errors. 5. Use data types, variables, constants, arithmetic operators, relational operators, logical operators, decisions, loop, functions, and arrays when writing computer programs. Credits: 3.00

CNIT 17600 - Information Technology Architectures

Credit Hours: 3.00. A conceptual and technological survey of information technology architectures inclusive of operating systems, network operating systems, distributed systems architectures, and distributed application architectures. Interoperability between these architectural components is explored. Current technology and trends in each architectural element are reviewed. PC literacy required.

Learning Outcomes: 1. Describe complexities, interoperations, & integration of hardware and software system components and architectures. 2. Analyze and describe operating systems, resource management, & security functions. 3. Apply knowledge of system architecture to solve complex problems. Credits: 3.00

CNIT 18000 - Introduction To Systems Development

Credit Hours: 3.00. This course introduces information systems development. Topics include types of information systems, system development, database management systems, and problem solving. Students will read/create UML, ERD, and data flow diagrams to model information system objects, data, processes, and logic. Labs emphasize modeling and SQL/QBE querying to prepare students for later systems, programming, and database classes. Given user requirements students will design, construct, and test a personal computer information system. PC literacy required.

Learning Outcomes: 1. Construct information systems using appropriate tools and techniques. 2. Demonstrate system modeling concepts, tools, and techniques. 3. Analyze data design concepts and data structures. 4. Apply systems development life cycle (SDLC) concepts. 5. Identify information systems components. Credits: 3.00

CNIT 24200 - System Administration

Credit Hours: 3.00. This course provides a comprehensive introduction to system administration. Topics include authentication and authorization, directory services, system management and system security. Emphasis is placed on enterprise level systems.

Learning Outcomes: 1. Explain systems administration concepts as applied to business environments. 2. Design, construct, troubleshoot, and administer an enterprise-class application environment using Microsoft Windows-based client and server software. 3. Describe, install, and maintain an enterprise-class application environment in a virtualized environment. 4. Plan and execute a cutover from a physical computing environment to a virtualized computing environment. 5. Produce written reports that document project work performed in the laboratory. Credits: 3.00

CNIT 25501 - Object-Oriented Programming Introduction

Credit Hours: 3.00. This course introduces software development concepts common to modern object-oriented programming languages. Topics include: intermediate data types, decisions, repetitive structures; methods; arrays and collections; encapsulation, inheritance, and polymorphism; exception handling; data persistence; Database Management System (DBMS) connectivity; user interface construction; software testing and debugging; and working in teams.

Learning Outcomes: 1. Build and apply object-oriented design concepts on a regular basis through exercises and labs. 2. Construct a complex project. Credits: 3.00

CNIT 27200 - Database Fundamentals

Credit Hours: 3.00. A study of relational database concepts. These concepts include data design, modeling, and normalization; the use of Structured Query Language (SQL) to define, manipulate, and test the database; programmatic access to a database and practical issues that database developers must handle.

Learning Outcomes: 1. Design an entity relationship diagrams (ERD) for a business problem domain. 2. Write Structured Query Language (SQL) queries to effectively present data/information from a database. 3. Employ critical thinking to a team-based project of database design. Credits: 3.00

CNIT 28000 - Systems Analysis And Design Methods

Credit Hours: 3.00. Comprehensive introduction to information systems development. Topics include the systems analyst, the systems development life cycle, methodologies, development technology, systems planning, project management, systems analysis, systems design, systems implementation, and systems support. Introduction to tools and techniques for systems development.

Learning Outcomes: 1. Identify the stages of the systems development life cycle and the different systems methodologies used to implement it. 2. Apply requirements analysis strategies and requirements-gathering techniques to determine business requirements. 3. Analyze an as-is system or a to-be system by applying appropriate tools for analysis modeling. 4. Design a system by applying appropriate tools for design modeling. 5. Apply project management techniques and tools for software development. 6. Perform as a functional member of a team and enact teamwork skills. Credits: 3.00

CNIT 48000 - Managing Information Technology Projects

Credit Hours: 3.00. This course introduces the application of knowledge, skills, tools, and techniques that project managers use to plan, staff, estimate, and manage information technology projects. Special emphasis is placed on learning and applying the concepts of managing scope, risk, budget, time, expectations, quality, people, communications, procurement, and externally provided services. Students will apply project management technology and techniques to business problems.

Learning Outcomes: 1. Understand the genesis of project management and its importance to improving the success of information technology projects. 2. Demonstrate knowledge of project management terms and techniques. 3. Use Microsoft Project and other software to help plan and manage information technology projects. 4. Appreciate the importance of good project management. Credits: 3.00

CNIT 32000 - Policy, Regulation, And Globalization In Information Technology

Credit Hours: 3.00. This course provides students with opportunities to study how technology is intertwined with larger economic, social, cultural, and ethical dynamics in an era of intensified globalization. The course examines technology in a global environment. Students will explore concepts and issues related to law, policy, regulation, outsourcing, offshoring, globalization, global competitiveness, global communications, cultural differences and quality of life issues. Students will examine ethical situations that arise as a result of the impact of technology. In summary, the course is designed to help students understand what it means to identify as, and/or work with, technology in a global environment.

Learning Outcomes: 1. Understand cultural traditions, societal ethics and the impact of culture on industry. 2. Understand issues with leading international teams and managing international projects. 3. Identify and apply public policy issues relevant to technology solutions. 4. Understand the logistics of

international travel including the use of passports and visas. 5. Identify, apply and understand organizational ethics including conflicts of interest and individual ethical responsibilities. Credits: 3.00

CNIT 27000 - Cybersecurity Fundamentals I

Credit Hours: 3.00. This course introduces cybersecurity fundamentals and concepts. Security models that provide a basis for overarching security solutions are introduced to provide a basis for discussion. Risks and vulnerabilities are examined along with technical controls that can be used to mitigate them. The role of security policy and the incident management framework are examined. Emphasis is placed on building a strong foundation for further study in the field.

Learning Outcomes: 1. Identify factors driving the need for cybersecurity and their associated risk. 2. Compare and contrast common cybersecurity models. 3. Identify and classify common types of information technology threats, risks, and vulnerabilities. 4. Explain and demonstrate how technical controls (access management, cryptography, firewalls, etc.) can be implemented to mitigate threats and vulnerabilities. 5. Explain and interpret the key steps in cybersecurity incident management. 6. Compare and contrast the roles of security policy and management. Credits: 3.00

Programming Selective - Credit Hours: 3.00

CNIT 31500 - Systems Programming

Credit Hours: 3.00. This course introduces concepts of lower level systems programming in C/C++ on a UNIX/Linus operation system platform. Command level development, algorithms, data structures, iteration and recursion, algorithms and analysis will be covered.

Learning Outcomes: 1. Develop applications for the command line. 2. Identify number systems and perform arithmetic operations. 3. Develop programs on Linux/UNIX operating systems. 4. Develop C/C++ programming proficiency. 5. Explain and use linear and tree-based data structures and algorithms. 6. Analyze algorithms. 7. Explain and use iteration and recursion. 8. Explain and use techniques of memory management. 9. Explain and use object-oriented programming in systems environments. 10. Explain and use text and binary file I/O. Credits: 3.00

CNIT 32500 - Object-Oriented Application Development

Credit Hours: 3.00. This course focuses on using object-oriented programming languages in the development of modern, business applications. Topics include object-oriented design, encapsulation, object interfaces, inheritance, aggregation, abstract classes, polymorphism, data structures, and exception handling.

Learning Outcomes: 1. Understand object-oriented concepts and architectures. 2. Understand software development motivations to use object-oriented design and development. 3. Demonstrate how to design and create classes and objects. 4. Understand the use of polymorphism and overloading. 5. Demonstrate how to design and use inheritance. 6. Understand how to apply a high-level integrated development environment to develop systems. 7. Demonstrate how to design, use and extend exception handling. 8. Demonstrate how to design, use and extend textual and binary data streams. 9. Understand how to integrate persistent data storage using RDBMS. 10. Understand the development of distributed systems and n-level architectures. Credits: 3.00

Database Selective - Credit Hours: 3.00

CNIT 37200 - Database Programming

Credit Hours: 3.00. This course explores advanced database programming techniques for enterprise-wide databases and their implementation. It uses programmatic extensions to Structured Query Language (SQL) supported by today's enterprise-class Relational Database Management Systems (RDBMS). Topics include advanced data manipulation, storage considerations, data transformation techniques to enhance interoperability of data, stored procedure and trigger design and implementation, and query optimization.

Learning Outcomes: 1. Deconstruct and explain database management system concepts and workable alternatives for contemporary database implementations. 2. Translate how triggers, procedures, and functions form the basis of methods that can be used to implement object-oriented capabilities in a relational database environment. 3. Analyze and improve declarative integrity constraints and security concerns in database implementation. 4. Design and apply triggers, procedures, and constraints for a given database model. Credits: 3.00

CNIT 39200 - Enterprise Data Management

Credit Hours: 3.00. This course examines advanced design techniques and physical issues relating to enterprise-wide data management. Topics include advanced design concepts, enhanced modeling and constructs, objects and unstructured and semi-structured data in databases, data management in non-business contexts, implementation of an enterprise data architecture, and data quality and stewardship.

Learning Outcomes: 1. Describe and apply enterprise information solutions through the design and implementation of architectures for complex databases. 2. Create and analyze a database solution based on user needs, physical and logical design options, and environmental constraints. 3. Use Entity/Relationship Modeling and database normalization techniques based on business requirements. Credits: 3.00

Information Technology Selectives - Credit Hours: 15.00

Other Departmental/Program Course Requirements (24 credits)

TLI 11200 - Foundations Of Organizational Leadership

Credit Hours: 3.00. A survey of individual and organizational behavioral concepts and principles that provide a foundation for leadership in technology organizations. The focus will be toward the understanding of behaviors necessary for effective organizational leadership, including concepts of work in a technology-rich environment.

Learning Outcomes: 1. Define the foundational theories, concepts, and practices of organizational behavior and technology leadership. 2. Use self-assessment for identifying behaviors and skills of technology leadership. 3. Define and implement reflective practice for leadership growth. 4. Explain the systematic study of organizational behavior. 5. Describe dimensions of technology as they relate to the organizational behavior and leadership. Credits: 3.00

Statistics Selective - Credit Hours: 3.00

STAT 22500 - Introduction To Probability Models

Credit Hours: 3.00. An introduction to basic probability. Emphasis is placed on formulation of models and applications. Probability calculus, standard distributions, random variables, and moments. Credit cannot be given for more than one of STAT 22500, 31100, or 41600.

Learning Outcomes: 1. Understand basic terminology, set theory, and counting rules related to probability. 2. Identify various discrete and continuous probability models/distributions and apply them to answer probability questions. 3. Understand the Normal distribution and how to use the Standard Normal Table. 4. Understand basic terms, graphs, and symbols and be able to interpret statistics in the media. 5. Have a foundation in statistical methodology including the basics of hypothesis testing. Credits: 3.00

STAT 30100 - Elementary Statistical Methods (UCC: IL)

Credit Hours: 3.00. Introduction to statistical methods with applications to diverse fields. Emphasis on understanding and interpreting standard techniques. Data analysis for one and several variables, design of samples and experiments, basic probability, sampling distributions, confidence intervals and significance tests for means and proportions, correlation and regression. Software is used throughout. For statistics majors and minors, credit should be allowed in no more than one of

STAT 30100, 35000, 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: college algebra.

University Core Curriculum (UCC): (UCC: IL) Learning Outcomes: 1. Students will be introduced to statistical methods and be able to apply them to multiple fields of study. 2. Students will be able to understand, interpret standard statistical techniques, analyze data for one variable and for several variables, calculate and use confidence intervals and significance test for means and proportions, understand the design of samples and experiments, perform and understand basic probability calculations, perform simple and multiple regression procedures, and understand correlation. Credits: 3.00

STAT 50100 - Experimental Statistics I

Credit Hours: 3.00. Concepts and methods of applied statistics. Exploratory analysis of data. Sample design and experimental design. Normal distributions. Sampling distributions. Confidence intervals and tests of hypotheses for one and two samples. Inference for contingency tables, regression and correlation, and one-way analysis of variance. Use of the SAS statistical software. Intended primarily for students who have not had calculus. Not open to students in mathematical sciences or engineering. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: College Algebra.

Learning Outcomes: 1. Produce and identify basic statistical analyses. 2. Discuss statistical terminology (speak statistics). 3. Use SAS to run basic statistical analyses and interpret corresponding SAS output. Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

General Business - Credit Hours: 3.00

TLI 15200 - Business Principles For Organizational Leadership

Credit Hours: 3.00. This course will introduce the topic of applied organization leadership in the context of working organizations. Topics include basic functions, structures, and operations of organizations, and an introduction to reading and understanding balance sheets, cash flow statements, and profit-loss statements.

Learning Outcomes: 1. Identify the business information that organizational leaders are expected to know to comprehensively manage the function and operation of profit and not-profit organizations. 2. Describe the major functions of business, including: operations, finance, marketing, and information technology. 3.

Interpret balance sheets, cash flow statements, and profit-loss statements. 4. Explore how organizations use technology to become competitive entities in global business environments. Credits: 3.00

Interdisciplinary Selective - Credit Hours: 15.00

Elective (3 credits)

Supplemental List

Grade Requirements

GPA Requirements

Course Requirements and Notes

Non-course / Non-credit Requirements

Sample 4-Year Plan

Fall 1st Year

ENGL 10600 - First Year Composition With Conferences (UCC: IL/WC)

Credit Hours: 4.00. This 4-credit hour composition course includes student-teacher conferences. Students in this course produce between 7,500-11,500 words of polished writing (or 15,000-22,000 total words, including drafts or the equivalent). Within the course, students will learn to write with a rhetorical awareness of diverse audiences, situations, and contexts; critically think about writing and rhetoric through reading, analysis, and reflection; provide constructive feedback and incorporate feedback into their own writing; perform research and evaluate sources to support claims; and engage multiple digital technologies for different purposes.

University Core Curriculum (UCC): (UCC: IL/WC) Learning Outcomes: 1. Demonstrate rhetorical awareness of diverse audiences, situations, and contexts. 2. Compose a variety of texts in a range of forms, equaling at least 7,500-11,500 words of polished writing (or 15,000-22,000 words, including drafts). 3. Critically think about writing and rhetoric through reading, analysis, and reflection. 4. Provide constructive feedback to others and incorporate feedback into their writing. 5. Perform research and evaluate sources to support claims. 6. Engage multiple digital technologies to compose for different purposes. Credits: 4.00

ENGL 10800 - First Year Composition (UCC: IL/WC)

Credit Hours: 3.00. In this 3-credit hour composition course students should expect an emphasis on self-guided work. Students in this course produce between 7,500-11,500 words of polished writing (or 15,000-22,000 total words, including drafts or the equivalent). Within the course, students will learn to write with a rhetorical awareness of diverse audiences, situations, and contexts; critically think about writing and rhetoric through reading, analysis, and reflection; provide constructive feedback and incorporate feedback into their own writing; perform research and evaluate sources to support claims; and engage multiple digital technologies for different purposes.

University Core Curriculum (UCC): (UCC: IL/WC) Learning Outcomes: 1. Demonstrate rhetorical awareness of diverse audiences, situations, and contexts. 2. Compose a variety of texts in a range of forms, equaling at least 7,500-11,500 words of polished writing (or 15,000-22,000 words, including drafts). 3. Critically think about writing and rhetoric through reading, analysis, and reflection. 4. Provide constructive feedback to others and incorporate feedback into their writing. 5. Perform research and evaluate sources to support claims. 6. Engage multiple digital technologies to compose for different purposes. Credits: 3.00

CNIT 18000 - Introduction To Systems Development

Credit Hours: 3.00. This course introduces information systems development. Topics include types of information systems, system development, database management systems, and

problem solving. Students will read/create UML, ERD, and data flow diagrams to model information system objects, data, processes, and logic. Labs emphasize modeling and SQL/QBE querying to prepare students for later systems, programming, and database classes. Given user requirements students will design, construct, and test a personal computer information system. PC literacy required.

Learning Outcomes: 1. Construct information systems using appropriate tools and techniques. 2. Demonstrate system modeling concepts, tools, and techniques. 3. Analyze data design concepts and data structures. 4. Apply systems development life cycle (SDLC) concepts. 5. Identify information systems components. Credits: 3.00

MA 16010 - Applied Calculus I (UCC: QR)

Credit Hours: 3.00. Topics include trigonometric and exponential functions; limits and differentiation, rules of differentiation, maxima, minima and optimization; curve sketching, integration, anti-derivatives, fundamental theorem of calculus. Properties of definite integrals and numerical methods. Applications to life, managerial and social sciences. CTL:IMA 1604 Calculus - Short I

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To create functional models and simplify difference quotients, compute limits of functions and apply limit laws. 2. To compute derivatives of elementary functions, including exponential, logarithmic and trigonometric functions, and apply rules of differentiation. 3. To sketch the graph of functions with the help of differentiation techniques, find maxima and minima of functions; optimization problems. 4. To computes integrals of some elementary functions and apply the Fundamental Theorem of Calculus. 5. Topics to be covered at a level required to perform standard applications related to life sciences, management and technology. Credits: 3.00

TECH 12000 - Design Thinking In Technology (UCC: IL/STS)

Credit Hours: 3.00. Student will engage in critical analysis of real-world problems and global challenges. They will demonstrate the ability to recognize opportunity and to take initiative in developing solutions applying the principles of human centered design. Students will be able to communicate effectively and to work well on teams. Problems and solutions will be examined from societal, cultural, and ethical perspectives.

University Core Curriculum (UCC): (UCC: IL/STS) Learning Outcomes: 1. Write a narrowly focused problem statement. 2. Apply ethnographic methods to understand technological problems. 3. Develop a search strategy, access technical databases and evaluate results and source quality. 4. Create a technical report documenting results of the design process. 5. Manage design projects, develop project timelines and negotiate individual responsibilities and accountability in the team environment. 6. Apply strategies of ideation to develop novel and innovation solutions. 7. Demonstrate rapid prototyping solutions for purposes of design, testing and communication. Credits: 3.00

TLI 11200 - Foundations Of Organizational Leadership

Credit Hours: 3.00. A survey of individual and organizational behavioral concepts and principles that provide a foundation for leadership in technology organizations. The focus will be toward the understanding of behaviors necessary for effective organizational leadership, including concepts of work in a technology-rich environment.

Learning Outcomes: 1. Define the foundational theories, concepts, and practices of organizational behavior and technology leadership. 2. Use self-assessment for identifying behaviors and skills of technology leadership. 3. Define and implement reflective practice for leadership growth. 4. Explain the systematic study of organizational behavior. 5. Describe dimensions of technology as they relate to the organizational behavior and leadership. Credits: 3.00

HONR 19903 - Interdisciplinary Approaches In Writing (UCC: IL/WC)

Credit Hours: 3.00. This course is a writing-intensive course in

which students learn how to find, evaluate, and use credible information, how to express themselves well in a variety of different written genres, and how to write for different audiences.

University Core Curriculum (UCC): (UCC: IL/WC) Learning Outcomes: 1. The ability to express themselves in writing clearly and concisely. 2. An understanding of different written genres and their characteristics. 3. An understanding of context and audience. 4. The ability to select and convey the appropriate content. 5. The ability to organize and format a written work. 6. An awareness and appreciation of writing style. 7. The ability to comment upon another's writing in a productive way. 8. The skills to improve their own writing through revision. 9. The ability to locate and evaluate credible information. 10. The ability to use and document information successfully and ethically. Credits: 3.00

SCLA 10100 - Transformative Texts, Critical Thinking And Communication I: Antiquity To Modernity (UCC: IL/WC)

Credit Hours: 3.00. The primary goal of the course is to provide students with a foundational knowledge of transformative literature from around the world as well as fundamental reading, writing, speaking and analytical skills. This first course in the sequence introduces students to great texts from antiquity to the birth of the modern era. Its goal is to create life-long learners, open to the world, and sensitive to other points of view. It exposes students from across the university to the ideas, skill-set and inspiration that animates from the liberal arts, and it also introduces them to liberal arts faculty.

University Core Curriculum (UCC): (UCC: IL/WC) Learning Outcomes: 1. Write with clarity, coherence, and concision in a variety of genres. 2. Demonstrate an importance of rhetorical situations and choices for a variety of audiences and contexts. 3. Demonstrate critical thinking about writing through reading, analysis, discussion, composing and revising texts in a range of genres. 4. Apply a clear understanding of the process of writing (including drafting, revising, editing, proofreading, and collaborating with others and providing feedback); and successfully organize, present, and communicate meaning to fellow readers in at least 8,000 words of polished writing. 5. Identify, analyze, and evaluate the claims of a variety of print, digital, audio and visual sources. 6. Engage critically with transformative texts, drawing on multiple perspectives including the individual, the historical, and the contemporary. Credits: 3.00

15 Credits

Spring 1st Year

COM 11400 - Fundamentals Of Speech Communication (UCC: OC)

Credit Hours: 3.00. A study of communication theories as applied to speech; practical communicative experiences ranging from interpersonal communication and small group process through problem identification and solution in discussion to informative and persuasive speaking in standard speaker-audience situations. NOTE: Concurrent registration is not permitted for ENGL 10600 and COM 11400. CTL:ICM 1103 Fundamentals Of Public Speaking

University Core Curriculum (UCC): (UCC: OC) Credits: 3.00

CNIT 15501 - Introduction To Software Development Concepts

Credit Hours: 3.00. This course introduces fundamental software development concepts common to most programming languages. Topics include problem solving and algorithm development, debugging, programming standards, variables, data types, operators, decisions, repetitive structures, modularity, arrays, user interface construction, software testing and debugging. A broad range of examples will be used throughout the course to show how each programming concept applies to real life problems.

Learning Outcomes: 1. Define key application development terms. 2. Explain the importance of programming to different domain areas. 3. Identify advantages and disadvantages of using an IDE to write program code. 4. Use debugging tools to find program errors. 5. Use data types, variables, constants, arithmetic operators, relational operators, logical

operators, decisions, loop, functions, and arrays when writing computer programs. Credits: 3.00

CNIT 17600 - Information Technology Architectures

Credit Hours: 3.00. A conceptual and technological survey of information technology architectures inclusive of operating systems, network operating systems, distributed systems architectures, and distributed application architectures. Interoperability between these architectural components is explored. Current technology and trends in each architectural element are reviewed. PC literacy required.

Learning Outcomes: 1. Describe complexities, interoperations, & integration of hardware and software system components and architectures. 2. Analyze and describe operating systems, resource management, & security functions. 3. Apply knowledge of system architecture to solve complex problems. Credits: 3.00

MA 16020 - Applied Calculus II (UCC: QR)

Credit Hours: 3.00. This course covers techniques and applications of integration; infinite series; differentiation and integration of functions of several variables; maxima and minima, optimization; differential equations and initial value problems. CTL:IMA 1605 Calculus - Short II

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Use techniques of integration to find areas between curves and compute volumes of solids of revolution. 2. Analyze the convergence of infinite series and power series, Taylor series expansions. 3. Compute derivatives of functions of several variables and use them to find maxima and minima of functions. 4. Perform multiple iterated integration. 5. Use differential equations for modeling simple real-life situations. 6. Solve first order linear initial value problems and separable equations. 7. Topics to be covered at a level required to perform standard applications related to life sciences, management and technology. Credits: 3.00

SCLA 10200 - Transformative Texts, Critical Thinking And Communication II: Modern World (UCC: OC)

Credit Hours: 3.00. The primary goal of the course is to provide students with a foundational knowledge of transformative literature from around the world as well as fundamental reading, writing, speaking and analytical skills. This second course in the sequence introduces students to great texts from the modern era. Its goal is to create life-long learners, open to the world, and sensitive to other points of view. It exposes students from across the university to the ideas, skill-set and inspiration that animates from the liberal arts, and it also introduces them to liberal arts faculty.

University Core Curriculum (UCC): (UCC: OC) Learning Outcomes: 1. Demonstrate effective, professional delivery, designing and adapting appropriate verbal appeals through vocal intonation and non-verbal cues. 2. Distinguish and apply appropriate informative, persuasive, explanatory, interrogatory and argumentative strategies and techniques in the discussions and in formal presentations. 3. Organize presentations with effective supporting materials. 4. Locate and evaluate effective sources of information. 5. Engage critically with transformative texts, drawing on multiple perspectives, including the individual, the historical, and the contemporary. Credits: 3.00

15 Credits

Fall 2nd Year

CNIT 24200 - System Administration

Credit Hours: 3.00. This course provides a comprehensive introduction to system administration. Topics include authentication and authorization, directory services, system management and system security. Emphasis is placed on enterprise level systems.

Learning Outcomes: 1. Explain systems administration concepts as applied to business environments. 2. Design, construct, troubleshoot, and administer an enterprise-class application environment using Microsoft Windows-based client and server software. 3. Describe, install, and maintain an enterprise-class application environment in a virtualized

environment. 4. Plan and execute a cutover from a physical computing environment to a virtualized computing environment. 5. Produce written reports that document project work performed in the laboratory. Credits: 3.00

CNIT 27200 - Database Fundamentals

Credit Hours: 3.00. A study of relational database concepts. These concepts include data design, modeling, and normalization; the use of Structured Query Language (SQL) to define, manipulate, and test the database; programmatic access to a database and practical issues that database developers must handle.

Learning Outcomes: 1. Design an entity relationship diagrams (ERD) for a business problem domain. 2. Write Structured Query Language (SQL) queries to effectively present data/information from a database. 3. Employ critical thinking to a team-based project of database design. Credits: 3.00

CNIT 28000 - Systems Analysis And Design Methods

Credit Hours: 3.00. Comprehensive introduction to information systems development. Topics include the systems analyst, the systems development life cycle, methodologies, development technology, systems planning, project management, systems analysis, systems design, systems implementation, and systems support. Introduction to tools and techniques for systems development.

Learning Outcomes: 1. Identify the stages of the systems development life cycle and the different systems methodologies used to implement it. 2. Apply requirements analysis strategies and requirements-gathering techniques to determine business requirements. 3. Analyze an as-is system or a to-be system by applying appropriate tools for analysis modeling. 4. Design a system by applying appropriate tools for design modeling. 5. Apply project management techniques and tools for software development. 6. Perform as a functional member of a team and enact teamwork skills. Credits: 3.00

TLI 15200 - Business Principles For Organizational Leadership

Credit Hours: 3.00. This course will introduce the topic of applied organization leadership in the context of working organizations. Topics include basic functions, structures, and operations of organizations, and an introduction to reading and understanding balance sheets, cash flow statements, and profit-loss statements.

Learning Outcomes: 1. Identify the business information that organizational leaders are expected to know to comprehensively manage the function and operation of profit and not-profit organizations. 2. Describe the major functions of business, including: operations, finance, marketing, and information technology. 3. Interpret balance sheets, cash flow statements, and profit-loss statements. 4. Explore how organizations use technology to become competitive entities in global business environments. Credits: 3.00

15 Credits

Spring 2nd Year

COM 21000 - Addressing Public Issues

Credit Hours: 3.00. Survey of argumentation and persuasion theories addressing contemporary public issues. Readings and discussions on cultural norms, audience reasoning, civic discourse, and constructing appeals addressing policies and practices. Preparation of appeals for public campaigns and social movements.

Learning Outcomes: 1. Describe argumentation and persuasion theories as applied to contemporary public issues. 2. Identify cultural norms, values, and beliefs of diverse communities contribute to civic discourse and audience reasoning. 3. Construct written and oral appeals addressing public issues, policies, and practices. Credits: 3.00

COM 21200 - Approaches To The Study Of Interpersonal Communication (UCC: BSS)

Credit Hours: 3.00. A study of the basic characteristics of

human communication and the theoretical and practical implications of these characteristics for various forms of oral communication. CTL:ICM 1101 Interpersonal Communication

University Core Curriculum (UCC): (UCC: BSS) Credits: 3.00

COM 22400 - Communicating In The Global Workplace (UCC: BSS)

Credit Hours: 3.00. This introductory course explores communication issues that arise in the global workplace. The course develops an appreciation of the relationship among culture, communication, and ways of organizing and doing business.

University Core Curriculum (UCC): (UCC: BSS) Learning Outcomes: 1. Critically analyze communication issues arising in culturally diverse organizations in the global environment by utilizing conceptual and theoretical frameworks. 2. Develop intercultural competencies for better managing communication issues in the global workplace by developing practical strategies for contemporary organizations operating in multiple cultures. 3. Explain macro social trends that are impacting global organizations by illustrating current examples. Credits: 3.00

COM 25100 - Communication, Information, And Society (UCC: IL/STS)

Credit Hours: 3.00. This course provides an introduction to information and communication technologies, including media and computer-related technologies. Basic information and technical literacy skills are developed, while discussing fundamental concepts of mediated communication in 21st century contexts.

University Core Curriculum (UCC): (UCC: IL/STS) Learning Outcomes: 1. Discuss implications of new technologies for individuals, institutions, and society. 2. Exercise basic information literacy skills through hands-on exercises involving new technologies. 3. Analyze impact of media technologies on communication behavior. 4. Write and make presentations that include new media technologies. Credits: 3.00

COM 31400 - Advanced Presentational Speaking

Credit Hours: 3.00. Development of a marked degree of skill in the composition and delivery of various types of speeches including presentations in corporate board rooms, orientation meetings, banquet halls, public forms. Special emphasis on speeches related to the student's major vocational area.

Credits: 3.00

COM 31500 - Speech Communication Of Technical Information

Credit Hours: 3.00. The organization and presentation of information of a practical technical nature. Emphasis is placed upon the study, preparation, and use of audiovisual materials in such presentations.

Credits: 3.00

COM 31800 - Principles Of Persuasion

Credit Hours: 3.00. Persuasion and its effects, ranging from individual influences to societal impacts. Various perspectives and models of persuasion are examined, including classical and modern approaches. Both theoretical and pragmatic considerations are introduced.

Learning Outcomes: 1. List the major areas of study in the field of persuasion. 2. Analyze and critique persuasive techniques. 3. Apply theories of persuasion to explain everyday circumstances. Credits: 3.00

COM 32000 - Small Group Communication

Credit Hours: 3.00. A study of group thinking and problem-solving methods; participation in, and evaluation of, committee, and informal discussion groups. Focus on the roles, networks, and messages employed by small group communicators.

Credits: 3.00

COM 32400 - Introduction To Organizational Communication

Credit Hours: 3.00. An introduction to fundamental concepts and basic research related to communication behavior in organizational settings. Units cover message processing, leadership communication, communication climates, communication training, and communication audits. Students participate in an organizational simulation in some sections.

Learning Outcomes: 1. Use the vocabulary of concepts and theories related to organizational communication. 2. List historical, current, and future communication issues facing

organizations. 3. Apply theoretical perspectives and concepts to organizational communication situations and settings. 4. Reflect on their own experience with organizations. Credits: 3.00

CNIT 25501 - Object-Oriented Programming Introduction

Credit Hours: 3.00. This course introduces software development concepts common to modern object-oriented programming languages. Topics include: intermediate data types, decisions, repetitive structures; methods; arrays and collections; encapsulation, inheritance, and polymorphism; exception handling; data persistence; Database Management System (DBMS) connectivity; user interface construction; software testing and debugging; and working in teams.

Learning Outcomes: 1. Build and apply object-oriented design concepts on a regular basis through exercises and labs. 2. Construct a complex project. Credits: 3.00

STAT 22500 - Introduction To Probability Models

Credit Hours: 3.00. An introduction to basic probability. Emphasis is placed on formulation of models and applications. Probability calculus, standard distributions, random variables, and moments. Credit cannot be given for more than one of STAT 22500, 31100, or 41600.

Learning Outcomes: 1. Understand basic terminology, set theory, and counting rules related to probability. 2. Identify various discrete and continuous probability models/distributions and apply them to answer probability questions. 3. Understand the Normal distribution and how to use the Standard Normal Table. 4. Understand basic terms, graphs, and symbols and be able to interpret statistics in the media. 5. Have a foundation in statistical methodology including the basics of hypothesis testing. Credits: 3.00

STAT 30100 - Elementary Statistical Methods (UCC: IL)

Credit Hours: 3.00. Introduction to statistical methods with applications to diverse fields. Emphasis on understanding and interpreting standard techniques. Data analysis for one and several variables, design of samples and experiments, basic probability, sampling distributions, confidence intervals and significance tests for means and proportions, correlation and regression. Software is used throughout. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, 35000, 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: college algebra.

University Core Curriculum (UCC): (UCC: IL)

Learning Outcomes: 1. Students will be introduced to statistical methods and be able to apply them to multiple fields of study. 2. Students will be able to understand, interpret standard statistical techniques, analyze data for one variable and for several variables, calculate and use confidence intervals and significance test for means and proportions, understand the design of samples and experiments, perform and understand basic probability calculations, perform simple and multiple regression procedures, and understand correlation. Credits: 3.00

STAT 50100 - Experimental Statistics I

Credit Hours: 3.00. Concepts and methods of applied statistics. Exploratory analysis of data. Sample design and experimental design. Normal distributions. Sampling distributions. Confidence intervals and tests of hypotheses for one and two samples. Inference for contingency tables, regression and correlation, and one-way analysis of variance. Use of the SAS statistical software. Intended primarily for students who have not had calculus. Not open to students in mathematical sciences or engineering. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: College Algebra.

Learning Outcomes: 1. Produce and identify basic statistical analyses. 2. Discuss statistical terminology (speak statistics). 3. Use SAS to run basic statistical analyses and interpret corresponding SAS output. Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100.

Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

CNIT 27000 - Cybersecurity Fundamentals I

Credit Hours: 3.00. This course introduces cybersecurity fundamentals and concepts. Security models that provide a basis for overarching security solutions are introduced to provide a basis for discussion. Risks and vulnerabilities are examined along with technical controls that can be used to mitigate them. The role of security policy and the incident management framework are examined. Emphasis is placed on building a strong foundation for further study in the field.

Learning Outcomes: 1. Identify factors driving the need for cybersecurity and their associated risk. 2. Compare and contrast common cybersecurity models. 3. Identify and classify common types of information technology threats, risks, and vulnerabilities. 4. Explain and demonstrate how technical controls (access management, cryptography, firewalls, etc.) can be implemented to mitigate threats and vulnerabilities. 5. Explain and interpret the key steps in cybersecurity incident management. 6. Compare and contrast the roles of security policy and management. Credits: 3.00

15 Credits

Fall 3rd Year

AGEC 21700 - Economics (UCC: BSS)

Credit Hours: 3.00. National economic problems such as unemployment, recessions, inflation, taxation, bank interest rates, the growth of government, monetary systems, and a rising national debt are discussed along with the principles, policies, and institutions for solving these macroeconomic problems.

University Core Curriculum (UCC): (UCC: BSS)

Learning Outcomes: 1. Apply knowledge of economic measurement, the economic model and the history of U.S. economic policy to analyze economic events, both personal and global, which occur during the rest of your life. Credits: 3.00

COM 31500 - Speech Communication Of Technical Information

Credit Hours: 3.00. The organization and presentation of information of a practical technical nature. Emphasis is placed upon the study, preparation, and use of audiovisual materials in such presentations.

Credits: 3.00

COM 32000 - Small Group Communication

Credit Hours: 3.00. A study of group thinking and problem-solving methods; participation in, and evaluation of, committee, and informal discussion groups. Focus on the roles, networks, and messages employed by small group communicators.

Credits: 3.00

COM 32500 - Interviewing: Principles And Practice

Credit Hours: 3.00. Theory and practice of methods in selected interview settings: informational, employment, and persuasive. Emphasis on communication between two persons, questioning

techniques, and the logical and psychological bases of interpersonal persuasion.

Credits: 3.00

COM 41500 - Discussion Of Technical Problems

Credit Hours: 3.00. Principles of speech communication related to interpersonal and group discussions on technical topics and problems; practice in using these modes in situations typically encountered by technologists.

Credits: 3.00

CNIT 31500 - Systems Programming

Credit Hours: 3.00. This course introduces concepts of lower level systems programming in C/C++ on a UNIX/Linus operation system platform. Command level development, algorithms, data structures, iteration and recursion, algorithms and analysis will be covered.

Learning Outcomes: 1. Develop applications for the command line. 2. Identify number systems and perform arithmetic operations. 3. Develop programs on Linux/UNIX operating systems. 4. Develop C/C++ programming proficiency. 5. Explain and use linear and tree-based data structures and algorithms. 6. Analyze algorithms. 7. Explain and use iteration and recursion. 8. Explain and use techniques of memory management. 9. Explain and use object-oriented programming in systems environments. 10. Explain and use text and binary file I/O. Credits: 3.00

CNIT 32500 - Object-Oriented Application Development

Credit Hours: 3.00. This course focuses on using object-oriented programming languages in the development of modern, business applications. Topics include object-oriented design, encapsulation, object interfaces, inheritance, aggregation, abstract classes, polymorphism, data structures, and exception handling.

Learning Outcomes: 1. Understand object-oriented concepts and architectures. 2. Understand software development motivations to use object-oriented design and development. 3. Demonstrate how to design and create classes and objects. 4. Understand the use of polymorphism and overloading. 5. Demonstrate how to design and use inheritance. 6. Understand how to apply a high-level integrated development environment to develop systems. 7. Demonstrate how to design, use and extend exception handling. 8. Demonstrate how to design, use and extend textual and binary data streams. 9. Understand how to integrate persistent data storage using RDBMS. 10. Understand the development of distributed systems and n-level architectures. Credits: 3.00

ECON 25200 - Macroeconomics (UCC: BSS)

Credit Hours: 3.00. This course examines how the US economy functions and provides an overview of important macroeconomic issues including: unemployment, inflation, social security, national debt, international trade, the sub-prime crisis, and business cycles. Emphasis is placed upon the role and limits of government fiscal and monetary policy in promoting economic growth and stable prices. CTL: ISH 1041 Macroeconomics

University Core Curriculum (UCC): (UCC: BSS)

Learning Outcomes: 1. Understand the causes of economic prosperity. 2. Recognize the causes and effects of unemployment, inflation, and business cycles. 3. Demonstrate an understanding of monetary and fiscal policy options as they relate to economic stabilization. 4. Critically assess economic information contained in news reports, policymakers' statements, and specialized publications.

Credits: 3.00

ECON 25100 - Microeconomics (UCC: BSS)

Credit Hours: 3.00. Microeconomics studies the choices individuals make and the incentives that influence those choices. Emphasis is on the incentives that determine market prices and resource allocation. The role of public policy in influencing incentives and efficiency is also addressed. CTL:ISH 1042 Microeconomics

University Core Curriculum (UCC): (UCC: BSS)

Learning Outcomes: 1. Calculate economic costs and benefits relevant for making rational decisions. 2. Identify factors that influence demand, supply, and market equilibrium. 3. Evaluate efficiency and equity of market

equilibrium and the role of government in achieving efficiency and equity. Credits: 3.00

ECON 21000 - Principles Of Economics (UCC: BSS)

Credit Hours: 3.00. This course presents the principles upon which the social science of economics is based. Specifically, it examines how individuals, firms, and the government interact through markets. It also examines several important macroeconomic issues including unemployment, inflation, international trade, and economic growth. Students are expected to be able to apply these economic principles to analyze current events, work decisions, and personal choices. CTL:ISH 1040 Introduction To Economics

University Core Curriculum (UCC): (UCC: BSS) Learning Outcomes: 1. Identify costs and benefits involved in economic decision making. 2. Predict market equilibrium and changes in equilibrium. 3. Evaluate the efficiency of market equilibrium. 4. Express and interpret economic theories and data using various visual representations (e.g., graphs, tables, charts). 5. Calculate basic measures of macroeconomic performance and the forces that influence those measures. Credits: 3.00

MGMT 21200 - Business Accounting

Credit Hours: 3.00. The two primary objectives are to teach the skills to produce financial information-to send the relevant signals to decision makers; and to teach the skills to interpret the financial report-to receive the signals. To meet these objectives the students will gain an understanding of the reasoning behind the processes used to record financial information and the manner in which it is reported to external decision makers; gain an understanding of the four basic statements; and an understanding of the importance of financial statement information in interpreting the performance of organizations.

Learning Outcomes: 1. Teach basics of accounting to students as future business owners and employees. 2. Establish communications with accountants and financial advisors when entering the workforce. Credits: 3.00

MGMT 20000 - Introductory Accounting

Credit Hours: 3.00. The objectives of the course are to help students: (1) understand what is in financial statements and what the statements say about a business, (2) identify the business activities that caused the amounts that appear in the statements, and (3) understand how, when, and at what amount the effects of manager and employee actions will appear in the statements. CTL:IPO 1801 Accounting I

Learning Outcomes: 1. Gain an understanding of accounting terminology, principles and concepts. 2. Learn how business events and transactions are reported in financial statements. 3. Prepare basic financial statements for a business. 4. Analyze financial statements to assess the performance and risk of a business. 5. Learn how financial information is utilized in the decision-making process. Credits: 3.00

15 Credits

Spring 3rd Year

ENGL 41900 - Multimedia Writing

Credit Hours: 3.00. Explores the rhetorical and cultural aspects of multimedia design, implementation and publishing. Students will create a broad spectrum of multimodal texts such as digital videos, podcasts and Web sites. The course focuses on preparing students to adapt to ever-changing media landscapes.

Learning Outcomes: 1. Use theories of rhetoric to develop texts, think critically, solve problems, and engage with the needs of diverse audiences. 2. Apply data-driven approaches to specific rhetorical contexts, problems, and situations. 3. Design multimedia documents and digital texts that include attention to accessibility and usability. 4. Communicate complex information via a variety of mediums and or genres. 5. Use common tools for creating multimedia and integrating visuals in written documents. Credits: 3.00

ENGL 42000 - Business Writing

Credit Hours: 3.00. This course helps students become better business writers, across a wide range of audiences, for multiple

purposes, and in a variety of media. This course engages business-related material with an awareness of audience needs and contexts. It prepares students to address problems in the workplace, social, or global levels.

Learning Outcomes: 1. Use theories of rhetoric to develop texts, think critically, solve problems, and engage with the needs of diverse audiences. 2. Apply data-driven approaches to specific rhetorical contexts, problems, and situations. 3. Compose effective, field-specific business documents through a process of analysis and revision. 4. Create business documents in collaborative, distributed, and/or networked environments. 5. Adapt to workplace specific writing practices. Credits: 3.00

ENGL 42100 - Technical Writing

Credit Hours: 3.00. This course teaches the practice and principles of technical writing. The course emphasizes rhetorical approaches to research and writing, teaching concepts such as usability and accessibility. Students write diverse technical documents such as memos, technical reports, documentation and websites.

Learning Outcomes: 1. Use theories of rhetoric to develop texts, think critically, solve problems, and engage with the needs of diverse audiences. 2. Apply data-driven approaches to specific rhetorical contexts, problems, and situations. 3. Communicate complex technical information, processes and procedures in a variety of genres. 4. Compose effective, industry specific, technical documents that emphasize the importance of usability and accessibility for the rapidly changing field of technical writing. 5. Produce team-written technical projects for specific contexts and industries. Credits: 3.00

CNIT 37200 - Database Programming

Credit Hours: 3.00. This course explores advanced database programming techniques for enterprise-wide databases and their implementation. It uses programmatic extensions to Structured Query Language (SQL) supported by today's enterprise-class Relational Database Management Systems (RDBMS). Topics include advanced data manipulation, storage considerations, data transformation techniques to enhance interoperability of data, stored procedure and trigger design and implementation, and query optimization.

Learning Outcomes: 1. Deconstruct and explain database management system concepts and workable alternatives for contemporary database implementations. 2. Translate how triggers, procedures, and functions form the basis of methods that can be used to implement object-oriented capabilities in a relational database environment. 3. Analyze and improve declarative integrity constraints and security concerns in database implementation. 4. Design and apply triggers, procedures, and constraints for a given database model. Credits: 3.00

CNIT 39200 - Enterprise Data Management

Credit Hours: 3.00. This course examines advanced design techniques and physical issues relating to enterprise-wide data management. Topics include advanced design concepts, enhanced modeling and constructs, objects and unstructured and semi-structured data in databases, data management in non-business contexts, implementation of an enterprise data architecture, and data quality and stewardship.

Learning Outcomes: 1. Describe and apply enterprise information solutions through the design and implementation of architectures for complex databases. 2. Create and analyze a database solution based on user needs, physical and logical design options, and environmental constraints. 3. Use Entity/Relationship Modeling and database normalization techniques based on business requirements. Credits: 3.00

CNIT 32000 - Policy, Regulation, And Globalization In Information Technology

Credit Hours: 3.00. This course provides students with opportunities to study how technology is intertwined with larger economic, social, cultural, and ethical dynamics in an era of intensified globalization. The course examines technology in a global environment. Students will explore concepts and issues related to law, policy, regulation, outsourcing, offshoring, globalization, global competitiveness, global communications, cultural differences and quality of life issues. Students will

examine ethical situations that arise as a result of the impact of technology. In summary, the course is designed to help students understand what it means to identify as, and/or work with, technology in a global environment.

Learning Outcomes: 1. Understand cultural traditions, societal ethics and the impact of culture on industry. 2. Understand issues with leading international teams and managing international projects. 3. Identify and apply public policy issues relevant to technology solutions. 4. Understand the logistics of international travel including the use of passports and visas. 5. Identify, apply and understand organizational ethics including conflicts of interest and individual ethical responsibilities. Credits: 3.00

15 Credits

Fall 4th Year

CNIT 48000 - Managing Information Technology Projects

Credit Hours: 3.00. This course introduces the application of knowledge, skills, tools, and techniques that project managers use to plan, staff, estimate, and manage information technology projects. Special emphasis is placed on learning and applying the concepts of managing scope, risk, budget, time, expectations, quality, people, communications, procurement, and externally provided services. Students will apply project management technology and techniques to business problems.

Learning Outcomes: 1. Understand the genesis of project management and its importance to improving the success of information technology projects. 2. Demonstrate knowledge of project management terms and techniques. 3. Use Microsoft Project and other software to help plan and manage information technology projects. 4. Appreciate the importance of good project management. Credits: 3.00

Spring 4th Year

15 Credits

Computer Engineering Technology, BS

About the Program

Degree Requirements

Departmental/Program Major Courses (52 credits)

Required Major Courses (49 credits)

ECET 17700 - Data Acquisition And Systems Control

Credit Hours: 3.00. Fundamental electrical parameters and measurement techniques are introduced. These are then applied to implementing power interfaces, actuators and sensors. Modules that provide signal conditioning, data conversion, filtering and controllers are evaluated. A full, closed loop control system is built and evaluated.

Learning Outcomes: 1. Make laboratory measurements using digital multi-meters, oscilloscopes, and a microcomputer. 2. Implement and evaluate the performance of each of the following elements at the module level while calculating key circuit parameters: Switching and linear power interfaces; Light, sound, motion, and temperature actuators and sensors; Amplifiers, signal conversion, and filters. On/off, linear, and computer controllers. 3. Evaluate the static and the dynamic performance of a closed loop system constructed of the elements from items 1 and 2 above. Credits: 3.00

ECET 17900 - Introduction To Digital Systems

Credit Hours: 3.00. This course introduces computing systems and defines the major classes of computing devices. Sequential and concurrent operations, along with logic and control structures, are covered. Knowledge of fundamental computing principles is discovered. Common software tools are used to create, test, and debug systems. Systems are constructed from standard blocks with a focus on subsystem operation and performance, troubleshooting/debugging and testing. Common applications of embedded systems are introduced.

Learning Outcomes: 1. Develop and utilize algorithms and flowcharts to create microcontroller applications to solve a given problem. 2. Apply the fundamental control structures and logic operations to control program flow within microcontroller applications. 3. Demonstrate the ability to convert numbers between number systems (bases) and compute arithmetic operations within microcontroller applications. 4. Utilize the primary tools used to create, test, and debug computing system hardware and software components. 5. Construct electronic hardware systems to solve a given microcontroller problem. Credits: 3.00

ECET 22700 - DC And Pulse Electronics

Credit Hours: 3.00. Capacitors, inductors, oscillators, rectifiers, bipolar and MOSFET power switches, switching power supplies, half-and full-H bridges, switching audio power amplifiers, and linear regulators are studied. Computer-aided analysis of circuits is utilized.

Learning Outcomes: 1. Explain the characteristics of capacitors, inductors, rectifier diodes, Zener diodes, IC regulators, bipolar junction transistors (BJTs), field effect transistors (MOSFETS), and general purpose operational amplifiers. 2. Apply the principles of circuit analysis to the following: switching and linear power supplies, op-amp based amplifiers, BJT and MOSFET switches, Class D amplifier, wave shape generators, RC and RL circuits. 3. Simulate circuits and compare actual data to simulated data. 4. Construct electronic circuit according to a given schematic. 5. Measure electrical parameters, using digital multimeters, signal generators, and oscilloscopes. 6. Interpret laboratory experiment data. Credits: 3.00

ECET 22900 - Concurrent Digital Systems

Credit Hours: 3.00. This course establishes a foundation for concurrent digital systems. Common methods of describing digital circuit operation are studied along with the techniques for translation between any two methods. Basic building blocks of digital systems are defined and applied. Analysis techniques for combinational and sequential logic circuits or subsystems are covered. Computer-based development tools, programmable logic devices, and technical reference sources are used to build, test, and evaluate digital systems.

Learning Outcomes: 1. Translate between any two forms of logic circuit descriptions: English, Boolean equation, Truth Table, Logic Diagram, Timing Diagram, Hardware Description language. 2. Anticipate the output of functional blocks given the current inputs or a recent event. 3. Validate the operation of any logic circuit using the simulator, Function generator, oscilloscope or DVM. Credits: 3.00

ECET 27000 - Electronics Prototype Development And Construction

Credit Hours: 3.00. This course introduces project planning and basic concepts in electronic design automation (EDA). The student develops a portion of an electronic system by utilization of EDA, design for testing, design for manufacturability (DFM), and component selection techniques. New construction methods and testing techniques are introduced.

Learning Outcomes: 1. Design an electronic device or system to accomplish a given task. 2. Demonstrate appropriate electronic assembly techniques. 3. Develop and execute appropriate testing techniques on electronic devices and systems. 4. Apply appropriate software applications to develop a prototype. 5. Apply graphical communication techniques to convey technical information. 6. Apply principles of design for manufacturability and design for testing to a project. 7. Employ teaming methods on a project. Credits: 3.00

ECET 27400 - Wireless Communications

Credit Hours: 3.00. The theory and techniques of wirelessly sending information (voice, music, data) from one location to another is studies from a systems point of view. This includes a signal analysis, modulation techniques, transmitters, receivers, low noise amplifiers, and filters in the RF frequency spectrum. In addition, special topics of current interest are introduced. This course incorporated a student-based communication design and analysis laboratory.

Learning Outcomes: 1. Perform power calculations, such as dB, dBm, dBuV. 2. Describe, identify and apply Fourier concepts communication signals and systems, such as wave shapes, signal mixing, carrier waves. 3. Evaluate, describe and calculate the effects of noise on communication circuits and systems. 4. Demonstrate the concepts and applications of amplitude, frequency, and phase modulation techniques. 5. Describe and compare the operation of various receiver and transmitter blocks and systems. 6. Describe and apply the concepts of EMC, EMI and RFI to RF components, circuits and systems. 7. Describe and apply the fundamentals of cellular communication, such as frequency reuse, spread spectrum techniques and network technologies. 8. Describe and apply the fundamentals of digital communications, such as coding, bandwidth and modulation techniques. 9. Demonstrate use of RF laboratory equipment including the spectrum analyzer and RF generator. Credits: 3.00

ECET 27900 - Embedded Digital Systems

Credit Hours: 3.00. A course emphasizing the advanced applications of embedded digital systems. Topics include embedded system architecture, use of advanced programmable counter/timer arrays, analog interfaces, serial communication, and interrupts.

Learning Outcomes: 1. Solve problems by the application of C programs emphasizing I/O and peripherals. 2. Demonstrate knowledge and skill in the application of parallel ports, counter-timers, programmable counter arrays, serial ports and interrupts. 3. Demonstrate a conceptual understanding of embedded microcontroller system hardware system design. 4. Demonstrate the use of software development tools such as an editor, an assembler, a C compiler, a linker and locator, an object-to-hex converter, etc. 5. Demonstrate fluency in the language of advanced microprocessors. Credits: 3.00

ECET 32900 - Advanced Embedded Digital Systems

Credit Hours: 3.00. This course focuses on the study and application of real-time embedded systems. Real-time operating systems (RTOS) are introduced and applied. Students learn and use programming and scripting languages to discover the advantages and limitations of RTOS application in the lab.

Learning Outcomes: 1. Define, compare and contrast embedded systems terms and the concepts of soft and hard real time. 2. Identify and explain real time operating system operational concepts. 3. Demonstrate the application of software design, documentation, and version control tools. 4. Demonstrate the application of an RTOS application programming interface and testing techniques to evaluate embedded system functional correctness and performance. Credits: 3.00

ECET 33900 - Digital Signal Processing

Credit Hours: 3.00. The course introduces students to the fundamental principles associated with processing discrete time signals. The architecture, instruction set and hardware and software development tools associated with a fixed point general purpose VLSI digital signal processor are examined. Some common real-time applications are implemented such as digital filters and DFT-based spectral estimation on a typical fixed point digital signal processor.

Learning Outcomes: 1. Describe the architectural features of a DSP and relate these to the DSP kernel equation. 2. Manipulate different binary number formats associated with a fixed point DSP. 3. Develop and debug simple programs that involve SOPs, modulo addressing, scaling and extraction of result, and common DSP program structures. 4. Describe

the consequences and limitations of sampling baseband signals including the Nyquist rate and bandwidth, quantization noise, aliasing, frequency folding, reconstruction, spectrum of sampled baseband signals. 5. Express a sampled deterministic analog signal in closed mathematical form and expanded form using the unit sample. 6. Express a sampled signal in terms of the Z transform, in expanded and closed form. 7. Describe the relationship between the transfer function and impulse response in an LTI system. 8. Describe the operation of convolution and its implementation using hand calculations, mathematical software packages, and a fixed-point DSP. 9. Design and analyze FIR filters with the aid of a mathematical software package such as MATLAB. Credits: 3.00

ECET 34900 - Advanced Digital Systems

Credit Hours: 3.00. This course investigates complex digital systems that are implemented with field programmable gate arrays (FPGAs) using concurrent and sequential digital design techniques. Applications will include interfacing with analog signals and memory systems.

Learning Outcomes: 1. Design FPGA solutions for given digital design problems using a hardware description language (HDL). 2. Design FPGA solutions for given digital problems using a high-level sequential programming language for embedded processors. 3. Design FPGA solutions by decomposing a system into concurrent and sequential functional blocks and using hierarchical system development techniques. 4. Verify digital designs using simulation and hardware prototyping. 5. Analyze and design memory subsystems. 6. Apply ADC and DAC circuits to interface digital systems with analog devices/systems. Credits: 3.00

ENGT 18200 - Gateway To Engineering Technology

Credit Hours: 4.00. This course introduces School of Engineering Technology students to the resources and skills needed to define and solve technical problems, which will help them be successful in their studies and ultimately in their careers. Instruction is given in analytical and computational problem-solving techniques. The application of software for analysis and problem-solving is emphasized. Foundational principles for electrical, industrial, manufacturing, and mechanical engineering technology are studied. Teamwork, global and societal concerns, and professional ethics are integrated into course.

Learning Outcomes: 1. Develop an academic pathway for success in the student's selected major. 2. Select appropriate strategies and technologies to solve technical problems. 3. Apply foundational principles and tools of electrical, industrial, manufacturing, and mechanical engineering technology to address technical problems. 4. Apply computational tools to address technical problems. 5. Work in a team to solve an engineering technology problem. 6. Demonstrate awareness of professional standards, practices, culture, and issues in engineering technology. Credits: 4.00

Other Departmental/Program Course Requirements (65 credits)

AGEC 33000 - Management Methods For Agricultural Business

Credit Hours: 3.00. Management of nonfarm, agriculturally related businesses. Topics include tools for management decision making, legal forms of business organization, basics of accounting, and important financial management techniques. Case studies and computer simulation game.

Credits: 3.00

AGEC 35200 - Quantitative Techniques For Firm Decision Making

Credit Hours: 3.00. Introduction to mathematical programming and computing as an aid to agricultural decision making by firms, linear programming, game theory and strategy, simulation, the waiting-line problem, the equipment replacement decision, and multiproduct scheduling methods.

Learning Outcomes: 1. Manipulate and use spreadsheets. 2. Formulate linear programming problems. 3. Solve linear programming problems in Excel. 4. Interpret results obtained

from linear programming models. 5. Present and explain linear programming results. 6. Understand graphically the concept of optimality in a linear program. 7. Understand the properties of optimal linear programming solutions. 8. Recognize and demonstrate instances where linear programming and simulation modeling might be valuable. Credits: 3.00

COM 11400 - Fundamentals Of Speech Communication (UCC: OC)

Credit Hours: 3.00. A study of communication theories as applied to speech; practical communicative experiences ranging from interpersonal communication and small group process through problem identification and solution in discussion to informative and persuasive speaking in standard speaker-audience situations. NOTE: Concurrent registration is not permitted for ENGL 10600 and COM 11400. CTL:ICM 1103 Fundamentals Of Public Speaking

University Core Curriculum (UCC): (UCC: OC) Credits: 3.00

ENGL 10600 - First Year Composition With Conferences (UCC: IL/WC)

Credit Hours: 4.00. This 4-credit hour composition course includes student-teacher conferences. Students in this course produce between 7,500-11,500 words of polished writing (or 15,000-22,000 total words, including drafts or the equivalent). Within the course, students will learn to write with a rhetorical awareness of diverse audiences, situations, and contexts; critically think about writing and rhetoric through reading, analysis, and reflection; provide constructive feedback and incorporate feedback into their own writing; perform research and evaluate sources to support claims; and engage multiple digital technologies for different purposes.

University Core Curriculum (UCC): (UCC: IL/WC) Learning Outcomes: 1. Demonstrate rhetorical awareness of diverse audiences, situations, and contexts. 2. Compose a variety of texts in a range of forms, equaling at least 7,500-11,500 words of polished writing (or 15,000-22,000 words, including drafts). 3. Critically think about writing and rhetoric through reading, analysis, and reflection. 4. Provide constructive feedback to others and incorporate feedback into their writing. 5. Perform research and evaluate sources to support claims. 6. Engage multiple digital technologies to compose for different purposes. Credits: 4.00

ENGL 10800 - First Year Composition (UCC: IL/WC)

Credit Hours: 3.00. In this 3-credit hour composition course students should expect an emphasis on self-guided work. Students in this course produce between 7,500-11,500 words of polished writing (or 15,000-22,000 total words, including drafts or the equivalent). Within the course, students will learn to write with a rhetorical awareness of diverse audiences, situations, and contexts; critically think about writing and rhetoric through reading, analysis, and reflection; provide constructive feedback and incorporate feedback into their own writing; perform research and evaluate sources to support claims; and engage multiple digital technologies for different purposes.

University Core Curriculum (UCC): (UCC: IL/WC) Learning Outcomes: 1. Demonstrate rhetorical awareness of diverse audiences, situations, and contexts. 2. Compose a variety of texts in a range of forms, equaling at least 7,500-11,500 words of polished writing (or 15,000-22,000 words, including drafts). 3. Critically think about writing and rhetoric through reading, analysis, and reflection. 4. Provide constructive feedback to others and incorporate feedback into their writing. 5. Perform research and evaluate sources to support claims. 6. Engage multiple digital technologies to compose for different purposes. Credits: 3.00

ENGL 20500 - Introduction To Creative Writing

Credit Hours: 3.00. Practice in writing short prose narratives and poetry for students who have finished composition and wish to develop their skills further. Workshop criticism. CTL:IEL 1230 Introduction To Creative Writing

Learning Outcomes: 1. Compose original poetry. 2. Compose original fiction. 3. Analyze and critique peer work by using the vocabulary of craft.. Credits: 3.00

ENGL 30400 - Advanced Composition (UCC: IL/WC)

Credit Hours: 3.00. Designed for students who wish additional training in composition beyond the basic requirements. Extensive practice in the writing of mature expository, critical, and argumentative prose. (The course satisfies the Indiana

certification requirement of three hours of advanced composition.)

University Core Curriculum (UCC): (UCC: IL/WC) Learning Outcomes: 1. Produce over 8,000 words of polished, rhetorically effective writing, fit for the academy, work, and civic life. 2. Use strategies of close reading and sound research methods for depth of understanding, expansion of knowledge, and honing critical acumen. 3. Apply rhetorical principles and techniques to a variety of writing tasks. 4. Read primary texts on rhetorical history and theory in order to understand them and use them. 5. Expand your knowledge of how persuasion permeates all aspects of life - verbal, visual, and material and increased your ability to discern better and worse forms of influence and argument. Credits: 3.00

ENGL 42000 - Business Writing

Credit Hours: 3.00. This course helps students become better business writers, across a wide range of audiences, for multiple purposes, and in a variety of media. This course engages business-related material with an awareness of audience needs and contexts. It prepares students to address problems in the workplace, social, or global levels.

Learning Outcomes: 1. Use theories of rhetoric to develop texts, think critically, solve problems, and engage with the needs of diverse audiences. 2. Apply data-driven approaches to specific rhetorical contexts, problems, and situations. 3. Compose effective, field-specific business documents through a process of analysis and revision. 4. Create business documents in collaborative, distributed, and/or networked environments. 5. Adapt to workplace specific writing practices. Credits: 3.00

ENGL 42100 - Technical Writing

Credit Hours: 3.00. This course teaches the practice and principles of technical writing. The course emphasizes rhetorical approaches to research and writing, teaching concepts such as usability and accessibility. Students write diverse technical documents such as memos, technical reports, documentation and websites.

Learning Outcomes: 1. Use theories of rhetoric to develop texts, think critically, solve problems, and engage with the needs of diverse audiences. 2. Apply data-driven approaches to specific rhetorical contexts, problems, and situations. 3. Communicate complex technical information, processes and procedures in a variety of genres. 4. Compose effective, industry specific, technical documents that emphasize the importance of usability and accessibility for the rapidly changing field of technical writing. 5. Produce team-written technical projects for specific contexts and industries. Credits: 3.00

CNIT 10500 - Introduction To C Programming

Credit Hours: 3.00. This course is an introduction to computer programming using the "C" language. The emphasis is on structured programming principles, and understanding the basic concepts that apply to engineering problems. Among topics covered in this course are: problem solving using top down design, using flowcharts to explain the program logic, selection structure, repetition structure, bitwise operations, arrays, pointers, strings, passing arguments, and sequential files.

Learning Outcomes: 1. Practice and apply basic programming concepts in weekly labs and assignments. 2. Construct programming solutions using different coding structures in C. 3. Illustrate the ability to design and build user defined functions in C. 4. Practice the use of one-dimensional Arrays, Struct, and Files in C programing. Credits: 3.00

CNIT 17600 - Information Technology Architectures

Credit Hours: 3.00. A conceptual and technological survey of information technology architectures inclusive of operating systems, network operating systems, distributed systems architectures, and distributed application architectures. Interoperability between these architectural components is explored. Current technology and trends in each architectural element are reviewed. PC literacy required.

Learning Outcomes: 1. Describe complexities, interoperations, & integration of hardware and software system components and architectures. 2. Analyze and describe operating systems,

resource management, & security functions. 3. Apply knowledge of system architecture to solve complex problems. Credits: 3.00

CNIT 18000 - Introduction To Systems Development

Credit Hours: 3.00. This course introduces information systems development. Topics include types of information systems, system development, database management systems, and problem solving. Students will read/create UML, ERD, and data flow diagrams to model information system objects, data, processes, and logic. Labs emphasize modeling and SQL/QBE querying to prepare students for later systems, programming, and database classes. Given user requirements students will design, construct, and test a personal computer information system. PC literacy required.

Learning Outcomes: 1. Construct information systems using appropriate tools and techniques. 2. Demonstrate system modeling concepts, tools, and techniques. 3. Analyze data design concepts and data structures. 4. Apply systems development life cycle (SDLC) concepts. 5. Identify information systems components. Credits: 3.00

CNIT 25501 - Object-Oriented Programming Introduction

Credit Hours: 3.00. This course introduces software development concepts common to modern object-oriented programming languages. Topics include: intermediate data types, decisions, repetitive structures; methods; arrays and collections; encapsulation, inheritance, and polymorphism; exception handling; data persistence; Database Management System (DBMS) connectivity; user interface construction; software testing and debugging; and working in teams.

Learning Outcomes: 1. Build and apply object-oriented design concepts on a regular basis through exercises and labs. 2. Construct a complex project. Credits: 3.00

CS 15900 - C Programming

Credit Hours: 3.00. Fundamental principles, concepts, and methods of programming in C, with emphasis on applications in the physical sciences and engineering. Basic problem solving and programming techniques; fundamental algorithms and data structures; and use of programming logic in solving engineering problems. Students are expected to complete assignments in a collaborative learning environment. Credit cannot be obtained for both CS 15900 and any of CS 15600, CS 15800 and CS 18000.

Learning Outcomes: 1. Understand the fundamental principles, concepts and methods of computer programming. 2. Use the C programming language to developing solutions in the domains of physical sciences, mathematics, and engineering. 3. Demonstrate the ability to function as part of a technical team to generate a solution to a programming problem. 4. Analyze alternative algorithm designs to implement solutions that make efficient use of limited resources of the computer. Credits: 3.00

MA 16010 - Applied Calculus I (UCC: QR)

Credit Hours: 3.00. Topics include trigonometric and exponential functions; limits and differentiation, rules of differentiation, maxima, minima and optimization; curve sketching, integration, anti-derivatives, fundamental theorem of calculus. Properties of definite integrals and numerical methods. Applications to life, managerial and social sciences. CTL:IMA 1604 Calculus - Short I

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. To create functional models and simplify difference quotients, compute limits of functions and apply limit laws. 2. To compute derivatives of elementary functions, including exponential, logarithmic and trigonometric functions, and apply rules of differentiation. 3. To sketch the graph of functions with the help of differentiation techniques, find maxima and minima of functions; optimization problems. 4. To computes integrals of some elementary functions and apply the Fundamental Theorem of Calculus. 5. Topics to be covered at a level required to perform standard applications related to life sciences, management and technology. Credits: 3.00

MA 16020 - Applied Calculus II (UCC: QR)

Credit Hours: 3.00. This course covers techniques and applications of integration; infinite series; differentiation and integration of functions of several variables; maxima and minima, optimization; differential equations and initial value

problems. CTL:IMA 1605 Calculus - Short II

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Use techniques of integration to find areas between curves and compute volumes of solids of revolution. 2. Analyze the convergence of infinite series and power series, Taylor series expansions. 3. Compute derivatives of functions of several variables and use them to find maxima and minima of functions. 4. Perform multiple iterated integration. 5. Use differential equations for modeling simple real-life situations. 6. Solve first order linear initial value problems and separable equations. 7. Topics to be covered at a level required to perform standard applications related to life sciences, management and technology. Credits: 3.00

MA 16100 - Plane Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 5.00. Introduction to differential and integral calculus of one variable, with applications. Some schools or departments may allow only 4 credit hours toward graduation for this course. Designed for students who have not had at least a one-semester calculus course in high school, with a grade of "A" or "B". Not open to students with credit in MA 16500 . Demonstrated competence in college algebra and trigonometry.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions Credits: 5.00

MA 16200 - Plane Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 5.00. Continuation of MA 16100 . Vectors in two and three dimensions, techniques of integration, infinite series, conic sections, polar coordinates, surfaces in three dimensions. Some schools or departments may allow only 4 credit hours toward graduation for this course.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 5.00

MA 16500 - Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 4.00. Introduction to differential and integral calculus of one variable, with applications. Conic sections. Designed for students who have had at least a one-semester calculus course in high school, with a grade of "A" or "B", but are not qualified to enter MA 16200 or MA 16600 or the advanced placement courses MA 17300 or the honors calculus course MA 18100. Demonstrated competence in college algebra and trigonometry. CTL:IMA 1602 Calculus - Long I

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems. 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions. Credits: 4.00

MA 16600 - Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 4.00. Continuation of MA 16500 . Vectors in two and three dimensions. Techniques of integration, infinite series, polar coordinates, surfaces in three dimensions. Not open to students with credit in MA 16200 . CTL:IMA 1603 Calculus - Long II

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 4.00

PHYS 17200 - Modern Mechanics (UCC: SCI)

Credit Hours: 4.00. Introductory calculus-based physics course using fundamental interactions between atoms to describe Newtonian mechanics, conservation laws, energy quantization, entropy, the kinetic theory of gases, and related topics in mechanics and thermodynamics. Emphasis is on using only a few fundamental principles to describe physical phenomena extending from nuclei to galaxies. 3-D graphical simulations and numerical problem solving by computer are employed by the student from the very beginning. CTL:IPS 1753 Calculus-based Physics I

University Core Curriculum (UCC): (UCC: SCI) Learning Outcomes: 1. Understand and describe a wide range of physical phenomena in mechanics and thermodynamics using only a few fundamental principles of physics. 2. Learn a unified approach that relates microscopic behavior to macroscopic behavior. 3. Model natural phenomena quantitatively. 4. Apply all this to a range of topics related to mechanics and thermodynamics. Credits: 4.00

PHYS 22000 - General Physics (UCC: SCI)

Credit Hours: 4.00. Mechanics, heat, and sound, for students not specializing in physics. CTL:IPS 1751 Algebra-based Physics I

University Core Curriculum (UCC): (UCC: SCI) Learning Outcomes: 1. Be familiar with the important modes of human thought that are the foundations of science. 2. Possess effective foundation skills: read, write, and speak with comprehension, clarity and precision; identify substantive knowledge and disciplinary methods; develop information literacy skills; reason quantitatively as means of gaining and creating knowledge and drawing reliable conclusions. 3. Demonstrate the ability to think critically and to solve problems using the foundation skills: evaluate their ideas and the ideas of others based upon disciplined reasoning; understand the traditions that have formed one's own and other cultures; be able to articulate their ideas in appropriate media. Credits: 4.00

PHYS 22100 - General Physics (UCC: SCI)

Credit Hours: 4.00. Electricity, light, and modern physics, for students not specializing in physics. CTL:IPS 1752 Algebra-based Physics II

University Core Curriculum (UCC): (UCC: SCI) Credits: 4.00

PHYS 24100 - Electricity And Optics (UCC: SCI)

Credit Hours: 3.00. Electrostatics, current electricity, electromagnetism, magnetic properties of matter. Electromagnetic waves, geometrical and physical optics.

University Core Curriculum (UCC): (UCC: SCI) Credits: 3.00

PHYS 27200 - Electric And Magnetic Interactions (UCC: SCI)

Credit Hours: 4.00. Calculus-based physics course using concepts of electric and magnetic fields and an atomic description of matter to describe polarization, fields produced by

charge distributions, potential, electrical circuits, magnetic forces, induction, and related topics, leading to Maxwell's equations and electromagnetic radiation and an introduction to waves and interference. 3-D graphical simulations and numerical problem solving by computer are employed throughout.

University Core Curriculum (UCC): (UCC: SCI) Learning Outcomes: 1. Understand and describe a wide range of physical phenomena in electricity and magnetism using only a few fundamental principles of physics. 2. Learn a unified approach that relates microscopic behavior to macroscopic behavior. 3. Model natural phenomena quantitatively. 4. Apply all this to a range of topics related to electricity and magnetism. Credits: 4.00

STAT 22500 - Introduction To Probability Models

Credit Hours: 3.00. An introduction to basic probability. Emphasis is placed on formulation of models and applications. Probability calculus, standard distributions, random variables, and moments. Credit cannot be given for more than one of STAT 22500, 31100, or 41600.

Learning Outcomes: 1. Understand basic terminology, set theory, and counting rules related to probability. 2. Identify various discrete and continuous probability models/distributions and apply them to answer probability questions. 3. Understand the Normal distribution and how to use the Standard Normal Table. 4. Understand basic terms, graphs, and symbols and be able to interpret statistics in the media. 5. Have a foundation in statistical methodology including the basics of hypothesis testing. Credits: 3.00

STAT 30100 - Elementary Statistical Methods (UCC: IL)

Credit Hours: 3.00. Introduction to statistical methods with applications to diverse fields. Emphasis on understanding and interpreting standard techniques. Data analysis for one and several variables, design of samples and experiments, basic probability, sampling distributions, confidence intervals and significance tests for means and proportions, correlation and regression. Software is used throughout. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, 35000, 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: college algebra.

University Core Curriculum (UCC): (UCC: IL) Learning Outcomes: 1. Students will be introduced to statistical methods and be able to apply them to multiple fields of study. 2. Students will be able to understand, interpret standard statistical techniques, analyze data for one variable and for several variables, calculate and use confidence intervals and significance test for means and proportions, understand the design of samples and experiments, perform and understand basic probability calculations, perform simple and multiple regression procedures, and understand correlation. Credits: 3.00

TECH 12000 - Design Thinking In Technology (UCC: IL/STS)

Credit Hours: 3.00. Student will engage in critical analysis of real-world problems and global challenges. They will demonstrate the ability to recognize opportunity and to take initiative in developing solutions applying the principles of human centered design. Students will be able to communicate effectively and to work well on teams. Problems and solutions will be examined from societal, cultural, and ethical perspectives.

University Core Curriculum (UCC): (UCC: IL/STS) Learning Outcomes: 1. Write a narrowly focused problem statement. 2. Apply ethnographic methods to understand technological problems. 3. Develop a search strategy, access technical databases and evaluate results and source quality. 4. Create a technical report documenting results of the design process. 5. Manage design projects, develop project timelines and negotiate individual responsibilities and accountability in the team environment. 6. Apply strategies of ideation to develop novel and innovation solutions. 7. Demonstrate rapid prototyping solutions for purposes of design, testing and communication. Credits: 3.00

IET 33400 - Economic Analysis For Technology Systems

Credit Hours: 3.00. This course examines techniques of

economic analysis for systems technologists, engineers, and leaders who evaluate and determine the financial attractiveness of multiple alternatives. Emphasizes economic feasibility and applying time value of money concepts to cost-volume-profit decisions. Topics include present worth, rate of return, benefit-cost, payback, breakeven analysis, depreciation, economic optimization, and decision-making under uncertainty.

Learning Outcomes: 1. Apply compound interest factors to establish economic equivalencies. 2. Use present worth analysis to evaluate alternatives. 3. Use annual worth analysis to evaluate alternatives. 4. Calculate the internal rate of return for a project. 5. Apply economic analysis concepts to personal finances. Credits: 3.00

HONR 19903 - Interdisciplinary Approaches In Writing (UCC: IL/WC)

Credit Hours: 3.00. This course is a writing-intensive course in which students learn how to find, evaluate, and use credible information, how to express themselves well in a variety of different written genres, and how to write for different audiences.

University Core Curriculum (UCC): (UCC: IL/WC) Learning Outcomes: 1. The ability to express themselves in writing clearly and concisely. 2. An understanding of different written genres and their characteristics. 3. An understanding of context and audience. 4. The ability to select and convey the appropriate content. 5. The ability to organize and format a written work. 6. An awareness and appreciation of writing style. 7. The ability to comment upon another's writing in a productive way. 8. The skills to improve their own writing through revision. 9. The ability to locate and evaluate credible information. 10. The ability to use and document information successfully and ethically. Credits: 3.00

MGMT 21200 - Business Accounting

Credit Hours: 3.00. The two primary objectives are to teach the skills to produce financial information-to send the relevant signals to decision makers; and to teach the skills to interpret the financial report-to receive the signals. To meet these objectives the students will gain an understanding of the reasoning behind the processes used to record financial information and the manner in which it is reported to external decision makers; gain an understanding of the four basic statements; and an understanding of the importance of financial statement information in interpreting the performance of organizations.

Learning Outcomes: 1. Teach basics of accounting to students as future business owners and employees. 2. Establish communications with accountants and financial advisors when entering the workforce. Credits: 3.00

MGMT 20000 - Introductory Accounting

Credit Hours: 3.00. The objectives of the course are to help students: (1) understand what is in financial statements and what the statements say about a business, (2) identify the business activities that caused the amounts that appear in the statements, and (3) understand how, when, and at what amount the effects of manager and employee actions will appear in the statements. CTL:IPO 1801 Accounting I

Learning Outcomes: 1. Gain an understanding of accounting terminology, principles and concepts. 2. Learn how business events and transactions are reported in financial statements. 3. Prepare basic financial statements for a business. 4. Analyze financial statements to assess the performance and risk of a business. 5. Learn how financial information is utilized in the decision-making process. Credits: 3.00

CNIT 34400 - Network Engineering Fundamentals

Credit Hours: 3.00. This course presents the foundations and intermediate levels of understanding required to effectively design, implement, and manage today's networked environments. Details of basic models; network addressing and operations; network protocol interactions; and enterprise-class hardware applications of both wired and wireless networks are provided. Students will gain experience with enterprise-class hardware through laboratory projects and assignments.

Learning Outcomes: 1. Understand, implement, and maintain stable, enterprise-class switched and/or routed networks. 2. Demonstrate knowledge of advantages/disadvantages of different types of networks. 3. Describe

hardware operations in terms of functionality, manageability, and security. 4. Research and solve hardware and software implementation problems. 5. Utilize command line tools for basic system administration tasks and objectives. 6. Discuss issues relevant to the management of network devices as presented in lecture and assigned readings. Credits: 3.00

SCLA 10100 - Transformative Texts, Critical Thinking And Communication I: Antiquity To Modernity (UCC: IL/WC)

Credit Hours: 3.00. The primary goal of the course is to provide students with a foundational knowledge of transformative literature from around the world as well as fundamental reading, writing, speaking and analytical skills. This first course in the sequence introduces students to great texts from antiquity to the birth of the modern era. Its goal is to create life-long learners, open to the world, and sensitive to other points of view. It exposes students from across the university to the ideas, skill-set and inspiration that animates from the liberal arts, and it also introduces them to liberal arts faculty.

University Core Curriculum (UCC): (UCC: IL/WC) Learning Outcomes: 1. Write with clarity, coherence, and concision in a variety of genres. 2. Demonstrate an importance of rhetorical situations and choices for a variety of audiences and contexts. 3. Demonstrate critical thinking about writing through reading, analysis, discussion, composing and revising texts in a range of genres. 4. Apply a clear understanding of the process of writing (including drafting, revising, editing, proofreading, and collaborating with others and providing feedback); and successfully organize, present, and communicate meaning to fellow readers in at least 8,000 words of polished writing. 5. Identify, analyze, and evaluate the claims of a variety of print, digital, audio and visual sources. 6. Engage critically with transformative texts, drawing on multiple perspectives including the individual, the historical, and the contemporary. Credits: 3.00

SCLA 10200 - Transformative Texts, Critical Thinking And Communication II: Modern World (UCC: OC)

Credit Hours: 3.00. The primary goal of the course is to provide students with a foundational knowledge of transformative literature from around the world as well as fundamental reading, writing, speaking and analytical skills. This second course in the sequence introduces students to great texts from the modern era. Its goal is to create life-long learners, open to the world, and sensitive to other points of view. It exposes students from across the university to the ideas, skill-set and inspiration that animates from the liberal arts, and it also introduces them to liberal arts faculty.

University Core Curriculum (UCC): (UCC: OC) Learning Outcomes: 1. Demonstrate effective, professional delivery, designing and adapting appropriate verbal appeals through vocal intonation and non-verbal cues. 2. Distinguish and apply appropriate informative, persuasive, explanatory, interrogatory and argumentative strategies and techniques in the discussions and in formal presentations. 3. Organize presentations with effective supporting materials. 4. Locate and evaluate effective sources of information. 5. Engage critically with transformative texts, drawing on multiple perspectives, including the individual, the historical, and the contemporary. Credits: 3.00

Sample 4-Year Plan

Fall 1st Year

ENGL 10600 - First Year Composition With Conferences (UCC: IL/WC)

Credit Hours: 4.00. This 4-credit hour composition course includes student-teacher conferences. Students in this course produce between 7,500-11,500 words of polished writing (or 15,000-22,000 total words, including drafts or the equivalent). Within the course, students will learn to write with a rhetorical awareness of diverse audiences, situations, and contexts; critically think about writing and rhetoric through reading, analysis, and reflection; provide constructive feedback and incorporate feedback into their own writing; perform research and evaluate sources to support claims; and engage multiple digital technologies for different purposes.

University Core Curriculum (UCC): (UCC: IL/WC) Learning Outcomes: 1. Demonstrate rhetorical awareness of diverse audiences, situations, and contexts. 2. Compose a variety of texts in a range of forms, equaling at least 7,500-11,500 words of polished writing (or 15,000-22,000 words, including drafts). 3. Critically think about writing and rhetoric through reading, analysis, and reflection. 4. Provide constructive feedback to others and incorporate feedback into their writing. 5. Perform research and evaluate sources to support claims. 6. Engage multiple digital technologies to compose for different purposes. Credits: 4.00

ENGL 10800 - First Year Composition (UCC: IL/WC)

Credit Hours: 3.00. In this 3-credit hour composition course students should expect an emphasis on self-guided work. Students in this course produce between 7,500-11,500 words of polished writing (or 15,000-22,000 total words, including drafts or the equivalent). Within the course, students will learn to write with a rhetorical awareness of diverse audiences, situations, and contexts; critically think about writing and rhetoric through reading, analysis, and reflection; provide constructive feedback and incorporate feedback into their own writing; perform research and evaluate sources to support claims; and engage multiple digital technologies for different purposes.

University Core Curriculum (UCC): (UCC: IL/WC) Learning Outcomes: 1. Demonstrate rhetorical awareness of diverse audiences, situations, and contexts. 2. Compose a variety of texts in a range of forms, equaling at least 7,500-11,500 words of polished writing (or 15,000-22,000 words, including drafts). 3. Critically think about writing and rhetoric through reading, analysis, and reflection. 4. Provide constructive feedback to others and incorporate feedback into their writing. 5. Perform research and evaluate sources to support claims. 6. Engage multiple digital technologies to compose for different purposes. Credits: 3.00

CNIT 10500 - Introduction To C Programming

Credit Hours: 3.00. This course is an introduction to computer programming using the "C" language. The emphasis is on structured programming principles, and understanding the basic concepts that apply to engineering problems. Among topics covered in this course are: problem solving using top down design, using flowcharts to explain the program logic, selection structure, repetition structure, bitwise operations, arrays, pointers, strings, passing arguments, and sequential files.

Learning Outcomes: 1. Practice and apply basic programming concepts in weekly labs and assignments. 2. Construct programming solutions using different coding structures in C. 3. Illustrate the ability to design and build user defined functions in C. 4. Practice the use of one-dimensional Arrays, Struct, and Files in C programing. Credits: 3.00

CS 15900 - C Programming

Credit Hours: 3.00. Fundamental principles, concepts, and methods of programming in C, with emphasis on applications in the physical sciences and engineering. Basic problem solving

and programming techniques; fundamental algorithms and data structures; and use of programming logic in solving engineering problems. Students are expected to complete assignments in a collaborative learning environment. Credit cannot be obtained for both CS 15900 and any of CS 15600, CS 15800 and CS 18000.

Learning Outcomes: 1. Understand the fundamental principles, concepts and methods of computer programming. 2. Use the C programming language to developing solutions in the domains of physical sciences, mathematics, and engineering. 3. Demonstrate the ability to function as part of a technical team to generate a solution to a programming problem. 4. Analyze alternative algorithm designs to implement solutions that make efficient use of limited resources of the computer. Credits: 3.00

MA 16010 - Applied Calculus I (UCC: QR)

Credit Hours: 3.00. Topics include trigonometric and exponential functions; limits and differentiation, rules of differentiation, maxima, minima and optimization; curve sketching, integration, anti-derivatives, fundamental theorem of calculus. Properties of definite integrals and numerical methods. Applications to life, managerial and social sciences. CTL:IMA 1604 Calculus - Short I

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. To create functional models and simplify difference quotients, compute limits of functions and apply limit laws. 2. To compute derivatives of elementary functions, including exponential, logarithmic and trigonometric functions, and apply rules of differentiation. 3. To sketch the graph of functions with the help of differentiation techniques, find maxima and minima of functions; optimization problems. 4. To computes integrals of some elementary functions and apply the Fundamental Theorem of Calculus. 5. Topics to be covered at a level required to perform standard applications related to life sciences, management and technology. Credits: 3.00

MA 16100 - Plane Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 5.00. Introduction to differential and integral calculus of one variable, with applications. Some schools or departments may allow only 4 credit hours toward graduation for this course. Designed for students who have not had at least a one-semester calculus course in high school, with a grade of "A" or "B". Not open to students with credit in MA 16500 . Demonstrated competence in college algebra and trigonometry.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions Credits: 5.00

MA 16500 - Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 4.00. Introduction to differential and integral calculus of one variable, with applications. Conic sections. Designed for students who have had at least a one-semester calculus course in high school, with a grade of "A" or "B", but are not qualified to enter MA 16200 or MA 16600 or the advanced placement courses MA 17300 or the honors calculus course MA 18100. Demonstrated competence in college algebra and trigonometry. CTL:IMA 1602 Calculus - Long I

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems. 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions. Credits: 4.00

TECH 12000 - Design Thinking In Technology (UCC: IL/STS)

Credit Hours: 3.00. Student will engage in critical analysis of real-world problems and global challenges. They will demonstrate the ability to recognize opportunity and to take initiative in developing solutions applying the principles of human centered design. Students will be able to communicate effectively and to work well on teams. Problems and solutions will be examined from societal, cultural, and ethical perspectives.

University Core Curriculum (UCC): (UCC: IL/STS) Learning Outcomes: 1. Write a narrowly focused problem statement. 2. Apply ethnographic methods to understand technological problems. 3. Develop a search strategy, access technical databases and evaluate results and source quality. 4. Create a technical report documenting results of the design process. 5. Manage design projects, develop project timelines and negotiate individual responsibilities and accountability in the team environment. 6. Apply strategies of ideation to develop novel and innovation solutions. 7. Demonstrate rapid prototyping solutions for purposes of design, testing and communication. Credits: 3.00

HONR 19903 - Interdisciplinary Approaches In Writing (UCC: IL/WC)

Credit Hours: 3.00. This course is a writing-intensive course in which students learn how to find, evaluate, and use credible information, how to express themselves well in a variety of different written genres, and how to write for different audiences.

University Core Curriculum (UCC): (UCC: IL/WC) Learning Outcomes: 1. The ability to express themselves in writing clearly and concisely. 2. An understanding of different written genres and their characteristics. 3. An understanding of context and audience. 4. The ability to select and convey the appropriate content. 5. The ability to organize and format a written work. 6. An awareness and appreciation of writing style. 7. The ability to comment upon another's writing in a productive way. 8. The skills to improve their own writing through revision. 9. The ability to locate and evaluate credible information. 10. The ability to use and document information successfully and ethically. Credits: 3.00

SCLA 10100 - Transformative Texts, Critical Thinking And Communication I: Antiquity To Modernity (UCC: IL/WC)

Credit Hours: 3.00. The primary goal of the course is to provide students with a foundational knowledge of transformative literature from around the world as well as fundamental reading, writing, speaking and analytical skills. This first course in the sequence introduces students to great texts from antiquity to the birth of the modern era. Its goal is to create life-long learners, open to the world, and sensitive to other points of view. It exposes students from across the university to the ideas, skill-set and inspiration that animates from the liberal arts, and it also introduces them to liberal arts faculty.

University Core Curriculum (UCC): (UCC: IL/WC) Learning Outcomes: 1. Write with clarity, coherence, and concision in a variety of genres. 2. Demonstrate an importance of rhetorical situations and choices for a variety of audiences and contexts. 3. Demonstrate critical thinking about writing through reading, analysis, discussion, composing and revising texts in a range of genres. 4. Apply a clear understanding of the process of writing (including drafting, revising, editing, proofreading, and collaborating with others and providing feedback); and successfully organize, present, and communicate meaning to fellow readers in at least 8,000 words of polished writing. 5. Identify, analyze, and evaluate the claims of a variety of print, digital, audio and visual sources. 6. Engage critically with transformative texts, drawing on multiple perspectives including the individual, the historical, and the contemporary. Credits: 3.00

ENGT 18200 - Gateway To Engineering Technology

Credit Hours: 4.00. This course introduces School of Engineering Technology students to the resources and skills needed to define and solve technical problems, which will help them be successful in their studies and ultimately in their

careers. Instruction is given in analytical and computational problem-solving techniques. The application of software for analysis and problem-solving is emphasized. Foundational principles for electrical, industrial, manufacturing, and mechanical engineering technology are studied. Teamwork, global and societal concerns, and professional ethics are integrated into course.

Learning Outcomes: 1. Develop an academic pathway for success in the student's selected major. 2. Select appropriate strategies and technologies to solve technical problems. 3. Apply foundational principles and tools of electrical, industrial, manufacturing, and mechanical engineering technology to address technical problems. 4. Apply computational tools to address technical problems. 5. Work in a team to solve an engineering technology problem. 6. Demonstrate awareness of professional standards, practices, culture, and issues in engineering technology. Credits: 4.00

16 Credits

Spring 1st Year

COM 11400 - Fundamentals Of Speech Communication (UCC: OC)

Credit Hours: 3.00. A study of communication theories as applied to speech; practical communicative experiences ranging from interpersonal communication and small group process through problem identification and solution in discussion to informative and persuasive speaking in standard speaker-audience situations. NOTE: Concurrent registration is not permitted for ENGL 10600 and COM 11400. CTL:ICM 1103 Fundamentals Of Public Speaking

University Core Curriculum (UCC): (UCC: OC) Credits: 3.00

ECET 17700 - Data Acquisition And Systems Control

Credit Hours: 3.00. Fundamental electrical parameters and measurement techniques are introduced. These are then applied to implementing power interfaces, actuators and sensors. Modules that provide signal conditioning, data conversion, filtering and controllers are evaluated. A full, closed loop control system is built and evaluated.

Learning Outcomes: 1. Make laboratory measurements using digital multi-meters, oscilloscopes, and a microcomputer. 2. Implement and evaluate the performance of each of the following elements at the module level while calculating key circuit parameters: Switching and linear power interfaces; Light, sound, motion, and temperature actuators and sensors; Amplifiers, signal conversion, and filters. On/off, linear, and computer controllers. 3. Evaluate the static and the dynamic performance of a closed loop system constructed of the elements from items 1 and 2 above. Credits: 3.00

ECET 17900 - Introduction To Digital Systems

Credit Hours: 3.00. This course introduces computing systems and defines the major classes of computing devices. Sequential and concurrent operations, along with logic and control structures, are covered. Knowledge of fundamental computing principles is discovered. Common software tools are used to create, test, and debug systems. Systems are constructed from standard blocks with a focus on subsystem operation and performance, troubleshooting/debugging and testing. Common applications of embedded systems are introduced.

Learning Outcomes: 1. Develop and utilize algorithms and flowcharts to create microcontroller applications to solve a given problem. 2. Apply the fundamental control structures and logic operations to control program flow within microcontroller applications. 3. Demonstrate the ability to convert numbers between number systems (bases) and compute arithmetic operations within microcontroller applications. 4. Utilize the primary tools used to create, test, and debug computing system hardware and software components. 5. Construct electronic hardware systems to solve a given microcontroller problem. Credits: 3.00

MA 16020 - Applied Calculus II (UCC: QR)

Credit Hours: 3.00. This course covers techniques and applications of integration; infinite series; differentiation and integration of functions of several variables; maxima and minima, optimization; differential equations and initial value problems. CTL:IMA 1605 Calculus - Short II

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Use techniques of integration to find areas between curves and compute volumes of solids of revolution. 2. Analyze the convergence of infinite series and power series, Taylor series expansions. 3. Compute derivatives of functions of several variables and use them to find maxima and minima of functions. 4. Perform multiple iterated integration. 5. Use differential equations for modeling simple real-life situations. 6. Solve first order linear initial value problems and separable equations. 7. Topics to be covered at a level required to perform standard applications related to life sciences, management and technology. Credits: 3.00

MA 16100 - Plane Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 5.00. Introduction to differential and integral calculus of one variable, with applications. Some schools or departments may allow only 4 credit hours toward graduation for this course. Designed for students who have not had at least a one-semester calculus course in high school, with a grade of "A" or "B". Not open to students with credit in MA 16500 . Demonstrated competence in college algebra and trigonometry.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions Credits: 5.00

MA 16500 - Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 4.00. Introduction to differential and integral calculus of one variable, with applications. Conic sections. Designed for students who have had at least a one-semester calculus course in high school, with a grade of "A" or "B", but are not qualified to enter MA 16200 or MA 16600 or the advanced placement courses MA 17300 or the honors calculus course MA 18100. Demonstrated competence in college algebra and trigonometry. CTL:IMA 1602 Calculus - Long I

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems. 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions. Credits: 4.00

PHYS 17200 - Modern Mechanics (UCC: SCI)

Credit Hours: 4.00. Introductory calculus-based physics course using fundamental interactions between atoms to describe Newtonian mechanics, conservation laws, energy quantization, entropy, the kinetic theory of gases, and related topics in mechanics and thermodynamics. Emphasis is on using only a few fundamental principles to describe physical phenomena extending from nuclei to galaxies. 3-D graphical simulations and numerical problem solving by computer are employed by the student from the very beginning. CTL:IPS 1753 Calculus-based Physics I

University Core Curriculum (UCC): (UCC: SCI) Learning Outcomes: 1. Understand and describe a wide range of physical phenomena in mechanics and thermodynamics using only a few fundamental principles of physics. 2. Learn a unified approach that relates microscopic behavior to macroscopic behavior. 3. Model natural phenomena quantitatively. 4. Apply all this to a range of topics related to mechanics and thermodynamics. Credits: 4.00

PHYS 22000 - General Physics (UCC: SCI)

Credit Hours: 4.00. Mechanics, heat, and sound, for students not specializing in physics. CTL:IPS 1751 Algebra-based Physics I

University Core Curriculum (UCC): (UCC: SCI) Learning Outcomes: 1. Be familiar with the

important modes of human thought that are the foundations of science. 2. Possess effective foundation skills: read, write, and speak with comprehension, clarity and precision; identify substantive knowledge and disciplinary methods; develop information literacy skills; reason quantitatively as means of gaining and creating knowledge and drawing reliable conclusions. 3. Demonstrate the ability to think critically and to solve problems using the foundation skills: evaluate their ideas and the ideas of others based upon disciplined reasoning; understand the traditions that have formed one's own and other cultures; be able to articulate their ideas in appropriate media. Credits: 4.00

SCLA 10200 - Transformative Texts, Critical Thinking And Communication II: Modern World (UCC: OC)

Credit Hours: 3.00. The primary goal of the course is to provide students with a foundational knowledge of transformative literature from around the world as well as fundamental reading, writing, speaking and analytical skills. This second course in the sequence introduces students to great texts from the modern era. Its goal is to create life-long learners, open to the world, and sensitive to other points of view. It exposes students from across the university to the ideas, skill-set and inspiration that animates from the liberal arts, and it also introduces them to liberal arts faculty.

University Core Curriculum (UCC): (UCC: OC) Learning Outcomes: 1. Demonstrate effective, professional delivery, designing and adapting appropriate verbal appeals through vocal intonation and non-verbal cues. 2. Distinguish and apply appropriate informative, persuasive, explanatory, interrogatory and argumentative strategies and techniques in the discussions and in formal presentations. 3. Organize presentations with effective supporting materials. 4. Locate and evaluate effective sources of information. 5. Engage critically with transformative texts, drawing on multiple perspectives, including the individual, the historical, and the contemporary. Credits: 3.00

16 Credits

Fall 2nd Year

ECET 22700 - DC And Pulse Electronics

Credit Hours: 3.00. Capacitors, inductors, oscillators, rectifiers, bipolar and MOSFET power switches, switching power supplies, half-and full-H bridges, switching audio power amplifiers, and linear regulators are studied. Computer-aided analysis of circuits is utilized.

Learning Outcomes: 1. Explain the characteristics of capacitors, inductors, rectifier diodes, Zener diodes, IC regulators, bipolar junction transistors (BJTs), field effect transistors (MOSFETS), and general purpose operational amplifiers. 2. Apply the principles of circuit analysis to the following: switching and linear power supplies, op-amp based amplifiers, BJT and MOSFET switches, Class D amplifier, wave shape generators, RC and RL circuits. 3. Simulate circuits and compare actual data to simulated data. 4. Construct electronic circuit according to a given schematic. 5. Measure electrical parameters, using digital multimeters, signal generators, and oscilloscopes. 6. Interpret laboratory experiment data. Credits: 3.00

ECET 22900 - Concurrent Digital Systems

Credit Hours: 3.00. This course establishes a foundation for concurrent digital systems. Common methods of describing digital circuit operation are studied along with the techniques for translation between any two methods. Basic building blocks of digital systems are defined and applied. Analysis techniques for combinational and sequential logic circuits or subsystems are covered. Computer-based development tools, programmable logic devices, and technical reference sources are used to build, test, and evaluate digital systems.

Learning Outcomes: 1. Translate between any two forms of logic circuit descriptions: English, Boolean equation, Truth Table, Logic Diagram, Timing Diagram, Hardware Description language. 2. Anticipate the output of functional

blocks given the current inputs or a recent event. 3. Validate the operation of any logic circuit using the simulator, Function generator, oscilloscope or DVM. Credits: 3.00

PHYS 22100 - General Physics (UCC: SCI)

Credit Hours: 4.00. Electricity, light, and modern physics, for students not specializing in physics. CTL:IPS 1752 Algebra-based Physics II

University Core Curriculum (UCC): (UCC: SCI) Credits: 4.00

PHYS 24100 - Electricity And Optics (UCC: SCI)

Credit Hours: 3.00. Electrostatics, current electricity, electromagnetism, magnetic properties of matter. Electromagnetic waves, geometrical and physical optics.

University Core Curriculum (UCC): (UCC: SCI) Credits: 3.00

PHYS 27200 - Electric And Magnetic Interactions (UCC: SCI)

Credit Hours: 4.00. Calculus-based physics course using concepts of electric and magnetic fields and an atomic description of matter to describe polarization, fields produced by charge distributions, potential, electrical circuits, magnetic forces, induction, and related topics, leading to Maxwell's equations and electromagnetic radiation and an introduction to waves and interference. 3-D graphical simulations and numerical problem solving by computer are employed throughout.

University Core Curriculum (UCC): (UCC: SCI) Learning Outcomes: 1. Understand and describe a wide range of physical phenomena in electricity and magnetism using only a few fundamental principles of physics. 2. Learn a unified approach that relates microscopic behavior to macroscopic behavior. 3. Model natural phenomena quantitatively. 4. Apply all this to a range of topics related to electricity and magnetism. Credits: 4.00

16 Credits

Spring 2nd Year

ENGL 20500 - Introduction To Creative Writing

Credit Hours: 3.00. Practice in writing short prose narratives and poetry for students who have finished composition and wish to develop their skills further. Workshop criticism. CTL:IEL 1230 Introduction To Creative Writing

Learning Outcomes: 1. Compose original poetry. 2. Compose original fiction. 3. Analyze and critique peer work by using the vocabulary of craft.. Credits: 3.00

ENGL 30400 - Advanced Composition (UCC: IL/WC)

Credit Hours: 3.00. Designed for students who wish additional training in composition beyond the basic requirements. Extensive practice in the writing of mature expository, critical, and argumentative prose. (The course satisfies the Indiana certification requirement of three hours of advanced composition.)

University Core Curriculum (UCC): (UCC: IL/WC) Learning Outcomes: 1. Produce over 8,000 words of polished, rhetorically effective writing, fit for the academy, work, and civic life. 2. Use strategies of close reading and sound research methods for depth of understanding, expansion of knowledge, and honing critical acumen. 3. Apply rhetorical principles and techniques to a variety of writing tasks. 4. Read primary texts on rhetorical history and theory in order to understand them and use them. 5. Expand your knowledge of how persuasion permeates all aspects of life - verbal, visual, and material and increased your ability to discern better and worse forms of influence and argument. Credits: 3.00

ENGL 42000 - Business Writing

Credit Hours: 3.00. This course helps students become better business writers, across a wide range of audiences, for multiple purposes, and in a variety of media. This course engages business-related material with an awareness of audience needs and contexts. It prepares students to address problems in the workplace, social, or global levels.

Learning Outcomes: 1. Use theories of rhetoric to develop texts, think critically, solve problems, and engage with the needs of diverse

audiences. 2. Apply data-driven approaches to specific rhetorical contexts, problems, and situations. 3. Compose effective, field-specific business documents through a process of analysis and revision. 4. Create business documents in collaborative, distributed, and/or networked environments. 5. Adapt to workplace specific writing practices. Credits: 3.00

ENGL 42100 - Technical Writing

Credit Hours: 3.00. This course teaches the practice and principles of technical writing. The course emphasizes rhetorical approaches to research and writing, teaching concepts such as usability and accessibility. Students write diverse technical documents such as memos, technical reports, documentation and websites.

Learning Outcomes: 1. Use theories of rhetoric to develop texts, think critically, solve problems, and engage with the needs of diverse audiences. 2. Apply data-driven approaches to specific rhetorical contexts, problems, and situations. 3. Communicate complex technical information, processes and procedures in a variety of genres. 4. Compose effective, industry specific, technical documents that emphasize the importance of usability and accessibility for the rapidly changing field of technical writing. 5. Produce team-written technical projects for specific contexts and industries. Credits: 3.00

CNIT 18000 - Introduction To Systems Development

Credit Hours: 3.00. This course introduces information systems development. Topics include types of information systems, system development, database management systems, and problem solving. Students will read/create UML, ERD, and data flow diagrams to model information system objects, data, processes, and logic. Labs emphasize modeling and SQL/QBE querying to prepare students for later systems, programming, and database classes. Given user requirements students will design, construct, and test a personal computer information system. PC literacy required.

Learning Outcomes: 1. Construct information systems using appropriate tools and techniques. 2. Demonstrate system modeling concepts, tools, and techniques. 3. Analyze data design concepts and data structures. 4. Apply systems development life cycle (SDLC) concepts. 5. Identify information systems components. Credits: 3.00

ECET 27000 - Electronics Prototype Development And Construction

Credit Hours: 3.00. This course introduces project planning and basic concepts in electronic design automation (EDA). The student develops a portion of an electronic system by utilization of EDA, design for testing, design for manufacturability (DFM), and component selection techniques. New construction methods and testing techniques are introduced.

Learning Outcomes: 1. Design an electronic device or system to accomplish a given task. 2. Demonstrate appropriate electronic assembly techniques. 3. Develop and execute appropriate testing techniques on electronic devices and systems. 4. Apply appropriate software applications to develop a prototype. 5. Apply graphical communication techniques to convey technical information. 6. Apply principles of design for manufacturability and design for testing to a project. 7. Employ teaming methods on a project. Credits: 3.00

ECET 27400 - Wireless Communications

Credit Hours: 3.00. The theory and techniques of wirelessly sending information (voice, music, data) from one location to another is studies from a systems point of view. This includes a signal analysis, modulation techniques, transmitters, receivers, low noise amplifiers, and filters in the RF frequency spectrum. In addition, special topics of current interest are introduced. This course incorporated a student-based communication design and analysis laboratory.

Learning Outcomes: 1. Perform power calculations, such as dB, dBm, dBuV. 2. Describe, identify and apply Fourier concepts communication signals and systems, such as wave shapes, signal mixing, carrier waves. 3. Evaluate, describe and calculate the effects of noise on communication circuits and systems. 4. Demonstrate the concepts and applications of amplitude, frequency, and phase modulation

techniques. 5. Describe and compare the operation of various receiver and transmitter blocks and systems. 6. Describe and apply the concepts of EMC, EMI and RFI to RF components, circuits and systems. 7. Describe and apply the fundamentals of cellular communication, such as frequency reuse, spread spectrum techniques and network technologies. 8. Describe and apply the fundamentals of digital communications, such as coding, bandwidth and modulation techniques. 9. Demonstrate use of RF laboratory equipment including the spectrum analyzer and RF generator. Credits: 3.00

ECET 27900 - Embedded Digital Systems

Credit Hours: 3.00. A course emphasizing the advanced applications of embedded digital systems. Topics include embedded system architecture, use of advanced programmable counter/timer arrays, analog interfaces, serial communication, and interrupts.

Learning Outcomes: 1. Solve problems by the application of C programs emphasizing I/O and peripherals. 2. Demonstrate knowledge and skill in the application of parallel ports, counter-timers, programmable counter arrays, serial ports and interrupts. 3. Demonstrate a conceptual understanding of embedded microcontroller system hardware system design. 4. Demonstrate the use of software development tools such as an editor, an assembler, a C compiler, a linker and locator, an object-to-hex converter, etc. 5. Demonstrate fluency in the language of advanced microprocessors. Credits: 3.00

15 Credits

Fall 3rd Year

CNIT 25501 - Object-Oriented Programming Introduction

Credit Hours: 3.00. This course introduces software development concepts common to modern object-oriented programming languages. Topics include: intermediate data types, decisions, repetitive structures; methods; arrays and collections; encapsulation, inheritance, and polymorphism; exception handling; data persistence; Database Management System (DBMS) connectivity; user interface construction; software testing and debugging; and working in teams.

Learning Outcomes: 1. Build and apply object-oriented design concepts on a regular basis through exercises and labs. 2. Construct a complex project. Credits: 3.00

ECET 33900 - Digital Signal Processing

Credit Hours: 3.00. The course introduces students to the fundamental principles associated with processing discrete time signals. The architecture, instruction set and hardware and software development tools associated with a fixed point general purpose VLSI digital signal processor are examined. Some common real-time applications are implemented such as digital filters and DFT-based spectral estimation on a typical fixed point digital signal processor.

Learning Outcomes: 1. Describe the architectural features of a DSP and relate these to the DSP kernel equation. 2. Manipulate different binary number formats associated with a fixed point DSP. 3. Develop and debug simple programs that involve SOPs, modulo addressing, scaling and extraction of result, and common DSP program structures. 4. Describe the consequences and limitations of sampling baseband signals including the Nyquist rate and bandwidth, quantization noise, aliasing, frequency folding, reconstruction, spectrum of sampled baseband signals. 5. Express a sampled deterministic analog signal in closed mathematical form and expanded form using the unit sample. 6. Express a sampled signal in terms of the Z transform, in expanded and closed form. 7. Describe the relationship between the transfer function and impulse response in an LTI system. 8. Describe the operation of convolution and its implementation using hand calculations, mathematical software packages, and a fixed-point DSP. 9. Design and analyze FIR filters with the aid of a

mathematical software package such as MATLAB. Credits: 3.00

ECET 34900 - Advanced Digital Systems

Credit Hours: 3.00. This course investigates complex digital systems that are implemented with field programmable gate arrays (FPGAs) using concurrent and sequential digital design techniques. Applications will include interfacing with analog signals and memory systems.

Learning Outcomes: 1. Design FPGA solutions for given digital design problems using a hardware description language (HDL). 2. Design FPGA solutions for given digital problems using a high-level sequential programming language for embedded processors. 3. Design FPGA solutions by decomposing a system into concurrent and sequential functional blocks and using hierarchical system development techniques. 4. Verify digital designs using simulation and hardware prototyping. 5. Analyze and design memory subsystems. 6. Apply ADC and DAC circuits to interface digital systems with analog devices/systems. Credits: 3.00

15 Credits

Spring 3rd Year

CNIT 17600 - Information Technology Architectures

Credit Hours: 3.00. A conceptual and technological survey of information technology architectures inclusive of operating systems, network operating systems, distributed systems architectures, and distributed application architectures. Interoperability between these architectural components is explored. Current technology and trends in each architectural element are reviewed. PC literacy required.

Learning Outcomes: 1. Describe complexities, interoperations, & integration of hardware and software system components and architectures. 2. Analyze and describe operating systems, resource management, & security functions. 3. Apply knowledge of system architecture to solve complex problems. Credits: 3.00

ECET 32900 - Advanced Embedded Digital Systems

Credit Hours: 3.00. This course focuses on the study and application of real-time embedded systems. Real-time operating systems (RTOS) are introduced and applied. Students learn and use programming and scripting languages to discover the advantages and limitations of RTOS application in the lab.

Learning Outcomes: 1. Define, compare and contrast embedded systems terms and the concepts of soft and hard real time. 2. Identify and explain real time operating system operational concepts. 3. Demonstrate the application of software design, documentation, and version control tools. 4. Demonstrate the application of an RTOS application programming interface and testing techniques to evaluate embedded system functional correctness and performance. Credits: 3.00

15 Credits

Fall 4th Year

AGEC 33000 - Management Methods For Agricultural Business

Credit Hours: 3.00. Management of nonfarm, agriculturally related businesses. Topics include tools for management decision making, legal forms of business organization, basics of accounting, and important financial management techniques. Case studies and computer simulation game.

Credits: 3.00

AGEC 35200 - Quantitative Techniques For Firm Decision Making

Credit Hours: 3.00. Introduction to mathematical programming and computing as an aid to agricultural decision making by firms, linear programming, game theory and strategy, simulation, the waiting-line problem, the equipment replacement decision, and multiproduct scheduling methods.

Learning Outcomes: 1. Manipulate and use spreadsheets. 2. Formulate linear programming problems. 3. Solve linear programming problems in Excel. 4. Interpret results obtained from linear programming models. 5. Present

and explain linear programming results. 6. Understand graphically the concept of optimality in a linear program. 7. Understand the properties of optimal linear programming solutions. 8. Recognize and demonstrate instances where linear programming and simulation modeling might be valuable. Credits: 3.00

IET 33400 - Economic Analysis For Technology Systems

Credit Hours: 3.00. This course examines techniques of economic analysis for systems technologists, engineers, and leaders who evaluate and determine the financial attractiveness of multiple alternatives. Emphasizes economic feasibility and applying time value of money concepts to cost-volume-profit decisions. Topics include present worth, rate of return, benefit-cost, payback, breakeven analysis, depreciation, economic optimization, and decision-making under uncertainty.

Learning Outcomes: 1. Apply compound interest factors to establish economic equivalencies. 2. Use present worth analysis to evaluate alternatives. 3. Use annual worth analysis to evaluate alternatives. 4. Calculate the internal rate of return for a project. 5. Apply economic analysis concepts to personal finances. Credits: 3.00

MGMT 21200 - Business Accounting

Credit Hours: 3.00. The two primary objectives are to teach the skills to produce financial information-to send the relevant signals to decision makers; and to teach the skills to interpret the financial report-to receive the signals. To meet these objectives the students will gain an understanding of the reasoning behind the processes used to record financial information and the manner in which it is reported to external decision makers; gain an understanding of the four basic statements; and an understanding of the importance of financial statement information in interpreting the performance of organizations.

Learning Outcomes: 1. Teach basics of accounting to students as future business owners and employees. 2. Establish communications with accountants and financial advisors when entering the workforce. Credits: 3.00

MGMT 20000 - Introductory Accounting

Credit Hours: 3.00. The objectives of the course are to help students: (1) understand what is in financial statements and what the statements say about a business, (2) identify the business activities that caused the amounts that appear in the statements, and (3) understand how, when, and at what amount the effects of manager and employee actions will appear in the statements. CTL:IPO 1801 Accounting I

Learning Outcomes: 1. Gain an understanding of accounting terminology, principles and concepts. 2. Learn how business events and transactions are reported in financial statements. 3. Prepare basic financial statements for a business. 4. Analyze financial statements to assess the performance and risk of a business. 5. Learn how financial information is utilized in the decision-making process. Credits: 3.00

CNIT 34400 - Network Engineering Fundamentals

Credit Hours: 3.00. This course presents the foundations and intermediate levels of understanding required to effectively design, implement, and manage today's networked environments. Details of basic models; network addressing and operations; network protocol interactions; and enterprise-class hardware applications of both wired and wireless networks are provided. Students will gain experience with enterprise-class hardware through laboratory projects and assignments.

Learning Outcomes: 1. Understand, implement, and maintain stable, enterprise-class switched and/or routed networks. 2. Demonstrate knowledge of advantages/disadvantages of different types of networks. 3. Describe hardware operations in terms of functionality, manageability, and security. 4. Research and solve hardware and software implementation problems. 5. Utilize command line tools for basic system administration tasks and objectives. 6. Discuss issues relevant to the management of network devices as presented in lecture and assigned readings. Credits: 3.00

15 Credits

Spring 4th Year

STAT 22500 - Introduction To Probability Models

Credit Hours: 3.00. An introduction to basic probability. Emphasis is placed on formulation of models and applications. Probability calculus, standard distributions, random variables, and moments. Credit cannot be given for more than one of STAT 22500, 31100, or 41600.

Learning Outcomes: 1. Understand basic terminology, set theory, and counting rules related to probability. 2. Identify various discrete and continuous probability models/distributions and apply them to answer probability questions. 3. Understand the Normal distribution and how to use the Standard Normal Table. 4. Understand basic terms, graphs, and symbols and be able to interpret statistics in the media. 5. Have a foundation in statistical methodology including the basics of hypothesis testing. Credits: 3.00

STAT 30100 - Elementary Statistical Methods (UCC: IL)

Credit Hours: 3.00. Introduction to statistical methods with applications to diverse fields. Emphasis on understanding and interpreting standard techniques. Data analysis for one and several variables, design of samples and experiments, basic probability, sampling distributions, confidence intervals and significance tests for means and proportions, correlation and regression. Software is used throughout. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, 35000, 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: college algebra.

University Core Curriculum (UCC): (UCC: IL) Learning Outcomes: 1. Students will be introduced to statistical methods and be able to apply them to multiple fields of study. 2. Students will be able to understand, interpret standard statistical techniques, analyze data for one variable and for several variables, calculate and use confidence intervals and significance test for means and proportions, understand the design of samples and experiments, perform and understand basic probability calculations, perform simple and multiple regression procedures, and understand correlation. Credits: 3.00

12 Credits

Computer Engineering, BSCMPE

About the Program

Degree Requirements

Computer Engineering Required Major Courses (53 credits)

Required Core Courses (30 credits)

ECE 26400 - Advanced C Programming

Credit Hours: 3.00. Continuation of a first programming course. Topics include files, structures, pointers, and the proper use of dynamic data structures. A basic knowledge of the UNIX operating system and an introductory C programming course; C programming knowledge should include basic syntax, control structures, and file I/O, as well as experience in declaring and using functions.

Learning Outcomes: 1. Ability to read and write C programs that use files. 2. Ability to read and write C programs that use structures. 3. Ability to read and write C programs that use dynamic data structures. Credits: 3.00

ECE 27000 - Introduction To Digital System Design

Credit Hours: 4.00. An introduction to digital system design and hardware engineering, with an emphasis on practical design techniques and circuit implementation.

Learning Outcomes: 1. Analyze and design CMOS logic gates. 2. Analyze and design combinational logic circuits. 3. Analyze and design sequential logic circuits. 4. Analyze and design computer logic circuits. 5. Realize, test, and debug practical digital circuits. Credits: 4.00

ECE 30100 - Signals And Systems

Credit Hours: 3.00. Classification, analysis and design of systems in both the time- and frequency-domains. Continuous-time linear systems: Fourier Series, Fourier Transform, bilateral Laplace Transform. Discrete-time linear systems: difference equations, Discrete-Time Fourier Transform, bilateral Z-Transform. Sampling, quantization, and discrete-time processing of continuous-time signals. Discrete-time nonlinear systems: median-type filters, threshold decomposition. System design examples such as the compact disc player and AM radio.

Learning Outcomes: 1. Able to classify signals (e.g., periodic, even) and systems (e.g., causal, linear) and an understanding of the difference between discrete and continuous time signals and systems. 2. Able to determine the impulse response of a differential or difference equation. 3. Able to determine the response of linear systems to any input signal by convolution in the time domain. 4. Understand the definitions and basic properties (e.g., time-shift, modulation, Parseval's Theorem) of Fourier series, Fourier transforms, bilateral Laplace transforms, Z transforms, and discrete time Fourier transforms and an ability to compute the transforms and inverse transforms of basic examples using methods such as partial fractions expansions. 5. Able to determine the response of linear systems to any input signal by transformation to the frequency domain, multiplication, and inverse transformation to the time domain, an ability to apply the Sampling theorem, reconstruction, aliasing, and Nyquist's theorem to represent continuous-time signal in discrete time so that they can be processed by digital computers. Credits: 3.00

ECE 30200 - Probabilistic Methods In Electrical And Computer Engineering

Credit Hours: 3.00. An introductory treatment including probability of events, discrete and continuous random variables, multiple random variables, sums of random variables and long-term averages, and elementary random processes. Applications involving uniform, Gaussian, exponential, geometric and related random variables. Introduction to parameter estimation and hypothesis testing. Discussion of wide-sense stationary random processes, including correlation functions, spectral densities and the response of linear time invariant systems. Course examples are drawn from signal processing, wireless communications, system reliability, and data science.

Credits: 3.00

ECE 36800 - Data Structures

Credit Hours: 3.00. Provides insight into the use of data structures. Topics include stacks, queues and lists, trees, graphs, sorting, searching, and hashing.

Learning Outcomes: 1. Understand various basic data structures, including stacks, queues, and trees. 2. Able to analyze time complexity and space complexity of algorithms. 3. Able to apply appropriate sorting and searching algorithms for a given application. 4. Able to apply graph theoretic techniques, data structures and algorithms for problem solving. 5. Able to design and implement appropriate data structures and algorithms for engineering applications. Credits: 3.00

ECE 36200 - Microprocessor Systems And Interfacing

Credit Hours: 4.00. An introduction to basic computer organization, microprocessor instruction sets, assembly language programming, and microcontroller peripherals.

Learning Outcomes: 1. Show ability to program a microcontroller to perform various tasks. 2. Show an ability to interface a microcontroller to various devices. 3. Show an ability to effectively utilize microcontroller peripheral. 4. Show an ability to design and implement a microcontroller-based embedded system. Credits: 4.00

ECE 20001 - Electrical Engineering Fundamentals I

Credit Hours: 3.00. This course covers fundamental concepts and applications for electrical and computer engineers as well as for engineers who need to gain a broad understanding of these disciplines. The course starts by the basic concepts of charge, current, and voltage as well as their expressions with regards to resistors and resistive circuits. Essential concepts, devices, theorems, and applications of direct-current (DC), 1st order, and alternating-current (AC) circuits are subsequently

discussed. Besides electrical devices and circuits, basic electronic components including diodes and transistors as well as their primary applications are also discussed.

Learning Outcomes: 1. Ability to analyze linear resistive circuits. 2. Ability to analyze 1st order linear circuits with sources and/or passive elements. 3. Ability to analyze electronic circuits with diodes and transistors. Credits: 3.00

ECE 20002 - Electrical Engineering Fundamentals II

Credit Hours: 3.00. Continuation of Electrical and Computer Engineering Fundamentals I. The course addresses mathematical and computational foundations of circuit analysis (differential equations, Laplace Transform techniques) with a focus on application to linear circuits having variable behavior as a function of frequency, with emphasis on filtering. Variable frequency behavior is further considered for applications of electronic components through single-transistor and operational amplifiers. The course ends with consideration of how circuits behave and may be modeled for analysis at high frequencies. Permission of Department required.

Learning Outcomes: 1. Analyze 2nd order linear circuits with sources and/or passive elements. 2. Compute responses of linear circuits with and without initial conditions via one-sided Laplace transform techniques. 3. Compute responses to linear circuits using transfer function and convolution techniques. 4. Analyze and design transistor amplifiers at low, mid and high frequencies. 5. Ability to work with transmission line models to analyze circuits at high-frequency. 6. Use a CAD tool (e.g., SPICE) in circuit analysis and design. Credits: 3.00

ECE 20007 - Electrical Engineering Fundamentals I Lab

Credit Hours: 1.00. This is an introduction course in electronic measurement and circuit modeling, simulation and design techniques. These skills are developed through a variety of laboratory experiments ranging from voltage, current, and frequency, to resistors, inductors, capacitors, and operational amplifiers. When possible, the experiments develop practical skills through small design and soldering tasks. Finally, the course culminates in a two week group design project. In many ways this course is the laboratory of the co-requisite lecture course ECE 20001: Electrical Engineering Fundamentals I; however, we remind students that this is a standalone course that expects students will learn and demonstrate material not taught in ECE 20001.

Learning Outcomes: 1. Select and use electronic measurement instruments competently. 2. Design, wire, and troubleshoot electronic circuits. 3. Simulate electronic circuits. 4. Keep a laboratory notebook and prepare a formal laboratory report. 5. Function on an interdisciplinary team that draws on diverse backgrounds. 6. Design, build, and test resistor-inductor-capacitor, operational amplifier, etc. circuits to meet specifications. 7. Demonstrate knowledge of laboratory safety precautions. Credits: 1.00

ECE 20875 - Python For Data Science

Credit Hours: 3.00. This course will introduce Python programming to students through data science problems. Students will learn Python concepts as well as introductory data science topics, and will use their knowledge of Python (and prior programming experience) to implement data analyses.

Learning Outcomes: 1. Understand of regular expressions [1, 2]. 2. Use Python to write data analyses [1, 2, 6]. 3. Explain when data analyses are appropriate [1, 2, 3, 6]. 4. Explain the results of data analyses [2, 3, 5]. 5. Incorporate classes in their Python programs [1, 2, 6]. 6. Incorporate associative arrays in their programs [1, 2, 6]. Credits: 3.00

Required Seminars (3 credits)

ECE 29401 - Electrical And Computer Engineering Sophomore Seminar

Credit Hours: 1.00. An introduction to the School of Electrical and Computer Engineering, the program's objectives, and outcomes, BSEE and BSCmpE degree requirements, professional writing and multicultural and professional development.

Learning Outcomes: 1. Knowledge of the ECE educational objectives and required outcomes. 2. Knowledge of the BSEE and/or BSCmpE degree requirements. 3. Ability to prepare a satisfactory plan-of-study. 4. Ability to write effectively in the English language. 5. Appreciation for ethical, professional and

academic conduct. Credits: 1.00

ECE 39401 - Professional Communications And Diversity

Credit Hours: 1.00. This course provides ECE students with practice in relevant aspects of communication. Topics include: successfully seeking employment, working effectively in teams, delivering engaging presentations, and leveraging the advantages and challenges of diversity and inclusion.

Learning Outcomes: 1. Ability to function effectively on a team whose members create a collaborative and inclusive environment, plan tasks, and meet objectives. 2. Communicate effectively with a range of audiences. 3. Develop and explain solutions to engineering problems, taking public health and cultural factors into consideration. Credits: 1.00

ECE 49401 - Professional Communication Capstone

Credit Hours: 1.00. This course provides ECE students an opportunity to refine their professional communication skills before launching into the workplace or graduate school. Topics include: ethics in ECE, workplace communication (written and verbal), and plans for professional growth.

Learning Outcomes: 1. Communicate effectively with a range of audiences. 2. Function effectively on a team whose members together create a collaborative and inclusive environment, plan tasks, and meet objectives. 3. Ability to make informed judgments based ethical and professional responsibilities in engineering situations, giving consideration to global, economic, environmental, and/or societal contexts. Credits: 1.00

Senior Design Requirement - Choose One Option (4 credits)

Option 1:

ECE 47700 - Digital Systems Senior Project

Credit Hours: 4.00. A structured approach to the development and integration of embedded microcontroller hardware and software that provides senior-level students with significant design experience applying microcontrollers to a wide range of embedded systems (e.g., instrumentation, process control, telecommunications, and intelligent devices). The primary objective is to provide practical experience developing integrated hardware and software for embedded microcontroller systems in an environment that models one which students will most likely encounter in industry. Permission of instructor required.

Learning Outcomes: 1. Apply knowledge obtained in earlier coursework and to obtain new knowledge necessary to design and test a microcontroller-based digital system. 2. Understand the engineering design process. 3. Function on a multidisciplinary team. 4. Be aware of professional and ethical responsibility. 5. Communicate effectively, in both oral and written form. Credits: 4.00

Option 2:

ECE 49022 - Electrical Engineering Senior Design Projects

Credit Hours: 4.00. Lecture sessions provide the student with background information on the design and management of projects. Formal lectures cover, for example, design for manufacturability, design for quality, test and evaluation, reliability and ethics, patents and copyrights, plus case studies. During the laboratory sessions, the students work in teams on challenging open-ended electrical engineering project that draws on previous coursework. Projects routinely involve standard design facets (such as consideration of alternative solutions, feasibility considerations, and detailed system descriptions) and include a number of realistic constraints (such as cost, safety, reliability, and aesthetics). Lectures require use of the I-Clicker system.

Learning Outcomes: 1. Apply knowledge obtained in earlier coursework and to obtain new knowledge necessary to design and test a system, component, or process to meet desired needs. 2. Understand the engineering design process. 3. Function on an interdisciplinary team. 4. Acquire an awareness of professional and ethical responsibility. 5. Develop effective communication skills, both oral and written. Credits: 4.00

Option 3:

EPCS 41200 - Senior Design Participation In EPICS

Credit Hours: 2.00. Continuation of EPICS courses. Seniors using EPCS 41200 to fulfill capstone or design requirements where approved for their major may be required to satisfy additional course requirements specified by their degree program. EPCS 41200 is offered for 2 credits. The EPICS procedures manual provides information on expected relative workload for EPCS 41100 and EPCS 41200 students. Seniors are responsible for the management tasks of planning and organizing their team project activity. They are expected to contribute expertise from their discipline to the design of the team's projects throughout most of the design process phases of problem identification, specification development, design, production, and deployment. Seniors will also meet with the customer and mentor the first year, sophomores and juniors. May not be taken concurrently with EPCS 41100 .

Learning Outcomes: 1. An ability to apply material from their discipline to the design of community-based projects. 2. An understanding of design as a start-to-finish process. 3. An ability to identify and acquire new knowledge as a part of the problem-solving/design process. 4. An awareness of the customer. 5. An ability to function on multidisciplinary teams and an appreciation for the contributions from individuals from multiple disciplines. 6. An ability to communicate effectively with audiences with widely-varying backgrounds. 7. An awareness of professional ethics and responsiblity. 8. An appreciation of the role that their discipline can play in social contexts. Credits: 2.00

Option 4:

VIP 47922 - Senior Design Participation In Vertically Integrated Projects (VIP) II

Credit Hours: 2.00. This course provides an opportunity for undergraduate students to engage in authentic and extended research and design projects related to active research areas of Purdue faculty members and national, international, and industry-sponsored design challenges. Students will work on interdisciplinary and vertically-integrated teams (first-year through seniors) with faculty and graduate student mentors to address these real-world research and design challenges. Students will participate in weekly lectures and professional development activities that include topics related to design, research, documentation and technical writing, communication, leadership and teamwork, ethics, project management, intellectual property, information literacy, and introduction to a broad range of applicable research topics, technologies and development tools.

Learning Outcomes: 1. Apply engineering design to create a product (device, system, process, software, etc.) that meets the specified needs of this engineering design experience with consideration of public health, safety, and welfare, as well as global, cultural, social, environmental, and economic factors. 2. Develop and conduct experimentation, analyze and interpret data, and use engineering judgment to draw conclusions related to the development of the product of this engineering design experience. 3. Identify, formulate, and solve complex engineering problems arising from this engineering design experience by applying principles of engineering, science, and mathematics. 4. Function effectively on a team whose members together provide leadership, create a collaborative and inclusive environment, establish goals, plan tasks, and meet objectives associated with this design experience. 5. Communicate effectively with a range of audiences appropriate to this design experience in both a written report and oral presentation. 6. Acquire and apply new knowledge as needed, using appropriate learning strategies to complete the engineering design experience associated with this course. 7. Recognize ethical and professional responsibilities associated with this engineering design experience and make informed judgments which must consider the impact of the product of this engineering design experience in global, economic, environmental, and societal contexts. Credits: 2.00

VIP 47921 - Senior Design Participation In Vertically Integrated Projects (VIP) I

Credit Hours: 2.00. This course provides an opportunity for undergraduate students to engage in authentic and extended

research and design projects related to active research areas of Purdue faculty members and national, international, and industry-sponsored design challenges. Students will work on interdisciplinary and vertically-integrated teams (first-year through seniors) with faculty and graduate student mentors to address these real-world research and design challenges. Students will participate in weekly lectures and professional development activities that include topics related to design, research, documentation and technical writing, communication, leadership and teamwork, ethics, project management, intellectual property, information literacy, and introduction to a broad range of applicable research topics, technologies and development tools.

Learning Outcomes: 1. Apply engineering design to create a product (device, system, process, software, etc.) that meets the specified needs of this engineering design experience with consideration of public health, safety, and welfare, as well as global, cultural, social, environmental, and economic factors. 2. Develop and conduct experimentation, analyze and interpret data, and use engineering judgment to draw conclusions related to the development of the product of this engineering design experience. 3. Identify, formulate, and solve complex engineering problems arising from this engineering design experience by applying principles of engineering, science, and mathematics. 4. Function effectively on a team whose members together provide leadership, create a collaborative and inclusive environment, establish goals, plan tasks, and meet objectives associated with this design experience. 5. Communicate effectively with a range of audiences appropriate to this design experience in both a written report and oral presentation. 6. Acquire and apply new knowledge as needed, using appropriate learning strategies to complete the engineering design experience associated with this course. 7. Recognize ethical and professional responsibilities associated with this engineering design experience and make informed judgments which must consider the impact of the product of this engineering design experience in global, economic, environmental, and societal contexts. Credits: 2.00

Computer Engineering Selectives (16 credits)

ECE 30834 - Fundamentals Of Computer Graphics

Credit Hours: 3.00. Fundamental principles and techniques of computer graphics. The course covers the basics of going from a scene representation to a raster image using OpenGL. Specific topics include coordinate manipulations, perspective, basics of illumination and shading, color models, texture maps, clipping and basic raster algorithms, fundamentals of scene constructions. Permission of department required.

Learning Outcomes: 1. An understanding of the design issues for creating raster graphics. 2. An ability to apply rendering techniques to an actual computer graphics problem and associated datasets. 3. An understanding of object transformations, representations, transformations and perspective projections. 4. An understanding of color, illumination, and shading techniques. 5. An understanding of the rendering and rasterization techniques. 6. An understanding of the application of computer graphics techniques to visualization, animation, and computer aided design. Credits: 3.00

ECE 33700 - ASIC Design Laboratory

Credit Hours: 2.00. Introduction to standard cell design of Application Specific Integrated Circuits (ASICs) using modern hardware description languages (HDLs). Emphasis on how to write HDL code that will map readily to hardware. Laboratory experiments using commercial grade computer-aided design (CAD) tools for HDL based design, logic simulation, automatic placement and routing, timing analysis and verification.

Learning Outcomes: 1. Design combinational and sequential logic in a variety of styles and awareness of resource usage. 2. Use, modify, create scripts to control logic synthesis. 3. Create a test bench and use it to verify a design that incorporates multiple sequential blocks. 4. Place, route, and verify timing of an ASIC design. 5. Determine the RTL architecture

implied by HDL code of moderate complexity. 6. Explain the difference between various ASIC and digital system design approaches - standard cell, full custom, and programmable device. Credits: 2.00

ECE 40400 - Introduction To Computer Security

Credit Hours: 3.00. Introduction to security issues related to the operation of computers and the workings of computer networks. Topics covered include introduction to cryptography, authentication protocols, digital signature algorithms, internet vulnerabilities, worms and virus propagation, denial of service attacks, etc. The students will also learn how to design firewalls to protect a system against unwanted intrusions. Permission of department required.

Credits: 3.00

ECE 43700 - Computer Design And Prototyping

Credit Hours: 4.00. An introduction to computer organization and design, including instruction set selection, arithmetic logic unit design, datapath design, control strategies, pipelining, memory hierarchy, and I/O interface design.

Credits: 4.00

ECE 46300 - Introduction To Computer Communication Networks

Credit Hours: 3.00. An introduction to the design and implementation of computer communication networks. The focus is on the concepts and the fundamental design principles that have contributed to the global Internet success. Topics include: digital transmission and multiplexing, protocols, MAC layer design (Ethernet/802.11), LAN interconnects and switching, congestion/flow/error control, routing, addressing, performance evaluation, internetworking (Internet) including TCP/IP, HTTP, DNS etc. This course will include one or more programming projects.

Learning Outcomes: 1. An understanding of the fundamental principles underlying packet switching networks, and different Local Area Network technologies. 2. An ability to implement network protocols using network socket programming. 3. An understanding of the key principles behind retransmission protocols, congestion control algorithms, and TCP. 4. An understanding of the basic concepts of routing. Credits: 3.00

ECE 46800 - Introduction To Compilers And Translation Engineering

Credit Hours: 4.00. The design and construction of compilers and other translators. Topics include compilation goals, organization of a translator, grammars and languages, symbol tables, lexical analysis, syntax analysis (parsing), error handling, intermediate and final code generation, assemblers, interpreters, and an introduction to optimization. Emphasis is on engineering a compiler or interpreter for a small programming language - typically a C or Pascal subset. Projects involve the stepwise implementation (and documentation) of such a system. Department permission required.

Credits: 4.00

ECE 46900 - Operating Systems Engineering

Credit Hours: 4.00. The design and construction of operating systems for both individual computers and distributed (networked) systems. Basic concepts and methods for managing processor, main memory, block-structured storage, and network resources are covered. Detailed examples are taken from a number of operating systems, emphasizing the techniques used in networked versions of UNIX. These techniques are applied to design improvements of portions of a simplified, networked, UNIX-based operating system; the improvements are implemented and their performance is evaluated in laboratory experiments.

Credits: 4.00

ECE 47300 - Introduction To Artificial Intelligence

Credit Hours: 3.00. The course introduces fundamental areas of artificial intelligence: knowledge representation and reasoning; machine learning; planning; game playing; natural language processing; and vision.

Learning Outcomes: No change Credits: 3.00

ECE 56800 - Embedded Systems

Credit Hours: 3.00. This course provides an introduction to the design of embedded and ubiquitous computing systems including their hardware and software architectures, design methodologies and tools, and communication protocols. The lectures are organized into three parts namely, (a) basic design principles including specification and modeling, hardware components and platforms, software organization, embedded and real-time operating systems, interfacing with external environments using sensors and actuators, and communication in distributed embedded systems, (b) advanced topics such as energy management, safety and reliability, and security, and (c) case-studies of real-world systems from a variety of embedded application domains such as biomedical devices, smart cards and RFID, networked sensors, personal computing devices,

home appliances and electronics, mobile robotics, etc. In addition to hands-on programming assignments using off-the-shelf embedded system development kits, the course will feature a comprehensive project where students will design, implement, and evaluate a prototype embedded system.

Credits: 3.00

ECE 57000 - Artificial Intelligence

Credit Hours: 3.00. Introduction to the basic concepts and various approaches of artificial intelligence. The first part of the course deals with heuristic search and shows how problems involving search can be solved more efficiently by the use of heuristics and how, in some cases, it is possible to discover heuristics automatically. The next part of the course presents ways to represent knowledge about the world and how to reason logically with that knowledge. The third part of the course introduces the student to advanced topics of AI drawn from machine learning, natural language understanding, computer vision, and reasoning under uncertainty. The emphasis of this part is to illustrate that representation and search are fundamental issues in all aspects of artificial intelligence.

Credits: 3.00

ECE 57300 - Compilers And Translator Writing Systems

Credit Hours: 3.00. This course presents the concepts needed to efficiently design and implement translators. Basic compiler/translation theory and technology are briefly reviewed, after which the course focuses on software tools for the automatic construction of translators, as well as more complex concepts involving the construction of compiler symbol tables, etc. Using C on ECN UNIX, each student will construct a simple lexical-recognizer generator, parser generator, and code-generator generator. Basic understanding of compilers and proficiency in C language required.

Credits: 3.00

ECE 50863 - Computer Network Systems

Credit Hours: 3.00. The goal of this course is to provide students with a proper grounding in the basic concepts and seminal work in computer network protocols and systems, and to introduce students to research in the field. The course will cover classical concepts such as network architecture, switching, routing, congestion control, and quality-of-service, and discuss recent developments in these areas. The course will also cover new developments in networking such as network measurements, network management, overlay networking and peer-to-peer systems, network security, and new network architectures. The course will emphasize a system-oriented and empirical view of internet architecture. Graduate standing or consent of instructor.

Learning Outcomes: 1. Understand the architectural principles underlying internet design. 2. Understand LAN interconnects, routing algorithms, and congestion control algorithms. 3. Identify, formulate, and solve problems encountered in the design of networks. 4. Implement networking systems and rigorously evaluate them using systematic empirical methods. Credits: 3.00

ECE 40862 - Software For Embedded Systems

Credit Hours: 3.00. This course provides an introduction to software design for embedded computing systems. Major topics covered include the importance of time and timing in embedded systems, embedded software organization (FSM-based program design, polled loop systems, foreground-background systems, event driven architectures, multi-tasking, etc.), real-time scheduling and real-time operating systems, wired/wireless networked embedded systems, debugging techniques for embedded software, and advanced topics such as memory-safe programming, implementing reentrant functions, and minimizing code space, memory usage, and power consumption. The course features a series of integrated assignments using state-of-the-art embedded hardware platforms, embedded software design tools, and real-time operating systems that reinforce the concepts taught in the lectures.

Learning Outcomes: 1. Understand the embedded software design process and tools used. 2. Understand various software architectures for embedded systems. 3. Apply advanced debugging techniques to embedded software. 4. Analyze and implement real-time embedded applications. 5. Design and implement distributed applications for networked embedded systems. Credits: 3.00

Other Department/Program Course Requirements (33-43 credits)

General Engineering Requirement (3-6 credits)

C Programming (0-3 credits)

CS 15900 - C Programming

Credit Hours: 3.00. Fundamental principles, concepts, and methods of programming in C, with emphasis on applications in the physical sciences and engineering. Basic problem solving and programming techniques; fundamental algorithms and data structures; and use of programming logic in solving engineering problems. Students are expected to complete assignments in a collaborative learning environment. Credit cannot be obtained for both CS 15900 and any of CS 15600, CS 15800 and CS 18000.

Learning Outcomes: 1. Understand the fundamental principles, concepts and methods of computer programming. 2. Use the C programming language to developing solutions in the domains of physical sciences, mathematics, and engineering. 3. Demonstrate the ability to function as part of a technical team to generate a solution to a programming problem. 4. Analyze alternative algorithm designs to implement solutions that make efficient use of limited resources of the computer. Credits: 3.00

Engineering Breadth Selective - Choose One (3 credits)

AAE 20300 - Aeromechanics I

Credit Hours: 3.00. Fundamental concepts and principles of bodies in motion, with applications to aeronautical and astronautical problems. Subjects covered include rectilinear motion, curvilinear motion, rotation, and plane motion. The static equilibrium and quasistatic equilibrium situations are treated as a part of motion in which the acceleration is zero. Problems involving impact, separation, work, and energy are considered.

Learning Outcomes: 1. Compute velocities and accelerations for any type of motion. 2. Compute angular velocities and accelerations of rigid bodies. 3. Model forces and apply Newton's Laws in particle dynamic problems. 4. Model forces and solve general statics of bodies problems. Credits: 3.00

ABE 20100 - Material And Energy Balances In Biological Engineering

Credit Hours: 4.00. Thermodynamic principles associated with biological systems and processing of biological materials. Emphasis on the first law of thermodynamics. Fundamentals of steady-state mass and energy balances for reacting and non-reacting processes including multiple unit operations emphasizing living systems and bioprocessing. Applications of the first law conservation of energy to biological systems, energy conversion systems, and the environmental impacts of energy production. Development of engineering problem solving skills via MathCad and MatLab software. Laboratory emphasizes combining technical engineering skills with professional skill development through computer and laboratory exercises including two extensive projects that result in a biological product design.

Learning Outcomes: 1. Analyze problems and use a systematic approach to problem solving in the engineering of biological systems. 2. Develop mass balances for systems with and without biochemical reactions for in vivo and in vitro biological systems. 3. Characterize the properties of solids, liquids, and gases common to biological systems. 4. Estimate gas/vapor properties using gas laws. 5. Understand the relationships between pressure, partial pressure, and humidity. 6. Apply the basic thermodynamic concepts to quantify phase and chemical equilibrium parameters for food and biological systems. 7. Use models to predict the physical behavior of materials at equilibrium in multi-component, multi-phase systems. 8. Use computational software to solve problems in biological systems. 9. Able to apply science and math skills to develop a new product and the processes required to transform the input materials into the final product. 10. Able to apply engineering fundamentals and analytical skills, specifically mass and energy balances and thermodynamics, to product and process development projects. 11. Able to communicate technical information, oral and written. 12. Develop leadership and teamwork skills through personal awareness and reflection, and team experiences. 13. Develop an innovative and a strong work ethic through new product development. 14. Have increased awareness of ethical responsibility through evaluating case

studies and classroom discussion. 15. Be more curious and persistent learners through self-directed team projects. Credits: 4.00

CHE 20500 - Chemical Engineering Calculations

Credit Hours: 4.00. Quantitative applications of steady-state mass and energy balances to solve problems involving multi-component systems and multi-unit chemical processes. Single-component and multi-component phase equilibria, single-reaction and multiple-reaction stoichiometry, coupled mass and energy balances, chemical processes involving bypass and recycle streams.

Learning Outcomes: 1. Estimate physical properties of real chemical systems. 2. Evaluate introductory single-component and multi-component phase equilibria and incorporate these concepts into solutions of mass and energy balance problems. 3. Solve steady state and transient mass and energy balance problems for both reacting and non-reacting systems with or without recycle using analytical and computational methods. 4. Work professionally and ethically in teams to solve new mass and energy balance problems. 5. Identify contemporary chemical engineering problems, including their societal, environmental, and global impacts. Credits: 4.00

CE 29700 - Basic Mechanics I (Statics)

Credit Hours: 3.00. Statics of particles. Rigid bodies: equivalent systems of forces, equilibrium. Centroids and centers of gravity. Static analysis of trusses, frames, and machines. Friction. Area moments of inertia.

Learning Outcomes: 1. Utilize fundamental vector mechanics concepts to understand, explain, and describe the behavior of particle and rigid-body equilibrium. 2. Determine centroids and moments of inertia of areas. 3. Analyze the behavior of typical engineering components using force and moment equilibrium. Credits: 3.00

CE 35000 - Introduction To Environmental And Ecological Engineering

Credit Hours: 3.00. Introduction to water pollution, air pollution, noise, hazardous and solid wastes, and their control. Environmental impact statements and global pollution issues. Field trips required.

Learning Outcomes: 1. An ability to apply material balance tools to environmental systems. 2. An ability to describe the different types of air, soil, and water pollutants and how they affect environmental quality on a local or global scale. 3. An ability to explain the principles of water, wastewater, air, soil, and hazardous waste treatment processes. 4. An ability to describe the professional and ethical responsibility of engineers in the context of environmental management. 5. An ability to describe the key roles and responsibilities of public institutions and private organizations in managing environmental resources. Credits: 3.00

CE 35500 - Engineering Environmental Sustainability (UCC: STS)

Credit Hours: 3.00. (EEE 35500) An introduction to the examination of global-scale resource utilization, food, energy and commodity production, population dynamics, and their ecosystem impacts.

University Core Curriculum (UCC): (UCC: STS)
Learning Outcomes: 1. Students will be creative thinkers that can collect and analyze appropriate data and information, and perform necessary quantitative analysis to develop original and innovative management strategies for real-world sustainability problems. 2. Students will be able to individually and in teams skillfully communicate in writing, orally, and with multimedia their ideas and conclusions about managing sustainability issues in a manner that increases knowledge and understanding of the audience. 3. Students will be critical thinkers that can identify the environmental, social, political, and economic

dimensions of technical challenges and evaluate their own and others' perspectives in forming logical opinions and conclusions. 4. Students will be able to effectively identify information needs, efficiently acquire appropriate information, and critically evaluate and use it in an ethical and scholarly fashion to gain understanding of and communicate about sustainability issues, challenges, and strategies. 5. Students will become global citizens and socially aware by gaining knowledge of diverse international and cultural perspectives and display social responsibility and leadership in managing sustainability issues, ultimately increasing their global literacy. 6. Students will learn how to be a productive team member, constructively evaluate their own and others' performances, resolve conflicts effectively and encourage the willing contributions of everyone. Credits: 3.00

EEE 35000 - Introduction To Environmental And Ecological Engineering

Credit Hours: 3.00. Introduction to water pollution, air pollution, noise, hazardous and solid wastes, and their control. Environmental impact statements and global pollution issues. Field trips required.

Learning Outcomes: 1. An ability to apply material balance tools to environmental systems. 2. An ability to describe the different types of air, soil, and water pollutants and how they affect environmental quality on a local or global scale. 3. An ability to explain the principles of water, wastewater, air, soil, and hazardous waste treatment processes. 4. An ability to describe the professional and ethical responsibility of engineers in the context of environmental management. 5. An ability to describe the key roles and responsibilities of public institutions and private organizations in managing environmental resources. Credits: 3.00

EEE 35500 - Engineering Environmental Sustainability (UCC: STS)

Credit Hours: 3.00. (CE 35500) An introduction to the examination of global-scale resource utilization, food, energy and commodity production, population dynamics, and their ecosystem impacts.

University Core Curriculum (UCC): (UCC: STS) Learning Outcomes: 1. Students will be creative thinkers that can collect and analyze appropriate data and information, and perform necessary quantitative analysis to develop original and innovative management strategies for real-world sustainability problems. 2. Students will be able to individually and in teams skillfully communicate in writing, orally, and with multimedia their ideas and conclusions about managing sustainability issues in a manner that increases knowledge and understanding of the audience. 3. Students will be critical thinkers that can identify the environmental, social, political, and economic dimensions of technical challenges and evaluate their own and others' perspectives in forming logical opinions and conclusions. 4. Students will be able to effectively identify information needs, efficiently acquire appropriate information, and critically evaluate and use it in an ethical and scholarly fashion to gain understanding of and communicate about sustainability issues, challenges, and strategies. 5. Students will become global citizens and socially aware by gaining knowledge of diverse international and cultural perspectives and display social responsibility and leadership in managing sustainability issues, ultimately increasing their global literacy. 6. Students will learn how to be a productive team member, constructively evaluate their own and others' performances, resolve conflicts effectively and encourage the willing contributions of everyone. Credits: 3.00

IE 33500 - Operations Research - Optimization

Credit Hours: 3.00. Introduction to deterministic optimization modeling and algorithms in operations research. Emphasis on formulation and solution of linear programs, networks flows, and integer programs.

Credits: 3.00

IE 33600 - Operations Research - Stochastic Models

Credit Hours: 3.00. Introduction to probabilistic models in operations research. Emphasis on Markov chains, Poisson processes, and their application to queuing systems.

Credits: 3.00

MSE 23000 - Structure And Properties Of Materials

Credit Hours: 3.00. The relationship between the structure of materials and the resulting mechanical, thermal, electrical, and optical properties. Atomic structure, bonding, atomic arrangement; crystal symmetry, crystal structure, habit, lattices, defects, and the use of X-ray diffraction. Phase equilibria and microstructural development. Applications to design.

Learning Outcomes: The learning outcomes for this course have more than 2,000 characters. Please see the course catalog for the learning outcomes. Credits: 3.00

ME 27000 - Basic Mechanics I

Credit Hours: 3.00. Vector operations, forces and couples. Free body diagrams, equilibrium of a particle and of rigid bodies. Distributed forces. Centers of gravity and centroids. Friction. Trusses, frames, and machines. Internal reactions resulting from axial, shear, torsional, and bending loading. Stress and strain analyses and elementary failure criteria.

Learning Outcomes: 1. Develop an understanding of static equilibrium and stresses in statically-determinate structures and how to apply them to engineering systems. 2. Learn a systematic approach to problem solving. 3. Foster effective mathematical and graphical communication skills. Credits: 3.00

ME 41300 - Noise Control

Credit Hours: 3.00. Fundamentals of acoustic waves. Psychoacoustics and theories of hearing. Environmental and building acoustics. Measurement methods and common instrumentation. Noise control methods. Machinery noise. Community reaction. Legal aspects. Design-oriented semester project. Course work in differential equations.

Credits: 3.00

NUCL 20000 - Introduction to Nuclear Engineering

Credit Hours: 3.00. A course designed to acquaint students with the field of nuclear engineering and design. Concepts of fission, fusion, radioactivity, and neutron physics are introduced. Modern applications of nuclear technology, including nuclear medicine, food preservation, space reactors and propulsion.

Learning Outcomes: 1. Demonstrate an ability to solve typical radiation and nuclear reactor calculations. 2. Demonstrate an understanding of the fundamental concepts and principles of nuclear engineering. 3. Understand and describe the societal impact of nuclear engineering and the need for nuclear education, regardless of career field. 4. Introduction to reactor physics. 5. Basic knowledge of radiation interaction with matter. 6. Application of nuclear energy in biomedical and industrial applications. Credits: 3.00

ME 20000 - Thermodynamics I

Credit Hours: 3.00. First and second laws of thermodynamics, entropy, reversible and irreversible processes, properties of pure substances. Application to engineering problems.

Learning Outcomes: 1. Provide a thorough understanding of the basic concepts of thermodynamics, (i.e., 1st and 2nd law). 2. Apply the basic concepts of thermodynamics to the solution of practical problems. 3. Develop a systematic approach to problem-solving skills. 4. Cultivate a strong work ethic in students. Credits: 3.00

Mathematics Requirement - Choose One Option (13-14 credits)

Option 1 (13 credits)

ECE 36900 - Discrete Mathematics For Computer Engineering

Credit Hours: 3.00. This course introduces discrete mathematical structures and finite-state machines. Students will

learn how to use logical and mathematical formalisms to formulate and solve problems in computer engineering. Topics include formal logic, proof techniques, recurrence relations, sets, combinatorics, relations, functions, algebraic structures, and finite-state machines.

Credits: 3.00

MA 26100 - Multivariate Calculus (UCC: QR)

Credit Hours: 4.00. Planes, lines, and curves in three dimensions. Differential calculus of several variables; multiple integrals. Introduction to vector calculus. Not open to students with credit in MA 17400 or 27100.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Know the equations for lines, planes and quadric surfaces in three dimensional space, and understand how these equations relate to the geometry. 2. Understand the relationship between vector functions and parametrized motion; know how to calculate velocity, acceleration, arc length and curvature. 3. Know the meaning of partial derivatives and how to calculate them. Know the multivariable chain rule. 4. Know the meaning of the gradient, how to calculate it, and how to apply it to directional derivatives and maximum and minimum values. 5. Understand the meaning of double and triple integrals; know how to compute them and how to apply them. 6. Understand the meaning of vector fields and line integrals. Know Green's theorem and be able to apply it. 7. Understand the meaning of surface integrals and know how to calculate them. Know Stokes' theorem and be able to apply it. Credits: 4.00

MA 26500 - Linear Algebra (UCC: QR)

Credit Hours: 3.00. Introduction to linear algebra. Systems of linear equations, matrix algebra, vector spaces, determinants, eigenvalues and eigenvectors, diagonalization of matrices, applications. Not open to students with credit in MA 26200, 27200, 35000 or 35100.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Learn the basic properties of matrices. 2. Learn how to solve systems of linear equations. 3. Learn the basic properties of determinants. 4. Learn about linear independence, spanning sets and bases in the context of vector spaces. 5. Learn the theory of inner product spaces and how it applies to least-squares approximations. 6. Learn the theory of eigenvalues and eigenvectors and how it applies to systems of differential equations. Credits: 3.00

MA 26600 - Ordinary Differential Equations (UCC: QR)

Credit Hours: 3.00. First order equations, second and n'th order linear equations, series solutions, solution by Laplace transform, systems of linear equations. It is preferable but not required to take MA 26500 either first or concurrently. Not open to students with credit in MA 26200, 27200, 36000, 36100, or 36600.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Understand the properties of and able to solve first-order differential equations, linear differential equations of second and higher orders, and linear systems of differential equations. 2. Understand and able to apply basic numerical methods for solving initial value problems. 3. Understand the properties of Laplace transforms and able to apply to solving differential equations and initial value problems. 4. Apply differential equations to mechanical, physical, and biological models. Credits: 3.00

Option 2 (14 credits)

ECE 36900 - Discrete Mathematics For Computer Engineering

Credit Hours: 3.00. This course introduces discrete mathematical structures and finite-state machines. Students will learn how to use logical and mathematical formalisms to formulate and solve problems in computer engineering. Topics include formal logic, proof techniques, recurrence relations, sets, combinatorics, relations, functions, algebraic structures, and finite-state machines.

Credits: 3.00

CS 31400 - Numerical Methods

Credit Hours: 3.00. Iterative methods for solving nonlinear equations; direct and iterative methods for solving linear

systems; approximations of functions, derivatives, and integrals; error analysis.

Credits: 3.00

MA 26100 - Multivariate Calculus (UCC: QR)

Credit Hours: 4.00. Planes, lines, and curves in three dimensions. Differential calculus of several variables; multiple integrals. Introduction to vector calculus. Not open to students with credit in MA 17400 or 27100.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Know the equations for lines, planes and quadric surfaces in three dimensional space, and understand how these equations relate to the geometry. 2. Understand the relationship between vector functions and parametrized motion; know how to calculate velocity, acceleration, arc length and curvature. 3. Know the meaning of partial derivatives and how to calculate them. Know the multivariable chain rule. 4. Know the meaning of the gradient, how to calculate it, and how to apply it to directional derivatives and maximum and minimum values. 5. Understand the meaning of double and triple integrals; know how to compute them and how to apply them. 6. Understand the meaning of vector fields and line integrals. Know Green's theorem and be able to apply it. 7. Understand the meaning of surface integrals and know how to calculate them. Know Stokes' theorem and be able to apply it. Credits: 4.00

MA 26200 - Linear Algebra And Differential Equations (UCC: QR)

Credit Hours: 4.00. Linear algebra, elements of differential equations. Not open to students with credit in MA 26500 or 26600.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Learn the basic properties of matrices. 2. Learn how to solve systems of linear equations. 3. Learn the basic properties of determinants. 4. Learn about linear independence, spanning sets and bases in the context of vector spaces. 5. Learn the properties of and standards methods of solving first-order differential equations and linear differential equations of second and higher orders. 6. Learn basic numerical methods for solving differential equations. 7. Learn about the applications of differential equations to mechanical, physical, and biological models. 8. Learn the theory of eigenvalues and eigenvectors and how it applies to systems of differential equations. Credits: 4.00

MA 30300 - Differential Equations And Partial Differential Equations For Engineering And The Sciences

Credit Hours: 3.00. This is a methods course for juniors in any branch of engineering and science, designed to follow MA 26200 or MA 26600. Materials to be covered are: linear systems of ordinary differential equations, nonlinear systems, Fourier series, separation of variables for partial differential equations, and Sturm-Liouville theory.

Learning Outcomes: 1. Learn the theory of systems of first order linear differential equations and methods for solving them. 2. Learn qualitative theory of systems of nonlinear differential equations. 3. Learn the Laplace transform method for solving differential equations. 4. Learn about Fourier series and Sturm-Liouville theory and how to use them to solve separable partial differential equations. Credits: 3.00

MA 35100 - Elementary Linear Algebra (UCC: QR)

Credit Hours: 3.00. Systems of linear equations, finite dimensional vector spaces, matrices, determinants, eigenvalues and eigenvector applications to analytical geometry. Not open to students with credit in MA 26500.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Solve systems of linear equations using concepts such as vector spaces, linear dependence, and Gaussian elimination. 2. Understand and test for linear independence, calculate the dimension of vector spaces, and apply the rank-nullity theorem in various contexts. 3. Define and apply linear transformations, including matrix

multiplication, inverses, LU factorization, and coordinate transformations. 4. Compute and understand determinants, including their use in calculating matrix inverses and practical applications such as volume calculations. 5. Analyze and compute eigenvectors and eigenvalues, and apply diagonalization techniques. Credits: 3.00

MA 38500 - Introduction To Logic

Credit Hours: 3.00. Propositional calculus and predicate calculus with applications to mathematical proofs, valid arguments, switching theory, and formal languages.

Credits: 3.00

MA 42500 - Elements Of Complex Analysis

Credit Hours: 3.00. Complex numbers and complex-valued functions; differentiation of complex functions; power series, uniform convergence; integration, contour integrals; elementary conformal mapping.

Learning Outcomes: 1. Apply complex number theory and understand algebraic and geometric representations. 2. Solve complex equations and analyze limits, continuity, and differentiability. 3. Use Cauchy-Riemann equations to identify analytic functions. 4. Evaluate integrals using Cauchy's integral theorem and formula. 5. Apply the residue theorem for evaluating integrals in engineering and science problems. 6. Use Taylor and Laurent series to expand complex functions. 7. Solve boundary value problems in fluid dynamics, electrostatics, and potential theory. 8. Apply complex analysis techniques to engineering and science applications. Credits: 3.00

MA 51000 - Vector Calculus

Credit Hours: 3.00. Calculus of functions of several variables and of vector fields in orthogonal coordinate systems. Optimization problems, implicit function theorem, Green's theorem, Stokes' theorem, divergence theorems. Applications to engineering and the physical sciences. Not open to students with credit in MA 36200 or MA 41000.

Credits: 3.00

Science Requirement (4-8 credits)

BIOL 11000 - Fundamentals Of Biology I (UCC: SCI)

Credit Hours: 4.00. This course is designed primarily to provide an introduction to the principles of biology for students in agriculture and health sciences. Principles of biology, focusing on diversity, ecology, evolution, and the development, structure, and function of organisms.

University Core Curriculum (UCC): (UCC: SCI)

Learning Outcomes: 1. Students demonstrate subject-matter competency, including the mastery of biological theories. 2. Students demonstrate proficiency with professional skills needed by practicing biologists, including experimental design and execution, biological techniques, data collection and documentation, communication of results, and responsible conduct of science. 3. Students demonstrate the ability to discuss ethical issues in the application of biological sciences, and the impact of science on society. 4. Students demonstrate skills in critical thinking. These skills include understanding scientific methods, solving biology-related problems, interpreting and analyzing primary literature in biology, and interpreting data in a meaningful way. 5. Students demonstrate knowledge of the path leading to specific careers in biology. 6. Students will understand how biochemistry contributes to improvements in human health, industry, and broader scientific understanding. 7. Students will be familiar with the biogenesis, structure, and chemistry of the basic types of macromolecules important in cells: nucleic acids, proteins, and membranes, and with the organic and inorganic molecules important in cellular metabolism. 8. Students will understand the role of macromolecules in cellular processes such as DNA replication, RNA transcription, protein translation, and metabolism. 9. Students

will understand the principles of how energy is obtained, stored and used in biological processes. 10. Graduates will understand the chemical and physical principles that govern biochemical and physiological processes. 11. Students will understand the role of evolution of creating and modifying the macromolecular components of the cell, and in creating biological complexity and variability. 12. Graduates will understand how chemical and biochemical processes relate to biological function at the molecular, cellular, organismal, and higher levels. 13. Students who complete the CMD BS program will have a broad understanding of the compositions and formations of cellular structures, the molecular basis underlying cellular processes, and the links between diseases and aberrant gene functions. 14. Students who complete the CMD BS program will have a broad understanding of the principles governing the development of multi-cellular animals and plants. 15. Students will understand ways in which organisms interact ecologically with each other and their environment. 16. Students will understand how evolutionary forces influence organisms to produce adaptations. 17. Students will exhibit proficiency in population and community ecology, animal behavior, and evolutionary mechanisms. 18. Students will exhibit proficiency in population and quantitative genetics. 19. Students will be familiar with taxonomic and phylogenic relationships among organisms. 19. Students can extend basic ecological principles to species and ecosystem conservation. 20. Students will use and understand the scientific method, including how to generate hypotheses and predications, develop an experimental design, collect data, statistically analyze data, and interpret results. 21. Demonstrate an understanding of concepts and theories of genetics. 22. Students will exhibit proficiency in the physiology, biochemistry, and genetics of bacteria including diversity, metabolism, and gene expression regulation as well as key metabolic control mechanisms. 23. Students will be able to demonstrate knowledge of how evolutionary forces impact and shape microbial function and activity. 24. Students will acquire knowledge of disease-causing microorganisms that includes an understanding of humoral, cell-mediated and non-specific immune responses, as well as the molecular basis for bacterial and viral pathogenesis. 25. Students will be able to demonstrate an understanding of the scientific method including hypothesis generation Credits: 4.00

BIOL 11100 - Fundamentals Of Biology II (UCC: SCI)

Credit Hours: 4.00. This course is designed primarily to provide an introduction to the principles of biology for students in agriculture and health sciences. Continuation of BIOL 11000 . Principles of biology, focusing on cell structure and function, molecular biology, and genetics.

University Core Curriculum (UCC): (UCC: SCI) Learning Outcomes: 1. Demonstrate the ability to think and function as a scientist. 2. Demonstrate depth in major. Credits: 4.00

BIOL 12100 - Biology I: Diversity, Ecology, And Behavior (UCC: SCI/STS)

Credit Hours: 2.00. Creates a framework for ordering biology by examining the unity and diversity of life on earth with an emphasis on ecology, genetics, population biology, evolution, and behavior.

University Core Curriculum (UCC): (UCC: SCI/STS) Credits: 2.00

BIOL 13100 - Biology II: Development, Structure, And Function Of Organisms (UCC: SCI)

Credit Hours: 3.00. Principles of development of plants and animals and the relationship between the structure and function of selected systems of these organisms.

University Core Curriculum (UCC): (UCC: SCI) Credits: 3.00

BIOL 13500 - First Year Biology Laboratory (UCC: SCI)

Credit Hours: 2.00. Laboratory exercises emphasizing student mastery of basic laboratory skills needed to succeed in the biological sciences; intended for beginning (first-year) biology majors.

University Core Curriculum (UCC): (UCC: SCI) Learning Outcomes: 1. Demonstrate the ability to think and function as a scientist. 2. Demonstrate depth in major. Credits: 2.00

PHYS 27200 - Electric And Magnetic Interactions (UCC: SCI)

Credit Hours: 4.00. Calculus-based physics course using concepts of electric and magnetic fields and an atomic description of matter to describe polarization, fields produced by charge distributions, potential, electrical circuits, magnetic forces, induction, and related topics, leading to Maxwell's equations and electromagnetic radiation and an introduction to waves and interference. 3-D graphical simulations and numerical problem solving by computer are employed throughout.

University Core Curriculum (UCC): (UCC: SCI) Learning Outcomes: 1. Understand and describe a wide range of physical phenomena in electricity and magnetism using only a few fundamental principles of physics. 2. Learn a unified approach that relates microscopic behavior to macroscopic behavior. 3. Model natural phenomena quantitatively. 4. Apply all this to a range of topics related to electricity and magnetism. Credits: 4.00

PHYS 31000 - Intermediate Mechanics

Credit Hours: 4.00. For students familiar with calculus. Elements of vector algebra; statics of particles and rigid bodies; theory of couples; principle of virtual work; kinematics; dynamics of particles and rigid bodies; work, power, and energy.

Learning Outcomes: 1. To Understand order in Nature as contained in the Laws of Physics. The student exhibits the knowledge of and the ability to apply the core physics subject of Classical Mechanics. Credits: 4.00

PHYS 32200 - Intermediate Optics

Credit Hours: 3.00. Wave optics and properties of light, including reflection, refraction interference. Fraunhofer and Fresnel diffraction dispersion, polarization, double refraction, introduction to lasers and holography.

Credits: 3.00

PHYS 34400 - Introduction To Quantum Science

Credit Hours: 4.00. This course offers an introduction to quantum mechanics, exploring how it has transformed our understanding of the physical world and revolutionized modern technology. The concepts will be illustrated with a variety of contemporary physics results and applications, including relativistic effects and a brief overview of the emerging field of quantum information science and engineering.

Learning Outcomes: 1. Understand key concepts in quantum mechanics, including wave-particle duality, superposition, entanglement, and the uncertainty principle. Apply these concepts to predict the behavior of quantum magnets (spins) and quantum light (photons). 2. Learn the wavefunction, the Schrodinger equation, and probability and measurement outcomes in quantum mechanics. Solve the Schrodinger equation in simple model systems and use the results to understand atom spectra, nuclear reactions, molecular bonds, and electronic motion in solids (including semiconductors and superconductors). 3. Understand how quantum mechanics has enabled many modern technologies, including lasers, transistors, solar cells, magnetic resonance imaging, electron microscopy, and the global positioning system. Understand basic ideas of the theory of relativity and relativistic effects in contemporary quantum science. 4. Gain an overview of the emerging field of quantum information science and engineering by exploring quantum computing, quantum communication, and quantum sensing. Credits: 4.00

CHM 11610 - General Chemistry II

Credit Hours: 3.00. A continuation of CHM 11510 (General Chemistry I). Topics covered can include solutions, quantitative equilibria in aqueous solutions, thermodynamics, oxidation-reduction and electrochemistry, chemical kinetics, qualitative analysis, and further descriptive chemistry of metals and

nonmetals.

Learning Outcomes: 1. Use theory to understand/predict experimental observations. 2. Demonstrate and understand key concepts and principles in chemistry, including the basic theory involved in chemical reactions, thermodynamics, equilibrium, and kinetics. Credits: 3.00

CHM 11620 - General Chemistry II - Laboratory (UCC: SCI)

Credit Hours: 1.00. In-person laboratory class to accompany CHM 11610. Topics covered can include chemical reactions, thermodynamics, equilibrium, rates, kinetics, quantitative analysis, and acid-base equilibria.

University Core Curriculum (UCC): (UCC: SCI)

Learning Outcomes: 1. Understand how scientific equipment and analog and/or digital instruments are used to obtain data measurements. 2. Understand safe laboratory practices and proper chemical hygiene methods associated with an experiment. 3. Develop observational skills during experiments to collect quality data and articulate observations in their laboratory reports. 4. Maintain ethical and trustworthy recordkeeping and reporting methods: recording data precisely, deciding on when a data set is kept or discarded for the experiments performed. 5. Analyze experimentally obtained data by using calculations and mathematical analysis techniques, such as graphical analysis of data sets. 6. Interpret experimental data and analyze this data using scientific models, concepts, representations, and equations. 7. Use evidenced-based reasoning to make claims and critique results. Make connections between lab results and the theories/concepts learned in lecture. 8. Use safe practices, proper chemical hygiene, and standard protocols while in a laboratory. 9. Collect and record digital data sets using modern data collection techniques including wireless data collection and cloud-based data storage. 10. Work with a partner(s) to accomplish laboratory work. 11. Experience chemistry in-person through direct use of chemicals, laboratory equipment, and instrumentation to complete a laboratory experiment. Credits: 1.00

CHM 11630 - General Chemistry II - Virtual Laboratory (UCC: SCI)

Credit Hours: 1.00. Online laboratory class to accompany CHM 11610. Topics covered can include chemical reactions, thermodynamics, equilibrium, rates, kinetics, quantitative analysis, and acid-base equilibrium.

University Core Curriculum (UCC): (UCC: SCI)

Learning Outcomes: 1. Understand how scientific equipment and analog and/or digital instruments are used to obtain data measurements. 2. Understand safe laboratory practices and proper chemical hygiene methods associated with an experiment. 3. Develop observational skills during experiments to collect quality data and articulate observations in their laboratory reports. 4. Maintain ethical and trustworthy recordkeeping and reporting methods: recording data precisely, deciding on when a data set is kept or discarded for the experiments performed. 5. Analyze experimentally obtained data by use calculations and mathematical analysis techniques, such as graphical analysis of data sets. 6. Interpret experimental data and analyze this data using scientific models, concepts, representations, and equations. 7. Use evidenced-based reasoning to make claims and critique results. Make connections between lab results and the theories/concepts learned in lecture. Credits: 1.00

ECE General Education Requirement (17-18 credits)

Electives (0-2 credits)

Optional Concentrations

Supplemental Lists

GPA Requirements

Pass/No Pass Policy

Transfer Credit Policy

Purdue in Indianapolis Students will be required to take the courses listed in First Year Engineering

Sample Computer Engineering Plan of Study

Fall 2nd Year

ECE 26400 - Advanced C Programming

Credit Hours: 3.00. Continuation of a first programming course. Topics include files, structures, pointers, and the proper use of dynamic data structures. A basic knowledge of the UNIX operating system and an introductory C programming course; C programming knowledge should include basic syntax, control structures, and file I/O, as well as experience in declaring and using functions.

Learning Outcomes: 1. Ability to read and write C programs that use files. 2. Ability to read and write C programs that use structures. 3. Ability to read and write C programs that use dynamic data structures. Credits: 3.00

ECE 36900 - Discrete Mathematics For Computer Engineering

Credit Hours: 3.00. This course introduces discrete mathematical structures and finite-state machines. Students will learn how to use logical and mathematical formalisms to formulate and solve problems in computer engineering. Topics include formal logic, proof techniques, recurrence relations, sets, combinatorics, relations, functions, algebraic structures, and finite-state machines.

Credits: 3.00

CS 15900 - C Programming

Credit Hours: 3.00. Fundamental principles, concepts, and methods of programming in C, with emphasis on applications in the physical sciences and engineering. Basic problem solving and programming techniques; fundamental algorithms and data structures; and use of programming logic in solving engineering problems. Students are expected to complete assignments in a collaborative learning environment. Credit cannot be obtained for both CS 15900 and any of CS 15600, CS 15800 and CS 18000.

Learning Outcomes: 1. Understand the fundamental principles, concepts and methods of computer programming. 2. Use the C programming language to developing solutions in the domains of physical sciences, mathematics, and engineering. 3. Demonstrate the ability to function as part of a technical team to generate a solution to a programming problem. 4. Analyze alternative algorithm designs to implement solutions that make efficient use of limited resources of the computer. Credits: 3.00

MA 26100 - Multivariate Calculus (UCC: QR)

Credit Hours: 4.00. Planes, lines, and curves in three dimensions. Differential calculus of several variables; multiple integrals. Introduction to vector calculus. Not open to students with credit in MA 17400 or 27100.

University Core Curriculum (UCC): (UCC: QR)
Learning Outcomes: 1. Know the equations for lines, planes and quadric surfaces in three dimensional space, and understand how these equations relate to the geometry. 2. Understand the relationship between vector functions and parametrized motion; know how to calculate velocity, acceleration, arc length and curvature. 3. Know the meaning of partial derivatives and how to calculate them. Know the multivariable chain rule. 4. Know the meaning of the gradient, how to calculate it, and how to apply it to directional derivatives and maximum and

minimum values. 5. Understand the meaning of double and triple integrals; know how to compute them and how to apply them. 6. Understand the meaning of vector fields and line integrals. Know Green's theorem and be able to apply it. 7. Understand the meaning of surface integrals and know how to calculate them. Know Stokes' theorem and be able to apply it. Credits: 4.00

ECE 29401 - Electrical And Computer Engineering Sophomore Seminar

Credit Hours: 1.00. An introduction to the School of Electrical and Computer Engineering, the program's objectives, and outcomes, BSEE and BSCmpE degree requirements, professional writing and multicultural and professional development.

Learning Outcomes: 1. Knowledge of the ECE educational objectives and required outcomes. 2. Knowledge of the BSEE and/or BSCmpE degree requirements. 3. Ability to prepare a satisfactory plan-of-study. 4. Ability to write effectively in the English language. 5. Appreciation for ethical, professional and academic conduct. Credits: 1.00

ECE 20001 - Electrical Engineering Fundamentals I

Credit Hours: 3.00. This course covers fundamental concepts and applications for electrical and computer engineers as well as for engineers who need to gain a broad understanding of these disciplines. The course starts by the basic concepts of charge, current, and voltage as well as their expressions with regards to resistors and resistive circuits. Essential concepts, devices, theorems, and applications of direct-current (DC), 1st order, and alternating-current (AC) circuits are subsequently discussed. Besides electrical devices and circuits, basic electronic components including diodes and transistors as well as their primary applications are also discussed.

Learning Outcomes: 1. Ability to analyze linear resistive circuits. 2. Ability to analyze 1st order linear circuits with sources and/or passive elements. 3. Ability to analyze electronic circuits with diodes and transistors. Credits: 3.00

ECE 20007 - Electrical Engineering Fundamentals I Lab

Credit Hours: 1.00. This is an introduction course in electronic measurement and circuit modeling, simulation and design techniques. These skills are developed through a variety of laboratory experiments ranging from voltage, current, and frequency, to resistors, inductors, capacitors, and operational amplifiers. When possible, the experiments develop practical skills through small design and soldering tasks. Finally, the course culminates in a two week group design project. In many ways this course is the laboratory of the co-requisite lecture course ECE 20001: Electrical Engineering Fundamentals I; however, we remind students that this is a standalone course that expects students will learn and demonstrate material not taught in ECE 20001.

Learning Outcomes: 1. Select and use electronic measurement instruments competently. 2. Design, wire, and troubleshoot electronic circuits. 3. Simulate electronic circuits. 4. Keep a laboratory notebook and prepare a formal laboratory report. 5. Function on an interdisciplinary team that draws on diverse backgrounds. 6. Design, build, and test resistor-inductor-capacitor, operational amplifier, etc. circuits to meet specifications. 7. Demonstrate knowledge of laboratory safety precautions. Credits: 1.00

16-19 Credits

Spring 2nd Year

ECE 27000 - Introduction To Digital System Design

Credit Hours: 4.00. An introduction to digital system design and hardware engineering, with an emphasis on practical design techniques and circuit implementation.

Learning Outcomes: 1. Analyze and design CMOS logic gates. 2. Analyze and design combinational logic circuits. 3. Analyze and design sequential logic circuits. 4. Analyze and design computer logic circuits. 5. Realize, test, and debug practical digital circuits. Credits: 4.00

MA 26200 - Linear Algebra And Differential Equations (UCC: QR)

Credit Hours: 4.00. Linear algebra, elements of differential equations. Not open to students with credit in MA 26500 or 26600.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Learn the basic properties of matrices. 2. Learn how to solve systems of linear equations. 3. Learn the basic properties of determinants. 4. Learn about linear independence, spanning sets and bases in the context of vector spaces. 5. Learn the properties of and standards methods of solving first-order differential equations and linear differential equations of second and higher orders. 6. Learn basic numerical methods for solving differential equations. 7. Learn about the applications of differential equations to mechanical, physical, and biological models. 8. Learn the theory of eigenvalues and eigenvectors and how it applies to systems of differential equations. Credits: 4.00

MA 26600 - Ordinary Differential Equations (UCC: QR)

Credit Hours: 3.00. First order equations, second and n'th order linear equations, series solutions, solution by Laplace transform, systems of linear equations. It is preferable but not required to take MA 26500 either first or concurrently. Not open to students with credit in MA 26200, 27200, 36000, 36100, or 36600.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Understand the properties of and able to solve first-order differential equations, linear differential equations of second and higher orders, and linear systems of differential equations. 2. Understand and able to apply basic numerical methods for solving initial value problems. 3. Understand the properties of Laplace transforms and able to apply to solving differential equations and initial value problems. 4. Apply differential equations to mechanical, physical, and biological models. Credits: 3.00

ECE 20002 - Electrical Engineering Fundamentals II

Credit Hours: 3.00. Continuation of Electrical and Computer Engineering Fundamentals I. The course addresses mathematical and computational foundations of circuit analysis (differential equations, Laplace Transform techniques) with a focus on application to linear circuits having variable behavior as a function of frequency, with emphasis on filtering. Variable frequency behavior is further considered for applications of electronic components through single-transistor and operational amplifiers. The course ends with consideration of how circuits behave and may be modeled for analysis at high frequencies. Permission of Department required.

Learning Outcomes: 1. Analyze 2nd order linear circuits with sources and/or passive elements. 2. Compute responses of linear circuits with and without initial conditions via one-sided Laplace transform techniques. 3. Compute responses to linear circuits using transfer function and convolution techniques. 4. Analyze and design transistor amplifiers at low, mid and high frequencies. 5. Ability to work with transmission line models to analyze circuits at high-frequency. 6. Use a CAD tool (e.g., SPICE) in circuit analysis and design. Credits: 3.00

ECE 20875 - Python For Data Science

Credit Hours: 3.00. This course will introduce Python programming to students through data science problems. Students will learn Python concepts as well as introductory data science topics, and will use their knowledge of Python (and prior programming experience) to implement data analyses.

Learning Outcomes: 1. Understand of regular expressions [1, 2]. 2. Use Python to write data analyses [1, 2, 6]. 3. Explain when data analyses are appropriate [1, 2, 3, 6]. 4. Explain the results of data analyses [2, 3, 5]. 5. Incorporate classes in their Python programs [1, 2, 6]. 6. Incorporate associative arrays in their programs [1, 2, 6]. Credits: 3.00

16-17 Credits

Fall 3rd Year

ECE 30100 - Signals And Systems

Credit Hours: 3.00. Classification, analysis and design of systems in both the time- and frequency-domains. Continuous-time linear systems: Fourier Series, Fourier Transform, bilateral Laplace Transform. Discrete-time linear systems: difference equations, Discrete-Time Fourier Transform, bilateral Z-

Transform. Sampling, quantization, and discrete-time processing of continuous-time signals. Discrete-time nonlinear systems: median-type filters, threshold decomposition. System design examples such as the compact disc player and AM radio.

Learning Outcomes: 1. Able to classify signals (e.g., periodic, even) and systems (e.g., causal, linear) and an understanding of the difference between discrete and continuous time signals and systems. 2. Able to determine the impulse response of a differential or difference equation. 3. Able to determine the response of linear systems to any input signal by convolution in the time domain. 4. Understand the definitions and basic properties (e.g., time-shift, modulation, Parseval's Theorem) of Fourier series, Fourier transforms, bilateral Laplace transforms, Z transforms, and discrete time Fourier transforms and an ability to compute the transforms and inverse transforms of basic examples using methods such as partial fractions expansions. 5. Able to determine the response of linear systems to any input signal by transformation to the frequency domain, multiplication, and inverse transformation to the time domain, an ability to apply the Sampling theorem, reconstruction, aliasing, and Nyquist's theorem to represent continuous-time signal in discrete time so that they can be processed by digital computers. Credits: 3.00

ECE 36800 - Data Structures

Credit Hours: 3.00. Provides insight into the use of data structures. Topics include stacks, queues and lists, trees, graphs, sorting, searching, and hashing.

Learning Outcomes: 1. Understand various basic data structures, including stacks, queues, and trees. 2. Able to analyze time complexity and space complexity of algorithms. 3. Able to apply appropriate sorting and searching algorithms for a given application. 4. Able to apply graph theoretic techniques, data structures and algorithms for problem solving. 5. Able to design and implement appropriate data structures and algorithms for engineering applications. Credits: 3.00

ECE 36200 - Microprocessor Systems And Interfacing

Credit Hours: 4.00. An introduction to basic computer organization, microprocessor instruction sets, assembly language programming, and microcontroller peripherals.

Learning Outcomes: 1. Show ability to program a microcontroller to perform various tasks. 2. Show an ability to interface a microcontroller to various devices. 3. Show an ability to effectively utilize microcontroller peripheral. 4. Show an ability to design and implement a microcontroller-based embedded system. Credits: 4.00

ECE 39401 - Professional Communications And Diversity

Credit Hours: 1.00. This course provides ECE students with practice in relevant aspects of communication. Topics include: successfully seeking employment, working effectively in teams, delivering engaging presentations, and leveraging the advantages and challenges of diversity and inclusion.

Learning Outcomes: 1. Ability to function effectively on a team whose members create a collaborative and inclusive environment, plan tasks, and meet objectives. 2. Communicate effectively with a range of audiences. 3. Develop and explain solutions to engineering problems, taking public health and cultural factors into consideration. Credits: 1.00

14-18 Credits

Spring 3rd Year

ECE 30200 - Probabilistic Methods In Electrical And Computer Engineering

Credit Hours: 3.00. An introductory treatment including probability of events, discrete and continuous random variables, multiple random variables, sums of random variables and long-term averages, and elementary random processes. Applications involving uniform, Gaussian, exponential, geometric and related random variables.

Introduction to parameter estimation and hypothesis testing. Discussion of wide-sense stationary random processes, including correlation functions, spectral densities and the response of linear time invariant systems. Course examples are drawn from signal processing, wireless communications, system reliability, and data science.

Credits: 3.00

PHYS 27200 - Electric And Magnetic Interactions (UCC: SCI)

Credit Hours: 4.00. Calculus-based physics course using concepts of electric and magnetic fields and an atomic description of matter to describe polarization, fields produced by charge distributions, potential, electrical circuits, magnetic forces, induction, and related topics, leading to Maxwell's equations and electromagnetic radiation and an introduction to waves and interference. 3-D graphical simulations and numerical problem solving by computer are employed throughout.

University Core Curriculum (UCC): (UCC: SCI)

Learning Outcomes: 1. Understand and describe a wide range of physical phenomena in electricity and magnetism using only a few fundamental principles of physics. 2. Learn a unified approach that relates microscopic behavior to macroscopic behavior. 3. Model natural phenomena quantitatively. 4. Apply all this to a range of topics related to electricity and magnetism. Credits: 4.00

16 Credits

Fall 4th Year

ECE 47700 - Digital Systems Senior Project

Credit Hours: 4.00. A structured approach to the development and integration of embedded microcontroller hardware and software that provides senior-level students with significant design experience applying microcontrollers to a wide range of embedded systems (e.g., instrumentation, process control, telecommunications, and intelligent devices). The primary objective is to provide practical experience developing integrated hardware and software for embedded microcontroller systems in an environment that models one which students will most likely encounter in industry. Permission of instructor required.

Learning Outcomes: 1. Apply knowledge obtained in earlier coursework and to obtain new knowledge necessary to design and test a microcontroller-based digital system. 2. Understand the engineering design process. 3. Function on a multidisciplinary team. 4. Be aware of professional and ethical responsibility. 5. Communicate effectively, in both oral and written form. Credits: 4.00

MA 26500 - Linear Algebra (UCC: QR)

Credit Hours: 3.00. Introduction to linear algebra. Systems of linear equations, matrix algebra, vector spaces, determinants, eigenvalues and eigenvectors, diagonalization of matrices, applications. Not open to students with credit in MA 26200, 27200, 35000 or 35100.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Learn the basic properties of matrices. 2. Learn how to solve systems of linear equations. 3. Learn the basic properties of determinants. 4. Learn about linear independence, spanning sets and bases in the context of vector spaces. 5. Learn the theory of inner product spaces and how it applies to least-squares approximations. 6. Learn the theory of eigenvalues and eigenvectors and how it applies to systems of differential equations. Credits: 3.00

13-16 Credits

Spring 4th Year

ECE 49401 - Professional Communication Capstone

Credit Hours: 1.00. This course provides ECE students an opportunity to refine their professional communication skills before launching into the workplace or graduate school. Topics include: ethics in ECE, workplace communication (written and verbal), and plans for professional growth.

Learning Outcomes: 1. Communicate effectively with a range of audiences. 2. Function effectively on a team whose members together create a collaborative and inclusive environment, plan tasks, and meet objectives. 3. Ability to make informed judgments based

ethical and professional responsibilities in engineering situations, giving consideration to global, economic, environmental, and/or societal contexts. Credits: 1.00

16-18 Credits

Computer Science Honors: Algorithmic Foundations, BS

About the Program

Degree Requirements

Computer Science Honors Major Courses (58-60 credits)

Required CS Honors Major Math Courses (7-8 credits)

MA 26100 - Multivariate Calculus (UCC: QR)

Credit Hours: 4.00. Planes, lines, and curves in three dimensions. Differential calculus of several variables; multiple integrals. Introduction to vector calculus. Not open to students with credit in MA 17400 or 27100.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Know the equations for lines, planes and quadric surfaces in three dimensional space, and understand how these equations relate to the geometry. 2. Understand the relationship between vector functions and parametrized motion; know how to calculate velocity, acceleration, arc length and curvature. 3. Know the meaning of partial derivatives and how to calculate them. Know the multivariable chain rule. 4. Know the meaning of the gradient, how to calculate it, and how to apply it to directional derivatives and maximum and minimum values. 5. Understand the meaning of double and triple integrals; know how to compute them and how to apply them. 6. Understand the meaning of vector fields and line integrals. Know Green's theorem and be able to apply it. 7. Understand the meaning of surface integrals and know how to calculate them. Know Stokes' theorem and be able to apply it. Credits: 4.00

MA 35100 - Elementary Linear Algebra (UCC: QR)

Credit Hours: 3.00. Systems of linear equations, finite dimensional vector spaces, matrices, determinants, eigenvalues and eigenvector applications to analytical geometry. Not open to students with credit in MA 26500.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Solve systems of linear equations using concepts such as vector spaces, linear dependence, and Gaussian elimination. 2. Understand and test for linear independence, calculate the dimension of vector spaces, and apply the rank-nullity theorem in various contexts. 3. Define and apply linear transformations, including matrix multiplication, inverses, LU factorization, and coordinate transformations. 4. Compute and understand determinants, including their use in calculating matrix inverses and practical applications such as volume calculations. 5. Analyze and compute eigenvectors and eigenvalues, and apply diagonalization techniques. Credits: 3.00

MA 27101 - Honors Multivariate Calculus (UCC: QR)

Credit Hours: 5.00. This course is the Honors version of MA 26100, Multivariate Calculus; it will also include a review of infinite series. The course is intended for first-year students who have credit for Calculus I and II. There will be a significant emphasis on conceptual explanation, but not on formal proof. Permission of department is required.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Know techniques of vector algebra and be able to apply these to the geometry of space; in particular they will be able to find equations for lines and planes in space. 2. Find equations for standard surfaces in

space. 3. Use vector methods to analyze motion in space, and calculate arc length and curvature. 4. Acquire a conceptual and computational knowledge of infinite series; in particular they will be able to test for convergence, and to do calculations with power series. 5. Understand the meaning of partial derivatives in various situations, and will be able to calculate with them. 6. Know the multivariable chain rule and its meaning, and will be able to apply it to calculate derivatives in various situations. 7. Know the meaning of directional derivatives and how to calculate them. 8. Find tangent planes. 9. Find and classify extreme values and saddle points and use the method of Lagrange multipliers. 10. Know the meaning of multiple integrals and how to calculate them. 11. Know the meaning of line integrals and surface integrals and how to calculate them. 12. Know Green's theorem, Stokes' theorem, and the divergence theorem and their applications. Credits: 5.00

Required CS Major Core Courses (21 credits)

CS 18000 - Problem Solving And Object-Oriented Programming

Credit Hours: 4.00. Problem solving and algorithms, implementation of algorithms in a high level programming language, conditionals, the iterative approach and debugging, collections of data, searching and sorting, solving problems by decomposition, the object-oriented approach, subclasses of existing classes, handling exceptions that occur when the program is running, graphical user interfaces (GUIs), data stored in files, abstract data types, a glimpse at topics from other CS courses. Intended primarily for students majoring in computer sciences. Credit cannot be obtained for both CS 18000 and any of 15600, 15800 and 15900. Not open to students with credit in CS 24000.

Learning Outcomes: 1. Understand solving problems by analyzing the problem, designing an algorithm, and programming the solution. Credits: 4.00

CS 18200 - Foundations Of Computer Science

Credit Hours: 3.00. Logic and proofs; sets, functions, relations, sequences and summations; number representations; counting; fundamentals of the analysis of algorithms; graphs and trees; proof techniques; recursion; Boolean logic; finite state machines; pushdown automata; computability and undecidability.

Learning Outcomes: 1. Understand discrete mathematical tools, facts, and reasoning relevant to computer science. Credits: 3.00

CS 24000 - Programming In C

Credit Hours: 3.00. The UNIX environment, C development cycle, data representation, operators, program structure, recursion, macros, C preprocessor, pointers and addresses, dynamic memory allocation, structures, unions, typedef, bit-fields, pointer/structure applications, UNIX file abstraction, file access, low-level I/O, concurrency.

Learning Outcomes: 1. Understand programming principles and techniques for problem solving in the C programming language. Credits: 3.00

CS 25000 - Computer Architecture

Credit Hours: 4.00. Digital logic: transistors, gates, and combinatorial circuits; clocks; registers and register banks; arithmetic-logic units; data representation: big-endian and little-endian integers; ones and twos complement arithmetic; signed and unsigned values; Von-Neumann architecture and bottleneck; instruction sets; RISC and CISC designs; instruction pipelines and stalls; rearranging code; memory and address spaces; physical and virtual memory; interleaving; page tables; memory caches; bus architecture; polling and interrupts; DMA; device programming; assembly language; optimizations; parallelism; data pipelining.

Learning Outcomes: 1. Students understand the function of basic hardware, including fundamentals of digital logic, processors, memory, and I/O. Credits: 4.00

CS 25100 - Data Structures And Algorithms

Credit Hours: 3.00. Running time analysis of algorithms and their implementations, one-dimensional data structures, trees, heaps, additional sorting algorithms, binary search trees, hash tables, graphs, directed graphs, weighted graph algorithms, additional topics.

Learning Outcomes: 1. Understand fundamental

data structures, fundamental algorithms, and their implementation. Credits: 3.00

CS 25200 - Systems Programming

Credit Hours: 4.00. Low-level programming; review of addresses, pointers, memory layout, and data representation; text, data, and bss segments; debugging and hex dumps; concurrent execution with threads and processes; address spaces; file names; descriptors and file pointers; inheritance; system calls and library functions; standard I/O and string libraries; simplified socket programming; building tools to help programmers; make and make files; shell scripts and quoting; Unix tools including sed, echo, test, and find; scripting languages such as awk; version control; object and executable files (.o and a.out); symbol tables; pointers to functions; hierarchical directories; and DNS hierarchy; programming embedded systems.

Learning Outcomes: 1. Have an appreciation and ability for low-level (systems) programming and debugging. Credits: 4.00

Algorithmic Foundations Concentration (18 credits)

Required Courses

CS 35200 - Compilers: Principles And Practice

Credit Hours: 3.00. Should not be taken concurrently with CS 35400. The theory and practice of programming language translation, compilation, and run-time systems, organized around a significant programming project to build a compiler for a simple but nontrivial programming language. Modules, interfaces, tools. Data structures for tree languages. Lexical analysis, syntax analysis, abstract syntax. Symbol tables, semantic analysis. Translation, intermediate code, basic blocks, traces. Instruction selection, CISC and RISC machines. Liveness analysis, graph coloring register allocation. Supplemental material drawn from garbage collection, object-oriented languages, higher-order languages, dataflow analysis, optimization, polymorphism, scheduling and pipelining, memory hierarchies.

Learning Outcomes: 1. Provides students with an understanding of how a computer program is converted into elementary code that causes the computer to produce the output intended by the programmer. Credits: 3.00

CS 35400 - Operating Systems

Credit Hours: 3.00. Should not be taken concurrently with CS 35200. Introduction to operating systems. Computer system and operating system architectures, processes, inter-process communication, inter-process synchronization, mutual exclusion, deadlocks, memory hierarchy, virtual memory, CPU scheduling, file systems, I/O device management, security.

Learning Outcomes: 1. Provides students with an understanding of the fundamentals of computer operating systems. Credits: 3.00

CS 38100 - Introduction To The Analysis Of Algorithms

Credit Hours: 3.00. Techniques for analyzing the time and space requirements of algorithms. Application of these techniques to sorting, searching, pattern-matching, graph problems, and other selected problems. Brief introduction to the intractable (NP-hard) problems.

Learning Outcomes: 1. Use big O-notation to give asymptotic time and space bounds of algorithms. 2. Explain the use of big-Omega, big-Theta, and little-o notations. 3. Use recurrence relations to determine the time complexity of recursive algorithms. 4. Solve recurrence relations commonly arising in algorithm design. 5. Give examples that illustrate time-space trade-offs of algorithms. Credits: 3.00

CS 47100 - Introduction To Artificial Intelligence

Credit Hours: 3.00. Students are expected to spend at least three hours per week gaining experience with artificial intelligence systems and developing software. Basic problem-solving strategies, heuristic search, problem reduction and AND/OR graphs, knowledge representation, expert systems, generating explanations, uncertainty reasoning, game playing, planning, machine learning, computer vision, and programming systems such as Lisp or Prolog.

Learning Outcomes: 1. Develop understandings of various applications of AI. 2. Recognize problems where AI techniques are applicable. 3. Implement and apply basic principles of AI in solutions that require problem-solving, inference, learning, and planning. 4. Understand how to evaluate various AI techniques and make appropriate

selections. Credits: 3.00

CS 37300 - Data Mining And Machine Learning

Credit Hours: 3.00. This course will introduce students to the field of data mining and machine learning, which sits at the interface between statistics and computer science. Data mining and machine learning focuses on developing algorithms to automatically discover patterns and learn models of large datasets. This course introduces students to the process and main techniques in data mining and machine learning, including exploratory data analysis, predictive modeling, descriptive modeling, and evaluation.

Learning Outcomes: 1. Identify key elements of data mining and machine learning algorithms. 2. Understand how algorithmic elements interact to impact performance. 3. Understand how to choose algorithms for different analysis tasks. 4. Analyze data in both an exploratory and targeted manner. 5. Implement and apply basic algorithms for supervised and unsupervised learning. 6. Accurately evaluate the performance of algorithms, as well as formulate and test hypotheses. Credits: 3.00

Selectives

CS 31400 - Numerical Methods

Credit Hours: 3.00. Iterative methods for solving nonlinear equations; direct and iterative methods for solving linear systems; approximations of functions, derivatives, and integrals; error analysis.

Credits: 3.00

CS 33400 - Fundamentals Of Computer Graphics

Credit Hours: 3.00. Fundamental principles and techniques of computer graphics. The course covers the basics of going from a scene representation to a raster image using OpenGL. Specific topics include coordinate manipulations, perspective, basics of illumination and shading, color models, texture maps, clipping and basic raster algorithms, fundamentals of scene constructions. CS 31400 is recommended.

Credits: 3.00

CS 35300 - Principles Of Concurrency And Parallelism

Credit Hours: 3.00. Important concepts, models, algorithms, abstractions, and implementation aspects of concurrent and parallel programs. Topics include: techniques used to describe concurrent programs (e.g., threads, events, co-routines, continuations), abstractions for shared-memory and message-passing programs, relaxed memory models, livelock and deadlock detection, lock-free algorithms, data races and atomicity, scheduling techniques, process calculi, and software transactions.

Learning Outcomes: 1. This course provides students the vocabulary and concepts to better understand how to design and program scalable multicore processors. Credits: 3.00

CS 35500 - Introduction To Cryptography

Credit Hours: 3.00. An introduction to cryptography basics: Classic historical ciphers including Caesar, Vigenere, and Vernam ciphers; modern ciphers including DES, AES, Pohlig-Hellman, and RSA; signatures and digests; key exchange; simple protocols; block and stream ciphers; network-centric protocols.

Learning Outcomes: 1. Understand the basic concepts and proof techniques in cryptography. 2. Develop skills to define and evaluate the security of existing schemes. 3. Construct provably secure schemes for common cryptographic tasks. Credits: 3.00

CS 44800 - Introduction To Relational Database Systems

Credit Hours: 3.00. An in-depth examination of relational database systems including theory and concepts as well as practical issues in relational databases. Modern database technologies such as object-relational and Web-based access to relational databases. Conceptual design and entity relationship modeling, relational algebra and calculus, data definition and manipulation languages using SQL, schema and view management, query processing and optimization, transaction management, security, privacy, integrity management.

Learning Outcomes: 1. Learn data modeling: physical, logical and conceptual data models, the entity-relationship model. 2. Study logical and Physical Design and interaction with operating systems, disk Storage, Basic File Structures, Hashing, Indexing. 3. Learn the relational database model and implementation and performance issues. 4. Understand transaction Processing, concurrency control, atomicity control and recovery control. 5.

Understand database privacy, integrity, and security. 6. Understand data mining, data warehousing, online analytical processing, and information retrieval. 7. Understand Cloud computing and Distributed Database Systems architectures, Big Data, Hadoop, MapReduce, and NoSQL. 8. Recognize performance issues. Credits: 3.00

CS 45600 - Programming Languages

Credit Hours: 3.00. Concepts for structuring data, computation, and whole programs. Object-oriented languages, functional languages, logic- and rule-based languages. Data types, type checking, exception handling, concurrent processes, synchronization, modularity, encapsulation, interfaces, separate compilation, inheritance, polymorphism, dynamic binding, subtyping, overloading, beta-reduction, unification.

Credits: 3.00

CS 48300 - Introduction To The Theory Of Computation

Credit Hours: 3.00. Turing machines and the Church-Turing thesis; decidability; halting problem; reducibility; undecidable problems; decidability of logical theories; Kolmogorov complexity; time classes; P, NP, NP-complete; space classes; Savitch's theorem, PSPACE-completeness, NL-completeness; hierarchy theorems; approximation theorems; probabilistic algorithms; applications of complexity to parallel computation and cryptography.

Credits: 3.00

CS 49000 - Topics In Computer Sciences For Undergraduates

Credit Hours: 1.00 to 5.00. Supervised reading and reports in various fields. Permission of instructor required.

Credits: 1.00 to 5.00

MA 34100 - Foundations Of Analysis

Credit Hours: 3.00. An introductory course in rigorous analysis, covering real numbers, sequences, series, continuous functions, differentiation, and Riemann integration. MA 30100 is helpful but not required.

Credits: 3.00

MA 36200 - Topics In Vector Calculus

Credit Hours: 3.00. Multivariate calculus; partial differentiation; implicit function theorems and transformations; line and surface integrals; vector fields; theorems of Gauss, Green, and Stokes. Credit granted for only one of MA 36200 and MA 51000 .

Credits: 3.00

MA 36600 - Ordinary Differential Equations (UCC: QR)

Credit Hours: 4.00. An introduction to ordinary differential equations with emphasis on problem solving and applications. The one-hour computer lab will give students an opportunity for hands-on experience with both the theory and applications of the subject.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Learn the statement of the theorem of existence and uniqueness of solutions of first order differential equations and standard methods of solving linear, and some special non-linear, differential equations of first order. 2. Interpret solutions qualitatively. 3. Learn how to construct mathematical models. 4. Learn the standard methods of solving linear homogenous differential equations of constant coefficients of arbitrary order. 5. Learn methods to solve nonhomogeneous differential equations of constant coefficients of arbitrary order. 6. Learn basic numerical methods for solving differential equations. 7. Learn about the applications of differential equations to mechanical, physical, and biological models. 8. Learn the theory of eigenvalues and eigenvectors and how they apply to systems of linear differential equations. 9. Learn how to analyze systems of nonlinear differential equations (optional). 10. Learn Laplace transforms and their applications to differential equations (optional). Credits: 4.00

MA 38500 - Introduction To Logic

Credit Hours: 3.00. Propositional calculus and predicate calculus with applications to mathematical proofs, valid arguments, switching theory, and formal languages.

Credits: 3.00

MA 42100 - Linear Programming And Optimization Techniques

Credit Hours: 3.00. Solution of linear programming problems by the simplex method, duality theory, transportation problems, assignment problems, network analysis, dynamic programming.

Credits: 3.00

MA 35301 - Linear Algebra II

Credit Hours: 3.00. Theoretical background for methods and results that appear in MA 35100. Inner products, orthogonality, and applications including least squares.

Learning Outcomes: 1. Perform rigorous proofs using the definitions of vector space, subspace, linear combination of vectors, linear dependence and linear independence, bases and dimension. 2. Perform rigorous proofs using the definitions of linear transformation and the null space and range of a linear transformation. 3. Exhibit a clear understanding of the relationship between composition of linear transformation and matrix multiplication. 4. Understand elementary matrices and their use in describing the solution set of a system of linear equations. 5. Understand that the determinant function on n x n matrices with entries in a field F is a function that may be defined recursively, and may be uniquely defined as an alternating multilinear form which takes the identity matrix to 1. 6. Perform rigorous proofs involving eigenvalues and eigenvectors. 7. Understand and be able to apply conditions for a linear operator on a finite-dimensional vector space to be diagonalizable. 8. Preform calculations with Gram-Schmidt, least squares and related topics. 9. Students should be able to do rigorous proofs involving inner product spaces and related topics. Credits: 3.00

MA 45300 - Elements Of Algebra I

Credit Hours: 3.00. Fundamental properties of integers, polynomials, groups, rings, and fields, with emphasis on problem solving and applications. Not open to students with credit in MA 45000.

Learning Outcomes: 1. Demonstrate knowledge of: divisibility properties of integers and polynomials, structure theory of groups and examples of groups, structure theory of rings and examples of rings, basic theory of fields. 2. Demonstrate knowledge of the proofs of facts covered in the course. Credits: 3.00

CS 31100 - Competitive Programming II

Credit Hours: 2.00. CP2 teaches experienced programmers additional techniques to solve interview and competitive programming problems and builds on material learned in CP1. This includes specific algorithmic techniques such as [shortest paths, topological sort, MST, union find, range queries], advanced algorithms surrounding trees and DAGs, advanced problem types in [dynamic programming, backtracking/simulation, mathematics, string processing], and more. It can be viewed as a programming complement to CS 38100, with some overlap in content.

Learning Outcomes: 1. Differentiate between advanced categories of problems in computer science including backtracking/simulation, advanced dynamic programming, advanced graphs (including trees and DAGs), mathematics, string processing, and range queries, as well as subcategories in each of these categories. 2. Implement well-known solutions (as discussed in class) to advanced categories of problems in computer science (listed in LO1). 3. Identify when a problem spans multiple categories of problems (as listed in LO1) 4. Design algorithms to solve problems that span multiple categories of problems. 5. Use new/novel algorithms to solve advanced problems. 6. Recognize key characteristics of certain problem types listed in LO1. 7. Classify an advanced problem by those key characteristics. 8. Deconstruct an advanced problem into subproblems that can be solved individually. 9. Determine runtime and space usage of a potential solution using big-O notation to judge if the potential solution will work. 10. Create an efficient solution to a problem based on analysis of the problem type, the deconstructed problem parts, and the time and space constraints of the problem. 11. Reflect on how one came up with a solution to a problem in order to better recognize patterns in

problem types. Credits: 2.00

CS 41100 - Competitive Programming III

Credit Hours: 2.00. CP3 teaches experienced programmers additional techniques to solve competitive programming problems and builds on material learned in CP1 and CP2. This includes algorithmic techniques in topics such as [network flow, computational geometry, graph matching, NP-hard problems]. Primarily, CP3 prepares students to compete in programming contests, which means most class time is focused on simulating contest environments and teaching teamwork and communication alongside problem practice.

Learning Outcomes: 1. Differentiate between advanced categories of problems in computer science including network flow, computational geometry, graph matching, and NP-hard problems, as well as subcategories in each of these categories. 2. Extrapolate generalized solutions and problem-solving strategies across advanced categories listed in LO1 as well as in general competitive programming categories. 3. Design algorithms to solve problems that span multiple advanced categories of problems, combining categorical solutions in complex ways. 4. Use new/novel algorithms to solve advanced problems. 5. Deconstruct an advanced problem into subproblems that can be solved individually. 6. Quickly determine runtime and space usage of a potential solution using big-O notation to judge if the potential solution will work. 7. Create an efficient solution to a problem based on analysis of the problem type, the deconstructed problem parts, and the time and space constraints of the problem. 8. Communicate ideas quickly and concisely to other competitive programmers to create efficient solutions. Credits: 2.00

CS 45800 - Introduction To Robotics

Credit Hours: 3.00. Any intelligent robot system interacting with our environment needs to have perception, planning, and control methods in its cognition process. The perception module outlines the robot's procedures to gather and interpret sensory observations into world models. The underlying planning and control modules use those world models to plan robot behaviors and their interaction with our natural environments. Therefore, this course will cover the fundamental topics in robot perception, planning, and control to design general-purpose robot cognition algorithms. Overall, this course is divided into four modules: Robot perception: This covers fundamental techniques needed for robot localization and mapping from raw 3D sensory data. Robot planning: This module will discuss robot behavior planning techniques such as A*, RRT*, and trajectory optimization. Robot Control: This introduces basic control techniques such as PID controller to execute the robot's planned behaviors in the real world. Robot Learning: This part will briefly introduce machine learning techniques for robot decision-making and control.

Learning Outcomes: 1. Formulate and solve the robot perception problems. 2. Identify the robot constraints, define their degree of freedom, and formulate their planning and control problems. 3. Apply classical and modern robot planning and control techniques to complex robot systems like manipulators, autonomous cars, etc. 4. Identify limitations in existing classical robot algorithms and understand their formal guarantees. 5. Evaluate and assess current best practices and mechanisms for robot programming. 6. Develop a skill for robot programming from perception to low-level control using standard methods. Credits: 3.00

Concentration Notes

Required CS Honors (12-13 credits)

CS 39700 - Honors Seminar

Credit Hours: 0.00. A seminar for all sophomores, juniors, and seniors in the Computer Sciences Honors Program. Meets eight times each semester under the supervision of the Honors coordinator. The meetings focus on honors research projects, helping students to identify appropriate projects and form groups, and providing a forum for juniors and seniors to report on their projects as required in the honors program.

Credits: 0.00

CS 49700 - Honors Research Project

Credit Hours: 3.00. One semester of the project may be counted as one of the seven computer science courses at or above the 300 level required for the bachelor's degree. One

more semester, if approved by the honors coordinator, can be used as a free elective. A group research project directed by Computer Sciences faculty members. Each group must submit a technical report describing its work and the results obtained.

Credits: 3.00

MA 35100 - Elementary Linear Algebra (UCC: QR)

Credit Hours: 3.00. Systems of linear equations, finite dimensional vector spaces, matrices, determinants, eigenvalues and eigenvector applications to analytical geometry. Not open to students with credit in MA 26500.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Solve systems of linear equations using concepts such as vector spaces, linear dependence, and Gaussian elimination. 2. Understand and test for linear independence, calculate the dimension of vector spaces, and apply the rank-nullity theorem in various contexts. 3. Define and apply linear transformations, including matrix multiplication, inverses, LU factorization, and coordinate transformations. 4. Compute and understand determinants, including their use in calculating matrix inverses and practical applications such as volume calculations. 5. Analyze and compute eigenvectors and eigenvalues, and apply diagonalization techniques. Credits: 3.00

MA 41600 - Probability

Credit Hours: 3.00. (STAT 41600) An introduction to mathematical probability suitable as a preparation for actuarial science, statistical theory, and mathematical modeling. General probability rules, conditional probability and Bayes theorem, discrete and continuous random variables, moments and moment generating functions, joint and conditional distributions, standard discrete and continuous distributions and their properties, law of large numbers and central limit theorem.

Credits: 3.00

MA 51800 - Advanced Discrete Mathematics

Credit Hours: 3.00. The course covers mathematics useful in analyzing computer algorithms. Topics include recurrence relations, evaluation of sums, integer functions, elementary number theory, binomial coefficients, generating functions, discrete probability, and asymptotic methods.

Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

MA 35301 - Linear Algebra II

Credit Hours: 3.00. Theoretical background for methods and results that appear in MA 35100. Inner products, orthogonality, and applications including least squares.

Learning Outcomes: 1. Perform rigorous proofs using the definitions of vector space, subspace,

linear combination of vectors, linear dependence and linear independence, bases and dimension. 2. Perform rigorous proofs using the definitions of linear transformation and the null space and range of a linear transformation. 3. Exhibit a clear understanding of the relationship between composition of linear transformation and matrix multiplication. 4. Understand elementary matrices and their use in describing the solution set of a system of linear equations. 5. Understand that the determinant function on n x n matrices with entries in a field F is a function that may be defined recursively, and may be uniquely defined as an alternating multilinear form which takes the identity matrix to 1. 6. Perform rigorous proofs involving eigenvalues and eigenvectors. 7. Understand and be able to apply conditions for a linear operator on a finite-dimensional vector space to be diagonalizable. 8. Preform calculations with Gram-Schmidt, least squares and related topics. 9. Students should be able to do rigorous proofs involving inner product spaces and related topics. Credits: 3.00

Other Departmental/Program Course Requirements (31-55 credits)

College of Science Additional Requirements

Computing

Laboratory Science (6-8 credits)

Mathematics (8-10 credits)

MA 16100 - Plane Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 5.00. Introduction to differential and integral calculus of one variable, with applications. Some schools or departments may allow only 4 credit hours toward graduation for this course. Designed for students who have not had at least a one-semester calculus course in high school, with a grade of "A" or "B". Not open to students with credit in MA 16500 . Demonstrated competence in college algebra and trigonometry.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions Credits: 5.00

MA 16200 - Plane Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 5.00. Continuation of MA 16100 . Vectors in two and three dimensions, techniques of integration, infinite series, conic sections, polar coordinates, surfaces in three dimensions. Some schools or departments may allow only 4 credit hours toward graduation for this course.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves.

5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 5.00

MA 16500 - Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 4.00. Introduction to differential and integral calculus of one variable, with applications. Conic sections. Designed for students who have had at least a one-semester calculus course in high school, with a grade of "A" or "B", but are not qualified to enter MA 16200 or MA 16600 or the advanced placement courses MA 17300 or the honors calculus course MA 18100. Demonstrated competence in college algebra and trigonometry. CTL:IMA 1602 Calculus - Long I

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems. 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions. Credits: 4.00

MA 16600 - Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 4.00. Continuation of MA 16500 . Vectors in two and three dimensions. Techniques of integration, infinite series, polar coordinates, surfaces in three dimensions. Not open to students with credit in MA 16200 . CTL:IMA 1603 Calculus - Long II

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 4.00

Statistics (3 credits)

STAT 35000 - Introduction To Statistics

Credit Hours: 3.00. This course provides a data-oriented introduction to applied statistics, covering exploratory data analysis, experimental design, probability distributions, simulation, sampling distributions, and the Central Limit Theorem. Students will learn the fundamentals of statistical inference, including confidence intervals and hypothesis tests for population means, paired and independent comparisons of means, analysis of variance, and regression. The course emphasizes hands-on experience with statistical software and is primarily intended for students majoring in the mathematical sciences. Prerequisite: two semesters of college calculus.

Learning Outcomes: 1. Understand basic terms, graphs, and symbols and be able to interpret statistics in the media. 2. Understand and be able to explain statistical processes and be able to fully interpret statistical results. 3. Understand why and how statistical investigations are conducted and the "big ideas" that underlie statistical investigations. 4. Be able to use a statistical package (R or SAS) to analyze data and interpret result. 5. Big Ideas in Statistics: variability, distributions, and models; causation vs correlation; practical significance vs statistical significance, etc. Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

Electives (5-31 credits)

Grade Requirements

GPA Requirements

Course Requirements and Notes

Program Requirements

Fall 1st Year

CS 18000 - Problem Solving And Object-Oriented Programming

Credit Hours: 4.00. Problem solving and algorithms, implementation of algorithms in a high level programming language, conditionals, the iterative approach and debugging, collections of data, searching and sorting, solving problems by decomposition, the object-oriented approach, subclasses of existing classes, handling exceptions that occur when the program is running, graphical user interfaces (GUIs), data stored in files, abstract data types, a glimpse at topics from other CS courses. Intended primarily for students majoring in computer sciences. Credit cannot be obtained for both CS 18000 and any of 15600, 15800 and 15900. Not open to students with credit in CS 24000.

Learning Outcomes: 1. Understand solving problems by analyzing the problem, designing an algorithm, and programming the solution. Credits: 4.00

MA 16100 - Plane Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 5.00. Introduction to differential and integral calculus of one variable, with applications. Some schools or departments may allow only 4 credit hours toward graduation for this course. Designed for students who have not had at least a one-semester calculus course in high school, with a grade of "A" or "B". Not open to students with credit in MA 16500 . Demonstrated competence in college algebra and trigonometry.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions Credits: 5.00

MA 16500 - Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 4.00. Introduction to differential and integral calculus of one variable, with applications. Conic sections. Designed for students who have had at least a one-semester calculus course in high school, with a grade of "A" or "B", but

are not qualified to enter MA 16200 or MA 16600 or the advanced placement courses MA 17300 or the honors calculus course MA 18100. Demonstrated competence in college algebra and trigonometry. CTL:IMA 1602 Calculus - Long I

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems. 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions. Credits: 4.00

15-17 Credits

Spring 1st Year

CS 18200 - Foundations Of Computer Science

Credit Hours: 3.00. Logic and proofs; sets, functions, relations, sequences and summations; number representations; counting; fundamentals of the analysis of algorithms; graphs and trees; proof techniques; recursion; Boolean logic; finite state machines; pushdown automata; computability and undecidability.

Learning Outcomes: 1. Understand discrete mathematical tools, facts, and reasoning relevant to computer science. Credits: 3.00

CS 24000 - Programming In C

Credit Hours: 3.00. The UNIX environment, C development cycle, data representation, operators, program structure, recursion, macros, C preprocessor, pointers and addresses, dynamic memory allocation, structures, unions, typedef, bit-fields, pointer/structure applications, UNIX file abstraction, file access, low-level I/O, concurrency.

Learning Outcomes: 1. Understand programming principles and techniques for problem solving in the C programming language. Credits: 3.00

MA 16200 - Plane Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 5.00. Continuation of MA 16100 . Vectors in two and three dimensions, techniques of integration, infinite series, conic sections, polar coordinates, surfaces in three dimensions. Some schools or departments may allow only 4 credit hours toward graduation for this course.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 5.00

MA 16600 - Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 4.00. Continuation of MA 16500 . Vectors in two and three dimensions. Techniques of integration, infinite series, polar coordinates, surfaces in three dimensions. Not open to students with credit in MA 16200 . CTL:IMA 1603 Calculus - Long II

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some

exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 4.00

15-17 Credits

Fall 2nd Year

CS 25000 - Computer Architecture

Credit Hours: 4.00. Digital logic: transistors, gates, and combinatorial circuits; clocks; registers and register banks; arithmetic-logic units; data representation: big-endian and little-endian integers; ones and twos complement arithmetic; signed and unsigned values; Von-Neumann architecture and bottleneck; instruction sets; RISC and CISC designs; instruction pipelines and stalls; rearranging code; memory and address spaces; physical and virtual memory; interleaving; page tables; memory caches; bus architecture; polling and interrupts; DMA; device programming; assembly language; optimizations; parallelism; data pipelining.

Learning Outcomes: 1. Students understand the function of basic hardware, including fundamentals of digital logic, processors, memory, and I/O. Credits: 4.00

CS 25100 - Data Structures And Algorithms

Credit Hours: 3.00. Running time analysis of algorithms and their implementations, one-dimensional data structures, trees, heaps, additional sorting algorithms, binary search trees, hash tables, graphs, directed graphs, weighted graph algorithms, additional topics.

Learning Outcomes: 1. Understand fundamental data structures, fundamental algorithms, and their implementation. Credits: 3.00

MA 26100 - Multivariate Calculus (UCC: QR)

Credit Hours: 4.00. Planes, lines, and curves in three dimensions. Differential calculus of several variables; multiple integrals. Introduction to vector calculus. Not open to students with credit in MA 17400 or 27100.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Know the equations for lines, planes and quadric surfaces in three dimensional space, and understand how these equations relate to the geometry. 2. Understand the relationship between vector functions and parametrized motion; know how to calculate velocity, acceleration, arc length and curvature. 3. Know the meaning of partial derivatives and how to calculate them. Know the multivariable chain rule. 4. Know the meaning of the gradient, how to calculate it, and how to apply it to directional derivatives and maximum and minimum values. 5. Understand the meaning of double and triple integrals; know how to compute them and how to apply them. 6. Understand the meaning of vector fields and line integrals. Know Green's theorem and be able to apply it. 7. Understand the meaning of surface integrals and know how to calculate them. Know Stokes' theorem and be able to apply it. Credits: 4.00

MA 27101 - Honors Multivariate Calculus (UCC: QR)

Credit Hours: 5.00. This course is the Honors version of MA 26100, Multivariate Calculus; it will also include a review of infinite series. The course is intended for first-year students who have credit for Calculus I and II. There will be a significant emphasis on conceptual explanation, but not on formal proof. Permission of department is required.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Know techniques of vector algebra and be able to apply these to the geometry of space; in particular they will be able to find equations for lines and planes in space. 2. Find equations for standard surfaces in space. 3. Use vector methods to analyze motion in space, and calculate arc length and curvature. 4. Acquire a conceptual and computational knowledge of infinite series; in particular they will be able to test for convergence, and to do calculations with power series. 5. Understand the meaning of partial derivatives in various situations, and will be able

to calculate with them. 6. Know the multivariable chain rule and its meaning, and will be able to apply it to calculate derivatives in various situations. 7. Know the meaning of directional derivatives and how to calculate them. 8. Find tangent planes. 9. Find and classify extreme values and saddle points and use the method of Lagrange multipliers. 10. Know the meaning of multiple integrals and how to calculate them. 11. Know the meaning of line integrals and surface integrals and how to calculate them. 12. Know Green's theorem, Stokes' theorem, and the divergence theorem and their applications. Credits: 5.00

15-17 Credits

Spring 2nd Year

CS 25200 - Systems Programming

Credit Hours: 4.00. Low-level programming; review of addresses, pointers, memory layout, and data representation; text, data, and bss segments; debugging and hex dumps; concurrent execution with threads and processes; address spaces; file names; descriptors and file pointers; inheritance; system calls and library functions; standard I/O and string libraries; simplified socket programming; building tools to help programmers; make and make files; shell scripts and quoting; Unix tools including sed, echo, test, and find; scripting languages such as awk; version control; object and executable files (.o and a.out); symbol tables; pointers to functions; hierarchical directories; and DNS hierarchy; programming embedded systems.

Learning Outcomes: 1. Have an appreciation and ability for low-level (systems) programming and debugging. Credits: 4.00

MA 35100 - Elementary Linear Algebra (UCC: QR)

Credit Hours: 3.00. Systems of linear equations, finite dimensional vector spaces, matrices, determinants, eigenvalues and eigenvector applications to analytical geometry. Not open to students with credit in MA 26500.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Solve systems of linear equations using concepts such as vector spaces, linear dependence, and Gaussian elimination. 2. Understand and test for linear independence, calculate the dimension of vector spaces, and apply the rank-nullity theorem in various contexts. 3. Define and apply linear transformations, including matrix multiplication, inverses, LU factorization, and coordinate transformations. 4. Compute and understand determinants, including their use in calculating matrix inverses and practical applications such as volume calculations. 5. Analyze and compute eigenvectors and eigenvalues, and apply diagonalization techniques. Credits: 3.00

16-17 Credits

Fall 3rd Year

MA 35100 - Elementary Linear Algebra (UCC: QR)

Credit Hours: 3.00. Systems of linear equations, finite dimensional vector spaces, matrices, determinants, eigenvalues and eigenvector applications to analytical geometry. Not open to students with credit in MA 26500.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Solve systems of linear equations using concepts such as vector spaces, linear dependence, and Gaussian elimination. 2. Understand and test for linear independence, calculate the dimension of vector spaces, and apply the rank-nullity theorem in various contexts. 3. Define and apply linear transformations, including matrix multiplication, inverses, LU factorization, and coordinate transformations. 4. Compute and understand determinants, including their use in calculating matrix inverses and practical applications such as volume calculations. 5. Analyze and compute eigenvectors and eigenvalues, and apply diagonalization

techniques. Credits: 3.00

MA 41600 - Probability

Credit Hours: 3.00. (STAT 41600) An introduction to mathematical probability suitable as a preparation for actuarial science, statistical theory, and mathematical modeling. General probability rules, conditional probability and Bayes theorem, discrete and continuous random variables, moments and moment generating functions, joint and conditional distributions, standard discrete and continuous distributions and their properties, law of large numbers and central limit theorem.

Credits: 3.00

STAT 35000 - Introduction To Statistics

Credit Hours: 3.00. This course provides a data-oriented introduction to applied statistics, covering exploratory data analysis, experimental design, probability distributions, simulation, sampling distributions, and the Central Limit Theorem. Students will learn the fundamentals of statistical inference, including confidence intervals and hypothesis tests for population means, paired and independent comparisons of means, analysis of variance, and regression. The course emphasizes hands-on experience with statistical software and is primarily intended for students majoring in the mathematical sciences. Prerequisite: two semesters of college calculus.

Learning Outcomes: 1. Understand basic terms, graphs, and symbols and be able to interpret statistics in the media. 2. Understand and be able to explain statistical processes and be able to fully interpret statistical results. 3. Understand why and how statistical investigations are conducted and the "big ideas" that underlie statistical investigations. 4. Be able to use a statistical package (R or SAS) to analyze data and interpret result. 5. Big Ideas in Statistics: variability, distributions, and models; causation vs correlation; practical significance vs statistical significance, etc. Credits: 3.00

MA 51800 - Advanced Discrete Mathematics

Credit Hours: 3.00. The course covers mathematics useful in analyzing computer algorithms. Topics include recurrence relations, evaluation of sums, integer functions, elementary number theory, binomial coefficients, generating functions, discrete probability, and asymptotic methods.

Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

MA 35301 - Linear Algebra II

Credit Hours: 3.00. Theoretical background for methods and results that appear in MA 35100. Inner products, orthogonality, and applications including least squares.

Learning Outcomes: 1. Perform rigorous proofs using the definitions of vector space, subspace, linear combination of vectors, linear

dependence and linear independence, bases and dimension. 2. Perform rigorous proofs using the definitions of linear transformation and the null space and range of a linear transformation. 3. Exhibit a clear understanding of the relationship between composition of linear transformation and matrix multiplication. 4. Understand elementary matrices and their use in describing the solution set of a system of linear equations. 5. Understand that the determinant function on n x n matrices with entries in a field F is a function that may be defined recursively, and may be uniquely defined as an alternating multilinear form which takes the identity matrix to 1. 6. Perform rigorous proofs involving eigenvalues and eigenvectors. 7. Understand and be able to apply conditions for a linear operator on a finite-dimensional vector space to be diagonalizable. 8. Preform calculations with Gram-Schmidt, least squares and related topics. 9. Students should be able to do rigorous proofs involving inner product spaces and related topics.

MA 35100 - Elementary Linear Algebra (UCC: QR)

Credit Hours: 3.00. Systems of linear equations, finite dimensional vector spaces, matrices, determinants, eigenvalues and eigenvector applications to analytical geometry. Not open to students with credit in MA 26500.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Solve systems of linear equations using concepts such as vector spaces, linear dependence, and Gaussian elimination. 2. Understand and test for linear independence, calculate the dimension of vector spaces, and apply the rank-nullity theorem in various contexts. 3. Define and apply linear transformations, including matrix multiplication, inverses, LU factorization, and coordinate transformations. 4. Compute and understand determinants, including their use in calculating matrix inverses and practical applications such as volume calculations. 5. Analyze and compute eigenvectors and eigenvalues, and apply diagonalization techniques. Credits: 3.00

MA 27101 - Honors Multivariate Calculus (UCC: QR)

Credit Hours: 5.00. This course is the Honors version of MA 26100, Multivariate Calculus; it will also include a review of infinite series. The course is intended for first-year students who have credit for Calculus I and II. There will be a significant emphasis on conceptual explanation, but not on formal proof. Permission of department is required.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Know techniques of vector algebra and be able to apply these to the geometry of space; in particular they will be able to find equations for lines and planes in space. 2. Find equations for standard surfaces in space. 3. Use vector methods to analyze motion in space, and calculate arc length and curvature. 4. Acquire a conceptual and computational knowledge of infinite series; in particular they will be able to test for convergence, and to do calculations with power series. 5. Understand the meaning of partial derivatives in various situations, and will be able to calculate with them. 6. Know the multivariable chain rule and its meaning, and will be able to apply it to calculate derivatives in various situations. 7. Know the meaning of directional derivatives and how to calculate them. 8. Find tangent planes. 9. Find and classify extreme values and saddle points and use the method of Lagrange multipliers. 10. Know the meaning of multiple integrals and how to calculate them. 11. Know the meaning of line integrals and surface integrals and how to calculate them. 12. Know Green's theorem, Stokes' theorem, and the divergence theorem and their applications. Credits: 5.00

Required CS Major Core Courses (21 credits)

CS 18000 - Problem Solving And Object-Oriented Programming

Credit Hours: 4.00. Problem solving and algorithms,

implementation of algorithms in a high level programming language, conditionals, the iterative approach and debugging, collections of data, searching and sorting, solving problems by decomposition, the object-oriented approach, subclasses of existing classes, handling exceptions that occur when the program is running, graphical user interfaces (GUIs), data stored in files, abstract data types, a glimpse at topics from other CS courses. Intended primarily for students majoring in computer sciences. Credit cannot be obtained for both CS 18000 and any of 15600, 15800 and 15900. Not open to students with credit in CS 24000.

Learning Outcomes: 1. Understand solving problems by analyzing the problem, designing an algorithm, and programming the solution. Credits: 4.00

CS 18200 - Foundations Of Computer Science

Credit Hours: 3.00. Logic and proofs; sets, functions, relations, sequences and summations; number representations; counting; fundamentals of the analysis of algorithms; graphs and trees; proof techniques; recursion; Boolean logic; finite state machines; pushdown automata; computability and undecidability.

Learning Outcomes: 1. Understand discrete mathematical tools, facts, and reasoning relevant to computer science. Credits: 3.00

CS 24000 - Programming In C

Credit Hours: 3.00. The UNIX environment, C development cycle, data representation, operators, program structure, recursion, macros, C preprocessor, pointers and addresses, dynamic memory allocation, structures, unions, typedef, bit-fields, pointer/structure applications, UNIX file abstraction, file access, low-level I/O, concurrency.

Learning Outcomes: 1. Understand programming principles and techniques for problem solving in the C programming language. Credits: 3.00

CS 25000 - Computer Architecture

Credit Hours: 4.00. Digital logic: transistors, gates, and combinatorial circuits; clocks; registers and register banks; arithmetic-logic units; data representation: big-endian and little-endian integers; ones and twos complement arithmetic; signed and unsigned values; Von-Neumann architecture and bottleneck; instruction sets; RISC and CISC designs; instruction pipelines and stalls; rearranging code; memory and address spaces; physical and virtual memory; interleaving; page tables; memory caches; bus architecture; polling and interrupts; DMA; device programming; assembly language; optimizations; parallelism; data pipelining.

Learning Outcomes: 1. Students understand the function of basic hardware, including fundamentals of digital logic, processors, memory, and I/O. Credits: 4.00

CS 25100 - Data Structures And Algorithms

Credit Hours: 3.00. Running time analysis of algorithms and their implementations, one-dimensional data structures, trees, heaps, additional sorting algorithms, binary search trees, hash tables, graphs, directed graphs, weighted graph algorithms, additional topics.

Learning Outcomes: 1. Understand fundamental data structures, fundamental algorithms, and their implementation. Credits: 3.00

CS 25200 - Systems Programming

Credit Hours: 4.00. Low-level programming; review of addresses, pointers, memory layout, and data representation; text, data, and bss segments; debugging and hex dumps; concurrent execution with threads and processes; address spaces; file names; descriptors and file pointers; inheritance; system calls and library functions; standard I/O and string libraries; simplified socket programming; building tools to help programmers; make and make files; shell scripts and quoting; Unix tools including sed, echo, test, and find; scripting languages such as awk; version control; object and executable files (.o and a.out); symbol tables; pointers to functions; hierarchical directories; and DNS hierarchy; programming embedded systems.

Learning Outcomes: 1. Have an appreciation and ability for low-level (systems) programming and debugging. Credits: 4.00

Computational Science and Engineering Concentration (21-22 credits)

Required Courses (9-10 credits)

CS 31400 - Numerical Methods

Credit Hours: 3.00. Iterative methods for solving nonlinear equations; direct and iterative methods for solving linear systems; approximations of functions, derivatives, and integrals; error analysis.

Credits: 3.00

CS 38100 - Introduction To The Analysis Of Algorithms

Credit Hours: 3.00. Techniques for analyzing the time and space requirements of algorithms. Application of these techniques to sorting, searching, pattern-matching, graph problems, and other selected problems. Brief introduction to the intractable (NP-hard) problems.

Learning Outcomes: 1. Use big O-notation to give asymptotic time and space bounds of algorithms. 2. Explain the use of big-Omega, big-Theta, and little-o notations. 3. Use recurrence relations to determine the time complexity of recursive algorithms. 4. Solve recurrence relations commonly arising in algorithm design. 5. Give examples that illustrate time-space trade-offs of algorithms. Credits: 3.00

MA 26600 - Ordinary Differential Equations (UCC: QR)

Credit Hours: 3.00. First order equations, second and n'th order linear equations, series solutions, solution by Laplace transform, systems of linear equations. It is preferable but not required to take MA 26500 either first or concurrently. Not open to students with credit in MA 26200, 27200, 36000, 36100, or 36600.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Understand the properties of and able to solve first-order differential equations, linear differential equations of second and higher orders, and linear systems of differential equations. 2. Understand and able to apply basic numerical methods for solving initial value problems. 3. Understand the properties of Laplace transforms and able to apply to solving differential equations and initial value problems. 4. Apply differential equations to mechanical, physical, and biological models. Credits: 3.00

MA 36600 - Ordinary Differential Equations (UCC: QR)

Credit Hours: 4.00. An introduction to ordinary differential equations with emphasis on problem solving and applications. The one-hour computer lab will give students an opportunity for hands-on experience with both the theory and applications of the subject.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Learn the statement of the theorem of existence and uniqueness of solutions of first order differential equations and standard methods of solving linear, and some special non-linear, differential equations of first order. 2. Interpret solutions qualitatively. 3. Learn how to construct mathematical models. 4. Learn the standard methods of solving linear homogenous differential equations of constant coefficients of arbitrary order. 5. Learn methods to solve nonhomogeneous differential equations of constant coefficients of arbitrary order. 6. Learn basic numerical methods for solving differential equations. 7. Learn about the applications of differential equations to mechanical, physical, and biological models. 8. Learn the theory of eigenvalues and eigenvectors and how they apply to systems of linear differential equations. 9. Learn how to analyze systems of nonlinear differential equations (optional). 10. Learn Laplace transforms and their applications to differential equations (optional). Credits: 4.00

Applications (3 credits)

ECE 30100 - Signals And Systems

Credit Hours: 3.00. Classification, analysis and design of systems in both the time- and frequency-domains. Continuous-time linear systems: Fourier Series, Fourier Transform, bilateral Laplace Transform. Discrete-time linear systems: difference equations, Discrete-Time Fourier Transform, bilateral Z-Transform. Sampling, quantization, and discrete-time processing of continuous-time signals. Discrete-time nonlinear systems: median-type filters, threshold decomposition. System design examples such as the compact disc player and AM radio.

Learning Outcomes: 1. Able to classify signals (e.g., periodic, even) and systems (e.g., causal, linear) and an understanding of the difference between discrete and continuous time signals and systems. 2. Able to determine the impulse response of a differential or difference equation.

3. Able to determine the response of linear systems to any input signal by convolution in the time domain. 4. Understand the definitions and basic properties (e.g., time-shift, modulation, Parseval's Theorem) of Fourier series, Fourier transforms, bilateral Laplace transforms, Z transforms, and discrete time Fourier transforms and an ability to compute the transforms and inverse transforms of basic examples using methods such as partial fractions expansions. 5. Able to determine the response of linear systems to any input signal by transformation to the frequency domain, multiplication, and inverse transformation to the time domain, an ability to apply the Sampling theorem, reconstruction, aliasing, and Nyquist's theorem to represent continuous-time signal in discrete time so that they can be processed by digital computers. Credits: 3.00

IE 33600 - Operations Research - Stochastic Models

Credit Hours: 3.00. Introduction to probabilistic models in operations research. Emphasis on Markov chains, Poisson processes, and their application to queuing systems.

Credits: 3.00

CS 47300 - Web Information Search And Management

Credit Hours: 3.00. This course teaches important concepts and knowledge of information retrieval for managing unstructured data such as text data on Web or in emails. At the same time, students will be exposed to a large number of important applications. Students in the course will get hands on experience from homework and a course project. The first part of the course focuses on general concepts/techniques such as stemming, indexing, vector space model, and feedback procedure. The second part of the course shows how to apply the set of techniques on different applications such as Web search, text categorization, and information recommendation.

Learning Outcomes: 1. Understand the important concepts and techniques of information retrieval and how to apply these techniques to a set of important or real world applications. Credits: 3.00

CS 47800 - Introduction To Bioinformatics

Credit Hours: 3.00. (BIOL 47800) Bioinformatics is broadly defined as the study of molecular biological information, targeting particularly the enormous volume of DNA sequence and functional complexity embedded in entire genomes. Topics will include understanding the evolutionary organization of genes (genomics), the structure and function of gene products (proteomics), and the dynamics of gene expression in biological processes (transcriptomics). Inherently, bioinformatics is interdisciplinary, melding various applications of computational science with biology. This jointly taught course introduces analytical methods from biology, statistics and computer science that are necessary for bioinformatics investigations. The course is intended for junior and senior undergraduates from various science backgrounds. Our objective is to develop the skills of both tool users and tool designers in this important new field of research.

Learning Outcomes: 1. Demonstrate proficiency with professional skills needed by practicing biologists, including experimental design and execution, biological techniques, data collection and documentation, communication of results, and responsible conduct of science. 2. Demonstrate the ability to discuss ethical issues in the application of biological sciences, and the impact of science on society. 3. Demonstrate skills in critical thinking. These skills include understanding scientific methods, solving biology-related problems, interpreting and analyzing primary literature in biology, and interpreting data in a meaningful way. 4. Demonstrate knowledge of the path leading to specific careers in biology. 5. Understand the role of evolution of creating and modifying the macromolecular components of the cell, and in creating biological complexity and variability. 6. Use and understand the scientific method, including how to generate hypotheses and predictions, develop an experimental design, collect data, statistically analyze data, and interpret results. 7. Demonstrate an understanding of laboratory skills used in genetics. 8. Demonstrate knowledge of how evolutionary forces impact and shape microbial

function and activity. 9. Demonstrate an understanding of the scientific method including hypothesis generation and testing, data collection, analysis, and interpretation. Credits: 3.00

CS 37300 - Data Mining And Machine Learning

Credit Hours: 3.00. This course will introduce students to the field of data mining and machine learning, which sits at the interface between statistics and computer science. Data mining and machine learning focuses on developing algorithms to automatically discover patterns and learn models of large datasets. This course introduces students to the process and main techniques in data mining and machine learning, including exploratory data analysis, predictive modeling, descriptive modeling, and evaluation.

Learning Outcomes: 1. Identify key elements of data mining and machine learning algorithms. 2. Understand how algorithmic elements interact to impact performance. 3. Understand how to choose algorithms for different analysis tasks. 4. Analyze data in both an exploratory and targeted manner. 5. Implement and apply basic algorithms for supervised and unsupervised learning. 6. Accurately evaluate the performance of algorithms, as well as formulate and test hypotheses. Credits: 3.00

Systems (3 credits)

CS 35200 - Compilers: Principles And Practice

Credit Hours: 3.00. Should not be taken concurrently with CS 35400. The theory and practice of programming language translation, compilation, and run-time systems, organized around a significant programming project to build a compiler for a simple but nontrivial programming language. Modules, interfaces, tools. Data structures for tree languages. Lexical analysis, syntax analysis, abstract syntax. Symbol tables, semantic analysis. Translation, intermediate code, basic blocks, traces. Instruction selection, CISC and RISC machines. Liveness analysis, graph coloring register allocation. Supplemental material drawn from garbage collection, object-oriented languages, higher-order languages, dataflow analysis, optimization, polymorphism, scheduling and pipelining, memory hierarchies.

Learning Outcomes: 1. Provides students with an understanding of how a computer program is converted into elementary code that causes the computer to produce the output intended by the programmer. Credits: 3.00

CS 35300 - Principles Of Concurrency And Parallelism

Credit Hours: 3.00. Important concepts, models, algorithms, abstractions, and implementation aspects of concurrent and parallel programs. Topics include: techniques used to describe concurrent programs (e.g., threads, events, co-routines, continuations), abstractions for shared-memory and message-passing programs, relaxed memory models, livelock and deadlock detection, lock-free algorithms, data races and atomicity, scheduling techniques, process calculi, and software transactions.

Learning Outcomes: 1. This course provides students the vocabulary and concepts to better understand how to design and program scalable multicore processors. Credits: 3.00

CS 35400 - Operating Systems

Credit Hours: 3.00. Should not be taken concurrently with CS 35200. Introduction to operating systems. Computer system and operating system architectures, processes, inter-process communication, inter-process synchronization, mutual exclusion, deadlocks, memory hierarchy, virtual memory, CPU scheduling, file systems, I/O device management, security.

Learning Outcomes: 1. Provides students with an understanding of the fundamentals of computer operating systems. Credits: 3.00

Selectives (6 credits)

IE 33500 - Operations Research - Optimization

Credit Hours: 3.00. Introduction to deterministic optimization modeling and algorithms in operations research. Emphasis on formulation and solution of linear programs, networks flows, and integer programs.

Credits: 3.00

CS 30700 - Software Engineering I

Credit Hours: 3.00. An introduction to the methods and tools of software engineering; software life cycle; specification and design of software, software testing, cost and effort estimation; laboratory exercises with design, testing, and other tools.

Learning Outcomes: 1. Architect and design

quality software. 2. Contrast and critique software lifecycle models. 3. Create software using current software engineering tools, methods, and concepts. 4. Work together on a team in a productive and professional manner. 5. Inspect and test software and documentation. Credits: 3.00

CS 42200 - Computer Networks

Credit Hours: 3.00. Undergraduate-level introduction to computer networks and data communication. Low-level details of media, signals, and bits: time division and frequency division multiplexing; encoding; modulation; bandwidth, throughput, and noise. Packet transmission: Local Area Network (Ethernet, FDDI) and Wide Area Network technologies (ATM); wireless networks; network interconnection with repeaters, bridges, and switches; DSU/CSU; xDSL and cable modems. Internetworking: router-based architecture; IP addressing; address binding with ARP; datagram encapsulation and fragmentation; UDP and TCP, retransmission; protocol ports; ICMP and error handling. Network applications: client/server concept; port demultiplexing; program interface to protocols (API); use by clients and servers; domain name system; TELNET; Web technologies including HTTP, CGI, Java; RPC and middleware; network management.

Credits: 3.00

CS 45600 - Programming Languages

Credit Hours: 3.00. Concepts for structuring data, computation, and whole programs. Object-oriented languages, functional languages, logic- and rule-based languages. Data types, type checking, exception handling, concurrent processes, synchronization, modularity, encapsulation, interfaces, separate compilation, inheritance, polymorphism, dynamic binding, subtyping, overloading, beta-reduction, unification.

Credits: 3.00

CS 47100 - Introduction To Artificial Intelligence

Credit Hours: 3.00. Students are expected to spend at least three hours per week gaining experience with artificial intelligence systems and developing software. Basic problem-solving strategies, heuristic search, problem reduction and AND/OR graphs, knowledge representation, expert systems, generating explanations, uncertainty reasoning, game playing, planning, machine learning, computer vision, and programming systems such as Lisp or Prolog.

Learning Outcomes: 1. Develop understandings of various applications of AI. 2. Recognize problems where AI techniques are applicable. 3. Implement and apply basic principles of AI in solutions that require problem-solving, inference, learning, and planning. 4. Understand how to evaluate various AI techniques and make appropriate selections. Credits: 3.00

CS 48300 - Introduction To The Theory Of Computation

Credit Hours: 3.00. Turing machines and the Church-Turing thesis; decidability; halting problem; reducibility; undecidable problems; decidability of logical theories; Kolmogorov complexity; time classes; P, NP, NP-complete; space classes; Savitch's theorem, PSPACE-completeness, NL-completeness; hierarchy theorems; approximation theorems; probabilistic algorithms; applications of complexity to parallel computation and cryptography.

Credits: 3.00

CS 49000 - Topics In Computer Sciences For Undergraduates

Credit Hours: 1.00 to 5.00. Supervised reading and reports in various fields. Permission of instructor required.

Credits: 1.00 to 5.00

MA 34100 - Foundations Of Analysis

Credit Hours: 3.00. An introductory course in rigorous analysis, covering real numbers, sequences, series, continuous functions, differentiation, and Riemann integration. MA 30100 is helpful but not required.

Credits: 3.00

MA 44000 - Honors Real Analysis I

Credit Hours: 3.00. Real analysis in one and n-dimensional Euclidean spaces. Topics include the completeness property of real numbers, topology of Euclidean spaces, Heine-Borel theorem, convergence of sequences and series in Euclidean spaces, limit superior and limit inferior, Bolzano-Weierstrass theorem, continuity, uniform continuity, limits and uniform convergence of functions, Riemann or Riemann-Stieltjes integrals.

Learning Outcomes: 1. Perform rigorous proofs using the definitions of open sets, closed sets, connected sets, compact sets, interior points, boundary points, cluster points, finite sets, infinite sets, and denumerable sets in Euclidean spaces. 2. Perform rigorous proofs of convergence or divergence for sequences or

series in Euclidean spaces. 3. Determine points of continuity and existence of limits using rigorous proofs for functions whose domain and range are in Euclidean spaces. 4. Perform rigorous proofs that a sequence of functions converges uniformly or does not converge uniformly on a subset of a Euclidean space. 5. Know and be able to apply the definition and related theorems on the existence of Riemann or Riemann-Stieltjes integrals. Credits: 3.00

CS 51400 - Numerical Analysis

Credit Hours: 3.00. (MA 51400) Alternative methods for solving nonlinear equations; linear difference equations, applications to solution of polynomial equations; differentiation and integration formulas; numerical solution of ordinary differential equations; roundoff error bounds.

Credits: 3.00

CS 51500 - Numerical Linear Algebra

Credit Hours: 3.00. Direct and iterative solvers of dense and sparse linear systems of equations, numerical schemes for handling symmetric algebraic eigenvalue problems, and the singular-value decomposition and its applications in linear least squares problems.

Learning Outcomes: 1. Become knowledgeable about major kernels and algorithms underlying matrix computations for dense and sparse matrices including linear systems of equation, symmetric eigenvalue problems, and the singular-value decomposition. 2. Be able to implement basic versions of these kernels and algorithms. 3. Learn about the difference between direct and iterative methods for linear systems. 4. Gain expertise in the design of iterative methods and preconditioning techniques for large-scale sparse linear systems. 5. Be able to implement eigenvalue and singular-value problem solvers. Credits: 3.00

CS 52000 - Computational Methods In Optimization

Credit Hours: 3.00. A treatment of numerical algorithms and software for optimization problems with a secondary emphasis on linear and nonlinear systems of equations: unconstrained and constrained optimization; line search methods; trust region methods; Quasi-Newton methods; linear programming; calculating derivatives; quadratic programming; global optimization, including simulated annealing.

Credits: 3.00

CS 52500 - Parallel Computing

Credit Hours: 3.00. Parallel computing for science and engineering applications: parallel programming and performance evaluation, parallel libraries and problem-solving environments, models of parallel computing and run-time support systems, and selected applications.

Credits: 3.00

CS 45800 - Introduction To Robotics

Credit Hours: 3.00. Any intelligent robot system interacting with our environment needs to have perception, planning, and control methods in its cognition process. The perception module outlines the robot's procedures to gather and interpret sensory observations into world models. The underlying planning and control modules use those world models to plan robot behaviors and their interaction with our natural environments. Therefore, this course will cover the fundamental topics in robot perception, planning, and control to design general-purpose robot cognition algorithms. Overall, this course is divided into four modules: Robot perception: This covers fundamental techniques needed for robot localization and mapping from raw 3D sensory data. Robot planning: This module will discuss robot behavior planning techniques such as A*, RRT*, and trajectory optimization. Robot Control: This introduces basic control techniques such as PID controller to execute the robot's planned behaviors in the real world. Robot Learning: This part will briefly introduce machine learning techniques for robot decision-making and control.

Learning Outcomes: 1. Formulate and solve the robot perception problems. 2. Identify the robot constraints, define their degree of freedom, and formulate their planning and control problems. 3. Apply classical and modern robot planning and control techniques to complex robot systems like manipulators, autonomous cars, etc. 4. Identify limitations in existing classical robot algorithms and understand their formal guarantees. 5. Evaluate and assess current best practices and mechanisms for robot programming. 6. Develop a skill for robot programming from perception to low-level

control using standard methods. Credits: 3.00

Concentration Notes

Required CS Honors (12-13 credits)

CS 39700 - Honors Seminar

Credit Hours: 0.00. A seminar for all sophomores, juniors, and seniors in the Computer Sciences Honors Program. Meets eight times each semester under the supervision of the Honors coordinator. The meetings focus on honors research projects, helping students to identify appropriate projects and form groups, and providing a forum for juniors and seniors to report on their projects as required in the honors program.

Credits: 0.00

CS 49700 - Honors Research Project

Credit Hours: 3.00. One semester of the project may be counted as one of the seven computer science courses at or above the 300 level required for the bachelor's degree. One more semester, if approved by the honors coordinator, can be used as a free elective. A group research project directed by Computer Sciences faculty members. Each group must submit a technical report describing its work and the results obtained.

Credits: 3.00

MA 35100 - Elementary Linear Algebra (UCC: QR)

Credit Hours: 3.00. Systems of linear equations, finite dimensional vector spaces, matrices, determinants, eigenvalues and eigenvector applications to analytical geometry. Not open to students with credit in MA 26500.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Solve systems of linear equations using concepts such as vector spaces, linear dependence, and Gaussian elimination. 2. Understand and test for linear independence, calculate the dimension of vector spaces, and apply the rank-nullity theorem in various contexts. 3. Define and apply linear transformations, including matrix multiplication, inverses, LU factorization, and coordinate transformations. 4. Compute and understand determinants, including their use in calculating matrix inverses and practical applications such as volume calculations. 5. Analyze and compute eigenvectors and eigenvalues, and apply diagonalization techniques. Credits: 3.00

MA 41600 - Probability

Credit Hours: 3.00. (STAT 41600) An introduction to mathematical probability suitable as a preparation for actuarial science, statistical theory, and mathematical modeling. General probability rules, conditional probability and Bayes theorem, discrete and continuous random variables, moments and moment generating functions, joint and conditional distributions, standard discrete and continuous distributions and their properties, law of large numbers and central limit theorem.

Credits: 3.00

MA 51800 - Advanced Discrete Mathematics

Credit Hours: 3.00. The course covers mathematics useful in analyzing computer algorithms. Topics include recurrence relations, evaluation of sums, integer functions, elementary number theory, binomial coefficients, generating functions, discrete probability, and asymptotic methods.

Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson,

Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

MA 35301 - Linear Algebra II

Credit Hours: 3.00. Theoretical background for methods and results that appear in MA 35100. Inner products, orthogonality, and applications including least squares.

Learning Outcomes: 1. Perform rigorous proofs using the definitions of vector space, subspace, linear combination of vectors, linear dependence and linear independence, bases and dimension. 2. Perform rigorous proofs using the definitions of linear transformation and the null space and range of a linear transformation. 3. Exhibit a clear understanding of the relationship between composition of linear transformation and matrix multiplication. 4. Understand elementary matrices and their use in describing the solution set of a system of linear equations. 5. Understand that the determinant function on n x n matrices with entries in a field F is a function that may be defined recursively, and may be uniquely defined as an alternating multilinear form which takes the identity matrix to 1. 6. Perform rigorous proofs involving eigenvalues and eigenvectors. 7. Understand and be able to apply conditions for a linear operator on a finite-dimensional vector space to be diagonalizable. 8. Preform calculations with Gram-Schmidt, least squares and related topics. 9. Students should be able to do rigorous proofs involving inner product spaces and related topics. Credits: 3.00

Other Departmental/Program Course Requirements (31-55 credits)

College of Science Additional Requirements

Computing (3-4 credits)

Laboratory Science (6-8 credits)

Mathematics (8-10 credits)

MA 16100 - Plane Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 5.00. Introduction to differential and integral calculus of one variable, with applications. Some schools or departments may allow only 4 credit hours toward graduation for this course. Designed for students who have not had at least a one-semester calculus course in high school, with a grade of "A" or "B". Not open to students with credit in MA 16500 . Demonstrated competence in college algebra and trigonometry.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions Credits: 5.00

MA 16200 - Plane Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 5.00. Continuation of MA 16100 . Vectors in two

and three dimensions, techniques of integration, infinite series, conic sections, polar coordinates, surfaces in three dimensions. Some schools or departments may allow only 4 credit hours toward graduation for this course.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 5.00

MA 16500 - Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 4.00. Introduction to differential and integral calculus of one variable, with applications. Conic sections. Designed for students who have had at least a one-semester calculus course in high school, with a grade of "A" or "B", but are not qualified to enter MA 16200 or MA 16600 or the advanced placement courses MA 17300 or the honors calculus course MA 18100. Demonstrated competence in college algebra and trigonometry. CTL:IMA 1602 Calculus - Long I

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems. 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions. Credits: 4.00

MA 16600 - Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 4.00. Continuation of MA 16500 . Vectors in two and three dimensions. Techniques of integration, infinite series, polar coordinates, surfaces in three dimensions. Not open to students with credit in MA 16200 . CTL:IMA 1603 Calculus - Long II

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 4.00

Statistics (3 credits)

STAT 35000 - Introduction To Statistics

Credit Hours: 3.00. This course provides a data-oriented introduction to applied statistics, covering exploratory data analysis, experimental design, probability distributions, simulation, sampling distributions, and the Central Limit Theorem. Students will learn the fundamentals of statistical inference, including confidence intervals and hypothesis tests for population means, paired and independent comparisons of means, analysis of variance, and regression. The course emphasizes hands-on experience with statistical software and is primarily intended for students majoring in the mathematical sciences. Prerequisite: two semesters of college calculus.

Learning Outcomes: 1. Understand basic terms, graphs, and symbols and be able to interpret statistics in the media. 2. Understand and be able to explain statistical processes and be able to fully interpret statistical results. 3. Understand

why and how statistical investigations are conducted and the "big ideas" that underlie statistical investigations. 4. Be able to use a statistical package (R or SAS) to analyze data and interpret result. 5. Big Ideas in Statistics: variability, distributions, and models; causation vs correlation; practical significance vs statistical significance, etc. Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

Electives (1-31 credits)

Grade Requirements

GPA Requirements

Course Requirements & Notes

Sample 4-Year Plan

Fall 1st Year

CS 18000 - Problem Solving And Object-Oriented Programming

Credit Hours: 4.00. Problem solving and algorithms, implementation of algorithms in a high level programming language, conditionals, the iterative approach and debugging, collections of data, searching and sorting, solving problems by decomposition, the object-oriented approach, subclasses of existing classes, handling exceptions that occur when the program is running, graphical user interfaces (GUIs), data stored in files, abstract data types, a glimpse at topics from other CS courses. Intended primarily for students majoring in computer sciences. Credit cannot be obtained for both CS 18000 and any of 15600, 15800 and 15900. Not open to students with credit in CS 24000.

Learning Outcomes: 1. Understand solving problems by analyzing the problem, designing an algorithm, and programming the solution. Credits: 4.00

MA 16100 - Plane Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 5.00. Introduction to differential and integral calculus of one variable, with applications. Some schools or departments may allow only 4 credit hours toward graduation for this course. Designed for students who have not had at least a one-semester calculus course in high school, with a grade of "A" or "B". Not open to students with credit in MA 16500 . Demonstrated competence in college algebra and trigonometry.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions Credits: 5.00

MA 16500 - Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 4.00. Introduction to differential and integral calculus of one variable, with applications. Conic sections. Designed for students who have had at least a one-semester calculus course in high school, with a grade of "A" or "B", but are not qualified to enter MA 16200 or MA 16600 or the advanced placement courses MA 17300 or the honors calculus course MA 18100. Demonstrated competence in college algebra and trigonometry. CTL:IMA 1602 Calculus - Long I

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems. 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions. Credits: 4.00

15-17 Credits

Spring 1st Year

CS 18200 - Foundations Of Computer Science

Credit Hours: 3.00. Logic and proofs; sets, functions, relations, sequences and summations; number representations; counting; fundamentals of the analysis of algorithms; graphs and trees; proof techniques; recursion; Boolean logic; finite state machines; pushdown automata; computability and undecidability.

Learning Outcomes: 1. Understand discrete mathematical tools, facts, and reasoning relevant to computer science. Credits: 3.00

CS 24000 - Programming In C

Credit Hours: 3.00. The UNIX environment, C development cycle, data representation, operators, program structure, recursion, macros, C preprocessor, pointers and addresses, dynamic memory allocation, structures, unions, typedef, bit-fields, pointer/structure applications, UNIX file abstraction, file access, low-level I/O, concurrency.

Learning Outcomes: 1. Understand programming principles and techniques for problem solving in the C programming language. Credits: 3.00

MA 16200 - Plane Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 5.00. Continuation of MA 16100 . Vectors in two and three dimensions, techniques of integration, infinite series, conic sections, polar coordinates, surfaces in three dimensions. Some schools or departments may allow only 4 credit hours toward graduation for this course.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 5.00

MA 16600 - Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 4.00. Continuation of MA 16500 . Vectors in two and three dimensions. Techniques of integration, infinite series, polar coordinates, surfaces in three dimensions. Not open to students with credit in MA 16200 . CTL:IMA 1603 Calculus - Long II

University Core Curriculum (UCC): (UCC: QR)
Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 4.00

15-17 Credits

Fall 2nd Year

CS 25000 - Computer Architecture

Credit Hours: 4.00. Digital logic: transistors, gates, and combinatorial circuits; clocks; registers and register banks; arithmetic-logic units; data representation: big-endian and little-endian integers; ones and twos complement arithmetic; signed and unsigned values; Von-Neumann architecture and bottleneck; instruction sets; RISC and CISC designs; instruction pipelines and stalls; rearranging code; memory and address spaces; physical and virtual memory; interleaving; page tables; memory caches; bus architecture; polling and interrupts; DMA; device programming; assembly language; optimizations; parallelism; data pipelining.

Learning Outcomes: 1. Students understand the function of basic hardware, including fundamentals of digital logic, processors, memory, and I/O. Credits: 4.00

CS 25100 - Data Structures And Algorithms

Credit Hours: 3.00. Running time analysis of algorithms and their implementations, one-dimensional data structures, trees, heaps, additional sorting algorithms, binary search trees, hash tables, graphs, directed graphs, weighted graph algorithms, additional topics.

Learning Outcomes: 1. Understand fundamental data structures, fundamental algorithms, and their implementation. Credits: 3.00

MA 26100 - Multivariate Calculus (UCC: QR)

Credit Hours: 4.00. Planes, lines, and curves in three dimensions. Differential calculus of several variables; multiple integrals. Introduction to vector calculus. Not open to students with credit in MA 17400 or 27100.

University Core Curriculum (UCC): (UCC: QR)
Learning Outcomes: 1. Know the equations for lines, planes and quadric surfaces in three dimensional space, and understand how these equations relate to the geometry. 2. Understand the relationship between vector functions and parametrized motion; know how to calculate velocity, acceleration, arc length and curvature. 3. Know the meaning of partial derivatives and how to calculate them. Know the multivariable chain rule. 4. Know the meaning of the gradient, how to calculate it, and how to apply it to directional derivatives and maximum and minimum values. 5. Understand the meaning of double and triple integrals; know how to compute them and how to apply them. 6. Understand the meaning of vector fields and line integrals. Know Green's theorem and be able to apply it. 7. Understand the meaning of surface integrals and know how to calculate them. Know Stokes' theorem and be able to apply it. Credits: 4.00

MA 27101 - Honors Multivariate Calculus (UCC: QR)

Credit Hours: 5.00. This course is the Honors version of MA 26100, Multivariate Calculus; it will also include a review of

infinite series. The course is intended for first-year students who have credit for Calculus I and II. There will be a significant emphasis on conceptual explanation, but not on formal proof. Permission of department is required.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Know techniques of vector algebra and be able to apply these to the geometry of space; in particular they will be able to find equations for lines and planes in space. 2. Find equations for standard surfaces in space. 3. Use vector methods to analyze motion in space, and calculate arc length and curvature. 4. Acquire a conceptual and computational knowledge of infinite series; in particular they will be able to test for convergence, and to do calculations with power series. 5. Understand the meaning of partial derivatives in various situations, and will be able to calculate with them. 6. Know the multivariable chain rule and its meaning, and will be able to apply it to calculate derivatives in various situations. 7. Know the meaning of directional derivatives and how to calculate them. 8. Find tangent planes. 9. Find and classify extreme values and saddle points and use the method of Lagrange multipliers. 10. Know the meaning of multiple integrals and how to calculate them. 11. Know the meaning of line integrals and surface integrals and how to calculate them. 12. Know Green's theorem, Stokes' theorem, and the divergence theorem and their applications. Credits: 5.00

15-17 Credits

Spring 2nd Year

CS 25200 - Systems Programming

Credit Hours: 4.00. Low-level programming; review of addresses, pointers, memory layout, and data representation; text, data, and bss segments; debugging and hex dumps; concurrent execution with threads and processes; address spaces; file names; descriptors and file pointers; inheritance; system calls and library functions; standard I/O and string libraries; simplified socket programming; building tools to help programmers; make and make files; shell scripts and quoting; Unix tools including sed, echo, test, and find; scripting languages such as awk; version control; object and executable files (.o and a.out); symbol tables; pointers to functions; hierarchical directories; and DNS hierarchy; programming embedded systems.

Learning Outcomes: 1. Have an appreciation and ability for low-level (systems) programming and debugging. Credits: 4.00

MA 35100 - Elementary Linear Algebra (UCC: QR)

Credit Hours: 3.00. Systems of linear equations, finite dimensional vector spaces, matrices, determinants, eigenvalues and eigenvector applications to analytical geometry. Not open to students with credit in MA 26500.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Solve systems of linear equations using concepts such as vector spaces, linear dependence, and Gaussian elimination. 2. Understand and test for linear independence, calculate the dimension of vector spaces, and apply the rank-nullity theorem in various contexts. 3. Define and apply linear transformations, including matrix multiplication, inverses, LU factorization, and coordinate transformations. 4. Compute and understand determinants, including their use in calculating matrix inverses and practical applications such as volume calculations. 5. Analyze and compute eigenvectors and eigenvalues, and apply diagonalization techniques. Credits: 3.00

16-17 Credits

Fall 3rd Year

MA 35100 - Elementary Linear Algebra (UCC: QR)

Credit Hours: 3.00. Systems of linear equations, finite dimensional vector spaces, matrices, determinants, eigenvalues and eigenvector applications to analytical geometry. Not open to

students with credit in MA 26500.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Solve systems of linear equations using concepts such as vector spaces, linear dependence, and Gaussian elimination. 2. Understand and test for linear independence, calculate the dimension of vector spaces, and apply the rank-nullity theorem in various contexts. 3. Define and apply linear transformations, including matrix multiplication, inverses, LU factorization, and coordinate transformations. 4. Compute and understand determinants, including their use in calculating matrix inverses and practical applications such as volume calculations. 5. Analyze and compute eigenvectors and eigenvalues, and apply diagonalization techniques. Credits: 3.00

MA 41600 - Probability

Credit Hours: 3.00. (STAT 41600) An introduction to mathematical probability suitable as a preparation for actuarial science, statistical theory, and mathematical modeling. General probability rules, conditional probability and Bayes theorem, discrete and continuous random variables, moments and moment generating functions, joint and conditional distributions, standard discrete and continuous distributions and their properties, law of large numbers and central limit theorem.

Credits: 3.00

STAT 35000 - Introduction To Statistics

Credit Hours: 3.00. This course provides a data-oriented introduction to applied statistics, covering exploratory data analysis, experimental design, probability distributions, simulation, sampling distributions, and the Central Limit Theorem. Students will learn the fundamentals of statistical inference, including confidence intervals and hypothesis tests for population means, paired and independent comparisons of means, analysis of variance, and regression. The course emphasizes hands-on experience with statistical software and is primarily intended for students majoring in the mathematical sciences. Prerequisite: two semesters of college calculus.

Learning Outcomes: 1. Understand basic terms, graphs, and symbols and be able to interpret statistics in the media. 2. Understand and be able to explain statistical processes and be able to fully interpret statistical results. 3. Understand why and how statistical investigations are conducted and the "big ideas" that underlie statistical investigations. 4. Be able to use a statistical package (R or SAS) to analyze data and interpret result. 5. Big Ideas in Statistics: variability, distributions, and models; causation vs correlation; practical significance vs statistical significance, etc. Credits: 3.00

MA 51800 - Advanced Discrete Mathematics

Credit Hours: 3.00. The course covers mathematics useful in analyzing computer algorithms. Topics include recurrence relations, evaluation of sums, integer functions, elementary number theory, binomial coefficients, generating functions, discrete probability, and asymptotic methods.

Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central

Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

MA 35301 - Linear Algebra II

Credit Hours: 3.00. Theoretical background for methods and results that appear in MA 35100. Inner products, orthogonality, and applications including least squares.

Learning Outcomes: 1. Perform rigorous proofs using the definitions of vector space, subspace, linear combination of vectors, linear dependence and linear independence, bases and dimension. 2. Perform rigorous proofs using the definitions of linear transformation and the null space and range of a linear transformation. 3. Exhibit a clear understanding of the relationship between composition of linear transformation and matrix multiplication. 4. Understand elementary matrices and their use in describing the solution set of a system of linear equations. 5. Understand that the determinant function on n x n matrices with entries in a field F is a function that may be defined recursively, and may be uniquely defined as an alternating multilinear form which takes the identity matrix to 1. 6. Perform rigorous proofs involving eigenvalues and eigenvectors. 7. Understand and be able to apply conditions for a linear operator on a finite-dimensional vector space to be diagonalizable. 8. Preform calculations with Gram-Schmidt, least squares and related topics. 9. Students should be able to do rigorous proofs involving inner product spaces and related topics. Credits: 3.00

16-17 Credits

Spring 3rd Year

15-16 Credits

Fall 4th Year

CS 39700 - Honors Seminar

Credit Hours: 0.00. A seminar for all sophomores, juniors, and seniors in the Computer Sciences Honors Program. Meets eight times each semester under the supervision of the Honors coordinator. The meetings focus on honors research projects, helping students to identify appropriate projects and form groups, and providing a forum for juniors and seniors to report on their projects as required in the honors program.

Credits: 0.00

15-17 Credits

Spring 4th Year

CS 49700 - Honors Research Project

Credit Hours: 3.00. One semester of the project may be counted as one of the seven computer science courses at or above the 300 level required for the bachelor's degree. One more semester, if approved by the honors coordinator, can be used as a free elective. A group research project directed by Computer Sciences faculty members. Each group must submit a technical report describing its work and the results obtained.

Credits: 3.00

15-17 Credits

Computer Science Honors: Computer Graphics and Visualization, BS

About the Program

Degree Requirements

Computer Science Honors Major Courses (58-60 credits)

Required CS Honors Major Math Courses (7-8 credits)

MA 26100 - Multivariate Calculus (UCC: QR)

Credit Hours: 4.00. Planes, lines, and curves in three dimensions. Differential calculus of several variables; multiple integrals. Introduction to vector calculus. Not open to students with credit in MA 17400 or 27100.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Know the equations for lines, planes and quadric surfaces in three dimensional space, and understand how these equations relate to the geometry. 2. Understand the relationship between vector functions and parametrized motion; know how to calculate velocity, acceleration, arc length and curvature. 3. Know the meaning of partial derivatives and how to calculate them. Know the multivariable chain rule. 4. Know the meaning of the gradient, how to calculate it, and how to apply it to directional derivatives and maximum and minimum values. 5. Understand the meaning of double and triple integrals; know how to compute them and how to apply them. 6. Understand the meaning of vector fields and line integrals. Know Green's theorem and be able to apply it. 7. Understand the meaning of surface integrals and know how to calculate them. Know Stokes' theorem and be able to apply it. Credits: 4.00

MA 35100 - Elementary Linear Algebra (UCC: QR)

Credit Hours: 3.00. Systems of linear equations, finite dimensional vector spaces, matrices, determinants, eigenvalues and eigenvector applications to analytical geometry. Not open to students with credit in MA 26500.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Solve systems of linear equations using concepts such as vector spaces, linear dependence, and Gaussian elimination. 2. Understand and test for linear independence, calculate the dimension of vector spaces, and apply the rank-nullity theorem in various contexts. 3. Define and apply linear transformations, including matrix multiplication, inverses, LU factorization, and coordinate transformations. 4. Compute and understand determinants, including their use in calculating matrix inverses and practical applications such as volume calculations. 5. Analyze and compute eigenvectors and eigenvalues, and apply diagonalization techniques. Credits: 3.00

MA 27101 - Honors Multivariate Calculus (UCC: QR)

Credit Hours: 5.00. This course is the Honors version of MA 26100, Multivariate Calculus; it will also include a review of infinite series. The course is intended for first-year students who have credit for Calculus I and II. There will be a significant emphasis on conceptual explanation, but not on formal proof. Permission of department is required.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Know techniques of vector algebra and be able to apply these to the geometry of space; in particular they will be able to find equations for lines and planes in space. 2. Find equations for standard surfaces in space. 3. Use vector methods to analyze motion in space, and calculate arc length and curvature. 4. Acquire a conceptual and computational knowledge of infinite series; in particular they will be able to test for convergence, and to do calculations with power series. 5. Understand the meaning of partial derivatives in various situations, and will be able to calculate with them. 6. Know the multivariable chain rule and its meaning, and will be able to apply it to calculate derivatives in various situations. 7. Know the meaning of directional

derivatives and how to calculate them. 8. Find tangent planes. 9. Find and classify extreme values and saddle points and use the method of Lagrange multipliers. 10. Know the meaning of multiple integrals and how to calculate them. 11. Know the meaning of line integrals and surface integrals and how to calculate them. 12. Know Green's theorem, Stokes' theorem, and the divergence theorem and their applications. Credits: 5.00

Required CS Major Core Courses (21 credits)

CS 18000 - Problem Solving And Object-Oriented Programming

Credit Hours: 4.00. Problem solving and algorithms, implementation of algorithms in a high level programming language, conditionals, the iterative approach and debugging, collections of data, searching and sorting, solving problems by decomposition, the object-oriented approach, subclasses of existing classes, handling exceptions that occur when the program is running, graphical user interfaces (GUIs), data stored in files, abstract data types, a glimpse at topics from other CS courses. Intended primarily for students majoring in computer sciences. Credit cannot be obtained for both CS 18000 and any of 15600, 15800 and 15900. Not open to students with credit in CS 24000.

Learning Outcomes: 1. Understand solving problems by analyzing the problem, designing an algorithm, and programming the solution. Credits: 4.00

CS 18200 - Foundations Of Computer Science

Credit Hours: 3.00. Logic and proofs; sets, functions, relations, sequences and summations; number representations; counting; fundamentals of the analysis of algorithms; graphs and trees; proof techniques; recursion; Boolean logic; finite state machines; pushdown automata; computability and undecidability.

Learning Outcomes: 1. Understand discrete mathematical tools, facts, and reasoning relevant to computer science. Credits: 3.00

CS 24000 - Programming In C

Credit Hours: 3.00. The UNIX environment, C development cycle, data representation, operators, program structure, recursion, macros, C preprocessor, pointers and addresses, dynamic memory allocation, structures, unions, typedef, bit-fields, pointer/structure applications, UNIX file abstraction, file access, low-level I/O, concurrency.

Learning Outcomes: 1. Understand programming principles and techniques for problem solving in the C programming language. Credits: 3.00

CS 25000 - Computer Architecture

Credit Hours: 4.00. Digital logic: transistors, gates, and combinatorial circuits; clocks; registers and register banks; arithmetic-logic units; data representation: big-endian and little-endian integers; ones and twos complement arithmetic; signed and unsigned values; Von-Neumann architecture and bottleneck; instruction sets; RISC and CISC designs; instruction pipelines and stalls; rearranging code; memory and address spaces; physical and virtual memory; interleaving; page tables; memory caches; bus architecture; polling and interrupts; DMA; device programming; assembly language; optimizations; parallelism; data pipelining.

Learning Outcomes: 1. Students understand the function of basic hardware, including fundamentals of digital logic, processors, memory, and I/O. Credits: 4.00

CS 25100 - Data Structures And Algorithms

Credit Hours: 3.00. Running time analysis of algorithms and their implementations, one-dimensional data structures, trees, heaps, additional sorting algorithms, binary search trees, hash tables, graphs, directed graphs, weighted graph algorithms, additional topics.

Learning Outcomes: 1. Understand fundamental data structures, fundamental algorithms, and their implementation. Credits: 3.00

CS 25200 - Systems Programming

Credit Hours: 4.00. Low-level programming; review of addresses, pointers, memory layout, and data representation; text, data, and bss segments; debugging and hex dumps; concurrent execution with threads and processes; address spaces; file names; descriptors and file pointers; inheritance; system calls and library functions; standard I/O and string libraries; simplified socket programming; building tools to help programmers; make and make files; shell scripts and quoting; Unix tools including sed, echo, test, and find; scripting languages such as awk; version control; object and executable files (.o and a.out); symbol tables; pointers to functions;

hierarchical directories; and DNS hierarchy; programming embedded systems.

Learning Outcomes: 1. Have an appreciation and ability for low-level (systems) programming and debugging. Credits: 4.00

Computer Graphics and Visualization Concentration (18 credits)

Required Courses

CS 31400 - Numerical Methods

Credit Hours: 3.00. Iterative methods for solving nonlinear equations; direct and iterative methods for solving linear systems; approximations of functions, derivatives, and integrals; error analysis.

Credits: 3.00

CS 33400 - Fundamentals Of Computer Graphics

Credit Hours: 3.00. Fundamental principles and techniques of computer graphics. The course covers the basics of going from a scene representation to a raster image using OpenGL. Specific topics include coordinate manipulations, perspective, basics of illumination and shading, color models, texture maps, clipping and basic raster algorithms, fundamentals of scene constructions. CS 31400 is recommended.

Credits: 3.00

CS 43400 - Advanced Computer Graphics

Credit Hours: 3.00. Advanced concepts and techniques of computer graphics. The course covers, in complete detail, going from a scene representation to a raster image without using OpenGL or other graphics packages. The course develops a complete graphics implementation in which the students implement every aspect of the graphics pipeline. This involves a substantial software project in C/C++.

Credits: 3.00

CS 47100 - Introduction To Artificial Intelligence

Credit Hours: 3.00. Students are expected to spend at least three hours per week gaining experience with artificial intelligence systems and developing software. Basic problem-solving strategies, heuristic search, problem reduction and AND/OR graphs, knowledge representation, expert systems, generating explanations, uncertainty reasoning, game playing, planning, machine learning, computer vision, and programming systems such as Lisp or Prolog.

Learning Outcomes: 1. Develop understandings of various applications of AI. 2. Recognize problems where AI techniques are applicable. 3. Implement and apply basic principles of AI in solutions that require problem-solving, inference, learning, and planning. 4. Understand how to evaluate various AI techniques and make appropriate selections. Credits: 3.00

CS 37300 - Data Mining And Machine Learning

Credit Hours: 3.00. This course will introduce students to the field of data mining and machine learning, which sits at the interface between statistics and computer science. Data mining and machine learning focuses on developing algorithms to automatically discover patterns and learn models of large datasets. This course introduces students to the process and main techniques in data mining and machine learning, including exploratory data analysis, predictive modeling, descriptive modeling, and evaluation.

Learning Outcomes: 1. Identify key elements of data mining and machine learning algorithms. 2. Understand how algorithmic elements interact to impact performance. 3. Understand how to choose algorithms for different analysis tasks. 4. Analyze data in both an exploratory and targeted manner. 5. Implement and apply basic algorithms for supervised and unsupervised learning. 6. Accurately evaluate the performance of algorithms, as well as formulate and test hypotheses. Credits: 3.00

Selectives

CS 35200 - Compilers: Principles And Practice

Credit Hours: 3.00. Should not be taken concurrently with CS 35400. The theory and practice of programming language translation, compilation, and run-time systems, organized around a significant programming project to build a compiler for a simple but nontrivial programming language. Modules, interfaces, tools. Data structures for tree languages. Lexical analysis, syntax analysis, abstract syntax. Symbol tables, semantic analysis. Translation, intermediate code, basic blocks, traces. Instruction selection, CISC and RISC machines. Liveness analysis, graph coloring register allocation. Supplemental material drawn from garbage collection, object-

oriented languages, higher-order languages, dataflow analysis, optimization, polymorphism, scheduling and pipelining, memory hierarchies.

Learning Outcomes: 1. Provides students with an understanding of how a computer program is converted into elementary code that causes the computer to produce the output intended by the programmer. Credits: 3.00

CS 35400 - Operating Systems

Credit Hours: 3.00. Should not be taken concurrently with CS 35200. Introduction to operating systems. Computer system and operating system architectures, processes, inter-process communication, inter-process synchronization, mutual exclusion, deadlocks, memory hierarchy, virtual memory, CPU scheduling, file systems, I/O device management, security.

Learning Outcomes: 1. Provides students with an understanding of the fundamentals of computer operating systems. Credits: 3.00

CS 38100 - Introduction To The Analysis Of Algorithms

Credit Hours: 3.00. Techniques for analyzing the time and space requirements of algorithms. Application of these techniques to sorting, searching, pattern-matching, graph problems, and other selected problems. Brief introduction to the intractable (NP-hard) problems.

Learning Outcomes: 1. Use big O-notation to give asymptotic time and space bounds of algorithms. 2. Explain the use of big-Omega, big-Theta, and little-o notations. 3. Use recurrence relations to determine the time complexity of recursive algorithms. 4. Solve recurrence relations commonly arising in algorithm design. 5. Give examples that illustrate time-space trade-offs of algorithms. Credits: 3.00

CS 42200 - Computer Networks

Credit Hours: 3.00. Undergraduate-level introduction to computer networks and data communication. Low-level details of media, signals, and bits: time division and frequency division multiplexing; encoding; modulation; bandwidth, throughput, and noise. Packet transmission: Local Area Network (Ethernet, FDDI) and Wide Area Network technologies (ATM); wireless networks; network interconnection with repeaters, bridges, and switches; DSU/CSU; xDSL and cable modems. Internetworking: router-based architecture; IP addressing; address binding with ARP; datagram encapsulation and fragmentation; UDP and TCP, retransmission; protocol ports; ICMP and error handling. Network applications: client/server concept; port demultiplexing; program interface to protocols (API); use by clients and servers; domain name system; TELNET; Web technologies including HTTP, CGI, Java; RPC and middleware; network management.

Credits: 3.00

CS 43400 - Advanced Computer Graphics

Credit Hours: 3.00. Advanced concepts and techniques of computer graphics. The course covers, in complete detail, going from a scene representation to a raster image without using OpenGL or other graphics packages. The course develops a complete graphics implementation in which the students implement every aspect of the graphics pipeline. This involves a substantial software project in C/C++.

Credits: 3.00

CS 45600 - Programming Languages

Credit Hours: 3.00. Concepts for structuring data, computation, and whole programs. Object-oriented languages, functional languages, logic- and rule-based languages. Data types, type checking, exception handling, concurrent processes, synchronization, modularity, encapsulation, interfaces, separate compilation, inheritance, polymorphism, dynamic binding, subtyping, overloading, beta-reduction, unification.

Credits: 3.00

CS 47100 - Introduction To Artificial Intelligence

Credit Hours: 3.00. Students are expected to spend at least three hours per week gaining experience with artificial intelligence systems and developing software. Basic problem-solving strategies, heuristic search, problem reduction and AND/OR graphs, knowledge representation, expert systems, generating explanations, uncertainty reasoning, game playing, planning, machine learning, computer vision, and programming systems such as Lisp or Prolog.

Learning Outcomes: 1. Develop understandings of various applications of AI. 2. Recognize problems where AI techniques are applicable. 3. Implement and apply basic principles of AI in solutions that require problem-solving, inference, learning, and planning. 4. Understand how to evaluate various AI techniques and make appropriate selections. Credits: 3.00

CS 49000 - Topics In Computer Sciences For Undergraduates

Credit Hours: 1.00 to 5.00. Supervised reading and reports in various fields. Permission of instructor required.

Credits: 1.00 to 5.00

CS 37300 - Data Mining And Machine Learning

Credit Hours: 3.00. This course will introduce students to the field of data mining and machine learning, which sits at the interface between statistics and computer science. Data mining and machine learning focuses on developing algorithms to automatically discover patterns and learn models of large datasets. This course introduces students to the process and main techniques in data mining and machine learning, including exploratory data analysis, predictive modeling, descriptive modeling, and evaluation.

Learning Outcomes: 1. Identify key elements of data mining and machine learning algorithms. 2. Understand how algorithmic elements interact to impact performance. 3. Understand how to choose algorithms for different analysis tasks. 4. Analyze data in both an exploratory and targeted manner. 5. Implement and apply basic algorithms for supervised and unsupervised learning. 6. Accurately evaluate the performance of algorithms, as well as formulate and test hypotheses. Credits: 3.00

CS 43900 - Introduction To Data Visualization

Credit Hours: 3.00. The course offers an introduction to the fundamentals principles, design strategies, and techniques needed to visually communicate, explore, and analyze data. The course focuses primarily on the visual representation of inherently non-spatial data (e.g., tables and spreadsheets, graphs and networks, trees, text, and time series), but also considers the visualization of maps and of data in geospatial context.

Learning Outcomes: 1. Describe the main visualization techniques and explain their strengths and limitations. 2. Select the most perceptually effective visual encoding for a given data attribute. 3. Perform a principled critique of an existing data visualization. 4. Design an effective data visualization solution for a given data set to address a specific data analysis objective. 5. Create interactive web-based visualizations using open-source software libraries. Credits: 3.00

CS 45800 - Introduction To Robotics

Credit Hours: 3.00. Any intelligent robot system interacting with our environment needs to have perception, planning, and control methods in its cognition process. The perception module outlines the robot's procedures to gather and interpret sensory observations into world models. The underlying planning and control modules use those world models to plan robot behaviors and their interaction with our natural environments. Therefore, this course will cover the fundamental topics in robot perception, planning, and control to design general-purpose robot cognition algorithms. Overall, this course is divided into four modules: Robot perception: This covers fundamental techniques needed for robot localization and mapping from raw 3D sensory data. Robot planning: This module will discuss robot behavior planning techniques such as A*, RRT*, and trajectory optimization. Robot Control: This introduces basic control techniques such as PID controller to execute the robot's planned behaviors in the real world. Robot Learning: This part will briefly introduce machine learning techniques for robot decision-making and control.

Learning Outcomes: 1. Formulate and solve the robot perception problems. 2. Identify the robot constraints, define their degree of freedom, and formulate their planning and control problems. 3. Apply classical and modern robot planning and control techniques to complex robot systems like manipulators, autonomous cars, etc. 4. Identify limitations in existing classical robot algorithms and understand their formal guarantees. 5. Evaluate and assess current best practices and mechanisms for robot programming. 6. Develop a skill for robot programming from perception to low-level control using standard methods. Credits: 3.00

Project Option

Concentration Notes

Required CS Honors (12-13 credits)

CS 39700 - Honors Seminar

Credit Hours: 0.00. A seminar for all sophomores, juniors, and seniors in the Computer Sciences Honors Program. Meets eight times each semester under the supervision of the Honors coordinator. The meetings focus on honors research projects, helping students to identify appropriate projects and form groups, and providing a forum for juniors and seniors to report on their projects as required in the honors program.

Credits: 0.00

CS 49700 - Honors Research Project

Credit Hours: 3.00. One semester of the project may be counted as one of the seven computer science courses at or above the 300 level required for the bachelor's degree. One more semester, if approved by the honors coordinator, can be used as a free elective. A group research project directed by Computer Sciences faculty members. Each group must submit a technical report describing its work and the results obtained.

Credits: 3.00

MA 35100 - Elementary Linear Algebra (UCC: QR)

Credit Hours: 3.00. Systems of linear equations, finite dimensional vector spaces, matrices, determinants, eigenvalues and eigenvector applications to analytical geometry. Not open to students with credit in MA 26500.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Solve systems of linear equations using concepts such as vector spaces, linear dependence, and Gaussian elimination. 2. Understand and test for linear independence, calculate the dimension of vector spaces, and apply the rank-nullity theorem in various contexts. 3. Define and apply linear transformations, including matrix multiplication, inverses, LU factorization, and coordinate transformations. 4. Compute and understand determinants, including their use in calculating matrix inverses and practical applications such as volume calculations. 5. Analyze and compute eigenvectors and eigenvalues, and apply diagonalization techniques. Credits: 3.00

MA 41600 - Probability

Credit Hours: 3.00. (STAT 41600) An introduction to mathematical probability suitable as a preparation for actuarial science, statistical theory, and mathematical modeling. General probability rules, conditional probability and Bayes theorem, discrete and continuous random variables, moments and moment generating functions, joint and conditional distributions, standard discrete and continuous distributions and their properties, law of large numbers and central limit theorem.

Credits: 3.00

MA 51800 - Advanced Discrete Mathematics

Credit Hours: 3.00. The course covers mathematics useful in analyzing computer algorithms. Topics include recurrence relations, evaluation of sums, integer functions, elementary number theory, binomial coefficients, generating functions, discrete probability, and asymptotic methods.

Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and

what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

MA 35301 - Linear Algebra II

Credit Hours: 3.00. Theoretical background for methods and results that appear in MA 35100. Inner products, orthogonality, and applications including least squares.

Learning Outcomes: 1. Perform rigorous proofs using the definitions of vector space, subspace, linear combination of vectors, linear dependence and linear independence, bases and dimension. 2. Perform rigorous proofs using the definitions of linear transformation and the null space and range of a linear transformation. 3. Exhibit a clear understanding of the relationship between composition of linear transformation and matrix multiplication. 4. Understand elementary matrices and their use in describing the solution set of a system of linear equations. 5. Understand that the determinant function on n x n matrices with entries in a field F is a function that may be defined recursively, and may be uniquely defined as an alternating multilinear form which takes the identity matrix to 1. 6. Perform rigorous proofs involving eigenvalues and eigenvectors. 7. Understand and be able to apply conditions for a linear operator on a finite-dimensional vector space to be diagonalizable. 8. Preform calculations with Gram-Schmidt, least squares and related topics. 9. Students should be able to do rigorous proofs involving inner product spaces and related topics. Credits: 3.00

Other Departmental/Program Course Requirements (31-55 credits)

College of Science Additional Requirements

Computing (3-4 credits)

Laboratory Science (6-8 credits)

Mathematics (8-10 credits)

MA 16100 - Plane Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 5.00. Introduction to differential and integral calculus of one variable, with applications. Some schools or departments may allow only 4 credit hours toward graduation for this course. Designed for students who have not had at least a one-semester calculus course in high school, with a grade of "A" or "B". Not open to students with credit in MA 16500 . Demonstrated competence in college algebra and trigonometry.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions Credits: 5.00

MA 16200 - Plane Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 5.00. Continuation of MA 16100 . Vectors in two and three dimensions, techniques of integration, infinite series, conic sections, polar coordinates, surfaces in three dimensions. Some schools or departments may allow only 4 credit hours toward graduation for this course.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric

substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 5.00

MA 16500 - Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 4.00. Introduction to differential and integral calculus of one variable, with applications. Conic sections. Designed for students who have had at least a one-semester calculus course in high school, with a grade of "A" or "B", but are not qualified to enter MA 16200 or MA 16600 or the advanced placement courses MA 17300 or the honors calculus course MA 18100. Demonstrated competence in college algebra and trigonometry. CTL:IMA 1602 Calculus - Long I University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems. 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions. Credits: 4.00

MA 16600 - Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 4.00. Continuation of MA 16500 . Vectors in two and three dimensions. Techniques of integration, infinite series, polar coordinates, surfaces in three dimensions. Not open to students with credit in MA 16200 . CTL:IMA 1603 Calculus - Long II University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 4.00

Statistics (3 credits)

STAT 35000 - Introduction To Statistics

Credit Hours: 3.00. This course provides a data-oriented introduction to applied statistics, covering exploratory data analysis, experimental design, probability distributions, simulation, sampling distributions, and the Central Limit Theorem. Students will learn the fundamentals of statistical inference, including confidence intervals and hypothesis tests for population means, paired and independent comparisons of means, analysis of variance, and regression. The course emphasizes hands-on experience with statistical software and is primarily intended for students majoring in the mathematical sciences. Prerequisite: two semesters of college calculus. Learning Outcomes: 1. Understand basic terms, graphs, and symbols and be able to interpret statistics in the media. 2. Understand and be able to explain statistical processes and be able to fully interpret statistical results. 3. Understand why and how statistical investigations are conducted and the "big ideas" that underlie statistical investigations. 4. Be able to use a statistical package (R or SAS) to analyze data and interpret result. 5. Big Ideas in Statistics:

variability, distributions, and models; causation vs correlation; practical significance vs statistical significance, etc. Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

Electives (5-31 credits)

GPA Requirements

Course Requirements & Notes

Sample 4-Year Plan

Fall 1st Year

CS 18000 - Problem Solving And Object-Oriented Programming

Credit Hours: 4.00. Problem solving and algorithms, implementation of algorithms in a high level programming language, conditionals, the iterative approach and debugging, collections of data, searching and sorting, solving problems by decomposition, the object-oriented approach, subclasses of existing classes, handling exceptions that occur when the program is running, graphical user interfaces (GUIs), data stored in files, abstract data types, a glimpse at topics from other CS courses. Intended primarily for students majoring in computer sciences. Credit cannot be obtained for both CS 18000 and any of 15600, 15800 and 15900. Not open to students with credit in CS 24000.

Learning Outcomes: 1. Understand solving problems by analyzing the problem, designing an algorithm, and programming the solution. Credits: 4.00

MA 16100 - Plane Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 5.00. Introduction to differential and integral calculus of one variable, with applications. Some schools or departments may allow only 4 credit hours toward graduation for this course. Designed for students who have not had at least a one-semester calculus course in high school, with a grade of "A" or "B". Not open to students with credit in MA 16500 . Demonstrated competence in college algebra and trigonometry.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of

elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions Credits: 5.00

MA 16500 - Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 4.00. Introduction to differential and integral calculus of one variable, with applications. Conic sections. Designed for students who have had at least a one-semester calculus course in high school, with a grade of "A" or "B", but are not qualified to enter MA 16200 or MA 16600 or the advanced placement courses MA 17300 or the honors calculus course MA 18100. Demonstrated competence in college algebra and trigonometry. CTL:IMA 1602 Calculus - Long I

University Core Curriculum (UCC): (UCC: QR)

To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems. 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions. Credits: 4.00

15-17 Credits

Spring 1st Year

CS 18200 - Foundations Of Computer Science

Credit Hours: 3.00. Logic and proofs; sets, functions, relations, sequences and summations; number representations; counting; fundamentals of the analysis of algorithms; graphs and trees; proof techniques; recursion; Boolean logic; finite state machines; pushdown automata; computability and undecidability.

Learning Outcomes: 1. Understand discrete mathematical tools, facts, and reasoning relevant to computer science. Credits: 3.00

CS 24000 - Programming In C

Credit Hours: 3.00. The UNIX environment, C development cycle, data representation, operators, program structure, recursion, macros, C preprocessor, pointers and addresses, dynamic memory allocation, structures, unions, typedef, bit-fields, pointer/structure applications, UNIX file abstraction, file access, low-level I/O, concurrency.

Learning Outcomes: 1. Understand programming principles and techniques for problem solving in the C programming language. Credits: 3.00

MA 16200 - Plane Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 5.00. Continuation of MA 16100 . Vectors in two and three dimensions, techniques of integration, infinite series, conic sections, polar coordinates, surfaces in three dimensions. Some schools or departments may allow only 4 credit hours toward graduation for this course.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 5.00

MA 16600 - Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 4.00. Continuation of MA 16500 . Vectors in two and three dimensions. Techniques of integration, infinite series, polar coordinates, surfaces in three dimensions. Not open to students with credit in MA 16200 . CTL:IMA 1603 Calculus -

Long II

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 4.00

15-17 Credits

Fall 2nd Year

CS 25000 - Computer Architecture

Credit Hours: 4.00. Digital logic: transistors, gates, and combinatorial circuits; clocks; registers and register banks; arithmetic-logic units; data representation: big-endian and little-endian integers; ones and twos complement arithmetic; signed and unsigned values; Von-Neumann architecture and bottleneck; instruction sets; RISC and CISC designs; instruction pipelines and stalls; rearranging code; memory and address spaces; physical and virtual memory; interleaving; page tables; memory caches; bus architecture; polling and interrupts; DMA; device programming; assembly language; optimizations; parallelism; data pipelining.

Learning Outcomes: 1. Students understand the function of basic hardware, including fundamentals of digital logic, processors, memory, and I/O. Credits: 4.00

CS 25100 - Data Structures And Algorithms

Credit Hours: 3.00. Running time analysis of algorithms and their implementations, one-dimensional data structures, trees, heaps, additional sorting algorithms, binary search trees, hash tables, graphs, directed graphs, weighted graph algorithms, additional topics.

Learning Outcomes: 1. Understand fundamental data structures, fundamental algorithms, and their implementation. Credits: 3.00

MA 26100 - Multivariate Calculus (UCC: QR)

Credit Hours: 4.00. Planes, lines, and curves in three dimensions. Differential calculus of several variables; multiple integrals. Introduction to vector calculus. Not open to students with credit in MA 17400 or 27100.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Know the equations for lines, planes and quadric surfaces in three dimensional space, and understand how these equations relate to the geometry. 2. Understand the relationship between vector functions and parametrized motion; know how to calculate velocity, acceleration, arc length and curvature. 3. Know the meaning of partial derivatives and how to calculate them. Know the multivariable chain rule. 4. Know the meaning of the gradient, how to calculate it, and how to apply it to directional derivatives and maximum and minimum values. 5. Understand the meaning of double and triple integrals; know how to compute them and how to apply them. 6. Understand the meaning of vector fields and line integrals. Know Green's theorem and be able to apply it. 7. Understand the meaning of surface integrals and know how to calculate them. Know Stokes' theorem and be able to apply it. Credits: 4.00

MA 27101 - Honors Multivariate Calculus (UCC: QR)

Credit Hours: 5.00. This course is the Honors version of MA 26100, Multivariate Calculus; it will also include a review of infinite series. The course is intended for first-year students who have credit for Calculus I and II. There will be a significant emphasis on conceptual explanation, but not on formal proof. Permission of department is required.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Know techniques of

vector algebra and be able to apply these to the geometry of space; in particular they will be able to find equations for lines and planes in space. 2. Find equations for standard surfaces in space. 3. Use vector methods to analyze motion in space, and calculate arc length and curvature. 4. Acquire a conceptual and computational knowledge of infinite series; in particular they will be able to test for convergence, and to do calculations with power series. 5. Understand the meaning of partial derivatives in various situations, and will be able to calculate with them. 6. Know the multivariable chain rule and its meaning, and will be able to apply it to calculate derivatives in various situations. 7. Know the meaning of directional derivatives and how to calculate them. 8. Find tangent planes. 9. Find and classify extreme values and saddle points and use the method of Lagrange multipliers. 10. Know the meaning of multiple integrals and how to calculate them. 11. Know the meaning of line integrals and surface integrals and how to calculate them. 12. Know Green's theorem, Stokes' theorem, and the divergence theorem and their applications. Credits: 5.00

15-17 Credits

Spring 2nd Year

CS 25200 - Systems Programming

Credit Hours: 4.00. Low-level programming; review of addresses, pointers, memory layout, and data representation; text, data, and bss segments; debugging and hex dumps; concurrent execution with threads and processes; address spaces; file names; descriptors and file pointers; inheritance; system calls and library functions; standard I/O and string libraries; simplified socket programming; building tools to help programmers; make and make files; shell scripts and quoting; Unix tools including sed, echo, test, and find; scripting languages such as awk; version control; object and executable files (.o and a.out); symbol tables; pointers to functions; hierarchical directories; and DNS hierarchy; programming embedded systems.

Learning Outcomes: 1. Have an appreciation and ability for low-level (systems) programming and debugging. Credits: 4.00

MA 35100 - Elementary Linear Algebra (UCC: QR)

Credit Hours: 3.00. Systems of linear equations, finite dimensional vector spaces, matrices, determinants, eigenvalues and eigenvector applications to analytical geometry. Not open to students with credit in MA 26500.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Solve systems of linear equations using concepts such as vector spaces, linear dependence, and Gaussian elimination. 2. Understand and test for linear independence, calculate the dimension of vector spaces, and apply the rank-nullity theorem in various contexts. 3. Define and apply linear transformations, including matrix multiplication, inverses, LU factorization, and coordinate transformations. 4. Compute and understand determinants, including their use in calculating matrix inverses and practical applications such as volume calculations. 5. Analyze and compute eigenvectors and eigenvalues, and apply diagonalization techniques. Credits: 3.00

16-17 Credits

Fall 3rd Year

MA 35100 - Elementary Linear Algebra (UCC: QR)

Credit Hours: 3.00. Systems of linear equations, finite dimensional vector spaces, matrices, determinants, eigenvalues and eigenvector applications to analytical geometry. Not open to students with credit in MA 26500.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Solve systems of linear equations using concepts such as vector spaces, linear dependence, and Gaussian elimination. 2. Understand and test for linear

independence, calculate the dimension of vector spaces, and apply the rank-nullity theorem in various contexts. 3. Define and apply linear transformations, including matrix multiplication, inverses, LU factorization, and coordinate transformations. 4. Compute and understand determinants, including their use in calculating matrix inverses and practical applications such as volume calculations. 5. Analyze and compute eigenvectors and eigenvalues, and apply diagonalization techniques. Credits: 3.00

MA 41600 - Probability

Credit Hours: 3.00. (STAT 41600) An introduction to mathematical probability suitable as a preparation for actuarial science, statistical theory, and mathematical modeling. General probability rules, conditional probability and Bayes theorem, discrete and continuous random variables, moments and moment generating functions, joint and conditional distributions, standard discrete and continuous distributions and their properties, law of large numbers and central limit theorem.

Credits: 3.00

STAT 35000 - Introduction To Statistics

Credit Hours: 3.00. This course provides a data-oriented introduction to applied statistics, covering exploratory data analysis, experimental design, probability distributions, simulation, sampling distributions, and the Central Limit Theorem. Students will learn the fundamentals of statistical inference, including confidence intervals and hypothesis tests for population means, paired and independent comparisons of means, analysis of variance, and regression. The course emphasizes hands-on experience with statistical software and is primarily intended for students majoring in the mathematical sciences. Prerequisite: two semesters of college calculus.

Learning Outcomes: 1. Understand basic terms, graphs, and symbols and be able to interpret statistics in the media. 2. Understand and be able to explain statistical processes and be able to fully interpret statistical results. 3. Understand why and how statistical investigations are conducted and the "big ideas" that underlie statistical investigations. 4. Be able to use a statistical package (R or SAS) to analyze data and interpret result. 5. Big Ideas in Statistics: variability, distributions, and models; causation vs correlation; practical significance vs statistical significance, etc. Credits: 3.00

MA 51800 - Advanced Discrete Mathematics

Credit Hours: 3.00. The course covers mathematics useful in analyzing computer algorithms. Topics include recurrence relations, evaluation of sums, integer functions, elementary number theory, binomial coefficients, generating functions, discrete probability, and asymptotic methods.

Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with

emphasis on the difference between causation and relationships. Credits: 3.00

MA 35301 - Linear Algebra II

Credit Hours: 3.00. Theoretical background for methods and results that appear in MA 35100. Inner products, orthogonality, and applications including least squares.

Learning Outcomes: 1. Perform rigorous proofs using the definitions of vector space, subspace, linear combination of vectors, linear dependence and linear independence, bases and dimension. 2. Perform rigorous proofs using the definitions of linear transformation and the null space and range of a linear transformation. 3. Exhibit a clear understanding of the relationship between composition of linear transformation and matrix multiplication. 4. Understand elementary matrices and their use in describing the solution set of a system of linear equations. 5. Understand that the determinant function on n x n matrices with entries in a field F is a function that may be defined recursively, and may be uniquely defined as an alternating multilinear form which takes the identity matrix to 1. 6. Perform rigorous proofs involving eigenvalues and eigenvectors. 7. Understand and be able to apply conditions for a linear operator on a finite-dimensional vector space to be diagonalizable. 8. Preform calculations with Gram-Schmidt, least squares and related topics. 9. Students should be able to do rigorous proofs involving inner product spaces and related topics. Credits: 3.00

16-17 Credits

Spring 3rd Year

15-16 Credits

Fall 4th Year

CS 39700 - Honors Seminar

Credit Hours: 0.00. A seminar for all sophomores, juniors, and seniors in the Computer Sciences Honors Program. Meets eight times each semester under the supervision of the Honors coordinator. The meetings focus on honors research projects, helping students to identify appropriate projects and form groups, and providing a forum for juniors and seniors to report on their projects as required in the honors program.

Credits: 0.00

15-17 Credits

Spring 4th Year

CS 49700 - Honors Research Project

Credit Hours: 3.00. One semester of the project may be counted as one of the seven computer science courses at or above the 300 level required for the bachelor's degree. One more semester, if approved by the honors coordinator, can be used as a free elective. A group research project directed by Computer Sciences faculty members. Each group must submit a technical report describing its work and the results obtained.

Credits: 3.00

15-17 Credits

Computer Science Honors: Database and Information Systems, BS

About the Program

Degree Requirements

Computer Science Honors Major Courses (61-63 credits)

Required CS Honors Major Math Courses (7-8 credits)

MA 26100 - Multivariate Calculus (UCC: QR)

Credit Hours: 4.00. Planes, lines, and curves in three dimensions. Differential calculus of several variables; multiple integrals. Introduction to vector calculus. Not open to students with credit in MA 17400 or 27100.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Know the equations for lines, planes and quadric surfaces in three dimensional space, and understand how these equations relate to the geometry. 2. Understand the relationship between vector functions and parametrized motion; know how to calculate velocity, acceleration, arc length and curvature. 3. Know the meaning of partial derivatives and how to calculate them. Know the multivariable chain rule. 4. Know the meaning of the gradient, how to calculate it, and how to apply it to directional derivatives and maximum and minimum values. 5. Understand the meaning of double and triple integrals; know how to compute them and how to apply them. 6. Understand the meaning of vector fields and line integrals. Know Green's theorem and be able to apply it. 7. Understand the meaning of surface integrals and know how to calculate them. Know Stokes' theorem and be able to apply it. Credits: 4.00

MA 35100 - Elementary Linear Algebra (UCC: QR)

Credit Hours: 3.00. Systems of linear equations, finite dimensional vector spaces, matrices, determinants, eigenvalues and eigenvector applications to analytical geometry. Not open to students with credit in MA 26500.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Solve systems of linear equations using concepts such as vector spaces, linear dependence, and Gaussian elimination. 2. Understand and test for linear independence, calculate the dimension of vector spaces, and apply the rank-nullity theorem in various contexts. 3. Define and apply linear transformations, including matrix multiplication, inverses, LU factorization, and coordinate transformations. 4. Compute and understand determinants, including their use in calculating matrix inverses and practical applications such as volume calculations. 5. Analyze and compute eigenvectors and eigenvalues, and apply diagonalization techniques. Credits: 3.00

MA 27101 - Honors Multivariate Calculus (UCC: QR)

Credit Hours: 5.00. This course is the Honors version of MA 26100, Multivariate Calculus; it will also include a review of infinite series. The course is intended for first-year students who have credit for Calculus I and II. There will be a significant emphasis on conceptual explanation, but not on formal proof. Permission of department is required.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Know techniques of vector algebra and be able to apply these to the geometry of space; in particular they will be able to find equations for lines and planes in space. 2. Find equations for standard surfaces in space. 3. Use vector methods to analyze motion in space, and calculate arc length and curvature. 4. Acquire a conceptual and computational knowledge of infinite series; in particular they will be able to test for convergence, and to do calculations with power series. 5. Understand the meaning of partial derivatives in various situations, and will be able to calculate with them. 6. Know the multivariable chain rule and its meaning, and will be able to apply it to calculate derivatives in various situations. 7. Know the meaning of directional derivatives and how to calculate them. 8. Find tangent planes. 9. Find and classify extreme values and saddle points and use the method of Lagrange multipliers. 10. Know the meaning of multiple integrals and how to calculate them. 11. Know the meaning of line integrals and surface

integrals and how to calculate them. 12. Know Green's theorem, Stokes' theorem, and the divergence theorem and their applications. Credits: 5.00

Required CS Major Core Courses (21 credits)

CS 18000 - Problem Solving And Object-Oriented Programming

Credit Hours: 4.00. Problem solving and algorithms, implementation of algorithms in a high level programming language, conditionals, the iterative approach and debugging, collections of data, searching and sorting, solving problems by decomposition, the object-oriented approach, subclasses of existing classes, handling exceptions that occur when the program is running, graphical user interfaces (GUIs), data stored in files, abstract data types, a glimpse at topics from other CS courses. Intended primarily for students majoring in computer sciences. Credit cannot be obtained for both CS 18000 and any of 15600, 15800 and 15900. Not open to students with credit in CS 24000.

Learning Outcomes: 1. Understand solving problems by analyzing the problem, designing an algorithm, and programming the solution. Credits: 4.00

CS 18200 - Foundations Of Computer Science

Credit Hours: 3.00. Logic and proofs; sets, functions, relations, sequences and summations; number representations; counting; fundamentals of the analysis of algorithms; graphs and trees; proof techniques; recursion; Boolean logic; finite state machines; pushdown automata; computability and undecidability.

Learning Outcomes: 1. Understand discrete mathematical tools, facts, and reasoning relevant to computer science. Credits: 3.00

CS 24000 - Programming In C

Credit Hours: 3.00. The UNIX environment, C development cycle, data representation, operators, program structure, recursion, macros, C preprocessor, pointers and addresses, dynamic memory allocation, structures, unions, typedef, bit-fields, pointer/structure applications, UNIX file abstraction, file access, low-level I/O, concurrency.

Learning Outcomes: 1. Understand programming principles and techniques for problem solving in the C programming language. Credits: 3.00

CS 25000 - Computer Architecture

Credit Hours: 4.00. Digital logic: transistors, gates, and combinatorial circuits; clocks; registers and register banks; arithmetic-logic units; data representation: big-endian and little-endian integers; ones and twos complement arithmetic; signed and unsigned values; Von-Neumann architecture and bottleneck; instruction sets; RISC and CISC designs; instruction pipelines and stalls; rearranging code; memory and address spaces; physical and virtual memory; interleaving; page tables; memory caches; bus architecture; polling and interrupts; DMA; device programming; assembly language; optimizations; parallelism; data pipelining.

Learning Outcomes: 1. Students understand the function of basic hardware, including fundamentals of digital logic, processors, memory, and I/O. Credits: 4.00

CS 25100 - Data Structures And Algorithms

Credit Hours: 3.00. Running time analysis of algorithms and their implementations, one-dimensional data structures, trees, heaps, additional sorting algorithms, binary search trees, hash tables, graphs, directed graphs, weighted graph algorithms, additional topics.

Learning Outcomes: 1. Understand fundamental data structures, fundamental algorithms, and their implementation. Credits: 3.00

CS 25200 - Systems Programming

Credit Hours: 4.00. Low-level programming; review of addresses, pointers, memory layout, and data representation; text, data, and bss segments; debugging and hex dumps; concurrent execution with threads and processes; address spaces; file names; descriptors and file pointers; inheritance; system calls and library functions; standard I/O and string libraries; simplified socket programming; building tools to help programmers; make and make files; shell scripts and quoting; Unix tools including sed, echo, test, and find; scripting languages such as awk; version control; object and executable files (.o and a.out); symbol tables; pointers to functions; hierarchical directories; and DNS hierarchy; programming embedded systems.

Learning Outcomes: 1. Have an appreciation and ability for low-level (systems) programming and debugging. Credits: 4.00

Database and Information Systems Concentration (21 credits)

Required Courses

CS 34800 - Information Systems

Credit Hours: 3.00. File organization and index structures; object-oriented database languages; the relational database model with introductions to SQL and DBMS; hierarchical models and network models with introductions to HDDL, HDML, and DBTG Codasyl; data mining; data warehousing; database connectivity; distributed databases; the client/server paradigm; middleware, including ODBC, JDBC, CORBA, and MOM.

Learning Outcomes: 1. Learn about different data models (relational, graph, and document) used in different database systems. 2. Learn how to pose complex database queries in SQL and NoSQL languages as well as theoretical query languages. 3. Gain an introductory background in indexing. 4. Learn about transactions and concurrency control. 5. Differentiate between OLTP and OLAP applications. Credits: 3.00

CS 38100 - Introduction To The Analysis Of Algorithms

Credit Hours: 3.00. Techniques for analyzing the time and space requirements of algorithms. Application of these techniques to sorting, searching, pattern-matching, graph problems, and other selected problems. Brief introduction to the intractable (NP-hard) problems.

Learning Outcomes: 1. Use big O-notation to give asymptotic time and space bounds of algorithms. 2. Explain the use of big-Omega, big-Theta, and little-o notations. 3. Use recurrence relations to determine the time complexity of recursive algorithms. 4. Solve recurrence relations commonly arising in algorithm design. 5. Give examples that illustrate time-space trade-offs of algorithms. Credits: 3.00

CS 44800 - Introduction To Relational Database Systems

Credit Hours: 3.00. An in-depth examination of relational database systems including theory and concepts as well as practical issues in relational databases. Modern database technologies such as object-relational and Web-based access to relational databases. Conceptual design and entity relationship modeling, relational algebra and calculus, data definition and manipulation languages using SQL, schema and view management, query processing and optimization, transaction management, security, privacy, integrity management.

Learning Outcomes: 1. Learn data modeling: physical, logical and conceptual data models, the entity-relationship model. 2. Study logical and Physical Design and interaction with operating systems, disk Storage, Basic File Structures, Hashing, Indexing. 3. Learn the relational database model and implementation and performance issues. 4. Understand transaction Processing, concurrency control, atomicity control and recovery control. 5. Understand database privacy, integrity, and security. 6. Understand data mining, data warehousing, online analytical processing, and information retrieval. 7. Understand Cloud computing and Distributed Database Systems architectures, Big Data, Hadoop, MapReduce, and NoSQL. 8. Recognize performance issues. Credits: 3.00

CS 47300 - Web Information Search And Management

Credit Hours: 3.00. This course teaches important concepts and knowledge of information retrieval for managing unstructured data such as text data on Web or in emails. At the same time, students will be exposed to a large number of important applications. Students in the course will get hands on experience from homework and a course project. The first part of the course focuses on general concepts/techniques such as stemming, indexing, vector space model, and feedback procedure. The second part of the course shows how to apply the set of techniques on different applications such as Web search, text categorization, and information recommendation.

Learning Outcomes: 1. Understand the important concepts and techniques of information retrieval and how to apply these techniques to a set of important or real world applications. Credits: 3.00

CS 37300 - Data Mining And Machine Learning

Credit Hours: 3.00. This course will introduce students to the field of data mining and machine learning, which sits at the interface between statistics and computer science. Data mining and machine learning focuses on developing algorithms to automatically discover patterns and learn models of large datasets. This course introduces students to the process and main techniques in data mining and machine learning, including exploratory data analysis, predictive modeling, descriptive modeling, and evaluation.

Learning Outcomes: 1. Identify key elements of data mining and machine learning algorithms. 2. Understand how algorithmic elements interact to impact performance. 3. Understand how to choose algorithms for different analysis tasks. 4. Analyze data in both an exploratory and targeted manner. 5. Implement and apply basic algorithms for supervised and unsupervised learning. 6. Accurately evaluate the performance of algorithms, as well as formulate and test hypotheses. Credits: 3.00

Selectives

Category I - Computing Systems

CS 35200 - Compilers: Principles And Practice

Credit Hours: 3.00. Should not be taken concurrently with CS 35400. The theory and practice of programming language translation, compilation, and run-time systems, organized around a significant programming project to build a compiler for a simple but nontrivial programming language. Modules, interfaces, tools. Data structures for tree languages. Lexical analysis, syntax analysis, abstract syntax. Symbol tables, semantic analysis. Translation, intermediate code, basic blocks, traces. Instruction selection, CISC and RISC machines. Liveness analysis, graph coloring register allocation. Supplemental material drawn from garbage collection, object-oriented languages, higher-order languages, dataflow analysis, optimization, polymorphism, scheduling and pipelining, memory hierarchies.

Learning Outcomes: 1. Provides students with an understanding of how a computer program is converted into elementary code that causes the computer to produce the output intended by the programmer. Credits: 3.00

CS 35300 - Principles Of Concurrency And Parallelism

Credit Hours: 3.00. Important concepts, models, algorithms, abstractions, and implementation aspects of concurrent and parallel programs. Topics include: techniques used to describe concurrent programs (e.g., threads, events, co-routines, continuations), abstractions for shared-memory and message-passing programs, relaxed memory models, livelock and deadlock detection, lock-free algorithms, data races and atomicity, scheduling techniques, process calculi, and software transactions.

Learning Outcomes: 1. This course provides students the vocabulary and concepts to better understand how to design and program scalable multicore processors. Credits: 3.00

CS 35400 - Operating Systems

Credit Hours: 3.00. Should not be taken concurrently with CS 35200. Introduction to operating systems. Computer system and operating system architectures, processes, inter-process communication, inter-process synchronization, mutual exclusion, deadlocks, memory hierarchy, virtual memory, CPU scheduling, file systems, I/O device management, security.

Learning Outcomes: 1. Provides students with an understanding of the fundamentals of computer operating systems. Credits: 3.00

Category II - Information Assurance

CS 35500 - Introduction To Cryptography

Credit Hours: 3.00. An introduction to cryptography basics: Classic historical ciphers including Caesar, Vigenere, and Vernam ciphers; modern ciphers including DES, AES, Pohlig-Hellman, and RSA; signatures and digests; key exchange; simple protocols; block and stream ciphers; network-centric protocols.

Learning Outcomes: 1. Understand the basic concepts and proof techniques in cryptography. 2. Develop skills to define and evaluate the security of existing schemes. 3. Construct provably secure schemes for common cryptographic tasks. Credits: 3.00

CS 42600 - Computer Security

Credit Hours: 3.00. A survey of the fundamentals of information

security. Risks and vulnerabilities, policy formation, controls and protection methods, database security, encryption, authentication technologies, host-based and network-based security issues, personnel and physical security issues, issues of law and privacy.

Learning Outcomes: 1. Apply the notions of threat, vulnerability, attack, countermeasure, security objectives, and adversarial models when analyzing security of computer and information systems. 2. Explain the main authorization mechanisms and access control models, and their applicability in different situations. 3. Explain security issues related to password and other authentication mechanisms. 4. Explain the different types of malware, the mechanisms of their propagation, and the strengths and limitations of different defense mechanisms. 5. Identify the threats and vulnerabilities for a networked environment, and explain different countermeasures, and their effectiveness. 6. Explain the vulnerabilities brought about by modern web-based application and services, different countermeasures, and their effectiveness. Credits: 3.00

Category III - Related Studies

EPCS 41200 - Senior Design Participation In EPICS

Credit Hours: 2.00. Continuation of EPICS courses. Seniors using EPCS 41200 to fulfill capstone or design requirements where approved for their major may be required to satisfy additional course requirements specified by their degree program. EPCS 41200 is offered for 2 credits. The EPICS procedures manual provides information on expected relative workload for EPCS 41100 and EPCS 41200 students. Seniors are responsible for the management tasks of planning and organizing their team project activity. They are expected to contribute expertise from their discipline to the design of the team's projects throughout most of the design process phases of problem identification, specification development, design, production, and deployment. Seniors will also meet with the customer and mentor the first year, sophomores and juniors. May not be taken concurrently with EPCS 41100 .

Learning Outcomes: 1. An ability to apply material from their discipline to the design of community-based projects. 2. An understanding of design as a start-to-finish process. 3. An ability to identify and acquire new knowledge as a part of the problem-solving/design process. 4. An awareness of the customer. 5. An ability to function on multidisciplinary teams and an appreciation for the contributions from individuals from multiple disciplines. 6. An ability to communicate effectively with audiences with widely-varying backgrounds. 7. An awareness of professional ethics and responsiblity. 8. An appreciation of the role that their discipline can play in social contexts. Credits: 2.00

EPCS 41100 - Senior Design Participation In EPICS

Credit Hours: 1.00. Continuation of EPICS courses. Seniors using EPCS 41100 to fulfill capstone or design requirements where approved for their major may be required to satisfy additional course requirements specified by their degree program. EPCS 41100 is offered for 1 credit. The EPICS procedures manual provides information on expected relative workload for EPCS 41100 and EPCS 41200 students. Seniors are responsible for the management tasks of planning and organizing their team project activity. They are expected to contribute expertise from their discipline to the design of the team's projects throughout most of the design process phases of problem identification, specification development, design, production, and deployment. Seniors will also meet with the customer and mentor the first year, sophomores and juniors. May not be taken concurrently with EPCS 41200 .

Learning Outcomes: 1. An ability to apply material from their discipline to the design of community-based projects. 2. An understanding of design as a start-to-finish process. 3. An ability to identify and acquire new knowledge as a part of the problem-solving/design process. 4. An awareness of the customer. 5. An ability to function on multidisciplinary teams and an appreciation for the contributions from individuals from multiple disciplines. 6. An ability to communicate effectively with audiences with widely-varying backgrounds. 7. An awareness of professional ethics and responsibility. 8. An appreciation of the role that their discipline can play in social contexts. Credits: 1.00

CS 42200 - Computer Networks

Credit Hours: 3.00. Undergraduate-level introduction to computer networks and data communication. Low-level details of media, signals, and bits: time division and frequency division multiplexing; encoding; modulation; bandwidth, throughput, and noise. Packet transmission: Local Area Network (Ethernet, FDDI) and Wide Area Network technologies (ATM); wireless networks; network interconnection with repeaters, bridges, and switches; DSU/CSU; xDSL and cable modems. Internetworking: router-based architecture; IP addressing; address binding with ARP; datagram encapsulation and fragmentation; UDP and TCP, retransmission; protocol ports; ICMP and error handling. Network applications: client/server concept; port demultiplexing; program interface to protocols (API); use by clients and servers; domain name system; TELNET; Web technologies including HTTP, CGI, Java; RPC and middleware; network management.

Credits: 3.00

CS 47100 - Introduction To Artificial Intelligence

Credit Hours: 3.00. Students are expected to spend at least three hours per week gaining experience with artificial intelligence systems and developing software. Basic problem-solving strategies, heuristic search, problem reduction and AND/OR graphs, knowledge representation, expert systems, generating explanations, uncertainty reasoning, game playing, planning, machine learning, computer vision, and programming systems such as Lisp or Prolog.

Learning Outcomes: 1. Develop understandings of various applications of AI. 2. Recognize problems where AI techniques are applicable. 3. Implement and apply basic principles of AI in solutions that require problem-solving, inference, learning, and planning. 4. Understand how to evaluate various AI techniques and make appropriate selections. Credits: 3.00

CS 47300 - Web Information Search And Management

Credit Hours: 3.00. This course teaches important concepts and knowledge of information retrieval for managing unstructured data such as text data on Web or in emails. At the same time, students will be exposed to a large number of important applications. Students in the course will get hands on experience from homework and a course project. The first part of the course focuses on general concepts/techniques such as stemming, indexing, vector space model, and feedback procedure. The second part of the course shows how to apply the set of techniques on different applications such as Web search, text categorization, and information recommendation.

Learning Outcomes: 1. Understand the important concepts and techniques of information retrieval and how to apply these techniques to a set of important or real world applications. Credits: 3.00

CS 47800 - Introduction To Bioinformatics

Credit Hours: 3.00. (BIOL 47800) Bioinformatics is broadly defined as the study of molecular biological information, targeting particularly the enormous volume of DNA sequence and functional complexity embedded in entire genomes. Topics will include understanding the evolutionary organization of genes (genomics), the structure and function of gene products (proteomics), and the dynamics of gene expression in biological processes (transcriptomics). Inherently, bioinformatics is interdisciplinary, melding various applications of computational science with biology. This jointly taught course introduces analytical methods from biology, statistics and computer science that are necessary for bioinformatics investigations. The course is intended for junior and senior undergraduates from various science backgrounds. Our objective is to develop the skills of both tool users and tool designers in this important new field of research.

Learning Outcomes: 1. Demonstrate proficiency with professional skills needed by practicing biologists, including experimental design and execution, biological techniques, data collection and documentation, communication of results, and responsible conduct of science. 2. Demonstrate the ability to discuss ethical issues in the application of biological sciences, and the impact of science on society. 3. Demonstrate skills in critical thinking. These skills include understanding scientific methods, solving biology-related problems, interpreting and analyzing primary literature in biology, and interpreting data in a meaningful way. 4. Demonstrate knowledge of the path leading to specific careers in biology. 5. Understand the role of evolution of creating and modifying the macromolecular components of the cell, and in creating biological complexity and variability. 6. Use and understand the scientific method, including how to generate hypotheses and

predictions, develop an experimental design, collect data, statistically analyze data, and interpret results. 7. Demonstrate an understanding of laboratory skills used in genetics. 8. Demonstrate knowledge of how evolutionary forces impact and shape microbial function and activity. 9. Demonstrate an understanding of the scientific method including hypothesis generation and testing, data collection, analysis, and interpretation. Credits: 3.00

CS 48300 - Introduction To The Theory Of Computation

Credit Hours: 3.00. Turing machines and the Church-Turing thesis; decidability; halting problem; reducibility; undecidable problems; decidability of logical theories; Kolmogorov complexity; time classes; P, NP, NP-complete; space classes; Savitch's theorem, PSPACE-completeness, NL-completeness; hierarchy theorems; approximation theorems; probabilistic algorithms; applications of complexity to parallel computation and cryptography.

Credits: 3.00

CS 49000 - Topics In Computer Sciences For Undergraduates

Credit Hours: 1.00 to 5.00. Supervised reading and reports in various fields. Permission of instructor required.

Credits: 1.00 to 5.00

CS 49700 - Honors Research Project

Credit Hours: 3.00. One semester of the project may be counted as one of the seven computer science courses at or above the 300 level required for the bachelor's degree. One more semester, if approved by the honors coordinator, can be used as a free elective. A group research project directed by Computer Sciences faculty members. Each group must submit a technical report describing its work and the results obtained.

Credits: 3.00

CS 37300 - Data Mining And Machine Learning

Credit Hours: 3.00. This course will introduce students to the field of data mining and machine learning, which sits at the interface between statistics and computer science. Data mining and machine learning focuses on developing algorithms to automatically discover patterns and learn models of large datasets. This course introduces students to the process and main techniques in data mining and machine learning, including exploratory data analysis, predictive modeling, descriptive modeling, and evaluation.

Learning Outcomes: 1. Identify key elements of data mining and machine learning algorithms. 2. Understand how algorithmic elements interact to impact performance. 3. Understand how to choose algorithms for different analysis tasks. 4. Analyze data in both an exploratory and targeted manner. 5. Implement and apply basic algorithms for supervised and unsupervised learning. 6. Accurately evaluate the performance of algorithms, as well as formulate and test hypotheses. Credits: 3.00

Concentration Notes

Required CS Honors (12-13 credits)

CS 39700 - Honors Seminar

Credit Hours: 0.00. A seminar for all sophomores, juniors, and seniors in the Computer Sciences Honors Program. Meets eight times each semester under the supervision of the Honors coordinator. The meetings focus on honors research projects, helping students to identify appropriate projects and form groups, and providing a forum for juniors and seniors to report on their projects as required in the honors program.

Credits: 0.00

CS 49700 - Honors Research Project

Credit Hours: 3.00. One semester of the project may be counted as one of the seven computer science courses at or above the 300 level required for the bachelor's degree. One more semester, if approved by the honors coordinator, can be used as a free elective. A group research project directed by Computer Sciences faculty members. Each group must submit a technical report describing its work and the results obtained.

Credits: 3.00

MA 35100 - Elementary Linear Algebra (UCC: QR)

Credit Hours: 3.00. Systems of linear equations, finite dimensional vector spaces, matrices, determinants, eigenvalues and eigenvector applications to analytical geometry. Not open to students with credit in MA 26500.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Solve systems of linear equations using concepts such as vector

spaces, linear dependence, and Gaussian elimination. 2. Understand and test for linear independence, calculate the dimension of vector spaces, and apply the rank-nullity theorem in various contexts. 3. Define and apply linear transformations, including matrix multiplication, inverses, LU factorization, and coordinate transformations. 4. Compute and understand determinants, including their use in calculating matrix inverses and practical applications such as volume calculations. 5. Analyze and compute eigenvectors and eigenvalues, and apply diagonalization techniques. Credits: 3.00

MA 41600 - Probability

Credit Hours: 3.00. (STAT 41600) An introduction to mathematical probability suitable as a preparation for actuarial science, statistical theory, and mathematical modeling. General probability rules, conditional probability and Bayes theorem, discrete and continuous random variables, moments and moment generating functions, joint and conditional distributions, standard discrete and continuous distributions and their properties, law of large numbers and central limit theorem.

Credits: 3.00

MA 51800 - Advanced Discrete Mathematics

Credit Hours: 3.00. The course covers mathematics useful in analyzing computer algorithms. Topics include recurrence relations, evaluation of sums, integer functions, elementary number theory, binomial coefficients, generating functions, discrete probability, and asymptotic methods.

Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

MA 35301 - Linear Algebra II

Credit Hours: 3.00. Theoretical background for methods and results that appear in MA 35100. Inner products, orthogonality, and applications including least squares.

Learning Outcomes: 1. Perform rigorous proofs using the definitions of vector space, subspace, linear combination of vectors, linear dependence and linear independence, bases and dimension. 2. Perform rigorous proofs using the definitions of linear transformation and the null space and range of a linear transformation. 3. Exhibit a clear understanding of the relationship between composition of linear transformation and matrix multiplication. 4. Understand elementary matrices and their use in describing the solution set of a system of linear equations. 5. Understand that the determinant function on n x n matrices with

entries in a field F is a function that may be defined recursively, and may be uniquely defined as an alternating multilinear form which takes the identity matrix to 1. 6. Perform rigorous proofs involving eigenvalues and eigenvectors. 7. Understand and be able to apply conditions for a linear operator on a finite-dimensional vector space to be diagonalizable. 8. Preform calculations with Gram-Schmidt, least squares and related topics. 9. Students should be able to do rigorous proofs involving inner product spaces and related topics. Credits: 3.00

Other Departmental/Program Course Requirements (31-55 credits)

College of Science Additional Requirements

Computing (3-4 credits)

Laboratory Science (6-8 credits)

Mathematics (8-10 credits)

MA 16100 - Plane Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 5.00. Introduction to differential and integral calculus of one variable, with applications. Some schools or departments may allow only 4 credit hours toward graduation for this course. Designed for students who have not had at least a one-semester calculus course in high school, with a grade of "A" or "B". Not open to students with credit in MA 16500 . Demonstrated competence in college algebra and trigonometry.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions Credits: 5.00

MA 16200 - Plane Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 5.00. Continuation of MA 16100 . Vectors in two and three dimensions, techniques of integration, infinite series, conic sections, polar coordinates, surfaces in three dimensions. Some schools or departments may allow only 4 credit hours toward graduation for this course.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 5.00

MA 16500 - Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 4.00. Introduction to differential and integral calculus of one variable, with applications. Conic sections. Designed for students who have had at least a one-semester calculus course in high school, with a grade of "A" or "B", but are not qualified to enter MA 16200 or MA 16600 or the advanced placement courses MA 17300 or the honors calculus course MA 18100. Demonstrated competence in college algebra and trigonometry. CTL:IMA 1602 Calculus - Long I

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to

apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems. 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions. Credits: 4.00

MA 16600 - Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 4.00. Continuation of MA 16500 . Vectors in two and three dimensions. Techniques of integration, infinite series, polar coordinates, surfaces in three dimensions. Not open to students with credit in MA 16200 . CTL:IMA 1603 Calculus - Long II

University Core Curriculum (UCC): (UCC: QR)
Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 4.00

Statistics (3 credits)

STAT 35000 - Introduction To Statistics

Credit Hours: 3.00. This course provides a data-oriented introduction to applied statistics, covering exploratory data analysis, experimental design, probability distributions, simulation, sampling distributions, and the Central Limit Theorem. Students will learn the fundamentals of statistical inference, including confidence intervals and hypothesis tests for population means, paired and independent comparisons of means, analysis of variance, and regression. The course emphasizes hands-on experience with statistical software and is primarily intended for students majoring in the mathematical sciences. Prerequisite: two semesters of college calculus.

Learning Outcomes: 1. Understand basic terms, graphs, and symbols and be able to interpret statistics in the media. 2. Understand and be able to explain statistical processes and be able to fully interpret statistical results. 3. Understand why and how statistical investigations are conducted and the "big ideas" that underlie statistical investigations. 4. Be able to use a statistical package (R or SAS) to analyze data and interpret result. 5. Big Ideas in Statistics: variability, distributions, and models; causation vs correlation; practical significance vs statistical significance, etc. Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5.

Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

Electives (2-31 credits)

Grade Requirements

GPA Requirements

Course Requirements & Notes

Sample 4-Year Plan

Fall 1st Year

CS 18000 - Problem Solving And Object-Oriented Programming

Credit Hours: 4.00. Problem solving and algorithms, implementation of algorithms in a high level programming language, conditionals, the iterative approach and debugging, collections of data, searching and sorting, solving problems by decomposition, the object-oriented approach, subclasses of existing classes, handling exceptions that occur when the program is running, graphical user interfaces (GUIs), data stored in files, abstract data types, a glimpse at topics from other CS courses. Intended primarily for students majoring in computer sciences. Credit cannot be obtained for both CS 18000 and any of 15600, 15800 and 15900. Not open to students with credit in CS 24000.

Learning Outcomes: 1. Understand solving problems by analyzing the problem, designing an algorithm, and programming the solution. Credits: 4.00

MA 16100 - Plane Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 5.00. Introduction to differential and integral calculus of one variable, with applications. Some schools or departments may allow only 4 credit hours toward graduation for this course. Designed for students who have not had at least a one-semester calculus course in high school, with a grade of "A" or "B". Not open to students with credit in MA 16500 . Demonstrated competence in college algebra and trigonometry.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions Credits: 5.00

MA 16500 - Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 4.00. Introduction to differential and integral calculus of one variable, with applications. Conic sections. Designed for students who have had at least a one-semester calculus course in high school, with a grade of "A" or "B", but are not qualified to enter MA 16200 or MA 16600 or the advanced placement courses MA 17300 or the honors calculus course MA 18100. Demonstrated competence in college algebra and trigonometry. CTL:IMA 1602 Calculus - Long I

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems. 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions. Credits: 4.00

15-17 Credits

Spring 1st Year

CS 18200 - Foundations Of Computer Science

Credit Hours: 3.00. Logic and proofs; sets, functions, relations, sequences and summations; number representations; counting; fundamentals of the analysis of algorithms; graphs and trees; proof techniques; recursion; Boolean logic; finite state machines; pushdown automata; computability and undecidability.

Learning Outcomes: 1. Understand discrete mathematical tools, facts, and reasoning relevant to computer science. Credits: 3.00

CS 24000 - Programming In C

Credit Hours: 3.00. The UNIX environment, C development cycle, data representation, operators, program structure, recursion, macros, C preprocessor, pointers and addresses, dynamic memory allocation, structures, unions, typedef, bit-fields, pointer/structure applications, UNIX file abstraction, file access, low-level I/O, concurrency.

Learning Outcomes: 1. Understand programming principles and techniques for problem solving in the C programming language. Credits: 3.00

MA 16200 - Plane Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 5.00. Continuation of MA 16100 . Vectors in two and three dimensions, techniques of integration, infinite series, conic sections, polar coordinates, surfaces in three dimensions. Some schools or departments may allow only 4 credit hours toward graduation for this course.

University Core Curriculum (UCC): (UCC: QR)
Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 5.00

MA 16600 - Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 4.00. Continuation of MA 16500 . Vectors in two and three dimensions. Techniques of integration, infinite series, polar coordinates, surfaces in three dimensions. Not open to students with credit in MA 16200 . CTL:IMA 1603 Calculus - Long II

University Core Curriculum (UCC): (UCC: QR)
Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 4.00

15-17 Credits

Fall 2nd Year

CS 25000 - Computer Architecture

Credit Hours: 4.00. Digital logic: transistors, gates, and combinatorial circuits; clocks; registers and register banks; arithmetic-logic units; data representation: big-endian and little-

endian integers; ones and twos complement arithmetic; signed and unsigned values; Von-Neumann architecture and bottleneck; instruction sets; RISC and CISC designs; instruction pipelines and stalls; rearranging code; memory and address spaces; physical and virtual memory; interleaving; page tables; memory caches; bus architecture; polling and interrupts; DMA; device programming; assembly language; optimizations; parallelism; data pipelining.

Learning Outcomes: 1. Students understand the function of basic hardware, including fundamentals of digital logic, processors, memory, and I/O. Credits: 4.00

CS 25100 - Data Structures And Algorithms

Credit Hours: 3.00. Running time analysis of algorithms and their implementations, one-dimensional data structures, trees, heaps, additional sorting algorithms, binary search trees, hash tables, graphs, directed graphs, weighted graph algorithms, additional topics.

Learning Outcomes: 1. Understand fundamental data structures, fundamental algorithms, and their implementation. Credits: 3.00

MA 26100 - Multivariate Calculus (UCC: QR)

Credit Hours: 4.00. Planes, lines, and curves in three dimensions. Differential calculus of several variables; multiple integrals. Introduction to vector calculus. Not open to students with credit in MA 17400 or 27100.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Know the equations for lines, planes and quadric surfaces in three dimensional space, and understand how these equations relate to the geometry. 2. Understand the relationship between vector functions and parametrized motion; know how to calculate velocity, acceleration, arc length and curvature. 3. Know the meaning of partial derivatives and how to calculate them. Know the multivariable chain rule. 4. Know the meaning of the gradient, how to calculate it, and how to apply it to directional derivatives and maximum and minimum values. 5. Understand the meaning of double and triple integrals; know how to compute them and how to apply them. 6. Understand the meaning of vector fields and line integrals. Know Green's theorem and be able to apply it. 7. Understand the meaning of surface integrals and know how to calculate them. Know Stokes' theorem and be able to apply it. Credits: 4.00

MA 27101 - Honors Multivariate Calculus (UCC: QR)

Credit Hours: 5.00. This course is the Honors version of MA 26100, Multivariate Calculus; it will also include a review of infinite series. The course is intended for first-year students who have credit for Calculus I and II. There will be a significant emphasis on conceptual explanation, but not on formal proof. Permission of department is required.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Know techniques of vector algebra and be able to apply these to the geometry of space; in particular they will be able to find equations for lines and planes in space. 2. Find equations for standard surfaces in space. 3. Use vector methods to analyze motion in space, and calculate arc length and curvature. 4. Acquire a conceptual and computational knowledge of infinite series; in particular they will be able to test for convergence, and to do calculations with power series. 5. Understand the meaning of partial derivatives in various situations, and will be able to calculate with them. 6. Know the multivariable chain rule and its meaning, and will be able to apply it to calculate derivatives in various situations. 7. Know the meaning of directional derivatives and how to calculate them. 8. Find tangent planes. 9. Find and classify extreme values and saddle points and use the method of Lagrange multipliers. 10. Know the meaning of multiple integrals and how to calculate them. 11. Know the meaning of line integrals and surface integrals and how to calculate them. 12. Know Green's theorem, Stokes' theorem, and the divergence theorem and their applications. Credits: 5.00

15-17 Credits

Spring 2nd Year

CS 25200 - Systems Programming

Credit Hours: 4.00. Low-level programming; review of addresses, pointers, memory layout, and data representation; text, data, and bss segments; debugging and hex dumps; concurrent execution with threads and processes; address spaces; file names; descriptors and file pointers; inheritance; system calls and library functions; standard I/O and string libraries; simplified socket programming; building tools to help programmers; make and make files; shell scripts and quoting; Unix tools including sed, echo, test, and find; scripting languages such as awk; version control; object and executable files (.o and a.out); symbol tables; pointers to functions; hierarchical directories; and DNS hierarchy; programming embedded systems.

Learning Outcomes: 1. Have an appreciation and ability for low-level (systems) programming and debugging. Credits: 4.00

MA 35100 - Elementary Linear Algebra (UCC: QR)

Credit Hours: 3.00. Systems of linear equations, finite dimensional vector spaces, matrices, determinants, eigenvalues and eigenvector applications to analytical geometry. Not open to students with credit in MA 26500.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Solve systems of linear equations using concepts such as vector spaces, linear dependence, and Gaussian elimination. 2. Understand and test for linear independence, calculate the dimension of vector spaces, and apply the rank-nullity theorem in various contexts. 3. Define and apply linear transformations, including matrix multiplication, inverses, LU factorization, and coordinate transformations. 4. Compute and understand determinants, including their use in calculating matrix inverses and practical applications such as volume calculations. 5. Analyze and compute eigenvectors and eigenvalues, and apply diagonalization techniques. Credits: 3.00

16-17 Credits

Fall 3rd Year

MA 35100 - Elementary Linear Algebra (UCC: QR)

Credit Hours: 3.00. Systems of linear equations, finite dimensional vector spaces, matrices, determinants, eigenvalues and eigenvector applications to analytical geometry. Not open to students with credit in MA 26500.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Solve systems of linear equations using concepts such as vector spaces, linear dependence, and Gaussian elimination. 2. Understand and test for linear independence, calculate the dimension of vector spaces, and apply the rank-nullity theorem in various contexts. 3. Define and apply linear transformations, including matrix multiplication, inverses, LU factorization, and coordinate transformations. 4. Compute and understand determinants, including their use in calculating matrix inverses and practical applications such as volume calculations. 5. Analyze and compute eigenvectors and eigenvalues, and apply diagonalization techniques. Credits: 3.00

MA 41600 - Probability

Credit Hours: 3.00. (STAT 41600) An introduction to mathematical probability suitable as a preparation for actuarial science, statistical theory, and mathematical modeling. General probability rules, conditional probability and Bayes theorem, discrete and continuous random variables, moments and moment generating functions, joint and conditional distributions, standard discrete and continuous distributions and their properties, law of large numbers and central limit theorem.

Credits: 3.00

STAT 35000 - Introduction To Statistics

Credit Hours: 3.00. This course provides a data-oriented introduction to applied statistics, covering exploratory data analysis, experimental design, probability distributions,

simulation, sampling distributions, and the Central Limit Theorem. Students will learn the fundamentals of statistical inference, including confidence intervals and hypothesis tests for population means, paired and independent comparisons of means, analysis of variance, and regression. The course emphasizes hands-on experience with statistical software and is primarily intended for students majoring in the mathematical sciences. Prerequisite: two semesters of college calculus.

Learning Outcomes: 1. Understand basic terms, graphs, and symbols and be able to interpret statistics in the media. 2. Understand and be able to explain statistical processes and be able to fully interpret statistical results. 3. Understand why and how statistical investigations are conducted and the "big ideas" that underlie statistical investigations. 4. Be able to use a statistical package (R or SAS) to analyze data and interpret result. 5. Big Ideas in Statistics: variability, distributions, and models; causation vs correlation; practical significance vs statistical significance, etc. Credits: 3.00

MA 51800 - Advanced Discrete Mathematics

Credit Hours: 3.00. The course covers mathematics useful in analyzing computer algorithms. Topics include recurrence relations, evaluation of sums, integer functions, elementary number theory, binomial coefficients, generating functions, discrete probability, and asymptotic methods.

Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

MA 35301 - Linear Algebra II

Credit Hours: 3.00. Theoretical background for methods and results that appear in MA 35100. Inner products, orthogonality, and applications including least squares.

Learning Outcomes: 1. Perform rigorous proofs using the definitions of vector space, subspace, linear combination of vectors, linear dependence and linear independence, bases and dimension. 2. Perform rigorous proofs using the definitions of linear transformation and the null space and range of a linear transformation. 3. Exhibit a clear understanding of the relationship between composition of linear transformation and matrix multiplication. 4. Understand elementary matrices and their use in describing the solution set of a system of linear equations. 5. Understand that the determinant function on n x n matrices with entries in a field F is a function that may be defined recursively, and may be uniquely defined as an alternating multilinear form which takes the identity matrix to 1. 6. Perform rigorous proofs involving eigenvalues and

eigenvectors. 7. Understand and be able to apply conditions for a linear operator on a finite-dimensional vector space to be diagonalizable. 8. Preform calculations with Gram-Schmidt, least squares and related topics. 9. Students should be able to do rigorous proofs involving inner product spaces and related topics.
Credits: 3.00

16-17 Credits

Spring 3rd Year

15-16 Credits

Fall 4th Year

CS 39700 - Honors Seminar

Credit Hours: 0.00. A seminar for all sophomores, juniors, and seniors in the Computer Sciences Honors Program. Meets eight times each semester under the supervision of the Honors coordinator. The meetings focus on honors research projects, helping students to identify appropriate projects and form groups, and providing a forum for juniors and seniors to report on their projects as required in the honors program.
Credits: 0.00

15-17 Credits

Spring 4th Year

CS 49700 - Honors Research Project

Credit Hours: 3.00. One semester of the project may be counted as one of the seven computer science courses at or above the 300 level required for the bachelor's degree. One more semester, if approved by the honors coordinator, can be used as a free elective. A group research project directed by Computer Sciences faculty members. Each group must submit a technical report describing its work and the results obtained.
Credits: 3.00

15-17 Credits

Computer Science Honors: Machine Intelligence, BS

About the Program

Degree Requirements

Computer Science Honors Major Courses (58-60 credits)

Required CS Honors Major Math Courses (7-8 credits)

MA 26100 - Multivariate Calculus (UCC: QR)

Credit Hours: 4.00. Planes, lines, and curves in three dimensions. Differential calculus of several variables; multiple integrals. Introduction to vector calculus. Not open to students with credit in MA 17400 or 27100.
University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Know the equations for lines, planes and quadric surfaces in three dimensional space, and understand how these equations relate to the geometry. 2. Understand the relationship between vector functions and parametrized motion; know how to calculate velocity, acceleration, arc length and curvature. 3. Know the meaning of partial derivatives and how to calculate them. Know the multivariable chain rule. 4. Know the meaning of the gradient, how to calculate it, and how to apply it to directional derivatives and maximum and minimum values. 5. Understand the meaning of double and triple integrals; know how to compute them and how to apply them. 6. Understand the meaning of vector fields and line integrals. Know Green's theorem and be able to apply it. 7. Understand the meaning of

surface integrals and know how to calculate them. Know Stokes' theorem and be able to apply it. Credits: 4.00

MA 35100 - Elementary Linear Algebra (UCC: QR)

Credit Hours: 3.00. Systems of linear equations, finite dimensional vector spaces, matrices, determinants, eigenvalues and eigenvector applications to analytical geometry. Not open to students with credit in MA 26500.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Solve systems of linear equations using concepts such as vector spaces, linear dependence, and Gaussian elimination. 2. Understand and test for linear independence, calculate the dimension of vector spaces, and apply the rank-nullity theorem in various contexts. 3. Define and apply linear transformations, including matrix multiplication, inverses, LU factorization, and coordinate transformations. 4. Compute and understand determinants, including their use in calculating matrix inverses and practical applications such as volume calculations. 5. Analyze and compute eigenvectors and eigenvalues, and apply diagonalization techniques. Credits: 3.00

MA 27101 - Honors Multivariate Calculus (UCC: QR)

Credit Hours: 5.00. This course is the Honors version of MA 26100, Multivariate Calculus; it will also include a review of infinite series. The course is intended for first-year students who have credit for Calculus I and II. There will be a significant emphasis on conceptual explanation, but not on formal proof. Permission of department is required.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Know techniques of vector algebra and be able to apply these to the geometry of space; in particular they will be able to find equations for lines and planes in space. 2. Find equations for standard surfaces in space. 3. Use vector methods to analyze motion in space, and calculate arc length and curvature. 4. Acquire a conceptual and computational knowledge of infinite series; in particular they will be able to test for convergence, and to do calculations with power series. 5. Understand the meaning of partial derivatives in various situations, and will be able to calculate with them. 6. Know the multivariable chain rule and its meaning, and will be able to apply it to calculate derivatives in various situations. 7. Know the meaning of directional derivatives and how to calculate them. 8. Find tangent planes. 9. Find and classify extreme values and saddle points and use the method of Lagrange multipliers. 10. Know the meaning of multiple integrals and how to calculate them. 11. Know the meaning of line integrals and surface integrals and how to calculate them. 12. Know Green's theorem, Stokes' theorem, and the divergence theorem and their applications. Credits: 5.00

Required CS Major Core Courses (21 credits)

CS 18000 - Problem Solving And Object-Oriented Programming

Credit Hours: 4.00. Problem solving and algorithms, implementation of algorithms in a high level programming language, conditionals, the iterative approach and debugging, collections of data, searching and sorting, solving problems by decomposition, the object-oriented approach, subclasses of existing classes, handling exceptions that occur when the program is running, graphical user interfaces (GUIs), data stored in files, abstract data types, a glimpse at topics from other CS courses. Intended primarily for students majoring in computer sciences. Credit cannot be obtained for both CS 18000 and any of 15600, 15800 and 15900. Not open to students with credit in CS 24000.

Learning Outcomes: 1. Understand solving problems by analyzing the problem, designing an algorithm, and programming the solution. Credits: 4.00

CS 18200 - Foundations Of Computer Science

Credit Hours: 3.00. Logic and proofs; sets, functions, relations, sequences and summations; number representations; counting; fundamentals of the analysis of algorithms; graphs and trees;

proof techniques; recursion; Boolean logic; finite state machines; pushdown automata; computability and undecidability.

Learning Outcomes: 1. Understand discrete mathematical tools, facts, and reasoning relevant to computer science. Credits: 3.00

CS 24000 - Programming In C

Credit Hours: 3.00. The UNIX environment, C development cycle, data representation, operators, program structure, recursion, macros, C preprocessor, pointers and addresses, dynamic memory allocation, structures, unions, typedef, bit-fields, pointer/structure applications, UNIX file abstraction, file access, low-level I/O, concurrency.

Learning Outcomes: 1. Understand programming principles and techniques for problem solving in the C programming language. Credits: 3.00

CS 25000 - Computer Architecture

Credit Hours: 4.00. Digital logic: transistors, gates, and combinatorial circuits; clocks; registers and register banks; arithmetic-logic units; data representation: big-endian and little-endian integers; ones and twos complement arithmetic; signed and unsigned values; Von-Neumann architecture and bottleneck; instruction sets; RISC and CISC designs; instruction pipelines and stalls; rearranging code; memory and address spaces; physical and virtual memory; interleaving; page tables; memory caches; bus architecture; polling and interrupts; DMA; device programming; assembly language; optimizations; parallelism; data pipelining.

Learning Outcomes: 1. Students understand the function of basic hardware, including fundamentals of digital logic, processors, memory, and I/O. Credits: 4.00

CS 25100 - Data Structures And Algorithms

Credit Hours: 3.00. Running time analysis of algorithms and their implementations, one-dimensional data structures, trees, heaps, additional sorting algorithms, binary search trees, hash tables, graphs, directed graphs, weighted graph algorithms, additional topics.

Learning Outcomes: 1. Understand fundamental data structures, fundamental algorithms, and their implementation. Credits: 3.00

CS 25200 - Systems Programming

Credit Hours: 4.00. Low-level programming; review of addresses, pointers, memory layout, and data representation; text, data, and bss segments; debugging and hex dumps; concurrent execution with threads and processes; address spaces; file names; descriptors and file pointers; inheritance; system calls and library functions; standard I/O and string libraries; simplified socket programming; building tools to help programmers; make and make files; shell scripts and quoting; Unix tools including sed, echo, test, and find; scripting languages such as awk; version control; object and executable files (.o and a.out); symbol tables; pointers to functions; hierarchical directories; and DNS hierarchy; programming embedded systems.

Learning Outcomes: 1. Have an appreciation and ability for low-level (systems) programming and debugging. Credits: 4.00

Machine Intelligence Concentration (18 credits)

Required Courses (4 courses)

CS 38100 - Introduction To The Analysis Of Algorithms

Credit Hours: 3.00. Techniques for analyzing the time and space requirements of algorithms. Application of these techniques to sorting, searching, pattern-matching, graph problems, and other selected problems. Brief introduction to the intractable (NP-hard) problems.

Learning Outcomes: 1. Use big O-notation to give asymptotic time and space bounds of algorithms. 2. Explain the use of big-Omega, big-Theta, and little-o notations. 3. Use recurrence relations to determine the time complexity of recursive algorithms. 4. Solve recurrence relations commonly arising in algorithm design. 5. Give examples that illustrate time-space trade-offs of algorithms. Credits: 3.00

CS 47100 - Introduction To Artificial Intelligence

Credit Hours: 3.00. Students are expected to spend at least three hours per week gaining experience with artificial intelligence systems and developing software. Basic problem-solving strategies, heuristic search, problem reduction and AND/OR graphs, knowledge representation, expert systems, generating explanations, uncertainty reasoning, game playing, planning, machine learning, computer vision, and programming

systems such as Lisp or Prolog.

Learning Outcomes: 1. Develop understandings of various applications of AI. 2. Recognize problems where AI techniques are applicable. 3. Implement and apply basic principles of AI in solutions that require problem-solving, inference, learning, and planning. 4. Understand how to evaluate various AI techniques and make appropriate selections. Credits: 3.00

CS 47300 - Web Information Search And Management

Credit Hours: 3.00. This course teaches important concepts and knowledge of information retrieval for managing unstructured data such as text data on Web or in emails. At the same time, students will be exposed to a large number of important applications. Students in the course will get hands on experience from homework and a course project. The first part of the course focuses on general concepts/techniques such as stemming, indexing, vector space model, and feedback procedure. The second part of the course shows how to apply the set of techniques on different applications such as Web search, text categorization, and information recommendation.

Learning Outcomes: 1. Understand the important concepts and techniques of information retrieval and how to apply these techniques to a set of important or real world applications. Credits: 3.00

MA 41600 - Probability

Credit Hours: 3.00. (STAT 41600) An introduction to mathematical probability suitable as a preparation for actuarial science, statistical theory, and mathematical modeling. General probability rules, conditional probability and Bayes theorem, discrete and continuous random variables, moments and moment generating functions, joint and conditional distributions, standard discrete and continuous distributions and their properties, law of large numbers and central limit theorem.

Credits: 3.00

STAT 41600 - Probability

Credit Hours: 3.00. (MA 41600) An introduction to mathematical probability suitable as preparation for actuarial science, statistical theory, and mathematical modeling. General probability rules, conditional probability and Bayes theorem, discrete and continuous random variables, moments and moment generating functions, joint and conditional distributions, standard discrete and continuous distributions and their properties, law of large numbers and central limit theorem. Credit cannot be given for more than one of STAT 22500, 31100, or 41600. Prerequisite: multivariate calculus.

Credits: 3.00

STAT 51200 - Applied Regression Analysis

Credit Hours: 3.00. Inference in simple and multiple linear regression, residual analysis, transformations, polynomial regression, model building with real data, nonlinear regression. One-way and two-way analysis of variance, multiple comparisons, fixed and random factors, analysis of covariance. Use of existing statistical computer programs. Prerequisite: Coursework in Statistical Methods with a calculus prerequisite.

Learning Outcomes: 1. Learn to build and analyze simple and multiple regression models, analysis of variance and covariance (ANOVA/ANCOVA) for regression, inference for regression, diagnostics and remedial measures for regression, transformations, residual analysis, model building, polynomial and interaction models. Credits: 3.00

CS 37300 - Data Mining And Machine Learning

Credit Hours: 3.00. This course will introduce students to the field of data mining and machine learning, which sits at the interface between statistics and computer science. Data mining and machine learning focuses on developing algorithms to automatically discover patterns and learn models of large datasets. This course introduces students to the process and main techniques in data mining and machine learning, including exploratory data analysis, predictive modeling, descriptive modeling, and evaluation.

Learning Outcomes: 1. Identify key elements of data mining and machine learning algorithms. 2. Understand how algorithmic elements interact to impact performance. 3. Understand how to choose algorithms for different analysis tasks. 4. Analyze data in both an exploratory and targeted manner. 5. Implement and apply basic algorithms for supervised and unsupervised learning. 6. Accurately evaluate the performance of algorithms, as well as formulate and test hypotheses. Credits: 3.00

Selectives (2 courses)

CS 31400 - Numerical Methods

Credit Hours: 3.00. Iterative methods for solving nonlinear equations; direct and iterative methods for solving linear systems; approximations of functions, derivatives, and integrals; error analysis.

Credits: 3.00

CS 34800 - Information Systems

Credit Hours: 3.00. File organization and index structures; object-oriented database languages; the relational database model with introductions to SQL and DBMS; hierarchical models and network models with introductions to HDDL, HDML, and DBTG Codasyl; data mining; data warehousing; database connectivity; distributed databases; the client/server paradigm; middleware, including ODBC, JDBC, CORBA, and MOM.

Learning Outcomes: 1. Learn about different data models (relational, graph, and document) used in different database systems. 2. Learn how to pose complex database queries in SQL and NoSQL languages as well as theoretical query languages. 3. Gain an introductory background in indexing. 4. Learn about transactions and concurrency control. 5. Differentiate between OLTP and OLAP applications. Credits: 3.00

CS 35200 - Compilers: Principles And Practice

Credit Hours: 3.00. Should not be taken concurrently with CS 35400. The theory and practice of programming language translation, compilation, and run-time systems, organized around a significant programming project to build a compiler for a simple but nontrivial programming language. Modules, interfaces, tools. Data structures for tree languages. Lexical analysis, syntax analysis, abstract syntax. Symbol tables, semantic analysis. Translation, intermediate code, basic blocks, traces. Instruction selection, CISC and RISC machines. Liveness analysis, graph coloring register allocation. Supplemental material drawn from garbage collection, object-oriented languages, higher-order languages, dataflow analysis, optimization, polymorphism, scheduling and pipelining, memory hierarchies.

Learning Outcomes: 1. Provides students with an understanding of how a computer program is converted into elementary code that causes the computer to produce the output intended by the programmer. Credits: 3.00

CS 44800 - Introduction To Relational Database Systems

Credit Hours: 3.00. An in-depth examination of relational database systems including theory and concepts as well as practical issues in relational databases. Modern database technologies such as object-relational and Web-based access to relational databases. Conceptual design and entity relationship modeling, relational algebra and calculus, data definition and manipulation languages using SQL, schema and view management, query processing and optimization, transaction management, security, privacy, integrity management.

Learning Outcomes: 1. Learn data modeling: physical, logical and conceptual data models, the entity-relationship model. 2. Study logical and Physical Design and interaction with operating systems, disk Storage, Basic File Structures, Hashing, Indexing. 3. Learn the relational database model and implementation and performance issues. 4. Understand transaction Processing, concurrency control, atomicity control and recovery control. 5. Understand database privacy, integrity, and security. 6. Understand data mining, data warehousing, online analytical processing, and information retrieval. 7. Understand Cloud computing and Distributed Database Systems architectures, Big Data, Hadoop, MapReduce, and NoSQL. 8. Recognize performance issues. Credits: 3.00

CS 45600 - Programming Languages

Credit Hours: 3.00. Concepts for structuring data, computation, and whole programs. Object-oriented languages, functional languages, logic- and rule-based languages. Data types, type checking, exception handling, concurrent processes, synchronization, modularity, encapsulation, interfaces, separate compilation, inheritance, polymorphism, dynamic binding, subtyping, overloading, beta-reduction, unification.

Credits: 3.00

CS 47100 - Introduction To Artificial Intelligence

Credit Hours: 3.00. Students are expected to spend at least three hours per week gaining experience with artificial intelligence systems and developing software. Basic problem-solving strategies, heuristic search, problem reduction and

AND/OR graphs, knowledge representation, expert systems, generating explanations, uncertainty reasoning, game playing, planning, machine learning, computer vision, and programming systems such as Lisp or Prolog.

Learning Outcomes: 1. Develop understandings of various applications of AI. 2. Recognize problems where AI techniques are applicable. 3. Implement and apply basic principles of AI in solutions that require problem-solving, inference, learning, and planning. 4. Understand how to evaluate various AI techniques and make appropriate selections. Credits: 3.00

CS 47300 - Web Information Search And Management

Credit Hours: 3.00. This course teaches important concepts and knowledge of information retrieval for managing unstructured data such as text data on Web or in emails. At the same time, students will be exposed to a large number of important applications. Students in the course will get hands on experience from homework and a course project. The first part of the course focuses on general concepts/techniques such as stemming, indexing, vector space model, and feedback procedure. The second part of the course shows how to apply the set of techniques on different applications such as Web search, text categorization, and information recommendation.

Learning Outcomes: 1. Understand the important concepts and techniques of information retrieval and how to apply these techniques to a set of important or real world applications. Credits: 3.00

CS 48300 - Introduction To The Theory Of Computation

Credit Hours: 3.00. Turing machines and the Church-Turing thesis; decidability; halting problem; reducibility; undecidable problems; decidability of logical theories; Kolmogorov complexity; time classes; P, NP, NP-complete; space classes; Savitch's theorem, PSPACE-completeness, NL-completeness; hierarchy theorems; approximation theorems; probabilistic algorithms; applications of complexity to parallel computation and cryptography.

Credits: 3.00

CS 57700 - Natural Language Processing

Credit Hours: 3.00. This course will cover the key concepts and methods used in modern Natural Language Processing (NLP). Throughout the course several core NLP tasks, such as sentiment analysis, information extraction, syntactic and semantic analysis, will be discussed. The course will emphasize machine-learning and data-driven algorithms and techniques, and will compare several different approaches to these problems in terms of their performance, supervision effort and computational complexity. Prerequisites: A background in linear algebra, calculus, statistics and probability, and completion of CS 57800 or equivalent are highly recommended. Strong programming skills in any modem language (Python, Java, C++) are required.

Learning Outcomes: 1. Describe and analyze the key challenges in dealing with natural language data and other fundamental areas of NLP. 2. Analyze and implement the key algorithms and techniques used in NLP. 3. Identify algorithmic techniques that can be applied to new problems and evaluate other possible solutions. 4. Conduct experiments using proper methodology for training and testing NLP systems using data. 5. Critically review current research work in the NLP field. Credits: 3.00

CS 43900 - Introduction To Data Visualization

Credit Hours: 3.00. The course offers an introduction to the fundamentals principles, design strategies, and techniques needed to visually communicate, explore, and analyze data. The course focuses primarily on the visual representation of inherently non-spatial data (e.g., tables and spreadsheets, graphs and networks, trees, text, and time series), but also considers the visualization of maps and of data in geospatial context.

Learning Outcomes: 1. Describe the main visualization techniques and explain their strengths and limitations. 2. Select the most perceptually effective visual encoding for a given data attribute. 3. Perform a principled critique of an existing data visualization. 4. Design an effective data visualization solution for a given data set to address a specific data analysis objective. 5. Create interactive web-based visualizations using open-source software libraries. Credits: 3.00

CS 44000 - Large Scale Data Analytics

Credit Hours: 3.00. This course provides an integrated view of the key concepts of modern algorithmic data analytics. It

focuses on teaching principles and methods needed to analyze large datasets in
order to extract novel, transformative insights for the underlying application. The course emphasizes the duality between formulating questions that can be answered by statistical data analysis tools (the statistical perspective) and the algorithmic challenge of actually extracting such answers using available parallel and distributed computational resources from massive datasets. The topics cover three areas: (1) algorithmic concepts necessary for big data analytics, (2) big data systems, including data management and programming, and (3) advanced analytic methods to address characteristics of real-world big data problems.

Learning Outcomes: 1. Identify techniques appropriate for solving a data analytics challenge. 2. Load and manipulate data in distributed computing environments. 3. Apply computing paradigms to effectively write efficient and scalable algorithms for data analysis pipelines. Know limitations, design details and design decisions of these algorithms. 4. Apply mixed-precision optimization and parallel learning algorithms to modern machine learning algorithms. 5. Present results in methods appropriate for domain experts. Credits: 3.00

CS 47500 - Human-Computer Interaction

Credit Hours: 3.00. The goal of this course is to teach students how to design useful and usable interactive systems that address important needs of people. Students will experience the entire user-centered design life cycle, from need finding to usability evaluation. Topics covered in the course include user-centered design principles, usability heuristics, need-finding methods such as semi-structured interviews and contextual inquiry, quick prototyping techniques, usability evaluation methods such as hallway testing and human-subjects user study, and theories about user interaction and decision making. As we are entering a new era of AI, the course will also include a brief introduction on how to apply the HCI principles and techniques to AI-powered systems. This course is project-based. Students will form project teams among themselves to work on a semester-long project and apply the user-centered design principles, theories, and techniques that they have learned in class to build a useful and usable interactive system such as a mobile application. This course is also highly interactive, including a series of design studios and in-class activities that require active participation, communication, and discussion with other students.

Learning Outcomes: 1. Apply HCI methods such as semi-structured interviews and contextual inquiries to uncover user needs and realistic problems that can be solved by computational methods. 2. Apply user-centered design principles to iteratively develop interface designs to address those needs. 3. Develop prototypes to concretize a design idea in different levels of fidelity. 4. Critique a design idea or prototype and pinpoint design flaws and usability issues based on commonly agreed upon design principles and usability heuristics. 5. Iteratively evaluate and improve upon the prototypes based on feedback from potential users. 6. Communicate design ideas and findings to target users, other designers, funders, etc. 7. Work in a team and succeed. Credits: 3.00

CS 31100 - Competitive Programming II

Credit Hours: 2.00. CP2 teaches experienced programmers additional techniques to solve interview and competitive programming problems and builds on material learned in CP1. This includes specific algorithmic techniques such as [shortest paths, topological sort, MST, union find, range queries], advanced algorithms surrounding trees and DAGs, advanced problem types in [dynamic programming, backtracking/simulation, mathematics, string processing], and more. It can be viewed as a programming complement to CS 38100, with some overlap in content.

Learning Outcomes: 1. Differentiate between advanced categories of problems in computer science including backtracking/simulation, advanced dynamic programming, advanced graphs (including trees and DAGs), mathematics, string processing, and range queries, as well as subcategories in each of these categories. 2. Implement well-known solutions (as discussed in class) to advanced categories of problems in computer science (listed in LO1). 3. Identify when a problem spans multiple categories of problems (as listed in LO1) 4. Design algorithms to solve problems that span multiple categories of problems. 5. Use new/novel algorithms to solve advanced

problems. 6. Recognize key characteristics of certain problem types listed in LO1. 7. Classify an advanced problem by those key characteristics. 8. Deconstruct an advanced problem into subproblems that can be solved individually. 9. Determine runtime and space usage of a potential solution using big-O notation to judge if the potential solution will work. 10. Create an efficient solution to a problem based on analysis of the problem type, the deconstructed problem parts, and the time and space constraints of the problem. 11. Reflect on how one came up with a solution to a problem in order to better recognize patterns in problem types. Credits: 2.00

CS 41100 - Competitive Programming III

Credit Hours: 2.00. CP3 teaches experienced programmers additional techniques to solve competitive programming problems and builds on material learned in CP1 and CP2. This includes algorithmic techniques in topics such as [network flow, computational geometry, graph matching, NP-hard problems]. Primarily, CP3 prepares students to compete in programming contests, which means most class time is focused on simulating contest environments and teaching teamwork and communication alongside problem practice.

Learning Outcomes: 1. Differentiate between advanced categories of problems in computer science including network flow, computational geometry, graph matching, and NP-hard problems, as well as subcategories in each of these categories. 2. Extrapolate generalized solutions and problem-solving strategies across advanced categories listed in LO1 as well as in general competitive programming categories. 3. Design algorithms to solve problems that span multiple advanced categories of problems, combining categorical solutions in complex ways. 4. Use new/novel algorithms to solve advanced problems. 5. Deconstruct an advanced problem into subproblems that can be solved individually. 6. Quickly determine runtime and space usage of a potential solution using big-O notation to judge if the potential solution will work. 7. Create an efficient solution to a problem based on analysis of the problem type, the deconstructed problem parts, and the time and space constraints of the problem. 8. Communicate ideas quickly and concisely to other competitive programmers to create efficient solutions. Credits: 2.00

CS 45800 - Introduction To Robotics

Credit Hours: 3.00. Any intelligent robot system interacting with our environment needs to have perception, planning, and control methods in its cognition process. The perception module outlines the robot's procedures to gather and interpret sensory observations into world models. The underlying planning and control modules use those world models to plan robot behaviors and their interaction with our natural environments. Therefore, this course will cover the fundamental topics in robot perception, planning, and control to design general-purpose robot cognition algorithms. Overall, this course is divided into four modules: Robot perception: This covers fundamental techniques needed for robot localization and mapping from raw 3D sensory data. Robot planning: This module will discuss robot behavior planning techniques such as A*, RRT*, and trajectory optimization. Robot Control: This introduces basic control techniques such as PID controller to execute the robot's planned behaviors in the real world. Robot Learning: This part will briefly introduce machine learning techniques for robot decision-making and control.

Learning Outcomes: 1. Formulate and solve the robot perception problems. 2. Identify the robot constraints, define their degree of freedom, and formulate their planning and control problems. 3. Apply classical and modern robot planning and control techniques to complex robot systems like manipulators, autonomous cars, etc. 4. Identify limitations in existing classical robot algorithms and understand their formal guarantees. 5. Evaluate and assess current best practices and mechanisms for robot programming. 6. Develop a skill for robot programming from perception to low-level control using standard methods. Credits: 3.00

CS 57800 - Statistical Machine Learning

Credit Hours: 3.00. This introductory course will cover many

concepts, models, and algorithms in machine learning. Topics include classical supervised learning (e.g., regression and classification), unsupervised learning (e.g., principle component analysis and K-means), and recent development in the machine learning field such as variational Bayes, expectation propagation, and Gaussian processes. While this course will give students the basic ideas and intuition behind modern machine learning methods, the underlying theme in the course is probabilistic inference.

Learning Outcomes: 1. Learn the theory and key algorithms used in machine learning. 2. Get hands-on machine learning experience by implementing several algorithms, applying them to datasets and analyzing their performance. 3. Understand how to use machine learning methods to their research projects, formulate the learning tasks and match them with appropriate solutions. Credits: 3.00

Concentration Notes

Required CS Honors (12-13 credits)

CS 39700 - Honors Seminar

Credit Hours: 0.00. A seminar for all sophomores, juniors, and seniors in the Computer Sciences Honors Program. Meets eight times each semester under the supervision of the Honors coordinator. The meetings focus on honors research projects, helping students to identify appropriate projects and form groups, and providing a forum for juniors and seniors to report on their projects as required in the honors program.

Credits: 0.00

CS 49700 - Honors Research Project

Credit Hours: 3.00. One semester of the project may be counted as one of the seven computer science courses at or above the 300 level required for the bachelor's degree. One more semester, if approved by the honors coordinator, can be used as a free elective. A group research project directed by Computer Sciences faculty members. Each group must submit a technical report describing its work and the results obtained.

Credits: 3.00

MA 35100 - Elementary Linear Algebra (UCC: QR)

Credit Hours: 3.00. Systems of linear equations, finite dimensional vector spaces, matrices, determinants, eigenvalues and eigenvector applications to analytical geometry. Not open to students with credit in MA 26500.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Solve systems of linear equations using concepts such as vector spaces, linear dependence, and Gaussian elimination. 2. Understand and test for linear independence, calculate the dimension of vector spaces, and apply the rank-nullity theorem in various contexts. 3. Define and apply linear transformations, including matrix multiplication, inverses, LU factorization, and coordinate transformations. 4. Compute and understand determinants, including their use in calculating matrix inverses and practical applications such as volume calculations. 5. Analyze and compute eigenvectors and eigenvalues, and apply diagonalization techniques. Credits: 3.00

MA 41600 - Probability

Credit Hours: 3.00. (STAT 41600) An introduction to mathematical probability suitable as a preparation for actuarial science, statistical theory, and mathematical modeling. General probability rules, conditional probability and Bayes theorem, discrete and continuous random variables, moments and moment generating functions, joint and conditional distributions, standard discrete and continuous distributions and their properties, law of large numbers and central limit theorem.

Credits: 3.00

MA 51800 - Advanced Discrete Mathematics

Credit Hours: 3.00. The course covers mathematics useful in analyzing computer algorithms. Topics include recurrence relations, evaluation of sums, integer functions, elementary number theory, binomial coefficients, generating functions, discrete probability, and asymptotic methods.

Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100,

STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

MA 35301 - Linear Algebra II

Credit Hours: 3.00. Theoretical background for methods and results that appear in MA 35100. Inner products, orthogonality, and applications including least squares.

Learning Outcomes: 1. Perform rigorous proofs using the definitions of vector space, subspace, linear combination of vectors, linear dependence and linear independence, bases and dimension. 2. Perform rigorous proofs using the definitions of linear transformation and the null space and range of a linear transformation. 3. Exhibit a clear understanding of the relationship between composition of linear transformation and matrix multiplication. 4. Understand elementary matrices and their use in describing the solution set of a system of linear equations. 5. Understand that the determinant function on n x n matrices with entries in a field F is a function that may be defined recursively, and may be uniquely defined as an alternating multilinear form which takes the identity matrix to 1. 6. Perform rigorous proofs involving eigenvalues and eigenvectors. 7. Understand and be able to apply conditions for a linear operator on a finite-dimensional vector space to be diagonalizable. 8. Preform calculations with Gram-Schmidt, least squares and related topics. 9. Students should be able to do rigorous proofs involving inner product spaces and related topics. Credits: 3.00

Other Departmental/Program Course Requirements (31-55 credits)

College of Science Additional Requirements

Computing (3-4 credits)

Laboratory Science (6-8 credits)

Mathematics (8-10 credits)

MA 16100 - Plane Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 5.00. Introduction to differential and integral calculus of one variable, with applications. Some schools or departments may allow only 4 credit hours toward graduation for this course. Designed for students who have not had at least a one-semester calculus course in high school, with a grade of "A" or "B". Not open to students with credit in MA 16500 . Demonstrated competence in college algebra and trigonometry.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions Credits: 5.00

MA 16200 - Plane Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 5.00. Continuation of MA 16100 . Vectors in two and three dimensions, techniques of integration, infinite series, conic sections, polar coordinates, surfaces in three dimensions. Some schools or departments may allow only 4 credit hours toward graduation for this course.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 5.00

MA 16500 - Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 4.00. Introduction to differential and integral calculus of one variable, with applications. Conic sections. Designed for students who have had at least a one-semester calculus course in high school, with a grade of "A" or "B", but are not qualified to enter MA 16200 or MA 16600 or the advanced placement courses MA 17300 or the honors calculus course MA 18100. Demonstrated competence in college algebra and trigonometry. CTL:IMA 1602 Calculus - Long I

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems. 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions. Credits: 4.00

MA 16600 - Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 4.00. Continuation of MA 16500 . Vectors in two and three dimensions. Techniques of integration, infinite series, polar coordinates, surfaces in three dimensions. Not open to students with credit in MA 16200 . CTL:IMA 1603 Calculus - Long II

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 4.00

Statistics (3 credits)

STAT 35000 - Introduction To Statistics

Credit Hours: 3.00. This course provides a data-oriented introduction to applied statistics, covering exploratory data analysis, experimental design, probability distributions, simulation, sampling distributions, and the Central Limit Theorem. Students will learn the fundamentals of statistical inference, including confidence intervals and hypothesis tests for population means, paired and independent comparisons of means, analysis of variance, and regression. The course emphasizes hands-on experience with statistical software and is primarily intended for students majoring in the mathematical sciences. Prerequisite: two semesters of college calculus.

Learning Outcomes: 1. Understand basic terms, graphs, and symbols and be able to interpret statistics in the media. 2. Understand and be able to explain statistical processes and be able to fully interpret statistical results. 3. Understand why and how statistical investigations are conducted and the "big ideas" that underlie statistical investigations. 4. Be able to use a statistical package (R or SAS) to analyze data and interpret result. 5. Big Ideas in Statistics: variability, distributions, and models; causation vs correlation; practical significance vs statistical significance, etc. Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

Electives (5-31 credits)

Grade Requirements

GPA Requirements

Course Requirements & Notes

Sample 4-Year Plan

Fall 1st Year

CS 18000 - Problem Solving And Object-Oriented Programming

Credit Hours: 4.00. Problem solving and algorithms, implementation of algorithms in a high level programming language, conditionals, the iterative approach and debugging, collections of data, searching and sorting, solving problems by decomposition, the object-oriented approach, subclasses of existing classes, handling exceptions that occur when the program is running, graphical user interfaces (GUIs), data stored in files, abstract data types, a glimpse at topics from other CS courses. Intended primarily for students majoring in

computer sciences. Credit cannot be obtained for both CS 18000 and any of 15600, 15800 and 15900. Not open to students with credit in CS 24000.

Learning Outcomes: 1. Understand solving problems by analyzing the problem, designing an algorithm, and programming the solution. Credits: 4.00

MA 16100 - Plane Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 5.00. Introduction to differential and integral calculus of one variable, with applications. Some schools or departments may allow only 4 credit hours toward graduation for this course. Designed for students who have not had at least a one-semester calculus course in high school, with a grade of "A" or "B". Not open to students with credit in MA 16500 . Demonstrated competence in college algebra and trigonometry.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions Credits: 5.00

MA 16500 - Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 4.00. Introduction to differential and integral calculus of one variable, with applications. Conic sections. Designed for students who have had at least a one-semester calculus course in high school, with a grade of "A" or "B", but are not qualified to enter MA 16200 or MA 16600 or the advanced placement courses MA 17300 or the honors calculus course MA 18100. Demonstrated competence in college algebra and trigonometry. CTL:IMA 1602 Calculus - Long I

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems. 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions. Credits: 4.00

15-17 Credits

Spring 1st Year

CS 18200 - Foundations Of Computer Science

Credit Hours: 3.00. Logic and proofs; sets, functions, relations, sequences and summations; number representations; counting; fundamentals of the analysis of algorithms; graphs and trees; proof techniques; recursion; Boolean logic; finite state machines; pushdown automata; computability and undecidability.

Learning Outcomes: 1. Understand discrete mathematical tools, facts, and reasoning relevant to computer science. Credits: 3.00

CS 24000 - Programming In C

Credit Hours: 3.00. The UNIX environment, C development cycle, data representation, operators, program structure, recursion, macros, C preprocessor, pointers and addresses, dynamic memory allocation, structures, unions, typedef, bit-fields, pointer/structure applications, UNIX file abstraction, file access, low-level I/O, concurrency.

Learning Outcomes: 1. Understand programming principles and techniques for problem solving in the C programming language. Credits: 3.00

MA 16200 - Plane Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 5.00. Continuation of MA 16100 . Vectors in two and three dimensions, techniques of integration, infinite series, conic sections, polar coordinates, surfaces in three dimensions. Some schools or departments may allow only 4 credit hours toward graduation for this course.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute

areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 5.00

MA 16600 - Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 4.00. Continuation of MA 16500 . Vectors in two and three dimensions. Techniques of integration, infinite series, polar coordinates, surfaces in three dimensions. Not open to students with credit in MA 16200 . CTL:IMA 1603 Calculus - Long II

University Core Curriculum (UCC): (UCC: QR)
Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 4.00

15-17 Credits

Fall 2nd Year

CS 25000 - Computer Architecture

Credit Hours: 4.00. Digital logic: transistors, gates, and combinatorial circuits; clocks; registers and register banks; arithmetic-logic units; data representation: big-endian and little-endian integers; ones and twos complement arithmetic; signed and unsigned values; Von-Neumann architecture and bottleneck; instruction sets; RISC and CISC designs; instruction pipelines and stalls; rearranging code; memory and address spaces; physical and virtual memory; interleaving; page tables; memory caches; bus architecture; polling and interrupts; DMA; device programming; assembly language; optimizations; parallelism; data pipelining.

Learning Outcomes: 1. Students understand the function of basic hardware, including fundamentals of digital logic, processors, memory, and I/O. Credits: 4.00

CS 25100 - Data Structures And Algorithms

Credit Hours: 3.00. Running time analysis of algorithms and their implementations, one-dimensional data structures, trees, heaps, additional sorting algorithms, binary search trees, hash tables, graphs, directed graphs, weighted graph algorithms, additional topics.

Learning Outcomes: 1. Understand fundamental data structures, fundamental algorithms, and their implementation. Credits: 3.00

MA 26100 - Multivariate Calculus (UCC: QR)

Credit Hours: 4.00. Planes, lines, and curves in three dimensions. Differential calculus of several variables; multiple integrals. Introduction to vector calculus. Not open to students with credit in MA 17400 or 27100.

University Core Curriculum (UCC): (UCC: QR)
Learning Outcomes: 1. Know the equations for lines, planes and quadric surfaces in three dimensional space, and understand how these equations relate to the geometry. 2. Understand the relationship between vector functions and parametrized motion; know how to calculate velocity, acceleration, arc length and curvature. 3. Know the meaning of partial derivatives and how to calculate them. Know the multivariable

chain rule. 4. Know the meaning of the gradient, how to calculate it, and how to apply it to directional derivatives and maximum and minimum values. 5. Understand the meaning of double and triple integrals; know how to compute them and how to apply them. 6. Understand the meaning of vector fields and line integrals. Know Green's theorem and be able to apply it. 7. Understand the meaning of surface integrals and know how to calculate them. Know Stokes' theorem and be able to apply it. Credits: 4.00

MA 27101 - Honors Multivariate Calculus (UCC: QR)

Credit Hours: 5.00. This course is the Honors version of MA 26100, Multivariate Calculus; it will also include a review of infinite series. The course is intended for first-year students who have credit for Calculus I and II. There will be a significant emphasis on conceptual explanation, but not on formal proof. Permission of department is required.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Know techniques of vector algebra and be able to apply these to the geometry of space; in particular they will be able to find equations for lines and planes in space. 2. Find equations for standard surfaces in space. 3. Use vector methods to analyze motion in space, and calculate arc length and curvature. 4. Acquire a conceptual and computational knowledge of infinite series; in particular they will be able to test for convergence, and to do calculations with power series. 5. Understand the meaning of partial derivatives in various situations, and will be able to calculate with them. 6. Know the multivariable chain rule and its meaning, and will be able to apply it to calculate derivatives in various situations. 7. Know the meaning of directional derivatives and how to calculate them. 8. Find tangent planes. 9. Find and classify extreme values and saddle points and use the method of Lagrange multipliers. 10. Know the meaning of multiple integrals and how to calculate them. 11. Know the meaning of line integrals and surface integrals and how to calculate them. 12. Know Green's theorem, Stokes' theorem, and the divergence theorem and their applications. Credits: 5.00

15-17 Credits

Spring 2nd Year

CS 25200 - Systems Programming

Credit Hours: 4.00. Low-level programming; review of addresses, pointers, memory layout, and data representation; text, data, and bss segments; debugging and hex dumps; concurrent execution with threads and processes; address spaces; file names; descriptors and file pointers; inheritance; system calls and library functions; standard I/O and string libraries; simplified socket programming; building tools to help programmers; make and make files; shell scripts and quoting; Unix tools including sed, echo, test, and find; scripting languages such as awk; version control; object and executable files (.o and a.out); symbol tables; pointers to functions; hierarchical directories; and DNS hierarchy; programming embedded systems.

Learning Outcomes: 1. Have an appreciation and ability for low-level (systems) programming and debugging. Credits: 4.00

MA 35100 - Elementary Linear Algebra (UCC: QR)

Credit Hours: 3.00. Systems of linear equations, finite dimensional vector spaces, matrices, determinants, eigenvalues and eigenvector applications to analytical geometry. Not open to students with credit in MA 26500.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Solve systems of linear equations using concepts such as vector spaces, linear dependence, and Gaussian elimination. 2. Understand and test for linear independence, calculate the dimension of vector spaces, and apply the rank-nullity theorem in various contexts. 3. Define and apply linear transformations, including matrix multiplication, inverses, LU factorization, and coordinate transformations. 4. Compute and

understand determinants, including their use in calculating matrix inverses and practical applications such as volume calculations. 5. Analyze and compute eigenvectors and eigenvalues, and apply diagonalization techniques. Credits: 3.00

16-17 Credits

Fall 3rd Year

MA 35100 - Elementary Linear Algebra (UCC: QR)

Credit Hours: 3.00. Systems of linear equations, finite dimensional vector spaces, matrices, determinants, eigenvalues and eigenvector applications to analytical geometry. Not open to students with credit in MA 26500.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Solve systems of linear equations using concepts such as vector spaces, linear dependence, and Gaussian elimination. 2. Understand and test for linear independence, calculate the dimension of vector spaces, and apply the rank-nullity theorem in various contexts. 3. Define and apply linear transformations, including matrix multiplication, inverses, LU factorization, and coordinate transformations. 4. Compute and understand determinants, including their use in calculating matrix inverses and practical applications such as volume calculations. 5. Analyze and compute eigenvectors and eigenvalues, and apply diagonalization techniques. Credits: 3.00

MA 41600 - Probability

Credit Hours: 3.00. (STAT 41600) An introduction to mathematical probability suitable as a preparation for actuarial science, statistical theory, and mathematical modeling. General probability rules, conditional probability and Bayes theorem, discrete and continuous random variables, moments and moment generating functions, joint and conditional distributions, standard discrete and continuous distributions and their properties, law of large numbers and central limit theorem.

Credits: 3.00

STAT 35000 - Introduction To Statistics

Credit Hours: 3.00. This course provides a data-oriented introduction to applied statistics, covering exploratory data analysis, experimental design, probability distributions, simulation, sampling distributions, and the Central Limit Theorem. Students will learn the fundamentals of statistical inference, including confidence intervals and hypothesis tests for population means, paired and independent comparisons of means, analysis of variance, and regression. The course emphasizes hands-on experience with statistical software and is primarily intended for students majoring in the mathematical sciences. Prerequisite: two semesters of college calculus.

Learning Outcomes: 1. Understand basic terms, graphs, and symbols and be able to interpret statistics in the media. 2. Understand and be able to explain statistical processes and be able to fully interpret statistical results. 3. Understand why and how statistical investigations are conducted and the "big ideas" that underlie statistical investigations. 4. Be able to use a statistical package (R or SAS) to analyze data and interpret result. 5. Big Ideas in Statistics: variability, distributions, and models; causation vs correlation; practical significance vs statistical significance, etc. Credits: 3.00

MA 51800 - Advanced Discrete Mathematics

Credit Hours: 3.00. The course covers mathematics useful in analyzing computer algorithms. Topics include recurrence relations, evaluation of sums, integer functions, elementary number theory, binomial coefficients, generating functions, discrete probability, and asymptotic methods.

Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the

difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

MA 35301 - Linear Algebra II

Credit Hours: 3.00. Theoretical background for methods and results that appear in MA 35100. Inner products, orthogonality, and applications including least squares.

Learning Outcomes: 1. Perform rigorous proofs using the definitions of vector space, subspace, linear combination of vectors, linear dependence and linear independence, bases and dimension. 2. Perform rigorous proofs using the definitions of linear transformation and the null space and range of a linear transformation. 3. Exhibit a clear understanding of the relationship between composition of linear transformation and matrix multiplication. 4. Understand elementary matrices and their use in describing the solution set of a system of linear equations. 5. Understand that the determinant function on n x n matrices with entries in a field F is a function that may be defined recursively, and may be uniquely defined as an alternating multilinear form which takes the identity matrix to 1. 6. Perform rigorous proofs involving eigenvalues and eigenvectors. 7. Understand and be able to apply conditions for a linear operator on a finite-dimensional vector space to be diagonalizable. 8. Preform calculations with Gram-Schmidt, least squares and related topics. 9. Students should be able to do rigorous proofs involving inner product spaces and related topics. Credits: 3.00

16-17 Credits

Spring 3rd Year

15-16 Credits

Fall 4th Year

CS 39700 - Honors Seminar

Credit Hours: 0.00. A seminar for all sophomores, juniors, and seniors in the Computer Sciences Honors Program. Meets eight times each semester under the supervision of the Honors coordinator. The meetings focus on honors research projects, helping students to identify appropriate projects and form groups, and providing a forum for juniors and seniors to report on their projects as required in the honors program.

Credits: 0.00

15-17 Credits

Spring 4th Year

CS 49700 - Honors Research Project

Credit Hours: 3.00. One semester of the project may be counted as one of the seven computer science courses at or above the 300 level required for the bachelor's degree. One

more semester, if approved by the honors coordinator, can be used as a free elective. A group research project directed by Computer Sciences faculty members. Each group must submit a technical report describing its work and the results obtained. Credits: 3.00

15-17 Credits

Computer Science Honors: Programming Language, BS

About the Program

Degree Requirements

Computer Science Honors Major Courses (58-60 credits)

Required CS Honors Major Math Courses (7-8 credits)

MA 26100 - Multivariate Calculus (UCC: QR)

Credit Hours: 4.00. Planes, lines, and curves in three dimensions. Differential calculus of several variables; multiple integrals. Introduction to vector calculus. Not open to students with credit in MA 17400 or 27100.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Know the equations for lines, planes and quadric surfaces in three dimensional space, and understand how these equations relate to the geometry. 2. Understand the relationship between vector functions and parametrized motion; know how to calculate velocity, acceleration, arc length and curvature. 3. Know the meaning of partial derivatives and how to calculate them. Know the multivariable chain rule. 4. Know the meaning of the gradient, how to calculate it, and how to apply it to directional derivatives and maximum and minimum values. 5. Understand the meaning of double and triple integrals; know how to compute them and how to apply them. 6. Understand the meaning of vector fields and line integrals. Know Green's theorem and be able to apply it. 7. Understand the meaning of surface integrals and know how to calculate them. Know Stokes' theorem and be able to apply it. Credits: 4.00

MA 35100 - Elementary Linear Algebra (UCC: QR)

Credit Hours: 3.00. Systems of linear equations, finite dimensional vector spaces, matrices, determinants, eigenvalues and eigenvector applications to analytical geometry. Not open to students with credit in MA 26500.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Solve systems of linear equations using concepts such as vector spaces, linear dependence, and Gaussian elimination. 2. Understand and test for linear independence, calculate the dimension of vector spaces, and apply the rank-nullity theorem in various contexts. 3. Define and apply linear transformations, including matrix multiplication, inverses, LU factorization, and coordinate transformations. 4. Compute and understand determinants, including their use in calculating matrix inverses and practical applications such as volume calculations. 5. Analyze and compute eigenvectors and eigenvalues, and apply diagonalization techniques. Credits: 3.00

MA 27101 - Honors Multivariate Calculus (UCC: QR)

Credit Hours: 5.00. This course is the Honors version of MA 26100, Multivariate Calculus; it will also include a review of infinite series. The course is intended for first-year students who have credit for Calculus I and II. There will be a significant emphasis on conceptual explanation, but not on formal proof. Permission of department is required.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Know techniques of vector algebra and be able to apply these to the geometry of space; in particular they will be able to find equations for lines and planes in space. 2. Find equations for standard surfaces in

space. 3. Use vector methods to analyze motion in space, and calculate arc length and curvature. 4. Acquire a conceptual and computational knowledge of infinite series; in particular they will be able to test for convergence, and to do calculations with power series. 5. Understand the meaning of partial derivatives in various situations, and will be able to calculate with them. 6. Know the multivariable chain rule and its meaning, and will be able to apply it to calculate derivatives in various situations. 7. Know the meaning of directional derivatives and how to calculate them. 8. Find tangent planes. 9. Find and classify extreme values and saddle points and use the method of Lagrange multipliers. 10. Know the meaning of multiple integrals and how to calculate them. 11. Know the meaning of line integrals and surface integrals and how to calculate them. 12. Know Green's theorem, Stokes' theorem, and the divergence theorem and their applications. Credits: 5.00

Required CS Major Core Courses (21 credits)

CS 18000 - Problem Solving And Object-Oriented Programming

Credit Hours: 4.00. Problem solving and algorithms, implementation of algorithms in a high level programming language, conditionals, the iterative approach and debugging, collections of data, searching and sorting, solving problems by decomposition, the object-oriented approach, subclasses of existing classes, handling exceptions that occur when the program is running, graphical user interfaces (GUIs), data stored in files, abstract data types, a glimpse at topics from other CS courses. Intended primarily for students majoring in computer sciences. Credit cannot be obtained for both CS 18000 and any of 15600, 15800 and 15900. Not open to students with credit in CS 24000.

Learning Outcomes: 1. Understand solving problems by analyzing the problem, designing an algorithm, and programming the solution. Credits: 4.00

CS 18200 - Foundations Of Computer Science

Credit Hours: 3.00. Logic and proofs; sets, functions, relations, sequences and summations; number representations; counting; fundamentals of the analysis of algorithms; graphs and trees; proof techniques; recursion; Boolean logic; finite state machines; pushdown automata; computability and undecidability.

Learning Outcomes: 1. Understand discrete mathematical tools, facts, and reasoning relevant to computer science. Credits: 3.00

CS 24000 - Programming In C

Credit Hours: 3.00. The UNIX environment, C development cycle, data representation, operators, program structure, recursion, macros, C preprocessor, pointers and addresses, dynamic memory allocation, structures, unions, typedef, bit-fields, pointer/structure applications, UNIX file abstraction, file access, low-level I/O, concurrency.

Learning Outcomes: 1. Understand programming principles and techniques for problem solving in the C programming language. Credits: 3.00

CS 25000 - Computer Architecture

Credit Hours: 4.00. Digital logic: transistors, gates, and combinatorial circuits; clocks; registers and register banks; arithmetic-logic units; data representation: big-endian and little-endian integers; ones and twos complement arithmetic; signed and unsigned values; Von-Neumann architecture and bottleneck; instruction sets; RISC and CISC designs; instruction pipelines and stalls; rearranging code; memory and address spaces; physical and virtual memory; interleaving; page tables; memory caches; bus architecture; polling and interrupts; DMA; device programming; assembly language; optimizations; parallelism; data pipelining.

Learning Outcomes: 1. Students understand the function of basic hardware, including fundamentals of digital logic, processors, memory, and I/O. Credits: 4.00

CS 25100 - Data Structures And Algorithms

Credit Hours: 3.00. Running time analysis of algorithms and their implementations, one-dimensional data structures, trees, heaps, additional sorting algorithms, binary search trees, hash tables, graphs, directed graphs, weighted graph algorithms, additional topics.

Learning Outcomes: 1. Understand fundamental

data structures, fundamental algorithms, and their implementation. Credits: 3.00

CS 25200 - Systems Programming

Credit Hours: 4.00. Low-level programming; review of addresses, pointers, memory layout, and data representation; text, data, and bss segments; debugging and hex dumps; concurrent execution with threads and processes; address spaces; file names; descriptors and file pointers; inheritance; system calls and library functions; standard I/O and string libraries; simplified socket programming; building tools to help programmers; make and make files; shell scripts and quoting; Unix tools including sed, echo, test, and find; scripting languages such as awk; version control; object and executable files (.o and a.out); symbol tables; pointers to functions; hierarchical directories; and DNS hierarchy; programming embedded systems.

Learning Outcomes: 1. Have an appreciation and ability for low-level (systems) programming and debugging. Credits: 4.00

Programming Language Concentration (18 credits)

Required Courses

CS 35200 - Compilers: Principles And Practice

Credit Hours: 3.00. Should not be taken concurrently with CS 35400. The theory and practice of programming language translation, compilation, and run-time systems, organized around a significant programming project to build a compiler for a simple but nontrivial programming language. Modules, interfaces, tools. Data structures for tree languages. Lexical analysis, syntax analysis, abstract syntax. Symbol tables, semantic analysis. Translation, intermediate code, basic blocks, traces. Instruction selection, CISC and RISC machines. Liveness analysis, graph coloring register allocation. Supplemental material drawn from garbage collection, object-oriented languages, higher-order languages, dataflow analysis, optimization, polymorphism, scheduling and pipelining, memory hierarchies.

Learning Outcomes: 1. Provides students with an understanding of how a computer program is converted into elementary code that causes the computer to produce the output intended by the programmer. Credits: 3.00

CS 35400 - Operating Systems

Credit Hours: 3.00. Should not be taken concurrently with CS 35200. Introduction to operating systems. Computer system and operating system architectures, processes, inter-process communication, inter-process synchronization, mutual exclusion, deadlocks, memory hierarchy, virtual memory, CPU scheduling, file systems, I/O device management, security.

Learning Outcomes: 1. Provides students with an understanding of the fundamentals of computer operating systems. Credits: 3.00

CS 45600 - Programming Languages

Credit Hours: 3.00. Concepts for structuring data, computation, and whole programs. Object-oriented languages, functional languages, logic- and rule-based languages. Data types, type checking, exception handling, concurrent processes, synchronization, modularity, encapsulation, interfaces, separate compilation, inheritance, polymorphism, dynamic binding, subtyping, overloading, beta-reduction, unification.

Credits: 3.00

Selectives

CS 30700 - Software Engineering I

Credit Hours: 3.00. An introduction to the methods and tools of software engineering; software life cycle; specification and design of software, software testing, cost and effort estimation; laboratory exercises with design, testing, and other tools.

Learning Outcomes: 1. Architect and design quality software. 2. Contrast and critique software lifecycle models. 3. Create software using current software engineering tools, methods, and concepts. 4. Work together on a team in a productive and professional manner. 5. Inspect and test software and documentation. Credits: 3.00

CS 34800 - Information Systems

Credit Hours: 3.00. File organization and index structures; object-oriented database languages; the relational database model with introductions to SQL and DBMS; hierarchical models and network models with introductions to HDDL, HDML, and DBTG Codasyl; data mining; data warehousing; database connectivity; distributed databases; the client/server paradigm; middleware, including ODBC, JDBC, CORBA, and MOM.

Learning Outcomes: 1. Learn about different data models (relational, graph, and document) used in different database systems. 2. Learn how to pose complex database queries in SQL and NoSQL languages as well as theoretical query languages. 3. Gain an introductory background in indexing. 4. Learn about transactions and concurrency control. 5. Differentiate between OLTP and OLAP applications. Credits: 3.00

CS 35300 - Principles Of Concurrency And Parallelism

Credit Hours: 3.00. Important concepts, models, algorithms, abstractions, and implementation aspects of concurrent and parallel programs. Topics include: techniques used to describe concurrent programs (e.g., threads, events, co-routines, continuations), abstractions for shared-memory and message-passing programs, relaxed memory models, livelock and deadlock detection, lock-free algorithms, data races and atomicity, scheduling techniques, process calculi, and software transactions.

Learning Outcomes: 1. This course provides students the vocabulary and concepts to better understand how to design and program scalable multicore processors. Credits: 3.00

CS 38100 - Introduction To The Analysis Of Algorithms

Credit Hours: 3.00. Techniques for analyzing the time and space requirements of algorithms. Application of these techniques to sorting, searching, pattern-matching, graph problems, and other selected problems. Brief introduction to the intractable (NP-hard) problems.

Learning Outcomes: 1. Use big O-notation to give asymptotic time and space bounds of algorithms. 2. Explain the use of big-Omega, big-Theta, and little-o notations. 3. Use recurrence relations to determine the time complexity of recursive algorithms. 4. Solve recurrence relations commonly arising in algorithm design. 5. Give examples that illustrate time-space trade-offs of algorithms. Credits: 3.00

CS 40800 - Software Testing

Credit Hours: 3.00. Preliminaries: errors and testing; software quality, requirements, behavior, and correctness; testing, debugging, verification; control flow graphs, dominators; types of testing; Test selection: from requirements, finite state models, and combinatorial designs; regression testing and test minimization; Test adequacy assessment: control and data flow; mutation based; testing tools.

Learning Outcomes: 1. Understand the basic technology related to software testing and debugging. 2. Differentiate between reliability and correctness. 3. Understand the impact of the saturation effect on the test process and its cost. 4. Understand the relationship between software development and test processes. 5. Apply a variety of black box test generation methods manually and using tools. 6. Use test adequacy criteria and understand their respective cost and effectiveness. 7. Select appropriate software test tools for a given testing task. Credits: 3.00

CS 42600 - Computer Security

Credit Hours: 3.00. A survey of the fundamentals of information security. Risks and vulnerabilities, policy formation, controls and protection methods, database security, encryption, authentication technologies, host-based and network-based security issues, personnel and physical security issues, issues of law and privacy.

Learning Outcomes: 1. Apply the notions of threat, vulnerability, attack, countermeasure, security objectives, and adversarial models when analyzing security of computer and information systems. 2. Explain the main authorization mechanisms and access control models, and their applicability in different situations. 3. Explain security issues related to password and other authentication mechanisms. 4. Explain the different types of malware, the mechanisms of their propagation, and the strengths and limitations of different defense mechanisms. 5. Identify the threats and vulnerabilities for a networked environment, and explain different countermeasures, and their effectiveness. 6. Explain the vulnerabilities brought about by modern web-based

application and services, different countermeasures, and their effectiveness.
Credits: 3.00

CS 44800 - Introduction To Relational Database Systems

Credit Hours: 3.00. An in-depth examination of relational database systems including theory and concepts as well as practical issues in relational databases. Modern database technologies such as object-relational and Web-based access to relational databases. Conceptual design and entity relationship modeling, relational algebra and calculus, data definition and manipulation languages using SQL, schema and view management, query processing and optimization, transaction management, security, privacy, integrity management.

Learning Outcomes: 1. Learn data modeling: physical, logical and conceptual data models, the entity-relationship model. 2. Study logical and Physical Design and interaction with operating systems, disk Storage, Basic File Structures, Hashing, Indexing. 3. Learn the relational database model and implementation and performance issues. 4. Understand transaction Processing, concurrency control, atomicity control and recovery control. 5. Understand database privacy, integrity, and security. 6. Understand data mining, data warehousing, online analytical processing, and information retrieval. 7. Understand Cloud computing and Distributed Database Systems architectures, Big Data, Hadoop, MapReduce, and NoSQL. 8. Recognize performance issues.
Credits: 3.00

CS 48300 - Introduction To The Theory Of Computation

Credit Hours: 3.00. Turing machines and the Church-Turing thesis; decidability; halting problem; reducibility; undecidable problems; decidability of logical theories; Kolmogorov complexity; time classes; P, NP, NP-complete; space classes; Savitch's theorem, PSPACE-completeness, NL-completeness; hierarchy theorems; approximation theorems; probabilistic algorithms; applications of complexity to parallel computation and cryptography.

Credits: 3.00

MA 38500 - Introduction To Logic

Credit Hours: 3.00. Propositional calculus and predicate calculus with applications to mathematical proofs, valid arguments, switching theory, and formal languages.

Credits: 3.00

CS 56000 - Reasoning About Programs

Credit Hours: 3.00. The course focuses on the logical foundations and algorithmic techniques used to ensure program correctness. With an emphasis on automated program verification and synthesis, the course covers classical concepts and techniques such as Hoare logic, abstract interpretation, abstraction-refinement and bounded model checking. The course also exposes students to approaches for program synthesis, a new frontier for program reasoning, such as inductive synthesis, synthesis using version space algebras, constraint-based synthesis and synthesis based on machine-learning techniques. The courses emphasizes both theoretical foundations as well as hands-on experience with verification/synthesis tools and SAT/SMT solvers. Students are expected to have completed undergraduate coursework in Foundations of Computer Science (CS 18200) or equivalent, Systems Programming (CS 25200) or equivalent, and Introduction to the Analysis of Algorithms (CS 38100) or equivalent. Mathematical maturity is expected.

Learning Outcomes: 1. Express the expected behavior of programs in logic. 2. Able to manually reason about satisfiability and validity of formulas in first-order logic (modulo theories). 3. Use SAT/SMT solvers to check satisfiability and validity of formulas in first-order logic (modulo theories). 4. Specify properties of programs using pre/postconditions, safety properties and assertions in first-order logic (modulo theories). 5. Describe and apply core approaches for program verification. 6. Explain and apply Hoare logic, invariant generation, abstract interpretation, abstraction-refinement, and bounded model checking. 7. Ability to verify programs using tools such as Dafny and the Z3 SMT solver. 8. Conduct original research in program synthesis. 9. Explain and apply inductive synthesis and functional synthesis, different search techniques (enumerative, explicit, constraint-based), and some recent

approaches based on machine learning. 10. Choose and apply appropriate synthesis techniques to a problem domain of their choice. 11. Ability to critically review and present current research in program synthesis. Credits: 3.00

MA 45300 - Elements Of Algebra I

Credit Hours: 3.00. Fundamental properties of integers, polynomials, groups, rings, and fields, with emphasis on problem solving and applications. Not open to students with credit in MA 45000.

Learning Outcomes: 1. Demonstrate knowledge of: divisibility properties of integers and polynomials, structure theory of groups and examples of groups, structure theory of rings and examples of rings, basic theory of fields. 2. Demonstrate knowledge of the proofs of facts covered in the course. Credits: 3.00

Concentration Notes

Required CS Honors (12-13 credits)

CS 39700 - Honors Seminar

Credit Hours: 0.00. A seminar for all sophomores, juniors, and seniors in the Computer Sciences Honors Program. Meets eight times each semester under the supervision of the Honors coordinator. The meetings focus on honors research projects, helping students to identify appropriate projects and form groups, and providing a forum for juniors and seniors to report on their projects as required in the honors program.

Credits: 0.00

CS 49700 - Honors Research Project

Credit Hours: 3.00. One semester of the project may be counted as one of the seven computer science courses at or above the 300 level required for the bachelor's degree. One more semester, if approved by the honors coordinator, can be used as a free elective. A group research project directed by Computer Sciences faculty members. Each group must submit a technical report describing its work and the results obtained.

Credits: 3.00

MA 35100 - Elementary Linear Algebra (UCC: QR)

Credit Hours: 3.00. Systems of linear equations, finite dimensional vector spaces, matrices, determinants, eigenvalues and eigenvector applications to analytical geometry. Not open to students with credit in MA 26500.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Solve systems of linear equations using concepts such as vector spaces, linear dependence, and Gaussian elimination. 2. Understand and test for linear independence, calculate the dimension of vector spaces, and apply the rank-nullity theorem in various contexts. 3. Define and apply linear transformations, including matrix multiplication, inverses, LU factorization, and coordinate transformations. 4. Compute and understand determinants, including their use in calculating matrix inverses and practical applications such as volume calculations. 5. Analyze and compute eigenvectors and eigenvalues, and apply diagonalization techniques. Credits: 3.00

MA 41600 - Probability

Credit Hours: 3.00. (STAT 41600) An introduction to mathematical probability suitable as a preparation for actuarial science, statistical theory, and mathematical modeling. General probability rules, conditional probability and Bayes theorem, discrete and continuous random variables, moments and moment generating functions, joint and conditional distributions, standard discrete and continuous distributions and their properties, law of large numbers and central limit theorem.

Credits: 3.00

MA 51800 - Advanced Discrete Mathematics

Credit Hours: 3.00. The course covers mathematics useful in analyzing computer algorithms. Topics include recurrence relations, evaluation of sums, integer functions, elementary number theory, binomial coefficients, generating functions, discrete probability, and asymptotic methods.

Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing

hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

MA 35301 - Linear Algebra II

Credit Hours: 3.00. Theoretical background for methods and results that appear in MA 35100. Inner products, orthogonality, and applications including least squares.

Learning Outcomes: 1. Perform rigorous proofs using the definitions of vector space, subspace, linear combination of vectors, linear dependence and linear independence, bases and dimension. 2. Perform rigorous proofs using the definitions of linear transformation and the null space and range of a linear transformation. 3. Exhibit a clear understanding of the relationship between composition of linear transformation and matrix multiplication. 4. Understand elementary matrices and their use in describing the solution set of a system of linear equations. 5. Understand that the determinant function on n x n matrices with entries in a field F is a function that may be defined recursively, and may be uniquely defined as an alternating multilinear form which takes the identity matrix to 1. 6. Perform rigorous proofs involving eigenvalues and eigenvectors. 7. Understand and be able to apply conditions for a linear operator on a finite-dimensional vector space to be diagonalizable. 8. Preform calculations with Gram-Schmidt, least squares and related topics. 9. Students should be able to do rigorous proofs involving inner product spaces and related topics. Credits: 3.00

Other Departmental/Program Course Requirements (31-55 credits)

Additional College of Science Requirements

Computing (3-4 credits)

Laboratory Science (6-8 credits)

Mathematics (8-10 credits)

MA 16100 - Plane Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 5.00. Introduction to differential and integral calculus of one variable, with applications. Some schools or departments may allow only 4 credit hours toward graduation for this course. Designed for students who have not had at least a one-semester calculus course in high school, with a grade of "A" or "B". Not open to students with credit in MA 16500 .

Demonstrated competence in college algebra and trigonometry.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions Credits: 5.00

MA 16200 - Plane Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 5.00. Continuation of MA 16100 . Vectors in two and three dimensions, techniques of integration, infinite series, conic sections, polar coordinates, surfaces in three dimensions. Some schools or departments may allow only 4 credit hours toward graduation for this course.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 5.00

MA 16500 - Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 4.00. Introduction to differential and integral calculus of one variable, with applications. Conic sections. Designed for students who have had at least a one-semester calculus course in high school, with a grade of "A" or "B", but are not qualified to enter MA 16200 or MA 16600 or the advanced placement courses MA 17300 or the honors calculus course MA 18100. Demonstrated competence in college algebra and trigonometry. CTL:IMA 1602 Calculus - Long I

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems. 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions. Credits: 4.00

MA 16600 - Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 4.00. Continuation of MA 16500 . Vectors in two and three dimensions. Techniques of integration, infinite series, polar coordinates, surfaces in three dimensions. Not open to students with credit in MA 16200 . CTL:IMA 1603 Calculus - Long II

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 4.00

Statistics (3 credits)

STAT 35000 - Introduction To Statistics

Credit Hours: 3.00. This course provides a data-oriented introduction to applied statistics, covering exploratory data analysis, experimental design, probability distributions, simulation, sampling distributions, and the Central Limit Theorem. Students will learn the fundamentals of statistical inference, including confidence intervals and hypothesis tests for population means, paired and independent comparisons of means, analysis of variance, and regression. The course emphasizes hands-on experience with statistical software and is primarily intended for students majoring in the mathematical sciences. Prerequisite: two semesters of college calculus.

Learning Outcomes: 1. Understand basic terms, graphs, and symbols and be able to interpret statistics in the media. 2. Understand and be able to explain statistical processes and be able to fully interpret statistical results. 3. Understand why and how statistical investigations are conducted and the "big ideas" that underlie statistical investigations. 4. Be able to use a statistical package (R or SAS) to analyze data and interpret result. 5. Big Ideas in Statistics: variability, distributions, and models; causation vs correlation; practical significance vs statistical significance, etc. Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

Electives (5-31 credits)

Grade Requirements

GPA Requirements

Course Requirements & Notes

Sample 4-Year Plan

Fall 1st Year

CS 18000 - Problem Solving And Object-Oriented Programming

Credit Hours: 4.00. Problem solving and algorithms, implementation of algorithms in a high level programming language, conditionals, the iterative approach and debugging, collections of data, searching and sorting, solving problems by decomposition, the object-oriented approach, subclasses of existing classes, handling exceptions that occur when the program is running, graphical user interfaces (GUIs), data

stored in files, abstract data types, a glimpse at topics from other CS courses. Intended primarily for students majoring in computer sciences. Credit cannot be obtained for both CS 18000 and any of 15600, 15800 and 15900. Not open to students with credit in CS 24000.

Learning Outcomes: 1. Understand solving problems by analyzing the problem, designing an algorithm, and programming the solution. Credits: 4.00

MA 16100 - Plane Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 5.00. Introduction to differential and integral calculus of one variable, with applications. Some schools or departments may allow only 4 credit hours toward graduation for this course. Designed for students who have not had at least a one-semester calculus course in high school, with a grade of "A" or "B". Not open to students with credit in MA 16500 . Demonstrated competence in college algebra and trigonometry.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions Credits: 5.00

MA 16500 - Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 4.00. Introduction to differential and integral calculus of one variable, with applications. Conic sections. Designed for students who have had at least a one-semester calculus course in high school, with a grade of "A" or "B", but are not qualified to enter MA 16200 or MA 16600 or the advanced placement courses MA 17300 or the honors calculus course MA 18100. Demonstrated competence in college algebra and trigonometry. CTL:IMA 1602 Calculus - Long I

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems. 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions. Credits: 4.00

15-17 Credits

Spring 1st Year

CS 18200 - Foundations Of Computer Science

Credit Hours: 3.00. Logic and proofs; sets, functions, relations, sequences and summations; number representations; counting; fundamentals of the analysis of algorithms; graphs and trees; proof techniques; recursion; Boolean logic; finite state machines; pushdown automata; computability and undecidability.

Learning Outcomes: 1. Understand discrete mathematical tools, facts, and reasoning relevant to computer science. Credits: 3.00

CS 24000 - Programming In C

Credit Hours: 3.00. The UNIX environment, C development cycle, data representation, operators, program structure, recursion, macros, C preprocessor, pointers and addresses, dynamic memory allocation, structures, unions, typedef, bit-fields, pointer/structure applications, UNIX file abstraction, file access, low-level I/O, concurrency.

Learning Outcomes: 1. Understand programming principles and techniques for problem solving in the C programming language. Credits: 3.00

MA 16200 - Plane Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 5.00. Continuation of MA 16100 . Vectors in two and three dimensions, techniques of integration, infinite series, conic sections, polar coordinates, surfaces in three dimensions. Some schools or departments may allow only 4 credit hours toward graduation for this course.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric

substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 5.00

MA 16600 - Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 4.00. Continuation of MA 16500 . Vectors in two and three dimensions. Techniques of integration, infinite series, polar coordinates, surfaces in three dimensions. Not open to students with credit in MA 16200 . CTL:IMA 1603 Calculus - Long II

University Core Curriculum (UCC): (UCC: QR)
Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 4.00

15-17 Credits

Fall 2nd Year

CS 25000 - Computer Architecture

Credit Hours: 4.00. Digital logic: transistors, gates, and combinatorial circuits; clocks; registers and register banks; arithmetic-logic units; data representation: big-endian and little-endian integers; ones and twos complement arithmetic; signed and unsigned values; Von-Neumann architecture and bottleneck; instruction sets; RISC and CISC designs; instruction pipelines and stalls; rearranging code; memory and address spaces; physical and virtual memory; interleaving; page tables; memory caches; bus architecture; polling and interrupts; DMA; device programming; assembly language; optimizations; parallelism; data pipelining.

Learning Outcomes: 1. Students understand the function of basic hardware, including fundamentals of digital logic, processors, memory, and I/O. Credits: 4.00

CS 25100 - Data Structures And Algorithms

Credit Hours: 3.00. Running time analysis of algorithms and their implementations, one-dimensional data structures, trees, heaps, additional sorting algorithms, binary search trees, hash tables, graphs, directed graphs, weighted graph algorithms, additional topics.

Learning Outcomes: 1. Understand fundamental data structures, fundamental algorithms, and their implementation. Credits: 3.00

MA 26100 - Multivariate Calculus (UCC: QR)

Credit Hours: 4.00. Planes, lines, and curves in three dimensions. Differential calculus of several variables; multiple integrals. Introduction to vector calculus. Not open to students with credit in MA 17400 or 27100.

University Core Curriculum (UCC): (UCC: QR)
Learning Outcomes: 1. Know the equations for lines, planes and quadric surfaces in three dimensional space, and understand how these equations relate to the geometry. 2. Understand the relationship between vector functions and parametrized motion; know how to calculate velocity, acceleration, arc length and curvature. 3. Know the meaning of partial derivatives and how to calculate them. Know the multivariable

chain rule. 4. Know the meaning of the gradient, how to calculate it, and how to apply it to directional derivatives and maximum and minimum values. 5. Understand the meaning of double and triple integrals; know how to compute them and how to apply them. 6. Understand the meaning of vector fields and line integrals. Know Green's theorem and be able to apply it. 7. Understand the meaning of surface integrals and know how to calculate them. Know Stokes' theorem and be able to apply it. Credits: 4.00

MA 27101 - Honors Multivariate Calculus (UCC: QR)

Credit Hours: 5.00. This course is the Honors version of MA 26100, Multivariate Calculus; it will also include a review of infinite series. The course is intended for first-year students who have credit for Calculus I and II. There will be a significant emphasis on conceptual explanation, but not on formal proof. Permission of department is required.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Know techniques of vector algebra and be able to apply these to the geometry of space; in particular they will be able to find equations for lines and planes in space. 2. Find equations for standard surfaces in space. 3. Use vector methods to analyze motion in space, and calculate arc length and curvature. 4. Acquire a conceptual and computational knowledge of infinite series; in particular they will be able to test for convergence, and to do calculations with power series. 5. Understand the meaning of partial derivatives in various situations, and will be able to calculate with them. 6. Know the multivariable chain rule and its meaning, and will be able to apply it to calculate derivatives in various situations. 7. Know the meaning of directional derivatives and how to calculate them. 8. Find tangent planes. 9. Find and classify extreme values and saddle points and use the method of Lagrange multipliers. 10. Know the meaning of multiple integrals and how to calculate them. 11. Know the meaning of line integrals and surface integrals and how to calculate them. 12. Know Green's theorem, Stokes' theorem, and the divergence theorem and their applications. Credits: 5.00

15-17 Credits

Spring 2nd Year

CS 25200 - Systems Programming

Credit Hours: 4.00. Low-level programming; review of addresses, pointers, memory layout, and data representation; text, data, and bss segments; debugging and hex dumps; concurrent execution with threads and processes; address spaces; file names; descriptors and file pointers; inheritance; system calls and library functions; standard I/O and string libraries; simplified socket programming; building tools to help programmers; make and make files; shell scripts and quoting; Unix tools including sed, echo, test, and find; scripting languages such as awk; version control; object and executable files (.o and a.out); symbol tables; pointers to functions; hierarchical directories; and DNS hierarchy; programming embedded systems.

Learning Outcomes: 1. Have an appreciation and ability for low-level (systems) programming and debugging. Credits: 4.00

MA 35100 - Elementary Linear Algebra (UCC: QR)

Credit Hours: 3.00. Systems of linear equations, finite dimensional vector spaces, matrices, determinants, eigenvalues and eigenvector applications to analytical geometry. Not open to students with credit in MA 26500.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Solve systems of linear equations using concepts such as vector spaces, linear dependence, and Gaussian elimination. 2. Understand and test for linear independence, calculate the dimension of vector spaces, and apply the rank-nullity theorem in various contexts. 3. Define and apply linear transformations, including matrix multiplication, inverses, LU factorization, and coordinate transformations. 4. Compute and

understand determinants, including their use in calculating matrix inverses and practical applications such as volume calculations. 5. Analyze and compute eigenvectors and eigenvalues, and apply diagonalization techniques. Credits: 3.00

16-17 Credits

Fall 3rd Year

MA 35100 - Elementary Linear Algebra (UCC: QR)

Credit Hours: 3.00. Systems of linear equations, finite dimensional vector spaces, matrices, determinants, eigenvalues and eigenvector applications to analytical geometry. Not open to students with credit in MA 26500.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Solve systems of linear equations using concepts such as vector spaces, linear dependence, and Gaussian elimination. 2. Understand and test for linear independence, calculate the dimension of vector spaces, and apply the rank-nullity theorem in various contexts. 3. Define and apply linear transformations, including matrix multiplication, inverses, LU factorization, and coordinate transformations. 4. Compute and understand determinants, including their use in calculating matrix inverses and practical applications such as volume calculations. 5. Analyze and compute eigenvectors and eigenvalues, and apply diagonalization techniques. Credits: 3.00

MA 41600 - Probability

Credit Hours: 3.00. (STAT 41600) An introduction to mathematical probability suitable as a preparation for actuarial science, statistical theory, and mathematical modeling. General probability rules, conditional probability and Bayes theorem, discrete and continuous random variables, moments and moment generating functions, joint and conditional distributions, standard discrete and continuous distributions and their properties, law of large numbers and central limit theorem.

Credits: 3.00

STAT 35000 - Introduction To Statistics

Credit Hours: 3.00. This course provides a data-oriented introduction to applied statistics, covering exploratory data analysis, experimental design, probability distributions, simulation, sampling distributions, and the Central Limit Theorem. Students will learn the fundamentals of statistical inference, including confidence intervals and hypothesis tests for population means, paired and independent comparisons of means, analysis of variance, and regression. The course emphasizes hands-on experience with statistical software and is primarily intended for students majoring in the mathematical sciences. Prerequisite: two semesters of college calculus.

Learning Outcomes: 1. Understand basic terms, graphs, and symbols and be able to interpret statistics in the media. 2. Understand and be able to explain statistical processes and be able to fully interpret statistical results. 3. Understand why and how statistical investigations are conducted and the "big ideas" that underlie statistical investigations. 4. Be able to use a statistical package (R or SAS) to analyze data and interpret result. 5. Big Ideas in Statistics: variability, distributions, and models; causation vs correlation; practical significance vs statistical significance, etc. Credits: 3.00

MA 51800 - Advanced Discrete Mathematics

Credit Hours: 3.00. The course covers mathematics useful in analyzing computer algorithms. Topics include recurrence relations, evaluation of sums, integer functions, elementary number theory, binomial coefficients, generating functions, discrete probability, and asymptotic methods.

Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the

difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

MA 35301 - Linear Algebra II

Credit Hours: 3.00. Theoretical background for methods and results that appear in MA 35100. Inner products, orthogonality, and applications including least squares.

Learning Outcomes: 1. Perform rigorous proofs using the definitions of vector space, subspace, linear combination of vectors, linear dependence and linear independence, bases and dimension. 2. Perform rigorous proofs using the definitions of linear transformation and the null space and range of a linear transformation. 3. Exhibit a clear understanding of the relationship between composition of linear transformation and matrix multiplication. 4. Credit Hours: 3.00. Systems of linear equations, finite dimensional vector spaces, matrices, determinants, eigenvalues and eigenvector applications to analytical geometry. Not open to students with credit in MA 26500.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Solve systems of linear equations using concepts such as vector spaces, linear dependence, and Gaussian elimination. 2. Understand and test for linear independence, calculate the dimension of vector spaces, and apply the rank-nullity theorem in various contexts. 3. Define and apply linear transformations, including matrix multiplication, inverses, LU factorization, and coordinate transformations. 4. Compute and understand determinants, including their use in calculating matrix inverses and practical applications such as volume calculations. 5. Analyze and compute eigenvectors and eigenvalues, and apply diagonalization techniques. Credits: 3.00

MA 27101 - Honors Multivariate Calculus (UCC: QR)

Credit Hours: 5.00. This course is the Honors version of MA 26100, Multivariate Calculus; it will also include a review of infinite series. The course is intended for first-year students who have credit for Calculus I and II. There will be a significant emphasis on conceptual explanation, but not on formal proof. Permission of department is required.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Know techniques of vector algebra and be able to apply these to the geometry of space; in particular they will be able to find equations for lines and planes in space. 2. Find equations for standard surfaces in

space. 3. Use vector methods to analyze motion in space, and calculate arc length and curvature. 4. Acquire a conceptual and computational knowledge of infinite series; in particular they will be able to test for convergence, and to do calculations with power series. 5. Understand the meaning of partial derivatives in various situations, and will be able to calculate with them. 6. Know the multivariable chain rule and its meaning, and will be able to apply it to calculate derivatives in various situations. 7. Know the meaning of directional derivatives and how to calculate them. 8. Find tangent planes. 9. Find and classify extreme values and saddle points and use the method of Lagrange multipliers. 10. Know the meaning of multiple integrals and how to calculate them. 11. Know the meaning of line integrals and surface integrals and how to calculate them. 12. Know Green's theorem, Stokes' theorem, and the divergence theorem and their applications. Credits: 5.00

Required CS Major Core Courses (21 credits)

CS 18000 - Problem Solving And Object-Oriented Programming

Credit Hours: 4.00. Problem solving and algorithms, implementation of algorithms in a high level programming language, conditionals, the iterative approach and debugging, collections of data, searching and sorting, solving problems by decomposition, the object-oriented approach, subclasses of existing classes, handling exceptions that occur when the program is running, graphical user interfaces (GUIs), data stored in files, abstract data types, a glimpse at topics from other CS courses. Intended primarily for students majoring in computer sciences. Credit cannot be obtained for both CS 18000 and any of 15600, 15800 and 15900. Not open to students with credit in CS 24000.

Learning Outcomes: 1. Understand solving problems by analyzing the problem, designing an algorithm, and programming the solution. Credits: 4.00

CS 18200 - Foundations Of Computer Science

Credit Hours: 3.00. Logic and proofs; sets, functions, relations, sequences and summations; number representations; counting; fundamentals of the analysis of algorithms; graphs and trees; proof techniques; recursion; Boolean logic; finite state machines; pushdown automata; computability and undecidability.

Learning Outcomes: 1. Understand discrete mathematical tools, facts, and reasoning relevant to computer science. Credits: 3.00

CS 24000 - Programming In C

Credit Hours: 3.00. The UNIX environment, C development cycle, data representation, operators, program structure, recursion, macros, C preprocessor, pointers and addresses, dynamic memory allocation, structures, unions, typedef, bit-fields, pointer/structure applications, UNIX file abstraction, file access, low-level I/O, concurrency.

Learning Outcomes: 1. Understand programming principles and techniques for problem solving in the C programming language. Credits: 3.00

CS 25000 - Computer Architecture

Credit Hours: 4.00. Digital logic: transistors, gates, and combinatorial circuits; clocks; registers and register banks; arithmetic-logic units; data representation: big-endian and little-endian integers; ones and twos complement arithmetic; signed and unsigned values; Von-Neumann architecture and bottleneck; instruction sets; RISC and CISC designs; instruction pipelines and stalls; rearranging code; memory and address spaces; physical and virtual memory; interleaving; page tables; memory caches; bus architecture; polling and interrupts; DMA; device programming; assembly language; optimizations; parallelism; data pipelining.

Learning Outcomes: 1. Students understand the function of basic hardware, including fundamentals of digital logic, processors, memory, and I/O. Credits: 4.00

CS 25100 - Data Structures And Algorithms

Credit Hours: 3.00. Running time analysis of algorithms and their implementations, one-dimensional data structures, trees, heaps, additional sorting algorithms, binary search trees, hash tables, graphs, directed graphs, weighted graph algorithms, additional topics.

Learning Outcomes: 1. Understand fundamental

data structures, fundamental algorithms, and their implementation. Credits: 3.00

CS 25200 - Systems Programming

Credit Hours: 4.00. Low-level programming; review of addresses, pointers, memory layout, and data representation; text, data, and bss segments; debugging and hex dumps; concurrent execution with threads and processes; address spaces; file names; descriptors and file pointers; inheritance; system calls and library functions; standard I/O and string libraries; simplified socket programming; building tools to help programmers; make and make files; shell scripts and quoting; Unix tools including sed, echo, test, and find; scripting languages such as awk; version control; object and executable files (.o and a.out); symbol tables; pointers to functions; hierarchical directories; and DNS hierarchy; programming embedded systems.

Learning Outcomes: 1. Have an appreciation and ability for low-level (systems) programming and debugging. Credits: 4.00

Security Concentration (18 credits)

Required Courses

CS 35400 - Operating Systems

Credit Hours: 3.00. Should not be taken concurrently with CS 35200. Introduction to operating systems. Computer system and operating system architectures, processes, inter-process communication, inter-process synchronization, mutual exclusion, deadlocks, memory hierarchy, virtual memory, CPU scheduling, file systems, I/O device management, security.

Learning Outcomes: 1. Provides students with an understanding of the fundamentals of computer operating systems. Credits: 3.00

CS 35500 - Introduction To Cryptography

Credit Hours: 3.00. An introduction to cryptography basics: Classic historical ciphers including Caesar, Vigenere, and Vernam ciphers; modern ciphers including DES, AES, Pohlig-Hellman, and RSA; signatures and digests; key exchange; simple protocols; block and stream ciphers; network-centric protocols.

Learning Outcomes: 1. Understand the basic concepts and proof techniques in cryptography. 2. Develop skills to define and evaluate the security of existing schemes. 3. Construct provably secure schemes for common cryptographic tasks. Credits: 3.00

CS 42600 - Computer Security

Credit Hours: 3.00. A survey of the fundamentals of information security. Risks and vulnerabilities, policy formation, controls and protection methods, database security, encryption, authentication technologies, host-based and network-based security issues, personnel and physical security issues, issues of law and privacy.

Learning Outcomes: 1. Apply the notions of threat, vulnerability, attack, countermeasure, security objectives, and adversarial models when analyzing security of computer and information systems. 2. Explain the main authorization mechanisms and access control models, and their applicability in different situations. 3. Explain security issues related to password and other authentication mechanisms. 4. Explain the different types of malware, the mechanisms of their propagation, and the strengths and limitations of different defense mechanisms. 5. Identify the threats and vulnerabilities for a networked environment, and explain different countermeasures, and their effectiveness. 6. Explain the vulnerabilities brought about by modern web-based application and services, different countermeasures, and their effectiveness. Credits: 3.00

Selectives

CS 30700 - Software Engineering I

Credit Hours: 3.00. An introduction to the methods and tools of software engineering; software life cycle; specification and design of software, software testing, cost and effort estimation; laboratory exercises with design, testing, and other tools.

Learning Outcomes: 1. Architect and design quality software. 2. Contrast and critique software lifecycle models. 3. Create software using current software engineering tools,

methods, and concepts. 4. Work together on a team in a productive and professional manner. 5. Inspect and test software and documentation. Credits: 3.00

CS 34800 - Information Systems

Credit Hours: 3.00. File organization and index structures; object-oriented database languages; the relational database model with introductions to SQL and DBMS; hierarchical models and network models with introductions to HDDL, HDML, and DBTG Codasyl; data mining; data warehousing; database connectivity; distributed databases; the client/server paradigm; middleware, including ODBC, JDBC, CORBA, and MOM.

Learning Outcomes: 1. Learn about different data models (relational, graph, and document) used in different database systems. 2. Learn how to pose complex database queries in SQL and NoSQL languages as well as theoretical query languages. 3. Gain an introductory background in indexing. 4. Learn about transactions and concurrency control. 5. Differentiate between OLTP and OLAP applications. Credits: 3.00

CS 35200 - Compilers: Principles And Practice

Credit Hours: 3.00. Should not be taken concurrently with CS 35400. The theory and practice of programming language translation, compilation, and run-time systems, organized around a significant programming project to build a compiler for a simple but nontrivial programming language. Modules, interfaces, tools. Data structures for tree languages. Lexical analysis, syntax analysis, abstract syntax. Symbol tables, semantic analysis. Translation, intermediate code, basic blocks, traces. Instruction selection, CISC and RISC machines. Liveness analysis, graph coloring register allocation. Supplemental material drawn from garbage collection, object-oriented languages, higher-order languages, dataflow analysis, optimization, polymorphism, scheduling and pipelining, memory hierarchies.

Learning Outcomes: 1. Provides students with an understanding of how a computer program is converted into elementary code that causes the computer to produce the output intended by the programmer. Credits: 3.00

CS 35300 - Principles Of Concurrency And Parallelism

Credit Hours: 3.00. Important concepts, models, algorithms, abstractions, and implementation aspects of concurrent and parallel programs. Topics include: techniques used to describe concurrent programs (e.g., threads, events, co-routines, continuations), abstractions for shared-memory and message-passing programs, relaxed memory models, livelock and deadlock detection, lock-free algorithms, data races and atomicity, scheduling techniques, process calculi, and software transactions.

Learning Outcomes: 1. This course provides students the vocabulary and concepts to better understand how to design and program scalable multicore processors. Credits: 3.00

CS 38100 - Introduction To The Analysis Of Algorithms

Credit Hours: 3.00. Techniques for analyzing the time and space requirements of algorithms. Application of these techniques to sorting, searching, pattern-matching, graph problems, and other selected problems. Brief introduction to the intractable (NP-hard) problems.

Learning Outcomes: 1. Use big O-notation to give asymptotic time and space bounds of algorithms. 2. Explain the use of big-Omega, big-Theta, and little-o notations. 3. Use recurrence relations to determine the time complexity of recursive algorithms. 4. Solve recurrence relations commonly arising in algorithm design. 5. Give examples that illustrate time-space trade-offs of algorithms. Credits: 3.00

CS 40800 - Software Testing

Credit Hours: 3.00. Preliminaries: errors and testing; software quality, requirements, behavior, and correctness; testing, debugging, verification; control flow graphs, dominators; types of testing; Test selection: from requirements, finite state models, and combinatorial designs; regression testing and test minimization; Test adequacy assessment: control and data flow; mutation based; testing tools.

Learning Outcomes: 1. Understand the basic technology related to software testing and debugging. 2. Differentiate between reliability and correctness. 3. Understand the impact of the saturation effect on the test process and its cost. 4. Understand the relationship between software development and test processes. 5.

Apply a variety of black box test generation methods manually and using tools. 6. Use test adequacy criteria and understand their respective cost and effectiveness. 7. Select appropriate software test tools for a given testing task. Credits: 3.00

CS 42200 - Computer Networks

Credit Hours: 3.00. Undergraduate-level introduction to computer networks and data communication. Low-level details of media, signals, and bits: time division and frequency division multiplexing; encoding; modulation; bandwidth, throughput, and noise. Packet transmission: Local Area Network (Ethernet, FDDI) and Wide Area Network technologies (ATM); wireless networks; network interconnection with repeaters, bridges, and switches; DSU/CSU; xDSL and cable modems. Internetworking: router-based architecture; IP addressing; address binding with ARP; datagram encapsulation and fragmentation; UDP and TCP, retransmission; protocol ports; ICMP and error handling. Network applications: client/server concept; port demultiplexing; program interface to protocols (API); use by clients and servers; domain name system; TELNET; Web technologies including HTTP, CGI, Java; RPC and middleware; network management.

Credits: 3.00

CS 44800 - Introduction To Relational Database Systems

Credit Hours: 3.00. An in-depth examination of relational database systems including theory and concepts as well as practical issues in relational databases. Modern database technologies such as object-relational and Web-based access to relational databases. Conceptual design and entity relationship modeling, relational algebra and calculus, data definition and manipulation languages using SQL, schema and view management, query processing and optimization, transaction management, security, privacy, integrity management.

Learning Outcomes: 1. Learn data modeling: physical, logical and conceptual data models, the entity-relationship model. 2. Study logical and Physical Design and interaction with operating systems, disk Storage, Basic File Structures, Hashing, Indexing. 3. Learn the relational database model and implementation and performance issues. 4. Understand transaction Processing, concurrency control, atomicity control and recovery control. 5. Understand database privacy, integrity, and security. 6. Understand data mining, data warehousing, online analytical processing, and information retrieval. 7. Understand Cloud computing and Distributed Database Systems architectures, Big Data, Hadoop, MapReduce, and NoSQL. 8. Recognize performance issues. Credits: 3.00

CS 45600 - Programming Languages

Credit Hours: 3.00. Concepts for structuring data, computation, and whole programs. Object-oriented languages, functional languages, logic- and rule-based languages. Data types, type checking, exception handling, concurrent processes, synchronization, modularity, encapsulation, interfaces, separate compilation, inheritance, polymorphism, dynamic binding, subtyping, overloading, beta-reduction, unification.

Credits: 3.00

CS 47100 - Introduction To Artificial Intelligence

Credit Hours: 3.00. Students are expected to spend at least three hours per week gaining experience with artificial intelligence systems and developing software. Basic problem-solving strategies, heuristic search, problem reduction and AND/OR graphs, knowledge representation, expert systems, generating explanations, uncertainty reasoning, game playing, planning, machine learning, computer vision, and programming systems such as Lisp or Prolog.

Learning Outcomes: 1. Develop understandings of various applications of AI. 2. Recognize problems where AI techniques are applicable. 3. Implement and apply basic principles of AI in solutions that require problem-solving, inference, learning, and planning. 4. Understand how to evaluate various AI techniques and make appropriate selections. Credits: 3.00

CS 47300 - Web Information Search And Management

Credit Hours: 3.00. This course teaches important concepts and knowledge of information retrieval for managing unstructured data such as text data on Web or in emails. At the same time, students will be exposed to a large number of important applications. Students in the course will get hands on experience from homework and a course project. The first part of the course focuses on general concepts/techniques such as stemming, indexing, vector space model, and feedback procedure. The second part of the course shows how to apply

the set of techniques on different applications such as Web search, text categorization, and information recommendation.

Learning Outcomes: 1. Understand the important concepts and techniques of information retrieval and how to apply these techniques to a set of important or real world applications. Credits: 3.00

CS 49000 - Topics In Computer Sciences For Undergraduates

Credit Hours: 1.00 to 5.00. Supervised reading and reports in various fields. Permission of instructor required.

Credits: 1.00 to 5.00

CS 37300 - Data Mining And Machine Learning

Credit Hours: 3.00. This course will introduce students to the field of data mining and machine learning, which sits at the interface between statistics and computer science. Data mining and machine learning focuses on developing algorithms to automatically discover patterns and learn models of large datasets. This course introduces students to the process and main techniques in data mining and machine learning, including exploratory data analysis, predictive modeling, descriptive modeling, and evaluation.

Learning Outcomes: 1. Identify key elements of data mining and machine learning algorithms. 2. Understand how algorithmic elements interact to impact performance. 3. Understand how to choose algorithms for different analysis tasks. 4. Analyze data in both an exploratory and targeted manner. 5. Implement and apply basic algorithms for supervised and unsupervised learning. 6. Accurately evaluate the performance of algorithms, as well as formulate and test hypotheses. Credits: 3.00

CS 48900 - Embedded Systems

Credit Hours: 3.00. Software for embedded systems; programming with extreme constraints on memory, storage, and processing power; programming models, including synchronous, asynchronous, and concurrent; programming systems that run forever; use of Finite State Machines (FSMs); review of embedded hardware and available boards; asynchronous and synchronous serial connections (e.g., RS232 and SPI); General Purpose I/O (GPIO) pins; relays, servos, and other peripherals; design for low power; battery characteristics; systems that communicate over computer networks and the Internet; current industry practices; design of embedded projects; working in teams. CS 35200 (Compilers) and CS 35400 (Operating Systems) are recommended, but not required.

Learning Outcomes: 1. Understand basics of embedded systems. 2. Understand how and why many Internet of Things (IoT) devices use the cloud. 3. Understand how embedded systems are employed in a variety of situations, including smart homes and buildings, security systems, cars, and planes. 4. Understand the three basic programming models, and when each is appropriate. 5. Understand how synchronous and asynchronous serial devices operate. 6. General characteristics of batteries and which type of battery is appropriate for various embedded designs. 7. Understand the use of relays and how embedded logic that operates on low voltage can control high voltage peripherals. 8. Understand why systems that use sensors and actuators must be calibrated. 9. Understand how to build and demonstrate a working embedded system. Credits: 3.00

Concentration Notes

Required CS Honors (12-13 credits)

CS 39700 - Honors Seminar

Credit Hours: 0.00. A seminar for all sophomores, juniors, and seniors in the Computer Sciences Honors Program. Meets eight times each semester under the supervision of the Honors coordinator. The meetings focus on honors research projects, helping students to identify appropriate projects and form groups, and providing a forum for juniors and seniors to report on their projects as required in the honors program.

Credits: 0.00

CS 49700 - Honors Research Project

Credit Hours: 3.00. One semester of the project may be counted as one of the seven computer science courses at or above the 300 level required for the bachelor's degree. One more semester, if approved by the honors coordinator, can be used as a free elective. A group research project directed by Computer Sciences faculty members. Each group must submit

a technical report describing its work and the results obtained.

Credits: 3.00

MA 35100 - Elementary Linear Algebra (UCC: QR)

Credit Hours: 3.00. Systems of linear equations, finite dimensional vector spaces, matrices, determinants, eigenvalues and eigenvector applications to analytical geometry. Not open to students with credit in MA 26500.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Solve systems of linear equations using concepts such as vector spaces, linear dependence, and Gaussian elimination. 2. Understand and test for linear independence, calculate the dimension of vector spaces, and apply the rank-nullity theorem in various contexts. 3. Define and apply linear transformations, including matrix multiplication, inverses, LU factorization, and coordinate transformations. 4. Compute and understand determinants, including their use in calculating matrix inverses and practical applications such as volume calculations. 5. Analyze and compute eigenvectors and eigenvalues, and apply diagonalization techniques. Credits: 3.00

MA 41600 - Probability

Credit Hours: 3.00. (STAT 41600) An introduction to mathematical probability suitable as a preparation for actuarial science, statistical theory, and mathematical modeling. General probability rules, conditional probability and Bayes theorem, discrete and continuous random variables, moments and moment generating functions, joint and conditional distributions, standard discrete and continuous distributions and their properties, law of large numbers and central limit theorem.

Credits: 3.00

MA 51800 - Advanced Discrete Mathematics

Credit Hours: 3.00. The course covers mathematics useful in analyzing computer algorithms. Topics include recurrence relations, evaluation of sums, integer functions, elementary number theory, binomial coefficients, generating functions, discrete probability, and asymptotic methods.

Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

MA 35301 - Linear Algebra II

Credit Hours: 3.00. Theoretical background for methods and results that appear in MA 35100. Inner products, orthogonality, and applications including least squares.

Learning Outcomes: 1. Perform rigorous proofs using the definitions of vector space, subspace, linear combination of vectors, linear

dependence and linear independence, bases and dimension. 2. Perform rigorous proofs using the definitions of linear transformation and the null space and range of a linear transformation. 3. Exhibit a clear understanding of the relationship between composition of linear transformation and matrix multiplication. 4. Understand elementary matrices and their use in describing the solution set of a system of linear equations. 5. Understand that the determinant function on n x n matrices with entries in a field F is a function that may be defined recursively, and may be uniquely defined as an alternating multilinear form which takes the identity matrix to 1. 6. Perform rigorous proofs involving eigenvalues and eigenvectors. 7. Understand and be able to apply conditions for a linear operator on a finite-dimensional vector space to be diagonalizable. 8. Preform calculations with Gram-Schmidt, least squares and related topics. 9. Students should be able to do rigorous proofs involving inner product spaces and related topics. Credits: 3.00

Other Departmental/Program Course Requirements (32-55 credits)

College of Science Additional Requirements

Computing (3-4 credits)

Laboratory Science (6-8 credits)

Mathematics (8-10 credits)

MA 16100 - Plane Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 5.00. Introduction to differential and integral calculus of one variable, with applications. Some schools or departments may allow only 4 credit hours toward graduation for this course. Designed for students who have not had at least a one-semester calculus course in high school, with a grade of "A" or "B". Not open to students with credit in MA 16500 . Demonstrated competence in college algebra and trigonometry.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions Credits: 5.00

MA 16200 - Plane Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 5.00. Continuation of MA 16100 . Vectors in two and three dimensions, techniques of integration, infinite series, conic sections, polar coordinates, surfaces in three dimensions. Some schools or departments may allow only 4 credit hours toward graduation for this course.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits:

5.00

MA 16500 - Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 4.00. Introduction to differential and integral calculus of one variable, with applications. Conic sections. Designed for students who have had at least a one-semester calculus course in high school, with a grade of "A" or "B", but are not qualified to enter MA 16200 or MA 16600 or the advanced placement courses MA 17300 or the honors calculus course MA 18100. Demonstrated competence in college algebra and trigonometry. CTL:IMA 1602 Calculus - Long I

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems. 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions. Credits: 4.00

MA 16600 - Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 4.00. Continuation of MA 16500 . Vectors in two and three dimensions. Techniques of integration, infinite series, polar coordinates, surfaces in three dimensions. Not open to students with credit in MA 16200 . CTL:IMA 1603 Calculus - Long II

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 4.00

Statistics (3 credits)

STAT 35000 - Introduction To Statistics

Credit Hours: 3.00. This course provides a data-oriented introduction to applied statistics, covering exploratory data analysis, experimental design, probability distributions, simulation, sampling distributions, and the Central Limit Theorem. Students will learn the fundamentals of statistical inference, including confidence intervals and hypothesis tests for population means, paired and independent comparisons of means, analysis of variance, and regression. The course emphasizes hands-on experience with statistical software and is primarily intended for students majoring in the mathematical sciences. Prerequisite: two semesters of college calculus.

Learning Outcomes: 1. Understand basic terms, graphs, and symbols and be able to interpret statistics in the media. 2. Understand and be able to explain statistical processes and be able to fully interpret statistical results. 3. Understand why and how statistical investigations are conducted and the "big ideas" that underlie statistical investigations. 4. Be able to use a statistical package (R or SAS) to analyze data and interpret result. 5. Big Ideas in Statistics: variability, distributions, and models; causation vs correlation; practical significance vs statistical significance, etc. Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data

displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

Electives (5-31 credits)

Grade Requirements

GPA Requirements

Course Requirements & Notes

Sample 4-Year Plan

Fall 1st Year

CS 18000 - Problem Solving And Object-Oriented Programming

Credit Hours: 4.00. Problem solving and algorithms, implementation of algorithms in a high level programming language, conditionals, the iterative approach and debugging, collections of data, searching and sorting, solving problems by decomposition, the object-oriented approach, subclasses of existing classes, handling exceptions that occur when the program is running, graphical user interfaces (GUIs), data stored in files, abstract data types, a glimpse at topics from other CS courses. Intended primarily for students majoring in computer sciences. Credit cannot be obtained for both CS 18000 and any of 15600, 15800 and 15900. Not open to students with credit in CS 24000.

Learning Outcomes: 1. Understand solving problems by analyzing the problem, designing an algorithm, and programming the solution. Credits: 4.00

MA 16100 - Plane Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 5.00. Introduction to differential and integral calculus of one variable, with applications. Some schools or departments may allow only 4 credit hours toward graduation for this course. Designed for students who have not had at least a one-semester calculus course in high school, with a grade of "A" or "B". Not open to students with credit in MA 16500 . Demonstrated competence in college algebra and trigonometry.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions Credits: 5.00

MA 16500 - Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 4.00. Introduction to differential and integral calculus of one variable, with applications. Conic sections. Designed for students who have had at least a one-semester calculus course in high school, with a grade of "A" or "B", but are not qualified to enter MA 16200 or MA 16600 or the advanced placement courses MA 17300 or the honors calculus course MA 18100. Demonstrated competence in college algebra and trigonometry. CTL:IMA 1602 Calculus - Long I

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems. 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions. Credits: 4.00

15-17 Credits

Spring 1st Year

CS 18200 - Foundations Of Computer Science

Credit Hours: 3.00. Logic and proofs; sets, functions, relations, sequences and summations; number representations; counting; fundamentals of the analysis of algorithms; graphs and trees; proof techniques; recursion; Boolean logic; finite state machines; pushdown automata; computability and undecidability.

Learning Outcomes: 1. Understand discrete mathematical tools, facts, and reasoning relevant to computer science. Credits: 3.00

CS 24000 - Programming In C

Credit Hours: 3.00. The UNIX environment, C development cycle, data representation, operators, program structure, recursion, macros, C preprocessor, pointers and addresses, dynamic memory allocation, structures, unions, typedef, bit-fields, pointer/structure applications, UNIX file abstraction, file access, low-level I/O, concurrency.

Learning Outcomes: 1. Understand programming principles and techniques for problem solving in the C programming language. Credits: 3.00

MA 16200 - Plane Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 5.00. Continuation of MA 16100 . Vectors in two and three dimensions, techniques of integration, infinite series, conic sections, polar coordinates, surfaces in three dimensions. Some schools or departments may allow only 4 credit hours toward graduation for this course.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 5.00

MA 16600 - Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 4.00. Continuation of MA 16500 . Vectors in two and three dimensions. Techniques of integration, infinite series, polar coordinates, surfaces in three dimensions. Not open to students with credit in MA 16200 . CTL:IMA 1603 Calculus - Long II

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum,

and should be able to apply elementary approximation methods of integration. Credits: 4.00

15-17 Credits

Fall 2nd Year

CS 25000 - Computer Architecture

Credit Hours: 4.00. Digital logic: transistors, gates, and combinatorial circuits; clocks; registers and register banks; arithmetic-logic units; data representation: big-endian and little-endian integers; ones and twos complement arithmetic; signed and unsigned values; Von-Neumann architecture and bottleneck; instruction sets; RISC and CISC designs; instruction pipelines and stalls; rearranging code; memory and address spaces; physical and virtual memory; interleaving; page tables; memory caches; bus architecture; polling and interrupts; DMA; device programming; assembly language; optimizations; parallelism; data pipelining.

Learning Outcomes: 1. Students understand the function of basic hardware, including fundamentals of digital logic, processors, memory, and I/O. Credits: 4.00

CS 25100 - Data Structures And Algorithms

Credit Hours: 3.00. Running time analysis of algorithms and their implementations, one-dimensional data structures, trees, heaps, additional sorting algorithms, binary search trees, hash tables, graphs, directed graphs, weighted graph algorithms, additional topics.

Learning Outcomes: 1. Understand fundamental data structures, fundamental algorithms, and their implementation. Credits: 3.00

MA 26100 - Multivariate Calculus (UCC: QR)

Credit Hours: 4.00. Planes, lines, and curves in three dimensions. Differential calculus of several variables; multiple integrals. Introduction to vector calculus. Not open to students with credit in MA 17400 or 27100.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Know the equations for lines, planes and quadric surfaces in three dimensional space, and understand how these equations relate to the geometry. 2. Understand the relationship between vector functions and parametrized motion; know how to calculate velocity, acceleration, arc length and curvature. 3. Know the meaning of partial derivatives and how to calculate them. Know the multivariable chain rule. 4. Know the meaning of the gradient, how to calculate it, and how to apply it to directional derivatives and maximum and minimum values. 5. Understand the meaning of double and triple integrals; know how to compute them and how to apply them. 6. Understand the meaning of vector fields and line integrals. Know Green's theorem and be able to apply it. 7. Understand the meaning of surface integrals and know how to calculate them. Know Stokes' theorem and be able to apply it. Credits: 4.00

MA 27101 - Honors Multivariate Calculus (UCC: QR)

Credit Hours: 5.00. This course is the Honors version of MA 26100, Multivariate Calculus; it will also include a review of infinite series. The course is intended for first-year students who have credit for Calculus I and II. There will be a significant emphasis on conceptual explanation, but not on formal proof. Permission of department is required.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Know techniques of vector algebra and be able to apply these to the geometry of space; in particular they will be able to find equations for lines and planes in space. 2. Find equations for standard surfaces in space. 3. Use vector methods to analyze motion in space, and calculate arc length and curvature. 4. Acquire a conceptual and computational knowledge of infinite series; in particular they will be able to test for convergence, and to do calculations with power series. 5. Understand the meaning of partial derivatives in various situations, and will be able to calculate with them. 6. Know the multivariable chain rule and its meaning, and will be able to apply it to calculate derivatives in various situations. 7. Know the meaning of directional

derivatives and how to calculate them. 8. Find tangent planes. 9. Find and classify extreme values and saddle points and use the method of Lagrange multipliers. 10. Know the meaning of multiple integrals and how to calculate them. 11. Know the meaning of line integrals and surface integrals and how to calculate them. 12. Know Green's theorem, Stokes' theorem, and the divergence theorem and their applications. Credits: 5.00

15-17 Credits

Spring 2nd Year

CS 25200 - Systems Programming

Credit Hours: 4.00. Low-level programming; review of addresses, pointers, memory layout, and data representation; text, data, and bss segments; debugging and hex dumps; concurrent execution with threads and processes; address spaces; file names; descriptors and file pointers; inheritance; system calls and library functions; standard I/O and string libraries; simplified socket programming; building tools to help programmers; make and make files; shell scripts and quoting; Unix tools including sed, echo, test, and find; scripting languages such as awk; version control; object and executable files (.o and a.out); symbol tables; pointers to functions; hierarchical directories; and DNS hierarchy; programming embedded systems.

Learning Outcomes: 1. Have an appreciation and ability for low-level (systems) programming and debugging. Credits: 4.00

MA 35100 - Elementary Linear Algebra (UCC: QR)

Credit Hours: 3.00. Systems of linear equations, finite dimensional vector spaces, matrices, determinants, eigenvalues and eigenvector applications to analytical geometry. Not open to students with credit in MA 26500.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Solve systems of linear equations using concepts such as vector spaces, linear dependence, and Gaussian elimination. 2. Understand and test for linear independence, calculate the dimension of vector spaces, and apply the rank-nullity theorem in various contexts. 3. Define and apply linear transformations, including matrix multiplication, inverses, LU factorization, and coordinate transformations. 4. Compute and understand determinants, including their use in calculating matrix inverses and practical applications such as volume calculations. 5. Analyze and compute eigenvectors and eigenvalues, and apply diagonalization techniques. Credits: 3.00

16-17 Credits

Fall 3rd Year

MA 35100 - Elementary Linear Algebra (UCC: QR)

Credit Hours: 3.00. Systems of linear equations, finite dimensional vector spaces, matrices, determinants, eigenvalues and eigenvector applications to analytical geometry. Not open to students with credit in MA 26500.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Solve systems of linear equations using concepts such as vector spaces, linear dependence, and Gaussian elimination. 2. Understand and test for linear independence, calculate the dimension of vector spaces, and apply the rank-nullity theorem in various contexts. 3. Define and apply linear transformations, including matrix multiplication, inverses, LU factorization, and coordinate transformations. 4. Compute and understand determinants, including their use in calculating matrix inverses and practical applications such as volume calculations. 5. Analyze and compute eigenvectors and eigenvalues, and apply diagonalization techniques. Credits: 3.00

MA 41600 - Probability

Credit Hours: 3.00. (STAT 41600) An introduction to mathematical probability suitable as a preparation for actuarial

science, statistical theory, and mathematical modeling. General probability rules, conditional probability and Bayes theorem, discrete and continuous random variables, moments and moment generating functions, joint and conditional distributions, standard discrete and continuous distributions and their properties, law of large numbers and central limit theorem.

Credits: 3.00

STAT 35000 - Introduction To Statistics

Credit Hours: 3.00. This course provides a data-oriented introduction to applied statistics, covering exploratory data analysis, experimental design, probability distributions, simulation, sampling distributions, and the Central Limit Theorem. Students will learn the fundamentals of statistical inference, including confidence intervals and hypothesis tests for population means, paired and independent comparisons of means, analysis of variance, and regression. The course emphasizes hands-on experience with statistical software and is primarily intended for students majoring in the mathematical sciences. Prerequisite: two semesters of college calculus.

Learning Outcomes: 1. Understand basic terms, graphs, and symbols and be able to interpret statistics in the media. 2. Understand and be able to explain statistical processes and be able to fully interpret statistical results. 3. Understand why and how statistical investigations are conducted and the "big ideas" that underlie statistical investigations. 4. Be able to use a statistical package (R or SAS) to analyze data and interpret result. 5. Big Ideas in Statistics: variability, distributions, and models; causation vs correlation; practical significance vs statistical significance, etc. Credits: 3.00

MA 51800 - Advanced Discrete Mathematics

Credit Hours: 3.00. The course covers mathematics useful in analyzing computer algorithms. Topics include recurrence relations, evaluation of sums, integer functions, elementary number theory, binomial coefficients, generating functions, discrete probability, and asymptotic methods.

Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

MA 35301 - Linear Algebra II

Credit Hours: 3.00. Theoretical background for methods and results that appear in MA 35100. Inner products, orthogonality, and applications including least squares.

Learning Outcomes: 1. Perform rigorous proofs using the definitions of vector space, subspace, linear combination of vectors, linear dependence and linear independence, bases and dimension. 2. Perform rigorous proofs using the definitions of linear transformation and the null space and range of a linear transformation. 3. Exhibit a clear understanding of the relationship between composition of linear

transformation and matrix multiplication. 4. Understand elementary matrices and their use in describing the solution set of a system of linear equations. 5. Understand that the determinant function on n x n matrices with entries in a field F is a function that may be defined recursively, and may be uniquely defined as an alternating multilinear form which takes the identity matrix to 1. 6. Perform rigorous proofs involving eigenvalues and eigenvectors. 7. Understand and be able to apply conditions for a linear operator on a finite-dimensional vector space to be diagonalizable. 8. Preform calculations with Gram-Schmidt, least squares and related topics. 9. Students should be able to do rigorous proofs involving inner product spaces and related topics.
Credits: 3.00

16-17 Credits

Spring 3rd Year

15-16 Credits

Fall 4th Year

CS 39700 - Honors Seminar

Credit Hours: 0.00. A seminar for all sophomores, juniors, and seniors in the Computer Sciences Honors Program. Meets eight times each semester under the supervision of the Honors coordinator. The meetings focus on honors research projects, helping students to identify appropriate projects and form groups, and providing a forum for juniors and seniors to report on their projects as required in the honors program.
Credits: 0.00

15-17 Credits

Spring 4th Year

CS 49700 - Honors Research Project

Credit Hours: 3.00. One semester of the project may be counted as one of the seven computer science courses at or above the 300 level required for the bachelor's degree. One more semester, if approved by the honors coordinator, can be used as a free elective. A group research project directed by Computer Sciences faculty members. Each group must submit a technical report describing its work and the results obtained.
Credits: 3.00

15-17 Credits

Computer Science Honors: Software Engineering, BS

About the Program

Degree Requirements

Computer Science Honors Major Courses (58-60 credits)

Required CS Honors Major Math Courses (7-8 credits)

MA 26100 - Multivariate Calculus (UCC: QR)

Credit Hours: 4.00. Planes, lines, and curves in three dimensions. Differential calculus of several variables; multiple integrals. Introduction to vector calculus. Not open to students with credit in MA 17400 or 27100.
University Core Curriculum (UCC): (UCC: QR)
Learning Outcomes: 1. Know the equations for lines, planes and quadric surfaces in three dimensional space, and understand how these equations relate to the geometry. 2. Understand the relationship between vector functions and parametrized motion; know how to calculate velocity, acceleration, arc length and curvature. 3. Know the meaning of partial derivatives and how to calculate them. Know the multivariable chain rule. 4. Know the meaning of the gradient,

how to calculate it, and how to apply it to directional derivatives and maximum and minimum values. 5. Understand the meaning of double and triple integrals; know how to compute them and how to apply them. 6. Understand the meaning of vector fields and line integrals. Know Green's theorem and be able to apply it. 7. Understand the meaning of surface integrals and know how to calculate them. Know Stokes' theorem and be able to apply it. Credits: 4.00

MA 35100 - Elementary Linear Algebra (UCC: QR)

Credit Hours: 3.00. Systems of linear equations, finite dimensional vector spaces, matrices, determinants, eigenvalues and eigenvector applications to analytical geometry. Not open to students with credit in MA 26500.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Solve systems of linear equations using concepts such as vector spaces, linear dependence, and Gaussian elimination. 2. Understand and test for linear independence, calculate the dimension of vector spaces, and apply the rank-nullity theorem in various contexts. 3. Define and apply linear transformations, including matrix multiplication, inverses, LU factorization, and coordinate transformations. 4. Compute and understand determinants, including their use in calculating matrix inverses and practical applications such as volume calculations. 5. Analyze and compute eigenvectors and eigenvalues, and apply diagonalization techniques. Credits: 3.00

MA 27101 - Honors Multivariate Calculus (UCC: QR)

Credit Hours: 5.00. This course is the Honors version of MA 26100, Multivariate Calculus; it will also include a review of infinite series. The course is intended for first-year students who have credit for Calculus I and II. There will be a significant emphasis on conceptual explanation, but not on formal proof. Permission of department is required.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Know techniques of vector algebra and be able to apply these to the geometry of space; in particular they will be able to find equations for lines and planes in space. 2. Find equations for standard surfaces in space. 3. Use vector methods to analyze motion in space, and calculate arc length and curvature. 4. Acquire a conceptual and computational knowledge of infinite series; in particular they will be able to test for convergence, and to do calculations with power series. 5. Understand the meaning of partial derivatives in various situations, and will be able to calculate with them. 6. Know the multivariable chain rule and its meaning, and will be able to apply it to calculate derivatives in various situations. 7. Know the meaning of directional derivatives and how to calculate them. 8. Find tangent planes. 9. Find and classify extreme values and saddle points and use the method of Lagrange multipliers. 10. Know the meaning of multiple integrals and how to calculate them. 11. Know the meaning of line integrals and surface integrals and how to calculate them. 12. Know Green's theorem, Stokes' theorem, and the divergence theorem and their applications. Credits: 5.00

Required CS Major Core Courses (21 credits)

CS 18000 - Problem Solving And Object-Oriented Programming

Credit Hours: 4.00. Problem solving and algorithms, implementation of algorithms in a high level programming language, conditionals, the iterative approach and debugging, collections of data, searching and sorting, solving problems by decomposition, the object-oriented approach, subclasses of existing classes, handling exceptions that occur when the program is running, graphical user interfaces (GUIs), data stored in files, abstract data types, a glimpse at topics from other CS courses. Intended primarily for students majoring in computer sciences. Credit cannot be obtained for both CS 18000 and any of 15600, 15800 and 15900. Not open to students with credit in CS 24000.

Learning Outcomes: 1. Understand solving problems by analyzing the problem, designing an algorithm, and programming the solution. Credits: 4.00

CS 18200 - Foundations Of Computer Science

Credit Hours: 3.00. Logic and proofs; sets, functions, relations, sequences and summations; number representations; counting; fundamentals of the analysis of algorithms; graphs and trees; proof techniques; recursion; Boolean logic; finite state machines; pushdown automata; computability and undecidability.

Learning Outcomes: 1. Understand discrete mathematical tools, facts, and reasoning relevant to computer science. Credits: 3.00

CS 24000 - Programming In C

Credit Hours: 3.00. The UNIX environment, C development cycle, data representation, operators, program structure, recursion, macros, C preprocessor, pointers and addresses, dynamic memory allocation, structures, unions, typedef, bit-fields, pointer/structure applications, UNIX file abstraction, file access, low-level I/O, concurrency.

Learning Outcomes: 1. Understand programming principles and techniques for problem solving in the C programming language. Credits: 3.00

CS 25000 - Computer Architecture

Credit Hours: 4.00. Digital logic: transistors, gates, and combinatorial circuits; clocks; registers and register banks; arithmetic-logic units; data representation: big-endian and little-endian integers; ones and twos complement arithmetic; signed and unsigned values; Von-Neumann architecture and bottleneck; instruction sets; RISC and CISC designs; instruction pipelines and stalls; rearranging code; memory and address spaces; physical and virtual memory; interleaving; page tables; memory caches; bus architecture; polling and interrupts; DMA; device programming; assembly language; optimizations; parallelism; data pipelining.

Learning Outcomes: 1. Students understand the function of basic hardware, including fundamentals of digital logic, processors, memory, and I/O. Credits: 4.00

CS 25100 - Data Structures And Algorithms

Credit Hours: 3.00. Running time analysis of algorithms and their implementations, one-dimensional data structures, trees, heaps, additional sorting algorithms, binary search trees, hash tables, graphs, directed graphs, weighted graph algorithms, additional topics.

Learning Outcomes: 1. Understand fundamental data structures, fundamental algorithms, and their implementation. Credits: 3.00

CS 25200 - Systems Programming

Credit Hours: 4.00. Low-level programming; review of addresses, pointers, memory layout, and data representation; text, data, and bss segments; debugging and hex dumps; concurrent execution with threads and processes; address spaces; file names; descriptors and file pointers; inheritance; system calls and library functions; standard I/O and string libraries; simplified socket programming; building tools to help programmers; make and make files; shell scripts and quoting; Unix tools including sed, echo, test, and find; scripting languages such as awk; version control; object and executable files (.o and a.out); symbol tables; pointers to functions; hierarchical directories; and DNS hierarchy; programming embedded systems.

Learning Outcomes: 1. Have an appreciation and ability for low-level (systems) programming and debugging. Credits: 4.00

Software Engineering Concentration (18 credits)

Required Courses

CS 30700 - Software Engineering I

Credit Hours: 3.00. An introduction to the methods and tools of software engineering; software life cycle; specification and design of software, software testing, cost and effort estimation; laboratory exercises with design, testing, and other tools.

Learning Outcomes: 1. Architect and design quality software. 2. Contrast and critique software lifecycle models. 3. Create software using current software engineering tools, methods, and concepts. 4. Work together on a team in a productive and professional manner. 5. Inspect and test software and documentation. Credits: 3.00

CS 35200 - Compilers: Principles And Practice

Credit Hours: 3.00. Should not be taken concurrently with CS 35400. The theory and practice of programming language translation, compilation, and run-time systems, organized around a significant programming project to build a compiler for a simple but nontrivial programming language. Modules, interfaces, tools. Data structures for tree languages. Lexical analysis, syntax analysis, abstract syntax. Symbol tables, semantic analysis. Translation, intermediate code, basic blocks, traces. Instruction selection, CISC and RISC machines. Liveness analysis, graph coloring register allocation. Supplemental material drawn from garbage collection, object-oriented languages, higher-order languages, dataflow analysis, optimization, polymorphism, scheduling and pipelining, memory hierarchies.

Learning Outcomes: 1. Provides students with an understanding of how a computer program is converted into elementary code that causes the computer to produce the output intended by the programmer. Credits: 3.00

CS 35400 - Operating Systems

Credit Hours: 3.00. Should not be taken concurrently with CS 35200. Introduction to operating systems. Computer system and operating system architectures, processes, inter-process communication, inter-process synchronization, mutual exclusion, deadlocks, memory hierarchy, virtual memory, CPU scheduling, file systems, I/O device management, security.

Learning Outcomes: 1. Provides students with an understanding of the fundamentals of computer operating systems. Credits: 3.00

CS 38100 - Introduction To The Analysis Of Algorithms

Credit Hours: 3.00. Techniques for analyzing the time and space requirements of algorithms. Application of these techniques to sorting, searching, pattern-matching, graph problems, and other selected problems. Brief introduction to the intractable (NP-hard) problems.

Learning Outcomes: 1. Use big O-notation to give asymptotic time and space bounds of algorithms. 2. Explain the use of big-Omega, big-Theta, and little-o notations. 3. Use recurrence relations to determine the time complexity of recursive algorithms. 4. Solve recurrence relations commonly arising in algorithm design. 5. Give examples that illustrate time-space trade-offs of algorithms. Credits: 3.00

CS 40800 - Software Testing

Credit Hours: 3.00. Preliminaries: errors and testing; software quality, requirements, behavior, and correctness; testing, debugging, verification; control flow graphs, dominators; types of testing; Test selection: from requirements, finite state models, and combinatorial designs; regression testing and test minimization; Test adequacy assessment: control and data flow; mutation based; testing tools.

Learning Outcomes: 1. Understand the basic technology related to software testing and debugging. 2. Differentiate between reliability and correctness. 3. Understand the impact of the saturation effect on the test process and its cost. 4. Understand the relationship between software development and test processes. 5. Apply a variety of black box test generation methods manually and using tools. 6. Use test adequacy criteria and understand their respective cost and effectiveness. 7. Select appropriate software test tools for a given testing task. Credits: 3.00

CS 40700 - Software Engineering Senior Project

Credit Hours: 3.00. A capstone course combining all the concepts students have learned in the Software Engineering Track: software and software engineering, working as a team leader and as a team member, Agile Software Development, Scrum Software Development, Version Control, basing software development on reusable technology, developing requirements (User Stories and Use Cases), modelling with classes, design patterns, focusing on users, modelling interactions and behavior, architecting and designing software, testing and inspecting, managing the software development process. This is a project course. Students are organized into 4-6 student teams. Each team completes a full-semester software engineering project. Each team creates a Project Charter, Product Backlog, Design, and for 3 Sprints -- Planning Document, Demo, Retrospective Document. The final demo is a formal presentation.

Learning Outcomes: 1. Understand the software development process. 2. Understand the best methods to plan, analyze, design, test, measure, and manage software projects. 3. Understand agile methodologies in general and

specifically Scrum. 4. Understand how to use version control systems in a team software engineering project. 5. Understand that good people are one of, if not the most important, requirements for successful projects. 6. Understand how to work on a team project as a team leader and/or team member. Credits: 3.00

Selective

CS 34800 - Information Systems

Credit Hours: 3.00. File organization and index structures; object-oriented database languages; the relational database model with introductions to SQL and DBMS; hierarchical models and network models with introductions to HDDL, HDML, and DBTG Codasyl; data mining; data warehousing; database connectivity; distributed databases; the client/server paradigm; middleware, including ODBC, JDBC, CORBA, and MOM.

Learning Outcomes: 1. Learn about different data models (relational, graph, and document) used in different database systems. 2. Learn how to pose complex database queries in SQL and NoSQL languages as well as theoretical query languages. 3. Gain an introductory background in indexing. 4. Learn about transactions and concurrency control. 5. Differentiate between OLTP and OLAP applications. Credits: 3.00

CS 35200 - Compilers: Principles And Practice

Credit Hours: 3.00. Should not be taken concurrently with CS 35400. The theory and practice of programming language translation, compilation, and run-time systems, organized around a significant programming project to build a compiler for a simple but nontrivial programming language. Modules, interfaces, tools. Data structures for tree languages. Lexical analysis, syntax analysis, abstract syntax. Symbol tables, semantic analysis. Translation, intermediate code, basic blocks, traces. Instruction selection, CISC and RISC machines. Liveness analysis, graph coloring register allocation. Supplemental material drawn from garbage collection, object-oriented languages, higher-order languages, dataflow analysis, optimization, polymorphism, scheduling and pipelining, memory hierarchies.

Learning Outcomes: 1. Provides students with an understanding of how a computer program is converted into elementary code that causes the computer to produce the output intended by the programmer. Credits: 3.00

CS 35300 - Principles Of Concurrency And Parallelism

Credit Hours: 3.00. Important concepts, models, algorithms, abstractions, and implementation aspects of concurrent and parallel programs. Topics include: techniques used to describe concurrent programs (e.g., threads, events, co-routines, continuations), abstractions for shared-memory and message-passing programs, relaxed memory models, livelock and deadlock detection, lock-free algorithms, data races and atomicity, scheduling techniques, process calculi, and software transactions.

Learning Outcomes: 1. This course provides students the vocabulary and concepts to better understand how to design and program scalable multicore processors. Credits: 3.00

CS 35400 - Operating Systems

Credit Hours: 3.00. Should not be taken concurrently with CS 35200. Introduction to operating systems. Computer system and operating system architectures, processes, inter-process communication, inter-process synchronization, mutual exclusion, deadlocks, memory hierarchy, virtual memory, CPU scheduling, file systems, I/O device management, security.

Learning Outcomes: 1. Provides students with an understanding of the fundamentals of computer operating systems. Credits: 3.00

CS 42200 - Computer Networks

Credit Hours: 3.00. Undergraduate-level introduction to computer networks and data communication. Low-level details of media, signals, and bits: time division and frequency division multiplexing; encoding; modulation; bandwidth, throughput, and noise. Packet transmission: Local Area Network (Ethernet, FDDI) and Wide Area Network technologies (ATM); wireless networks; network interconnection with repeaters, bridges, and switches; DSU/CSU; xDSL and cable modems. Internetworking: router-based architecture; IP addressing; address binding with ARP; datagram encapsulation and fragmentation; UDP and TCP, retransmission; protocol ports; ICMP and error handling. Network applications: client/server concept; port demultiplexing; program interface to protocols (API); use by clients and servers; domain name system; TELNET; Web technologies including HTTP, CGI, Java; RPC and middleware; network management.

Credits: 3.00

CS 42600 - Computer Security

Credit Hours: 3.00. A survey of the fundamentals of information security. Risks and vulnerabilities, policy formation, controls and protection methods, database security, encryption, authentication technologies, host-based and network-based security issues, personnel and physical security issues, issues of law and privacy.

Learning Outcomes: 1. Apply the notions of threat, vulnerability, attack, countermeasure, security objectives, and adversarial models when analyzing security of computer and information systems. 2. Explain the main authorization mechanisms and access control models, and their applicability in different situations. 3. Explain security issues related to password and other authentication mechanisms. 4. Explain the different types of malware, the mechanisms of their propagation, and the strengths and limitations of different defense mechanisms. 5. Identify the threats and vulnerabilities for a networked environment, and explain different countermeasures, and their effectiveness. 6. Explain the vulnerabilities brought about by modern web-based application and services, different countermeasures, and their effectiveness. Credits: 3.00

CS 44800 - Introduction To Relational Database Systems

Credit Hours: 3.00. An in-depth examination of relational database systems including theory and concepts as well as practical issues in relational databases. Modern database technologies such as object-relational and Web-based access to relational databases. Conceptual design and entity relationship modeling, relational algebra and calculus, data definition and manipulation languages using SQL, schema and view management, query processing and optimization, transaction management, security, privacy, integrity management.

Learning Outcomes: 1. Learn data modeling: physical, logical and conceptual data models, the entity-relationship model. 2. Study logical and Physical Design and interaction with operating systems, disk Storage, Basic File Structures, Hashing, Indexing. 3. Learn the relational database model and implementation and performance issues. 4. Understand transaction Processing, concurrency control, atomicity control and recovery control. 5. Understand database privacy, integrity, and security. 6. Understand data mining, data warehousing, online analytical processing, and information retrieval. 7. Understand Cloud computing and Distributed Database Systems architectures, Big Data, Hadoop, MapReduce, and NoSQL. 8. Recognize performance issues. Credits: 3.00

CS 45600 - Programming Languages

Credit Hours: 3.00. Concepts for structuring data, computation, and whole programs. Object-oriented languages, functional languages, logic- and rule-based languages. Data types, type checking, exception handling, concurrent processes, synchronization, modularity, encapsulation, interfaces, separate compilation, inheritance, polymorphism, dynamic binding, subtyping, overloading, beta-reduction, unification.

Credits: 3.00

CS 47300 - Web Information Search And Management

Credit Hours: 3.00. This course teaches important concepts and knowledge of information retrieval for managing unstructured data such as text data on Web or in emails. At the same time, students will be exposed to a large number of important applications. Students in the course will get hands on experience from homework and a course project. The first part of the course focuses on general concepts/techniques such as stemming, indexing, vector space model, and feedback procedure. The second part of the course shows how to apply the set of techniques on different applications such as Web search, text categorization, and information recommendation.

Learning Outcomes: 1. Understand the important concepts and techniques of information retrieval and how to apply these techniques to a set of important or real world applications. Credits: 3.00

CS 49000 - Topics In Computer Sciences For Undergraduates

Credit Hours: 1.00 to 5.00. Supervised reading and reports in various fields. Permission of instructor required.

Credits: 1.00 to 5.00

CS 51000 - Software Engineering

Credit Hours: 3.00. Software life cycles, requirements engineering, software design, design of distributed systems, verification and validation, software architecture, process metrics and models, and research methods in software engineering.

Credits: 3.00

CS 37300 - Data Mining And Machine Learning

Credit Hours: 3.00. This course will introduce students to the field of data mining and machine learning, which sits at the interface between statistics and computer science. Data mining and machine learning focuses on developing algorithms to automatically discover patterns and learn models of large datasets. This course introduces students to the process and main techniques in data mining and machine learning, including exploratory data analysis, predictive modeling, descriptive modeling, and evaluation.

Learning Outcomes: 1. Identify key elements of data mining and machine learning algorithms. 2. Understand how algorithmic elements interact to impact performance. 3. Understand how to choose algorithms for different analysis tasks. 4. Analyze data in both an exploratory and targeted manner. 5. Implement and apply basic algorithms for supervised and unsupervised learning. 6. Accurately evaluate the performance of algorithms, as well as formulate and test hypotheses. Credits: 3.00

CS 48900 - Embedded Systems

Credit Hours: 3.00. Software for embedded systems; programming with extreme constraints on memory, storage, and processing power; programming models, including synchronous, asynchronous, and concurrent; programming systems that run forever; use of Finite State Machines (FSMs); review of embedded hardware and available boards; asynchronous and synchronous serial connections (e.g., RS232 and SPI); General Purpose I/O (GPIO) pins; relays, servos, and other peripherals; design for low power; battery characteristics; systems that communicate over computer networks and the Internet; current industry practices; design of embedded projects; working in teams. CS 35200 (Compilers) and CS 35400 (Operating Systems) are recommended, but not required.

Learning Outcomes: 1. Understand basics of embedded systems. 2. Understand how and why many Internet of Things (IoT) devices use the cloud. 3. Understand how embedded systems are employed in a variety of situations, including smart homes and buildings, security systems, cars, and planes. 4. Understand the three basic programming models, and when each is appropriate. 5. Understand how synchronous and asynchronous serial devices operate. 6. General characteristics of batteries and which type of battery is appropriate for various embedded designs. 7. Understand the use of relays and how embedded logic that operates on low voltage can control high voltage peripherals. 8. Understand why systems that use sensors and actuators must be calibrated. 9. Understand how to build and demonstrate a working embedded system. Credits: 3.00

CS 35100 - Cloud Computing

Credit Hours: 3.00. Introduction to cloud computing. Cloud data center infrastructure, public and private clouds, servers and virtualized servers, data center networks and virtualized networks, virtualized disk, file, and object storage, the concept of scale-out, algorithms and programming systems used in the design and implementation of cloud-native software, especially using containers and orchestration systems, microservices, serverless designs, controller-based designs, edge and fog computing, security in a cloud environment, programming models.

Learning Outcomes: 1. Describe physical facilities and virtualized technologies used in a cloud data center. 2. Understand major algorithms and programming paradigms used to build cloud-native software. 3. Design and deploy containerized software in a cloud environment. 4. Demonstrate orchestration of container software. Credits: 3.00

CS 31100 - Competitive Programming II

Credit Hours: 2.00. CP2 teaches experienced programmers additional techniques to solve interview and competitive programming problems and builds on material learned in CP1. This includes specific algorithmic techniques such as [shortest paths, topological sort, MST, union find, range queries], advanced algorithms surrounding trees and DAGs, advanced

problem types in [dynamic programming, backtracking/simulation, mathematics, string processing], and more. It can be viewed as a programming complement to CS 38100, with some overlap in content.

Learning Outcomes: 1. Differentiate between advanced categories of problems in computer science including backtracking/simulation, advanced dynamic programming, advanced graphs (including trees and DAGs), mathematics, string processing, and range queries, as well as subcategories in each of these categories. 2. Implement well-known solutions (as discussed in class) to advanced categories of problems in computer science (listed in LO1). 3. Identify when a problem spans multiple categories of problems (as listed in LO1) 4. Design algorithms to solve problems that span multiple categories of problems. 5. Use new/novel algorithms to solve advanced problems. 6. Recognize key characteristics of certain problem types listed in LO1. 7. Classify an advanced problem by those key characteristics. 8. Deconstruct an advanced problem into subproblems that can be solved individually. 9. Determine runtime and space usage of a potential solution using big-O notation to judge if the potential solution will work. 10. Create an efficient solution to a problem based on analysis of the problem type, the deconstructed problem parts, and the time and space constraints of the problem. 11. Reflect on how one came up with a solution to a problem in order to better recognize patterns in problem types. Credits: 2.00

CS 41100 - Competitive Programming III

Credit Hours: 2.00. CP3 teaches experienced programmers additional techniques to solve competitive programming problems and builds on material learned in CP1 and CP2. This includes algorithmic techniques in topics such as [network flow, computational geometry, graph matching, NP-hard problems]. Primarily, CP3 prepares students to compete in programming contests, which means most class time is focused on simulating contest environments and teaching teamwork and communication alongside problem practice.

Learning Outcomes: 1. Differentiate between advanced categories of problems in computer science including network flow, computational geometry, graph matching, and NP-hard problems, as well as subcategories in each of these categories. 2. Extrapolate generalized solutions and problem-solving strategies across advanced categories listed in LO1 as well as in general competitive programming categories. 3. Design algorithms to solve problems that span multiple advanced categories of problems, combining categorical solutions in complex ways. 4. Use new/novel algorithms to solve advanced problems. 5. Deconstruct an advanced problem into subproblems that can be solved individually. 6. Quickly determine runtime and space usage of a potential solution using big-O notation to judge if the potential solution will work. 7. Create an efficient solution to a problem based on analysis of the problem type, the deconstructed problem parts, and the time and space constraints of the problem. 8. Communicate ideas quickly and concisely to other competitive programmers to create efficient solutions. Credits: 2.00

Software Engineering Senior Project

Concentration Notes

Required CS Honors (12-13 credits)

CS 39700 - Honors Seminar

Credit Hours: 0.00. A seminar for all sophomores, juniors, and seniors in the Computer Sciences Honors Program. Meets eight times each semester under the supervision of the Honors coordinator. The meetings focus on honors research projects, helping students to identify appropriate projects and form groups, and providing a forum for juniors and seniors to report on their projects as required in the honors program.

Credits: 0.00

CS 49700 - Honors Research Project

Credit Hours: 3.00. One semester of the project may be counted as one of the seven computer science courses at or above the 300 level required for the bachelor's degree. One more semester, if approved by the honors coordinator, can be used as a free elective. A group research project directed by Computer Sciences faculty members. Each group must submit a technical report describing its work and the results obtained.

Credits: 3.00

MA 35100 - Elementary Linear Algebra (UCC: QR)

Credit Hours: 3.00. Systems of linear equations, finite dimensional vector spaces, matrices, determinants, eigenvalues and eigenvector applications to analytical geometry. Not open to students with credit in MA 26500.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Solve systems of linear equations using concepts such as vector spaces, linear dependence, and Gaussian elimination. 2. Understand and test for linear independence, calculate the dimension of vector spaces, and apply the rank-nullity theorem in various contexts. 3. Define and apply linear transformations, including matrix multiplication, inverses, LU factorization, and coordinate transformations. 4. Compute and understand determinants, including their use in calculating matrix inverses and practical applications such as volume calculations. 5. Analyze and compute eigenvectors and eigenvalues, and apply diagonalization techniques. Credits: 3.00

MA 41600 - Probability

Credit Hours: 3.00. (STAT 41600) An introduction to mathematical probability suitable as a preparation for actuarial science, statistical theory, and mathematical modeling. General probability rules, conditional probability and Bayes theorem, discrete and continuous random variables, moments and moment generating functions, joint and conditional distributions, standard discrete and continuous distributions and their properties, law of large numbers and central limit theorem.

Credits: 3.00

MA 51800 - Advanced Discrete Mathematics

Credit Hours: 3.00. The course covers mathematics useful in analyzing computer algorithms. Topics include recurrence relations, evaluation of sums, integer functions, elementary number theory, binomial coefficients, generating functions, discrete probability, and asymptotic methods.

Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

MA 35301 - Linear Algebra II

Credit Hours: 3.00. Theoretical background for methods and

results that appear in MA 35100. Inner products, orthogonality, and applications including least squares.

Learning Outcomes: 1. Perform rigorous proofs using the definitions of vector space, subspace, linear combination of vectors, linear dependence and linear independence, bases and dimension. 2. Perform rigorous proofs using the definitions of linear transformation and the null space and range of a linear transformation. 3. Exhibit a clear understanding of the relationship between composition of linear transformation and matrix multiplication. 4. Understand elementary matrices and their use in describing the solution set of a system of linear equations. 5. Understand that the determinant function on n x n matrices with entries in a field F is a function that may be defined recursively, and may be uniquely defined as an alternating multilinear form which takes the identity matrix to 1. 6. Perform rigorous proofs involving eigenvalues and eigenvectors. 7. Understand and be able to apply conditions for a linear operator on a finite-dimensional vector space to be diagonalizable. 8. Preform calculations with Gram-Schmidt, least squares and related topics. 9. Students should be able to do rigorous proofs involving inner product spaces and related topics. Credits: 3.00

Other Departmental/Program Course Requirements (31-55 credits)

College of Science Additional Requirements

Computing (3-4 credits)

Laboratory Science (6-8 credits)

Mathematics (8-10 credits)

MA 16100 - Plane Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 5.00. Introduction to differential and integral calculus of one variable, with applications. Some schools or departments may allow only 4 credit hours toward graduation for this course. Designed for students who have not had at least a one-semester calculus course in high school, with a grade of "A" or "B". Not open to students with credit in MA 16500 . Demonstrated competence in college algebra and trigonometry.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions Credits: 5.00

MA 16200 - Plane Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 5.00. Continuation of MA 16100 . Vectors in two and three dimensions, techniques of integration, infinite series, conic sections, polar coordinates, surfaces in three dimensions. Some schools or departments may allow only 4 credit hours toward graduation for this course.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric

functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 5.00

MA 16500 - Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 4.00. Introduction to differential and integral calculus of one variable, with applications. Conic sections. Designed for students who have had at least a one-semester calculus course in high school, with a grade of "A" or "B", but are not qualified to enter MA 16200 or MA 16600 or the advanced placement courses MA 17300 or the honors calculus course MA 18100. Demonstrated competence in college algebra and trigonometry. CTL:IMA 1602 Calculus - Long I

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems. 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions. Credits: 4.00

MA 16600 - Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 4.00. Continuation of MA 16500 . Vectors in two and three dimensions. Techniques of integration, infinite series, polar coordinates, surfaces in three dimensions. Not open to students with credit in MA 16200 . CTL:IMA 1603 Calculus - Long II

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 4.00

Statistics (3 credits)

STAT 35000 - Introduction To Statistics

Credit Hours: 3.00. This course provides a data-oriented introduction to applied statistics, covering exploratory data analysis, experimental design, probability distributions, simulation, sampling distributions, and the Central Limit Theorem. Students will learn the fundamentals of statistical inference, including confidence intervals and hypothesis tests for population means, paired and independent comparisons of means, analysis of variance, and regression. The course emphasizes hands-on experience with statistical software and is primarily intended for students majoring in the mathematical sciences. Prerequisite: two semesters of college calculus.

Learning Outcomes: 1. Understand basic terms, graphs, and symbols and be able to interpret statistics in the media. 2. Understand and be able to explain statistical processes and be able to fully interpret statistical results. 3. Understand why and how statistical investigations are conducted and the "big ideas" that underlie statistical investigations. 4. Be able to use a statistical package (R or SAS) to analyze data and interpret result. 5. Big Ideas in Statistics: variability, distributions, and models; causation vs correlation; practical significance vs statistical significance, etc. Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100,

STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

Electives (5-31 credits)

Grade Requirements

GPA Requirements

Course Requirements & Notes

Sample 4-Year Plan

Fall 1st Year

CS 18000 - Problem Solving And Object-Oriented Programming

Credit Hours: 4.00. Problem solving and algorithms, implementation of algorithms in a high level programming language, conditionals, the iterative approach and debugging, collections of data, searching and sorting, solving problems by decomposition, the object-oriented approach, subclasses of existing classes, handling exceptions that occur when the program is running, graphical user interfaces (GUIs), data stored in files, abstract data types, a glimpse at topics from other CS courses. Intended primarily for students majoring in computer sciences. Credit cannot be obtained for both CS 18000 and any of 15600, 15800 and 15900. Not open to students with credit in CS 24000.

Learning Outcomes: 1. Understand solving problems by analyzing the problem, designing an algorithm, and programming the solution. Credits: 4.00

MA 16100 - Plane Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 5.00. Introduction to differential and integral calculus of one variable, with applications. Some schools or departments may allow only 4 credit hours toward graduation for this course. Designed for students who have not had at least a one-semester calculus course in high school, with a grade of "A" or "B". Not open to students with credit in MA 16500 . Demonstrated competence in college algebra and trigonometry.

University Core Curriculum (UCC): (UCC: QR)
Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions Credits: 5.00

MA 16500 - Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 4.00. Introduction to differential and integral

calculus of one variable, with applications. Conic sections. Designed for students who have had at least a one-semester calculus course in high school, with a grade of "A" or "B", but are not qualified to enter MA 16200 or MA 16600 or the advanced placement courses MA 17300 or the honors calculus course MA 18100. Demonstrated competence in college algebra and trigonometry. CTL:IMA 1602 Calculus - Long I

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems. 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions. Credits: 4.00

15-17 Credits

Spring 1st Year

CS 18200 - Foundations Of Computer Science

Credit Hours: 3.00. Logic and proofs; sets, functions, relations, sequences and summations; number representations; counting; fundamentals of the analysis of algorithms; graphs and trees; proof techniques; recursion; Boolean logic; finite state machines; pushdown automata; computability and undecidability.

Learning Outcomes: 1. Understand discrete mathematical tools, facts, and reasoning relevant to computer science. Credits: 3.00

CS 24000 - Programming In C

Credit Hours: 3.00. The UNIX environment, C development cycle, data representation, operators, program structure, recursion, macros, C preprocessor, pointers and addresses, dynamic memory allocation, structures, unions, typedef, bit-fields, pointer/structure applications, UNIX file abstraction, file access, low-level I/O, concurrency.

Learning Outcomes: 1. Understand programming principles and techniques for problem solving in the C programming language. Credits: 3.00

MA 16200 - Plane Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 5.00. Continuation of MA 16100 . Vectors in two and three dimensions, techniques of integration, infinite series, conic sections, polar coordinates, surfaces in three dimensions. Some schools or departments may allow only 4 credit hours toward graduation for this course.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 5.00

MA 16600 - Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 4.00. Continuation of MA 16500 . Vectors in two and three dimensions. Techniques of integration, infinite series, polar coordinates, surfaces in three dimensions. Not open to students with credit in MA 16200 . CTL:IMA 1603 Calculus - Long II

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series.

3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 4.00

15-17 Credits

Fall 2nd Year

CS 25000 - Computer Architecture

Credit Hours: 4.00. Digital logic: transistors, gates, and combinatorial circuits; clocks; registers and register banks; arithmetic-logic units; data representation: big-endian and little-endian integers; ones and twos complement arithmetic; signed and unsigned values; Von-Neumann architecture and bottleneck; instruction sets; RISC and CISC designs; instruction pipelines and stalls; rearranging code; memory and address spaces; physical and virtual memory; interleaving; page tables; memory caches; bus architecture; polling and interrupts; DMA; device programming; assembly language; optimizations; parallelism; data pipelining.

Learning Outcomes: 1. Students understand the function of basic hardware, including fundamentals of digital logic, processors, memory, and I/O. Credits: 4.00

CS 25100 - Data Structures And Algorithms

Credit Hours: 3.00. Running time analysis of algorithms and their implementations, one-dimensional data structures, trees, heaps, additional sorting algorithms, binary search trees, hash tables, graphs, directed graphs, weighted graph algorithms, additional topics.

Learning Outcomes: 1. Understand fundamental data structures, fundamental algorithms, and their implementation. Credits: 3.00

MA 26100 - Multivariate Calculus (UCC: QR)

Credit Hours: 4.00. Planes, lines, and curves in three dimensions. Differential calculus of several variables; multiple integrals. Introduction to vector calculus. Not open to students with credit in MA 17400 or 27100.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Know the equations for lines, planes and quadric surfaces in three dimensional space, and understand how these equations relate to the geometry. 2. Understand the relationship between vector functions and parametrized motion; know how to calculate velocity, acceleration, arc length and curvature. 3. Know the meaning of partial derivatives and how to calculate them. Know the multivariable chain rule. 4. Know the meaning of the gradient, how to calculate it, and how to apply it to directional derivatives and maximum and minimum values. 5. Understand the meaning of double and triple integrals; know how to compute them and how to apply them. 6. Understand the meaning of vector fields and line integrals. Know Green's theorem and be able to apply it. 7. Understand the meaning of surface integrals and know how to calculate them. Know Stokes' theorem and be able to apply it. Credits: 4.00

MA 27101 - Honors Multivariate Calculus (UCC: QR)

Credit Hours: 5.00. This course is the Honors version of MA 26100, Multivariate Calculus; it will also include a review of infinite series. The course is intended for first-year students who have credit for Calculus I and II. There will be a significant emphasis on conceptual explanation, but not on formal proof. Permission of department is required.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Know techniques of vector algebra and be able to apply these to the geometry of space; in particular they will be able to find equations for lines and planes in space. 2. Find equations for standard surfaces in space. 3. Use vector methods to analyze motion in space, and calculate arc length and curvature. 4. Acquire a conceptual and computational knowledge of infinite series; in particular they will be able to test for convergence, and to do calculations with power series. 5. Understand the meaning of partial

derivatives in various situations, and will be able to calculate with them. 6. Know the multivariable chain rule and its meaning, and will be able to apply it to calculate derivatives in various situations. 7. Know the meaning of directional derivatives and how to calculate them. 8. Find tangent planes. 9. Find and classify extreme values and saddle points and use the method of Lagrange multipliers. 10. Know the meaning of multiple integrals and how to calculate them. 11. Know the meaning of line integrals and surface integrals and how to calculate them. 12. Know Green's theorem, Stokes' theorem, and the divergence theorem and their applications. Credits: 5.00

15-17 Credits

Spring 2nd Year

CS 25200 - Systems Programming

Credit Hours: 4.00. Low-level programming; review of addresses, pointers, memory layout, and data representation; text, data, and bss segments; debugging and hex dumps; concurrent execution with threads and processes; address spaces; file names; descriptors and file pointers; inheritance; system calls and library functions; standard I/O and string libraries; simplified socket programming; building tools to help programmers; make and make files; shell scripts and quoting; Unix tools including sed, echo, test, and find; scripting languages such as awk; version control; object and executable files (.o and a.out); symbol tables; pointers to functions; hierarchical directories; and DNS hierarchy; programming embedded systems.

Learning Outcomes: 1. Have an appreciation and ability for low-level (systems) programming and debugging. Credits: 4.00

MA 35100 - Elementary Linear Algebra (UCC: QR)

Credit Hours: 3.00. Systems of linear equations, finite dimensional vector spaces, matrices, determinants, eigenvalues and eigenvector applications to analytical geometry. Not open to students with credit in MA 26500.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Solve systems of linear equations using concepts such as vector spaces, linear dependence, and Gaussian elimination. 2. Understand and test for linear independence, calculate the dimension of vector spaces, and apply the rank-nullity theorem in various contexts. 3. Define and apply linear transformations, including matrix multiplication, inverses, LU factorization, and coordinate transformations. 4. Compute and understand determinants, including their use in calculating matrix inverses and practical applications such as volume calculations. 5. Analyze and compute eigenvectors and eigenvalues, and apply diagonalization techniques. Credits: 3.00

16-17 Credits

Fall 3rd Year

MA 35100 - Elementary Linear Algebra (UCC: QR)

Credit Hours: 3.00. Systems of linear equations, finite dimensional vector spaces, matrices, determinants, eigenvalues and eigenvector applications to analytical geometry. Not open to students with credit in MA 26500.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Solve systems of linear equations using concepts such as vector spaces, linear dependence, and Gaussian elimination. 2. Understand and test for linear independence, calculate the dimension of vector spaces, and apply the rank-nullity theorem in various contexts. 3. Define and apply linear transformations, including matrix multiplication, inverses, LU factorization, and coordinate transformations. 4. Compute and understand determinants, including their use in calculating matrix inverses and practical applications such as volume calculations. 5. Analyze and compute eigenvectors and

eigenvalues, and apply diagonalization techniques. Credits: 3.00

MA 41600 - Probability

Credit Hours: 3.00. (STAT 41600) An introduction to mathematical probability suitable as a preparation for actuarial science, statistical theory, and mathematical modeling. General probability rules, conditional probability and Bayes theorem, discrete and continuous random variables, moments and moment generating functions, joint and conditional distributions, standard discrete and continuous distributions and their properties, law of large numbers and central limit theorem.

Credits: 3.00

STAT 35000 - Introduction To Statistics

Credit Hours: 3.00. This course provides a data-oriented introduction to applied statistics, covering exploratory data analysis, experimental design, probability distributions, simulation, sampling distributions, and the Central Limit Theorem. Students will learn the fundamentals of statistical inference, including confidence intervals and hypothesis tests for population means, paired and independent comparisons of means, analysis of variance, and regression. The course emphasizes hands-on experience with statistical software and is primarily intended for students majoring in the mathematical sciences. Prerequisite: two semesters of college calculus.

Learning Outcomes: 1. Understand basic terms, graphs, and symbols and be able to interpret statistics in the media. 2. Understand and be able to explain statistical processes and be able to fully interpret statistical results. 3. Understand why and how statistical investigations are conducted and the "big ideas" that underlie statistical investigations. 4. Be able to use a statistical package (R or SAS) to analyze data and interpret result. 5. Big Ideas in Statistics: variability, distributions, and models; causation vs correlation; practical significance vs statistical significance, etc. Credits: 3.00

MA 51800 - Advanced Discrete Mathematics

Credit Hours: 3.00. The course covers mathematics useful in analyzing computer algorithms. Topics include recurrence relations, evaluation of sums, integer functions, elementary number theory, binomial coefficients, generating functions, discrete probability, and asymptotic methods.

Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

MA 35301 - Linear Algebra II

Credit Hours: 3.00. Theoretical background for methods and results that appear in MA 35100. Inner products, orthogonality, and applications including least squares.

Learning Outcomes: 1. Perform rigorous proofs using the definitions of vector space, subspace, linear combination of vectors, linear

dependence and linear independence, bases and dimension. 2. Perform rigorous proofs using the definitions of linear transformation and the null space and range of a linear transformation. 3. Exhibit a clear understanding of the relationship between composition of linear transformation and matrix multiplication. 4. Understand elementary matrices and their use in describing the solution set of a system of linear equations. 5. Understand that the determinant function on n x n matrices with entries in a field F is a function that may be defined recursively, and may be uniquely defined as an alternating multilinear form which takes the identity matrix to 1. 6. Perform rigorous proofs involving eigenvalues and eigenvectors. 7. Understand and be able to apply conditions for a linear operator on a finite-dimensional vector space to be diagonalizable. 8. Preform calculations with Gram-Schmidt, least squares and related topics. 9. Students should be able to do rigorous proofs involving inner product spaces and related topics.
Credits: 3.00

16-17 Credits

Spring 3rd Year

15-16 Credits

Fall 4th Year

CS 39700 - Honors Seminar

Credit Hours: 0.00. A seminar for all sophomores, juniors, and seniors in the Computer Sciences Honors Program. Meets eight times each semester under the supervision of the Honors coordinator. The meetings focus on honors research projects, helping students to identify appropriate projects and form groups, and providing a forum for juniors and seniors to report on their projects as required in the honors program.
Credits: 0.00

15-17 Credits

Spring 4th Year

CS 49700 - Honors Research Project

Credit Hours: 3.00. One semester of the project may be counted as one of the seven computer science courses at or above the 300 level required for the bachelor's degree. One more semester, if approved by the honors coordinator, can be used as a free elective. A group research project directed by Computer Sciences faculty members. Each group must submit a technical report describing its work and the results obtained.
Credits: 3.00

15-17 Credits

Computer Science Honors: Systems Software, BS

About the Program

Degree Requirements

Computer Science Honors Major Courses (58-60 credits)

Required CS Honors Major Math Courses (7-8 credits)

MA 26100 - Multivariate Calculus (UCC: QR)

Credit Hours: 4.00. Planes, lines, and curves in three dimensions. Differential calculus of several variables; multiple integrals. Introduction to vector calculus. Not open to students with credit in MA 17400 or 27100.
University Core Curriculum (UCC): (UCC: QR)
Learning Outcomes: 1. Know the equations for lines, planes and quadric surfaces in three dimensional space, and understand how these equations relate to the geometry. 2. Understand

the relationship between vector functions and parametrized motion; know how to calculate velocity, acceleration, arc length and curvature. 3. Know the meaning of partial derivatives and how to calculate them. Know the multivariable chain rule. 4. Know the meaning of the gradient, how to calculate it, and how to apply it to directional derivatives and maximum and minimum values. 5. Understand the meaning of double and triple integrals; know how to compute them and how to apply them. 6. Understand the meaning of vector fields and line integrals. Know Green's theorem and be able to apply it. 7. Understand the meaning of surface integrals and know how to calculate them. Know Stokes' theorem and be able to apply it. Credits: 4.00

MA 35100 - Elementary Linear Algebra (UCC: QR)

Credit Hours: 3.00. Systems of linear equations, finite dimensional vector spaces, matrices, determinants, eigenvalues and eigenvector applications to analytical geometry. Not open to students with credit in MA 26500.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Solve systems of linear equations using concepts such as vector spaces, linear dependence, and Gaussian elimination. 2. Understand and test for linear independence, calculate the dimension of vector spaces, and apply the rank-nullity theorem in various contexts. 3. Define and apply linear transformations, including matrix multiplication, inverses, LU factorization, and coordinate transformations. 4. Compute and understand determinants, including their use in calculating matrix inverses and practical applications such as volume calculations. 5. Analyze and compute eigenvectors and eigenvalues, and apply diagonalization techniques. Credits: 3.00

MA 27101 - Honors Multivariate Calculus (UCC: QR)

Credit Hours: 5.00. This course is the Honors version of MA 26100, Multivariate Calculus; it will also include a review of infinite series. The course is intended for first-year students who have credit for Calculus I and II. There will be a significant emphasis on conceptual explanation, but not on formal proof. Permission of department is required.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Know techniques of vector algebra and be able to apply these to the geometry of space; in particular they will be able to find equations for lines and planes in space. 2. Find equations for standard surfaces in space. 3. Use vector methods to analyze motion in space, and calculate arc length and curvature. 4. Acquire a conceptual and computational knowledge of infinite series; in particular they will be able to test for convergence, and to do calculations with power series. 5. Understand the meaning of partial derivatives in various situations, and will be able to calculate with them. 6. Know the multivariable chain rule and its meaning, and will be able to apply it to calculate derivatives in various situations. 7. Know the meaning of directional derivatives and how to calculate them. 8. Find tangent planes. 9. Find and classify extreme values and saddle points and use the method of Lagrange multipliers. 10. Know the meaning of multiple integrals and how to calculate them. 11. Know the meaning of line integrals and surface integrals and how to calculate them. 12. Know Green's theorem, Stokes' theorem, and the divergence theorem and their applications. Credits: 5.00

Required CS Major Core Courses (21 credits)

CS 18000 - Problem Solving And Object-Oriented Programming

Credit Hours: 4.00. Problem solving and algorithms, implementation of algorithms in a high level programming language, conditionals, the iterative approach and debugging, collections of data, searching and sorting, solving problems by

decomposition, the object-oriented approach, subclasses of existing classes, handling exceptions that occur when the program is running, graphical user interfaces (GUIs), data stored in files, abstract data types, a glimpse at topics from other CS courses. Intended primarily for students majoring in computer sciences. Credit cannot be obtained for both CS 18000 and any of 15600, 15800 and 15900. Not open to students with credit in CS 24000.

Learning Outcomes: 1. Understand solving problems by analyzing the problem, designing an algorithm, and programming the solution. Credits: 4.00

CS 18200 - Foundations Of Computer Science

Credit Hours: 3.00. Logic and proofs; sets, functions, relations, sequences and summations; number representations; counting; fundamentals of the analysis of algorithms; graphs and trees; proof techniques; recursion; Boolean logic; finite state machines; pushdown automata; computability and undecidability.

Learning Outcomes: 1. Understand discrete mathematical tools, facts, and reasoning relevant to computer science. Credits: 3.00

CS 24000 - Programming In C

Credit Hours: 3.00. The UNIX environment, C development cycle, data representation, operators, program structure, recursion, macros, C preprocessor, pointers and addresses, dynamic memory allocation, structures, unions, typedef, bit-fields, pointer/structure applications, UNIX file abstraction, file access, low-level I/O, concurrency.

Learning Outcomes: 1. Understand programming principles and techniques for problem solving in the C programming language. Credits: 3.00

CS 25000 - Computer Architecture

Credit Hours: 4.00. Digital logic: transistors, gates, and combinatorial circuits; clocks; registers and register banks; arithmetic-logic units; data representation: big-endian and little-endian integers; ones and twos complement arithmetic; signed and unsigned values; Von-Neumann architecture and bottleneck; instruction sets; RISC and CISC designs; instruction pipelines and stalls; rearranging code; memory and address spaces; physical and virtual memory; interleaving; page tables; memory caches; bus architecture; polling and interrupts; DMA; device programming; assembly language; optimizations; parallelism; data pipelining.

Learning Outcomes: 1. Students understand the function of basic hardware, including fundamentals of digital logic, processors, memory, and I/O. Credits: 4.00

CS 25100 - Data Structures And Algorithms

Credit Hours: 3.00. Running time analysis of algorithms and their implementations, one-dimensional data structures, trees, heaps, additional sorting algorithms, binary search trees, hash tables, graphs, directed graphs, weighted graph algorithms, additional topics.

Learning Outcomes: 1. Understand fundamental data structures, fundamental algorithms, and their implementation. Credits: 3.00

CS 25200 - Systems Programming

Credit Hours: 4.00. Low-level programming; review of addresses, pointers, memory layout, and data representation; text, data, and bss segments; debugging and hex dumps; concurrent execution with threads and processes; address spaces; file names; descriptors and file pointers; inheritance; system calls and library functions; standard I/O and string libraries; simplified socket programming; building tools to help programmers; make and make files; shell scripts and quoting; Unix tools including sed, echo, test, and find; scripting languages such as awk; version control; object and executable files (.o and a.out); symbol tables; pointers to functions; hierarchical directories; and DNS hierarchy; programming embedded systems.

Learning Outcomes: 1. Have an appreciation and ability for low-level (systems) programming and debugging. Credits: 4.00

Systems Software Concentration (18 credits)

Required Courses

CS 35200 - Compilers: Principles And Practice

Credit Hours: 3.00. Should not be taken concurrently with CS 35400. The theory and practice of programming language translation, compilation, and run-time systems, organized around a significant programming project to build a compiler for a simple but nontrivial programming language. Modules, interfaces, tools. Data structures for tree languages. Lexical analysis, syntax analysis, abstract syntax. Symbol tables, semantic analysis. Translation, intermediate code, basic blocks, traces. Instruction selection, CISC and RISC machines.

Liveness analysis, graph coloring register allocation. Supplemental material drawn from garbage collection, object-oriented languages, higher-order languages, dataflow analysis, optimization, polymorphism, scheduling and pipelining, memory hierarchies.

Learning Outcomes: 1. Provides students with an understanding of how a computer program is converted into elementary code that causes the computer to produce the output intended by the programmer. Credits: 3.00

CS 35400 - Operating Systems

Credit Hours: 3.00. Should not be taken concurrently with CS 35200. Introduction to operating systems. Computer system and operating system architectures, processes, inter-process communication, inter-process synchronization, mutual exclusion, deadlocks, memory hierarchy, virtual memory, CPU scheduling, file systems, I/O device management, security.

Learning Outcomes: 1. Provides students with an understanding of the fundamentals of computer operating systems. Credits: 3.00

CS 42200 - Computer Networks

Credit Hours: 3.00. Undergraduate-level introduction to computer networks and data communication. Low-level details of media, signals, and bits: time division and frequency division multiplexing; encoding; modulation; bandwidth, throughput, and noise. Packet transmission: Local Area Network (Ethernet, FDDI) and Wide Area Network technologies (ATM); wireless networks; network interconnection with repeaters, bridges, and switches; DSU/CSU; xDSL and cable modems. Internetworking: router-based architecture; IP addressing; address binding with ARP; datagram encapsulation and fragmentation; UDP and TCP, retransmission; protocol ports; ICMP and error handling. Network applications: client/server concept; port demultiplexing; program interface to protocols (API); use by clients and servers; domain name system; TELNET; Web technologies including HTTP, CGI, Java; RPC and middleware; network management.

Credits: 3.00

Selectives

CS 30700 - Software Engineering I

Credit Hours: 3.00. An introduction to the methods and tools of software engineering; software life cycle; specification and design of software, software testing, cost and effort estimation; laboratory exercises with design, testing, and other tools.

Learning Outcomes: 1. Architect and design quality software. 2. Contrast and critique software lifecycle models. 3. Create software using current software engineering tools, methods, and concepts. 4. Work together on a team in a productive and professional manner. 5. Inspect and test software and documentation. Credits: 3.00

CS 33400 - Fundamentals Of Computer Graphics

Credit Hours: 3.00. Fundamental principles and techniques of computer graphics. The course covers the basics of going from a scene representation to a raster image using OpenGL. Specific topics include coordinate manipulations, perspective, basics of illumination and shading, color models, texture maps, clipping and basic raster algorithms, fundamentals of scene constructions. CS 31400 is recommended.

Credits: 3.00

CS 35300 - Principles Of Concurrency And Parallelism

Credit Hours: 3.00. Important concepts, models, algorithms, abstractions, and implementation aspects of concurrent and parallel programs. Topics include: techniques used to describe concurrent programs (e.g., threads, events, co-routines, continuations), abstractions for shared-memory and message-passing programs, relaxed memory models, livelock and deadlock detection, lock-free algorithms, data races and atomicity, scheduling techniques, process calculi, and software transactions.

Learning Outcomes: 1. This course provides students the vocabulary and concepts to better understand how to design and program scalable multicore processors. Credits: 3.00

CS 38100 - Introduction To The Analysis Of Algorithms

Credit Hours: 3.00. Techniques for analyzing the time and space requirements of algorithms. Application of these techniques to sorting, searching, pattern-matching, graph problems, and other selected problems. Brief introduction to the intractable (NP-hard) problems.

Learning Outcomes: 1. Use big O-notation to give asymptotic time and space bounds of algorithms. 2. Explain the use of big-Omega, big-Theta, and little-o notations. 3. Use recurrence relations to determine the time complexity of recursive algorithms. 4. Solve

recurrence relations commonly arising in algorithm design. 5. Give examples that illustrate time-space trade-offs of algorithms.
Credits: 3.00

CS 42600 - Computer Security

Credit Hours: 3.00. A survey of the fundamentals of information security. Risks and vulnerabilities, policy formation, controls and protection methods, database security, encryption, authentication technologies, host-based and network-based security issues, personnel and physical security issues, issues of law and privacy.

Learning Outcomes: 1. Apply the notions of threat, vulnerability, attack, countermeasure, security objectives, and adversarial models when analyzing security of computer and information systems. 2. Explain the main authorization mechanisms and access control models, and their applicability in different situations. 3. Explain security issues related to password and other authentication mechanisms. 4. Explain the different types of malware, the mechanisms of their propagation, and the strengths and limitations of different defense mechanisms. 5. Identify the threats and vulnerabilities for a networked environment, and explain different countermeasures, and their effectiveness. 6. Explain the vulnerabilities brought about by modern web-based application and services, different countermeasures, and their effectiveness.
Credits: 3.00

CS 44800 - Introduction To Relational Database Systems

Credit Hours: 3.00. An in-depth examination of relational database systems including theory and concepts as well as practical issues in relational databases. Modern database technologies such as object-relational and Web-based access to relational databases. Conceptual design and entity relationship modeling, relational algebra and calculus, data definition and manipulation languages using SQL, schema and view management, query processing and optimization, transaction management, security, privacy, integrity management.

Learning Outcomes: 1. Learn data modeling: physical, logical and conceptual data models, the entity-relationship model. 2. Study logical and Physical Design and interaction with operating systems, disk Storage, Basic File Structures, Hashing, Indexing. 3. Learn the relational database model and implementation and performance issues. 4. Understand transaction Processing, concurrency control, atomicity control and recovery control. 5. Understand database privacy, integrity, and security. 6. Understand data mining, data warehousing, online analytical processing, and information retrieval. 7. Understand Cloud computing and Distributed Database Systems architectures, Big Data, Hadoop, MapReduce, and NoSQL. 8. Recognize performance issues.
Credits: 3.00

CS 45600 - Programming Languages

Credit Hours: 3.00. Concepts for structuring data, computation, and whole programs. Object-oriented languages, functional languages, logic- and rule-based languages. Data types, type checking, exception handling, concurrent processes, synchronization, modularity, encapsulation, interfaces, separate compilation, inheritance, polymorphism, dynamic binding, subtyping, overloading, beta-reduction, unification.

Credits: 3.00

CS 49000 - Topics In Computer Sciences For Undergraduates

Credit Hours: 1.00 to 5.00. Supervised reading and reports in various fields. Permission of instructor required.

Credits: 1.00 to 5.00

CS 48900 - Embedded Systems

Credit Hours: 3.00. Software for embedded systems; programming with extreme constraints on memory, storage, and processing power; programming models, including synchronous, asynchronous, and concurrent; programming systems that run forever; use of Finite State Machines (FSMs); review of embedded hardware and available boards; asynchronous and synchronous serial connections (e.g., RS232 and SPI); General Purpose I/O (GPIO) pins; relays, servos, and other peripherals; design for low power; battery characteristics; systems that communicate over computer networks and the Internet; current industry practices; design of embedded projects; working in teams. CS 35200 (Compilers) and CS

35400 (Operating Systems) are recommended, but not required. Learning Outcomes: 1. Understand basics of embedded systems. 2. Understand how and why many Internet of Things (IoT) devices use the cloud. 3. Understand how embedded systems are employed in a variety of situations, including smart homes and buildings, security systems, cars, and planes. 4. Understand the three basic programming models, and when each is appropriate. 5. Understand how synchronous and asynchronous serial devices operate. 6. General characteristics of batteries and which type of battery is appropriate for various embedded designs. 7. Understand the use of relays and how embedded logic that operates on low voltage can control high voltage peripherals. 8. Understand why systems that use sensors and actuators must be calibrated. 9. Understand how to build and demonstrate a working embedded system. Credits: 3.00

CS 35100 - Cloud Computing

Credit Hours: 3.00. Introduction to cloud computing. Cloud data center infrastructure, public and private clouds, servers and virtualized servers, data center networks and virtualized networks, virtualized disk, file, and object storage, the concept of scale-out, algorithms and programming systems used in the design and implementation of cloud-native software, especially using containers and orchestration systems, microservices, serverless designs, controller-based designs, edge and fog computing, security in a cloud environment, programming models.

Learning Outcomes: 1. Describe physical facilities and virtualized technologies used in a cloud data center. 2. Understand major algorithms and programming paradigms used to build cloud-native software. 3. Design and deploy containerized software in a cloud environment. 4. Demonstrate orchestration of container software. Credits: 3.00

CS 31100 - Competitive Programming II

Credit Hours: 2.00. CP2 teaches experienced programmers additional techniques to solve interview and competitive programming problems and builds on material learned in CP1. This includes specific algorithmic techniques such as [shortest paths, topological sort, MST, union find, range queries], advanced algorithms surrounding trees and DAGs, advanced problem types in [dynamic programming, backtracking/simulation, mathematics, string processing], and more. It can be viewed as a programming complement to CS 38100, with some overlap in content.

Learning Outcomes: 1. Differentiate between advanced categories of problems in computer science including backtracking/simulation, advanced dynamic programming, advanced graphs (including trees and DAGs), mathematics, string processing, and range queries, as well as subcategories in each of these categories. 2. Implement well-known solutions (as discussed in class) to advanced categories of problems in computer science (listed in LO1). 3. Identify when a problem spans multiple categories of problems (as listed in LO1) 4. Design algorithms to solve problems that span multiple categories of problems. 5. Use new/novel algorithms to solve advanced problems. 6. Recognize key characteristics of certain problem types listed in LO1. 7. Classify an advanced problem by those key characteristics. 8. Deconstruct an advanced problem into subproblems that can be solved individually. 9. Determine runtime and space usage of a potential solution using big-O notation to judge if the potential solution will work. 10. Create an efficient solution to a problem based on analysis of the problem type, the deconstructed problem parts, and the time and space constraints of the problem. 11. Reflect on how one came up with a solution to a problem in order to better recognize patterns in problem types. Credits: 2.00

CS 41100 - Competitive Programming III

Credit Hours: 2.00. CP3 teaches experienced programmers additional techniques to solve competitive programming problems and builds on material learned in CP1 and CP2. This

includes algorithmic techniques in topics such as [network flow, computational geometry, graph matching, NP-hard problems]. Primarily, CP3 prepares students to compete in programming contests, which means most class time is focused on simulating contest environments and teaching teamwork and communication alongside problem practice.

Learning Outcomes: 1. Differentiate between advanced categories of problems in computer science including network flow, computational geometry, graph matching, and NP-hard problems, as well as subcategories in each of these categories. 2. Extrapolate generalized solutions and problem-solving strategies across advanced categories listed in LO1 as well as in general competitive programming categories. 3. Design algorithms to solve problems that span multiple advanced categories of problems, combining categorical solutions in complex ways. 4. Use new/novel algorithms to solve advanced problems. 5. Deconstruct an advanced problem into subproblems that can be solved individually. 6. Quickly determine runtime and space usage of a potential solution using big-O notation to judge if the potential solution will work. 7. Create an efficient solution to a problem based on analysis of the problem type, the deconstructed problem parts, and the time and space constraints of the problem. 8. Communicate ideas quickly and concisely to other competitive programmers to create efficient solutions. Credits: 2.00

Concentration Notes

Required CS Honors - (12-13 credits)

CS 39700 - Honors Seminar

Credit Hours: 0.00. A seminar for all sophomores, juniors, and seniors in the Computer Sciences Honors Program. Meets eight times each semester under the supervision of the Honors coordinator. The meetings focus on honors research projects, helping students to identify appropriate projects and form groups, and providing a forum for juniors and seniors to report on their projects as required in the honors program.

Credits: 0.00

CS 49700 - Honors Research Project

Credit Hours: 3.00. One semester of the project may be counted as one of the seven computer science courses at or above the 300 level required for the bachelor's degree. One more semester, if approved by the honors coordinator, can be used as a free elective. A group research project directed by Computer Sciences faculty members. Each group must submit a technical report describing its work and the results obtained.

Credits: 3.00

MA 35100 - Elementary Linear Algebra (UCC: QR)

Credit Hours: 3.00. Systems of linear equations, finite dimensional vector spaces, matrices, determinants, eigenvalues and eigenvector applications to analytical geometry. Not open to students with credit in MA 26500.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Solve systems of linear equations using concepts such as vector spaces, linear dependence, and Gaussian elimination. 2. Understand and test for linear independence, calculate the dimension of vector spaces, and apply the rank-nullity theorem in various contexts. 3. Define and apply linear transformations, including matrix multiplication, inverses, LU factorization, and coordinate transformations. 4. Compute and understand determinants, including their use in calculating matrix inverses and practical applications such as volume calculations. 5. Analyze and compute eigenvectors and eigenvalues, and apply diagonalization techniques. Credits: 3.00

MA 41600 - Probability

Credit Hours: 3.00. (STAT 41600) An introduction to mathematical probability suitable as a preparation for actuarial science, statistical theory, and mathematical modeling. General probability rules, conditional probability and Bayes theorem, discrete and continuous random variables, moments and moment generating functions, joint and conditional distributions, standard discrete and continuous distributions and their properties, law of large numbers and central limit theorem.

Credits: 3.00

MA 51800 - Advanced Discrete Mathematics

Credit Hours: 3.00. The course covers mathematics useful in analyzing computer algorithms. Topics include recurrence relations, evaluation of sums, integer functions, elementary number theory, binomial coefficients, generating functions, discrete probability, and asymptotic methods.

Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

MA 35301 - Linear Algebra II

Credit Hours: 3.00. Theoretical background for methods and results that appear in MA 35100. Inner products, orthogonality, and applications including least squares.

Learning Outcomes: 1. Perform rigorous proofs using the definitions of vector space, subspace, linear combination of vectors, linear dependence and linear independence, bases and dimension. 2. Perform rigorous proofs using the definitions of linear transformation and the null space and range of a linear transformation. 3. Exhibit a clear understanding of the relationship between composition of linear transformation and matrix multiplication. 4. Understand elementary matrices and their use in describing the solution set of a system of linear equations. 5. Understand that the determinant function on n x n matrices with entries in a field F is a function that may be defined recursively, and may be uniquely defined as an alternating multilinear form which takes the identity matrix to 1. 6. Perform rigorous proofs involving eigenvalues and eigenvectors. 7. Understand and be able to apply conditions for a linear operator on a finite-dimensional vector space to be diagonalizable. 8. Preform calculations with Gram-Schmidt, least squares and related topics. 9. Students should be able to do rigorous proofs involving inner product spaces and related topics.
Credits: 3.00

Other Departmental/Program Course Requirements (31-55 credits)

College of Science Additional Requirements

Computing (3-4 credits)

Laboratory Science (6-8 credits)

Mathematics (8-10 credits)

MA 16100 - Plane Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 5.00. Introduction to differential and integral calculus of one variable, with applications. Some schools or departments may allow only 4 credit hours toward graduation for this course. Designed for students who have not had at least a one-semester calculus course in high school, with a grade of "A" or "B". Not open to students with credit in MA 16500 . Demonstrated competence in college algebra and trigonometry.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions Credits: 5.00

MA 16200 - Plane Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 5.00. Continuation of MA 16100 . Vectors in two and three dimensions, techniques of integration, infinite series, conic sections, polar coordinates, surfaces in three dimensions. Some schools or departments may allow only 4 credit hours toward graduation for this course.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 5.00

MA 16500 - Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 4.00. Introduction to differential and integral calculus of one variable, with applications. Conic sections. Designed for students who have had at least a one-semester calculus course in high school, with a grade of "A" or "B", but are not qualified to enter MA 16200 or MA 16600 or the advanced placement courses MA 17300 or the honors calculus course MA 18100. Demonstrated competence in college algebra and trigonometry. CTL:IMA 1602 Calculus - Long I

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems. 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions. Credits: 4.00

MA 16600 - Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 4.00. Continuation of MA 16500 . Vectors in two and three dimensions. Techniques of integration, infinite series, polar coordinates, surfaces in three dimensions. Not open to students with credit in MA 16200 . CTL:IMA 1603 Calculus - Long II

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution,

work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 4.00

Statistics (3 credits)

STAT 35000 - Introduction To Statistics

Credit Hours: 3.00. This course provides a data-oriented introduction to applied statistics, covering exploratory data analysis, experimental design, probability distributions, simulation, sampling distributions, and the Central Limit Theorem. Students will learn the fundamentals of statistical inference, including confidence intervals and hypothesis tests for population means, paired and independent comparisons of means, analysis of variance, and regression. The course emphasizes hands-on experience with statistical software and is primarily intended for students majoring in the mathematical sciences. Prerequisite: two semesters of college calculus.

Learning Outcomes: 1. Understand basic terms, graphs, and symbols and be able to interpret statistics in the media. 2. Understand and be able to explain statistical processes and be able to fully interpret statistical results. 3. Understand why and how statistical investigations are conducted and the "big ideas" that underlie statistical investigations. 4. Be able to use a statistical package (R or SAS) to analyze data and interpret result. 5. Big Ideas in Statistics: variability, distributions, and models; causation vs correlation; practical significance vs statistical significance, etc. Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

Electives (5-31 credits)

Grade Requirements

GPA Requirements

Course Requirements & Notes

Sample 4-Year Plan

Fall 1st Year

CS 18000 - Problem Solving And Object-Oriented Programming

Credit Hours: 4.00. Problem solving and algorithms, implementation of algorithms in a high level programming language, conditionals, the iterative approach and debugging, collections of data, searching and sorting, solving problems by decomposition, the object-oriented approach, subclasses of existing classes, handling exceptions that occur when the program is running, graphical user interfaces (GUIs), data stored in files, abstract data types, a glimpse at topics from other CS courses. Intended primarily for students majoring in computer sciences. Credit cannot be obtained for both CS 18000 and any of 15600, 15800 and 15900. Not open to students with credit in CS 24000.

Learning Outcomes: 1. Understand solving problems by analyzing the problem, designing an algorithm, and programming the solution. Credits: 4.00

MA 16100 - Plane Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 5.00. Introduction to differential and integral calculus of one variable, with applications. Some schools or departments may allow only 4 credit hours toward graduation for this course. Designed for students who have not had at least a one-semester calculus course in high school, with a grade of "A" or "B". Not open to students with credit in MA 16500 . Demonstrated competence in college algebra and trigonometry.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions Credits: 5.00

MA 16500 - Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 4.00. Introduction to differential and integral calculus of one variable, with applications. Conic sections. Designed for students who have had at least a one-semester calculus course in high school, with a grade of "A" or "B", but are not qualified to enter MA 16200 or MA 16600 or the advanced placement courses MA 17300 or the honors calculus course MA 18100. Demonstrated competence in college algebra and trigonometry. CTL:IMA 1602 Calculus - Long I

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems. 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions. Credits: 4.00

15-17 Credits

Spring 1st Year

CS 18200 - Foundations Of Computer Science

Credit Hours: 3.00. Logic and proofs; sets, functions, relations, sequences and summations; number representations; counting; fundamentals of the analysis of algorithms; graphs and trees; proof techniques; recursion; Boolean logic; finite state machines; pushdown automata; computability and undecidability.

Learning Outcomes: 1. Understand discrete mathematical tools, facts, and reasoning relevant to computer science. Credits: 3.00

CS 24000 - Programming In C

Credit Hours: 3.00. The UNIX environment, C development cycle, data representation, operators, program structure, recursion, macros, C preprocessor, pointers and addresses, dynamic memory allocation, structures, unions, typedef, bit-fields, pointer/structure applications, UNIX file abstraction, file access, low-level I/O, concurrency.

Learning Outcomes: 1. Understand programming principles and techniques for problem solving in the C programming language. Credits: 3.00

MA 16200 - Plane Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 5.00. Continuation of MA 16100 . Vectors in two and three dimensions, techniques of integration, infinite series, conic sections, polar coordinates, surfaces in three dimensions. Some schools or departments may allow only 4 credit hours toward graduation for this course.

University Core Curriculum (UCC): (UCC: QR)
Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 5.00

MA 16600 - Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 4.00. Continuation of MA 16500 . Vectors in two and three dimensions. Techniques of integration, infinite series, polar coordinates, surfaces in three dimensions. Not open to students with credit in MA 16200 . CTL:IMA 1603 Calculus - Long II

University Core Curriculum (UCC): (UCC: QR)
Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 4.00

15-17 Credits

Fall 2nd Year

CS 25000 - Computer Architecture

Credit Hours: 4.00. Digital logic: transistors, gates, and combinatorial circuits; clocks; registers and register banks; arithmetic-logic units; data representation: big-endian and little-endian integers; ones and twos complement arithmetic; signed and unsigned values; Von-Neumann architecture and bottleneck; instruction sets; RISC and CISC designs; instruction pipelines and stalls; rearranging code; memory and address spaces; physical and virtual memory; interleaving; page tables; memory caches; bus architecture; polling and interrupts; DMA; device programming; assembly language; optimizations; parallelism; data pipelining.

Learning Outcomes: 1. Students understand the function of basic hardware, including fundamentals of digital logic, processors, memory, and I/O. Credits: 4.00

CS 25100 - Data Structures And Algorithms

Credit Hours: 3.00. Running time analysis of algorithms and their implementations, one-dimensional data structures, trees, heaps, additional sorting algorithms, binary search trees, hash tables, graphs, directed graphs, weighted graph algorithms, additional topics.

Learning Outcomes: 1. Understand fundamental data structures, fundamental algorithms, and their implementation. Credits: 3.00

MA 26100 - Multivariate Calculus (UCC: QR)

Credit Hours: 4.00. Planes, lines, and curves in three dimensions. Differential calculus of several variables; multiple integrals. Introduction to vector calculus. Not open to students with credit in MA 17400 or 27100.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Know the equations for lines, planes and quadric surfaces in three dimensional space, and understand how these equations relate to the geometry. 2. Understand the relationship between vector functions and parametrized motion; know how to calculate velocity, acceleration, arc length and curvature. 3. Know the meaning of partial derivatives and how to calculate them. Know the multivariable chain rule. 4. Know the meaning of the gradient, how to calculate it, and how to apply it to directional derivatives and maximum and minimum values. 5. Understand the meaning of double and triple integrals; know how to compute them and how to apply them. 6. Understand the meaning of vector fields and line integrals. Know Green's theorem and be able to apply it. 7. Understand the meaning of surface integrals and know how to calculate them. Know Stokes' theorem and be able to apply it. Credits: 4.00

MA 27101 - Honors Multivariate Calculus (UCC: QR)

Credit Hours: 5.00. This course is the Honors version of MA 26100, Multivariate Calculus; it will also include a review of infinite series. The course is intended for first-year students who have credit for Calculus I and II. There will be a significant emphasis on conceptual explanation, but not on formal proof. Permission of department is required.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Know techniques of vector algebra and be able to apply these to the geometry of space; in particular they will be able to find equations for lines and planes in space. 2. Find equations for standard surfaces in space. 3. Use vector methods to analyze motion in space, and calculate arc length and curvature. 4. Acquire a conceptual and computational knowledge of infinite series; in particular they will be able to test for convergence, and to do calculations with power series. 5. Understand the meaning of partial derivatives in various situations, and will be able to calculate with them. 6. Know the multivariable chain rule and its meaning, and will be able to apply it to calculate derivatives in various situations. 7. Know the meaning of directional derivatives and how to calculate them. 8. Find tangent planes. 9. Find and classify extreme values and saddle points and use the method of Lagrange multipliers. 10. Know the meaning of multiple integrals and how to calculate them. 11. Know the meaning of line integrals and surface integrals and how to calculate them. 12. Know Green's theorem, Stokes' theorem, and the divergence theorem and their applications. Credits: 5.00

15-17 Credits

Spring 2nd Year

CS 25200 - Systems Programming

Credit Hours: 4.00. Low-level programming; review of addresses, pointers, memory layout, and data representation; text, data, and bss segments; debugging and hex dumps; concurrent execution with threads and processes; address spaces; file names; descriptors and file pointers; inheritance; system calls and library functions; standard I/O and string libraries; simplified socket programming; building tools to help programmers; make and make files; shell scripts and quoting; Unix tools including sed, echo, test, and find; scripting languages such as awk; version control; object and executable files (.o and a.out); symbol tables; pointers to functions; hierarchical directories; and DNS hierarchy; programming embedded systems.

Learning Outcomes: 1. Have an appreciation and ability for low-level (systems) programming and debugging. Credits: 4.00

MA 35100 - Elementary Linear Algebra (UCC: QR)

Credit Hours: 3.00. Systems of linear equations, finite dimensional vector spaces, matrices, determinants, eigenvalues

and eigenvector applications to analytical geometry. Not open to students with credit in MA 26500.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Solve systems of linear equations using concepts such as vector spaces, linear dependence, and Gaussian elimination. 2. Understand and test for linear independence, calculate the dimension of vector spaces, and apply the rank-nullity theorem in various contexts. 3. Define and apply linear transformations, including matrix multiplication, inverses, LU factorization, and coordinate transformations. 4. Compute and understand determinants, including their use in calculating matrix inverses and practical applications such as volume calculations. 5. Analyze and compute eigenvectors and eigenvalues, and apply diagonalization techniques. Credits: 3.00

16-17 Credits

Fall 3rd Year

MA 35100 - Elementary Linear Algebra (UCC: QR)

Credit Hours: 3.00. Systems of linear equations, finite dimensional vector spaces, matrices, determinants, eigenvalues and eigenvector applications to analytical geometry. Not open to students with credit in MA 26500.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Solve systems of linear equations using concepts such as vector spaces, linear dependence, and Gaussian elimination. 2. Understand and test for linear independence, calculate the dimension of vector spaces, and apply the rank-nullity theorem in various contexts. 3. Define and apply linear transformations, including matrix multiplication, inverses, LU factorization, and coordinate transformations. 4. Compute and understand determinants, including their use in calculating matrix inverses and practical applications such as volume calculations. 5. Analyze and compute eigenvectors and eigenvalues, and apply diagonalization techniques. Credits: 3.00

MA 41600 - Probability

Credit Hours: 3.00. (STAT 41600) An introduction to mathematical probability suitable as a preparation for actuarial science, statistical theory, and mathematical modeling. General probability rules, conditional probability and Bayes theorem, discrete and continuous random variables, moments and moment generating functions, joint and conditional distributions, standard discrete and continuous distributions and their properties, law of large numbers and central limit theorem.

Credits: 3.00

STAT 35000 - Introduction To Statistics

Credit Hours: 3.00. This course provides a data-oriented introduction to applied statistics, covering exploratory data analysis, experimental design, probability distributions, simulation, sampling distributions, and the Central Limit Theorem. Students will learn the fundamentals of statistical inference, including confidence intervals and hypothesis tests for population means, paired and independent comparisons of means, analysis of variance, and regression. The course emphasizes hands-on experience with statistical software and is primarily intended for students majoring in the mathematical sciences. Prerequisite: two semesters of college calculus.

Learning Outcomes: 1. Understand basic terms, graphs, and symbols and be able to interpret statistics in the media. 2. Understand and be able to explain statistical processes and be able to fully interpret statistical results. 3. Understand why and how statistical investigations are conducted and the "big ideas" that underlie statistical investigations. 4. Be able to use a statistical package (R or SAS) to analyze data and interpret result. 5. Big Ideas in Statistics: variability, distributions, and models; causation vs correlation; practical significance vs statistical significance, etc. Credits: 3.00

MA 51800 - Advanced Discrete Mathematics

Credit Hours: 3.00. The course covers mathematics useful in analyzing computer algorithms. Topics include recurrence relations, evaluation of sums, integer functions, elementary number theory, binomial coefficients, generating functions,

discrete probability, and asymptotic methods.

Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

MA 35301 - Linear Algebra II

Credit Hours: 3.00. Theoretical background for methods and results that appear in MA 35100. Inner products, orthogonality, and applications including least squares.

Learning Outcomes: 1. Perform rigorous proofs using the definitions of vector space, subspace, linear combination of vectors, linear dependence and linear independence, bases and dimension. 2. Perform rigorous proofs using the definitions of linear transformation and the null space and range of a linear transformation. 3. Exhibit a clear understanding of the relationship between composition of linear transformation and matrix multiplication. 4. Understand elementary matrices and their use in describing the solution set of a system of linear equations. 5. Understand that the determinant function on n x n matrices with entries in a field F is a function that may be defined recursively, and may be uniquely defined as an alternating multilinear form which takes the identity matrix to 1. 6. Perform rigorous proofs involving eigenvalues and eigenvectors. 7. Understand and be able to apply conditions for a linear operator on a finite-dimensional vector space to be diagonalizable. 8. Preform calculations with Gram-Schmidt, least squares and related topics. 9. Students should be able to do rigorous proofs involving inner product spaces and related topics.

Credits: 3.00

16-17 Credits

Spring 3rd Year

15-16 Credits

Fall 4th Year

CS 39700 - Honors Seminar

Credit Hours: 0.00. A seminar for all sophomores, juniors, and seniors in the Computer Sciences Honors Program. Meets eight times each semester under the supervision of the Honors coordinator. The meetings focus on honors research projects,

helping students to identify appropriate projects and form groups, and providing a forum for juniors and seniors to report on their projects as required in the honors program.

Credits: 0.00

15-17 Credits

Spring 4th Year

CS 49700 - Honors Research Project

Credit Hours: 3.00. One semester of the project may be counted as one of the seven computer science courses at or above the 300 level required for the bachelor's degree. One more semester, if approved by the honors coordinator, can be used as a free elective. A group research project directed by Computer Sciences faculty members. Each group must submit a technical report describing its work and the results obtained.

Credits: 3.00

15-17 Credits

Computer Science: Algorithmic Foundations, BS

About the Program

Degree Requirements

Computer Science Major Courses (46-47 credits)

Required CS Major Math Courses (7-8 credits)

MA 26100 - Multivariate Calculus (UCC: QR)

Credit Hours: 4.00. Planes, lines, and curves in three dimensions. Differential calculus of several variables; multiple integrals. Introduction to vector calculus. Not open to students with credit in MA 17400 or 27100.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Know the equations for lines, planes and quadric surfaces in three dimensional space, and understand how these equations relate to the geometry. 2. Understand the relationship between vector functions and parametrized motion; know how to calculate velocity, acceleration, arc length and curvature. 3. Know the meaning of partial derivatives and how to calculate them. Know the multivariable chain rule. 4. Know the meaning of the gradient, how to calculate it, and how to apply it to directional derivatives and maximum and minimum values. 5. Understand the meaning of double and triple integrals; know how to compute them and how to apply them. 6. Understand the meaning of vector fields and line integrals. Know Green's theorem and be able to apply it. 7. Understand the meaning of surface integrals and know how to calculate them. Know Stokes' theorem and be able to apply it. Credits: 4.00

MA 26500 - Linear Algebra (UCC: QR)

Credit Hours: 3.00. Introduction to linear algebra. Systems of linear equations, matrix algebra, vector spaces, determinants, eigenvalues and eigenvectors, diagonalization of matrices, applications. Not open to students with credit in MA 26200, 27200, 35000 or 35100.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Learn the basic properties of matrices. 2. Learn how to solve systems of linear equations. 3. Learn the basic properties of determinants. 4. Learn about linear independence, spanning sets and bases in the context of vector spaces. 5. Learn the theory of inner product spaces and how it applies to least-squares approximations. 6. Learn the theory of eigenvalues and eigenvectors and how it applies to systems of differential equations. Credits: 3.00

MA 35100 - Elementary Linear Algebra (UCC: QR)

Credit Hours: 3.00. Systems of linear equations, finite dimensional vector spaces, matrices, determinants, eigenvalues

and eigenvector applications to analytical geometry. Not open to students with credit in MA 26500.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Solve systems of linear equations using concepts such as vector spaces, linear dependence, and Gaussian elimination. 2. Understand and test for linear independence, calculate the dimension of vector spaces, and apply the rank-nullity theorem in various contexts. 3. Define and apply linear transformations, including matrix multiplication, inverses, LU factorization, and coordinate transformations. 4. Compute and understand determinants, including their use in calculating matrix inverses and practical applications such as volume calculations. 5. Analyze and compute eigenvectors and eigenvalues, and apply diagonalization techniques. Credits: 3.00

MA 27101 - Honors Multivariate Calculus (UCC: QR)

Credit Hours: 5.00. This course is the Honors version of MA 26100, Multivariate Calculus; it will also include a review of infinite series. The course is intended for first-year students who have credit for Calculus I and II. There will be a significant emphasis on conceptual explanation, but not on formal proof. Permission of department is required.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Know techniques of vector algebra and be able to apply these to the geometry of space; in particular they will be able to find equations for lines and planes in space. 2. Find equations for standard surfaces in space. 3. Use vector methods to analyze motion in space, and calculate arc length and curvature. 4. Acquire a conceptual and computational knowledge of infinite series; in particular they will be able to test for convergence, and to do calculations with power series. 5. Understand the meaning of partial derivatives in various situations, and will be able to calculate with them. 6. Know the multivariable chain rule and its meaning, and will be able to apply it to calculate derivatives in various situations. 7. Know the meaning of directional derivatives and how to calculate them. 8. Find tangent planes. 9. Find and classify extreme values and saddle points and use the method of Lagrange multipliers. 10. Know the meaning of multiple integrals and how to calculate them. 11. Know the meaning of line integrals and surface integrals and how to calculate them. 12. Know Green's theorem, Stokes' theorem, and the divergence theorem and their applications. Credits: 5.00

Required CS Major Core Courses (21 credits)

CS 18000 - Problem Solving And Object-Oriented Programming

Credit Hours: 4.00. Problem solving and algorithms, implementation of algorithms in a high level programming language, conditionals, the iterative approach and debugging, collections of data, searching and sorting, solving problems by decomposition, the object-oriented approach, subclasses of existing classes, handling exceptions that occur when the program is running, graphical user interfaces (GUIs), data stored in files, abstract data types, a glimpse at topics from other CS courses. Intended primarily for students majoring in computer sciences. Credit cannot be obtained for both CS 18000 and any of 15600, 15800 and 15900. Not open to students with credit in CS 24000.

Learning Outcomes: 1. Understand solving problems by analyzing the problem, designing an algorithm, and programming the solution. Credits: 4.00

CS 18200 - Foundations Of Computer Science

Credit Hours: 3.00. Logic and proofs; sets, functions, relations, sequences and summations; number representations; counting; fundamentals of the analysis of algorithms; graphs and trees; proof techniques; recursion; Boolean logic; finite state machines; pushdown automata; computability and undecidability.

Learning Outcomes: 1. Understand discrete mathematical tools, facts, and reasoning relevant to computer science. Credits: 3.00

CS 24000 - Programming In C

Credit Hours: 3.00. The UNIX environment, C development cycle, data representation, operators, program structure, recursion, macros, C preprocessor, pointers and addresses, dynamic memory allocation, structures, unions, typedef, bit-fields, pointer/structure applications, UNIX file abstraction, file access, low-level I/O, concurrency.

Learning Outcomes: 1. Understand programming principles and techniques for problem solving in the C programming language. Credits: 3.00

CS 25000 - Computer Architecture

Credit Hours: 4.00. Digital logic: transistors, gates, and combinatorial circuits; clocks; registers and register banks; arithmetic-logic units; data representation: big-endian and little-endian integers; ones and twos complement arithmetic; signed and unsigned values; Von-Neumann architecture and bottleneck; instruction sets; RISC and CISC designs; instruction pipelines and stalls; rearranging code; memory and address spaces; physical and virtual memory; interleaving; page tables; memory caches; bus architecture; polling and interrupts; DMA; device programming; assembly language; optimizations; parallelism; data pipelining.

Learning Outcomes: 1. Students understand the function of basic hardware, including fundamentals of digital logic, processors, memory, and I/O. Credits: 4.00

CS 25100 - Data Structures And Algorithms

Credit Hours: 3.00. Running time analysis of algorithms and their implementations, one-dimensional data structures, trees, heaps, additional sorting algorithms, binary search trees, hash tables, graphs, directed graphs, weighted graph algorithms, additional topics.

Learning Outcomes: 1. Understand fundamental data structures, fundamental algorithms, and their implementation. Credits: 3.00

CS 25200 - Systems Programming

Credit Hours: 4.00. Low-level programming; review of addresses, pointers, memory layout, and data representation; text, data, and bss segments; debugging and hex dumps; concurrent execution with threads and processes; address spaces; file names; descriptors and file pointers; inheritance; system calls and library functions; standard I/O and string libraries; simplified socket programming; building tools to help programmers; make and make files; shell scripts and quoting; Unix tools including sed, echo, test, and find; scripting languages such as awk; version control; object and executable files (.o and a.out); symbol tables; pointers to functions; hierarchical directories; and DNS hierarchy; programming embedded systems.

Learning Outcomes: 1. Have an appreciation and ability for low-level (systems) programming and debugging. Credits: 4.00

Algorithmic Foundations Concentration (18 credits)

Required Courses

CS 35200 - Compilers: Principles And Practice

Credit Hours: 3.00. Should not be taken concurrently with CS 35400. The theory and practice of programming language translation, compilation, and run-time systems, organized around a significant programming project to build a compiler for a simple but nontrivial programming language. Modules, interfaces, tools. Data structures for tree languages. Lexical analysis, syntax analysis, abstract syntax. Symbol tables, semantic analysis. Translation, intermediate code, basic blocks, traces. Instruction selection, CISC and RISC machines. Liveness analysis, graph coloring register allocation. Supplemental material drawn from garbage collection, object-oriented languages, higher-order languages, dataflow analysis, optimization, polymorphism, scheduling and pipelining, memory hierarchies.

Learning Outcomes: 1. Provides students with an understanding of how a computer program is converted into elementary code that causes the computer to produce the output intended by the programmer. Credits: 3.00

CS 35400 - Operating Systems

Credit Hours: 3.00. Should not be taken concurrently with CS 35200. Introduction to operating systems. Computer system and operating system architectures, processes, inter-process communication, inter-process synchronization, mutual exclusion, deadlocks, memory hierarchy, virtual memory, CPU scheduling, file systems, I/O device management, security.

Learning Outcomes: 1. Provides students with an understanding of the fundamentals of computer operating systems. Credits: 3.00

CS 38100 - Introduction To The Analysis Of Algorithms

Credit Hours: 3.00. Techniques for analyzing the time and space requirements of algorithms. Application of these techniques to sorting, searching, pattern-matching, graph problems, and other selected problems. Brief introduction to the intractable (NP-hard) problems.

Learning Outcomes: 1. Use big O-notation to give asymptotic time and space bounds of algorithms. 2. Explain the use of big-Omega, big-Theta, and little-o notations. 3. Use recurrence relations to determine the time complexity of recursive algorithms. 4. Solve recurrence relations commonly arising in algorithm design. 5. Give examples that illustrate time-space trade-offs of algorithms. Credits: 3.00

CS 47100 - Introduction To Artificial Intelligence

Credit Hours: 3.00. Students are expected to spend at least three hours per week gaining experience with artificial intelligence systems and developing software. Basic problem-solving strategies, heuristic search, problem reduction and AND/OR graphs, knowledge representation, expert systems, generating explanations, uncertainty reasoning, game playing, planning, machine learning, computer vision, and programming systems such as Lisp or Prolog.

Learning Outcomes: 1. Develop understandings of various applications of AI. 2. Recognize problems where AI techniques are applicable. 3. Implement and apply basic principles of AI in solutions that require problem-solving, inference, learning, and planning. 4. Understand how to evaluate various AI techniques and make appropriate selections. Credits: 3.00

CS 37300 - Data Mining And Machine Learning

Credit Hours: 3.00. This course will introduce students to the field of data mining and machine learning, which sits at the interface between statistics and computer science. Data mining and machine learning focuses on developing algorithms to automatically discover patterns and learn models of large datasets. This course introduces students to the process and main techniques in data mining and machine learning, including exploratory data analysis, predictive modeling, descriptive modeling, and evaluation.

Learning Outcomes: 1. Identify key elements of data mining and machine learning algorithms. 2. Understand how algorithmic elements interact to impact performance. 3. Understand how to choose algorithms for different analysis tasks. 4. Analyze data in both an exploratory and targeted manner. 5. Implement and apply basic algorithms for supervised and unsupervised learning. 6. Accurately evaluate the performance of algorithms, as well as formulate and test hypotheses. Credits: 3.00

Selectives

CS 31400 - Numerical Methods

Credit Hours: 3.00. Iterative methods for solving nonlinear equations; direct and iterative methods for solving linear systems; approximations of functions, derivatives, and integrals; error analysis.

Credits: 3.00

CS 33400 - Fundamentals Of Computer Graphics

Credit Hours: 3.00. Fundamental principles and techniques of computer graphics. The course covers the basics of going from a scene representation to a raster image using OpenGL. Specific topics include coordinate manipulations, perspective, basics of illumination and shading, color models, texture maps, clipping and basic raster algorithms, fundamentals of scene constructions. CS 31400 is recommended.

Credits: 3.00

CS 35300 - Principles Of Concurrency And Parallelism

Credit Hours: 3.00. Important concepts, models, algorithms, abstractions, and implementation aspects of concurrent and parallel programs. Topics include: techniques used to describe concurrent programs (e.g., threads, events, co-routines, continuations), abstractions for shared-memory and message-passing programs, relaxed memory models, livelock and deadlock detection, lock-free algorithms, data races and atomicity, scheduling techniques, process calculi, and software transactions.

Learning Outcomes: 1. This course provides students the vocabulary and concepts to better understand how to design and program scalable multicore processors. Credits: 3.00

CS 35500 - Introduction To Cryptography

Credit Hours: 3.00. An introduction to cryptography basics: Classic historical ciphers including Caesar, Vigenere, and Vernam ciphers; modern ciphers including DES, AES, Pohlig-Hellman, and RSA; signatures and digests; key exchange; simple protocols; block and stream ciphers; network-centric protocols.

Learning Outcomes: 1. Understand the basic concepts and proof techniques in cryptography. 2. Develop skills to define and evaluate the security of existing schemes. 3. Construct provably secure schemes for common cryptographic tasks. Credits: 3.00

CS 44800 - Introduction To Relational Database Systems

Credit Hours: 3.00. An in-depth examination of relational database systems including theory and concepts as well as practical issues in relational databases. Modern database technologies such as object-relational and Web-based access to relational databases. Conceptual design and entity relationship modeling, relational algebra and calculus, data definition and manipulation languages using SQL, schema and view management, query processing and optimization, transaction management, security, privacy, integrity management.

Learning Outcomes: 1. Learn data modeling: physical, logical and conceptual data models, the entity-relationship model. 2. Study logical and Physical Design and interaction with operating systems, disk Storage, Basic File Structures, Hashing, Indexing. 3. Learn the relational database model and implementation and performance issues. 4. Understand transaction Processing, concurrency control, atomicity control and recovery control. 5. Understand database privacy, integrity, and security. 6. Understand data mining, data warehousing, online analytical processing, and information retrieval. 7. Understand Cloud computing and Distributed Database Systems architectures, Big Data, Hadoop, MapReduce, and NoSQL. 8. Recognize performance issues. Credits: 3.00

CS 45600 - Programming Languages

Credit Hours: 3.00. Concepts for structuring data, computation, and whole programs. Object-oriented languages, functional languages, logic- and rule-based languages. Data types, type checking, exception handling, concurrent processes, synchronization, modularity, encapsulation, interfaces, separate compilation, inheritance, polymorphism, dynamic binding, subtyping, overloading, beta-reduction, unification.

Credits: 3.00

CS 48300 - Introduction To The Theory Of Computation

Credit Hours: 3.00. Turing machines and the Church-Turing thesis; decidability; halting problem; reducibility; undecidable problems; decidability of logical theories; Kolmogorov complexity; time classes; P, NP, NP-complete; space classes; Savitch's theorem, PSPACE-completeness, NL-completeness; hierarchy theorems; approximation theorems; probabilistic algorithms; applications of complexity to parallel computation and cryptography.

Credits: 3.00

CS 49000 - Topics In Computer Sciences For Undergraduates

Credit Hours: 1.00 to 5.00. Supervised reading and reports in various fields. Permission of instructor required.

Credits: 1.00 to 5.00

MA 34100 - Foundations Of Analysis

Credit Hours: 3.00. An introductory course in rigorous analysis, covering real numbers, sequences, series, continuous functions, differentiation, and Riemann integration. MA 30100 is helpful but not required.

Credits: 3.00

MA 36200 - Topics In Vector Calculus

Credit Hours: 3.00. Multivariate calculus; partial differentiation; implicit function theorems and transformations; line and surface integrals; vector fields; theorems of Gauss, Green, and Stokes. Credit granted for only one of MA 36200 and MA 51000 .

Credits: 3.00

MA 36600 - Ordinary Differential Equations (UCC: QR)

Credit Hours: 4.00. An introduction to ordinary differential equations with emphasis on problem solving and applications. The one-hour computer lab will give students an opportunity for hands-on experience with both the theory and applications of the subject.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Learn the statement of the theorem of existence and uniqueness of solutions of first order differential equations and standard methods of solving linear, and some special non-linear, differential equations of first order. 2. Interpret solutions qualitatively. 3. Learn how to construct mathematical models. 4. Learn the standard methods of solving linear homogenous differential equations of constant coefficients of arbitrary order. 5. Learn methods to solve nonhomogeneous differential equations of constant coefficients of arbitrary order. 6. Learn basic numerical methods for solving differential equations. 7. Learn about the applications of differential equations to mechanical, physical, and biological models. 8. Learn the theory of eigenvalues and eigenvectors and how they apply to systems of linear differential equations. 9. Learn how to analyze systems of nonlinear differential equations (optional). 10. Learn Laplace transforms and their applications to differential equations (optional). Credits: 4.00

MA 38500 - Introduction To Logic

Credit Hours: 3.00. Propositional calculus and predicate calculus with applications to mathematical proofs, valid arguments, switching theory, and formal languages.

Credits: 3.00

MA 42100 - Linear Programming And Optimization Techniques

Credit Hours: 3.00. Solution of linear programming problems by the simplex method, duality theory, transportation problems, assignment problems, network analysis, dynamic programming.

Credits: 3.00

MA 35301 - Linear Algebra II

Credit Hours: 3.00. Theoretical background for methods and results that appear in MA 35100. Inner products, orthogonality, and applications including least squares.

Learning Outcomes: 1. Perform rigorous proofs using the definitions of vector space, subspace, linear combination of vectors, linear dependence and linear independence, bases and dimension. 2. Perform rigorous proofs using the definitions of linear transformation and the null space and range of a linear transformation. 3. Exhibit a clear understanding of the relationship between composition of linear transformation and matrix multiplication. 4. Understand elementary matrices and their use in describing the solution set of a system of linear equations. 5. Understand that the determinant function on n x n matrices with entries in a field F is a function that may be defined recursively, and may be uniquely defined as an alternating multilinear form which takes the identity matrix to 1. 6. Perform rigorous proofs involving eigenvalues and eigenvectors. 7. Understand and be able to apply conditions for a linear operator on a finite-dimensional vector space to be diagonalizable. 8. Preform calculations with Gram-Schmidt, least squares and related topics. 9. Students should be able to do rigorous proofs involving inner product spaces and related topics. Credits: 3.00

MA 45300 - Elements Of Algebra I

Credit Hours: 3.00. Fundamental properties of integers, polynomials, groups, rings, and fields, with emphasis on problem solving and applications. Not open to students with credit in MA 45000.

Learning Outcomes: 1. Demonstrate knowledge of: divisibility properties of integers and polynomials, structure theory of groups and examples of groups, structure theory of rings and examples of rings, basic theory of fields. 2. Demonstrate knowledge of the proofs of facts covered in the course. Credits: 3.00

CS 31100 - Competitive Programming II

Credit Hours: 2.00. CP2 teaches experienced programmers additional techniques to solve interview and competitive programming problems and builds on material learned in CP1.

This includes specific algorithmic techniques such as [shortest paths, topological sort, MST, union find, range queries], advanced algorithms surrounding trees and DAGs, advanced problem types in [dynamic programming, backtracking/simulation, mathematics, string processing], and more. It can be viewed as a programming complement to CS 38100, with some overlap in content.

Learning Outcomes: 1. Differentiate between advanced categories of problems in computer science including backtracking/simulation, advanced dynamic programming, advanced graphs (including trees and DAGs), mathematics, string processing, and range queries, as well as subcategories in each of these categories. 2. Implement well-known solutions (as discussed in class) to advanced categories of problems in computer science (listed in LO1). 3. Identify when a problem spans multiple categories of problems (as listed in LO1) 4. Design algorithms to solve problems that span multiple categories of problems. 5. Use new/novel algorithms to solve advanced problems. 6. Recognize key characteristics of certain problem types listed in LO1. 7. Classify an advanced problem by those key characteristics. 8. Deconstruct an advanced problem into subproblems that can be solved individually. 9. Determine runtime and space usage of a potential solution using big-O notation to judge if the potential solution will work. 10. Create an efficient solution to a problem based on analysis of the problem type, the deconstructed problem parts, and the time and space constraints of the problem. 11. Reflect on how one came up with a solution to a problem in order to better recognize patterns in problem types. Credits: 2.00

CS 41100 - Competitive Programming III

Credit Hours: 2.00. CP3 teaches experienced programmers additional techniques to solve competitive programming problems and builds on material learned in CP1 and CP2. This includes algorithmic techniques in topics such as [network flow, computational geometry, graph matching, NP-hard problems]. Primarily, CP3 prepares students to compete in programming contests, which means most class time is focused on simulating contest environments and teaching teamwork and communication alongside problem practice.

Learning Outcomes: 1. Differentiate between advanced categories of problems in computer science including network flow, computational geometry, graph matching, and NP-hard problems, as well as subcategories in each of these categories. 2. Extrapolate generalized solutions and problem-solving strategies across advanced categories listed in LO1 as well as in general competitive programming categories. 3. Design algorithms to solve problems that span multiple advanced categories of problems, combining categorical solutions in complex ways. 4. Use new/novel algorithms to solve advanced problems. 5. Deconstruct an advanced problem into subproblems that can be solved individually. 6. Quickly determine runtime and space usage of a potential solution using big-O notation to judge if the potential solution will work. 7. Create an efficient solution to a problem based on analysis of the problem type, the deconstructed problem parts, and the time and space constraints of the problem. 8. Communicate ideas quickly and concisely to other competitive programmers to create efficient solutions. Credits: 2.00

CS 45800 - Introduction To Robotics

Credit Hours: 3.00. Any intelligent robot system interacting with our environment needs to have perception, planning, and control methods in its cognition process. The perception module outlines the robot's procedures to gather and interpret sensory observations into world models. The underlying planning and control modules use those world models to plan robot behaviors and their interaction with our natural environments. Therefore, this course will cover the fundamental topics in robot perception, planning, and control to design general-purpose robot cognition algorithms. Overall, this course is divided into four modules: Robot perception: This covers fundamental techniques needed for robot localization and mapping from raw 3D sensory data. Robot planning: This module will discuss robot behavior planning techniques such as A*, RRT*, and trajectory optimization. Robot Control: This introduces basic control

techniques such as PID controller to execute the robot's planned behaviors in the real world. Robot Learning: This part will briefly introduce machine learning techniques for robot decision-making and control.

Learning Outcomes: 1. Formulate and solve the robot perception problems. 2. Identify the robot constraints, define their degree of freedom, and formulate their planning and control problems. 3. Apply classical and modern robot planning and control techniques to complex robot systems like manipulators, autonomous cars, etc. 4. Identify limitations in existing classical robot algorithms and understand their formal guarantees. 5. Evaluate and assess current best practices and mechanisms for robot programming. 6. Develop a skill for robot programming from perception to low-level control using standard methods. Credits: 3.00

Concentration Notes

Other Departmental/Program Course Requirements (31-55 credits)

College of Science Additional Requirements

Computing (3-4 credits)

Laboratory Science (6-8 credits)

Mathematics (8-10 credits)

MA 16100 - Plane Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 5.00. Introduction to differential and integral calculus of one variable, with applications. Some schools or departments may allow only 4 credit hours toward graduation for this course. Designed for students who have not had at least a one-semester calculus course in high school, with a grade of "A" or "B". Not open to students with credit in MA 16500 . Demonstrated competence in college algebra and trigonometry.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions Credits: 5.00

MA 16200 - Plane Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 5.00. Continuation of MA 16100 . Vectors in two and three dimensions, techniques of integration, infinite series, conic sections, polar coordinates, surfaces in three dimensions. Some schools or departments may allow only 4 credit hours toward graduation for this course.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 5.00

MA 16500 - Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 4.00. Introduction to differential and integral calculus of one variable, with applications. Conic sections.

Designed for students who have had at least a one-semester calculus course in high school, with a grade of "A" or "B", but are not qualified to enter MA 16200 or MA 16600 or the advanced placement courses MA 17300 or the honors calculus course MA 18100. Demonstrated competence in college algebra and trigonometry. CTL:IMA 1602 Calculus - Long I

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems. 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions. Credits: 4.00

MA 16600 - Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 4.00. Continuation of MA 16500 . Vectors in two and three dimensions. Techniques of integration, infinite series, polar coordinates, surfaces in three dimensions. Not open to students with credit in MA 16200 . CTL:IMA 1603 Calculus - Long II

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 4.00

Statistics (3 credits)

STAT 35000 - Introduction To Statistics

Credit Hours: 3.00. This course provides a data-oriented introduction to applied statistics, covering exploratory data analysis, experimental design, probability distributions, simulation, sampling distributions, and the Central Limit Theorem. Students will learn the fundamentals of statistical inference, including confidence intervals and hypothesis tests for population means, paired and independent comparisons of means, analysis of variance, and regression. The course emphasizes hands-on experience with statistical software and is primarily intended for students majoring in the mathematical sciences. Prerequisite: two semesters of college calculus.

Learning Outcomes: 1. Understand basic terms, graphs, and symbols and be able to interpret statistics in the media. 2. Understand and be able to explain statistical processes and be able to fully interpret statistical results. 3. Understand why and how statistical investigations are conducted and the "big ideas" that underlie statistical investigations. 4. Be able to use a statistical package (R or SAS) to analyze data and interpret result. 5. Big Ideas in Statistics: variability, distributions, and models; causation vs correlation; practical significance vs statistical significance, etc. Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand

statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

Electives (15-43 credits)

Grade Requirements

GPA Requirements

Sample 4-Year Plan

Fall 1st Year

CS 18000 - Problem Solving And Object-Oriented Programming

Credit Hours: 4.00. Problem solving and algorithms, implementation of algorithms in a high level programming language, conditionals, the iterative approach and debugging, collections of data, searching and sorting, solving problems by decomposition, the object-oriented approach, subclasses of existing classes, handling exceptions that occur when the program is running, graphical user interfaces (GUIs), data stored in files, abstract data types, a glimpse at topics from other CS courses. Intended primarily for students majoring in computer sciences. Credit cannot be obtained for both CS 18000 and any of 15600, 15800 and 15900. Not open to students with credit in CS 24000.

Learning Outcomes: 1. Understand solving problems by analyzing the problem, designing an algorithm, and programming the solution. Credits: 4.00

MA 16100 - Plane Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 5.00. Introduction to differential and integral calculus of one variable, with applications. Some schools or departments may allow only 4 credit hours toward graduation for this course. Designed for students who have not had at least a one-semester calculus course in high school, with a grade of "A" or "B". Not open to students with credit in MA 16500 . Demonstrated competence in college algebra and trigonometry.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions Credits: 5.00

MA 16500 - Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 4.00. Introduction to differential and integral calculus of one variable, with applications. Conic sections. Designed for students who have had at least a one-semester calculus course in high school, with a grade of "A" or "B", but are not qualified to enter MA 16200 or MA 16600 or the advanced placement courses MA 17300 or the honors calculus course MA 18100. Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of

functions; optimization problems. 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions. Credits: 4.00

15-17 Credits

Spring 1st Year

CS 18200 - Foundations Of Computer Science

Credit Hours: 3.00. Logic and proofs; sets, functions, relations, sequences and summations; number representations; counting; fundamentals of the analysis of algorithms; graphs and trees; proof techniques; recursion; Boolean logic; finite state machines; pushdown automata; computability and undecidability.

Learning Outcomes: 1. Understand discrete mathematical tools, facts, and reasoning relevant to computer science. Credits: 3.00

CS 24000 - Programming In C

Credit Hours: 3.00. The UNIX environment, C development cycle, data representation, operators, program structure, recursion, macros, C preprocessor, pointers and addresses, dynamic memory allocation, structures, unions, typedef, bit-fields, pointer/structure applications, UNIX file abstraction, file access, low-level I/O, concurrency.

Learning Outcomes: 1. Understand programming principles and techniques for problem solving in the C programming language. Credits: 3.00

MA 16200 - Plane Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 5.00. Continuation of MA 16100 . Vectors in two and three dimensions, techniques of integration, infinite series, conic sections, polar coordinates, surfaces in three dimensions. Some schools or departments may allow only 4 credit hours toward graduation for this course.

University Core Curriculum (UCC): (UCC: QR)
Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 5.00

MA 16600 - Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 4.00. Continuation of MA 16500 . Vectors in two and three dimensions. Techniques of integration, infinite series, polar coordinates, surfaces in three dimensions. Not open to students with credit in MA 16200 . CTL:IMA 1603 Calculus - Long II

Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 4.00

14-18 Credits

Fall 2nd Year

CS 25000 - Computer Architecture

Credit Hours: 4.00. Digital logic: transistors, gates, and combinatorial circuits; clocks; registers and register banks; arithmetic-logic units; data representation: big-endian and little-endian integers; ones and twos complement arithmetic; signed and unsigned values; Von-Neumann architecture and bottleneck; instruction sets; RISC and CISC designs; instruction pipelines and stalls; rearranging code; memory and address spaces; physical and virtual memory; interleaving; page tables; memory caches; bus architecture; polling and interrupts; DMA; device programming; assembly language; optimizations; parallelism; data pipelining.

Learning Outcomes: 1. Students understand the function of basic hardware, including fundamentals of digital logic, processors, memory, and I/O. Credits: 4.00

CS 25100 - Data Structures And Algorithms

Credit Hours: 3.00. Running time analysis of algorithms and their implementations, one-dimensional data structures, trees, heaps, additional sorting algorithms, binary search trees, hash tables, graphs, directed graphs, weighted graph algorithms, additional topics.

Learning Outcomes: 1. Understand fundamental data structures, fundamental algorithms, and their implementation. Credits: 3.00

MA 26100 - Multivariate Calculus (UCC: QR)

Credit Hours: 4.00. Planes, lines, and curves in three dimensions. Differential calculus of several variables; multiple integrals. Introduction to vector calculus. Not open to students with credit in MA 17400 or 27100.

University Core Curriculum (UCC): (UCC: QR)
Learning Outcomes: 1. Know the equations for lines, planes and quadric surfaces in three dimensional space, and understand how these equations relate to the geometry. 2. Understand the relationship between vector functions and parametrized motion; know how to calculate velocity, acceleration, arc length and curvature. 3. Know the meaning of partial derivatives and how to calculate them. Know the multivariable chain rule. 4. Know the meaning of the gradient, how to calculate it, and how to apply it to directional derivatives and maximum and minimum values. 5. Understand the meaning of double and triple integrals; know how to compute them and how to apply them. 6. Understand the meaning of vector fields and line integrals. Know Green's theorem and be able to apply it. 7. Understand the meaning of surface integrals and know how to calculate them. Know Stokes' theorem and be able to apply it. Credits: 4.00

MA 27101 - Honors Multivariate Calculus (UCC: QR)

Credit Hours: 5.00. This course is the Honors version of MA 26100, Multivariate Calculus; it will also include a review of infinite series. The course is intended for first-year students who have credit for Calculus I and II. There will be a significant emphasis on conceptual explanation, but not on formal proof. Permission of department is required.

University Core Curriculum (UCC): (UCC: QR)
Learning Outcomes: 1. Know techniques of vector algebra and be able to apply these to the geometry of space; in particular they will be able to find equations for lines and planes in space. 2. Find equations for standard surfaces in space. 3. Use vector methods to analyze motion in space, and calculate arc length and curvature. 4. Acquire a conceptual and computational knowledge of infinite series; in particular they will be able to test for convergence, and to do calculations with power series. 5. Understand the meaning of partial derivatives in various situations, and will be able to calculate with them. 6. Know the multivariable chain rule and its meaning, and will be able to apply it to calculate derivatives in various situations. 7. Know the meaning of directional derivatives and how to calculate them. 8. Find tangent planes. 9. Find and classify extreme values and saddle points and use the method of Lagrange multipliers. 10. Know the meaning of multiple integrals and how to calculate them. 11.

Know the meaning of line integrals and surface integrals and how to calculate them. 12. Know Green's theorem, Stokes' theorem, and the divergence theorem and their applications. Credits: 5.00

15-18 Credits

Spring 2nd Year

CS 25200 - Systems Programming

Credit Hours: 4.00. Low-level programming; review of addresses, pointers, memory layout, and data representation; text, data, and bss segments; debugging and hex dumps; concurrent execution with threads and processes; address spaces; file names; descriptors and file pointers; inheritance; system calls and library functions; standard I/O and string libraries; simplified socket programming; building tools to help programmers; make and make files; shell scripts and quoting; Unix tools including sed, echo, test, and find; scripting languages such as awk; version control; object and executable files (.o and a.out); symbol tables; pointers to functions; hierarchical directories; and DNS hierarchy; programming embedded systems.

Learning Outcomes: 1. Have an appreciation and ability for low-level (systems) programming and debugging. Credits: 4.00

MA 26500 - Linear Algebra (UCC: QR)

Credit Hours: 3.00. Introduction to linear algebra. Systems of linear equations, matrix algebra, vector spaces, determinants, eigenvalues and eigenvectors, diagonalization of matrices, applications. Not open to students with credit in MA 26200, 27200, 35000 or 35100.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Learn the basic properties of matrices. 2. Learn how to solve systems of linear equations. 3. Learn the basic properties of determinants. 4. Learn about linear independence, spanning sets and bases in the context of vector spaces. 5. Learn the theory of inner product spaces and how it applies to least-squares approximations. 6. Learn the theory of eigenvalues and eigenvectors and how it applies to systems of differential equations. Credits: 3.00

MA 35100 - Elementary Linear Algebra (UCC: QR)

Credit Hours: 3.00. Systems of linear equations, finite dimensional vector spaces, matrices, determinants, eigenvalues and eigenvector applications to analytical geometry. Not open to students with credit in MA 26500.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Solve systems of linear equations using concepts such as vector spaces, linear dependence, and Gaussian elimination. 2. Understand and test for linear independence, calculate the dimension of vector spaces, and apply the rank-nullity theorem in various contexts. 3. Define and apply linear transformations, including matrix multiplication, inverses, LU factorization, and coordinate transformations. 4. Compute and understand determinants, including their use in calculating matrix inverses and practical applications such as volume calculations. 5. Analyze and compute eigenvectors and eigenvalues, and apply diagonalization techniques. Credits: 3.00

16-17 Credits

Fall 3rd Year

STAT 35000 - Introduction To Statistics

Credit Hours: 3.00. This course provides a data-oriented introduction to applied statistics, covering exploratory data analysis, experimental design, probability distributions, simulation, sampling distributions, and the Central Limit Theorem. Students will learn the fundamentals of statistical inference, including confidence intervals and hypothesis tests for population means, paired and independent comparisons of means, analysis of variance, and regression. The course emphasizes hands-on experience with statistical software and is primarily intended for students majoring in the mathematical sciences. Prerequisite: two semesters of college calculus.

Learning Outcomes: 1. Understand basic terms, graphs, and symbols and be able to interpret statistics in the media. 2. Understand and be

able to explain statistical processes and be able to fully interpret statistical results. 3. Understand why and how statistical investigations are conducted and the "big ideas" that underlie statistical investigations. 4. Be able to use a statistical package (R or SAS) to analyze data and interpret result. 5. Big Ideas in Statistics: variability, distributions, and models; causation vs correlation; practical significance vs statistical significance, etc. Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

Fall 4th Year

16-18 Credits

Spring 4th Year

15-17 Credits

Computer Science: Computational Science And Engineering, BS

About the Program

Degree Requirements

Computer Science Major Courses (49-50 credits)

Required CS Major Math Courses (7-8 credits)

MA 26100 - Multivariate Calculus (UCC: QR)

Credit Hours: 4.00. Planes, lines, and curves in three dimensions. Differential calculus of several variables; multiple integrals. Introduction to vector calculus. Not open to students with credit in MA 17400 or 27100.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Know the equations for lines, planes and quadric surfaces in three dimensional space, and understand how these equations relate to the geometry. 2. Understand the relationship between vector functions and parametrized motion; know how to calculate velocity, acceleration, arc length and curvature. 3. Know the meaning of partial derivatives and how to calculate them. Know the multivariable chain rule. 4. Know the meaning of the gradient, how to calculate it, and how to apply it to directional derivatives and maximum and minimum values. 5. Understand the meaning of double and triple integrals; know how to compute them and how to apply them. 6. Understand the meaning of vector fields and line integrals. Know Green's theorem and be able to apply it. 7. Understand the meaning of surface integrals and know how to calculate them. Know Stokes' theorem and be able to apply it. Credits: 4.00

MA 26500 - Linear Algebra (UCC: QR)

Credit Hours: 3.00. Introduction to linear algebra. Systems of linear equations, matrix algebra, vector spaces, determinants, eigenvalues and eigenvectors, diagonalization of matrices, applications. Not open to students with credit in MA 26200, 27200, 35000 or 35100.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Learn the basic properties of matrices. 2. Learn how to solve systems of linear equations. 3. Learn the basic properties of determinants. 4. Learn about linear independence, spanning sets and bases in the context of vector spaces. 5. Learn the theory of inner product spaces and how it applies to least-squares approximations. 6. Learn the theory of eigenvalues and eigenvectors and how it applies to systems of differential equations. Credits: 3.00

MA 35100 - Elementary Linear Algebra (UCC: QR)

Credit Hours: 3.00. Systems of linear equations, finite dimensional vector spaces, matrices, determinants, eigenvalues and eigenvector applications to analytical geometry. Not open to students with credit in MA 26500.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Solve systems of linear equations using concepts such as vector spaces, linear dependence, and Gaussian elimination. 2. Understand and test for linear independence, calculate the dimension of vector spaces, and apply the rank-nullity theorem in various contexts. 3. Define and apply linear transformations, including matrix multiplication, inverses, LU factorization, and coordinate transformations. 4. Compute and understand determinants, including their use in calculating matrix inverses and practical applications such as volume calculations. 5. Analyze and compute eigenvectors and eigenvalues, and apply diagonalization techniques. Credits: 3.00

MA 27101 - Honors Multivariate Calculus (UCC: QR)

Credit Hours: 5.00. This course is the Honors version of MA 26100, Multivariate Calculus; it will also include a review of infinite series. The course is intended for first-year students who have credit for Calculus I and II. There will be a significant emphasis on conceptual explanation, but not on formal proof. Permission of department is required.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Know techniques of vector algebra and be able to apply these to the geometry of space; in particular they will be able to find equations for lines and planes in space. 2. Find equations for standard surfaces in space. 3. Use vector methods to analyze motion in space, and calculate arc length and curvature. 4. Acquire a conceptual and computational knowledge of infinite series; in particular they will be able to test for convergence, and to do calculations with power series. 5. Understand the meaning of partial

derivatives in various situations, and will be able to calculate with them. 6. Know the multivariable chain rule and its meaning, and will be able to apply it to calculate derivatives in various situations. 7. Know the meaning of directional derivatives and how to calculate them. 8. Find tangent planes. 9. Find and classify extreme values and saddle points and use the method of Lagrange multipliers. 10. Know the meaning of multiple integrals and how to calculate them. 11. Know the meaning of line integrals and surface integrals and how to calculate them. 12. Know Green's theorem, Stokes' theorem, and the divergence theorem and their applications. Credits: 5.00

Required CS Major Core Courses (21 credits)

CS 18000 - Problem Solving And Object-Oriented Programming

Credit Hours: 4.00. Problem solving and algorithms, implementation of algorithms in a high level programming language, conditionals, the iterative approach and debugging, collections of data, searching and sorting, solving problems by decomposition, the object-oriented approach, subclasses of existing classes, handling exceptions that occur when the program is running, graphical user interfaces (GUIs), data stored in files, abstract data types, a glimpse at topics from other CS courses. Intended primarily for students majoring in computer sciences. Credit cannot be obtained for both CS 18000 and any of 15600, 15800 and 15900. Not open to students with credit in CS 24000.

Learning Outcomes: 1. Understand solving problems by analyzing the problem, designing an algorithm, and programming the solution. Credits: 4.00

CS 18200 - Foundations Of Computer Science

Credit Hours: 3.00. Logic and proofs; sets, functions, relations, sequences and summations; number representations; counting; fundamentals of the analysis of algorithms; graphs and trees; proof techniques; recursion; Boolean logic; finite state machines; pushdown automata; computability and undecidability.

Learning Outcomes: 1. Understand discrete mathematical tools, facts, and reasoning relevant to computer science. Credits: 3.00

CS 24000 - Programming In C

Credit Hours: 3.00. The UNIX environment, C development cycle, data representation, operators, program structure, recursion, macros, C preprocessor, pointers and addresses, dynamic memory allocation, structures, unions, typedef, bit-fields, pointer/structure applications, UNIX file abstraction, file access, low-level I/O, concurrency.

Learning Outcomes: 1. Understand programming principles and techniques for problem solving in the C programming language. Credits: 3.00

CS 25000 - Computer Architecture

Credit Hours: 4.00. Digital logic: transistors, gates, and combinatorial circuits; clocks; registers and register banks; arithmetic-logic units; data representation: big-endian and little-endian integers; ones and twos complement arithmetic; signed and unsigned values; Von-Neumann architecture and bottleneck; instruction sets; RISC and CISC designs; instruction pipelines and stalls; rearranging code; memory and address spaces; physical and virtual memory; interleaving; page tables; memory caches; bus architecture; polling and interrupts; DMA; device programming; assembly language; optimizations; parallelism; data pipelining.

Learning Outcomes: 1. Students understand the function of basic hardware, including fundamentals of digital logic, processors, memory, and I/O. Credits: 4.00

CS 25100 - Data Structures And Algorithms

Credit Hours: 3.00. Running time analysis of algorithms and their implementations, one-dimensional data structures, trees, heaps, additional sorting algorithms, binary search trees, hash tables, graphs, directed graphs, weighted graph algorithms, additional topics.

Learning Outcomes: 1. Understand fundamental data structures, fundamental algorithms, and their implementation. Credits: 3.00

CS 25200 - Systems Programming

Credit Hours: 4.00. Low-level programming; review of addresses, pointers, memory layout, and data representation; text, data, and bss segments; debugging and hex dumps; concurrent execution with threads and processes; address spaces; file names; descriptors and file pointers; inheritance;

system calls and library functions; standard I/O and string libraries; simplified socket programming; building tools to help programmers; make and make files; shell scripts and quoting; Unix tools including sed, echo, test, and find; scripting languages such as awk; version control; object and executable files (.o and a.out); symbol tables; pointers to functions; hierarchical directories; and DNS hierarchy; programming embedded systems.

Learning Outcomes: 1. Have an appreciation and ability for low-level (systems) programming and debugging. Credits: 4.00

Computational Science and Engineering Concentration (21 credits)

Required Courses

CS 31400 - Numerical Methods

Credit Hours: 3.00. Iterative methods for solving nonlinear equations; direct and iterative methods for solving linear systems; approximations of functions, derivatives, and integrals; error analysis.

Credits: 3.00

CS 38100 - Introduction To The Analysis Of Algorithms

Credit Hours: 3.00. Techniques for analyzing the time and space requirements of algorithms. Application of these techniques to sorting, searching, pattern-matching, graph problems, and other selected problems. Brief introduction to the intractable (NP-hard) problems.

Learning Outcomes: 1. Use big O-notation to give asymptotic time and space bounds of algorithms. 2. Explain the use of big-Omega, big-Theta, and little-o notations. 3. Use recurrence relations to determine the time complexity of recursive algorithms. 4. Solve recurrence relations commonly arising in algorithm design. 5. Give examples that illustrate time-space trade-offs of algorithms. Credits: 3.00

MA 26600 - Ordinary Differential Equations (UCC: QR)

Credit Hours: 3.00. First order equations, second and n'th order linear equations, series solutions, solution by Laplace transform, systems of linear equations. It is preferable but not required to take MA 26500 either first or concurrently. Not open to students with credit in MA 26200, 27200, 36000, 36100, or 36600.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Understand the properties of and able to solve first-order differential equations, linear differential equations of second and higher orders, and linear systems of differential equations. 2. Understand and able to apply basic numerical methods for solving initial value problems. 3. Understand the properties of Laplace transforms and able to apply to solving differential equations and initial value problems. 4. Apply differential equations to mechanical, physical, and biological models. Credits: 3.00

MA 36600 - Ordinary Differential Equations (UCC: QR)

Credit Hours: 4.00. An introduction to ordinary differential equations with emphasis on problem solving and applications. The one-hour computer lab will give students an opportunity for hands-on experience with both the theory and applications of the subject.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Learn the statement of the theorem of existence and uniqueness of solutions of first order differential equations and standard methods of solving linear, and some special non-linear, differential equations of first order. 2. Interpret solutions qualitatively. 3. Learn how to construct mathematical models. 4. Learn the standard methods of solving linear homogenous differential equations of constant coefficients of arbitrary order. 5. Learn methods to solve nonhomogeneous differential equations of constant coefficients of arbitrary order. 6. Learn basic numerical methods for solving differential equations. 7. Learn about the applications of differential equations to mechanical, physical, and biological models. 8. Learn the theory of eigenvalues and eigenvectors and how they apply to systems of linear differential equations. 9. Learn how to analyze systems of nonlinear differential

equations (optional). 10. Learn Laplace transforms and their applications to differential equations (optional). Credits: 4.00

Applications

ECE 30100 - Signals And Systems

Credit Hours: 3.00. Classification, analysis and design of systems in both the time- and frequency-domains. Continuous-time linear systems: Fourier Series, Fourier Transform, bilateral Laplace Transform. Discrete-time linear systems: difference equations, Discrete-Time Fourier Transform, bilateral Z-Transform. Sampling, quantization, and discrete-time processing of continuous-time signals. Discrete-time nonlinear systems: median-type filters, threshold decomposition. System design examples such as the compact disc player and AM radio.

Learning Outcomes: 1. Able to classify signals (e.g., periodic, even) and systems (e.g., causal, linear) and an understanding of the difference between discrete and continuous time signals and systems. 2. Able to determine the impulse response of a differential or difference equation. 3. Able to determine the response of linear systems to any input signal by convolution in the time domain. 4. Understand the definitions and basic properties (e.g., time-shift, modulation, Parseval's Theorem) of Fourier series, Fourier transforms, bilateral Laplace transforms, Z transforms, and discrete time Fourier transforms and an ability to compute the transforms and inverse transforms of basic examples using methods such as partial fractions expansions. 5. Able to determine the response of linear systems to any input signal by transformation to the frequency domain, multiplication, and inverse transformation to the time domain, an ability to apply the Sampling theorem, reconstruction, aliasing, and Nyquist's theorem to represent continuous-time signal in discrete time so that they can be processed by digital computers. Credits: 3.00

IE 33600 - Operations Research - Stochastic Models

Credit Hours: 3.00. Introduction to probabilistic models in operations research. Emphasis on Markov chains, Poisson processes, and their application to queuing systems.

Credits: 3.00

CS 47300 - Web Information Search And Management

Credit Hours: 3.00. This course teaches important concepts and knowledge of information retrieval for managing unstructured data such as text data on Web or in emails. At the same time, students will be exposed to a large number of important applications. Students in the course will get hands on experience from homework and a course project. The first part of the course focuses on general concepts/techniques such as stemming, indexing, vector space model, and feedback procedure. The second part of the course shows how to apply the set of techniques on different applications such as Web search, text categorization, and information recommendation.

Learning Outcomes: 1. Understand the important concepts and techniques of information retrieval and how to apply these techniques to a set of important or real world applications. Credits: 3.00

CS 47800 - Introduction To Bioinformatics

Credit Hours: 3.00. (BIOL 47800) Bioinformatics is broadly defined as the study of molecular biological information, targeting particularly the enormous volume of DNA sequence and functional complexity embedded in entire genomes. Topics will include understanding the evolutionary organization of genes (genomics), the structure and function of gene products (proteomics), and the dynamics of gene expression in biological processes (transcriptomics). Inherently, bioinformatics is interdisciplinary, melding various applications of computational science with biology. This jointly taught course introduces analytical methods from biology, statistics and computer science that are necessary for bioinformatics investigations. The course is intended for junior and senior undergraduates from various science backgrounds. Our objective is to develop the skills of both tool users and tool designers in this important new field of research.

Learning Outcomes: 1. Demonstrate proficiency with professional skills needed by practicing biologists, including experimental design and execution, biological techniques, data collection and documentation, communication of results, and responsible conduct of science. 2.

Demonstrate the ability to discuss ethical issues in the application of biological sciences, and the impact of science on society. 3. Demonstrate skills in critical thinking. These skills include understanding scientific methods, solving biology-related problems, interpreting and analyzing primary literature in biology, and interpreting data in a meaningful way. 4. Demonstrate knowledge of the path leading to specific careers in biology. 5. Understand the role of evolution of creating and modifying the macromolecular components of the cell, and in creating biological complexity and variability. 6. Use and understand the scientific method, including how to generate hypotheses and predictions, develop an experimental design, collect data, statistically analyze data, and interpret results. 7. Demonstrate an understanding of laboratory skills used in genetics. 8. Demonstrate knowledge of how evolutionary forces impact and shape microbial function and activity. 9. Demonstrate an understanding of the scientific method including hypothesis generation and testing, data collection, analysis, and interpretation. Credits: 3.00

CS 37300 - Data Mining And Machine Learning

Credit Hours: 3.00. This course will introduce students to the field of data mining and machine learning, which sits at the interface between statistics and computer science. Data mining and machine learning focuses on developing algorithms to automatically discover patterns and learn models of large datasets. This course introduces students to the process and main techniques in data mining and machine learning, including exploratory data analysis, predictive modeling, descriptive modeling, and evaluation.

Learning Outcomes: 1. Identify key elements of data mining and machine learning algorithms. 2. Understand how algorithmic elements interact to impact performance. 3. Understand how to choose algorithms for different analysis tasks. 4. Analyze data in both an exploratory and targeted manner. 5. Implement and apply basic algorithms for supervised and unsupervised learning. 6. Accurately evaluate the performance of algorithms, as well as formulate and test hypotheses. Credits: 3.00

Systems

CS 35200 - Compilers: Principles And Practice

Credit Hours: 3.00. Should not be taken concurrently with CS 35400. The theory and practice of programming language translation, compilation, and run-time systems, organized around a significant programming project to build a compiler for a simple but nontrivial programming language. Modules, interfaces, tools. Data structures for tree languages. Lexical analysis, syntax analysis, abstract syntax. Symbol tables, semantic analysis. Translation, intermediate code, basic blocks, traces. Instruction selection, CISC and RISC machines. Liveness analysis, graph coloring register allocation. Supplemental material drawn from garbage collection, object-oriented languages, higher-order languages, dataflow analysis, optimization, polymorphism, scheduling and pipelining, memory hierarchies.

Learning Outcomes: 1. Provides students with an understanding of how a computer program is converted into elementary code that causes the computer to produce the output intended by the programmer. Credits: 3.00

CS 35300 - Principles Of Concurrency And Parallelism

Credit Hours: 3.00. Important concepts, models, algorithms, abstractions, and implementation aspects of concurrent and parallel programs. Topics include: techniques used to describe concurrent programs (e.g., threads, events, co-routines, continuations), abstractions for shared-memory and message-passing programs, relaxed memory models, livelock and deadlock detection, lock-free algorithms, data races and atomicity, scheduling techniques, process calculi, and software transactions.

Learning Outcomes: 1. This course provides students the vocabulary and concepts to better understand how to design and program scalable multicore processors. Credits: 3.00

CS 35400 - Operating Systems

Credit Hours: 3.00. Should not be taken concurrently with CS 35200. Introduction to operating systems. Computer system and

operating system architectures, processes, inter-process communication, inter-process synchronization, mutual exclusion, deadlocks, memory hierarchy, virtual memory, CPU scheduling, file systems, I/O device management, security.

Learning Outcomes: 1. Provides students with an understanding of the fundamentals of computer operating systems. Credits: 3.00

Selectives

IE 33500 - Operations Research - Optimization

Credit Hours: 3.00. Introduction to deterministic optimization modeling and algorithms in operations research. Emphasis on formulation and solution of linear programs, networks flows, and integer programs.

Credits: 3.00

CS 30700 - Software Engineering I

Credit Hours: 3.00. An introduction to the methods and tools of software engineering; software life cycle; specification and design of software, software testing, cost and effort estimation; laboratory exercises with design, testing, and other tools.

Learning Outcomes: 1. Architect and design quality software. 2. Contrast and critique software lifecycle models. 3. Create software using current software engineering tools, methods, and concepts. 4. Work together on a team in a productive and professional manner. 5. Inspect and test software and documentation. Credits: 3.00

CS 42200 - Computer Networks

Credit Hours: 3.00. Undergraduate-level introduction to computer networks and data communication. Low-level details of media, signals, and bits: time division and frequency division multiplexing; encoding; modulation; bandwidth, throughput, and noise. Packet transmission: Local Area Network (Ethernet, FDDI) and Wide Area Network technologies (ATM); wireless networks; network interconnection with repeaters, bridges, and switches; DSU/CSU; xDSL and cable modems. Internetworking: router-based architecture; IP addressing; address binding with ARP; datagram encapsulation and fragmentation; UDP and TCP, retransmission; protocol ports; ICMP and error handling. Network applications: client/server concept; port demultiplexing; program interface to protocols (API); use by clients and servers; domain name system; TELNET; Web technologies including HTTP, CGI, Java; RPC and middleware; network management.

Credits: 3.00

CS 45600 - Programming Languages

Credit Hours: 3.00. Concepts for structuring data, computation, and whole programs. Object-oriented languages, functional languages, logic- and rule-based languages. Data types, type checking, exception handling, concurrent processes, synchronization, modularity, encapsulation, interfaces, separate compilation, inheritance, polymorphism, dynamic binding, subtyping, overloading, beta-reduction, unification.

Credits: 3.00

CS 47100 - Introduction To Artificial Intelligence

Credit Hours: 3.00. Students are expected to spend at least three hours per week gaining experience with artificial intelligence systems and developing software. Basic problem-solving strategies, heuristic search, problem reduction and AND/OR graphs, knowledge representation, expert systems, generating explanations, uncertainty reasoning, game playing, planning, machine learning, computer vision, and programming systems such as Lisp or Prolog.

Learning Outcomes: 1. Develop understandings of various applications of AI. 2. Recognize problems where AI techniques are applicable. 3. Implement and apply basic principles of AI in solutions that require problem-solving, inference, learning, and planning. 4. Understand how to evaluate various AI techniques and make appropriate selections. Credits: 3.00

CS 48300 - Introduction To The Theory Of Computation

Credit Hours: 3.00. Turing machines and the Church-Turing thesis; decidability; halting problem; reducibility; undecidable problems; decidability of logical theories; Kolmogorov complexity; time classes; P, NP, NP-complete; space classes; Savitch's theorem, PSPACE-completeness, NL-completeness; hierarchy theorems; approximation theorems; probabilistic algorithms; applications of complexity to parallel computation and cryptography.

Credits: 3.00

MA 34100 - Foundations Of Analysis

Credit Hours: 3.00. An introductory course in rigorous analysis, covering real numbers, sequences, series, continuous functions, differentiation, and Riemann integration. MA 30100 is helpful but not required.

Credits: 3.00

MA 44000 - Honors Real Analysis I

Credit Hours: 3.00. Real analysis in one and n-dimensional Euclidean spaces. Topics include the completeness property of real numbers, topology of Euclidean spaces, Heine-Borel theorem, convergence of sequences and series in Euclidean spaces, limit superior and limit inferior, Bolzano-Weierstrass theorem, continuity, uniform continuity, limits and uniform convergence of functions, Riemann or Riemann-Stieltjes integrals.

Learning Outcomes: 1. Perform rigorous proofs using the definitions of open sets, closed sets, connected sets, compact sets, interior points, boundary points, cluster points, finite sets, infinite sets, and denumerable sets in Euclidean spaces. 2. Perform rigorous proofs of convergence or divergence for sequences or series in Euclidean spaces. 3. Determine points of continuity and existence of limits using rigorous proofs for functions whose domain and range are in Euclidean spaces. 4. Perform rigorous proofs that a sequence of functions converges uniformly or does not converge uniformly on a subset of a Euclidean space. 5. Know and be able to apply the definition and related theorems on the existence of Riemann or Riemann-Stieltjes integrals. Credits: 3.00

CS 51400 - Numerical Analysis

Credit Hours: 3.00. (MA 51400) Alternative methods for solving nonlinear equations; linear difference equations, applications to solution of polynomial equations; differentiation and integration formulas; numerical solution of ordinary differential equations; roundoff error bounds.

Credits: 3.00

CS 51500 - Numerical Linear Algebra

Credit Hours: 3.00. Direct and iterative solvers of dense and sparse linear systems of equations, numerical schemes for handling symmetric algebraic eigenvalue problems, and the singular-value decomposition and its applications in linear least squares problems.

Learning Outcomes: 1. Become knowledgeable about major kernels and algorithms underlying matrix computations for dense and sparse matrices including linear systems of equation, symmetric eigenvalue problems, and the singular-value decomposition. 2. Be able to implement basic versions of these kernels and algorithms. 3. Learn about the difference between direct and iterative methods for linear systems. 4. Gain expertise in the design of iterative methods and preconditioning techniques for large-scale sparse linear systems. 5. Be able to implement eigenvalue and singular-value problem solvers. Credits: 3.00

CS 52000 - Computational Methods In Optimization

Credit Hours: 3.00. A treatment of numerical algorithms and software for optimization problems with a secondary emphasis on linear and nonlinear systems of equations: unconstrained and constrained optimization; line search methods; trust region methods; Quasi-Newton methods; linear programming; calculating derivatives; quadratic programming; global optimization, including simulated annealing.

Credits: 3.00

CS 52500 - Parallel Computing

Credit Hours: 3.00. Parallel computing for science and engineering applications: parallel programming and performance evaluation, parallel libraries and problem-solving environments, models of parallel computing and run-time support systems, and selected applications.

Credits: 3.00

CS 45800 - Introduction To Robotics

Credit Hours: 3.00. Any intelligent robot system interacting with our environment needs to have perception, planning, and control methods in its cognition process. The perception module outlines the robot's procedures to gather and interpret sensory observations into world models. The underlying planning and control modules use those world models to plan robot behaviors and their interaction with our natural environments. Therefore, this course will cover the fundamental topics in robot perception, planning, and control to design general-purpose robot cognition algorithms. Overall, this course is divided into four modules: Robot perception: This covers fundamental techniques needed for robot localization and mapping from raw 3D sensory data. Robot planning: This module will discuss robot behavior planning techniques such as A*, RRT*, and trajectory optimization. Robot Control: This introduces basic control techniques such as PID controller to execute the robot's

planned behaviors in the real world. Robot Learning: This part will briefly introduce machine learning techniques for robot decision-making and control.

Learning Outcomes: 1. Formulate and solve the robot perception problems. 2. Identify the robot constraints, define their degree of freedom, and formulate their planning and control problems. 3. Apply classical and modern robot planning and control techniques to complex robot systems like manipulators, autonomous cars, etc. 4. Identify limitations in existing classical robot algorithms and understand their formal guarantees. 5. Evaluate and assess current best practices and mechanisms for robot programming. 6. Develop a skill for robot programming from perception to low-level control using standard methods. Credits: 3.00

Concentration Notes

Other Departmental/Program Course Requirements (31-55 credits)

College of Science Additional Requirements

Computing (3-4 credits)

Laboratory Science (6-8 credits)

Mathematics (8-10 credits)

MA 16100 - Plane Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 5.00. Introduction to differential and integral calculus of one variable, with applications. Some schools or departments may allow only 4 credit hours toward graduation for this course. Designed for students who have not had at least a one-semester calculus course in high school, with a grade of "A" or "B". Not open to students with credit in MA 16500 . Demonstrated competence in college algebra and trigonometry.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions Credits: 5.00

MA 16200 - Plane Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 5.00. Continuation of MA 16100 . Vectors in two and three dimensions, techniques of integration, infinite series, conic sections, polar coordinates, surfaces in three dimensions. Some schools or departments may allow only 4 credit hours toward graduation for this course.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 5.00

MA 16500 - Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 4.00. Introduction to differential and integral calculus of one variable, with applications. Conic sections. Designed for students who have had at least a one-semester

calculus course in high school, with a grade of "A" or "B", but are not qualified to enter MA 16200 or MA 16600 or the advanced placement courses MA 17300 or the honors calculus course MA 18100. Demonstrated competence in college algebra and trigonometry. CTL:IMA 1602 Calculus - Long I

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems. 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions. Credits: 4.00

MA 16600 - Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 4.00. Continuation of MA 16500 . Vectors in two and three dimensions. Techniques of integration, infinite series, polar coordinates, surfaces in three dimensions. Not open to students with credit in MA 16200 . CTL:IMA 1603 Calculus - Long II

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 4.00

Statistics (3 credits)

STAT 35000 - Introduction To Statistics

Credit Hours: 3.00. This course provides a data-oriented introduction to applied statistics, covering exploratory data analysis, experimental design, probability distributions, simulation, sampling distributions, and the Central Limit Theorem. Students will learn the fundamentals of statistical inference, including confidence intervals and hypothesis tests for population means, paired and independent comparisons of means, analysis of variance, and regression. The course emphasizes hands-on experience with statistical software and is primarily intended for students majoring in the mathematical sciences. Prerequisite: two semesters of college calculus.

Learning Outcomes: 1. Understand basic terms, graphs, and symbols and be able to interpret statistics in the media. 2. Understand and be able to explain statistical processes and be able to fully interpret statistical results. 3. Understand why and how statistical investigations are conducted and the "big ideas" that underlie statistical investigations. 4. Be able to use a statistical package (R or SAS) to analyze data and interpret result. 5. Big Ideas in Statistics: variability, distributions, and models; causation vs correlation; practical significance vs statistical significance, etc. Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand

statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

Electives (15-43 credits)

Grade Requirements

GPA Requirements

Course Requirements & Notes

Sample 4-Year Plan

Fall 1st Year

CS 18000 - Problem Solving And Object-Oriented Programming

Credit Hours: 4.00. Problem solving and algorithms, implementation of algorithms in a high level programming language, conditionals, the iterative approach and debugging, collections of data, searching and sorting, solving problems by decomposition, the object-oriented approach, subclasses of existing classes, handling exceptions that occur when the program is running, graphical user interfaces (GUIs), data stored in files, abstract data types, a glimpse at topics from other CS courses. Intended primarily for students majoring in computer sciences. Credit cannot be obtained for both CS 18000 and any of 15600, 15800 and 15900. Not open to students with credit in CS 24000.

Learning Outcomes: 1. Understand solving problems by analyzing the problem, designing an algorithm, and programming the solution. Credits: 4.00

MA 16100 - Plane Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 5.00. Introduction to differential and integral calculus of one variable, with applications. Some schools or departments may allow only 4 credit hours toward graduation for this course. Designed for students who have not had at least a one-semester calculus course in high school, with a grade of "A" or "B". Not open to students with credit in MA 16500 . Demonstrated competence in college algebra and trigonometry.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions Credits: 5.00

MA 16500 - Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 4.00. Introduction to differential and integral calculus of one variable, with applications. Conic sections. Designed for students who have had at least a one-semester calculus course in high school, with a grade of "A" or "B", but are not qualified to enter MA 16200 or MA 16600 or the advanced placement courses MA 17300 or the honors calculus course MA 18100. Demonstrated competence in college algebra and trigonometry. CTL:IMA 1602 Calculus - Long I

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of

functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems. 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions. Credits: 4.00

15-17 Credits

Spring 1st Year

CS 18200 - Foundations Of Computer Science

Credit Hours: 3.00. Logic and proofs; sets, functions, relations, sequences and summations; number representations; counting; fundamentals of the analysis of algorithms; graphs and trees; proof techniques; recursion; Boolean logic; finite state machines; pushdown automata; computability and undecidability.

Learning Outcomes: 1. Understand discrete mathematical tools, facts, and reasoning relevant to computer science. Credits: 3.00

CS 24000 - Programming In C

Credit Hours: 3.00. The UNIX environment, C development cycle, data representation, operators, program structure, recursion, macros, C preprocessor, pointers and addresses, dynamic memory allocation, structures, unions, typedef, bit-fields, pointer/structure applications, UNIX file abstraction, file access, low-level I/O, concurrency.

Learning Outcomes: 1. Understand programming principles and techniques for problem solving in the C programming language. Credits: 3.00

MA 16200 - Plane Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 5.00. Continuation of MA 16100 . Vectors in two and three dimensions, techniques of integration, infinite series, conic sections, polar coordinates, surfaces in three dimensions. Some schools or departments may allow only 4 credit hours toward graduation for this course.

University Core Curriculum (UCC): (UCC: QR)
Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 5.00

MA 16600 - Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 4.00. Continuation of MA 16500 . Vectors in two and three dimensions. Techniques of integration, infinite series, polar coordinates, surfaces in three dimensions. Not open to students with credit in MA 16200 . CTL:IMA 1603 Calculus - Long II

University Core Curriculum (UCC): (UCC: QR)
Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 4.00

14-18 Credits

Fall 2nd Year

CS 25000 - Computer Architecture

Credit Hours: 4.00. Digital logic: transistors, gates, and combinatorial circuits; clocks; registers and register banks; arithmetic-logic units; data representation: big-endian and little-endian integers; ones and twos complement arithmetic; signed and unsigned values; Von-Neumann architecture and bottleneck; instruction sets; RISC and CISC designs; instruction pipelines and stalls; rearranging code; memory and address spaces; physical and virtual memory; interleaving; page tables; memory caches; bus architecture; polling and interrupts; DMA; device programming; assembly language; optimizations; parallelism; data pipelining.

Learning Outcomes: 1. Students understand the function of basic hardware, including fundamentals of digital logic, processors, memory, and I/O. Credits: 4.00

CS 25100 - Data Structures And Algorithms

Credit Hours: 3.00. Running time analysis of algorithms and their implementations, one-dimensional data structures, trees, heaps, additional sorting algorithms, binary search trees, hash tables, graphs, directed graphs, weighted graph algorithms, additional topics.

Learning Outcomes: 1. Understand fundamental data structures, fundamental algorithms, and their implementation. Credits: 3.00

MA 26100 - Multivariate Calculus (UCC: QR)

Credit Hours: 4.00. Planes, lines, and curves in three dimensions. Differential calculus of several variables; multiple integrals. Introduction to vector calculus. Not open to students with credit in MA 17400 or 27100.

University Core Curriculum (UCC): (UCC: QR)
Learning Outcomes: 1. Know the equations for lines, planes and quadric surfaces in three dimensional space, and understand how these equations relate to the geometry. 2. Understand the relationship between vector functions and parametrized motion; know how to calculate velocity, acceleration, arc length and curvature. 3. Know the meaning of partial derivatives and how to calculate them. Know the multivariable chain rule. 4. Know the meaning of the gradient, how to calculate it, and how to apply it to directional derivatives and maximum and minimum values. 5. Understand the meaning of double and triple integrals; know how to compute them and how to apply them. 6. Understand the meaning of vector fields and line integrals. Know Green's theorem and be able to apply it. 7. Understand the meaning of surface integrals and know how to calculate them. Know Stokes' theorem and be able to apply it. Credits: 4.00

MA 27101 - Honors Multivariate Calculus (UCC: QR)

Credit Hours: 5.00. This course is the Honors version of MA 26100, Multivariate Calculus; it will also include a review of infinite series. The course is intended for first-year students who have credit for Calculus I and II. There will be a significant emphasis on conceptual explanation, but not on formal proof. Permission of department is required.

University Core Curriculum (UCC): (UCC: QR)
Learning Outcomes: 1. Know techniques of vector algebra and be able to apply these to the geometry of space; in particular they will be able to find equations for lines and planes in space. 2. Find equations for standard surfaces in space. 3. Use vector methods to analyze motion in space, and calculate arc length and curvature. 4. Acquire a conceptual and computational knowledge of infinite series; in particular they will be able to test for convergence, and to do calculations with power series. 5. Understand the meaning of partial derivatives in various situations, and will be able to calculate with them. 6. Know the multivariable chain rule and its meaning, and will be able to apply it to calculate derivatives in various situations. 7. Know the meaning of directional derivatives and how to calculate them. 8. Find tangent planes. 9. Find and classify extreme values and saddle points and use the method of Lagrange multipliers. 10. Know the meaning of multiple integrals and how to calculate them. 11.

Know the meaning of line integrals and surface integrals and how to calculate them. 12. Know Green's theorem, Stokes' theorem, and the divergence theorem and their applications. Credits: 5.00

15-17 Credits

Spring 2nd Year

CS 25200 - Systems Programming

Credit Hours: 4.00. Low-level programming; review of addresses, pointers, memory layout, and data representation; text, data, and bss segments; debugging and hex dumps; concurrent execution with threads and processes; address spaces; file names; descriptors and file pointers; inheritance; system calls and library functions; standard I/O and string libraries; simplified socket programming; building tools to help programmers; make and make files; shell scripts and quoting; Unix tools including sed, echo, test, and find; scripting languages such as awk; version control; object and executable files (.o and a.out); symbol tables; pointers to functions; hierarchical directories; and DNS hierarchy; programming embedded systems.

Learning Outcomes: 1. Have an appreciation and ability for low-level (systems) programming and debugging. Credits: 4.00

MA 26500 - Linear Algebra (UCC: QR)

Credit Hours: 3.00. Introduction to linear algebra. Systems of linear equations, matrix algebra, vector spaces, determinants, eigenvalues and eigenvectors, diagonalization of matrices, applications. Not open to students with credit in MA 26200, 27200, 35000 or 35100.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Learn the basic properties of matrices. 2. Learn how to solve systems of linear equations. 3. Learn the basic properties of determinants. 4. Learn about linear independence, spanning sets and bases in the context of vector spaces. 5. Learn the theory of inner product spaces and how it applies to least-squares approximations. 6. Learn the theory of eigenvalues and eigenvectors and how it applies to systems of differential equations. Credits: 3.00

MA 35100 - Elementary Linear Algebra (UCC: QR)

Credit Hours: 3.00. Systems of linear equations, finite dimensional vector spaces, matrices, determinants, eigenvalues and eigenvector applications to analytical geometry. Not open to students with credit in MA 26500.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Solve systems of linear equations using concepts such as vector spaces, linear dependence, and Gaussian elimination. 2. Understand and test for linear independence, calculate the dimension of vector spaces, and apply the rank-nullity theorem in various contexts. 3. Define and apply linear transformations, including matrix multiplication, inverses, LU factorization, and coordinate transformations. 4. Compute and understand determinants, including their use in calculating matrix inverses and practical applications such as volume calculations. 5. Analyze and compute eigenvectors and eigenvalues, and apply diagonalization techniques. Credits: 3.00

16-17 Credits

Fall 3rd Year

STAT 35000 - Introduction To Statistics

Credit Hours: 3.00. This course provides a data-oriented introduction to applied statistics, covering exploratory data analysis, experimental design, probability distributions, simulation, sampling distributions, and the Central Limit Theorem. Students will learn the fundamentals of statistical inference, including confidence intervals and hypothesis tests for population means, paired and independent comparisons of means, analysis of variance, and regression. The course emphasizes hands-on experience with statistical software and is primarily intended for students majoring in the mathematical sciences. Prerequisite: two semesters of college calculus.

Learning Outcomes: 1. Understand basic terms, graphs, and symbols and be able to interpret statistics in the media. 2. Understand and be

able to explain statistical processes and be able to fully interpret statistical results. 3. Understand why and how statistical investigations are conducted and the "big ideas" that underlie statistical investigations. 4. Be able to use a statistical package (R or SAS) to analyze data and interpret result. 5. Big Ideas in Statistics: variability, distributions, and models; causation vs correlation; practical significance vs statistical significance, etc. Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

chain rule and its meaning, and will be able to apply it to calculate derivatives in various situations. 7. Know the meaning of directional derivatives and how to calculate them. 8. Find tangent planes. 9. Find and classify extreme values and saddle points and use the method of Lagrange multipliers. 10. Know the meaning of multiple integrals and how to calculate them. 11. Know the meaning of line integrals and surface integrals and how to calculate them. 12. Know Green's theorem, Stokes' theorem, and the divergence theorem and their applications. Credits: 5.00

Required CS Major Core Courses (21 credits)

CS 18000 - Problem Solving And Object-Oriented Programming

Credit Hours: 4.00. Problem solving and algorithms, implementation of algorithms in a high level programming language, conditionals, the iterative approach and debugging, collections of data, searching and sorting, solving problems by decomposition, the object-oriented approach, subclasses of existing classes, handling exceptions that occur when the program is running, graphical user interfaces (GUIs), data stored in files, abstract data types, a glimpse at topics from other CS courses. Intended primarily for students majoring in computer sciences. Credit cannot be obtained for both CS 18000 and any of 15600, 15800 and 15900. Not open to students with credit in CS 24000.

Learning Outcomes: 1. Understand solving problems by analyzing the problem, designing an algorithm, and programming the solution. Credits: 4.00

CS 18200 - Foundations Of Computer Science

Credit Hours: 3.00. Logic and proofs; sets, functions, relations, sequences and summations; number representations; counting; fundamentals of the analysis of algorithms; graphs and trees; proof techniques; recursion; Boolean logic; finite state machines; pushdown automata; computability and undecidability.

Learning Outcomes: 1. Understand discrete mathematical tools, facts, and reasoning relevant to computer science. Credits: 3.00

CS 24000 - Programming In C

Credit Hours: 3.00. The UNIX environment, C development cycle, data representation, operators, program structure, recursion, macros, C preprocessor, pointers and addresses, dynamic memory allocation, structures, unions, typedef, bit-fields, pointer/structure applications, UNIX file abstraction, file access, low-level I/O, concurrency.

Learning Outcomes: 1. Understand programming principles and techniques for problem solving in the C programming language. Credits: 3.00

CS 25000 - Computer Architecture

Credit Hours: 4.00. Digital logic: transistors, gates, and combinatorial circuits; clocks; registers and register banks; arithmetic-logic units; data representation: big-endian and little-endian integers; ones and twos complement arithmetic; signed and unsigned values; Von-Neumann architecture and bottleneck; instruction sets; RISC and CISC designs; instruction pipelines and stalls; rearranging code; memory and address spaces; physical and virtual memory; interleaving; page tables; memory caches; bus architecture; polling and interrupts; DMA; device programming; assembly language; optimizations; parallelism; data pipelining.

Learning Outcomes: 1. Students understand the function of basic hardware, including fundamentals of digital logic, processors, memory, and I/O. Credits: 4.00

CS 25100 - Data Structures And Algorithms

Credit Hours: 3.00. Running time analysis of algorithms and their implementations, one-dimensional data structures, trees, heaps, additional sorting algorithms, binary search trees, hash tables, graphs, directed graphs, weighted graph algorithms, additional topics.

Learning Outcomes: 1. Understand fundamental data structures, fundamental algorithms, and their implementation. Credits: 3.00

CS 25200 - Systems Programming

Credit Hours: 4.00. Low-level programming; review of addresses, pointers, memory layout, and data representation; text, data, and bss segments; debugging and hex dumps; concurrent execution with threads and processes; address spaces; file names; descriptors and file pointers; inheritance; system calls and library functions; standard I/O and string libraries; simplified socket programming; building tools to help

programmers; make and make files; shell scripts and quoting; Unix tools including sed, echo, test, and find; scripting languages such as awk; version control; object and executable files (.o and a.out); symbol tables; pointers to functions; hierarchical directories; and DNS hierarchy; programming embedded systems.

Learning Outcomes: 1. Have an appreciation and ability for low-level (systems) programming and debugging. Credits: 4.00

Computer Graphics and Visualization Concentration (18 credits)

Required Courses

CS 31400 - Numerical Methods

Credit Hours: 3.00. Iterative methods for solving nonlinear equations; direct and iterative methods for solving linear systems; approximations of functions, derivatives, and integrals; error analysis.

Credits: 3.00

CS 33400 - Fundamentals Of Computer Graphics

Credit Hours: 3.00. Fundamental principles and techniques of computer graphics. The course covers the basics of going from a scene representation to a raster image using OpenGL. Specific topics include coordinate manipulations, perspective, basics of illumination and shading, color models, texture maps, clipping and basic raster algorithms, fundamentals of scene constructions. CS 31400 is recommended.

Credits: 3.00

CS 43400 - Advanced Computer Graphics

Credit Hours: 3.00. Advanced concepts and techniques of computer graphics. The course covers, in complete detail, going from a scene representation to a raster image without using OpenGL or other graphics packages. The course develops a complete graphics implementation in which the students implement every aspect of the graphics pipeline. This involves a substantial software project in C/C++.

Credits: 3.00

CS 47100 - Introduction To Artificial Intelligence

Credit Hours: 3.00. Students are expected to spend at least three hours per week gaining experience with artificial intelligence systems and developing software. Basic problem-solving strategies, heuristic search, problem reduction and AND/OR graphs, knowledge representation, expert systems, generating explanations, uncertainty reasoning, game playing, planning, machine learning, computer vision, and programming systems such as Lisp or Prolog.

Learning Outcomes: 1. Develop understandings of various applications of AI. 2. Recognize problems where AI techniques are applicable. 3. Implement and apply basic principles of AI in solutions that require problem-solving, inference, learning, and planning. 4. Understand how to evaluate various AI techniques and make appropriate selections. Credits: 3.00

CS 37300 - Data Mining And Machine Learning

Credit Hours: 3.00. This course will introduce students to the field of data mining and machine learning, which sits at the interface between statistics and computer science. Data mining and machine learning focuses on developing algorithms to automatically discover patterns and learn models of large datasets. This course introduces students to the process and main techniques in data mining and machine learning, including exploratory data analysis, predictive modeling, descriptive modeling, and evaluation.

Learning Outcomes: 1. Identify key elements of data mining and machine learning algorithms. 2. Understand how algorithmic elements interact to impact performance. 3. Understand how to choose algorithms for different analysis tasks. 4. Analyze data in both an exploratory and targeted manner. 5. Implement and apply basic algorithms for supervised and unsupervised learning. 6. Accurately evaluate the performance of algorithms, as well as formulate and test hypotheses. Credits: 3.00

Selectives

CS 35200 - Compilers: Principles And Practice

Credit Hours: 3.00. Should not be taken concurrently with CS 35400. The theory and practice of programming language translation, compilation, and run-time systems, organized around a significant programming project to build a compiler for a simple but nontrivial programming language. Modules, interfaces, tools. Data structures for tree languages. Lexical analysis, syntax analysis, abstract syntax. Symbol tables,

semantic analysis. Translation, intermediate code, basic blocks, traces. Instruction selection, CISC and RISC machines. Liveness analysis, graph coloring register allocation. Supplemental material drawn from garbage collection, object-oriented languages, higher-order languages, dataflow analysis, optimization, polymorphism, scheduling and pipelining, memory hierarchies.

Learning Outcomes: 1. Provides students with an understanding of how a computer program is converted into elementary code that causes the computer to produce the output intended by the programmer. Credits: 3.00

CS 35400 - Operating Systems

Credit Hours: 3.00. Should not be taken concurrently with CS 35200. Introduction to operating systems. Computer system and operating system architectures, processes, inter-process communication, inter-process synchronization, mutual exclusion, deadlocks, memory hierarchy, virtual memory, CPU scheduling, file systems, I/O device management, security.

Learning Outcomes: 1. Provides students with an understanding of the fundamentals of computer operating systems. Credits: 3.00

CS 38100 - Introduction To The Analysis Of Algorithms

Credit Hours: 3.00. Techniques for analyzing the time and space requirements of algorithms. Application of these techniques to sorting, searching, pattern-matching, graph problems, and other selected problems. Brief introduction to the intractable (NP-hard) problems.

Learning Outcomes: 1. Use big O-notation to give asymptotic time and space bounds of algorithms. 2. Explain the use of big-Omega, big-Theta, and little-o notations. 3. Use recurrence relations to determine the time complexity of recursive algorithms. 4. Solve recurrence relations commonly arising in algorithm design. 5. Give examples that illustrate time-space trade-offs of algorithms. Credits: 3.00

CS 42200 - Computer Networks

Credit Hours: 3.00. Undergraduate-level introduction to computer networks and data communication. Low-level details of media, signals, and bits: time division and frequency division multiplexing; encoding; modulation; bandwidth, throughput, and noise. Packet transmission: Local Area Network (Ethernet, FDDI) and Wide Area Network technologies (ATM); wireless networks; network interconnection with repeaters, bridges, and switches; DSU/CSU; xDSL and cable modems. Internetworking: router-based architecture; IP addressing; address binding with ARP; datagram encapsulation and fragmentation; UDP and TCP, retransmission; protocol ports; ICMP and error handling. Network applications: client/server concept; port demultiplexing; program interface to protocols (API); use by clients and servers; domain name system; TELNET; Web technologies including HTTP, CGI, Java; RPC and middleware; network management.

Credits: 3.00

CS 43400 - Advanced Computer Graphics

Credit Hours: 3.00. Advanced concepts and techniques of computer graphics. The course covers, in complete detail, going from a scene representation to a raster image without using OpenGL or other graphics packages. The course develops a complete graphics implementation in which the students implement every aspect of the graphics pipeline. This involves a substantial software project in C/C++.

Credits: 3.00

CS 45600 - Programming Languages

Credit Hours: 3.00. Concepts for structuring data, computation, and whole programs. Object-oriented languages, functional languages, logic- and rule-based languages. Data types, type checking, exception handling, concurrent processes, synchronization, modularity, encapsulation, interfaces, separate compilation, inheritance, polymorphism, dynamic binding, subtyping, overloading, beta-reduction, unification.

Credits: 3.00

CS 47100 - Introduction To Artificial Intelligence

Credit Hours: 3.00. Students are expected to spend at least three hours per week gaining experience with artificial intelligence systems and developing software. Basic problem-solving strategies, heuristic search, problem reduction and AND/OR graphs, knowledge representation, expert systems, generating explanations, uncertainty reasoning, game playing, planning, machine learning, computer vision, and programming systems such as Lisp or Prolog.

Learning Outcomes: 1. Develop understandings of various applications of AI. 2. Recognize problems where AI techniques are applicable. 3. Implement and apply basic principles of AI in solutions that require problem-solving, inference, learning, and planning. 4. Understand how to evaluate

various AI techniques and make appropriate selections. Credits: 3.00

CS 49000 - Topics In Computer Sciences For Undergraduates

Credit Hours: 1.00 to 5.00. Supervised reading and reports in various fields. Permission of instructor required.

Credits: 1.00 to 5.00

CS 37300 - Data Mining And Machine Learning

Credit Hours: 3.00. This course will introduce students to the field of data mining and machine learning, which sits at the interface between statistics and computer science. Data mining and machine learning focuses on developing algorithms to automatically discover patterns and learn models of large datasets. This course introduces students to the process and main techniques in data mining and machine learning, including exploratory data analysis, predictive modeling, descriptive modeling, and evaluation.

Learning Outcomes: 1. Identify key elements of data mining and machine learning algorithms. 2. Understand how algorithmic elements interact to impact performance. 3. Understand how to choose algorithms for different analysis tasks. 4. Analyze data in both an exploratory and targeted manner. 5. Implement and apply basic algorithms for supervised and unsupervised learning. 6. Accurately evaluate the performance of algorithms, as well as formulate and test hypotheses. Credits: 3.00

CS 43900 - Introduction To Data Visualization

Credit Hours: 3.00. The course offers an introduction to the fundamentals principles, design strategies, and techniques needed to visually communicate, explore, and analyze data. The course focuses primarily on the visual representation of inherently non-spatial data (e.g., tables and spreadsheets, graphs and networks, trees, text, and time series), but also considers the visualization of maps and of data in geospatial context.

Learning Outcomes: 1. Describe the main visualization techniques and explain their strengths and limitations. 2. Select the most perceptually effective visual encoding for a given data attribute. 3. Perform a principled critique of an existing data visualization. 4. Design an effective data visualization solution for a given data set to address a specific data analysis objective. 5. Create interactive web-based visualizations using open-source software libraries. Credits: 3.00

CS 45800 - Introduction To Robotics

Credit Hours: 3.00. Any intelligent robot system interacting with our environment needs to have perception, planning, and control methods in its cognition process. The perception module outlines the robot's procedures to gather and interpret sensory observations into world models. The underlying planning and control modules use those world models to plan robot behaviors and their interaction with our natural environments. Therefore, this course will cover the fundamental topics in robot perception, planning, and control to design general-purpose robot cognition algorithms. Overall, this course is divided into four modules: Robot perception: This covers fundamental techniques needed for robot localization and mapping from raw 3D sensory data. Robot planning: This module will discuss robot behavior planning techniques such as A*, RRT*, and trajectory optimization. Robot Control: This introduces basic control techniques such as PID controller to execute the robot's planned behaviors in the real world. Robot Learning: This part will briefly introduce machine learning techniques for robot decision-making and control.

Learning Outcomes: 1. Formulate and solve the robot perception problems. 2. Identify the robot constraints, define their degree of freedom, and formulate their planning and control problems. 3. Apply classical and modern robot planning and control techniques to complex robot systems like manipulators, autonomous cars, etc. 4. Identify limitations in existing classical robot algorithms and understand their formal guarantees. 5. Evaluate and assess current best practices and mechanisms for robot programming. 6. Develop a skill for robot programming from perception to low-level control using standard methods. Credits: 3.00

Project Option

Concentration Notes

Other Departmental/Program Course Requirements (31-55 credits)

College of Science Additional Requirements

Computing (3-4 credits)

Laboratory Science (6-8 credits)

Mathematics (8-10 credits)

MA 16100 - Plane Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 5.00. Introduction to differential and integral calculus of one variable, with applications. Some schools or departments may allow only 4 credit hours toward graduation for this course. Designed for students who have not had at least a one-semester calculus course in high school, with a grade of "A" or "B". Not open to students with credit in MA 16500 . Demonstrated competence in college algebra and trigonometry.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions Credits: 5.00

MA 16200 - Plane Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 5.00. Continuation of MA 16100 . Vectors in two and three dimensions, techniques of integration, infinite series, conic sections, polar coordinates, surfaces in three dimensions. Some schools or departments may allow only 4 credit hours toward graduation for this course.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 5.00

MA 16500 - Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 4.00. Introduction to differential and integral calculus of one variable, with applications. Conic sections. Designed for students who have had at least a one-semester calculus course in high school, with a grade of "A" or "B", but are not qualified to enter MA 16200 or MA 16600 or the advanced placement courses MA 17300 or the honors calculus course MA 18100. Demonstrated competence in college algebra and trigonometry. CTL:IMA 1602 Calculus - Long I

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems. 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions. Credits: 4.00

MA 16600 - Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 4.00. Continuation of MA 16500 . Vectors in two and three dimensions. Techniques of integration, infinite series,

polar coordinates, surfaces in three dimensions. Not open to students with credit in MA 16200 . CTL:IMA 1603 Calculus - Long II

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 4.00

Statistics (3 credits)

STAT 35000 - Introduction To Statistics

Credit Hours: 3.00. This course provides a data-oriented introduction to applied statistics, covering exploratory data analysis, experimental design, probability distributions, simulation, sampling distributions, and the Central Limit Theorem. Students will learn the fundamentals of statistical inference, including confidence intervals and hypothesis tests for population means, paired and independent comparisons of means, analysis of variance, and regression. The course emphasizes hands-on experience with statistical software and is primarily intended for students majoring in the mathematical sciences. Prerequisite: two semesters of college calculus.

Learning Outcomes: 1. Understand basic terms, graphs, and symbols and be able to interpret statistics in the media. 2. Understand and be able to explain statistical processes and be able to fully interpret statistical results. 3. Understand why and how statistical investigations are conducted and the "big ideas" that underlie statistical investigations. 4. Be able to use a statistical package (R or SAS) to analyze data and interpret result. 5. Big Ideas in Statistics: variability, distributions, and models; causation vs correlation; practical significance vs statistical significance, etc. Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

Electives (15-43 credits)

Grade Requirements

GPA Requirements

Sample 4-Year Plan

Fall 1st Year

CS 18000 - Problem Solving And Object-Oriented Programming

Credit Hours: 4.00. Problem solving and algorithms, implementation of algorithms in a high level programming language, conditionals, the iterative approach and debugging, collections of data, searching and sorting, solving problems by decomposition, the object-oriented approach, subclasses of existing classes, handling exceptions that occur when the program is running, graphical user interfaces (GUIs), data stored in files, abstract data types, a glimpse at topics from other CS courses. Intended primarily for students majoring in computer sciences. Credit cannot be obtained for both CS 18000 and any of 15600, 15800 and 15900. Not open to students with credit in CS 24000.

Learning Outcomes: 1. Understand solving problems by analyzing the problem, designing an algorithm, and programming the solution. Credits: 4.00

MA 16100 - Plane Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 5.00. Introduction to differential and integral calculus of one variable, with applications. Some schools or departments may allow only 4 credit hours toward graduation for this course. Designed for students who have not had at least a one-semester calculus course in high school, with a grade of "A" or "B". Not open to students with credit in MA 16500 . Demonstrated competence in college algebra and trigonometry.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions Credits: 5.00

MA 16500 - Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 4.00. Introduction to differential and integral calculus of one variable, with applications. Conic sections. Designed for students who have had at least a one-semester calculus course in high school, with a grade of "A" or "B", but are not qualified to enter MA 16200 or MA 16600 or the advanced placement courses MA 17300 or the honors calculus course MA 18100. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions. Credits: 4.00

15-17 Credits

Spring 1st Year

CS 18200 - Foundations Of Computer Science

Credit Hours: 3.00. Logic and proofs; sets, functions, relations, sequences and summations; number representations; counting; fundamentals of the analysis of algorithms; graphs and trees; proof techniques; recursion; Boolean logic; finite state machines; pushdown automata; computability and undecidability.

Learning Outcomes: 1. Understand discrete mathematical tools, facts, and reasoning relevant to computer science. Credits: 3.00

CS 24000 - Programming In C

Credit Hours: 3.00. The UNIX environment, C development cycle, data representation, operators, program structure, recursion, macros, C preprocessor, pointers and addresses, dynamic memory allocation, structures, unions, typedef, bit-fields, pointer/structure applications, UNIX file abstraction, file access, low-level I/O, concurrency.

Learning Outcomes: 1. Understand programming principles and techniques for problem solving in the C programming language. Credits: 3.00

MA 16200 - Plane Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 5.00. Continuation of MA 16100 . Vectors in two and three dimensions, techniques of integration, infinite series, conic sections, polar coordinates, surfaces in three dimensions. Some schools or departments may allow only 4 credit hours toward graduation for this course.

University Core Curriculum (UCC): (UCC: QR)
Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 5.00

MA 16600 - Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 4.00. Continuation of MA 16500 . Vectors in two and three dimensions. Techniques of integration, infinite series, polar coordinates, surfaces in three dimensions. Not open to students with credit in MA 16200 . CTL:IMA 1603 Calculus - Long II

University Core Curriculum (UCC): (UCC: QR)
Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 4.00

14-18 Credits

Fall 2nd Year

CS 25000 - Computer Architecture

Credit Hours: 4.00. Digital logic: transistors, gates, and combinatorial circuits; clocks; registers and register banks; arithmetic-logic units; data representation: big-endian and little-endian integers; ones and twos complement arithmetic; signed and unsigned values; Von-Neumann architecture and bottleneck; instruction sets; RISC and CISC designs; instruction pipelines and stalls; rearranging code; memory and address spaces; physical and virtual memory; interleaving; page tables; memory caches; bus architecture; polling and interrupts; DMA; device programming; assembly language; optimizations; parallelism; data pipelining.

Learning Outcomes: 1. Students understand the function of basic hardware, including fundamentals of digital logic, processors, memory, and I/O. Credits: 4.00

CS 25100 - Data Structures And Algorithms

Credit Hours: 3.00. Running time analysis of algorithms and their implementations, one-dimensional data structures, trees, heaps, additional sorting algorithms, binary search trees, hash

tables, graphs, directed graphs, weighted graph algorithms, additional topics.

Learning Outcomes: 1. Understand fundamental data structures, fundamental algorithms, and their implementation. Credits: 3.00

MA 26100 - Multivariate Calculus (UCC: QR)

Credit Hours: 4.00. Planes, lines, and curves in three dimensions. Differential calculus of several variables; multiple integrals. Introduction to vector calculus. Not open to students with credit in MA 17400 or 27100.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Know the equations for lines, planes and quadric surfaces in three dimensional space, and understand how these equations relate to the geometry. 2. Understand the relationship between vector functions and parametrized motion; know how to calculate velocity, acceleration, arc length and curvature. 3. Know the meaning of partial derivatives and how to calculate them. Know the multivariable chain rule. 4. Know the meaning of the gradient, how to calculate it, and how to apply it to directional derivatives and maximum and minimum values. 5. Understand the meaning of double and triple integrals; know how to compute them and how to apply them. 6. Understand the meaning of vector fields and line integrals. Know Green's theorem and be able to apply it. 7. Understand the meaning of surface integrals and know how to calculate them. Know Stokes' theorem and be able to apply it. Credits: 4.00

MA 27101 - Honors Multivariate Calculus (UCC: QR)

Credit Hours: 5.00. This course is the Honors version of MA 26100, Multivariate Calculus; it will also include a review of infinite series. The course is intended for first-year students who have credit for Calculus I and II. There will be a significant emphasis on conceptual explanation, but not on formal proof. Permission of department is required.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Know techniques of vector algebra and be able to apply these to the geometry of space; in particular they will be able to find equations for lines and planes in space. 2. Find equations for standard surfaces in space. 3. Use vector methods to analyze motion in space, and calculate arc length and curvature. 4. Acquire a conceptual and computational knowledge of infinite series; in particular they will be able to test for convergence, and to do calculations with power series. 5. Understand the meaning of partial derivatives in various situations, and will be able to calculate with them. 6. Know the multivariable chain rule and its meaning, and will be able to apply it to calculate derivatives in various situations. 7. Know the meaning of directional derivatives and how to calculate them. 8. Find tangent planes. 9. Find and classify extreme values and saddle points and use the method of Lagrange multipliers. 10. Know the meaning of multiple integrals and how to calculate them. 11. Know the meaning of line integrals and surface integrals and how to calculate them. 12. Know Green's theorem, Stokes' theorem, and the divergence theorem and their applications. Credits: 5.00

15-17 Credits

Spring 2nd Year

CS 25200 - Systems Programming

Credit Hours: 4.00. Low-level programming; review of addresses, pointers, memory layout, and data representation; text, data, and bss segments; debugging and hex dumps; concurrent execution with threads and processes; address spaces; file names; descriptors and file pointers; inheritance; system calls and library functions; standard I/O and string libraries; simplified socket programming; building tools to help programmers; make and make files; shell scripts and quoting; Unix tools including sed, echo, test, and find; scripting languages such as awk; version control; object and executable files (.o and a.out); symbol tables; pointers to functions; hierarchical directories; and DNS hierarchy; programming

embedded systems.

Learning Outcomes: 1. Have an appreciation and ability for low-level (systems) programming and debugging. Credits: 4.00

MA 26500 - Linear Algebra (UCC: QR)

Credit Hours: 3.00. Introduction to linear algebra. Systems of linear equations, matrix algebra, vector spaces, determinants, eigenvalues and eigenvectors, diagonalization of matrices, applications. Not open to students with credit in MA 26200, 27200, 35000 or 35100.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Learn the basic properties of matrices. 2. Learn how to solve systems of linear equations. 3. Learn the basic properties of determinants. 4. Learn about linear independence, spanning sets and bases in the context of vector spaces. 5. Learn the theory of inner product spaces and how it applies to least-squares approximations. 6. Learn the theory of eigenvalues and eigenvectors and how it applies to systems of differential equations. Credits: 3.00

MA 35100 - Elementary Linear Algebra (UCC: QR)

Credit Hours: 3.00. Systems of linear equations, finite dimensional vector spaces, matrices, determinants, eigenvalues and eigenvector applications to analytical geometry. Not open to students with credit in MA 26500.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Solve systems of linear equations using concepts such as vector spaces, linear dependence, and Gaussian elimination. 2. Understand and test for linear independence, calculate the dimension of vector spaces, and apply the rank-nullity theorem in various contexts. 3. Define and apply linear transformations, including matrix multiplication, inverses, LU factorization, and coordinate transformations. 4. Compute and understand determinants, including their use in calculating matrix inverses and practical applications such as volume calculations. 5. Analyze and compute eigenvectors and eigenvalues, and apply diagonalization techniques. Credits: 3.00

16-17 Credits

Fall 3rd Year

STAT 35000 - Introduction To Statistics

Credit Hours: 3.00. This course provides a data-oriented introduction to applied statistics, covering exploratory data analysis, experimental design, probability distributions, simulation, sampling distributions, and the Central Limit Theorem. Students will learn the fundamentals of statistical inference, including confidence intervals and hypothesis tests for population means, paired and independent comparisons of means, analysis of variance, and regression. Know Green's theorem, Stokes' theorem, and the divergence theorem and their applications. Credits: 5.00

Required CS Major Core Courses (21 credits)

CS 18000 - Problem Solving And Object-Oriented Programming

Credit Hours: 4.00. Problem solving and algorithms,

implementation of algorithms in a high level programming language, conditionals, the iterative approach and debugging, collections of data, searching and sorting, solving problems by decomposition, the object-oriented approach, subclasses of existing classes, handling exceptions that occur when the program is running, graphical user interfaces (GUIs), data stored in files, abstract data types, a glimpse at topics from other CS courses. Intended primarily for students majoring in computer sciences. Credit cannot be obtained for both CS 18000 and any of 15600, 15800 and 15900. Not open to students with credit in CS 24000.

Learning Outcomes: 1. Understand solving problems by analyzing the problem, designing an algorithm, and programming the solution. Credits: 4.00

CS 18200 - Foundations Of Computer Science

Credit Hours: 3.00. Logic and proofs; sets, functions, relations, sequences and summations; number representations; counting; fundamentals of the analysis of algorithms; graphs and trees; proof techniques; recursion; Boolean logic; finite state machines; pushdown automata; computability and undecidability.

Learning Outcomes: 1. Understand discrete mathematical tools, facts, and reasoning relevant to computer science. Credits: 3.00

CS 24000 - Programming In C

Credit Hours: 3.00. The UNIX environment, C development cycle, data representation, operators, program structure, recursion, macros, C preprocessor, pointers and addresses, dynamic memory allocation, structures, unions, typedef, bit-fields, pointer/structure applications, UNIX file abstraction, file access, low-level I/O, concurrency.

Learning Outcomes: 1. Understand programming principles and techniques for problem solving in the C programming language. Credits: 3.00

CS 25000 - Computer Architecture

Credit Hours: 4.00. Digital logic: transistors, gates, and combinatorial circuits; clocks; registers and register banks; arithmetic-logic units; data representation: big-endian and little-endian integers; ones and twos complement arithmetic; signed and unsigned values; Von-Neumann architecture and bottleneck; instruction sets; RISC and CISC designs; instruction pipelines and stalls; rearranging code; memory and address spaces; physical and virtual memory; interleaving; page tables; memory caches; bus architecture; polling and interrupts; DMA; device programming; assembly language; optimizations; parallelism; data pipelining.

Learning Outcomes: 1. Students understand the function of basic hardware, including fundamentals of digital logic, processors, memory, and I/O. Credits: 4.00

CS 25100 - Data Structures And Algorithms

Credit Hours: 3.00. Running time analysis of algorithms and their implementations, one-dimensional data structures, trees, heaps, additional sorting algorithms, binary search trees, hash tables, graphs, directed graphs, weighted graph algorithms, additional topics.

Learning Outcomes: 1. Understand fundamental data structures, fundamental algorithms, and their implementation. Credits: 3.00

CS 25200 - Systems Programming

Credit Hours: 4.00. Low-level programming; review of addresses, pointers, memory layout, and data representation; text, data, and bss segments; debugging and hex dumps; concurrent execution with threads and processes; address spaces; file names; descriptors and file pointers; inheritance; system calls and library functions; standard I/O and string libraries; simplified socket programming; building tools to help programmers; make and make files; shell scripts and quoting; Unix tools including sed, echo, test, and find; scripting languages such as awk; version control; object and executable files (.o and a.out); symbol tables; pointers to functions; hierarchical directories; and DNS hierarchy; programming embedded systems.

Learning Outcomes: 1. Have an appreciation and ability for low-level (systems) programming and debugging. Credits: 4.00

Database and Information Systems Concentration (21 credits)

Required Courses

CS 34800 - Information Systems

Credit Hours: 3.00. File organization and index structures; object-oriented database languages; the relational database model with introductions to SQL and DBMS; hierarchical models and network models with introductions to HDDL, HDML, and DBTG Codasyl; data mining; data warehousing; database connectivity; distributed databases; the client/server paradigm;

middleware, including ODBC, JDBC, CORBA, and MOM.

Learning Outcomes: 1. Learn about different data models (relational, graph, and document) used in different database systems. 2. Learn how to pose complex database queries in SQL and NoSQL languages as well as theoretical query languages. 3. Gain an introductory background in indexing. 4. Learn about transactions and concurrency control. 5. Differentiate between OLTP and OLAP applications. Credits: 3.00

CS 38100 - Introduction To The Analysis Of Algorithms

Credit Hours: 3.00. Techniques for analyzing the time and space requirements of algorithms. Application of these techniques to sorting, searching, pattern-matching, graph problems, and other selected problems. Brief introduction to the intractable (NP-hard) problems.

Learning Outcomes: 1. Use big O-notation to give asymptotic time and space bounds of algorithms. 2. Explain the use of big-Omega, big-Theta, and little-o notations. 3. Use recurrence relations to determine the time complexity of recursive algorithms. 4. Solve recurrence relations commonly arising in algorithm design. 5. Give examples that illustrate time-space trade-offs of algorithms. Credits: 3.00

CS 44800 - Introduction To Relational Database Systems

Credit Hours: 3.00. An in-depth examination of relational database systems including theory and concepts as well as practical issues in relational databases. Modern database technologies such as object-relational and Web-based access to relational databases. Conceptual design and entity relationship modeling, relational algebra and calculus, data definition and manipulation languages using SQL, schema and view management, query processing and optimization, transaction management, security, privacy, integrity management.

Learning Outcomes: 1. Learn data modeling: physical, logical and conceptual data models, the entity-relationship model. 2. Study logical and Physical Design and interaction with operating systems, disk Storage, Basic File Structures, Hashing, Indexing. 3. Learn the relational database model and implementation and performance issues. 4. Understand transaction Processing, concurrency control, atomicity control and recovery control. 5. Understand database privacy, integrity, and security. 6. Understand data mining, data warehousing, online analytical processing, and information retrieval. 7. Understand Cloud computing and Distributed Database Systems architectures, Big Data, Hadoop, MapReduce, and NoSQL. 8. Recognize performance issues. Credits: 3.00

CS 47300 - Web Information Search And Management

Credit Hours: 3.00. This course teaches important concepts and knowledge of information retrieval for managing unstructured data such as text data on Web or in emails. At the same time, students will be exposed to a large number of important applications. Students in the course will get hands on experience from homework and a course project. The first part of the course focuses on general concepts/techniques such as stemming, indexing, vector space model, and feedback procedure. The second part of the course shows how to apply the set of techniques on different applications such as Web search, text categorization, and information recommendation.

Learning Outcomes: 1. Understand the important concepts and techniques of information retrieval and how to apply these techniques to a set of important or real world applications. Credits: 3.00

CS 37300 - Data Mining And Machine Learning

Credit Hours: 3.00. This course will introduce students to the field of data mining and machine learning, which sits at the interface between statistics and computer science. Data mining and machine learning focuses on developing algorithms to automatically discover patterns and learn models of large datasets. This course introduces students to the process and main techniques in data mining and machine learning, including exploratory data analysis, predictive modeling, descriptive modeling, and evaluation.

Learning Outcomes: 1. Identify key elements of data mining and machine learning algorithms. 2. Understand how algorithmic elements interact to impact performance. 3. Understand how to

choose algorithms for different analysis tasks. 4. Analyze data in both an exploratory and targeted manner. 5. Implement and apply basic algorithms for supervised and unsupervised learning. 6. Accurately evaluate the performance of algorithms, as well as formulate and test hypotheses. Credits: 3.00

Selectives

Category I - Computing Systems

CS 35200 - Compilers: Principles And Practice

Credit Hours: 3.00. Should not be taken concurrently with CS 35400. The theory and practice of programming language translation, compilation, and run-time systems, organized around a significant programming project to build a compiler for a simple but nontrivial programming language. Modules, interfaces, tools. Data structures for tree languages. Lexical analysis, syntax analysis, abstract syntax. Symbol tables, semantic analysis. Translation, intermediate code, basic blocks, traces. Instruction selection, CISC and RISC machines. Liveness analysis, graph coloring register allocation. Supplemental material drawn from garbage collection, object-oriented languages, higher-order languages, dataflow analysis, optimization, polymorphism, scheduling and pipelining, memory hierarchies.

Learning Outcomes: 1. Provides students with an understanding of how a computer program is converted into elementary code that causes the computer to produce the output intended by the programmer. Credits: 3.00

CS 35300 - Principles Of Concurrency And Parallelism

Credit Hours: 3.00. Important concepts, models, algorithms, abstractions, and implementation aspects of concurrent and parallel programs. Topics include: techniques used to describe concurrent programs (e.g., threads, events, co-routines, continuations), abstractions for shared-memory and message-passing programs, relaxed memory models, livelock and deadlock detection, lock-free algorithms, data races and atomicity, scheduling techniques, process calculi, and software transactions.

Learning Outcomes: 1. This course provides students the vocabulary and concepts to better understand how to design and program scalable multicore processors. Credits: 3.00

CS 35400 - Operating Systems

Credit Hours: 3.00. Should not be taken concurrently with CS 35200. Introduction to operating systems. Computer system and operating system architectures, processes, inter-process communication, inter-process synchronization, mutual exclusion, deadlocks, memory hierarchy, virtual memory, CPU scheduling, file systems, I/O device management, security.

Learning Outcomes: 1. Provides students with an understanding of the fundamentals of computer operating systems. Credits: 3.00

Category II - Information Assurance

CS 35500 - Introduction To Cryptography

Credit Hours: 3.00. An introduction to cryptography basics: Classic historical ciphers including Caesar, Vigenere, and Vernam ciphers; modern ciphers including DES, AES, Pohlig-Hellman, and RSA; signatures and digests; key exchange; simple protocols; block and stream ciphers; network-centric protocols.

Learning Outcomes: 1. Understand the basic concepts and proof techniques in cryptography. 2. Develop skills to define and evaluate the security of existing schemes. 3. Construct provably secure schemes for common cryptographic tasks. Credits: 3.00

CS 42600 - Computer Security

Credit Hours: 3.00. A survey of the fundamentals of information security. Risks and vulnerabilities, policy formation, controls and protection methods, database security, encryption, authentication technologies, host-based and network-based security issues, personnel and physical security issues, issues of law and privacy.

Learning Outcomes: 1. Apply the notions of threat, vulnerability, attack, countermeasure, security objectives, and adversarial models when analyzing security of computer and information systems. 2. Explain the main authorization mechanisms and access control models, and their applicability in different situations. 3. Explain security issues related to password and other authentication

mechanisms. 4. Explain the different types of malware, the mechanisms of their propagation, and the strengths and limitations of different defense mechanisms. 5. Identify the threats and vulnerabilities for a networked environment, and explain different countermeasures, and their effectiveness. 6. Explain the vulnerabilities brought about by modern web-based application and services, different countermeasures, and their effectiveness. Credits: 3.00

Category III - Related Studies

EPCS 41200 - Senior Design Participation In EPICS

Credit Hours: 2.00. Continuation of EPICS courses. Seniors using EPCS 41200 to fulfill capstone or design requirements where approved for their major may be required to satisfy additional course requirements specified by their degree program. EPCS 41200 is offered for 2 credits. The EPICS procedures manual provides information on expected relative workload for EPCS 41100 and EPCS 41200 students. Seniors are responsible for the management tasks of planning and organizing their team project activity. They are expected to contribute expertise from their discipline to the design of the team's projects throughout most of the design process phases of problem identification, specification development, design, production, and deployment. Seniors will also meet with the customer and mentor the first year, sophomores and juniors. May not be taken concurrently with EPCS 41100 .

Learning Outcomes: 1. An ability to apply material from their discipline to the design of community-based projects. 2. An understanding of design as a start-to-finish process. 3. An ability to identify and acquire new knowledge as a part of the problem-solving/design process. 4. An awareness of the customer. 5. An ability to function on multidisciplinary teams and an appreciation for the contributions from individuals from multiple disciplines. 6. An ability to communicate effectively with audiences with widely-varying backgrounds. 7. An awareness of professional ethics and responsiblity. 8. An appreciation of the role that their discipline can play in social contexts. Credits: 2.00

EPCS 41100 - Senior Design Participation In EPICS

Credit Hours: 1.00. Continuation of EPICS courses. Seniors using EPCS 41100 to fulfill capstone or design requirements where approved for their major may be required to satisfy additional course requirements specified by their degree program. EPCS 41100 is offered for 1 credit. The EPICS procedures manual provides information on expected relative workload for EPCS 41100 and EPCS 41200 students. Seniors are responsible for the management tasks of planning and organizing their team project activity. They are expected to contribute expertise from their discipline to the design of the team's projects throughout most of the design process phases of problem identification, specification development, design, production, and deployment. Seniors will also meet with the customer and mentor the first year, sophomores and juniors. May not be taken concurrently with EPCS 41200 .

Learning Outcomes: 1. An ability to apply material from their discipline to the design of community-based projects. 2. An understanding of design as a start-to-finish process. 3. An ability to identify and acquire new knowledge as a part of the problem-solving/design process. 4. An awareness of the customer. 5. An ability to function on multidisciplinary teams and an appreciation for the contributions from individuals from multiple disciplines. 6. An ability to communicate effectively with audiences with widely-varying backgrounds. 7. An awareness of professional ethics and responsibility. 8. An appreciation of the role that their discipline can play in social contexts. Credits: 1.00

CS 42200 - Computer Networks

Credit Hours: 3.00. Undergraduate-level introduction to computer networks and data communication. Low-level details of media, signals, and bits: time division and frequency division multiplexing; encoding; modulation; bandwidth, throughput, and noise. Packet transmission: Local Area Network (Ethernet, FDDI) and Wide Area Network technologies (ATM); wireless networks; network interconnection with repeaters, bridges, and switches; DSU/CSU; xDSL and cable modems. Internetworking: router-based architecture; IP addressing; address binding with ARP; datagram encapsulation and fragmentation; UDP and TCP, retransmission; protocol ports; ICMP and error handling. Network applications: client/server concept; port demultiplexing; program interface to protocols (API); use by clients and servers; domain name system; TELNET; Web technologies including HTTP, CGI, Java; RPC and middleware; network management.

Credits: 3.00

CS 47100 - Introduction To Artificial Intelligence

Credit Hours: 3.00. Students are expected to spend at least three hours per week gaining experience with artificial intelligence systems and developing software. Basic problem-solving strategies, heuristic search, problem reduction and AND/OR graphs, knowledge representation, expert systems, generating explanations, uncertainty reasoning, game playing, planning, machine learning, computer vision, and programming systems such as Lisp or Prolog.

Learning Outcomes: 1. Develop understandings of various applications of AI. 2. Recognize problems where AI techniques are applicable. 3. Implement and apply basic principles of AI in solutions that require problem-solving, inference, learning, and planning. 4. Understand how to evaluate various AI techniques and make appropriate selections. Credits: 3.00

CS 47300 - Web Information Search And Management

Credit Hours: 3.00. This course teaches important concepts and knowledge of information retrieval for managing unstructured data such as text data on Web or in emails. At the same time, students will be exposed to a large number of important applications. Students in the course will get hands on experience from homework and a course project. The first part of the course focuses on general concepts/techniques such as stemming, indexing, vector space model, and feedback procedure. The second part of the course shows how to apply the set of techniques on different applications such as Web search, text categorization, and information recommendation.

Learning Outcomes: 1. Understand the important concepts and techniques of information retrieval and how to apply these techniques to a set of important or real world applications. Credits: 3.00

CS 47800 - Introduction To Bioinformatics

Credit Hours: 3.00. (BIOL 47800) Bioinformatics is broadly defined as the study of molecular biological information, targeting particularly the enormous volume of DNA sequence and functional complexity embedded in entire genomes. Topics will include understanding the evolutionary organization of genes (genomics), the structure and function of gene products (proteomics), and the dynamics of gene expression in biological processes (transcriptomics). Inherently, bioinformatics is interdisciplinary, melding various applications of computational science with biology. This jointly taught course introduces analytical methods from biology, statistics and computer science that are necessary for bioinformatics investigations. The course is intended for junior and senior undergraduates from various science backgrounds. Our objective is to develop the skills of both tool users and tool designers in this important new field of research.

Learning Outcomes: 1. Demonstrate proficiency with professional skills needed by practicing biologists, including experimental design and execution, biological techniques, data collection and documentation, communication of results, and responsible conduct of science. 2. Demonstrate the ability to discuss ethical issues in the application of biological sciences, and the impact of science on society. 3. Demonstrate skills in critical thinking. These skills include understanding scientific methods, solving biology-related problems, interpreting and analyzing primary literature in biology, and interpreting data in a meaningful way. 4. Demonstrate knowledge of the path leading to specific careers in biology. 5. Understand the role of evolution of creating and modifying the macromolecular components of the cell, and in creating biological complexity and variability. 6. Use and understand the scientific method, including how to generate hypotheses and predictions, develop an experimental design, collect data, statistically analyze data, and interpret results. 7. Demonstrate an understanding of laboratory skills used in genetics. 8. Demonstrate knowledge of how evolutionary forces impact and shape microbial function and activity. 9. Demonstrate an understanding of the scientific method including hypothesis generation and testing, data collection, analysis, and interpretation. Credits: 3.00

CS 48300 - Introduction To The Theory Of Computation

Credit Hours: 3.00. Turing machines and the Church-Turing

thesis; decidability; halting problem; reducibility; undecidable problems; decidability of logical theories; Kolmogorov complexity; time classes; P, NP, NP-complete; space classes; Savitch's theorem, PSPACE-completeness, NL-completeness; hierarchy theorems; approximation theorems; probabilistic algorithms; applications of complexity to parallel computation and cryptography.

Credits: 3.00

CS 49000 - Topics In Computer Sciences For Undergraduates

Credit Hours: 1.00 to 5.00. Supervised reading and reports in various fields. Permission of instructor required.

Credits: 1.00 to 5.00

CS 49700 - Honors Research Project

Credit Hours: 3.00. One semester of the project may be counted as one of the seven computer science courses at or above the 300 level required for the bachelor's degree. One more semester, if approved by the honors coordinator, can be used as a free elective. A group research project directed by Computer Sciences faculty members. Each group must submit a technical report describing its work and the results obtained.

Credits: 3.00

CS 37300 - Data Mining And Machine Learning

Credit Hours: 3.00. This course will introduce students to the field of data mining and machine learning, which sits at the interface between statistics and computer science. Data mining and machine learning focuses on developing algorithms to automatically discover patterns and learn models of large datasets. This course introduces students to the process and main techniques in data mining and machine learning, including exploratory data analysis, predictive modeling, descriptive modeling, and evaluation.

Learning Outcomes: 1. Identify key elements of data mining and machine learning algorithms. 2. Understand how algorithmic elements interact to impact performance. 3. Understand how to choose algorithms for different analysis tasks. 4. Analyze data in both an exploratory and targeted manner. 5. Implement and apply basic algorithms for supervised and unsupervised learning. 6. Accurately evaluate the performance of algorithms, as well as formulate and test hypotheses. Credits: 3.00

Concentration Notes

Other Departmental/Program Course Requirements (31-55 credits)

College of Science Additional Requirements

Computing (3-4 credits)

Laboratory Science (6-8 credits)

Mathematics (8-10 credits)

MA 16100 - Plane Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 5.00. Introduction to differential and integral calculus of one variable, with applications. Some schools or departments may allow only 4 credit hours toward graduation for this course. Designed for students who have not had at least a one-semester calculus course in high school, with a grade of "A" or "B". Not open to students with credit in MA 16500 . Demonstrated competence in college algebra and trigonometry.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions Credits: 5.00

MA 16200 - Plane Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 5.00. Continuation of MA 16100 . Vectors in two and three dimensions, techniques of integration, infinite series, conic sections, polar coordinates, surfaces in three dimensions. Some schools or departments may allow only 4 credit hours toward graduation for this course.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 5.00

MA 16500 - Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 4.00. Introduction to differential and integral calculus of one variable, with applications. Conic sections. Designed for students who have had at least a one-semester calculus course in high school, with a grade of "A" or "B", but are not qualified to enter MA 16200 or MA 16600 or the advanced placement courses MA 17300 or the honors calculus course MA 18100. Demonstrated competence in college algebra and trigonometry. CTL:IMA 1602 Calculus - Long I

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems. 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions. Credits: 4.00

MA 16600 - Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 4.00. Continuation of MA 16500 . Vectors in two and three dimensions. Techniques of integration, infinite series, polar coordinates, surfaces in three dimensions. Not open to students with credit in MA 16200 . CTL:IMA 1603 Calculus - Long II

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 4.00

Statistics (3 credits)

STAT 35000 - Introduction To Statistics

Credit Hours: 3.00. This course provides a data-oriented introduction to applied statistics, covering exploratory data analysis, experimental design, probability distributions, simulation, sampling distributions, and the Central Limit Theorem. Students will learn the fundamentals of statistical inference, including confidence intervals and hypothesis tests for population means, paired and independent comparisons of means, analysis of variance, and regression. The course emphasizes hands-on experience with statistical software and is primarily intended for students majoring in the mathematical sciences. Prerequisite: two semesters of college calculus.

Learning Outcomes: 1. Understand basic terms, graphs, and symbols and be able to interpret statistics in the media. 2. Understand and be able to explain statistical processes and be able to fully interpret statistical results. 3. Understand why and how statistical investigations are conducted and the "big ideas" that underlie statistical investigations. 4. Be able to use a

statistical package (R or SAS) to analyze data and interpret result. 5. Big Ideas in Statistics: variability, distributions, and models; causation vs correlation; practical significance vs statistical significance, etc. Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

Electives (15-40 credits)

Grade Requirements

GPA Requirements

Course Requirements & Notes

Sample 4-Year Plan

Fall 1st Year

CS 18000 - Problem Solving And Object-Oriented Programming

Credit Hours: 4.00. Problem solving and algorithms, implementation of algorithms in a high level programming language, conditionals, the iterative approach and debugging, collections of data, searching and sorting, solving problems by decomposition, the object-oriented approach, subclasses of existing classes, handling exceptions that occur when the program is running, graphical user interfaces (GUIs), data stored in files, abstract data types, a glimpse at topics from other CS courses. Intended primarily for students majoring in computer sciences. Credit cannot be obtained for both CS 18000 and any of 15600, 15800 and 15900. Not open to students with credit in CS 24000.

Learning Outcomes: 1. Understand solving problems by analyzing the problem, designing an algorithm, and programming the solution. Credits: 4.00

MA 16100 - Plane Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 5.00. Introduction to differential and integral calculus of one variable, with applications. Some schools or departments may allow only 4 credit hours toward graduation for this course. Designed for students who have not had at least a one-semester calculus course in high school, with a grade of "A" or "B". Not open to students with credit in MA 16500 . Demonstrated competence in college algebra and trigonometry.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of

elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions Credits: 5.00

MA 16500 - Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 4.00. Introduction to differential and integral calculus of one variable, with applications. Conic sections. Designed for students who have had at least a one-semester calculus course in high school, with a grade of "A" or "B", but are not qualified to enter MA 16200 or MA 16600 or the advanced placement courses MA 17300 or the honors calculus course MA 18100. Demonstrated competence in college algebra and trigonometry. CTL:IMA 1602 Calculus - Long I

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems. 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions. Credits: 4.00

15-17 Credits

Spring 1st Year

CS 18200 - Foundations Of Computer Science

Credit Hours: 3.00. Logic and proofs; sets, functions, relations, sequences and summations; number representations; counting; fundamentals of the analysis of algorithms; graphs and trees; proof techniques; recursion; Boolean logic; finite state machines; pushdown automata; computability and undecidability.

Learning Outcomes: 1. Understand discrete mathematical tools, facts, and reasoning relevant to computer science. Credits: 3.00

CS 24000 - Programming In C

Credit Hours: 3.00. The UNIX environment, C development cycle, data representation, operators, program structure, recursion, macros, C preprocessor, pointers and addresses, dynamic memory allocation, structures, unions, typedef, bit-fields, pointer/structure applications, UNIX file abstraction, file access, low-level I/O, concurrency.

Learning Outcomes: 1. Understand programming principles and techniques for problem solving in the C programming language. Credits: 3.00

MA 16200 - Plane Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 5.00. Continuation of MA 16100 . Vectors in two and three dimensions, techniques of integration, infinite series, conic sections, polar coordinates, surfaces in three dimensions. Some schools or departments may allow only 4 credit hours toward graduation for this course.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 5.00

MA 16600 - Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 4.00. Continuation of MA 16500 . Vectors in two and three dimensions. Techniques of integration, infinite series, polar coordinates, surfaces in three dimensions. Not open to students with credit in MA 16200 . CTL:IMA 1603 Calculus -

Long II

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 4.00

14-18 Credits

Fall 2nd Year

CS 25000 - Computer Architecture

Credit Hours: 4.00. Digital logic: transistors, gates, and combinatorial circuits; clocks; registers and register banks; arithmetic-logic units; data representation: big-endian and little-endian integers; ones and twos complement arithmetic; signed and unsigned values; Von-Neumann architecture and bottleneck; instruction sets; RISC and CISC designs; instruction pipelines and stalls; rearranging code; memory and address spaces; physical and virtual memory; interleaving; page tables; memory caches; bus architecture; polling and interrupts; DMA; device programming; assembly language; optimizations; parallelism; data pipelining.

Learning Outcomes: 1. Students understand the function of basic hardware, including fundamentals of digital logic, processors, memory, and I/O. Credits: 4.00

CS 25100 - Data Structures And Algorithms

Credit Hours: 3.00. Running time analysis of algorithms and their implementations, one-dimensional data structures, trees, heaps, additional sorting algorithms, binary search trees, hash tables, graphs, directed graphs, weighted graph algorithms, additional topics.

Learning Outcomes: 1. Understand fundamental data structures, fundamental algorithms, and their implementation. Credits: 3.00

MA 26100 - Multivariate Calculus (UCC: QR)

Credit Hours: 4.00. Planes, lines, and curves in three dimensions. Differential calculus of several variables; multiple integrals. Introduction to vector calculus. Not open to students with credit in MA 17400 or 27100.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Know the equations for lines, planes and quadric surfaces in three dimensional space, and understand how these equations relate to the geometry. 2. Understand the relationship between vector functions and parametrized motion; know how to calculate velocity, acceleration, arc length and curvature. 3. Know the meaning of partial derivatives and how to calculate them. Know the multivariable chain rule. 4. Know the meaning of the gradient, how to calculate it, and how to apply it to directional derivatives and maximum and minimum values. 5. Understand the meaning of double and triple integrals; know how to compute them and how to apply them. 6. Understand the meaning of vector fields and line integrals. Know Green's theorem and be able to apply it. 7. Understand the meaning of surface integrals and know how to calculate them. Know Stokes' theorem and be able to apply it. Credits: 4.00

MA 27101 - Honors Multivariate Calculus (UCC: QR)

Credit Hours: 5.00. This course is the Honors version of MA 26100, Multivariate Calculus; it will also include a review of infinite series. The course is intended for first-year students who have credit for Calculus I and II. There will be a significant emphasis on conceptual explanation, but not on formal proof. Permission of department is required.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Know techniques of

vector algebra and be able to apply these to the geometry of space; in particular they will be able to find equations for lines and planes in space. 2. Find equations for standard surfaces in space. 3. Use vector methods to analyze motion in space, and calculate arc length and curvature. 4. Acquire a conceptual and computational knowledge of infinite series; in particular they will be able to test for convergence, and to do calculations with power series. 5. Understand the meaning of partial derivatives in various situations, and will be able to calculate with them. 6. Know the multivariable chain rule and its meaning, and will be able to apply it to calculate derivatives in various situations. 7. Know the meaning of directional derivatives and how to calculate them. 8. Find tangent planes. 9. Find and classify extreme values and saddle points and use the method of Lagrange multipliers. 10. Know the meaning of multiple integrals and how to calculate them. 11. Know the meaning of line integrals and surface integrals and how to calculate them. 12. Know Green's theorem, Stokes' theorem, and the divergence theorem and their applications. Credits: 5.00

15-17 Credits

Spring 2nd Year

CS 25200 - Systems Programming

Credit Hours: 4.00. Low-level programming; review of addresses, pointers, memory layout, and data representation; text, data, and bss segments; debugging and hex dumps; concurrent execution with threads and processes; address spaces; file names; descriptors and file pointers; inheritance; system calls and library functions; standard I/O and string libraries; simplified socket programming; building tools to help programmers; make and make files; shell scripts and quoting; Unix tools including sed, echo, test, and find; scripting languages such as awk; version control; object and executable files (.o and a.out); symbol tables; pointers to functions; hierarchical directories; and DNS hierarchy; programming embedded systems.

Learning Outcomes: 1. Have an appreciation and ability for low-level (systems) programming and debugging. Credits: 4.00

MA 26500 - Linear Algebra (UCC: QR)

Credit Hours: 3.00. Introduction to linear algebra. Systems of linear equations, matrix algebra, vector spaces, determinants, eigenvalues and eigenvectors, diagonalization of matrices, applications. Not open to students with credit in MA 26200, 27200, 35000 or 35100.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Learn the basic properties of matrices. 2. Learn how to solve systems of linear equations. 3. Learn the basic properties of determinants. 4. Learn about linear independence, spanning sets and bases in the context of vector spaces. 5. Learn the theory of inner product spaces and how it applies to least-squares approximations. 6. Learn the theory of eigenvalues and eigenvectors and how it applies to systems of differential equations. Credits: 3.00

MA 35100 - Elementary Linear Algebra (UCC: QR)

Credit Hours: 3.00. Systems of linear equations, finite dimensional vector spaces, matrices, determinants, eigenvalues and eigenvector applications to analytical geometry. Not open to students with credit in MA 26500.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Solve systems of linear equations using concepts such as vector spaces, linear dependence, and Gaussian elimination. 2. Understand and test for linear independence, calculate the dimension of vector spaces, and apply the rank-nullity theorem in various contexts. 3. Define and apply linear transformations, including matrix multiplication, inverses, LU factorization, and coordinate transformations. 4. Compute and understand determinants, including their use in calculating matrix inverses and practical applications such as volume calculations. 5.

Analyze and compute eigenvectors and eigenvalues, and apply diagonalization techniques. Credits: 3.00

16-17 Credits

Fall 3rd Year

STAT 35000 - Introduction To Statistics

Credit Hours: 3.00. This course provides a data-oriented introduction to applied statistics, covering exploratory data analysis, experimental design, probability distributions, simulation, sampling distributions, and the Central Limit Theorem. Students will learn the fundamentals of statistical inference, including confidence intervals and hypothesis tests for population means, paired and independent comparisons of means, analysis of variance, and regression. The course emphasizes hands-on experience with statistical software and is primarily intended for students majoring in the mathematical sciences. Prerequisite: two semesters of college calculus.

Learning Outcomes: 1. Understand basic terms, graphs, and symbols and be able to interpret statistics in the media. 2. Understand and be able to explain statistical processes and be able to fully interpret statistical results. 3. Understand why and how statistical investigations are conducted and the "big ideas" that underlie statistical investigations. 4. Be able to use a statistical package (R or SAS) to analyze data and interpret result. 5. Big Ideas in Statistics: variability, distributions, and models; causation vs correlation; practical significance vs statistical significance, etc. Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

16-17 Credits

Computer Science: Machine Intelligence, BS

About the Program

Degree Requirements

Computer Science Major Courses (46-47 credits)

Required CS Major Math Courses (7-8 credits)

MA 26100 - Multivariate Calculus (UCC: QR)

Credit Hours: 4.00. Planes, lines, and curves in three dimensions. Differential calculus of several variables; multiple integrals. Introduction to vector calculus. Not open to students with credit in MA 17400 or 27100.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Know the equations for lines, planes and quadric surfaces in three dimensional space, and understand how these equations relate to the geometry. 2. Understand the relationship between vector functions and parametrized motion; know how to calculate velocity, acceleration, arc length and curvature. 3. Know the meaning of partial derivatives and how to calculate them. Know the multivariable chain rule. 4. Know the meaning of the gradient, how to calculate it, and how to apply it to directional derivatives and maximum and minimum values. 5. Understand the meaning of double and triple integrals; know how to compute them and how to apply them. 6. Understand the meaning of vector fields and line integrals. Know Green's theorem and be able to apply it. 7. Understand the meaning of surface integrals and know how to calculate them. Know Stokes' theorem and be able to apply it. Credits: 4.00

MA 26500 - Linear Algebra (UCC: QR)

Credit Hours: 3.00. Introduction to linear algebra. Systems of linear equations, matrix algebra, vector spaces, determinants, eigenvalues and eigenvectors, diagonalization of matrices, applications. Not open to students with credit in MA 26200, 27200, 35000 or 35100.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Learn the basic properties of matrices. 2. Learn how to solve systems of linear equations. 3. Learn the basic properties of determinants. 4. Learn about linear independence, spanning sets and bases in the context of vector spaces. 5. Learn the theory of inner product spaces and how it applies to least-squares approximations. 6. Learn the theory of eigenvalues and eigenvectors and how it applies to systems of differential equations. Credits: 3.00

MA 35100 - Elementary Linear Algebra (UCC: QR)

Credit Hours: 3.00. Systems of linear equations, finite dimensional vector spaces, matrices, determinants, eigenvalues and eigenvector applications to analytical geometry. Not open to students with credit in MA 26500.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Solve systems of linear equations using concepts such as vector spaces, linear dependence, and Gaussian elimination. 2. Understand and test for linear independence, calculate the dimension of vector spaces, and apply the rank-nullity theorem in various contexts. 3. Define and apply linear transformations, including matrix multiplication, inverses, LU factorization, and coordinate transformations. 4. Compute and understand determinants, including their use in calculating matrix inverses and practical applications such as volume calculations. 5. Analyze and compute eigenvectors and eigenvalues, and apply diagonalization techniques. Credits: 3.00

MA 27101 - Honors Multivariate Calculus (UCC: QR)

Credit Hours: 5.00. This course is the Honors version of MA 26100, Multivariate Calculus; it will also include a review of infinite series. The course is intended for first-year students who have credit for Calculus I and II. There will be a significant emphasis on conceptual explanation, but not on formal proof. Permission of department is required.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Know techniques of vector algebra and be able to apply these to the geometry of space; in particular they will be able to find equations for lines and planes in space. 2. Find equations for standard surfaces in space. 3. Use vector methods to analyze motion in space, and calculate arc length and curvature. 4. Acquire a conceptual and computational knowledge of infinite series; in particular they will be able to test for convergence, and to do calculations with power series. 5. Understand the meaning of partial derivatives in various situations, and will be able to calculate with them. 6. Know the multivariable chain rule and its meaning, and will be able to apply it to calculate derivatives in various situations. 7. Know the meaning of directional derivatives and how to calculate them. 8. Find tangent planes. 9. Find and classify extreme values and saddle points and use the method of Lagrange multipliers. 10. Know the meaning of multiple integrals and how to calculate them. 11. Know the meaning of line integrals and surface integrals and how to calculate them. 12. Know Green's theorem, Stokes' theorem, and the divergence theorem and their applications. Credits: 5.00

Required CS Major Core Courses (21 credits)

CS 18000 - Problem Solving And Object-Oriented Programming

Credit Hours: 4.00. Problem solving and algorithms, implementation of algorithms in a high level programming language, conditionals, the iterative approach and debugging, collections of data, searching and sorting, solving problems by decomposition, the object-oriented approach, subclasses of existing classes, handling exceptions that occur when the program is running, graphical user interfaces (GUIs), data stored in files, abstract data types, a glimpse at topics from other CS courses. Intended primarily for students majoring in computer sciences. Credit cannot be obtained for both CS 18000 and any of 15600, 15800 and 15900. Not open to students with credit in CS 24000.

Learning Outcomes: 1. Understand solving problems by analyzing the problem, designing an algorithm, and programming the solution. Credits: 4.00

CS 18200 - Foundations Of Computer Science

Credit Hours: 3.00. Logic and proofs; sets, functions, relations, sequences and summations; number representations; counting; fundamentals of the analysis of algorithms; graphs and trees; proof techniques; recursion; Boolean logic; finite state machines; pushdown automata; computability and undecidability.

Learning Outcomes: 1. Understand discrete mathematical tools, facts, and reasoning relevant to computer science. Credits: 3.00

CS 24000 - Programming In C

Credit Hours: 3.00. The UNIX environment, C development cycle, data representation, operators, program structure, recursion, macros, C preprocessor, pointers and addresses, dynamic memory allocation, structures, unions, typedef, bit-fields, pointer/structure applications, UNIX file abstraction, file access, low-level I/O, concurrency.

Learning Outcomes: 1. Understand programming principles and techniques for problem solving in the C programming language. Credits: 3.00

CS 25000 - Computer Architecture

Credit Hours: 4.00. Digital logic: transistors, gates, and combinatorial circuits; clocks; registers and register banks; arithmetic-logic units; data representation: big-endian and little-endian integers; ones and twos complement arithmetic; signed and unsigned values; Von-Neumann architecture and bottleneck; instruction sets; RISC and CISC designs; instruction pipelines and stalls; rearranging code; memory and address spaces; physical and virtual memory; interleaving; page tables; memory caches; bus architecture; polling and interrupts; DMA;

device programming; assembly language; optimizations; parallelism; data pipelining.

Learning Outcomes: 1. Students understand the function of basic hardware, including fundamentals of digital logic, processors, memory, and I/O. Credits: 4.00

CS 25100 - Data Structures And Algorithms

Credit Hours: 3.00. Running time analysis of algorithms and their implementations, one-dimensional data structures, trees, heaps, additional sorting algorithms, binary search trees, hash tables, graphs, directed graphs, weighted graph algorithms, additional topics.

Learning Outcomes: 1. Understand fundamental data structures, fundamental algorithms, and their implementation. Credits: 3.00

CS 25200 - Systems Programming

Credit Hours: 4.00. Low-level programming; review of addresses, pointers, memory layout, and data representation; text, data, and bss segments; debugging and hex dumps; concurrent execution with threads and processes; address spaces; file names; descriptors and file pointers; inheritance; system calls and library functions; standard I/O and string libraries; simplified socket programming; building tools to help programmers; make and make files; shell scripts and quoting; Unix tools including sed, echo, test, and find; scripting languages such as awk; version control; object and executable files (.o and a.out); symbol tables; pointers to functions; hierarchical directories; and DNS hierarchy; programming embedded systems.

Learning Outcomes: 1. Have an appreciation and ability for low-level (systems) programming and debugging. Credits: 4.00

Machine Intelligence Concentration (18 credits)

Required Courses for Machine Intelligence (12 credits)

CS 38100 - Introduction To The Analysis Of Algorithms

Credit Hours: 3.00. Techniques for analyzing the time and space requirements of algorithms. Application of these techniques to sorting, searching, pattern-matching, graph problems, and other selected problems. Brief introduction to the intractable (NP-hard) problems.

Learning Outcomes: 1. Use big O-notation to give asymptotic time and space bounds of algorithms. 2. Explain the use of big-Omega, big-Theta, and little-o notations. 3. Use recurrence relations to determine the time complexity of recursive algorithms. 4. Solve recurrence relations commonly arising in algorithm design. 5. Give examples that illustrate time-space trade-offs of algorithms. Credits: 3.00

CS 47100 - Introduction To Artificial Intelligence

Credit Hours: 3.00. Students are expected to spend at least three hours per week gaining experience with artificial intelligence systems and developing software. Basic problem-solving strategies, heuristic search, problem reduction and AND/OR graphs, knowledge representation, expert systems, generating explanations, uncertainty reasoning, game playing, planning, machine learning, computer vision, and programming systems such as Lisp or Prolog.

Learning Outcomes: 1. Develop understandings of various applications of AI. 2. Recognize problems where AI techniques are applicable. 3. Implement and apply basic principles of AI in solutions that require problem-solving, inference, learning, and planning. 4. Understand how to evaluate various AI techniques and make appropriate selections. Credits: 3.00

CS 47300 - Web Information Search And Management

Credit Hours: 3.00. This course teaches important concepts and knowledge of information retrieval for managing unstructured data such as text data on Web or in emails. At the same time, students will be exposed to a large number of important applications. Students in the course will get hands on experience from homework and a course project. The first part of the course focuses on general concepts/techniques such as stemming, indexing, vector space model, and feedback procedure. The second part of the course shows how to apply the set of techniques on different applications such as Web search, text categorization, and information recommendation.

Learning Outcomes: 1. Understand the important concepts and techniques of information retrieval and how to apply these techniques to a set of important or real world

applications. Credits: 3.00

MA 41600 - Probability

Credit Hours: 3.00. (STAT 41600) An introduction to mathematical probability suitable as a preparation for actuarial science, statistical theory, and mathematical modeling. General probability rules, conditional probability and Bayes theorem, discrete and continuous random variables, moments and moment generating functions, joint and conditional distributions, standard discrete and continuous distributions and their properties, law of large numbers and central limit theorem.

Credits: 3.00

STAT 41600 - Probability

Credit Hours: 3.00. (MA 41600) An introduction to mathematical probability suitable as preparation for actuarial science, statistical theory, and mathematical modeling. General probability rules, conditional probability and Bayes theorem, discrete and continuous random variables, moments and moment generating functions, joint and conditional distributions, standard discrete and continuous distributions and their properties, law of large numbers and central limit theorem. Credit cannot be given for more than one of STAT 22500, 31100, or 41600. Prerequisite: multivariate calculus.

Credits: 3.00

STAT 51200 - Applied Regression Analysis

Credit Hours: 3.00. Inference in simple and multiple linear regression, residual analysis, transformations, polynomial regression, model building with real data, nonlinear regression. One-way and two-way analysis of variance, multiple comparisons, fixed and random factors, analysis of covariance. Use of existing statistical computer programs. Prerequisite: Coursework in Statistical Methods with a calculus prerequisite.

Learning Outcomes: 1. Learn to build and analyze simple and multiple regression models, analysis of variance and covariance (ANOVA/ANCOVA) for regression, inference for regression, diagnostics and remedial measures for regression, transformations, residual analysis, model building, polynomial and interaction models. Credits: 3.00

CS 37300 - Data Mining And Machine Learning

Credit Hours: 3.00. This course will introduce students to the field of data mining and machine learning, which sits at the interface between statistics and computer science. Data mining and machine learning focuses on developing algorithms to automatically discover patterns and learn models of large datasets. This course introduces students to the process and main techniques in data mining and machine learning, including exploratory data analysis, predictive modeling, descriptive modeling, and evaluation.

Learning Outcomes: 1. Identify key elements of data mining and machine learning algorithms. 2. Understand how algorithmic elements interact to impact performance. 3. Understand how to choose algorithms for different analysis tasks. 4. Analyze data in both an exploratory and targeted manner. 5. Implement and apply basic algorithms for supervised and unsupervised learning. 6. Accurately evaluate the performance of algorithms, as well as formulate and test hypotheses. Credits: 3.00

Selectives (6 credits)

CS 31400 - Numerical Methods

Credit Hours: 3.00. Iterative methods for solving nonlinear equations; direct and iterative methods for solving linear systems; approximations of functions, derivatives, and integrals; error analysis.

Credits: 3.00

CS 34800 - Information Systems

Credit Hours: 3.00. File organization and index structures; object-oriented database languages; the relational database model with introductions to SQL and DBMS; hierarchical models and network models with introductions to HDDL, HDML, and DBTG Codasyl; data mining; data warehousing; database connectivity; distributed databases; the client/server paradigm; middleware, including ODBC, JDBC, CORBA, and MOM.

Learning Outcomes: 1. Learn about different data models (relational, graph, and document) used in different database systems. 2. Learn how to pose complex database queries in SQL and NoSQL languages as well as theoretical query languages. 3. Gain an introductory background in indexing. 4. Learn about transactions and concurrency control. 5. Differentiate between OLTP and OLAP applications. Credits: 3.00

CS 35200 - Compilers: Principles And Practice

Credit Hours: 3.00. Should not be taken concurrently with CS 35400. The theory and practice of programming language translation, compilation, and run-time systems, organized around a significant programming project to build a compiler for a simple but nontrivial programming language. Modules, interfaces, tools. Data structures for tree languages. Lexical analysis, syntax analysis, abstract syntax. Symbol tables, semantic analysis. Translation, intermediate code, basic blocks, traces. Instruction selection, CISC and RISC machines. Liveness analysis, graph coloring register allocation. Supplemental material drawn from garbage collection, object-oriented languages, higher-order languages, dataflow analysis, optimization, polymorphism, scheduling and pipelining, memory hierarchies.

Learning Outcomes: 1. Provides students with an understanding of how a computer program is converted into elementary code that causes the computer to produce the output intended by the programmer. Credits: 3.00

CS 44800 - Introduction To Relational Database Systems

Credit Hours: 3.00. An in-depth examination of relational database systems including theory and concepts as well as practical issues in relational databases. Modern database technologies such as object-relational and Web-based access to relational databases. Conceptual design and entity relationship modeling, relational algebra and calculus, data definition and manipulation languages using SQL, schema and view management, query processing and optimization, transaction management, security, privacy, integrity management.

Learning Outcomes: 1. Learn data modeling: physical, logical and conceptual data models, the entity-relationship model. 2. Study logical and Physical Design and interaction with operating systems, disk Storage, Basic File Structures, Hashing, Indexing. 3. Learn the relational database model and implementation and performance issues. 4. Understand transaction Processing, concurrency control, atomicity control and recovery control. 5. Understand database privacy, integrity, and security. 6. Understand data mining, data warehousing, online analytical processing, and information retrieval. 7. Understand Cloud computing and Distributed Database Systems architectures, Big Data, Hadoop, MapReduce, and NoSQL. 8. Recognize performance issues. Credits: 3.00

CS 45600 - Programming Languages

Credit Hours: 3.00. Concepts for structuring data, computation, and whole programs. Object-oriented languages, functional languages, logic- and rule-based languages. Data types, type checking, exception handling, concurrent processes, synchronization, modularity, encapsulation, interfaces, separate compilation, inheritance, polymorphism, dynamic binding, subtyping, overloading, beta-reduction, unification.

Credits: 3.00

CS 47100 - Introduction To Artificial Intelligence

Credit Hours: 3.00. Students are expected to spend at least three hours per week gaining experience with artificial intelligence systems and developing software. Basic problem-solving strategies, heuristic search, problem reduction and AND/OR graphs, knowledge representation, expert systems, generating explanations, uncertainty reasoning, game playing, planning, machine learning, computer vision, and programming systems such as Lisp or Prolog.

Learning Outcomes: 1. Develop understandings of various applications of AI. 2. Recognize problems where AI techniques are applicable. 3. Implement and apply basic principles of AI in solutions that require problem-solving, inference, learning, and planning. 4. Understand how to evaluate various AI techniques and make appropriate selections. Credits: 3.00

CS 47300 - Web Information Search And Management

Credit Hours: 3.00. This course teaches important concepts and knowledge of information retrieval for managing unstructured data such as text data on Web or in emails. At the same time, students will be exposed to a large number of important applications. Students in the course will get hands on experience from homework and a course project. The first part of the course focuses on general concepts/techniques such as stemming, indexing, vector space model, and feedback procedure. The second part of the course shows how to apply the set of techniques on different applications such as Web search, text categorization, and information recommendation.

Learning Outcomes: 1. Understand the

important concepts and techniques of information retrieval and how to apply these techniques to a set of important or real world applications. Credits: 3.00

CS 48300 - Introduction To The Theory Of Computation

Credit Hours: 3.00. Turing machines and the Church-Turing thesis; decidability; halting problem; reducibility; undecidable problems; decidability of logical theories; Kolmogorov complexity; time classes; P, NP, NP-complete; space classes; Savitch's theorem, PSPACE-completeness, NL-completeness; hierarchy theorems; approximation theorems; probabilistic algorithms; applications of complexity to parallel computation and cryptography.

Credits: 3.00

CS 57700 - Natural Language Processing

Credit Hours: 3.00. This course will cover the key concepts and methods used in modern Natural Language Processing (NLP). Throughout the course several core NLP tasks, such as sentiment analysis, information extraction, syntactic and semantic analysis, will be discussed. The course will emphasize machine-learning and data-driven algorithms and techniques, and will compare several different approaches to these problems in terms of their performance, supervision effort and computational complexity. Prerequisites: A background in linear algebra, calculus, statistics and probability, and completion of CS 57800 or equivalent are highly recommended. Strong programming skills in any modem language (Python, Java, C++) are required.

Learning Outcomes: 1. Describe and analyze the key challenges in dealing with natural language data and other fundamental areas of NLP. 2. Analyze and implement the key algorithms and techniques used in NLP. 3. Identify algorithmic techniques that can be applied to new problems and evaluate other possible solutions. 4. Conduct experiments using proper methodology for training and testing NLP systems using data. 5. Critically review current research work in the NLP field. Credits: 3.00

CS 43900 - Introduction To Data Visualization

Credit Hours: 3.00. The course offers an introduction to the fundamentals principles, design strategies, and techniques needed to visually communicate, explore, and analyze data. The course focuses primarily on the visual representation of inherently non-spatial data (e.g., tables and spreadsheets, graphs and networks, trees, text, and time series), but also considers the visualization of maps and of data in geospatial context.

Learning Outcomes: 1. Describe the main visualization techniques and explain their strengths and limitations. 2. Select the most perceptually effective visual encoding for a given data attribute. 3. Perform a principled critique of an existing data visualization. 4. Design an effective data visualization solution for a given data set to address a specific data analysis objective. 5. Create interactive web-based visualizations using open-source software libraries. Credits: 3.00

CS 44000 - Large Scale Data Analytics

Credit Hours: 3.00. This course provides an integrated view of the key concepts of modern algorithmic data analytics. It focuses on teaching principles and methods needed to analyze large datasets in
order to extract novel, transformative insights for the underlying application. The course emphasizes the duality between formulating questions that can be answered by statistical data analysis tools (the statistical perspective) and the algorithmic challenge of actually extracting such answers using available parallel and distributed computational resources from massive datasets. The topics cover three areas: (1) algorithmic concepts necessary for big data analytics, (2) big data systems, including data management and programming, and (3) advanced analytic methods to address characteristics of real-world big data problems.

Learning Outcomes: 1. Identify techniques appropriate for solving a data analytics challenge. 2. Load and manipulate data in distributed computing environments. 3. Apply computing paradigms to effectively write efficient and scalable algorithms for data analysis pipelines. Know limitations, design details and design decisions of these algorithms. 4. Apply mixed-precision optimization and parallel learning algorithms to modern machine learning algorithms. 5. Present results in methods appropriate for domain experts. Credits: 3.00

CS 47500 - Human-Computer Interaction

Credit Hours: 3.00. The goal of this course is to teach students how to design useful and usable interactive systems that address important needs of people. Students will experience the entire user-centered design life cycle, from need finding to usability evaluation. Topics covered in the course include user-centered design principles, usability heuristics, need-finding methods such as semi-structured interviews and contextual inquiry, quick prototyping techniques, usability evaluation methods such as hallway testing and human-subjects user study, and theories about user interaction and decision making. As we are entering a new era of AI, the course will also include a brief introduction on how to apply the HCI principles and techniques to AI-powered systems. This course is project-based. Students will form project teams among themselves to work on a semester-long project and apply the user-centered design principles, theories, and techniques that they have learned in class to build a useful and usable interactive system such as a mobile application. This course is also highly interactive, including a series of design studios and in-class activities that require active participation, communication, and discussion with other students.

Learning Outcomes: 1. Apply HCI methods such as semi-structured interviews and contextual inquiries to uncover user needs and realistic problems that can be solved by computational methods. 2. Apply user-centered design principles to iteratively develop interface designs to address those needs. 3. Develop prototypes to concretize a design idea in different levels of fidelity. 4. Critique a design idea or prototype and pinpoint design flaws and usability issues based on commonly agreed upon design principles and usability heuristics. 5. Iteratively evaluate and improve upon the prototypes based on feedback from potential users. 6. Communicate design ideas and findings to target users, other designers, funders, etc. 7. Work in a team and succeed. Credits: 3.00

CS 31100 - Competitive Programming II

Credit Hours: 2.00. CP2 teaches experienced programmers additional techniques to solve interview and competitive programming problems and builds on material learned in CP1. This includes specific algorithmic techniques such as [shortest paths, topological sort, MST, union find, range queries], advanced algorithms surrounding trees and DAGs, advanced problem types in [dynamic programming, backtracking/simulation, mathematics, string processing], and more. It can be viewed as a programming complement to CS 38100, with some overlap in content.

Learning Outcomes: 1. Differentiate between advanced categories of problems in computer science including backtracking/simulation, advanced dynamic programming, advanced graphs (including trees and DAGs), mathematics, string processing, and range queries, as well as subcategories in each of these categories. 2. Implement well-known solutions (as discussed in class) to advanced categories of problems in computer science (listed in LO1). 3. Identify when a problem spans multiple categories of problems (as listed in LO1) 4. Design algorithms to solve problems that span multiple categories of problems. 5. Use new/novel algorithms to solve advanced problems. 6. Recognize key characteristics of certain problem types listed in LO1. 7. Classify an advanced problem by those key characteristics. 8. Deconstruct an advanced problem into subproblems that can be solved individually. 9. Determine runtime and space usage of a potential solution using big-O notation to judge if the potential solution will work. 10. Create an efficient solution to a problem based on analysis of the problem type, the deconstructed problem parts, and the time and space constraints of the problem. 11. Reflect on how one came up with a solution to a problem in order to better recognize patterns in problem types. Credits: 2.00

CS 41100 - Competitive Programming III

Credit Hours: 2.00. CP3 teaches experienced programmers additional techniques to solve competitive programming problems and builds on material learned in CP1 and CP2. This includes algorithmic techniques in topics such as [network flow, computational geometry, graph matching, NP-hard problems]. Primarily, CP3 prepares students to compete in programming contests, which means most class time is focused on simulating

contest environments and teaching teamwork and communication alongside problem practice.

Learning Outcomes: 1. Differentiate between advanced categories of problems in computer science including network flow, computational geometry, graph matching, and NP-hard problems, as well as subcategories in each of these categories. 2. Extrapolate generalized solutions and problem-solving strategies across advanced categories listed in LO1 as well as in general competitive programming categories. 3. Design algorithms to solve problems that span multiple advanced categories of problems, combining categorical solutions in complex ways. 4. Use new/novel algorithms to solve advanced problems. 5. Deconstruct an advanced problem into subproblems that can be solved individually. 6. Quickly determine runtime and space usage of a potential solution using big-O notation to judge if the potential solution will work. 7. Create an efficient solution to a problem based on analysis of the problem type, the deconstructed problem parts, and the time and space constraints of the problem. 8. Communicate ideas quickly and concisely to other competitive programmers to create efficient solutions. Credits: 2.00

CS 45800 - Introduction To Robotics

Credit Hours: 3.00. Any intelligent robot system interacting with our environment needs to have perception, planning, and control methods in its cognition process. The perception module outlines the robot's procedures to gather and interpret sensory observations into world models. The underlying planning and control modules use those world models to plan robot behaviors and their interaction with our natural environments. Therefore, this course will cover the fundamental topics in robot perception, planning, and control to design general-purpose robot cognition algorithms. Overall, this course is divided into four modules: Robot perception: This covers fundamental techniques needed for robot localization and mapping from raw 3D sensory data. Robot planning: This module will discuss robot behavior planning techniques such as A*, RRT*, and trajectory optimization. Robot Control: This introduces basic control techniques such as PID controller to execute the robot's planned behaviors in the real world. Robot Learning: This part will briefly introduce machine learning techniques for robot decision-making and control.

Learning Outcomes: 1. Formulate and solve the robot perception problems. 2. Identify the robot constraints, define their degree of freedom, and formulate their planning and control problems. 3. Apply classical and modern robot planning and control techniques to complex robot systems like manipulators, autonomous cars, etc. 4. Identify limitations in existing classical robot algorithms and understand their formal guarantees. 5. Evaluate and assess current best practices and mechanisms for robot programming. 6. Develop a skill for robot programming from perception to low-level control using standard methods. Credits: 3.00

CS 57800 - Statistical Machine Learning

Credit Hours: 3.00. This introductory course will cover many concepts, models, and algorithms in machine learning. Topics include classical supervised learning (e.g., regression and classification), unsupervised learning (e.g., principle component analysis and K-means), and recent development in the machine learning field such as variational Bayes, expectation propagation, and Gaussian processes. While this course will give students the basic ideas and intuition behind modern machine learning methods, the underlying theme in the course is probabilistic inference.

Learning Outcomes: 1. Learn the theory and key algorithms used in machine learning. 2. Get hands-on machine learning experience by implementing several algorithms, applying them to datasets and analyzing their performance. 3. Understand how to use machine learning methods to their research projects, formulate the learning tasks and match them with appropriate solutions. Credits: 3.00

Concentration Notes

Other Departmental/Program Course Requirements (31-55 credits)

College of Science Additional Requirements

Computing (3-4 credits)

Laboratory Science (6-8 credits)

Mathematics (8-10 credits)

MA 16100 - Plane Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 5.00. Introduction to differential and integral calculus of one variable, with applications. Some schools or departments may allow only 4 credit hours toward graduation for this course. Designed for students who have not had at least a one-semester calculus course in high school, with a grade of "A" or "B". Not open to students with credit in MA 16500 . Demonstrated competence in college algebra and trigonometry.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions Credits: 5.00

MA 16200 - Plane Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 5.00. Continuation of MA 16100 . Vectors in two and three dimensions, techniques of integration, infinite series, conic sections, polar coordinates, surfaces in three dimensions. Some schools or departments may allow only 4 credit hours toward graduation for this course.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 5.00

MA 16500 - Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 4.00. Introduction to differential and integral calculus of one variable, with applications. Conic sections. Designed for students who have had at least a one-semester calculus course in high school, with a grade of "A" or "B", but are not qualified to enter MA 16200 or MA 16600 or the advanced placement courses MA 17300 or the honors calculus course MA 18100. Demonstrated competence in college algebra and trigonometry. CTL:IMA 1602 Calculus - Long I

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems. 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions. Credits: 4.00

MA 16600 - Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 4.00. Continuation of MA 16500 . Vectors in two and three dimensions. Techniques of integration, infinite series, polar coordinates, surfaces in three dimensions. Not open to students with credit in MA 16200 . CTL:IMA 1603 Calculus - Long II

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 4.00

Statistics (3 credits)

STAT 35000 - Introduction To Statistics

Credit Hours: 3.00. This course provides a data-oriented introduction to applied statistics, covering exploratory data analysis, experimental design, probability distributions, simulation, sampling distributions, and the Central Limit Theorem. Students will learn the fundamentals of statistical inference, including confidence intervals and hypothesis tests for population means, paired and independent comparisons of means, analysis of variance, and regression. The course emphasizes hands-on experience with statistical software and is primarily intended for students majoring in the mathematical sciences. Prerequisite: two semesters of college calculus.

Learning Outcomes: 1. Understand basic terms, graphs, and symbols and be able to interpret statistics in the media. 2. Understand and be able to explain statistical processes and be able to fully interpret statistical results. 3. Understand why and how statistical investigations are conducted and the "big ideas" that underlie statistical investigations. 4. Be able to use a statistical package (R or SAS) to analyze data and interpret result. 5. Big Ideas in Statistics: variability, distributions, and models; causation vs correlation; practical significance vs statistical significance, etc. Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

Electives (18-43 credits)

Grade Requirements

GPA Requirements

Course Requirements & Notes

Sample 4-Year Plan

Fall 1st Year

CS 18000 - Problem Solving And Object-Oriented Programming

Credit Hours: 4.00. Problem solving and algorithms, implementation of algorithms in a high level programming language, conditionals, the iterative approach and debugging, collections of data, searching and sorting, solving problems by decomposition, the object-oriented approach, subclasses of existing classes, handling exceptions that occur when the program is running, graphical user interfaces (GUIs), data stored in files, abstract data types, a glimpse at topics from other CS courses. Intended primarily for students majoring in computer sciences. Credit cannot be obtained for both CS 18000 and any of 15600, 15800 and 15900. Not open to students with credit in CS 24000.

Learning Outcomes: 1. Understand solving problems by analyzing the problem, designing an algorithm, and programming the solution. Credits: 4.00

MA 16100 - Plane Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 5.00. Introduction to differential and integral calculus of one variable, with applications. Some schools or departments may allow only 4 credit hours toward graduation for this course. Designed for students who have not had at least a one-semester calculus course in high school, with a grade of "A" or "B". Not open to students with credit in MA 16500 . Demonstrated competence in college algebra and trigonometry.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions Credits: 5.00

MA 16500 - Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 4.00. Introduction to differential and integral calculus of one variable, with applications. Conic sections. Designed for students who have had at least a one-semester calculus course in high school, with a grade of "A" or "B", but are not qualified to enter MA 16200 or MA 16600 or the advanced placement courses MA 17300 or the honors calculus course MA 18100. Demonstrated competence in college algebra and trigonometry. CTL:IMA 1602 Calculus - Long I

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems. 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions. Credits: 4.00

15-17 Credits

Spring 1st Year

CS 18200 - Foundations Of Computer Science

Credit Hours: 3.00. Logic and proofs; sets, functions, relations, sequences and summations; number representations; counting; fundamentals of the analysis of algorithms; graphs and trees; proof techniques; recursion; Boolean logic; finite state machines; pushdown automata; computability and undecidability.

Learning Outcomes: 1. Understand discrete mathematical tools, facts, and reasoning

relevant to computer science. Credits: 3.00

CS 24000 - Programming In C

Credit Hours: 3.00. The UNIX environment, C development cycle, data representation, operators, program structure, recursion, macros, C preprocessor, pointers and addresses, dynamic memory allocation, structures, unions, typedef, bit-fields, pointer/structure applications, UNIX file abstraction, file access, low-level I/O, concurrency.

Learning Outcomes: 1. Understand programming principles and techniques for problem solving in the C programming language. Credits: 3.00

MA 16200 - Plane Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 5.00. Continuation of MA 16100 . Vectors in two and three dimensions, techniques of integration, infinite series, conic sections, polar coordinates, surfaces in three dimensions. Some schools or departments may allow only 4 credit hours toward graduation for this course.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 5.00

MA 16600 - Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 4.00. Continuation of MA 16500 . Vectors in two and three dimensions. Techniques of integration, infinite series, polar coordinates, surfaces in three dimensions. Not open to students with credit in MA 16200 . CTL:IMA 1603 Calculus - Long II

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 4.00

14-18 Credits

Fall 2nd Year

CS 25000 - Computer Architecture

Credit Hours: 4.00. Digital logic: transistors, gates, and combinatorial circuits; clocks; registers and register banks; arithmetic-logic units; data representation: big-endian and little-endian integers; ones and twos complement arithmetic; signed and unsigned values; Von-Neumann architecture and bottleneck; instruction sets; RISC and CISC designs; instruction pipelines and stalls; rearranging code; memory and address spaces; physical and virtual memory; interleaving; page tables; memory caches; bus architecture; polling and interrupts; DMA; device programming; assembly language; optimizations; parallelism; data pipelining.

Learning Outcomes: 1. Students understand the function of basic hardware, including fundamentals of digital logic, processors, memory, and I/O. Credits: 4.00

CS 25100 - Data Structures And Algorithms

Credit Hours: 3.00. Running time analysis of algorithms and their implementations, one-dimensional data structures, trees,

heaps, additional sorting algorithms, binary search trees, hash tables, graphs, directed graphs, weighted graph algorithms, additional topics.

Learning Outcomes: 1. Understand fundamental data structures, fundamental algorithms, and their implementation. Credits: 3.00

MA 26100 - Multivariate Calculus (UCC: QR)

Credit Hours: 4.00. Planes, lines, and curves in three dimensions. Differential calculus of several variables; multiple integrals. Introduction to vector calculus. Not open to students with credit in MA 17400 or 27100.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Know the equations for lines, planes and quadric surfaces in three dimensional space, and understand how these equations relate to the geometry. 2. Understand the relationship between vector functions and parametrized motion; know how to calculate velocity, acceleration, arc length and curvature. 3. Know the meaning of partial derivatives and how to calculate them. Know the multivariable chain rule. 4. Know the meaning of the gradient, how to calculate it, and how to apply it to directional derivatives and maximum and minimum values. 5. Understand the meaning of double and triple integrals; know how to compute them and how to apply them. 6. Understand the meaning of vector fields and line integrals. Know Green's theorem and be able to apply it. 7. Understand the meaning of surface integrals and know how to calculate them. Know Stokes' theorem and be able to apply it. Credits: 4.00

MA 27101 - Honors Multivariate Calculus (UCC: QR)

Credit Hours: 5.00. This course is the Honors version of MA 26100, Multivariate Calculus; it will also include a review of infinite series. The course is intended for first-year students who have credit for Calculus I and II. There will be a significant emphasis on conceptual explanation, but not on formal proof. Permission of department is required.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Know techniques of vector algebra and be able to apply these to the geometry of space; in particular they will be able to find equations for lines and planes in space. 2. Find equations for standard surfaces in space. 3. Use vector methods to analyze motion in space, and calculate arc length and curvature. 4. Acquire a conceptual and computational knowledge of infinite series; in particular they will be able to test for convergence, and to do calculations with power series. 5. Understand the meaning of partial derivatives in various situations, and will be able to calculate with them. 6. Know the multivariable chain rule and its meaning, and will be able to apply it to calculate derivatives in various situations. 7. Know the meaning of directional derivatives and how to calculate them. 8. Find tangent planes. 9. Find and classify extreme values and saddle points and use the method of Lagrange multipliers. 10. Know the meaning of multiple integrals and how to calculate them. 11. Know the meaning of line integrals and surface integrals and how to calculate them. 12. Know Green's theorem, Stokes' theorem, and the divergence theorem and their applications. Credits: 5.00

15-17 Credits

Spring 2nd Year

CS 25200 - Systems Programming

Credit Hours: 4.00. Low-level programming; review of addresses, pointers, memory layout, and data representation; text, data, and bss segments; debugging and hex dumps; concurrent execution with threads and processes; address spaces; file names; descriptors and file pointers; inheritance; system calls and library functions; standard I/O and string libraries; simplified socket programming; building tools to help programmers; make and make files; shell scripts and quoting; Unix tools including sed, echo, test, and find; scripting languages such as awk; version control; object and executable files (.o and a.out); symbol tables; pointers to functions;

hierarchical directories; and DNS hierarchy; programming embedded systems.

Learning Outcomes: 1. Have an appreciation and ability for low-level (systems) programming and debugging. Credits: 4.00

MA 26500 - Linear Algebra (UCC: QR)

Credit Hours: 3.00. Introduction to linear algebra. Systems of linear equations, matrix algebra, vector spaces, determinants, eigenvalues and eigenvectors, diagonalization of matrices, applications. Not open to students with credit in MA 26200, 27200, 35000 or 35100.

University Core Curriculum (UCC): (UCC: QR)
Learning Outcomes: 1. Learn the basic properties of matrices. 2. Learn how to solve systems of linear equations. 3. Learn the basic properties of determinants. 4. Learn about linear independence, spanning sets and bases in the context of vector spaces. 5. Learn the theory of inner product spaces and how it applies to least-squares approximations. 6. Learn the theory of eigenvalues and eigenvectors and how it applies to systems of differential equations. Credits: 3.00

MA 35100 - Elementary Linear Algebra (UCC: QR)

Credit Hours: 3.00. Systems of linear equations, finite dimensional vector spaces, matrices, determinants, eigenvalues and eigenvector applications to analytical geometry. Not open to students with credit in MA 26500.

University Core Curriculum (UCC): (UCC: QR)
Learning Outcomes: 1. Solve systems of linear equations using concepts such as vector spaces, linear dependence, and Gaussian elimination. 2. Understand and test for linear independence, calculate the dimension of vector spaces, and apply the rank-nullity theorem in various contexts. 3. Define and apply linear transformations, including matrix multiplication, inverses, LU factorization, and coordinate transformations. 4. Compute and understand determinants, including their use in calculating matrix inverses and practical applications such as volume calculations. 5. Analyze and compute eigenvectors and eigenvalues, and apply diagonalization techniques. Credits: 3.00

16-17 Credits

Fall 3rd Year

STAT 35000 - Introduction To Statistics

Credit Hours: 3.00. This course provides a data-oriented introduction to applied statistics, covering exploratory data analysis, experimental design, probability distributions, simulation, sampling distributions, and the Central Limit Theorem. Students will learn the fundamentals of statistical inference, including confidence intervals and hypothesis tests for population means, paired and independent comparisons of means, analysis of variance, and regression. The course emphasizes hands-on experience with statistical software and is primarily intended for students majoring in the mathematical sciences. Prerequisite: two semesters of college calculus.

Learning Outcomes: 1. Understand basic terms, graphs, and symbols and be able to interpret statistics in the media. 2. Understand and be able to explain statistical processes and be able to fully interpret statistical results. 3. Understand why and how statistical investigations are conducted and the "big ideas" that underlie statistical investigations. 4. Be able to use a statistical package (R or SAS) to analyze data and interpret result. 5. Big Ideas in Statistics: variability, distributions, and models; causation vs correlation; practical significance vs statistical significance, etc. Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Required CS Major Core Courses (21 credits)

CS 18000 - Problem Solving And Object-Oriented Programming

Credit Hours: 4.00. Problem solving and algorithms,

implementation of algorithms in a high level programming language, conditionals, the iterative approach and debugging, collections of data, searching and sorting, solving problems by decomposition, the object-oriented approach, subclasses of existing classes, handling exceptions that occur when the program is running, graphical user interfaces (GUIs), data stored in files, abstract data types, a glimpse at topics from other CS courses. Intended primarily for students majoring in computer sciences. Credit cannot be obtained for both CS 18000 and any of 15600, 15800 and 15900. Not open to students with credit in CS 24000.

Learning Outcomes: 1. Understand solving problems by analyzing the problem, designing an algorithm, and programming the solution. Credits: 4.00

CS 18200 - Foundations Of Computer Science

Credit Hours: 3.00. Logic and proofs; sets, functions, relations, sequences and summations; number representations; counting; fundamentals of the analysis of algorithms; graphs and trees; proof techniques; recursion; Boolean logic; finite state machines; pushdown automata; computability and undecidability.

Learning Outcomes: 1. Understand discrete mathematical tools, facts, and reasoning relevant to computer science. Credits: 3.00

CS 24000 - Programming In C

Credit Hours: 3.00. The UNIX environment, C development cycle, data representation, operators, program structure, recursion, macros, C preprocessor, pointers and addresses, dynamic memory allocation, structures, unions, typedef, bit-fields, pointer/structure applications, UNIX file abstraction, file access, low-level I/O, concurrency.

Learning Outcomes: 1. Understand programming principles and techniques for problem solving in the C programming language. Credits: 3.00

CS 25000 - Computer Architecture

Credit Hours: 4.00. Digital logic: transistors, gates, and combinatorial circuits; clocks; registers and register banks; arithmetic-logic units; data representation: big-endian and little-endian integers; ones and twos complement arithmetic; signed and unsigned values; Von-Neumann architecture and bottleneck; instruction sets; RISC and CISC designs; instruction pipelines and stalls; rearranging code; memory and address spaces; physical and virtual memory; interleaving; page tables; memory caches; bus architecture; polling and interrupts; DMA; device programming; assembly language; optimizations; parallelism; data pipelining.

Learning Outcomes: 1. Students understand the function of basic hardware, including fundamentals of digital logic, processors, memory, and I/O. Credits: 4.00

CS 25100 - Data Structures And Algorithms

Credit Hours: 3.00. Running time analysis of algorithms and their implementations, one-dimensional data structures, trees, heaps, additional sorting algorithms, binary search trees, hash tables, graphs, directed graphs, weighted graph algorithms, additional topics.

Learning Outcomes: 1. Understand fundamental data structures, fundamental algorithms, and their implementation. Credits: 3.00

CS 25200 - Systems Programming

Credit Hours: 4.00. Low-level programming; review of addresses, pointers, memory layout, and data representation; text, data, and bss segments; debugging and hex dumps; concurrent execution with threads and processes; address spaces; file names; descriptors and file pointers; inheritance; system calls and library functions; standard I/O and string libraries; simplified socket programming; building tools to help programmers; make and make files; shell scripts and quoting; Unix tools including sed, echo, test, and find; scripting languages such as awk; version control; object and executable files (.o and a.out); symbol tables; pointers to functions; hierarchical directories; and DNS hierarchy; programming embedded systems.

Learning Outcomes: 1. Have an appreciation and ability for low-level (systems) programming and debugging. Credits: 4.00

Programming Language Concentration (18 credits)

Required Courses

CS 35200 - Compilers: Principles And Practice

Credit Hours: 3.00. Should not be taken concurrently with CS 35400. The theory and practice of programming language translation, compilation, and run-time systems, organized around a significant programming project to build a compiler for a simple but nontrivial programming language. Modules, interfaces, tools. Data structures for tree languages. Lexical

analysis, syntax analysis, abstract syntax. Symbol tables, semantic analysis. Translation, intermediate code, basic blocks, traces. Instruction selection, CISC and RISC machines. Liveness analysis, graph coloring register allocation. Supplemental material drawn from garbage collection, object-oriented languages, higher-order languages, dataflow analysis, optimization, polymorphism, scheduling and pipelining, memory hierarchies.

Learning Outcomes: 1. Provides students with an understanding of how a computer program is converted into elementary code that causes the computer to produce the output intended by the programmer. Credits: 3.00

CS 35400 - Operating Systems

Credit Hours: 3.00. Should not be taken concurrently with CS 35200. Introduction to operating systems. Computer system and operating system architectures, processes, inter-process communication, inter-process synchronization, mutual exclusion, deadlocks, memory hierarchy, virtual memory, CPU scheduling, file systems, I/O device management, security.

Learning Outcomes: 1. Provides students with an understanding of the fundamentals of computer operating systems. Credits: 3.00

CS 45600 - Programming Languages

Credit Hours: 3.00. Concepts for structuring data, computation, and whole programs. Object-oriented languages, functional languages, logic- and rule-based languages. Data types, type checking, exception handling, concurrent processes, synchronization, modularity, encapsulation, interfaces, separate compilation, inheritance, polymorphism, dynamic binding, subtyping, overloading, beta-reduction, unification.

Credits: 3.00

Selectives

CS 30700 - Software Engineering I

Credit Hours: 3.00. An introduction to the methods and tools of software engineering; software life cycle; specification and design of software, software testing, cost and effort estimation; laboratory exercises with design, testing, and other tools.

Learning Outcomes: 1. Architect and design quality software. 2. Contrast and critique software lifecycle models. 3. Create software using current software engineering tools, methods, and concepts. 4. Work together on a team in a productive and professional manner. 5. Inspect and test software and documentation. Credits: 3.00

CS 34800 - Information Systems

Credit Hours: 3.00. File organization and index structures; object-oriented database languages; the relational database model with introductions to SQL and DBMS; hierarchical models and network models with introductions to HDDL, HDML, and DBTG Codasyl; data mining; data warehousing; database connectivity; distributed databases; the client/server paradigm; middleware, including ODBC, JDBC, CORBA, and MOM.

Learning Outcomes: 1. Learn about different data models (relational, graph, and document) used in different database systems. 2. Learn how to pose complex database queries in SQL and NoSQL languages as well as theoretical query languages. 3. Gain an introductory background in indexing. 4. Learn about transactions and concurrency control. 5. Differentiate between OLTP and OLAP applications. Credits: 3.00

CS 35300 - Principles Of Concurrency And Parallelism

Credit Hours: 3.00. Important concepts, models, algorithms, abstractions, and implementation aspects of concurrent and parallel programs. Topics include: techniques used to describe concurrent programs (e.g., threads, events, co-routines, continuations), abstractions for shared-memory and message-passing programs, relaxed memory models, livelock and deadlock detection, lock-free algorithms, data races and atomicity, scheduling techniques, process calculi, and software transactions.

Learning Outcomes: 1. This course provides students the vocabulary and concepts to better understand how to design and program scalable multicore processors. Credits: 3.00

CS 38100 - Introduction To The Analysis Of Algorithms

Credit Hours: 3.00. Techniques for analyzing the time and space requirements of algorithms. Application of these techniques to sorting, searching, pattern-matching, graph problems, and other selected problems. Brief introduction to the intractable (NP-hard) problems.

Learning Outcomes: 1. Use big O-notation to give asymptotic time and space bounds of

algorithms. 2. Explain the use of big-Omega, big-Theta, and little-o notations. 3. Use recurrence relations to determine the time complexity of recursive algorithms. 4. Solve recurrence relations commonly arising in algorithm design. 5. Give examples that illustrate time-space trade-offs of algorithms. Credits: 3.00

CS 40800 - Software Testing

Credit Hours: 3.00. Preliminaries: errors and testing; software quality, requirements, behavior, and correctness; testing, debugging, verification; control flow graphs, dominators; types of testing; Test selection: from requirements, finite state models, and combinatorial designs; regression testing and test minimization; Test adequacy assessment: control and data flow; mutation based; testing tools.

Learning Outcomes: 1. Understand the basic technology related to software testing and debugging. 2. Differentiate between reliability and correctness. 3. Understand the impact of the saturation effect on the test process and its cost. 4. Understand the relationship between software development and test processes. 5. Apply a variety of black box test generation methods manually and using tools. 6. Use test adequacy criteria and understand their respective cost and effectiveness. 7. Select appropriate software test tools for a given testing task. Credits: 3.00

CS 42600 - Computer Security

Credit Hours: 3.00. A survey of the fundamentals of information security. Risks and vulnerabilities, policy formation, controls and protection methods, database security, encryption, authentication technologies, host-based and network-based security issues, personnel and physical security issues, issues of law and privacy.

Learning Outcomes: 1. Apply the notions of threat, vulnerability, attack, countermeasure, security objectives, and adversarial models when analyzing security of computer and information systems. 2. Explain the main authorization mechanisms and access control models, and their applicability in different situations. 3. Explain security issues related to password and other authentication mechanisms. 4. Explain the different types of malware, the mechanisms of their propagation, and the strengths and limitations of different defense mechanisms. 5. Identify the threats and vulnerabilities for a networked environment, and explain different countermeasures, and their effectiveness. 6. Explain the vulnerabilities brought about by modern web-based application and services, different countermeasures, and their effectiveness. Credits: 3.00

CS 44800 - Introduction To Relational Database Systems

Credit Hours: 3.00. An in-depth examination of relational database systems including theory and concepts as well as practical issues in relational databases. Modern database technologies such as object-relational and Web-based access to relational databases. Conceptual design and entity relationship modeling, relational algebra and calculus, data definition and manipulation languages using SQL, schema and view management, query processing and optimization, transaction management, security, privacy, integrity management.

Learning Outcomes: 1. Learn data modeling: physical, logical and conceptual data models, the entity-relationship model. 2. Study logical and Physical Design and interaction with operating systems, disk Storage, Basic File Structures, Hashing, Indexing. 3. Learn the relational database model and implementation and performance issues. 4. Understand transaction Processing, concurrency control, atomicity control and recovery control. 5. Understand database privacy, integrity, and security. 6. Understand data mining, data warehousing, online analytical processing, and information retrieval. 7. Understand Cloud computing and Distributed Database Systems architectures, Big Data, Hadoop, MapReduce, and NoSQL. 8. Recognize performance issues. Credits: 3.00

CS 48300 - Introduction To The Theory Of Computation

Credit Hours: 3.00. Turing machines and the Church-Turing thesis; decidability; halting problem; reducibility; undecidable problems; decidability of logical theories; Kolmogorov complexity; time classes; P, NP, NP-complete; space classes; Savitch's theorem, PSPACE-completeness, NL-completeness; hierarchy theorems; approximation theorems; probabilistic algorithms; applications of complexity to parallel computation and cryptography.

Credits: 3.00

MA 38500 - Introduction To Logic

Credit Hours: 3.00. Propositional calculus and predicate calculus with applications to mathematical proofs, valid arguments, switching theory, and formal languages.

Credits: 3.00

CS 56000 - Reasoning About Programs

Credit Hours: 3.00. The course focuses on the logical foundations and algorithmic techniques used to ensure program correctness. With an emphasis on automated program verification and synthesis, the course covers classical concepts and techniques such as Hoare logic, abstract interpretation, abstraction-refinement and bounded model checking. The course also exposes students to approaches for program synthesis, a new frontier for program reasoning, such as inductive synthesis, synthesis using version space algebras, constraint-based synthesis and synthesis based on machine-learning techniques. The courses emphasizes both theoretical foundations as well as hands-on experience with verification/synthesis tools and SAT/SMT solvers. Students are expected to have completed undergraduate coursework in Foundations of Computer Science (CS 18200) or equivalent, Systems Programming (CS 25200) or equivalent, and Introduction to the Analysis of Algorithms (CS 38100) or equivalent. Mathematical maturity is expected.

Learning Outcomes: 1. Express the expected behavior of programs in logic. 2. Able to manually reason about satisfiability and validity of formulas in first-order logic (modulo theories). 3. Use SAT/SMT solvers to check satisfiability and validity of formulas in first-order logic (modulo theories). 4. Specify properties of programs using pre/postconditions, safety properties and assertions in first-order logic (modulo theories). 5. Describe and apply core approaches for program verification. 6. Explain and apply Hoare logic, invariant generation, abstract interpretation, abstraction-refinement, and bounded model checking. 7. Ability to verify programs using tools such as Dafny and the Z3 SMT solver. 8. Conduct original research in program synthesis. 9. Explain and apply inductive synthesis and functional synthesis, different search techniques (enumerative, explicit, constraint-based), and some recent approaches based on machine learning. 10. Choose and apply appropriate synthesis techniques to a problem domain of their choice. 11. Ability to critically review and present current research in program synthesis. Credits: 3.00

MA 45300 - Elements Of Algebra I

Credit Hours: 3.00. Fundamental properties of integers, polynomials, groups, rings, and fields, with emphasis on problem solving and applications. Not open to students with credit in MA 45000.

Learning Outcomes: 1. Demonstrate knowledge of: divisibility properties of integers and polynomials, structure theory of groups and examples of groups, structure theory of rings and examples of rings, basic theory of fields. 2. Demonstrate knowledge of the proofs of facts covered in the course. Credits: 3.00

Concentration Notes

Other Departmental/Program Course Requirements (32-54 credits)

College of Science Additional Requirements

Computing (3-4 credits)

Laboratory Science (6-8 credits)

Mathematics (8-10 credits)

MA 16100 - Plane Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 5.00. Introduction to differential and integral calculus of one variable, with applications. Some schools or departments may allow only 4 credit hours toward graduation for this course. Designed for students who have not had at least a one-semester calculus course in high school, with a grade of "A" or "B". Not open to students with credit in MA 16500 . Demonstrated competence in college algebra and trigonometry.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions Credits: 5.00

MA 16200 - Plane Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 5.00. Continuation of MA 16100 . Vectors in two and three dimensions, techniques of integration, infinite series, conic sections, polar coordinates, surfaces in three dimensions. Some schools or departments may allow only 4 credit hours toward graduation for this course.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 5.00

MA 16500 - Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 4.00. Introduction to differential and integral calculus of one variable, with applications. Conic sections. Designed for students who have had at least a one-semester calculus course in high school, with a grade of "A" or "B", but are not qualified to enter MA 16200 or MA 16600 or the advanced placement courses MA 17300 or the honors calculus course MA 18100. Demonstrated competence in college algebra and trigonometry. CTL:IMA 1602 Calculus - Long I

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems. 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions. Credits: 4.00

MA 16600 - Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 4.00. Continuation of MA 16500 . Vectors in two and three dimensions. Techniques of integration, infinite series, polar coordinates, surfaces in three dimensions. Not open to students with credit in MA 16200 . CTL:IMA 1603 Calculus - Long II

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the

interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 4.00

Statistics (3 credits)

STAT 35000 - Introduction To Statistics

Credit Hours: 3.00. This course provides a data-oriented introduction to applied statistics, covering exploratory data analysis, experimental design, probability distributions, simulation, sampling distributions, and the Central Limit Theorem. Students will learn the fundamentals of statistical inference, including confidence intervals and hypothesis tests for population means, paired and independent comparisons of means, analysis of variance, and regression. The course emphasizes hands-on experience with statistical software and is primarily intended for students majoring in the mathematical sciences. Prerequisite: two semesters of college calculus.

Learning Outcomes: 1. Understand basic terms, graphs, and symbols and be able to interpret statistics in the media. 2. Understand and be able to explain statistical processes and be able to fully interpret statistical results. 3. Understand why and how statistical investigations are conducted and the "big ideas" that underlie statistical investigations. 4. Be able to use a statistical package (R or SAS) to analyze data and interpret result. 5. Big Ideas in Statistics: variability, distributions, and models; causation vs correlation; practical significance vs statistical significance, etc. Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

Electives (18-43 credits)

Grade Requirements

GPA Requirements

Course Requirements & Notes

Sample 4-Year Plan

Fall 1st Year

CS 18000 - Problem Solving And Object-Oriented Programming

Credit Hours: 4.00. Problem solving and algorithms, implementation of algorithms in a high level programming language, conditionals, the iterative approach and debugging, collections of data, searching and sorting, solving problems by decomposition, the object-oriented approach, subclasses of existing classes, handling exceptions that occur when the program is running, graphical user interfaces (GUIs), data stored in files, abstract data types, a glimpse at topics from other CS courses. Intended primarily for students majoring in computer sciences. Credit cannot be obtained for both CS 18000 and any of 15600, 15800 and 15900. Not open to students with credit in CS 24000.

Learning Outcomes: 1. Understand solving problems by analyzing the problem, designing an algorithm, and programming the solution. Credits: 4.00

MA 16100 - Plane Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 5.00. Introduction to differential and integral calculus of one variable, with applications. Some schools or departments may allow only 4 credit hours toward graduation for this course. Designed for students who have not had at least a one-semester calculus course in high school, with a grade of "A" or "B". Not open to students with credit in MA 16500 . Demonstrated competence in college algebra and trigonometry.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions Credits: 5.00

MA 16500 - Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 4.00. Introduction to differential and integral calculus of one variable, with applications. Conic sections. Designed for students who have had at least a one-semester calculus course in high school, with a grade of "A" or "B", but are not qualified to enter MA 16200 or MA 16600 or the advanced placement courses MA 17300 or the honors calculus course MA 18100. Demonstrated competence in college algebra and trigonometry. CTL:IMA 1602 Calculus - Long I

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems. 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions. Credits: 4.00

15-17 Credits

Spring 1st Year

CS 18200 - Foundations Of Computer Science

Credit Hours: 3.00. Logic and proofs; sets, functions, relations, sequences and summations; number representations; counting; fundamentals of the analysis of algorithms; graphs and trees; proof techniques; recursion; Boolean logic; finite state machines; pushdown automata; computability and undecidability.

Learning Outcomes: 1. Understand discrete mathematical tools, facts, and reasoning relevant to computer science. Credits: 3.00

CS 24000 - Programming In C

Credit Hours: 3.00. The UNIX environment, C development cycle, data representation, operators, program structure, recursion, macros, C preprocessor, pointers and addresses, dynamic memory allocation, structures, unions, typedef, bit-fields, pointer/structure applications, UNIX file abstraction, file access, low-level I/O, concurrency.

Learning Outcomes: 1. Understand programming principles and techniques for problem solving in the C programming

language. Credits: 3.00

MA 16200 - Plane Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 5.00. Continuation of MA 16100 . Vectors in two and three dimensions, techniques of integration, infinite series, conic sections, polar coordinates, surfaces in three dimensions. Some schools or departments may allow only 4 credit hours toward graduation for this course.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 5.00

MA 16600 - Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 4.00. Continuation of MA 16500 . Vectors in two and three dimensions. Techniques of integration, infinite series, polar coordinates, surfaces in three dimensions. Not open to students with credit in MA 16200 . CTL:IMA 1603 Calculus - Long II

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 4.00

14-18 Credits

Fall 2nd Year

CS 25000 - Computer Architecture

Credit Hours: 4.00. Digital logic: transistors, gates, and combinatorial circuits; clocks; registers and register banks; arithmetic-logic units; data representation: big-endian and little-endian integers; ones and twos complement arithmetic; signed and unsigned values; Von-Neumann architecture and bottleneck; instruction sets; RISC and CISC designs; instruction pipelines and stalls; rearranging code; memory and address spaces; physical and virtual memory; interleaving; page tables; memory caches; bus architecture; polling and interrupts; DMA; device programming; assembly language; optimizations; parallelism; data pipelining.

Learning Outcomes: 1. Students understand the function of basic hardware, including fundamentals of digital logic, processors, memory, and I/O. Credits: 4.00

CS 25100 - Data Structures And Algorithms

Credit Hours: 3.00. Running time analysis of algorithms and their implementations, one-dimensional data structures, trees, heaps, additional sorting algorithms, binary search trees, hash tables, graphs, directed graphs, weighted graph algorithms, additional topics.

Learning Outcomes: 1. Understand fundamental data structures, fundamental algorithms, and their implementation. Credits: 3.00

MA 26100 - Multivariate Calculus (UCC: QR)

Credit Hours: 4.00. Planes, lines, and curves in three dimensions. Differential calculus of several variables; multiple integrals. Introduction to vector calculus. Not open to students with credit in MA 17400 or 27100.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Know the equations for lines, planes and quadric surfaces in three dimensional space, and understand how these equations relate to the geometry. 2. Understand the relationship between vector functions and parametrized motion; know how to calculate velocity, acceleration, arc length and curvature. 3. Know the meaning of partial derivatives and how to calculate them. Know the multivariable chain rule. 4. Know the meaning of the gradient, how to calculate it, and how to apply it to directional derivatives and maximum and minimum values. 5. Understand the meaning of double and triple integrals; know how to compute them and how to apply them. 6. Understand the meaning of vector fields and line integrals. Know Green's theorem and be able to apply it. 7. Understand the meaning of surface integrals and know how to calculate them. Know Stokes' theorem and be able to apply it. Credits: 4.00

MA 27101 - Honors Multivariate Calculus (UCC: QR)

Credit Hours: 5.00. This course is the Honors version of MA 26100, Multivariate Calculus; it will also include a review of infinite series. The course is intended for first-year students who have credit for Calculus I and II. There will be a significant emphasis on conceptual explanation, but not on formal proof. Permission of department is required.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Know techniques of vector algebra and be able to apply these to the geometry of space; in particular they will be able to find equations for lines and planes in space. 2. Find equations for standard surfaces in space. 3. Use vector methods to analyze motion in space, and calculate arc length and curvature. 4. Acquire a conceptual and computational knowledge of infinite series; in particular they will be able to test for convergence, and to do calculations with power series. 5. Understand the meaning of partial derivatives in various situations, and will be able to calculate with them. 6. Know the multivariable chain rule and its meaning, and will be able to apply it to calculate derivatives in various situations. 7. Know the meaning of directional derivatives and how to calculate them. 8. Find tangent planes. 9. Find and classify extreme values and saddle points and use the method of Lagrange multipliers. 10. Know the meaning of multiple integrals and how to calculate them. 11. Know the meaning of line integrals and surface integrals and how to calculate them. 12. Know Green's theorem, Stokes' theorem, and the divergence theorem and their applications. Credits: 5.00

15-17 Credits

Spring 2nd Year

CS 25200 - Systems Programming

Credit Hours: 4.00. Low-level programming; review of addresses, pointers, memory layout, and data representation; text, data, and bss segments; debugging and hex dumps; concurrent execution with threads and processes; address spaces; file names; descriptors and file pointers; inheritance; system calls and library functions; standard I/O and string libraries; simplified socket programming; building tools to help programmers; make and make files; shell scripts and quoting; Unix tools including sed, echo, test, and find; scripting languages such as awk; version control; object and executable files (.o and a.out); symbol tables; pointers to functions; hierarchical directories; and DNS hierarchy; programming embedded systems.

Learning Outcomes: 1. Have an appreciation and ability for low-level (systems) programming and debugging. Credits: 4.00

MA 26500 - Linear Algebra (UCC: QR)

Credit Hours: 3.00. Introduction to linear algebra. Systems of linear equations, matrix algebra, vector spaces, determinants, eigenvalues and eigenvectors, diagonalization of matrices, applications. Not open to students with credit in MA 26200, 27200, 35000 or 35100.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Learn the basic properties of matrices. 2. Learn how to solve systems of linear equations. 3. Learn the basic properties of determinants. 4. Learn about linear independence, spanning sets and bases in the context of vector spaces. 5. Learn the theory of inner product spaces and how it applies to least-squares approximations. 6. Learn the theory of eigenvalues and eigenvectors and how it applies to systems of differential equations. Credits: 3.00

MA 35100 - Elementary Linear Algebra (UCC: QR)

Credit Hours: 3.00. Systems of linear equations, finite dimensional vector spaces, matrices, determinants, eigenvalues and eigenvector applications to analytical geometry. Not open to students with credit in MA 26500.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Solve systems of linear equations using concepts such as vector spaces, linear dependence, and Gaussian elimination. 2. Understand and test for linear independence, calculate the dimension of vector spaces, and apply the rank-nullity theorem in various contexts. 3. Define and apply linear transformations, including matrix multiplication, inverses, LU factorization, and coordinate transformations. 4. Compute and understand determinants, including their use in calculating matrix inverses and practical applications such as volume calculations. 5. Analyze and compute eigenvectors and eigenvalues, and apply diagonalization techniques. Credits: 3.00

16-17 Credits

Fall 3rd Year

STAT 35000 - Introduction To Statistics

Credit Hours: 3.00. This course provides a data-oriented introduction to applied statistics, covering exploratory data analysis, experimental design, probability distributions, simulation, sampling distributions, and the Central Limit Theorem. Students will learn the fundamentals of statistical inference, including confidence intervals and hypothesis tests for population means, paired and independent comparisons of means, analysis of variance, and regression. The course emphasizes hands-on experience with statistical software and is primarily intended for students majoring in the mathematical sciences. Prerequisite: two semesters of college calculus.

Learning Outcomes: 1. Understand basic terms, graphs, and symbols and be able to interpret statistics in the media. 2. Understand and be able to explain statistical processes and be able to fully interpret statistical results. 3. Understand why and how statistical investigations are conducted and the "big ideas" that underlie statistical investigations. 4. Be able to use a statistical package (R or SAS) to analyze data and interpret result. 5. Big Ideas in Statistics: variability, distributions, and models; causation vs correlation; practical significance vs statistical significance, etc. Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing

probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

16-18 Credits

Spring 4th Year

15-17 Credits

Computer Science: Security, BS

About the Program

Degree Requirements

Computer Science Major Courses (46-47 credits)

Required CS Major Math Courses (7-8 credits)

MA 26100 - Multivariate Calculus (UCC: QR)

Credit Hours: 4.00. Planes, lines, and curves in three dimensions. Differential calculus of several variables; multiple integrals. Introduction to vector calculus. Not open to students with credit in MA 17400 or 27100.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Know the equations for lines, planes and quadric surfaces in three dimensional space, and understand how these equations relate to the geometry. 2. Understand the relationship between vector functions and parametrized motion; know how to calculate velocity, acceleration, arc length and curvature. 3. Know the meaning of partial derivatives and how to calculate them. Know the multivariable chain rule. 4. Know the meaning of the gradient, how to calculate it, and how to apply it to directional derivatives and maximum and minimum values. 5. Understand the meaning of double and triple integrals; know how to compute them and how to apply them. 6. Understand the meaning of vector fields and line integrals. Know Green's theorem and be able to apply it. 7. Understand the meaning of surface integrals and know how to calculate them. Know Stokes' theorem and be able to apply it. Credits: 4.00

MA 26500 - Linear Algebra (UCC: QR)

Credit Hours: 3.00. Introduction to linear algebra. Systems of linear equations, matrix algebra, vector spaces, determinants, eigenvalues and eigenvectors, diagonalization of matrices, applications. Not open to students with credit in MA 26200, 27200, 35000 or 35100.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Learn the basic properties of matrices. 2. Learn how to solve systems of linear equations. 3. Learn the basic properties of determinants. 4. Learn about linear

independence, spanning sets and bases in the context of vector spaces. 5. Learn the theory of inner product spaces and how it applies to least-squares approximations. 6. Learn the theory of eigenvalues and eigenvectors and how it applies to systems of differential equations. Credits: 3.00

MA 35100 - Elementary Linear Algebra (UCC: QR)

Credit Hours: 3.00. Systems of linear equations, finite dimensional vector spaces, matrices, determinants, eigenvalues and eigenvector applications to analytical geometry. Not open to students with credit in MA 26500.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Solve systems of linear equations using concepts such as vector spaces, linear dependence, and Gaussian elimination. 2. Understand and test for linear independence, calculate the dimension of vector spaces, and apply the rank-nullity theorem in various contexts. 3. Define and apply linear transformations, including matrix multiplication, inverses, LU factorization, and coordinate transformations. 4. Compute and understand determinants, including their use in calculating matrix inverses and practical applications such as volume calculations. 5. Analyze and compute eigenvectors and eigenvalues, and apply diagonalization techniques. Credits: 3.00

MA 27101 - Honors Multivariate Calculus (UCC: QR)

Credit Hours: 5.00. This course is the Honors version of MA 26100, Multivariate Calculus; it will also include a review of infinite series. The course is intended for first-year students who have credit for Calculus I and II. There will be a significant emphasis on conceptual explanation, but not on formal proof. Permission of department is required.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Know techniques of vector algebra and be able to apply these to the geometry of space; in particular they will be able to find equations for lines and planes in space. 2. Find equations for standard surfaces in space. 3. Use vector methods to analyze motion in space, and calculate arc length and curvature. 4. Acquire a conceptual and computational knowledge of infinite series; in particular they will be able to test for convergence, and to do calculations with power series. 5. Understand the meaning of partial derivatives in various situations, and will be able to calculate with them. 6. Know the multivariable chain rule and its meaning, and will be able to apply it to calculate derivatives in various situations. 7. Know the meaning of directional derivatives and how to calculate them. 8. Find tangent planes. 9. Find and classify extreme values and saddle points and use the method of Lagrange multipliers. 10. Know the meaning of multiple integrals and how to calculate them. 11. Know the meaning of line integrals and surface integrals and how to calculate them. 12. Know Green's theorem, Stokes' theorem, and the divergence theorem and their applications. Credits: 5.00

Required CS Major Core Courses (21 credits)

CS 18000 - Problem Solving And Object-Oriented Programming

Credit Hours: 4.00. Problem solving and algorithms, implementation of algorithms in a high level programming language, conditionals, the iterative approach and debugging, collections of data, searching and sorting, solving problems by decomposition, the object-oriented approach, subclasses of existing classes, handling exceptions that occur when the program is running, graphical user interfaces (GUIs), data stored in files, abstract data types, a glimpse at topics from other CS courses. Intended primarily for students majoring in computer sciences. Credit cannot be obtained for both CS 18000 and any of 15600, 15800 and 15900. Not open to students with credit in CS 24000.

Learning Outcomes: 1. Understand solving problems by analyzing the problem, designing an algorithm, and programming the solution. Credits: 4.00

CS 18200 - Foundations Of Computer Science

Credit Hours: 3.00. Logic and proofs; sets, functions, relations, sequences and summations; number representations; counting; fundamentals of the analysis of algorithms; graphs and trees; proof techniques; recursion; Boolean logic; finite state machines; pushdown automata; computability and undecidability.

Learning Outcomes: 1. Understand discrete mathematical tools, facts, and reasoning relevant to computer science. Credits: 3.00

CS 24000 - Programming In C

Credit Hours: 3.00. The UNIX environment, C development cycle, data representation, operators, program structure, recursion, macros, C preprocessor, pointers and addresses, dynamic memory allocation, structures, unions, typedef, bit-fields, pointer/structure applications, UNIX file abstraction, file access, low-level I/O, concurrency.

Learning Outcomes: 1. Understand programming principles and techniques for problem solving in the C programming language. Credits: 3.00

CS 25000 - Computer Architecture

Credit Hours: 4.00. Digital logic: transistors, gates, and combinatorial circuits; clocks; registers and register banks; arithmetic-logic units; data representation: big-endian and little-endian integers; ones and twos complement arithmetic; signed and unsigned values; Von-Neumann architecture and bottleneck; instruction sets; RISC and CISC designs; instruction pipelines and stalls; rearranging code; memory and address spaces; physical and virtual memory; interleaving; page tables; memory caches; bus architecture; polling and interrupts; DMA; device programming; assembly language; optimizations; parallelism; data pipelining.

Learning Outcomes: 1. Students understand the function of basic hardware, including fundamentals of digital logic, processors, memory, and I/O. Credits: 4.00

CS 25100 - Data Structures And Algorithms

Credit Hours: 3.00. Running time analysis of algorithms and their implementations, one-dimensional data structures, trees, heaps, additional sorting algorithms, binary search trees, hash tables, graphs, directed graphs, weighted graph algorithms, additional topics.

Learning Outcomes: 1. Understand fundamental data structures, fundamental algorithms, and their implementation. Credits: 3.00

CS 25200 - Systems Programming

Credit Hours: 4.00. Low-level programming; review of addresses, pointers, memory layout, and data representation; text, data, and bss segments; debugging and hex dumps; concurrent execution with threads and processes; address spaces; file names; descriptors and file pointers; inheritance; system calls and library functions; standard I/O and string libraries; simplified socket programming; building tools to help programmers; make and make files; shell scripts and quoting; Unix tools including sed, echo, test, and find; scripting languages such as awk; version control; object and executable files (.o and a.out); symbol tables; pointers to functions; hierarchical directories; and DNS hierarchy; programming embedded systems.

Learning Outcomes: 1. Have an appreciation and ability for low-level (systems) programming and debugging. Credits: 4.00

Security Concentration (18 credits)

Required Courses

CS 35400 - Operating Systems

Credit Hours: 3.00. Should not be taken concurrently with CS 35200. Introduction to operating systems. Computer system and operating system architectures, processes, inter-process communication, inter-process synchronization, mutual exclusion, deadlocks, memory hierarchy, virtual memory, CPU scheduling, file systems, I/O device management, security.

Learning Outcomes: 1. Provides students with an understanding of the fundamentals of computer operating systems. Credits: 3.00

CS 35500 - Introduction To Cryptography

Credit Hours: 3.00. An introduction to cryptography basics: Classic historical ciphers including Caesar, Vigenere, and Vernam ciphers; modern ciphers including DES, AES, Pohlig-Hellman, and RSA; signatures and digests; key exchange; simple protocols; block and stream ciphers; network-centric protocols.

Learning Outcomes: 1. Understand the basic concepts and proof techniques in cryptography. 2. Develop skills to define and evaluate the

security of existing schemes. 3. Construct provably secure schemes for common cryptographic tasks. Credits: 3.00

CS 42600 - Computer Security

Credit Hours: 3.00. A survey of the fundamentals of information security. Risks and vulnerabilities, policy formation, controls and protection methods, database security, encryption, authentication technologies, host-based and network-based security issues, personnel and physical security issues, issues of law and privacy.

Learning Outcomes: 1. Apply the notions of threat, vulnerability, attack, countermeasure, security objectives, and adversarial models when analyzing security of computer and information systems. 2. Explain the main authorization mechanisms and access control models, and their applicability in different situations. 3. Explain security issues related to password and other authentication mechanisms. 4. Explain the different types of malware, the mechanisms of their propagation, and the strengths and limitations of different defense mechanisms. 5. Identify the threats and vulnerabilities for a networked environment, and explain different countermeasures, and their effectiveness. 6. Explain the vulnerabilities brought about by modern web-based application and services, different countermeasures, and their effectiveness. Credits: 3.00

Selectives

CS 30700 - Software Engineering I

Credit Hours: 3.00. An introduction to the methods and tools of software engineering; software life cycle; specification and design of software, software testing, cost and effort estimation; laboratory exercises with design, testing, and other tools.

Learning Outcomes: 1. Architect and design quality software. 2. Contrast and critique software lifecycle models. 3. Create software using current software engineering tools, methods, and concepts. 4. Work together on a team in a productive and professional manner. 5. Inspect and test software and documentation. Credits: 3.00

CS 34800 - Information Systems

Credit Hours: 3.00. File organization and index structures; object-oriented database languages; the relational database model with introductions to SQL and DBMS; hierarchical models and network models with introductions to HDDL, HDML, and DBTG Codasyl; data mining; data warehousing; database connectivity; distributed databases; the client/server paradigm; middleware, including ODBC, JDBC, CORBA, and MOM.

Learning Outcomes: 1. Learn about different data models (relational, graph, and document) used in different database systems. 2. Learn how to pose complex database queries in SQL and NoSQL languages as well as theoretical query languages. 3. Gain an introductory background in indexing. 4. Learn about transactions and concurrency control. 5. Differentiate between OLTP and OLAP applications. Credits: 3.00

CS 35200 - Compilers: Principles And Practice

Credit Hours: 3.00. Should not be taken concurrently with CS 35400. The theory and practice of programming language translation, compilation, and run-time systems, organized around a significant programming project to build a compiler for a simple but nontrivial programming language. Modules, interfaces, tools. Data structures for tree languages. Lexical analysis, syntax analysis, abstract syntax. Symbol tables, semantic analysis. Translation, intermediate code, basic blocks, traces. Instruction selection, CISC and RISC machines. Liveness analysis, graph coloring register allocation. Supplemental material drawn from garbage collection, object-oriented languages, higher-order languages, dataflow analysis, optimization, polymorphism, scheduling and pipelining, memory hierarchies.

Learning Outcomes: 1. Provides students with an understanding of how a computer program is converted into elementary code that causes the computer to produce the output intended by the programmer. Credits: 3.00

CS 35300 - Principles Of Concurrency And Parallelism

Credit Hours: 3.00. Important concepts, models, algorithms, abstractions, and implementation aspects of concurrent and parallel programs. Topics include: techniques used to describe concurrent programs (e.g., threads, events, co-routines, continuations), abstractions for shared-memory and message-passing programs, relaxed memory models, livelock and deadlock detection, lock-free algorithms, data races and atomicity, scheduling techniques, process calculi, and software transactions.

Learning Outcomes: 1. This course provides students the vocabulary and concepts to better understand how to design and program scalable multicore processors. Credits: 3.00

CS 38100 - Introduction To The Analysis Of Algorithms

Credit Hours: 3.00. Techniques for analyzing the time and space requirements of algorithms. Application of these techniques to sorting, searching, pattern-matching, graph problems, and other selected problems. Brief introduction to the intractable (NP-hard) problems.

Learning Outcomes: 1. Use big O-notation to give asymptotic time and space bounds of algorithms. 2. Explain the use of big-Omega, big-Theta, and little-o notations. 3. Use recurrence relations to determine the time complexity of recursive algorithms. 4. Solve recurrence relations commonly arising in algorithm design. 5. Give examples that illustrate time-space trade-offs of algorithms. Credits: 3.00

CS 40800 - Software Testing

Credit Hours: 3.00. Preliminaries: errors and testing; software quality, requirements, behavior, and correctness; testing, debugging, verification; control flow graphs, dominators; types of testing; Test selection: from requirements, finite state models, and combinatorial designs; regression testing and test minimization; Test adequacy assessment: control and data flow; mutation based; testing tools.

Learning Outcomes: 1. Understand the basic technology related to software testing and debugging. 2. Differentiate between reliability and correctness. 3. Understand the impact of the saturation effect on the test process and its cost. 4. Understand the relationship between software development and test processes. 5. Apply a variety of black box test generation methods manually and using tools. 6. Use test adequacy criteria and understand their respective cost and effectiveness. 7. Select appropriate software test tools for a given testing task. Credits: 3.00

CS 42200 - Computer Networks

Credit Hours: 3.00. Undergraduate-level introduction to computer networks and data communication. Low-level details of media, signals, and bits: time division and frequency division multiplexing; encoding; modulation; bandwidth, throughput, and noise. Packet transmission: Local Area Network (Ethernet, FDDI) and Wide Area Network technologies (ATM); wireless networks; network interconnection with repeaters, bridges, and switches; DSU/CSU; xDSL and cable modems. Internetworking: router-based architecture; IP addressing; address binding with ARP; datagram encapsulation and fragmentation; UDP and TCP, retransmission; protocol ports; ICMP and error handling. Network applications: client/server concept; port demultiplexing; program interface to protocols (API); use by clients and servers; domain name system; TELNET; Web technologies including HTTP, CGI, Java; RPC and middleware; network management.

Credits: 3.00

CS 44800 - Introduction To Relational Database Systems

Credit Hours: 3.00. An in-depth examination of relational database systems including theory and concepts as well as practical issues in relational databases. Modern database technologies such as object-relational and Web-based access to relational databases. Conceptual design and entity relationship modeling, relational algebra and calculus, data definition and manipulation languages using SQL, schema and view management, query processing and optimization, transaction management, security, privacy, integrity management.

Learning Outcomes: 1. Learn data modeling: physical, logical and conceptual data models, the entity-relationship model. 2. Study logical and Physical Design and interaction with operating systems, disk Storage, Basic File Structures, Hashing, Indexing. 3. Learn the relational database model and implementation and performance issues. 4. Understand transaction Processing, concurrency control, atomicity control and recovery control. 5. Understand database privacy, integrity, and

security. 6. Understand data mining, data warehousing, online analytical processing, and information retrieval. 7. Understand Cloud computing and Distributed Database Systems architectures, Big Data, Hadoop, MapReduce, and NoSQL. 8. Recognize performance issues. Credits: 3.00

CS 45600 - Programming Languages

Credit Hours: 3.00. Concepts for structuring data, computation, and whole programs. Object-oriented languages, functional languages, logic- and rule-based languages. Data types, type checking, exception handling, concurrent processes, synchronization, modularity, encapsulation, interfaces, separate compilation, inheritance, polymorphism, dynamic binding, subtyping, overloading, beta-reduction, unification.

Credits: 3.00

CS 47100 - Introduction To Artificial Intelligence

Credit Hours: 3.00. Students are expected to spend at least three hours per week gaining experience with artificial intelligence systems and developing software. Basic problem-solving strategies, heuristic search, problem reduction and AND/OR graphs, knowledge representation, expert systems, generating explanations, uncertainty reasoning, game playing, planning, machine learning, computer vision, and programming systems such as Lisp or Prolog.

Learning Outcomes: 1. Develop understandings of various applications of AI. 2. Recognize problems where AI techniques are applicable. 3. Implement and apply basic principles of AI in solutions that require problem-solving, inference, learning, and planning. 4. Understand how to evaluate various AI techniques and make appropriate selections. Credits: 3.00

CS 47300 - Web Information Search And Management

Credit Hours: 3.00. This course teaches important concepts and knowledge of information retrieval for managing unstructured data such as text data on Web or in emails. At the same time, students will be exposed to a large number of important applications. Students in the course will get hands on experience from homework and a course project. The first part of the course focuses on general concepts/techniques such as stemming, indexing, vector space model, and feedback procedure. The second part of the course shows how to apply the set of techniques on different applications such as Web search, text categorization, and information recommendation.

Learning Outcomes: 1. Understand the important concepts and techniques of information retrieval and how to apply these techniques to a set of important or real world applications. Credits: 3.00

CS 49000 - Topics In Computer Sciences For Undergraduates

Credit Hours: 1.00 to 5.00. Supervised reading and reports in various fields. Permission of instructor required.

Credits: 1.00 to 5.00

CS 37300 - Data Mining And Machine Learning

Credit Hours: 3.00. This course will introduce students to the field of data mining and machine learning, which sits at the interface between statistics and computer science. Data mining and machine learning focuses on developing algorithms to automatically discover patterns and learn models of large datasets. This course introduces students to the process and main techniques in data mining and machine learning, including exploratory data analysis, predictive modeling, descriptive modeling, and evaluation.

Learning Outcomes: 1. Identify key elements of data mining and machine learning algorithms. 2. Understand how algorithmic elements interact to impact performance. 3. Understand how to choose algorithms for different analysis tasks. 4. Analyze data in both an exploratory and targeted manner. 5. Implement and apply basic algorithms for supervised and unsupervised learning. 6. Accurately evaluate the performance of algorithms, as well as formulate and test hypotheses. Credits: 3.00

CS 48900 - Embedded Systems

Credit Hours: 3.00. Software for embedded systems; programming with extreme constraints on memory, storage, and processing power; programming models, including synchronous, asynchronous, and concurrent; programming systems that run forever; use of Finite State Machines (FSMs); review of embedded hardware and available boards; asynchronous and synchronous serial connections (e.g., RS232 and SPI); General Purpose I/O (GPIO) pins; relays, servos, and other peripherals; design for low power; battery characteristics; systems that communicate over computer networks and the Internet; current industry practices; design of embedded

projects; working in teams. CS 35200 (Compilers) and CS 35400 (Operating Systems) are recommended, but not required. Learning Outcomes: 1. Understand basics of embedded systems. 2. Understand how and why many Internet of Things (IoT) devices use the cloud. 3. Understand how embedded systems are employed in a variety of situations, including smart homes and buildings, security systems, cars, and planes. 4. Understand the three basic programming models, and when each is appropriate. 5. Understand how synchronous and asynchronous serial devices operate. 6. General characteristics of batteries and which type of battery is appropriate for various embedded designs. 7. Understand the use of relays and how embedded logic that operates on low voltage can control high voltage peripherals. 8. Understand why systems that use sensors and actuators must be calibrated. 9. Understand how to build and demonstrate a working embedded system. Credits: 3.00

Concentration Notes

Other Departmental/Program Course Requirements (31-55 credits)

College of Science Additional Requirements

Computing (3-4 credits)

Laboratory Science (6-8 credits)

Mathematics (8-10 credits)

MA 16100 - Plane Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 5.00. Introduction to differential and integral calculus of one variable, with applications. Some schools or departments may allow only 4 credit hours toward graduation for this course. Designed for students who have not had at least a one-semester calculus course in high school, with a grade of "A" or "B". Not open to students with credit in MA 16500 . Demonstrated competence in college algebra and trigonometry.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions Credits: 5.00

MA 16200 - Plane Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 5.00. Continuation of MA 16100 . Vectors in two and three dimensions, techniques of integration, infinite series, conic sections, polar coordinates, surfaces in three dimensions. Some schools or departments may allow only 4 credit hours toward graduation for this course.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits:

5.00

MA 16500 - Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 4.00. Introduction to differential and integral calculus of one variable, with applications. Conic sections. Designed for students who have had at least a one-semester calculus course in high school, with a grade of "A" or "B", but are not qualified to enter MA 16200 or MA 16600 or the advanced placement courses MA 17300 or the honors calculus course MA 18100. Demonstrated competence in college algebra and trigonometry. CTL:IMA 1602 Calculus - Long I

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems. 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions. Credits: 4.00

MA 16600 - Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 4.00. Continuation of MA 16500 . Vectors in two and three dimensions. Techniques of integration, infinite series, polar coordinates, surfaces in three dimensions. Not open to students with credit in MA 16200 . CTL:IMA 1603 Calculus - Long II

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 4.00

Statistics (3 credits)

STAT 35000 - Introduction To Statistics

Credit Hours: 3.00. This course provides a data-oriented introduction to applied statistics, covering exploratory data analysis, experimental design, probability distributions, simulation, sampling distributions, and the Central Limit Theorem. Students will learn the fundamentals of statistical inference, including confidence intervals and hypothesis tests for population means, paired and independent comparisons of means, analysis of variance, and regression. The course emphasizes hands-on experience with statistical software and is primarily intended for students majoring in the mathematical sciences. Prerequisite: two semesters of college calculus.

Learning Outcomes: 1. Understand basic terms, graphs, and symbols and be able to interpret statistics in the media. 2. Understand and be able to explain statistical processes and be able to fully interpret statistical results. 3. Understand why and how statistical investigations are conducted and the "big ideas" that underlie statistical investigations. 4. Be able to use a statistical package (R or SAS) to analyze data and interpret result. 5. Big Ideas in Statistics: variability, distributions, and models; causation vs correlation; practical significance vs statistical significance, etc. Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data

displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

Electives (18-43 credits)

Grade Requirements

GPA Requirements

Course Requirements & Notes

Sample 4-Year Plan

Fall 1st Year

CS 18000 - Problem Solving And Object-Oriented Programming

Credit Hours: 4.00. Problem solving and algorithms, implementation of algorithms in a high level programming language, conditionals, the iterative approach and debugging, collections of data, searching and sorting, solving problems by decomposition, the object-oriented approach, subclasses of existing classes, handling exceptions that occur when the program is running, graphical user interfaces (GUIs), data stored in files, abstract data types, a glimpse at topics from other CS courses. Intended primarily for students majoring in computer sciences. Credit cannot be obtained for both CS 18000 and any of 15600, 15800 and 15900. Not open to students with credit in CS 24000.

Learning Outcomes: 1. Understand solving problems by analyzing the problem, designing an algorithm, and programming the solution. Credits: 4.00

MA 16100 - Plane Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 5.00. Introduction to differential and integral calculus of one variable, with applications. Some schools or departments may allow only 4 credit hours toward graduation for this course. Designed for students who have not had at least a one-semester calculus course in high school, with a grade of "A" or "B". Not open to students with credit in MA 16500 . Demonstrated competence in college algebra and trigonometry.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions Credits: 5.00

MA 16500 - Analytic Geometry And Calculus I (UCC: QR)

Credit Hours: 4.00. Introduction to differential and integral calculus of one variable, with applications. Conic sections. Designed for students who have had at least a one-semester calculus course in high school, with a grade of "A" or "B", but are not qualified to enter MA 16200 or MA 16600 or the advanced placement courses MA 17300 or the honors calculus course MA 18100. Demonstrated competence in college algebra and trigonometry. CTL:IMA 1602 Calculus - Long I

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. To compute limits and to apply limit laws. 2. To apply rules of differentiation to compute derivatives of elementary functions. 3. To sketch graphs of functions with the aid of differentiation techniques. 4. To find maxima and minima of functions; optimization problems. 5. To compute integrals of some elementary functions and to apply the Fundamental Theorem of Calculus to compute areas of certain planar regions. Credits: 4.00

15-17 Credits

Spring 1st Year

CS 18200 - Foundations Of Computer Science

Credit Hours: 3.00. Logic and proofs; sets, functions, relations, sequences and summations; number representations; counting; fundamentals of the analysis of algorithms; graphs and trees; proof techniques; recursion; Boolean logic; finite state machines; pushdown automata; computability and undecidability.

Learning Outcomes: 1. Understand discrete mathematical tools, facts, and reasoning relevant to computer science. Credits: 3.00

CS 24000 - Programming In C

Credit Hours: 3.00. The UNIX environment, C development cycle, data representation, operators, program structure, recursion, macros, C preprocessor, pointers and addresses, dynamic memory allocation, structures, unions, typedef, bit-fields, pointer/structure applications, UNIX file abstraction, file access, low-level I/O, concurrency.

Learning Outcomes: 1. Understand programming principles and techniques for problem solving in the C programming language. Credits: 3.00

MA 16200 - Plane Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 5.00. Continuation of MA 16100 . Vectors in two and three dimensions, techniques of integration, infinite series, conic sections, polar coordinates, surfaces in three dimensions. Some schools or departments may allow only 4 credit hours toward graduation for this course.

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum, and should be able to apply elementary approximation methods of integration. Credits: 5.00

MA 16600 - Analytic Geometry And Calculus II (UCC: QR)

Credit Hours: 4.00. Continuation of MA 16500 . Vectors in two and three dimensions. Techniques of integration, infinite series, polar coordinates, surfaces in three dimensions. Not open to students with credit in MA 16200 . CTL:IMA 1603 Calculus - Long II

University Core Curriculum (UCC): (UCC: QR) Learning Outcomes: 1. Apply techniques of integration (integration by parts, trigonometric substitution and partial fractions) to compute areas of planar regions, volumes of solids of revolution and areas of surfaces of revolution, work, moments and centers of mass of homogeneous laminas. 2. Apply tests of absolute convergence of series to find the interval of convergence of some power series. 3. Find the Taylor and Maclaurin series of some exponential, rational and trigonometric functions. 4. Use polar coordinates to make it possible to sketch the graphs of some curves. 5. Understand the definition of a Riemann sum,

and should be able to apply elementary approximation methods of integration. Credits: 4.00

14-18 Credits

Fall 2nd Year

CS 25000 - Computer Architecture

Credit Hours: 4.00. Digital logic: transistors, gates, and combinatorial circuits; clocks; registers and register banks; arithmetic-logic units; data representation: big-endian and little-endian integers; ones and twos complement arithmetic; signed and unsigned values; Von-Neumann architecture and bottleneck; instruction sets; RISC and CISC designs; instruction pipelines and stalls; rearranging code; memory and address spaces; physical and virtual memory; interleaving; page tables; memory caches; bus architecture; polling and interrupts; DMA; device programming; assembly language; optimizations; parallelism; data pipelining.

Learning Outcomes: 1. Students understand the function of basic hardware, including fundamentals of digital logic, processors, memory, and I/O. Credits: 4.00

CS 25100 - Data Structures And Algorithms

Credit Hours: 3.00. Running time analysis of algorithms and their implementations, one-dimensional data structures, trees, heaps, additional sorting algorithms, binary search trees, hash tables, graphs, directed graphs, weighted graph algorithms, additional topics.

Learning Outcomes: 1. Understand fundamental data structures, fundamental algorithms, and their implementation. Credits: 3.00

MA 26100 - Multivariate Calculus (UCC: QR)

Credit Hours: 4.00. Planes, lines, and curves in three dimensions. Differential calculus of several variables; multiple integrals. Introduction to vector calculus. Not open to students with credit in MA 17400 or 27100.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Know the equations for lines, planes and quadric surfaces in three dimensional space, and understand how these equations relate to the geometry. 2. Understand the relationship between vector functions and parametrized motion; know how to calculate velocity, acceleration, arc length and curvature. 3. Know the meaning of partial derivatives and how to calculate them. Know the multivariable chain rule. 4. Know the meaning of the gradient, how to calculate it, and how to apply it to directional derivatives and maximum and minimum values. 5. Understand the meaning of double and triple integrals; know how to compute them and how to apply them. 6. Understand the meaning of vector fields and line integrals. Know Green's theorem and be able to apply it. 7. Understand the meaning of surface integrals and know how to calculate them. Know Stokes' theorem and be able to apply it. Credits: 4.00

MA 27101 - Honors Multivariate Calculus (UCC: QR)

Credit Hours: 5.00. This course is the Honors version of MA 26100, Multivariate Calculus; it will also include a review of infinite series. The course is intended for first-year students who have credit for Calculus I and II. There will be a significant emphasis on conceptual explanation, but not on formal proof. Permission of department is required.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Know techniques of vector algebra and be able to apply these to the geometry of space; in particular they will be able to find equations for lines and planes in space. 2. Find equations for standard surfaces in space. 3. Use vector methods to analyze motion in space, and calculate arc length and curvature. 4. Acquire a conceptual and computational knowledge of infinite series; in particular they will be able to test for convergence, and to do calculations with power series. 5. Understand the meaning of partial derivatives in various situations, and will be able to calculate with them. 6. Know the multivariable chain rule and its meaning, and will be able to apply it to calculate derivatives in various situations. 7. Know the meaning of directional

derivatives and how to calculate them. 8. Find tangent planes. 9. Find and classify extreme values and saddle points and use the method of Lagrange multipliers. 10. Know the meaning of multiple integrals and how to calculate them. 11. Know the meaning of line integrals and surface integrals and how to calculate them. 12. Know Green's theorem, Stokes' theorem, and the divergence theorem and their applications. Credits: 5.00

15-17 Credits

Spring 2nd Year

CS 25200 - Systems Programming

Credit Hours: 4.00. Low-level programming; review of addresses, pointers, memory layout, and data representation; text, data, and bss segments; debugging and hex dumps; concurrent execution with threads and processes; address spaces; file names; descriptors and file pointers; inheritance; system calls and library functions; standard I/O and string libraries; simplified socket programming; building tools to help programmers; make and make files; shell scripts and quoting; Unix tools including sed, echo, test, and find; scripting languages such as awk; version control; object and executable files (.o and a.out); symbol tables; pointers to functions; hierarchical directories; and DNS hierarchy; programming embedded systems.

Learning Outcomes: 1. Have an appreciation and ability for low-level (systems) programming and debugging. Credits: 4.00

MA 26500 - Linear Algebra (UCC: QR)

Credit Hours: 3.00. Introduction to linear algebra. Systems of linear equations, matrix algebra, vector spaces, determinants, eigenvalues and eigenvectors, diagonalization of matrices, applications. Not open to students with credit in MA 26200, 27200, 35000 or 35100.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Learn the basic properties of matrices. 2. Learn how to solve systems of linear equations. 3. Learn the basic properties of determinants. 4. Learn about linear independence, spanning sets and bases in the context of vector spaces. 5. Learn the theory of inner product spaces and how it applies to least-squares approximations. 6. Learn the theory of eigenvalues and eigenvectors and how it applies to systems of differential equations. Credits: 3.00

MA 35100 - Elementary Linear Algebra (UCC: QR)

Credit Hours: 3.00. Systems of linear equations, finite dimensional vector spaces, matrices, determinants, eigenvalues and eigenvector applications to analytical geometry. Not open to students with credit in MA 26500.

University Core Curriculum (UCC): (UCC: QR)

Learning Outcomes: 1. Solve systems of linear equations using concepts such as vector spaces, linear dependence, and Gaussian elimination. 2. Understand and test for linear independence, calculate the dimension of vector spaces, and apply the rank-nullity theorem in various contexts. 3. Define and apply linear transformations, including matrix multiplication, inverses, LU factorization, and coordinate transformations. 4. Compute and understand determinants, including their use in calculating matrix inverses and practical applications such as volume calculations. 5. Analyze and compute eigenvectors and eigenvalues, and apply diagonalization techniques. Credits: 3.00

16-17 Credits

Fall 3rd Year

STAT 35000 - Introduction To Statistics

Credit Hours: 3.00. This course provides a data-oriented introduction to applied statistics, covering exploratory data analysis, experimental design, probability distributions, simulation, sampling distributions, and the Central Limit Theorem. Students will learn the fundamentals of statistical inference, including confidence intervals and hypothesis tests for population means, paired and independent comparisons of means, analysis of variance, and regression. The course

emphasizes hands-on experience with statistical software and is primarily intended for students majoring in the mathematical sciences. Prerequisite: two semesters of college calculus.

Learning Outcomes: 1. Understand basic terms, graphs, and symbols and be able to interpret statistics in the media. 2. Understand and be able to explain statistical processes and be able to fully interpret statistical results. 3. Understand why and how statistical investigations are conducted and the "big ideas" that underlie statistical investigations. 4. Be able to use a statistical package (R or SAS) to analyze data and interpret result. 5. Big Ideas in Statistics: variability, distributions, and models; causation vs correlation; practical significance vs statistical significance, etc. Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00
