Learning Outcomes: 1. Meet the Graduate School learning objectives of knowledge, communication, critical thinking, and ethical research through the goals listed here. 2. Learn about theory in linguistic anthropology. 3. Understand when and how various theoretical positions and logics of interpretation have emerged. 4. Analyze a series of case studies that illustrate dominant positions and fissures in linguistic anthropological thought and practices. 5. Gain an understanding of how theory works and how to work with different theories in their own research. Credits: 3.00

ANTH 53500 - Foundations Of Biological Anthropology

Credit Hours: 3.00. Covers topics in biological anthropology, applying to both living and extinct humans and to non-human primates. Topics include: evolutionary theory; genetics; human variation and the race concept; intersections of biology and culture; fossils and paleoanthropology; ecology and speciation, primate behavior, and theories on the social behavior of early and contemporary humans.

Learning Outcomes: 1. Meet the Graduate School learning objectives of knowledge, communication, critical thinking, and ethical research through the goals listed here. 2. Learn about contemporary theory in biological anthropology from 1980s to the present. 3. Understand when and how various theoretical positions and logics of interpretation have emerged. 4. Review several genres of anthropological writing to understand biological anthropology, and review representation of human and non-human primates and their ecology and evolutionary history. 5. Analyze a series of case studies that illustrate dominant positions and fissures in biological anthropological thought and practices. 6. Gain an understanding of how theory works and how to work with different theories in their own research. Credits: 3.00

Methods Courses (6 credits)

ABE 59100 - Special Topics

Credit Hours: 0.00 to 4.00. Primarily designed for students (two or more) desiring credit from subject areas for which no specific course, workshop, or individual study plan is offered. Area of study will deal with topics that have enough student interest to justify the formalized teaching of a specialized topic. The course may be repeated by a student as long as the topic being taught is not repeated. Permission of instructor required.

Credits: 0.00 to 4.00

ANTH 53400 - Human Osteology

Credit Hours: 3.00. Anatomy of the human skeleton and dentition. Detailed study of skeletal elements and teeth, morphology, function, disease, and pathology. Identification of human remains with regard to age at death, gender, growth, and development in biocultural context.

Credits: 3.00

ANTH 53600 - Primate Ecology

Credit Hours: 3.00. An examination of the complex interrelationships between populations of nonhuman primates and their habitats. Course topics focus on behavioral ecology and conservation including, predator-prey relationships, diet, and interspecific relations.

Credits: 3.00

ANTH 58900 - Archaeology And Materials Science

Credit Hours: 3.00. This course provides instruction in the methods and theories used by archaeologists and materials scientists to study ancient and historic technology. The course focuses on the analysis and interpretation of archaeological artifacts and provides opportunities for hands-on learning.

Learning Outcomes: 1. Gain a more nuanced understanding of, and appreciation for, contemporary technology and materials science. 2. Understand the historical development of theory in anthropology and archaeology related to the study of technology. 3. Understand the role of materials science in contemporary archaeological studies. 4. Able to critique the application of scientific and materials science methods to the analysis of archaeological material through a discussion of case studies. 5. Demonstrate the ability to write a research proposal that incorporates the use of materials science in investigating past technology. 6. Understand the relationship between Culture and Technology and appreciate the impact of this relationship on the environment and issues of sustainability. Credits: 3.00

ANTH 60500 - Seminar In Ethnographic Analysis

Credit Hours: 3.00. Focuses on ethnographic research design, methodology, and ethics, discussing the appropriate selection of any method. Students gain experience with the varieties of ethnographic practice across anthropology and sibling sciences, the generation and analysis of data, and the writing up of ethnographic and of other qualitative research.

Learning Outcomes: 1. Meet the Graduate School learning objectives of knowledge, communication, critical thinking, and ethical research through the goals listed here. 2. Learn about qualitative research design, ethics and methods. 3. Understand when and how to appropriately select qualitative and quantitative methods and identify how and when to use them. 4. Gain an understanding on how anthropologists across the subfields and other scholars use and apply qualitative methods. 5. Gain experience in generating and analyzing qualitative data, including being exposed to common qualitative software packages (such as NVivo). 6. Achieve qualitative literacy for understanding and working in a mixed methods environment. Credits: 3.00

ANTH 60600 - Quantitative Research Design

Credit Hours: 3.00. Focuses on quantitative research design, methodology, and ethics, discussing the appropriate selection of any method. Students gain experience in generating and analyzing of quantitative and mixed-method data, and in the writing up and communication of quantitative research, altogether aiming for statistical literacy.

Learning Outcomes: 1. Meet the Graduate School learning objectives of knowledge, communication, critical thinking, and ethical research through the goals listed here. 2. Learn about quantitative research design, ethics and methods. 3. Understand when and how to appropriately select qualitative and quantitative methods and identify how and when to use them. 4. Gain an understanding on how anthropologists across the subfields use and other scholars apply quantitative methods. 5. Gain experience in generating and analyzing quantitative data, including being versed in common statistical packages (such as SPSS). 6. Achieve statistical literacy for understanding and working in a mixed methods environment. Credits: 3.00

ANTH 62000 - Special Topics In Cultural Anthropology

Credit Hours: 3.00. Critical examination of a selected aspect of contemporary cultural anthropology research and theory. Topics will vary from year to year.

Credits: 3.00

BIOL 59100 - Field Ecology

Credit Hours: 0.00 to 4.00. A field course in ecology that stresses natural history and testing ecological theory under natural conditions. Group and individual projects include observational and experimental approaches. Emphasis is on the study of plant and animal species interactions in terrestrial (including montane and coastal) and aquatic habitats. Issues in community, population, behavioral, and conservation biology

are addressed. Several all-day Saturday and two weekend field trips. Offered in alternate years. Permission of instructor required.

Credits: 0.00 to 4.00

NUTR 53400 - Human Sensory Systems And Food Evaluation

Credit Hours: 3.00. Overview of human chemosensory (taste, smell, chemesthetic) mechanisms and function, as well as procedural and statistical methods for evaluating the sensory responsiveness of people and the sensory properties of foods.

Credits: 3.00

SOC 58100 - Methods of Social Research II

Credit Hours: 3.00. Emphasis on statistical inference applied to sociological problems; topics include the binomial distribution and the logic of inference, one and two sample tests, confidence intervals, and chi-square. Introduction to bivariate correlation and regression, analysis of variance.

Credits: 3.00

SOC 58300 - Application Of Social Research Methods

Credit Hours: 3.00. Specific methods of survey research, including questionnaire construction, and sampling techniques, as well as case studies and field experiments are covered. Emphasis is on the use of such methods and their implications for the nature of social data. Permission of instructor required.

Credits: 3.00

Advanced Anthropology Seminar (3 credits)

Core Courses (9 credits)

ANTH 50400 - Archaeological Theory

Credit Hours: 3.00. Focuses on the development of archaeological theory, discussing several theoretical positions and genres of archaeological research. Students gain experience in working with theory in their own research and achieve literacy in archaeological theories.

Learning Outcomes: 1. Meet the Graduate School learning objectives of knowledge, communication, critical thinking, and ethical research through the goals listed here. 2. Learn about the historical development of the archaeological method and theory from 1980s to the present. 3. Understand when and how various theoretical positions and logics of interpretation have emerged. 4. Review several genres of archaeology writing to understand archaeology and its representation of the human past. 5. Analyze a series of case studies that illustrate dominant positions and fissures in archaeological thought and practices. 6. Gain an understanding of how theory works and how to work with different theories in their own research. Credits: 3.00

ANTH 50500 - Culture And Society

Credit Hours: 3.00. Introduces contemporary sociocultural anthropology theory and practices, relating material to anthropology's history and its place in the social sciences. Covers problem formulation, study of cultural change, representation of human cultural diversity, and key case studies.

Learning Outcomes: 1. Meet the Graduate School learning objectives of knowledge, communication, critical thinking, and ethical research through the goals listed here. 2. Learn about contemporary theory in cultural anthropology from 1980s to the present. 3. Understand when and how various theoretical positions and logics of interpretation have emerged. 4. Review several genres of anthropological writing to understand cultural anthropology and its representation of human cultural diversity. 5. Analyze a series of case studies that illustrate dominant positions and fissures in cultural anthropological thought and practices. 6. Gain an understanding of how theory works and how to work with different theories in their own research. Credits: 3.00

ANTH 50700 - History Of Theory In Anthropology

Credit Hours: 3.00. Connects the theoretical foundations of anthropology throughout the development of the discipline and related disciplines. Unpacks the when, how, and why of various theoretical positions, their shaping of research, and their concomitant logics of evidence.

Learning Outcomes: 1. Meet the Graduate School learning objectives of knowledge,

communication, critical thinking, and ethical research through the goals listed here. 2. Learn about the foundations of theory in anthropology and the development of the discipline over time up to approximately 1980. 3. Understand when and how various theoretical positions and logics of interpretation have emerged. 4. Review several genres of anthropological writing to understand anthropology and its representation in past and present. 5. Analyze a series of case studies that illustrate dominant positions and fissures in anthropological thought and practices. Credits: 3.00

ANTH 51400 - Anthropological Linguistics

Credit Hours: 3.00. Investigates the varieties of communication in human behavior, while exploring linguistics as a tool in social science research. Also considers origins of human language and speech, and relations of language with other aspects of culture, with societal phenomena and with individual cognition.

Learning Outcomes: 1. Meet the Graduate School learning objectives of knowledge, communication, critical thinking, and ethical research through the goals listed here. 2. Learn about theory in linguistic anthropology. 3. Understand when and how various theoretical positions and logics of interpretation have emerged. 4. Analyze a series of case studies that illustrate dominant positions and fissures in linguistic anthropological thought and practices. 5. Gain an understanding of how theory works and how to work with different theories in their own research. Credits: 3.00

ANTH 53500 - Foundations Of Biological Anthropology

Credit Hours: 3.00. Covers topics in biological anthropology, applying to both living and extinct humans and to non-human primates. Topics include: evolutionary theory; genetics; human variation and the race concept; intersections of biology and culture; fossils and paleoanthropology; ecology and speciation, primate behavior, and theories on the social behavior of early and contemporary humans.

Learning Outcomes: 1. Meet the Graduate School learning objectives of knowledge, communication, critical thinking, and ethical research through the goals listed here. 2. Learn about contemporary theory in biological anthropology from 1980s to the present. 3. Understand when and how various theoretical positions and logics of interpretation have emerged. 4. Review several genres of anthropological writing to understand biological anthropology, and review representation of human and non-human primates and their ecology and evolutionary history. 5. Analyze a series of case studies that illustrate dominant positions and fissures in biological anthropological thought and practices. 6. Gain an understanding of how theory works and how to work with different theories in their own research. Credits: 3.00

Option A: Applied and Practicing Anthropology Courses (9 credits)

ANTH 64000 - Foundations And Frameworks: Applying Anthropology

Credit Hours: 3.00. This course focuses on using anthropology to address social issues. The course examines topics including: the history of anthropologists working in applied settings, the relationship between theory and practice, professional ethics, job opportunities, and skills needed as anthropological practitioners. Students should have some background in anthropology if coming from another discipline e.g. prior coursework or relevant experience as determined by instructor.

Learning Outcomes: 1. Identify key questions and concerns in applied anthropology. 2. Speak about the relationship of anthropological theory and practice and how that relationship has been discussed in the discipline. 3. Know about a series of anthropological practice areas and their progression over time. 4. Analyze your own development as an anthropologist by doing career related research and self-reflexive writing in the course. Credits: 3.00

ANTH 64200 - Public Engagement: Using Anthropological Knowledge

Credit Hours: 3.00. This course is about using and communicating anthropological knowledge. We will discuss what it means to work as an anthropologist and public intellectual. Effectively working with stakeholders, presenting information, offering solutions for addressing problems and implementing change are addressed. Students should have some background in anthropology if coming from another discipline e.g. prior coursework or relevant experience as determined by instructor.

Learning Outcomes: 1. Know how to convey your anthropological ideas and findings for multiple purposes and audiences. 2. Be familiar with how some well-known anthropologists have had broad influence inside and outside our discipline. 3. Prepare your anthropological data and information for disseminating to different audiences and outlets. 4. Develop your anthropological critical thinking, writing and presentation skills to become a more effective anthropological communicator. 5. Consider the most successful ways for being an engaged anthropologist in your own areas of interests. Credits: 3.00

ANTH 64100 - Discovery And Design: Making Projects Work

Credit Hours: 3.00. This course is about using anthropology to make projects work. Students will learn anthropological approaches and methods to discover salient aspects of a design problem and use this understanding to devise responses. Anthropological discovery, design and delivery processes are demonstrated. Students should have some background in anthropology if coming from another discipline e.g. prior coursework or relevant experience as determined by instructor.

Learning Outcomes: 1. Be able to use Rapid Assessment Procedures (RAP), the Delphi Technique, Domain Analysis and Cross-Cultural Survey Design. 2. Understand how community projects are put together from goals and objectives, strategies implementation plans and monitoring and evaluation and be able to use that knowledge in effectively designing projects. 3. Write a funding proposal that clearly explains the purpose, impact, and essential features of the project in order to secure funding or other essential support. 4. Apply the skills of anthropological discovery and design in your own practice area of interest. Credits: 3.00

Statistics Course (0-3 credits)

SOC 38200 - Introduction To Statistics In Sociology

Credit Hours: 3.00. Introduction to the basic techniques of statistical analysis applicable to sociological data. Elementary descriptive statistics and statistical inference. Introduction to multivariate analysis.

Learning Outcomes: 1. Identify the relevance of statistics to everyday life. 2. Understand how descriptive and inferential statistics are used and described in sociological research. 3. Compute and interpret univariate and bivariate statistics. Credits: 3.00

ANTH 30600 - Quantitative Methods For Anthropological Research

Credit Hours: 3.00. This course provides an introduction to the broad statistical methods used throughout the 4-fields of Anthropology. It covers elementary probability theory, basic concepts of statistical inference and study design. The course will motivate statistical methods through data analysis and visualization. It is designed for students who intend to focus in an anthropological discipline. It would also benefit a variety of students interested in 1) quantitative science literacy and planning for graduate work, 2) joining the workforce and becoming part of the educated citizenry. There are no prerequisites from the Statistics or Mathematics Departments.

Learning Outcomes: 1. Acquire the ability to explain anthropological data collection methods, their limitations and effect on inference. 2. Summarize data numerically and visually and perform data analysis using statistical software. 3. Describe the unified nature of statistical inference. 4. Learn applications of analytical methods for single variables or for relationships between two variables to describe natural phenomena and make data-based decisions. 5. Analyze numerical response variables using a single or multiple explanatory variables to investigate relationships between variables. 6. Interpret results correctly, effectively, and in context without relying on statistical jargon. 7.

Gain skills to assess data-based claims and evaluate data-based decisions. Credits: 3.00

Electives (6-18 credits)

Additional Requirements - Option A: Applied and Practicing Anthropology

Additional Requirements - Option B: Doctoral Pre-Proposal

Required Courses (18 credits)

Core Courses (9 credits)

ANTH 50400 - Archaeological Theory

Credit Hours: 3.00. Focuses on the development of archaeological theory, discussing several theoretical positions and genres of archaeological research. Students gain experience in working with theory in their own research and achieve literacy in archaeological theories.

Learning Outcomes: 1. Meet the Graduate School learning objectives of knowledge, communication, critical thinking, and ethical research through the goals listed here. 2. Learn about the historical development of the archaeological method and theory from 1980s to the present. 3. Understand when and how various theoretical positions and logics of interpretation have emerged. 4. Review several genres of archaeology writing to understand archaeology and its representation of the human past. 5. Analyze a series of case studies that illustrate dominant positions and fissures in archaeological thought and practices. 6. Gain an understanding of how theory works and how to work with different theories in their own research. Credits: 3.00

ANTH 50500 - Culture And Society

Credit Hours: 3.00. Introduces contemporary sociocultural anthropology theory and practices, relating material to anthropology's history and its place in the social sciences. Covers problem formulation, study of cultural change, representation of human cultural diversity, and key case studies.

Learning Outcomes: 1. Meet the Graduate School learning objectives of knowledge, communication, critical thinking, and ethical research through the goals listed here. 2. Learn about contemporary theory in cultural anthropology from 1980s to the present. 3. Understand when and how various theoretical positions and logics of interpretation have emerged. 4. Review several genres of anthropological writing to understand cultural anthropology and its representation of human cultural diversity. 5. Analyze a series of case studies that illustrate dominant positions and fissures in cultural anthropological thought and practices. 6. Gain an understanding of how theory works and how to work with different theories in their own research. Credits: 3.00

ANTH 50700 - History Of Theory In Anthropology

Credit Hours: 3.00. Connects the theoretical foundations of anthropology throughout the development of the discipline and related disciplines. Unpacks the when, how, and why of various theoretical positions, their shaping of research, and their concomitant logics of evidence.

Learning Outcomes: 1. Meet the Graduate School learning objectives of knowledge, communication, critical thinking, and ethical research through the goals listed here. 2. Learn about the foundations of theory in anthropology and the development of the discipline over time up to approximately 1980. 3. Understand when and how various theoretical positions and logics of interpretation have emerged. 4. Review several genres of anthropological writing to understand anthropology and its representation in past and present. 5. Analyze a series of case studies that illustrate dominant positions and fissures in anthropological thought and

practices. Credits: 3.00

ANTH 51400 - Anthropological Linguistics

Credit Hours: 3.00. Investigates the varieties of communication in human behavior, while exploring linguistics as a tool in social science research. Also considers origins of human language and speech, and relations of language with other aspects of culture, with societal phenomena and with individual cognition.

Learning Outcomes: 1. Meet the Graduate School learning objectives of knowledge, communication, critical thinking, and ethical research through the goals listed here. 2. Learn about theory in linguistic anthropology. 3. Understand when and how various theoretical positions and logics of interpretation have emerged. 4. Analyze a series of case studies that illustrate dominant positions and fissures in linguistic anthropological thought and practices. 5. Gain an understanding of how theory works and how to work with different theories in their own research. Credits: 3.00

ANTH 53500 - Foundations Of Biological Anthropology

Credit Hours: 3.00. Covers topics in biological anthropology, applying to both living and extinct humans and to non-human primates. Topics include: evolutionary theory; genetics; human variation and the race concept; intersections of biology and culture; fossils and paleoanthropology; ecology and speciation, primate behavior, and theories on the social behavior of early and contemporary humans.

Learning Outcomes: 1. Meet the Graduate School learning objectives of knowledge, communication, critical thinking, and ethical research through the goals listed here. 2. Learn about contemporary theory in biological anthropology from 1980s to the present. 3. Understand when and how various theoretical positions and logics of interpretation have emerged. 4. Review several genres of anthropological writing to understand biological anthropology, and review representation of human and non-human primates and their ecology and evolutionary history. 5. Analyze a series of case studies that illustrate dominant positions and fissures in biological anthropological thought and practices. 6. Gain an understanding of how theory works and how to work with different theories in their own research. Credits: 3.00

Methods Courses (6 credits)

ABE 59100 - Special Topics

Credit Hours: 0.00 to 4.00. Primarily designed for students (two or more) desiring credit from subject areas for which no specific course, workshop, or individual study plan is offered. Area of study will deal with topics that have enough student interest to justify the formalized teaching of a specialized topic. The course may be repeated by a student as long as the topic being taught is not repeated. Permission of instructor required.

Credits: 0.00 to 4.00

ANTH 53400 - Human Osteology

Credit Hours: 3.00. Anatomy of the human skeleton and dentition. Detailed study of skeletal elements and teeth, morphology, function, disease, and pathology. Identification of human remains with regard to age at death, gender, growth, and development in biocultural context.

Credits: 3.00

ANTH 53600 - Primate Ecology

Credit Hours: 3.00. An examination of the complex interrelationships between populations of nonhuman primates and their habitats. Course topics focus on behavioral ecology and conservation including, predator-prey relationships, diet, and interspecific relations.

Credits: 3.00

ANTH 58900 - Archaeology And Materials Science

Credit Hours: 3.00. This course provides instruction in the methods and theories used by archaeologists and materials scientists to study ancient and historic technology. The course focuses on the analysis and interpretation of archaeological artifacts and provides opportunities for hands-on learning.

Learning Outcomes: 1. Gain a more nuanced understanding of, and appreciation for, contemporary technology and materials science. 2. Understand the historical development of theory in anthropology and archaeology related to the study of technology.

3. Understand the role of materials science in contemporary archaeological studies. 4. Able to critique the application of scientific and materials science methods to the analysis of archaeological material through a discussion of case studies. 5. Demonstrate the ability to write a research proposal that incorporates the use of materials science in investigating past technology. 6. Understand the relationship between Culture and Technology and appreciate the impact of this relationship on the environment and issues of sustainability. Credits: 3.00

ANTH 60500 - Seminar In Ethnographic Analysis

Credit Hours: 3.00. Focuses on ethnographic research design, methodology, and ethics, discussing the appropriate selection of any method. Students gain experience with the varieties of ethnographic practice across anthropology and sibling sciences, the generation and analysis of data, and the writing up of ethnographic and of other qualitative research.

Learning Outcomes: 1. Meet the Graduate School learning objectives of knowledge, communication, critical thinking, and ethical research through the goals listed here. 2. Learn about qualitative research design, ethics and methods. 3. Understand when and how to appropriately select qualitative and quantitative methods and identify how and when to use them. 4. Gain an understanding on how anthropologists across the subfields and other scholars use and apply qualitative methods. 5. Gain experience in generating and analyzing qualitative data, including being exposed to common qualitative software packages (such as NVivo). 6. Achieve qualitative literacy for understanding and working in a mixed methods environment. Credits: 3.00

ANTH 60600 - Quantitative Research Design

Credit Hours: 3.00. Focuses on quantitative research design, methodology, and ethics, discussing the appropriate selection of any method. Students gain experience in generating and analyzing of quantitative and mixed-method data, and in the writing up and communication of quantitative research, altogether aiming for statistical literacy.

Learning Outcomes: 1. Meet the Graduate School learning objectives of knowledge, communication, critical thinking, and ethical research through the goals listed here. 2. Learn about quantitative research design, ethics and methods. 3. Understand when and how to appropriately select qualitative and quantitative methods and identify how and when to use them. 4. Gain an understanding on how anthropologists across the subfields use and other scholars apply quantitative methods. 5. Gain experience in generating and analyzing quantitative data, including being versed in common statistical packages (such as SPSS). 6. Achieve statistical literacy for understanding and working in a mixed methods environment. Credits: 3.00

ANTH 62000 - Special Topics In Cultural Anthropology

Credit Hours: 3.00. Critical examination of a selected aspect of contemporary cultural anthropology research and theory. Topics will vary from year to year.

Credits: 3.00

BIOL 59100 - Field Ecology

Credit Hours: 0.00 to 4.00. A field course in ecology that stresses natural history and testing ecological theory under natural conditions. Group and individual projects include observational and experimental approaches. Emphasis is on the study of plant and animal species interactions in terrestrial (including montane and coastal) and aquatic habitats. Issues in community, population, behavioral, and conservation biology are addressed. Several all-day Saturday and two weekend field trips. Offered in alternate years. Permission of instructor required.

Credits: 0.00 to 4.00

NUTR 53400 - Human Sensory Systems And Food Evaluation

Credit Hours: 3.00. Overview of human chemosensory (taste, smell, chemesthetic) mechanisms and function, as well as procedural and statistical methods for evaluating the sensory responsiveness of people and the sensory properties of foods.

Credits: 3.00

SOC 58100 - Methods of Social Research II

Credit Hours: 3.00. Emphasis on statistical inference applied to sociological problems; topics include the binomial distribution and the logic of inference, one and two sample tests, confidence intervals, and chi-square. Introduction to bivariate correlation and regression, analysis of variance.

Credits: 3.00

SOC 58300 - Application Of Social Research Methods

Credit Hours: 3.00. Specific methods of survey research, including questionnaire construction, and sampling techniques, as well as case studies and field experiments are covered. Emphasis is on the use of such methods and their implications for the nature of social data. Permission of instructor required.

Credits: 3.00

Advanced Anthropology Seminar (3 credits)

Core Courses (9 credits)

ANTH 50400 - Archaeological Theory

Credit Hours: 3.00. Focuses on the development of archaeological theory, discussing several theoretical positions and genres of archaeological research. Students gain experience in working with theory in their own research and achieve literacy in archaeological theories.

Learning Outcomes: 1. Meet the Graduate School learning objectives of knowledge, communication, critical thinking, and ethical research through the goals listed here. 2. Learn about the historical development of the archaeological method and theory from 1980s to the present. 3. Understand when and how various theoretical positions and logics of interpretation have emerged. 4. Review several genres of archaeology writing to understand archaeology and its representation of the human past. 5. Analyze a series of case studies that illustrate dominant positions and fissures in archaeological thought and practices. 6. Gain an understanding of how theory works and how to work with different theories in their own research. Credits: 3.00

ANTH 50500 - Culture And Society

Credit Hours: 3.00. Introduces contemporary sociocultural anthropology theory and practices, relating material to anthropology's history and its place in the social sciences. Covers problem formulation, study of cultural change, representation of human cultural diversity, and key case studies.

Learning Outcomes: 1. Meet the Graduate School learning objectives of knowledge, communication, critical thinking, and ethical research through the goals listed here. 2. Learn about contemporary theory in cultural anthropology from 1980s to the present. 3. Understand when and how various theoretical positions and logics of interpretation have emerged. 4. Review several genres of anthropological writing to understand cultural anthropology and its representation of human cultural diversity. 5. Analyze a series of case studies that illustrate dominant positions and fissures in cultural anthropological thought and practices. 6. Gain an understanding of how theory works and how to work with different theories in their own research. Credits: 3.00

ANTH 50700 - History Of Theory In Anthropology

Credit Hours: 3.00. Connects the theoretical foundations of anthropology throughout the development of the discipline and related disciplines. Unpacks the when, how, and why of various theoretical positions, their shaping of research, and their concomitant logics of evidence.

Learning Outcomes: 1. Meet the Graduate School learning objectives of knowledge, communication, critical thinking, and ethical research through the goals listed here. 2. Learn about the foundations of theory in anthropology and the development of the discipline over time up to approximately 1980. 3. Understand when and how various theoretical positions and logics of interpretation have emerged. 4. Review several genres of anthropological writing to understand anthropology and its representation in past and present. 5. Analyze a series of case

studies that illustrate dominant positions and fissures in anthropological thought and practices. Credits: 3.00

ANTH 51400 - Anthropological Linguistics

Credit Hours: 3.00. Investigates the varieties of communication in human behavior, while exploring linguistics as a tool in social science research. Also considers origins of human language and speech, and relations of language with other aspects of culture, with societal phenomena and with individual cognition.

Learning Outcomes: 1. Meet the Graduate School learning objectives of knowledge, communication, critical thinking, and ethical research through the goals listed here. 2. Learn about theory in linguistic anthropology. 3. Understand when and how various theoretical positions and logics of interpretation have emerged. 4. Analyze a series of case studies that illustrate dominant positions and fissures in linguistic anthropological thought and practices. 5. Gain an understanding of how theory works and how to work with different theories in their own research. Credits: 3.00

ANTH 53500 - Foundations Of Biological Anthropology

Credit Hours: 3.00. Covers topics in biological anthropology, applying to both living and extinct humans and to non-human primates. Topics include: evolutionary theory; genetics; human variation and the race concept; intersections of biology and culture; fossils and paleoanthropology; ecology and speciation, primate behavior, and theories on the social behavior of early and contemporary humans.

Learning Outcomes: 1. Meet the Graduate School learning objectives of knowledge, communication, critical thinking, and ethical research through the goals listed here. 2. Learn about contemporary theory in biological anthropology from 1980s to the present. 3. Understand when and how various theoretical positions and logics of interpretation have emerged. 4. Review several genres of anthropological writing to understand biological anthropology, and review representation of human and non-human primates and their ecology and evolutionary history. 5. Analyze a series of case studies that illustrate dominant positions and fissures in biological anthropological thought and practices. 6. Gain an understanding of how theory works and how to work with different theories in their own research. Credits: 3.00

Concentrations and Certificates

GPA Requirements

About the Program

Applied Geospatial Analytics, MS

About the Program

Program Requirements

Required Courses (30 credits)

Core Courses (24 credits)

COM 60111 - Seminar In Strategic Communication

Credit Hours: 3.00. This graduate course will survey the theories and processes of strategic communication and its practice by business, government, politicians, and non-profits - in domestic and international arenas. The course will emphasize the application of theory to provide an in-depth understanding of planning, executing, and evaluating strategic communication plans. Prerequisite: Graduate student in communication. Permission of department required.

Learning Outcomes: 1. Understand the context in which strategic communication operates and the dynamics changing the profession, its work, and its value to clients and society. 2. Understand the theories which underlie strategic communication. 3. Understand the processes of the development and

implementation of comprehensive communication strategies. 4. Strengthen writing and presentation skills relevant to strategic communication through course assignments. Credits: 3.00

ABE 65100 - Environmental Informatics

Credit Hours: 3.00. This course will educate students in the use, manipulation and analysis of environmental data by introducing them to scripting languages (e.g. c-shell, python), data types (e.g. ASCII, binary, NetCDF), databases (e.g. XML, DBF) and data visualization software (e.g. GMT, ArcMap) as well as techniques for checking data quality, working with missing data, and handling large diverse sources of time series and spatial data. Students will manipulate, check and insert data from a variety of sources, use that data as input to distributed hydrologic model, analyze model output and learn methods for properly documenting their data use (creation of metadata) and long-term archival storage of those data. Skills learned should be applicable to most computer operating systems, but the majority of work for this class will be done within the Unix/Linux environment. Students taking this course should have experience with one or more programming languages, including but not limited to C, Fortran, Perl, Python, java, Basic, or two writing scripts or macros within programs such as MATLAB, S-Plus, R, SAS.

Learning Outcomes: 1. Demonstrate use of the scientific method to identify problems, formulate and test hypotheses, conduct experiments and analyze data, and derive conclusions. 2. Demonstrate critical thinking by using data and reasoning to develop sound responses to complex problems. 3. Demonstrate the ability to write and speak with effectiveness while considering audience and purpose. 4. Demonstrate the ability to work effectively as part of a problem-solving team. 5. Demonstrate skills necessary for lifelong learning. 6. An ability to apply knowledge of mathematics, science, and engineering. 7. Ability to design and conduct experiments, as well as to analyze and interpret data. 8. An ability to function on multidisciplinary teams. 9. An ability to communicate effectively. 10. A recognition of the need for, and an ability to engage in life-long learning. 11. An ability to use the techniques, skills, and modern engineering tools necessary for engineering practice. Credits: 3.00

ASM 54000 - Geographic Information System Application

Credit Hours: 3.00. Fundamentals of GIS analysis applied to environmental, agricultural, and engineering-related problems. Topics include data sources, spatial analysis; projections; creating data and metadata, and conceptualizing and solving spatial problems using GIS.

Learning Outcomes: 1. Apply fundamental geographic information system concepts for organizing, symbolizing, and visualizing spatial and temporal data. 2. Demonstrate proficiency with spatial data manipulation methods for creating and editing geodatabases, geocoding, and performing geoprocessing operations on spatial data. 3. Apply spatial analysis tools to process vector and raster data for decision-making. 4. Create models to automate GIS workflow and build custom geoprocessing tools. 5. Construct user-friendly dashboards/web apps/StoryMaps for sharing developed solutions. 6. Research publicly available GIS data and use it for the final project or demonstrate Python programming skills to analyze publicly available data. Credits: 3.00

AGRY 54500 - Remote Sensing Of Land Resources

Credit Hours: 3.00. Application of remote sensing and spatial databases for observing and managing land resources within the Earth System; analysis and interpretation of remotely sensed data in combination with field observations and other data sources; conceptualization and design of a global earth resources information system.

Learning Outcomes: 1. Evaluate, analyze, and apply the fundamentals of remote sensing related to sensor technologies, Multispectral/hyperspectral imaging, active and passive radar, LIDAR, GPS, preprocessing of remote sensing image data, Radiometric and geometric correction, data enhancement for visual interpretation, extraction of information from data, spatial and spectral feature extraction for analysis, Unsupervised and

supervised classification, terrain modeling and sources of remote sensing data/information. Credits: 3.00

CGT 57500 - Data Visualization Tools And Applications

Credit Hours: 3.00. This course provides hands-on experience in data visualization tools and applications. The course is designed for students with little or no background in Data Visualization. It introduces students to design principles for creating meaningful displays of quantitative and qualitative data to facilitate insight and decision-making. The goal is to introduce visualization as a tool, explore and identify which visualization tools are better suited to visualize different types of data, and understand the role visualization plays in understanding what the data represent. This course gives students an in-depth view of the various branches of visualization and the visualization tools in each area. After taking the course students will be able to evaluate data visualization tools and determine which tool to use for different types of data. This course is targeted towards students interested in using visualization in their own work and future academic courses.

Learning Outcomes: 1. Assess the visualization process. 2. Assess the applicability of various visualization tools. 3. Evaluate different techniques of visual representation. Credits: 3.00

FNR 58700 - Advanced Spatial Ecology And GIS

Credit Hours: 3.00. Introduction to the principles of landscape ecology and biogeography with a laboratory devoted to the analysis of spatial data using geographic information systems and other database tools. Landscape ecology focuses on the important relationships of landscape structure (pattern, heterogeneity) and ecological processes (movement of animals, hydrologic dynamics) and how this information is used for natural resource management. Biogeography examines ecological patterns and processes at larger scales (generally at subcontinental to global) for the purposes of managing plants and animals of global importance. In the last 15 years, tremendous efforts have been made to create spatial databases that help support research and management of natural resources at various scales. The lab will focus on the use and application of these databases that are common in natural resource management settings.

Learning Outcomes: 1. Apply the principles of landscape ecology to the analysis of spatial change in urban, agricultural and forested landscapes for the purposes of natural resource management. 2. Calculate change in landscape patterns using a variety of geospatial tools such as geographic information systems, spatial models, and geostatistics. 3. Prepare reports using the traditional scientific journal article format, on the analysis of landscape-scale change, focusing on problems common to watershed management. 4. Compare and contrast the ways that biodiversity can be calculated using standard indices of organismal diversity. 5. Calculate ecological footprints and evaluate why these vary across geopolitical and/or ecological units. Credits: 3.00

CNIT 51000 - Data Literacy

Credit Hours: 3.00. This course examines concepts, models, and methods useful for applying data analytics in business environments. Focusing on hypothesis generation, the capturing, storage and expression of data, analysis for research and visualizations.

Learning Outcomes: 1. Apply critical thinking abilities and analytical thought. 2. Recognize diverse range of data types/storage strategies and demonstrate the ability to analyze and debate the applications of each proficiently. 3. Examine aspects of the analytical thinking process and formulate individualized opinions surrounding the approach to data analytics. 4. Analyze a set of data yielding actionable insights that can be applied to research or business. 5. Gain a wide perspective on data analytics utilizing article reviews and up to the week content. Credits: 3.00

CNIT 57500 - Data Analysis

Credit Hours: 3.00. This course will teach students how data analysis can inform decision-making. Students will develop analytical skills and focus is placed on predictive analysis to evaluate business decision. Students will develop logical reasoning and communication skills related to quantitative outputs. This course will also develop the ability to collect large datasets, organize, and combine them using Tableau software.

Learning Outcomes: 1. Recognize the pervasiveness and breadth of data collection options available in today's world. 2. Discern

and defend ethical applications of how collected data can be used for marketing. 3. Discuss how to find, download, clean and combine data sets. 4. Identify and evaluate trends in data sets. 5. Build models to make predictions about future events based upon historic data. Credits: 3.00

Selectives (6 credits)

COM 60311 - Seminar In Crisis Communication

Credit Hours: 3.00. This graduate course will focus on how to communicate in a time of crisis in order to manage the situation and disseminate key messages to various stakeholders. Prerequisite: Graduate student in Communication and COM 60111 . Permission of department required.

Learning Outcomes: 1. Have a broad understanding of the crisis communication literature. 2. Be able to formulate solutions to crisis situations from multiple perspectives. 3. Anticipate actions and analyze stakeholders involved in crisis situations. 4. Be aware of and challenge critical assumptions in crisis situations. 5. Evaluate crisis plans. Credits: 3.00

COM 60911 - Strategic Public Relations

Credit Hours: 3.00. Strategic communication is composed, in part, of integrated marketing communication (IMC), advertising, and public relations. This course highlights public relations scholarship, which is one of the strengths of the Brian Lamb School of Communication. As such, it builds on the general strategic communication course by providing an in-depth understanding of public relations. Specifically, the class will cover public relations theories, ethics, concepts, principles, and applications. Permission of department required.

Learning Outcomes: 1. Demonstrate knowledge of public relations theory. 2. Articulate the roles of ethics in public relations. 3. Assess the research, planning, and evaluation used in public relations practices. 4. Identify the unique challenges associated with developing public relations campaigns. 5. Evaluate public relations campaigns and responses. 6. Identify the various publics that public relations scholarship addresses. Credits: 3.00

COM 62111 - Seminar In Strategic Communication And Social Media

Credit Hours: 3.00. This course will provide an overview of social media and its relationship to strategic communication. Students will learn about the available forms of social media (e.g., Blogs, Social Networks, and Wikis) as well as their uses, strengths and weaknesses for building and managing relationship with stakeholders. Students will also gain exposure to methods for analyzing social media metrics as a framework for evaluating the effectiveness of social media strategies as tools for developing corporate, nonprofit, and governmental images and brands. Permission of department required.

Learning Outcomes: 1. Demonstrate their understanding of current theories of communication technology that bear on the use and impact of social media environments. 2. Articulate changes in strategic communication brought about by changes in technology. 3. Identify and become familiar with the most commonly used social media technologies used in industry to communicate with stakeholders. 4. Demonstrate the ability to use contemporary social media tools. 5. Develop a social media strategy for an organization. 6. Identify, track, and analyze key social media metrics for evaluating the effectiveness of a social media strategy. Credits: 3.00

COM 65000 - Communication And Leadership

Credit Hours: 3.00. Communication is the essence of leadership, and this course aims to identify how communication can fuel productivity, drive consensus and push the organization to a leadership position within a market. At the same time, communication can sabotage one's success or be used as a weapon to silence voices and promote political agendas. This course aims to empower you to shape leadership throughout the organization and to know how to advise other leaders in their efforts to overcome communication challenges. Permission of department required.

Learning Outcomes: 1. Identify relevant theories and principles of organizational communication. 2. Understand how communication can increase team productivity. 3. Develop comprehensive internal and external communications plans. 4. Use data from an audit to make recommendations and decisions. 5. Construct a

communications plan to achieve a leadership position in a marketplace. 6. Advise peers and colleagues as they work through their own communication challenges. 7. Identify communication strategies to communicate with executives when stakes are high. Credits: 3.00

Program Learning Outcomes

About the Program

Art: Studio Arts Concentration, MFA

About the Program

Program Requirements

Required Courses (xx credits)

Core Courses (27 credits)

AD 60300 - Theory In Art Seminar

Credit Hours: 3.00. Study of critical issues in modern and postmodern art and relevant methodologies: formalism, iconography, biography and autobiography. Marxism (cultural studies), semiotics, and psychoanalyses. Elements of contemporary professional art practice discussed, including writing of artists' and designers' statements, biographies, and resumes. Prerequisite: Admission to the M.F.A. program in Art and Design. Permission of department required.

Credits: 3.00

AD 59200 - Graduate Seminar In Art Or Design History

Credit Hours: 3.00. This is a graduate seminar that focuses on a particular theme, period, or movement in the history of art or design. Permission from department required.

Learning Outcomes: 1. Analyze and discuss scholarly readings related to the history of art and design. 2. Analyze primary sources, artifacts, images, and other such materials related to the theme of the term. 3. Conduct original primary and scholarly research on a topic related to the seminar and present that research in written, visual, or oral forms. 4. Understand the social, cultural, and/or political context of art and design history. Credits: 3.00

Research Methods Course (3 credits)

AD 55000 - Research Methods In Art And Design

Credit Hours: 3.00. An intensive course in research methods to assist students in developing a topic for directed study. Introduction to various research tools; exercises exploring issues of style, content, and organization; research methods and how they pertain to art and design. Permission of department required.

Learning Outcomes: 1. Identify and develop effective research skills and methods as they apply to individual thesis projects. 2. Analyze and critique existing scholarship. 3. Design an effective thesis statement, devise a research plan and begin conducting research. 4. Practice critical writing skills through peer review of section drafts. Credits: 3.00

Graduate Critique Course (0-3 credits)

AD 61400 - Graduate Installation And Critique

Credit Hours: 3.00. A seminar for all graduate students in the studio arts incorporating the process of installation art to facilitate the exchange of ideas and professional criticism.

Credits: 3.00

Electives (9-12 credits)

Directed Project Research (9 credits)

AD 55800 - Directed Project Research In Studio Arts

Credit Hours: 1.00 to 3.00. Initial M.F.A. project research and production in studio arts. Permission of instructor required.

Learning Outcomes: 1. Varies due to nature of

the course. Credits: 1.00 to 3.00

AD 56800 - Directed Project Research In Design

Credit Hours: 1.00 to 3.00. Initial M.F.A. project research and production in design. Permission of instructor required.

Learning Outcomes: 1. Varies due to nature of the course. Credits: 1.00 to 3.00

AD 65800 - MFA Project Research In Studio Arts

Credit Hours: 1.00 to 6.00. Intensive M.F.A. project production and thesis research in studio arts. Prerequisite: Three credit hours of AD 55800 with a minimum B- grade. Permission of instructor required.

Credits: 1.00 to 6.00

AD 66800 - MFA Project Research In Design

Credit Hours: 1.00 to 6.00. Intensive M.F.A. project production and thesis research in design. Prerequisite: Three credit hours of AD 56800 with a minimum B- grade. Permission of instructor required.

Credits: 1.00 to 12.00

Thesis Research (6 credits)

AD 69800 - Research MA Or MFA Thesis

Credit Hours: 1.00 to 18.00. Research MA Thesis. Permission of instructor required.

Credits: 1.00 to 18.00

MFA Exhibition (3 credits)

AD 69700 - MFA Graduate Exhibition

Credit Hours: 3.00. Completion of M.F.A. thesis, oral defense, gallery installation of M.F.A. exhibition, public presentation, and documentation of exhibition. Prerequisite: Admission to the M.F.A. program in Art and Design. Concurrent Prerequisite: Must complete 12 credit hours of AD 65800 or AD 66800 during the same or prior session. Only open to M.F.A. graduate students in Art and Design. Permission of instructor required.

Credits: 3.00

GPA Requirements

Artificial Intelligence and Machine Learning, MSAI (OL)

About the Program

Program Requirements

Required Courses (27 credits)

Core Courses (10 credits)

SCLA 52200 - Artificial Intelligence Policy, Governance, And Ethics

Credit Hours: 3.00. This course provides students with a strong grounding in the policy, ethical, and legal regulatory dimensions and environment that shape the governance of AI. Students will analyze current and emerging laws, regulations, and governance strategies shaping the AI landscape across multiple jurisdictions and sectors. The course will help students gain an interdisciplinary understanding of the core ethical principles and values that guide AI.

Learning Outcomes: 1. Describe key stakeholders, institutions, and strategies involved in AI policymaking across multiple levels of government (local to global) in multiple fields and explain their roles in governing AI systems. 2. Evaluate the legal, regulatory, and other governance strategies that have been proposed or adopted by governments, firms, and civil society organizations, such as model cards, liability frameworks, standards, and impact assessments. 3. Analyze ethical and social issues related to the development and application of AI systems within multiple fields, including power, model bias, transparency, accountability, worker well-being, and privacy, as well as the translation of ethical values into technical aspects of AI governance practices within public and private, and non-profit sector organizations. 4. Synthesize, analyze, and communicate information about emerging policy issues in AI and the associated ethical and

social dimensions, identify stakeholder perspectives, and summarize proposed solutions. 5. Assess current and evolving trends, debates, and solutions in AI governance and ethics through case studies, contemporary issues, and comparative analysis. Credits: 3.00

SCLA 52100 - Societal Impacts Of Artificial Intelligence

Credit Hours: 3.00. Students in this course will draw upon knowledge from multiple fields to understand how AI is transforming social, political, and economic practices in institutions and in society. They will utilize interdisciplinary theories and methodological tools to measure and evaluate the societal impacts of AI. The utilizes a mix of case and source data and recent research in the field of AI to create opportunities for shared communication and learning among those in technical and non-technical fields that utilize artificial intelligence. Students will engage in systematic analysis of societal impact.

Learning Outcomes: 1. Describe how AI is transforming social, political, and economic institutions, practices and employment in multiple sectors, including healthcare, education, finance, communications, criminal justice and others. 2. Explain the nature of risks of AI in society and outline common strategies to manage risks. 3. Evaluate core theories used to understand AI's potential societal impact on connectedness, trust, creativity, and conflict. 4. Assess and communicate AI impacts by applying interdisciplinary tools drawing from social sciences, humanities, and STEM fields. 5. Identify the human rights implications of AI and understand potential mitigation practices. Credits: 3.00

GRAD 50200 - Interdisciplinary AI Fundamentals: Bridging Knowledge

Credit Hours: 1.00. This course provides foundational concepts for AI for those in both MSAI majors. This course covers the history of AI, the foundations of artificial reasoning and knowledge, and practical skills for communicating about AI technology, projects, and workflow. This graduate course, designed to be accessible to learners with diverse backgrounds, serves as a foundational introduction to the field of AI. Whether you come from a technical or non-technical background, this course will provide you with a solid grasp of AI concepts, principles, and their real-world applications. To be successful in this course, we encourage students to know math (e.g., algebra and calculus) and a basic understanding of programming (e.g., R, Python, or Java).

Learning Outcomes: 1. Describe the foundations of artificial reasoning, knowledge, and trace the historical development of AI. 2. Explain the basic concepts, terminologies, and applications of different AI algorithms, developing a problem-solving mindset applicable to various domains. 3. Examine the diverse range of AI applications across varied industries. 4. Explain the role human factors and social context play in the development of artificial intelligence. Credits: 1.00

GRAD 50400 - Advanced AI Fundamentals For Technical Professional

Credit Hours: 2.00. Artificial Intelligence (AI) is the driving force behind the transformation of industries, research, and technology. For students with a highly technical background, this 2-credit hour graduate course offers a deep dive into the fundamental principles, theories, and applications of AI. Specifically, this course will introduce students to the field of data mining and machine learning, which sits at the interface between statistics and computer science. Data mining and machine learning focus on developing algorithms to automatically discover patterns and learn models of large datasets. This course introduces students to the process and main techniques in data mining and machine learning, including exploratory data analysis, predictive modeling, descriptive modeling, and evaluation. To be successful in this course students should have experience with programming such as Python and R and have a background that includes calculus, linear algebra, algorithms, and probability theory.

Learning Outcomes: 1. Identify key elements of Artificial Intelligence (AI) and Machine Learning (ML) algorithms. 2. Understand how to choose AI/ML algorithms for different analysis tasks. 3. Analyze data in both an exploratory and targeted manner using AI and ML approaches. 4. Implement and apply basic AI/ML algorithms for supervised and unsupervised learning. 5. Accurately evaluate the performance of AI/ML algorithms, as well as formulate and test hypotheses. Credits: 2.00

GRAD 58900 - Master Of Science In Artificial Intelligence Capstone

Credit Hours: 3.00. The capstone course aims to provide students with an opportunity to integrate their accumulated knowledge, technical, and social skills to identify and solve a realistic or real-world artificial intelligence problem, with an emphasis on the application domain. The capstone course for the MSAI provides students with practical experience applying the collective set of skills developed through the MSAI program to complete a professional project in support of a private, public, or non-profit partner. Students, in teams, will select a target beneficiary, arrange a consultation, develop a problem statement, a project plan that will yield benefits, and a strategy for measuring the outcome of the project compared to a baseline.

Learning Outcomes: 1. Identify the public, non-profit, or business objectives in a complex problem. 2. Evaluate and define an applied problem using AI that requires practical analysis and recommendations / and analytic output to a stakeholder. 3. Design a professional-level applied project that provides meaningful input to a targeted beneficiary. 4. Evaluate the proposed solution and interpret results concerning the "business" objectives. 5. Demonstrate an understanding of translational communication skills by communicating technical information to both technical and non-technical audiences. Credits: 3.00

Major Courses (8 credits)

Required Major Course (2 credits)

GRAD 50400 - Advanced AI Fundamentals For Technical Professional

Credit Hours: 2.00. Artificial Intelligence (AI) is the driving force behind the transformation of industries, research, and technology. For students with a highly technical background, this 2-credit hour graduate course offers a deep dive into the fundamental principles, theories, and applications of AI. Specifically, this course will introduce students to the field of data mining and machine learning, which sits at the interface between statistics and computer science. Data mining and machine learning focus on developing algorithms to automatically discover patterns and learn models of large datasets. This course introduces students to the process and main techniques in data mining and machine learning, including exploratory data analysis, predictive modeling, descriptive modeling, and evaluation. To be successful in this course students should have experience with programming such as Python and R and have a background that includes calculus, linear algebra, algorithms, and probability theory.

Learning Outcomes: 1. Identify key elements of Artificial Intelligence (AI) and Machine Learning (ML) algorithms. 2. Understand how to choose AI/ML algorithms for different analysis tasks. 3. Analyze data in both an exploratory and targeted manner using AI and ML approaches. 4. Implement and apply basic AI/ML algorithms for supervised and unsupervised learning. 5. Accurately evaluate the performance of AI/ML algorithms, as well as formulate and test hypotheses. Credits: 2.00

Artificial Intelligence/Machine Learning Courses (2-6 credits)

CNIT 58100 - Workshop In Computer Technology

Credit Hours: 0.00 to 8.00. Advanced study of technical and professional topics. Emphasis is on new developments relating to technical, operational, and training aspects of industry and technology education.

Credits: 0.00 to 8.00

ECE 57000 - Artificial Intelligence

Credit Hours: 3.00. Introduction to the basic concepts and various approaches of artificial intelligence. The first part of the course deals with heuristic search and shows how problems involving search can be solved more efficiently by the use of heuristics and how, in some cases, it is possible to discover heuristics automatically. The next part of the course presents ways to represent knowledge about the world and how to reason logically with that knowledge. The third part of the course introduces the student to advanced topics of AI drawn from machine learning, natural language understanding, computer vision, and reasoning under uncertainty. The emphasis of this part is to illustrate that representation and search are fundamental issues in all aspects of artificial intelligence.

Credits: 3.00

ECE 59500 - Selected Topics In Electrical Engineering

Credit Hours: 1.00 to 3.00. Formal classroom or individualized

instruction on topics of current interest. Permission of instructor required.

Credits: 1.00 to 3.00

ECE 69500 - Advanced Topics In Electrical And Computer Engineering

Credit Hours: 1.00 to 3.00. Formal classroom or individualized instruction on advanced topics of current interest. Permission of instructor required.

Credits: 1.00 to 3.00

MGMT 59000 - Directed Readings In Management

Credit Hours: 1.00 to 4.00 (West Lafayette, North Central) 2.00 to 4.00 (Calumet). Supervised reading and reports in various subjects. Open only to a limited number of seniors and graduate students. Permission of instructor required.

Credits: 1.00 to 4.00

ME 59700 - Advanced Mechanical Engineering Projects I

Credit Hours: 0.00 to 6.00. Projects or special topics of contemporary importance or of special interest that are outside the scope of the standard graduate curriculum can be studied under the Mechanical Engineering Projects course. Interested students should seek a faculty advisor by meeting with individual faculty members who work in their area of special interest and prepare a brief description of the work to be undertaken in cooperation with their advisor. Permission of instructor required.

Credits: 0.00 to 6.00

ME 69700 - Advanced Mechanical Engineering Projects II

Credit Hours: 1.00 to 6.00. Projects or special topics of contemporary importance or of special interest that are outside the scope of the standard graduate curriculum can be studied under the Mechanical Engineering Projects course. Interested students should seek a faculty advisor by meeting with individual faculty members who work in their area of special interest and prepare a brief description of the work to be undertaken in cooperation with their advisor. Prerequisite: Doctoral student standing. Permission of instructor required.

Credits: 1.00 to 6.00

ECON 57600 - Statistical & Machine Learning

Credit Hours: 2.00 or 3.00. This is an introductory course in statistical and machine learning. It will cover fundamental concepts and essential tools that are critical in understanding cutting-edge machine learning techniques. Students will develop skills in applying a wide
variety of modeling and prediction methods. Topics include linear regression, classification, regularization and shrinkage methods, tree-based methods, and support vector machines. An integral part of this course is the extensive use of the open source statistical software R. Students will gain hands-on experience in analyzing datasets commonly used in business and economics.

Learning Outcomes: 1. Develop skills in applying a wide variety of modeling and prediction methods. Topics include linear regression, classification, regularization and shrinkage methods, tree-based methods, and support vector machines. An integral part of this course is the extensive use of the open source statistical software R. 2. Gain hands-on experience in analyzing datasets commonly used in business and economics. Credits: 2.00 or 3.00

ECE 50024 - Machine Learning

Credit Hours: 3.00. An introductory course to machine learning, with a focus on supervised learning using linear models. The course will have four parts: (1) mathematical background on linear algebra, probability, and optimization. (2) classification methods including Bayesian decision, linear regression, logistic, regression,
and support vector machine. (3) robustness of classifier and adversarial examples. (4) learning theory on the feasibility of learning, VC dimension, complexity analysis, bias-variance analysis. Suitable for senior undergraduates and graduates with a background in probability, linear algebra, and programming.

Learning Outcomes: 1. Apply basic linear algebra, probability, and optimization tools to solve machine learning problems. 2. Understand the principles of supervised learning methodologies, and can comment on their advantages and limitations. 3. Explain the trade-os in model complexity, sample complexity, bias, variance, and generalization error in the learning theory. 4. Implement, debug, and execute basic machine learning algorithms on computers. Credits: 3.00

CS 57800 - Statistical Machine Learning

Credit Hours: 3.00. This introductory course will cover many concepts, models, and algorithms in machine learning. Topics include classical supervised learning (e.g., regression and classification), unsupervised learning (e.g., principle component

analysis and K-means), and recent development in the machine learning field such as variational Bayes, expectation propagation, and Gaussian processes. While this course will give students the basic ideas and intuition behind modern machine learning methods, the underlying theme in the course is probabilistic inference.

Learning Outcomes: 1. Learn the theory and key algorithms used in machine learning. 2. Get hands-on machine learning experience by implementing several algorithms, applying them to datasets and analyzing their performance. 3. Understand how to use machine learning methods to their research projects, formulate the learning tasks and match them with appropriate solutions. Credits: 3.00

ECON 57800 - Statistical & Machine Learning II

Credit Hours: 2.00. This is a second course in machine learning. After studying the fundamental concepts and essential machine learning tools in Machine Learning I, this follow-up course will go over a range of more advanced topics and learning methods. Topics include support vector machines, deep learning and neural networks, principal components analysis and other unsupervised learning methods. As in the first course, we will be using the statistical software R and its packages extensively to implement various learning methods.

Learning Outcomes: 1. Explain how common learning methods are implemented. 2. Train a range of deep learning models. 3. Perform dimension reduction techniques to summarize high-dimensional data in an efficient manner. 4. Select appropriate models and learning methods for a particular application. Credits: 2.00

Data Mining Courses (1-6 credits)

CS 57300 - Data Mining

Credit Hours: 3.00. (CSCI 57300) Data Mining has emerged at the confluence of artificial intelligence, statistics, and databases as a technique for automatically discovering summary knowledge in large datasets. This course introduces students to the process and main techniques in data mining, including classification, clustering, and pattern mining approaches. Data mining systems and applications are also covered, along with selected topics in current research. Offered in alternate years.

Learning Outcomes: 1. Learn Data mining techniques. 2. Learn how to summarize large data sets. 3. Learn current research topics. Credits: 3.00

MA 59800 - Topics In Mathematics

Credit Hours: 1.00 to 5.00. Supervised reading courses as well as dual-level special topics courses are given under this number. Permission of instructor required.

Credits: 1.00 to 5.00

ECE 59500 - Selected Topics In Electrical Engineering

Credit Hours: 1.00 to 3.00. Formal classroom or individualized instruction on topics of current interest. Permission of instructor required.

Credits: 1.00 to 3.00

ECE 69500 - Advanced Topics In Electrical And Computer Engineering

Credit Hours: 1.00 to 3.00. Formal classroom or individualized instruction on advanced topics of current interest. Permission of instructor required.

Credits: 1.00 to 3.00

CS 50023 - Data Engineering I

Credit Hours: 1.00. The course introduces students to the fundamentals of Data Engineering with a focus on tools and computational techniques to gather, construct, manipulate, summarize, and visualize data sets as a means to extract knowledge from the underlying data. Python and Python libraries are used. Completion of the course will allow learners to perform basic data analysis on data sets. Experience in Python Programming and Linear Algebra is required. The course also prepares learners for additional instruction in the courses Data Engineering II and Foundations of Decision Making.

Learning Outcomes: 1. Identify key file types (TXT, CSV, HTML) and their characteristics. Using Python, read data in these formats. 2. Create and execute Python scripts to parse, select, transform, summarize, and visualize data. 3. Explain how to identify and fill in missing values in data values. 4. Create informative visualizations from given data and recognize the key qualities of good visualizations. 5. Apply Pandas functions to

slice, dice, and summarize datasets. 6. Apply the process of sampling data and sample probabilistically. 7. Demonstrate how to transform and construct features (e.g., standardization, distances). 8. Compute summary statistics from data (e.g., covariance, correlation). 9. Explain how to solve simple data analysis problems. Credits: 1.00

CS 50024 - Data Engineering II

Credit Hours: 1.00. This course introduces students to the fundamentals of database management systems (DBMS) from a user's perspective. The principles of modeling an enterprise using Entity-Relationship diagrams and transforming the model into a relational or NoSQL database are illustrated through a range of examples. The SQL language is used to create, query, aggregate, and update a relational database. NOSQL databases and the related data models (column, graph, and document-based) are introduced. Experience in Python Programming is required.

Learning Outcomes: 1. Carry out database design steps from conceptual to logical to physical design. 2. Use SQL commands to define the structure of a relational database, populate, update and delete data in the database, retrieve data having specified characteristics, and specify access control. 3. Explain the differences, advantages, and disadvantages of relational and NOSQL databases. 4. Describe features of relational databases not needed in big data applications. 5. Create a document-based, NOSQL database like mongoDB and movie data from an SQL to a NOSQL database. 6. Understand the benefits and downsides of creating index structures on query performance for relational, and NOSQL databases. 7. Explain the difference between hash indices and B-tree indices. 8. Analyze large data sets created from piecing together multiple data files through the application of SQL queries. Credits: 1.00

CS 50025 - Foundations Of Decision Making

Credit Hours: 1.00. This course provides an overview of data science methods used for data-driven discovery, extraction of knowledge, and informed decision making. The course covers fundamental computational methods and statistical techniques used to correctly reason about uncertainty, conduct hypothesis tests, infer causal relationships, and apply and evaluate predictive models. The course highlights how sampling biases can impact fairness in decision making. Throughout, students get hands-on experience on how to make correct and explainable inferences from data. Experience in Python Progamming, Probability, Statistics and Linear Algebra is required.

Learning Outcomes: 1. Support and justify claims with evidence from data and discuss how human biases can impact interpretations. 2. Recognize the basic approach to formulating statistical hypothesis tests and apply parametric hypothesis tests for both discrete and continuous data. 3. Interpret p-values and apply them effectively to support claims about data. 4. Formulate and test conjectures with controlled experiments, including A/B testing. 5. Recognize the types of errors encountered when conducting multiple hypothesis tests. 6. Use computational approaches based on randomization for hypothesis testing and uncertainty quantification. 7. Discuss ethical issues such as privacy and fairness that can be associated with automating decisions based on machine learning methods. 8. Apply the basic components of classification methods using Python libraries. 9. Evaluate the performance of learned models with learning curves and k-fold cross validation and assess significance with hypothesis tests. Credits: 1.00

ECE 50836 - Introduction To Data Mining

Credit Hours: 3.00. This course introduces fundamental techniques in data mining, i.e., the techniques that extract useful knowledge from a large amount of data. Topics include data preprocessing, exploratory data analysis, association rule mining, clustering, classification, anomaly detection, recommendation and graph analysis. Students are expected to gain the skills to formulate data mining problems, solve the problems using data mining techniques and interpret the output.

Learning Outcomes: 1. Describe and explain

the process of data mining. 2. Formulate problems in real-world applications into data mining tasks and solve the problems using data mining techniques. 3. Implement software programs that conduct data mining and evaluate the output of data mining programs. 4. Present data mining solutions to people in scientific and other disciplines. Credits: 3.00

MGMT 57100 - Data Mining

Credit Hours: 2.00. Introduces the concepts, techniques, tools, and applications of data mining. The material is approached from the perspective of a business analyst, with an emphasis on supporting tactical and strategic decisions. Includes a variety of techniques to identify nuggets of information or decision-making knowledge in bodies of data, and extracting these in such a way that they can be put to use in the area, such as decision support, prediction, forecasting, and estimation.

Credits: 2.00

CS 59000 - Topics In Computer Sciences

Credit Hours: 1.00 to 5.00. Directed study for students who wish to undertake individual reading and study on approved topics. Permission of instructor required.

Credits: 1.00 to 5.00

ILS 65100 - Introduction To Natural Language Processing

Credit Hours: 3.00. This course provides a comprehensive overview of the fundamental concepts, techniques, and applications in the field of natural language processing. Using Python programming, students will learn to implement NLP tasks from basic text processing to advanced techniques, including sentiment analysis to discern emotions from text and topic modeling to uncover latent themes within large datasets. Additionally, students will explore emerging technologies such as generative AI and Large Language Models (LLMs) and their implications for NLP. By the end of this course, students will emerge with a solid understanding of NLP principles, proficiency in Python programming for NLP tasks, and the ability to apply these skills to address diverse NLP challenges.

Learning Outcomes: 1. Describe Natural Language Processing (NLP) and its applications. 2. Apply Python programming to Natural Language Processing tasks. 3. Implement text analysis to extract information from text data. 4. Create solutions for sentiment analysis problems. 5. Build solutions for topic modeling tasks. 6. Describe generative AI and Large Language Models (LLMs) and their use cases. Credits: 3.00

Selectives (9 credits)

COM 60311 - Seminar In Crisis Communication

Credit Hours: 3.00. This graduate course will focus on how to communicate in a time of crisis in order to manage the situation and disseminate key messages to various stakeholders. Prerequisite: Graduate student in Communication and COM 60111 . Permission of department required.

Learning Outcomes: 1. Have a broad understanding of the crisis communication literature. 2. Be able to formulate solutions to crisis situations from multiple perspectives. 3. Anticipate actions and analyze stakeholders involved in crisis situations. 4. Be aware of and challenge critical assumptions in crisis situations. 5. Evaluate crisis plans. Credits: 3.00

ASM 54000 - Geographic Information System Application

Credit Hours: 3.00. Fundamentals of GIS analysis applied to environmental, agricultural, and engineering-related problems. Topics include data sources, spatial analysis; projections; creating data and metadata, and conceptualizing and solving spatial problems using GIS.

Learning Outcomes: 1. Apply fundamental geographic information system concepts for organizing, symbolizing, and visualizing spatial and temporal data. 2. Demonstrate proficiency with spatial data manipulation methods for creating and editing geodatabases, geocoding, and performing geoprocessing operations on spatial data. 3. Apply spatial analysis tools to process vector and raster data for decision-making. 4. Create models to automate GIS workflow and build custom geoprocessing tools. 5. Construct user-friendly dashboards/web apps/StoryMaps for sharing developed solutions. 6. Research publicly available GIS data and use it for the final project or demonstrate Python programming skills to

analyze publicly available data. Credits: 3.00

CNIT 55200 - Information Technology Project Management

Credit Hours: 3.00. Explores the necessary skills and knowledge to successfully initiate, plan, manage, control, and report on information technology projects. Special emphasis is placed on learning the PMBOK and its practices concerning integration management, scope management, time management, cost management, quality management, human resource management, communications management, risk management, and procurement management. Practical examples are used to demonstrate the concepts and techniques, plus hands-on experience is received by working on a case study. Permission of instructor required.

Credits: 3.00

CNIT 58100 - Workshop In Computer Technology

Credit Hours: 0.00 to 8.00. Advanced study of technical and professional topics. Emphasis is on new developments relating to technical, operational, and training aspects of industry and technology education.

Credits: 0.00 to 8.00

EDPS 53100 - Introduction To Measurement And Instrument Design

Credit Hours: 3.00. An application-oriented introduction to constructing educational and psychological tests and surveys. Class sessions include guided practice with the process of instrument development, from trait and test task domain definition, item writing and revision, and item analysis, to score interpretation and validation.

Learning Outcomes: 1. Explain fundamental concepts and terminology in educational measurement. 2. Evaluate existing measurement instruments and score uses. 3. Contribute to development of instruments for measuring educational outcomes. 4. Interpret descriptive statistics for test and test item scores. Credits: 3.00

MA 59800 - Topics In Mathematics

Credit Hours: 1.00 to 5.00. Supervised reading courses as well as dual-level special topics courses are given under this number. Permission of instructor required.

Credits: 1.00 to 5.00

ECE 56900 - Introduction To Robotic Systems

Credit Hours: 3.00. The topics to be covered include: basic components of robotic systems; selection of coordinate frames; homogeneous transformations; solutions to kinematic equations; velocity and force/torque relations; manipulator dynamics in Lagrange's formulation; digital simulation of manipulator motion; motion planning; obstacle avoidance; controller design using the computed torque method; and classical controllers for manipulators. Basic knowledge of vector-matrix manipulations required.

Credits: 3.00

ECE 59500 - Selected Topics In Electrical Engineering

Credit Hours: 1.00 to 3.00. Formal classroom or individualized instruction on topics of current interest. Permission of instructor required.

Credits: 1.00 to 3.00

OLS 58100 - Workshop In Organizational Leadership And Supervision

Credit Hours: 0.00 to 8.00. Advanced study of technical and professional topics. Emphasis is on new developments relating to technical, operational, and training aspects of industry and technology education. Course may be offered in traditional, distance, or blended format. Course format may vary, depending upon topic of course.

Credits: 0.00 to 8.00

OLS 58000 - Interpersonal Skills For Leaders

Credit Hours: 3.00. Development and improvement of interpersonal and group dynamic skills for effective leadership in organizations. Emphasis on action learning and real-world application of skills. Course may be offered in traditional, distance, or blended format. Open to all graduate students with special consideration given to senior OLS students with 3.0 GPA and School of Technology graduate students.

Credits: 3.00

OLS 57900 - Emerging World-Class Leadership Strategies

Credit Hours: 3.00. Exposes graduate students to the theoretical foundation and empirical research associated with emerging strategies and theories in the study of world-class leadership. The structure of the course is four fold: the discovery of critical leadership skills and behaviors, discovery of critical world-class leadership strategies, encouragement of self analysis, discovery of leadership strengths, and conducting research on leadership issues. Permission of instructor required.

Credits: 3.00

STAT 59800 - Topics In Statistical Methods

Credit Hours: 0.00 to 6.00 (West Lafayette, IUPUI) 1.00 to 3.00 (North Central). Directed study and reports for students who wish to undertake individual reading and study on approved topics. Permission of instructor required.

Credits: 0.00 to 6.00

MGMT 56800 - Supply Chain Analytics

Credit Hours: 2.00. There is an exponential growth in the adoption of big data technologies in every walk of life. Organizations are collecting, storing, and analyzing massive amounts of data. This data is commonly referred to as big data because of its large volume, the velocity with which it is collected and transmitted, the variety of forms it takes, and veracity of its origin and content. In order to capitalize on the opportunities presented by big data, businesses are putting in place technologies, people, and processes. Just collecting, transmitting and storing big data creates little value for an organization. For many organizations, the term big data currently represents only a data infrastructure such as the Apache Hadoop family of products. The key to delivering real value from big data is the use of analytics. Data must be analyzed and the results used by decision makers and organizational processes in order to generate value. The main objective of this course is to learn how to collect, process, store, and analyze big data. Assignments could easily be completed in Python or SQL. We assume no familiarity with Linux and will introduce you to all essential Linux commands. Students need access to a computer with a 64 bit operating system and at least 4 GB of RAM. Note: 8 GB or more of RAM is strongly recommended.

Learning Outcomes: 1. Learn a systematic set of current popular analytical methodologies, including (1) data management and exploration (database management, data visualization, etc.), (2) data analysis (statistical methods, time series analysis, etc.), (3) modeling (math models, advanced spreadsheet engineering, etc.), and (4) decision analysis (optimization, simulation, numerical analysis, etc.). 2. Use these methodologies in a large-scale supply chain simulation game and to analyze cases involving multiple supply chain functions, such as forecasting, procurement, inventory, transportation, pricing, contract, revenue management, and reverse supply chain. Credits: 2.00

ENGT 50700 - Fundamentals Of Collaborative Leadership And Agile Strategy For Engineering Technology

Credit Hours: 3.00. This course will provide students with a foundation in collaborative leadership and agile strategy. The course brings together theories and insights from a variety of disciplines including engineering, management, psychology, and social science. Increasingly manufacturing management is being called upon to apply their technical skills in collaborative environments that cut across organizational units and inter-organizational boundaries. Understanding how to design and guide collaborations and apply agile approaches for meeting strategic objectives is an important skill set and knowledge base in the 21st-century economy, defined more by open networks than the ridged hierarchies of the past.

Learning Outcomes: 1. Describe characteristics of highly effective leaders in engineering and technology-focused teams and organizations. 2. Apply tools and frameworks for highly effective leadership of engineering and technology-focused teams and organizations. 3. Analyze the potential strengths and potential of various leadership approaches and behaviors in engineering and technologically focused teams and organizations. Credits: 3.00

CNIT 58500 - Organizational Change Management For IT Projects

Credit Hours: 3.00. An exploration of the body of knowledge, skills, processes, methods, and techniques that IT project managers can use to manage the "people" side of organizational change that results from IT projects that implement new technologies, systems, services, and products into the workplace. This is sometimes called stakeholder management. The course reviews research of best practices in change management and their impact on project metrics such as schedule, budget, scope, stakeholder satisfaction. Students also learn how to identify and document the organizational and people impacts of new information technology solutions, and then develop a formal project plan to manage the organizational change. Permission of Department required.

Learning Outcomes: 1. Discuss the pros and cons in intelligent discourse, of the need for, and integration of techniques for organizational change management into information technology projects. 2. Pro-actively apply an organizational change management framework and principles to a business situation, ideally an

information technology project. 3. Discuss, in intelligent discourse, the types of disruptive organizational change and how they can be caused by information technology projects. 4. Accurately document, and communicate IT-enabled changes to existing business processes. 5. Select, defend and utilize organizational change management tools and techniques in the context of information technology projects and management. 6. For residential, thesis students, research and contribute to the organizational change management body of knowledge as it can be applied to information technology projects. Credits: 3.00

IT 57100 - Project Management In Industry And Technology

Credit Hours: 3.00. The factors influencing decisions during the initiation, implementation, and termination of industrial and manufacturing projects are examined. Students work as project teams, using project management tools to develop implementation strategies. Permission of instructor required.

Learning Outcomes: 1. Understand and learn latest tools and techniques used in projects. 2. Develop a system perspective for understanding projects. 3. Align projects with strategic objectives. 4. Develop and think analytically in order to successfully apply knowledge and technical expertise to the solution of real business problems. Credits: 3.00

ME 53900 - Introduction To Scientific Machine Learning

Credit Hours: 3.00. Introduction to the fundamentals of predictive modeling for advanced undergraduates and graduate science and engineering students that work in the intersection of data and theory.

Learning Outcomes: 1. Represent mathematically the uncertainty in the parameters of physical models. 2. Propagate parametric uncertainty through physical models to quantify the induced uncertainty in quantities of interest. 3. Calibrate the uncertain parameters of physical models using experimental data. 4. Combine multiple sources of information to enhance the predictive capabilities of models. 5. Pose and solve design optimization problems under uncertainty involving expensive simulations or experiments. 6. Improve scientific writing and data visualization skills. Credits: 3.00

SCLA 53000 - Strategic Foresight And Leadership

Credit Hours: 3.00. This course provides emerging leaders with strategic foresight tools and skills to understand and make decisions regarding long-term future operational defense-related environments. Strategic foresight is the ability to create and sustain a variety of high-quality long-term views and apply emerging insights in organizationally adaptive ways. Strategic foresight produces scenarios that are the basis for strategies and plans to help defense or industry organizations remain competitive into the foreseeable future.

Learning Outcomes: 1. Define and explain strategic foresight. 2. Distinguish the difference between a growth, fixed, and futures mindset in strategic foresight. 3. Make use of specific strategic foresight methodologies: horizon scanning, signals and drivers of change, the 2 x 2 matrix and archetype methods. 4. Make use of vision and alignment in executing a strategic foresight model. 5. Argue the importance of vision for strategic leadership. Credits: 3.00

GRAD 50600 - Big Data Tools And Technologies

Credit Hours: 3.00. This course is designed to equip students with the essential skills to handle big data effectively. It covers proficiency in big data technologies, scalable data processing techniques, and the integration of big data tools into data science workflows.

Learning Outcomes: 1. Demonstrate proficiency in big data technologies. 2. Apply scalable data processing techniques to handle large datasets. 3. Integrate big data tools into comprehensive data science workflows. 4. Demonstrate proficiency with cloud computing. Credits: 3.00

MGMT 65440 - Change Management

Credit Hours: 2.00. The purpose of this course is to provide you with essential tools and concepts you need to help create and

sustain needed change in your personal and/or professional life, in your work teams and in organizations. This course is taught in an executive style format, intended for working future managers with emphasis on knowledge application and experiential learning.

Learning Outcomes: 1. Understand how classic and contemporary change models can be used to create and sustain change in individuals, teams, and organizations. 2. Understand how micro-level barriers to change are often overlooked, and how to overcome them. 3. Learn to influence others when holding them accountable so that they choose to change. 4. Understand fundamental sources of power and how they can be appropriately used to influence others to change. 5. Understand how and when to utilize different leadership to lead change, and how to anticipate blind spots to be more influential. 6. Understand how individual differences within teams impact effectiveness and change. 7. Apply program materials to create a personal leadership development plan, and learn how to avoid regression to the status quo. Credits: 2.00

MGMT 69000 - Advanced Problems In Management

Credit Hours: 1.00 to 4.00. Advanced investigation in a specific management field at the graduate level.

Credits: 1.00 to 4.00

SCLA 50900 - Strategic Intelligence: Organizations, Technologies, Procedures, Policies

Credit hours: 3.00. The present course will examine all facets of strategic intelligence, anchoring the investigation around specific organizations and processes, from the major civilian to the major military-strategic intelligence agencies, the legislation that directs their work, and the supervisory bodies. The course will also include case studies that analyze and operationalize how intelligence agencies contribute to national security. The course aims to provide the students with a rounded and practical education in strategic intelligence, describing who is responsible for its deployment and exploitation and what its benefits are for national security.

Learning Outcomes: 1. Analyze the diplomatic, economic, informational, military, and political elements influencing national strategic intelligence. 2. Evaluate key agencies, institutions, and legislative frameworks that shape U.S. strategic intelligence collection, analysis, and dissemination. 3. Differentiate between various strategic intelligence organizations - civilian and military - and understand their unique contributions and limitations. 4. Assess how political, institutional, and cultural factors affect the development and execution of national strategic intelligence policies. 5. Formulate recommendations for improving strategic intelligence oversight, policymaking, and response mechanisms to current and emerging global threats. Credits: 3.00

OLS 58200 - Leadership and Organizational Change

Credit Hours: 3.00. Explores issues in leadership and organizational change. Included are change theories, utilizing resistance to change, contemporary approaches to change, the future workplace, and researching best practices in organizational change.

Learning Outcomes: 1. Attain an understanding of the major models of change theory. 2. Gain skills in managing change through pragmatic applications of change theories. 3. Complete a major change research project in which they investigate a change initiative, gather data, and make recommendations for successfully implementing the change. Credits: 3.00

Electives (3 credits)

Program Learning Outcomes

About the Program

Artificial Intelligence Management and Policy, MSAI (OL)

About the Program

Program Requirements

Required Courses (27 credits)

Core Courses (10 credits)

SCLA 52200 - Artificial Intelligence Policy, Governance, And Ethics

Credit Hours: 3.00. This course provides students with a strong grounding in the policy, ethical, and legal regulatory dimensions and environment that shape the governance of AI. Students will analyze current and emerging laws, regulations, and governance strategies shaping the AI landscape across multiple jurisdictions and sectors. The course will help students gain an interdisciplinary understanding of the core ethical principles and values that guide AI.

Learning Outcomes: 1. Describe key stakeholders, institutions, and strategies involved in AI policymaking across multiple levels of government (local to global) in multiple fields and explain their roles in governing AI systems. 2. Evaluate the legal, regulatory, and other governance strategies that have been proposed or adopted by governments, firms, and civil society organizations, such as model cards, liability frameworks, standards, and impact assessments. 3. Analyze ethical and social issues related to the development and application of AI systems within multiple fields, including power, model bias, transparency, accountability, worker well-being, and privacy, as well as the translation of ethical values into technical aspects of AI governance practices within public and private, and non-profit sector organizations. 4. Synthesize, analyze, and communicate information about emerging policy issues in AI and the associated ethical and social dimensions, identify stakeholder perspectives, and summarize proposed solutions. 5. Assess current and evolving trends, debates, and solutions in AI governance and ethics through case studies, contemporary issues, and comparative analysis. Credits: 3.00

SCLA 52100 - Societal Impacts Of Artificial Intelligence

Credit Hours: 3.00. Students in this course will draw upon knowledge from multiple fields to understand how AI is transforming social, political, and economic practices in institutions and in society. They will utilize interdisciplinary theories and methodological tools to measure and evaluate the societal impacts of AI. The utilizes a mix of case and source data and recent research in the field of AI to create opportunities for shared communication and learning among those in technical and non-technical fields that utilize artificial intelligence. Students will engage in systematic analysis of societal impact.

Learning Outcomes: 1. Describe how AI is transforming social, political, and economic institutions, practices and employment in multiple sectors, including healthcare, education, finance, communications, criminal justice and others. 2. Explain the nature of risks of AI in society and outline common strategies to manage risks. 3. Evaluate core theories used to understand AI's potential societal impact on connectedness, trust, creativity, and conflict. 4. Assess and communicate AI impacts by applying interdisciplinary tools drawing from social sciences, humanities, and STEM fields. 5. Identify the human rights implications of AI and understand potential mitigation practices. Credits: 3.00

GRAD 50200 - Interdisciplinary AI Fundamentals: Bridging Knowledge

Credit Hours: 1.00. This course provides foundational concepts for AI for those in both MSAI majors. This course covers the history of AI, the foundations of artificial reasoning and knowledge, and practical skills for communicating about AI technology, projects, and workflow. This graduate course, designed to be accessible to learners with diverse backgrounds, serves as a foundational introduction to the field of AI. Whether you come from a technical or non-technical background, this course will provide you with a solid grasp of AI concepts, principles, and their real-world applications. To be successful in

this course, we encourage students to know math (e.g., algebra and calculus) and a basic understanding of programming (e.g., R, Python, or Java).

Learning Outcomes: 1. Describe the foundations of artificial reasoning, knowledge, and trace the historical development of AI. 2. Explain the basic concepts, terminologies, and applications of different AI algorithms, developing a problem-solving mindset applicable to various domains. 3. Examine the diverse range of AI applications across varied industries. 4. Explain the role human factors and social context play in the development of artificial intelligence. Credits: 1.00

GRAD 50300 - AI Essentials: A Non-Technical Introduction

Credit Hours: 2.00. This course provides students on the translator track a foundation in the principles and methodologies of Artificial Intelligence (AI) to empower them to actively engage in interdisciplinary collaborations. With a focus on the essentials of AI, machine learning, and natural language processing, students will gain the knowledge and skills needed to bridge the gap between language and technology. Students will leverage AI tools and techniques to enhance translation efficiency, accuracy, and engagement in the ever-evolving digital landscape. Students will have a foundation in the methodology so they can effectively participate in interdisciplinary collaborations, serving as a valuable resource for industries where language and technology converge.

Learning Outcomes: 1. Explain the basic concepts and applications of different AI algorithms and how they apply for specific fields for application or research purposes. 2. Describe the types of data inputs and outputs used in different AI applications. 3. Define a project and apply basic AI approaches in a programming environment. 4. Communicate methods and results of an AI project to specialists and non-specialists. Credits: 2.00

GRAD 58900 - Master Of Science In Artificial Intelligence Capstone

Credit Hours: 3.00. The capstone course aims to provide students with an opportunity to integrate their accumulated knowledge, technical, and social skills to identify and solve a realistic or real-world artificial intelligence problem, with an emphasis on the application domain. The capstone course for the MSAI provides students with practical experience applying the collective set of skills developed through the MSAI program to complete a professional project in support of a private, public, or non-profit partner. Students, in teams, will select a target beneficiary, arrange a consultation, develop a problem statement, a project plan that will yield benefits, and a strategy for measuring the outcome of the project compared to a baseline.

Learning Outcomes: 1. Identify the public, non-profit, or business objectives in a complex problem. 2. Evaluate and define an applied problem using AI that requires practical analysis and recommendations / and analytic output to a stakeholder. 3. Design a professional-level applied project that provides meaningful input to a targeted beneficiary. 4. Evaluate the proposed solution and interpret results concerning the "business" objectives. 5. Demonstrate an understanding of translational communication skills by communicating technical information to both technical and non-technical audiences. Credits: 3.00

Major Courses (8 credits)

GRAD 50400 - Advanced AI Fundamentals For Technical Professional

Credit Hours: 2.00. Artificial Intelligence (AI) is the driving force behind the transformation of industries, research, and technology. For students with a highly technical background, this 2-credit hour graduate course offers a deep dive into the fundamental principles, theories, and applications of AI. Specifically, this course will introduce students to the field of data mining and machine learning, which sits at the interface between statistics and computer science. Data mining and machine learning focus on developing algorithms to automatically discover patterns and learn models of large datasets. This course introduces students to the process and main techniques in data mining and machine learning, including exploratory data analysis, predictive modeling, descriptive modeling, and evaluation. To be successful in this course students should have experience with programming such as Python and R and have a background that includes calculus, linear algebra, algorithms, and probability theory.

Learning Outcomes: 1. Identify key elements of Artificial Intelligence (AI) and Machine Learning (ML) algorithms. 2. Understand how to choose

AI/ML algorithms for different analysis tasks. 3. Analyze data in both an exploratory and targeted manner using AI and ML approaches. 4. Implement and apply basic AI/ML algorithms for supervised and unsupervised learning. 5. Accurately evaluate the performance of AI/ML algorithms, as well as formulate and test hypotheses. Credits: 2.00

GRAD 50300 - AI Essentials: A Non-Technical Introduction

Credit Hours: 2.00. This course provides students on the translator track a foundation in the principles and methodologies of Artificial Intelligence (AI) to empower them to actively engage in interdisciplinary collaborations. With a focus on the essentials of AI, machine learning, and natural language processing, students will gain the knowledge and skills needed to bridge the gap between language and technology. Students will leverage AI tools and techniques to enhance translation efficiency, accuracy, and engagement in the ever-evolving digital landscape. Students will have a foundation in the methodology so they can effectively participate in interdisciplinary collaborations, serving as a valuable resource for industries where language and technology converge.

Learning Outcomes: 1. Explain the basic concepts and applications of different AI algorithms and how they apply for specific fields for application or research purposes. 2. Describe the types of data inputs and outputs used in different AI applications. 3. Define a project and apply basic AI approaches in a programming environment. 4. Communicate methods and results of an AI project to specialists and non-specialists. Credits: 2.00

Applications of AI in Business, Non-Profit, & Public Sectors Courses

MGMT 68300 - Technology-Driven Business

Credit Hours: 2.00 to 3.00. Digital technologies such as the Internet, IoT, and AI are rapidly and fundamentally transforming today's companies and industries. They have enabled completely new ways for companies to organize work, generate innovations, make decisions, and interact with customers, suppliers, and competitors. This course is designed for students who want to deeply analyze digital transformations and, more importantly, manage technology-driven businesses. Applying information economics principles and theoretical rigor, this course studies how digital technologies affect consumer behavior, business model innovations, market design, and competitive outcomes. This course trains students to apply data analytics skills to real business problems and develop a rich understanding of the strategic value of digital transformations.

Learning Outcomes: 1. Develop analytical and quantitative skills to analyze and formulate business decisions. 2. Understand current business technologies and related knowledge to translate data into useful information for decision making. 3. Become familiar with the ethical issues that individuals face in organizations. 4. Develop effective written and oral communication skills. 5. Develop the leadership and teamwork skills to function effectively in a diverse, cross-functional environment. 6. Develop awareness of global and multicultural issues relating to business decisions. Credits: 2.00 to 3.00

MGMT 52500 - Marketing Analytics

Credit Hours: 2.00. This course introduces modern statistical methods for marketing using big data. Firms are increasingly facing vast amounts of data on their customers and the marketplace, thanks to the rapid development of information technology in the last couple of decades. The challenge is becoming more about how to turn the big data into information and insights to improve firms' marketing decisions and profitability. This course discusses marketing applications for which we may use econometric, statistical, and machine-learning methods to improve and optimize decisions. Students will use RStudio to analyze real-world data and gain hands-on experience on data manipulation, visualization, and analysis. Intro-level Statistics/econometrics (at the level of STAT 35000 or ECON 47200) and R coding experience (comfortable with manipulating data, plotting, defining functions, using for loops,

and running linear and logistic regressions in R) are required prerequisites.

Learning Outcomes: 1. Enable students to articulate analytical process and logic for selecting a particular marketing strategy/plan 2. Enable students to do (and also evaluate/critique) good marketing research in their respective careers 3. Marketing knowledge and critical thinking Credits: 2.00

POL 52601 - Technology, AI, And Ethics In Public Policy And Public Administration

Credit Hours: 3.00. Examines how emerging technologies like artificial intelligence (AI), automated decision systems, and digital platforms are being adopted in the public sector. It explores the benefits as well as ethical risks and challenges associated with implementing these technologies in areas like healthcare, education, child welfare, and criminal justice. Students will analyze governance strategies, policies, and administrative procedures to promote responsible technology use in government.

Learning Outcomes: 1. Summarize the main forms of digital technology and algorithmic practices (AI) that are being adopted in government operations and decision-making, including automated decision systems, digital public interfaces, and data integration platforms. 2. Analyze emerging trends and developments in the use of AI, automated decision systems, and data analytics in public agencies and governments, in the U.S., internationally, and at the local level. 3. Assess the benefits as well as risks and challenges associated with implementing these technologies in the public sector, including how the use of new technology is transforming interactions between government and citizens, impacting social welfare, and implicating issues of transparency, accountability, discretion, discrimination, and public trust. 4. Evaluate ethical concerns, biases, and risks to social welfare that may arise from the use of AI and automated decision systems in administering public programs and services and demonstrate the ability to examine issues from multiple stakeholder perspectives. 5. Propose governance strategies, policy solutions, and administrative procedures to ensure responsible and ethical use of AI and other emerging technologies in the public sector, such as best practices for procurement, implementation, auditing, and public engagement. Credits: 3.00

POL 52701 - Local To Global Governance Of Data, AI, And Emerging Technology

Credit Hours: 3.00. This course introduces students to the institutions and governing systems at the subnational, national, supranational, and international levels that regulate emerging technology, AI, and data. Focusing on laws, standards, and best practices, students will examine comparative case studies of regulation of big tech in differing governing environments. Students will explore how social, economic, and political factors shape differences in technology regulation across the globe.

Learning Outcomes: 1. Summarize the main policy institutions, stakeholders, and regulatory actors in subnational, national, supranational, and international settings as applied to area of emerging technology, AI, and data. 2. Analyze the current state of policy and its implementation in one or more regions or states as applied to areas of emerging technology, AI, and data. 3. Develop a proposal for best practices for managing the use of AI, data resources, or other emerging technology in a private, public, or non-profit setting. 4. Compare and contrast differences in technology regulation across the globe and explain common sources for these differences. Credits: 3.00

POL 50601 - Data, Machine Learning, And Artificial Intelligence For The Public Sector

Credit Hours: 3.00. This course examines how machine learning algorithms and tools related to artificial intelligence can be used to advance our understanding in public sector domains. Students will develop a comprehensive understanding of how to apply AI and various machine learning algorithms, focusing on practical applications and hands-on experience. It provides an overview public sector data sources and addresses ethical and privacy issues associated with this type of data.

Learning Outcomes: 1. Identify, construct, and manipulate public data ethically and appropriately for use in AI and machine learning applications. 2. Explain privacy and ethical considerations associated with the use of public sector data, including issues that arise when combining public and private sector data. 3. Demonstrate a comprehensive understanding of popular AI and machine learning algorithms, including supervised and unsupervised learning techniques. 4. Apply AI and machine learning techniques to real-world data sets, emphasizing those techniques commonly used in government, policy, and political settings. 5. Assess, interpret, and report AI and machine learning output to audiences commonly found in government, policy, and political settings. Credits: 3.00

PHRM 50000 - Artificial Intelligence And Its Use In Clinical Care

Credit Hours: 2.00. The course comprehensively covers key topics such as the mechanisms behind how AI functions, the capabilities and limitations of current technologies, and important considerations around data privacy, bias, and health equity. Ethical issues are also explored through analyses of real-world case studies. The course equips participants with a solid foundation to thoughtfully engage with, evaluate, and contribute to the ongoing integration of AI into clinical practice and beyond.

Learning Outcomes: 1. Identify various applications and settings where AI is being utilized in healthcare today and where it will migrate to in the future. 2. Describe the technical underpinnings of how AI tools are built and function. 3. Analyze the clinical and social impacts of AI for patient care including how patients are using these tools as well as various ethical and regulatory issues. 4. Synthesize a solution to clinical cases using AI tools to improve your skills in the healthcare industry. Credits: 2.00

EDCI 55201 - AI Integration In Education

Credit Hours: 3.00. This course aims to provide students with the knowledge and skills needed to understand and utilize Generative AI in education. Students will acquire fundamental coding skills and develop technical expertise in using and comprehending AI. By engaging in hands-on activities and analyzing real-world case studies, students will design and create their own AI applications using Google Teachable Machine to solve a specific problem of their choosing. Additionally, the course will examine ethical issues related to AI/GenAI, allowing students to establish guidelines for the meaningful integration of AI/GenAI in teaching and learning.

Learning Outcomes: 1. Define AI/GenAI and discuss its potential integration into education. 2. Create an innovative AI/Gen application using Google Teachable Machine. 3. Develop a learning activity using GenAI that caters to different learning preferences and needs. 4. Analyze and discuss the ethical issues surrounding the use of AI, specifically GenAI, in education from the perspectives of both learners and educators. Credits: 3.00

Data Management, Analysis, & Communication Courses

ABE 65100 - Environmental Informatics

Credit Hours: 3.00. This course will educate students in the use, manipulation and analysis of environmental data by introducing them to scripting languages (e.g. c-shell, python), data types (e.g. ASCII, binary, NetCDF), databases (e.g. XML, DBF) and data visualization software (e.g. GMT, ArcMap) as well as techniques for checking data quality, working with missing data, and handling large diverse sources of time series and spatial data. Students will manipulate, check and insert data from a variety of sources, use that data as input to distributed hydrologic model, analyze model output and learn methods for properly documenting their data use (creation of metadata) and long-term archival storage of those data. Skills learned should be applicable to most computer operating systems, but the majority of work for this class will be done within the Unix/Linux environment. Students taking this course should have experience with one or more programming languages, including but not limited to C, Fortran, Perl, Python, java, Basic, or two writing scripts or macros within programs such as MATLAB, S-Plus, R, SAS.

Learning Outcomes: 1. Demonstrate use of the scientific method to identify problems, formulate and test hypotheses, conduct experiments and analyze data, and derive conclusions. 2.

Demonstrate critical thinking by using data and reasoning to develop sound responses to complex problems. 3. Demonstrate the ability to write and speak with effectiveness while considering audience and purpose. 4. Demonstrate the ability to work effectively as part of a problem-solving team. 5. Demonstrate skills necessary for lifelong learning. 6. An ability to apply knowledge of mathematics, science, and engineering. 7. Ability to design and conduct experiments, as well as to analyze and interpret data. 8. An ability to function on multidisciplinary teams. 9. An ability to communicate effectively. 10. A recognition of the need for, and an ability to engage in life-long learning. 11. An ability to use the techniques, skills, and modern engineering tools necessary for engineering practice. Credits: 3.00

MGMT 59000 - Directed Readings In Management

Credit Hours: 1.00 to 4.00 (West Lafayette, North Central) 2.00 to 4.00 (Calumet). Supervised reading and reports in various subjects. Open only to a limited number of seniors and graduate students. Permission of instructor required.

Credits: 1.00 to 4.00

EDPS 55600 - Introduction To Quantitative Data Analysis Methods In Education I

Credit Hours: 3.00. This online course is designed to provide an overview of introductory quantitative data analysis methods in education. The course is specially designed to enhance students' quantitative reasoning and skills through discussions of issues in educational data and authentic data analysis experiences of a variety of education data. The topics to be covered in this course include data collection and description, sampling distributions, methods of quantitative data analysis often used in education research. Permission of instructor required.

Learning Outcomes: 1. Think critically about quantitative data analysis used in popular magazines, newspapers, and journal articles. 2. Apply the knowledge gained in the course to analysis his/her own data with simple quantitative methods. 3. Understand common issues in analysis and interpretation of educational/social science data. 4. Design a research study, use a statistical software package to analyze the data generated from the research study, and appropriately interpret the results and report the conclusions of the study. Credits: 3.00

EDPS 55700 - Introduction To Quantitative Data Analysis Methods In Education II

Credit Hours: 3.00. This online course is the second quantitative data analysis methods sequences within the college of education. This course is specially designed to enhance students' quantitative reasoning and skills through discussions of issues in educational data and authentic data analysis experiences of a variety of education data. The topics to be covered in this course include simple/multiple linear regression, different types of group comparison methods (including n-way ANOVA, ANCOVA, Repeated-measures ANOVA, and Mixed ANOVA). The course is specifically designed: 1) to understand how the quantitative methods covered in the course can be used appropriately to address proposed research questions in education, and 2) to interpret quantitative results meaningfully for a given context. It is expected that all students who enroll in this course have completed at least one semester of introductory statistics course (e.g. STAT 50100 or equivalent.) Permission of instructor required.

Learning Outcomes: 1. Understand the common quantitative techniques and terminology used in studies that are presented in the popular press and education related journal. 2. Use and understand the principal numeric and graphical techniques to display and summarize education and social science related data. 3. Discuss common issues in analysis and interpretation of educational/social science data. 4. Design a research study, use a statistical software package to analyze the data generated from the research study, and appropriately interpret the results and report the conclusions of the study. 5. Expand their quantitative data analysis skills by taking advanced quantitative methods courses. Credits: 3.00

ILS 59500 - Special Topics In Information And Data Science

Credit Hours: 1.00 to 4.00. Intensive study of selected topics varying from semester to semester, from the practice of information and data sciences. Topics may include data

management and organization, digital scholarship, data visualization, computer languages for data and information science, information literacy, archival literacy, and emerging trends in information and data science. Permission of the instructor is required for undergraduates.

Learning Outcomes: 1. Critically examine and apply information and data sciences to various disciplines. 2. Develop practical skills and apply them to their disciplinary research. Credits: 1.00 to 4.00

ILS 69500 - Special Topics In Information And Data Science

Credit Hours: 1.00 to 4.00. Intensive study of selected topics varying from semester to semester, from the practice of information and data sciences. Topics may include data management and organization, digital scholarship, data visualization, computer languages for data and information science, information literacy, archival literacy, and emerging trends in information and data science.

Learning Outcomes: 1. Critically examine and apply information and data sciences to various disciplines. 2. Develop practical skills and apply them to their disciplinary research. Credits: 1.00 to 4.00

CNIT 57000 - IT Data Analytics

Credit Hours: 3.00. Students learn decision strategies as well as Big Data and data analytics concepts using statistical inference, regression, predictive analytics, and data mining. Students will have "hands-on" opportunities using tools such as R to assist in these efforts. The primary mission of this course is to provide students 1) an awareness of the primary approaches, techniques, and tools used for business/data analytics in industry, 2) opportunities to see their applications in a variety of areas, and 3) practical experience in applying them to challenges of interest to the students. Of primary emphases are the roles and responsibilities of Information Technology in enabling and supporting data analytics in organizations. Upon successful completion of this course, students will be able to understand key business/data analytics concepts and apply analytics approaches, techniques, and tools for decision making purposes. Permission of instructor required.

Learning Outcomes: 1. Research and analyze key business/data analytics concepts. 2. Apply analytics approaches, techniques, and tools for decision making purposes. 3. Recognize the roles and responsibilities of Information Technology in enabling and supporting data analytics in organizations. Credits: 3.00

COM 65000 - Communication And Leadership

Credit Hours: 3.00. Communication is the essence of leadership, and this course aims to identify how communication can fuel productivity, drive consensus and push the organization to a leadership position within a market. At the same time, communication can sabotage one's success or be used as a weapon to silence voices and promote political agendas. This course aims to empower you to shape leadership throughout the organization and to know how to advise other leaders in their efforts to overcome communication challenges. Permission of department required.

Learning Outcomes: 1. Identify relevant theories and principles of organizational communication. 2. Understand how communication can increase team productivity. 3. Develop comprehensive internal and external communications plans. 4. Use data from an audit to make recommendations and decisions. 5. Construct a communications plan to achieve a leadership position in a marketplace. 6. Advise peers and colleagues as they work through their own communication challenges. 7. Identify communication strategies to communicate with executives when stakes are high. Credits: 3.00

MGMT 58600 - Python Programming

Credit Hours: 2.00 or 3.00. Because data grows exponentially and becomes complex, we need computational methods to collect, store, and analyze them in order to be successful in science, engineering, business, and other professions. Python Programming, is an introductory programming class that meets this need. You will learn how to write computer programs in Python language to solve real-world problems. This class is designed for students that want to learn to computer programming for data science. This course guides students through the basic Python programming language, from initial concepts to final data analysis using python and external packages.

Learning Outcomes: 1. Understand the basic programming concepts. 2. Understand the basic syntax and semantics of the Python language. 3. Understand the primitive data types build into Python. 4. Understand principles of data storage and manipulation. 5. Understand and use computer programming for basic interactive

web applications. 6. Able to design, write and debug simple program to handle real-world data. Credits: 2.00 or 3.00

CGT 57500 - Data Visualization Tools And Applications

Credit Hours: 3.00. This course provides hands-on experience in data visualization tools and applications. The course is designed for students with little or no background in Data Visualization. It introduces students to design principles for creating meaningful displays of quantitative and qualitative data to facilitate insight and decision-making. The goal is to introduce visualization as a tool, explore and identify which visualization tools are better suited to visualize different types of data, and understand the role visualization plays in understanding what the data represent. This course gives students an in-depth view of the various branches of visualization and the visualization tools in each area. After taking the course students will be able to evaluate data visualization tools and determine which tool to use for different types of data. This course is targeted towards students interested in using visualization in their own work and future academic courses.

Learning Outcomes: 1. Assess the visualization process. 2. Assess the applicability of various visualization tools. 3. Evaluate different techniques of visual representation. Credits: 3.00

CNIT 51000 - Data Literacy

Credit Hours: 3.00. This course examines concepts, models, and methods useful for applying data analytics in business environments. Focusing on hypothesis generation, the capturing, storage and expression of data, analysis for research and visualizations.

Learning Outcomes: 1. Apply critical thinking abilities and analytical thought. 2. Recognize diverse range of data types/storage strategies and demonstrate the ability to analyze and debate the applications of each proficiently. 3. Examine aspects of the analytical thinking process and formulate individualized opinions surrounding the approach to data analytics. 4. Analyze a set of data yielding actionable insights that can be applied to research or business. 5. Gain a wide perspective on data analytics utilizing article reviews and up to the week content. Credits: 3.00

CNIT 57500 - Data Analysis

Credit Hours: 3.00. This course will teach students how data analysis can inform decision-making. Students will develop analytical skills and focus is placed on predictive analysis to evaluate business decision. Students will develop logical reasoning and communication skills related to quantitative outputs. This course will also develop the ability to collect large datasets, organize, and combine them using Tableau software.

Learning Outcomes: 1. Recognize the pervasiveness and breadth of data collection options available in today's world. 2. Discern and defend ethical applications of how collected data can be used for marketing. 3. Discuss how to find, download, clean and combine data sets. 4. Identify and evaluate trends in data sets. 5. Build models to make predictions about future events based upon historic data. Credits: 3.00

POL 52801 - Organizational Governance Of Technology And AI

Credit Hours: 3.00. This course examines the impact of technology policy on organizations and their organizational governance strategies for AI and technology. It explores the incentives, strategies, and activities of the private and non-profit sector in governing AI, as well as the relationship between the private, public, and non-governmental sectors.

Learning Outcomes: 1. Describe and evaluate the impact of legal, regulatory, and ethical frameworks (soft laws and hard laws) on organizational governance of AI, including how legal, technological, and social factors can advance and hinder AI governance in organizations. 2. Analyze different considerations for companies using and governing AI, depending on their size and stage, industry, and jurisdiction. 3. Evaluate strategies that AI practitioners in AI governance functions of organizations have used to manage AI systems and their risks. 4. Develop and communicate strategies to advance AI governance objectives in different organizational contexts, including through policies, assessments, procurement strategies, and/or education. Credits: 3.00

Selectives (9 credits)

COM 60311 - Seminar In Crisis Communication

Credit Hours: 3.00. This graduate course will focus on how to communicate in a time of crisis in order to manage the situation and disseminate key messages to various stakeholders. Prerequisite: Graduate student in Communication and COM 60111 . Permission of department required.

Learning Outcomes: 1. Have a broad understanding of the crisis communication literature. 2. Be able to formulate solutions to crisis situations from multiple perspectives. 3. Anticipate actions and analyze stakeholders involved in crisis situations. 4. Be aware of and challenge critical assumptions in crisis situations. 5. Evaluate crisis plans. Credits: 3.00

ASM 54000 - Geographic Information System Application

Credit Hours: 3.00. Fundamentals of GIS analysis applied to environmental, agricultural, and engineering-related problems. Topics include data sources, spatial analysis; projections; creating data and metadata, and conceptualizing and solving spatial problems using GIS.

Learning Outcomes: 1. Apply fundamental geographic information system concepts for organizing, symbolizing, and visualizing spatial and temporal data. 2. Demonstrate proficiency with spatial data manipulation methods for creating and editing geodatabases, geocoding, and performing geoprocessing operations on spatial data. 3. Apply spatial analysis tools to process vector and raster data for decision-making. 4. Create models to automate GIS workflow and build custom geoprocessing tools. 5. Construct user-friendly dashboards/web apps/StoryMaps for sharing developed solutions. 6. Research publicly available GIS data and use it for the final project or demonstrate Python programming skills to analyze publicly available data. Credits: 3.00

CNIT 55200 - Information Technology Project Management

Credit Hours: 3.00. Explores the necessary skills and knowledge to successfully initiate, plan, manage, control, and report on information technology projects. Special emphasis is placed on learning the PMBOK and its practices concerning integration management, scope management, time management, cost management, quality management, human resource management, communications management, risk management, and procurement management. Practical examples are used to demonstrate the concepts and techniques, plus hands-on experience is received by working on a case study. Permission of instructor required.

Credits: 3.00

CNIT 58100 - Workshop In Computer Technology

Credit Hours: 0.00 to 8.00. Advanced study of technical and professional topics. Emphasis is on new developments relating to technical, operational, and training aspects of industry and technology education.

Credits: 0.00 to 8.00

EDPS 53100 - Introduction To Measurement And Instrument Design

Credit Hours: 3.00. An application-oriented introduction to constructing educational and psychological tests and surveys. Class sessions include guided practice with the process of instrument development, from trait and test task domain definition, item writing and revision, and item analysis, to score interpretation and validation.

Learning Outcomes: 1. Explain fundamental concepts and terminology in educational measurement. 2. Evaluate existing measurement instruments and score uses. 3. Contribute to development of instruments for measuring educational outcomes. 4. Interpret descriptive statistics for test and test item scores. Credits: 3.00

MA 59800 - Topics In Mathematics

Credit Hours: 1.00 to 5.00. Supervised reading courses as well as dual-level special topics courses are given under this number. Permission of instructor required.

Credits: 1.00 to 5.00

POL 50100 - Political Science: Methodology

Credit Hours: 3.00. Introduction to the basic techniques of statistical analysis applicable to political science data. Elementary descriptive statistics and statistical inference. Introduction to multivariate analysis. Permission of instructor required.

Credits: 3.00

ECE 56900 - Introduction To Robotic Systems

Credit Hours: 3.00. The topics to be covered include: basic components of robotic systems; selection of coordinate frames; homogeneous transformations; solutions to kinematic equations; velocity and force/torque relations; manipulator dynamics in Lagrange's formulation; digital simulation of manipulator motion; motion planning; obstacle avoidance; controller design using the computed torque method; and classical controllers for manipulators. Basic knowledge of vector-matrix manipulations required.

Credits: 3.00

ECE 59500 - Selected Topics In Electrical Engineering

Credit Hours: 1.00 to 3.00. Formal classroom or individualized instruction on topics of current interest. Permission of instructor required.

Credits: 1.00 to 3.00

OLS 58100 - Workshop In Organizational Leadership And Supervision

Credit Hours: 0.00 to 8.00. Advanced study of technical and professional topics. Emphasis is on new developments relating to technical, operational, and training aspects of industry and technology education. Course may be offered in traditional, distance, or blended format. Course format may vary, depending upon topic of course.

Credits: 0.00 to 8.00

OLS 58000 - Interpersonal Skills For Leaders

Credit Hours: 3.00. Development and improvement of interpersonal and group dynamic skills for effective leadership in organizations. Emphasis on action learning and real-world application of skills. Course may be offered in traditional, distance, or blended format. Open to all graduate students with special consideration given to senior OLS students with 3.0 GPA and School of Technology graduate students.

Credits: 3.00

STAT 59800 - Topics In Statistical Methods

Credit Hours: 0.00 to 6.00 (West Lafayette, IUPUI) 1.00 to 3.00 (North Central). Directed study and reports for students who wish to undertake individual reading and study on approved topics. Permission of instructor required.

Credits: 0.00 to 6.00

MGMT 56800 - Supply Chain Analytics

Credit Hours: 2.00. There is an exponential growth in the adoption of big data technologies in every walk of life. Organizations are collecting, storing, and analyzing massive amounts of data. This data is commonly referred to as big data because of its large volume, the velocity with which it is collected and transmitted, the variety of forms it takes, and veracity of its origin and content. In order to capitalize on the opportunities presented by big data, businesses are putting in place technologies, people, and processes. Just collecting, transmitting and storing big data creates little value for an organization. For many organizations, the term big data currently represents only a data infrastructure such as the Apache Hadoop family of products. The key to delivering real value from big data is the use of analytics. Data must be analyzed and the results used by decision makers and organizational processes in order to generate value. The main objective of this course is to learn how to collect, process, store, and analyze big data. Assignments could easily be completed in Python or SQL. We assume no familiarity with Linux and will introduce you to all essential Linux commands. Students need access to a computer with a 64 bit operating system and at least 4 GB of RAM. Note: 8 GB or more of RAM is strongly recommended.

Learning Outcomes: 1. Learn a systematic set of current popular analytical methodologies, including (1) data management and exploration (database management, data visualization, etc.), (2) data analysis (statistical methods, time series analysis, etc.), (3) modeling (math models, advanced spreadsheet engineering, etc.), and (4) decision analysis (optimization, simulation, numerical analysis, etc.). 2. Use these methodologies in a large-scale supply chain simulation game and to analyze cases involving multiple supply chain functions, such as forecasting, procurement, inventory, transportation, pricing, contract, revenue management, and reverse supply chain.

Credits: 2.00

ENGT 50700 - Fundamentals Of Collaborative Leadership And Agile Strategy For Engineering Technology

Credit Hours: 3.00. This course will provide students with a foundation in collaborative leadership and agile strategy. The course brings together theories and insights from a variety of disciplines including engineering, management, psychology, and social science. Increasingly manufacturing management is being called upon to apply their technical skills in collaborative environments that cut across organizational units and inter-organizational boundaries. Understanding how to design and

guide collaborations and apply agile approaches for meeting strategic objectives is an important skill set and knowledge base in the 21st-century economy, defined more by open networks than the ridged hierarchies of the past.

Learning Outcomes: 1. Describe characteristics of highly effective leaders in engineering and technology-focused teams and organizations. 2. Apply tools and frameworks for highly effective leadership of engineering and technology-focused teams and organizations. 3. Analyze the potential strengths and potential of various leadership approaches and behaviors in engineering and technologically focused teams and organizations. Credits: 3.00

CNIT 58500 - Organizational Change Management For IT Projects

Credit Hours: 3.00. An exploration of the body of knowledge, skills, processes, methods, and techniques that IT project managers can use to manage the "people" side of organizational change that results from IT projects that implement new technologies, systems, services, and products into the workplace. This is sometimes called stakeholder management. The course reviews research of best practices in change management and their impact on project metrics such as schedule, budget, scope, stakeholder satisfaction. Students also learn how to identify and document the organizational and people impacts of new information technology solutions, and then develop a formal project plan to manage the organizational change. Permission of Department required.

Learning Outcomes: 1. Discuss the pros and cons in intelligent discourse, of the need for, and integration of techniques for organizational change management into information technology projects. 2. Pro-actively apply an organizational change management framework and principles to a business situation, ideally an information technology project. 3. Discuss, in intelligent discourse, the types of disruptive organizational change and how they can be caused by information technology projects. 4. Accurately document, and communicate IT-enabled changes to existing business processes. 5. Select, defend and utilize organizational change management tools and techniques in the context of information technology projects and management. 6. For residential, thesis students, research and contribute to the organizational change management body of knowledge as it can be applied to information technology projects. Credits: 3.00

IT 57100 - Project Management In Industry And Technology

Credit Hours: 3.00. The factors influencing decisions during the initiation, implementation, and termination of industrial and manufacturing projects are examined. Students work as project teams, using project management tools to develop implementation strategies. Permission of instructor required.

Learning Outcomes: 1. Understand and learn latest tools and techniques used in projects. 2. Develop a system perspective for understanding projects. 3. Align projects with strategic objectives. 4. Develop and think analytically in order to successfully apply knowledge and technical expertise to the solution of real business problems. Credits: 3.00

ME 53900 - Introduction To Scientific Machine Learning

Credit Hours: 3.00. Introduction to the fundamentals of predictive modeling for advanced undergraduates and graduate science and engineering students that work in the intersection of data and theory.

Learning Outcomes: 1. Represent mathematically the uncertainty in the parameters of physical models. 2. Propagate parametric uncertainty through physical models to quantify the induced uncertainty in quantities of interest. 3. Calibrate the uncertain parameters of physical models using experimental data. 4. Combine multiple sources of information to enhance the predictive capabilities of models. 5. Pose and solve design optimization problems under uncertainty involving expensive simulations or experiments. 6. Improve scientific writing and data visualization skills. Credits: 3.00

SCLA 53000 - Strategic Foresight And Leadership

Credit Hours: 3.00. This course provides emerging leaders with strategic foresight tools and skills to understand and make decisions regarding long-term future operational defense-related environments. Strategic foresight is the ability to create and sustain a variety of high-quality long-term views and apply emerging insights in organizationally adaptive ways. Strategic foresight produces scenarios that are the basis for strategies and plans to help defense or industry organizations remain competitive into the foreseeable future.

Learning Outcomes: 1. Define and explain strategic foresight. 2. Distinguish the difference between a growth, fixed, and futures mindset in strategic foresight. 3. Make use of specific strategic foresight methodologies: horizon scanning, signals and drivers of change, the 2 x 2 matrix and archetype methods. 4. Make use of vision and alignment in executing a strategic foresight model. 5. Argue the importance of vision for strategic leadership. Credits: 3.00

POL 50601 - Data, Machine Learning, And Artificial Intelligence For The Public Sector

Credit Hours: 3.00. This course examines how machine learning algorithms and tools related to artificial intelligence can be used to advance our understanding in public sector domains. Students will develop a comprehensive understanding of how to apply AI and various machine learning algorithms, focusing on practical applications and hands-on experience. It provides an overview public sector data sources and addresses ethical and privacy issues associated with this type of data.

Learning Outcomes: 1. Identify, construct, and manipulate public data ethically and appropriately for use in AI and machine learning applications. 2. Explain privacy and ethical considerations associated with the use of public sector data, including issues that arise when combining public and private sector data. 3. Demonstrate a comprehensive understanding of popular AI and machine learning algorithms, including supervised and unsupervised learning techniques. 4. Apply AI and machine learning techniques to real-world data sets, emphasizing those techniques commonly used in government, policy, and political settings. 5. Assess, interpret, and report AI and machine learning output to audiences commonly found in government, policy, and political settings. Credits: 3.00

GRAD 50600 - Big Data Tools And Technologies

Credit Hours: 3.00. This course is designed to equip students with the essential skills to handle big data effectively. It covers proficiency in big data technologies, scalable data processing techniques, and the integration of big data tools into data science workflows.

Learning Outcomes: 1. Demonstrate proficiency in big data technologies. 2. Apply scalable data processing techniques to handle large datasets. 3. Integrate big data tools into comprehensive data science workflows. 4. Demonstrate proficiency with cloud computing. Credits: 3.00

MGMT 65440 - Change Management

Credit Hours: 2.00. The purpose of this course is to provide you with essential tools and concepts you need to help create and sustain needed change in your personal and/or professional life, in your work teams and in organizations. This course is taught in an executive style format, intended for working future managers with emphasis on knowledge application and experiential learning.

Learning Outcomes: 1. Understand how classic and contemporary change models can be used to create and sustain change in individuals, teams, and organizations. 2. Understand how micro-level barriers to change are often overlooked, and how to overcome them. 3. Learn to influence others when holding them accountable so that they choose to change. 4. Understand fundamental sources of power and how they can be appropriately used to influence others to change. 5. Understand how and when to utilize different leadership to lead change, and how to anticipate blind spots to be more influential. 6. Understand how individual differences within teams impact effectiveness and change. 7. Apply program materials to create a personal leadership development plan, and learn how to avoid regression to the status quo. Credits: 2.00

PHIL 50000 - Advanced Ethics For Technology, Engineering, And Design

Credit Hours: 3.00. This graduate seminar is designed to increase your understanding of professional and ethical responsibilities in national, international, and cross-cultural environments, helping you to anticipate, understand, and navigate issues that will likely arise in your working life. The focus of the course is on developing the ability to apply a general ethical framework to new and unique situations, including those arising from the global cultural context of modern engineering. The course covers how this ethical framework should be constituted, and provides practice in applying this framework to specific, concrete cases. Together, these components work toward your development as a better engineer and a more responsible global citizen.

Learning Outcomes: 1. Recall and describe key concepts of professional and ethical responsibilities in national, international, and cross-cultural environments. 2. Apply the general ethical framework to analyze and resolve specific, concrete cases in engineering. 3. Develop a well-researched original case study that integrates professional and ethical considerations, informed by personal experiences and future aspirations in engineering. Credits: 3.00

PHIL 50800 - Advanced Ethics Of Data Science

Credit Hours: 3.00. This graduate seminar is designed to examine the new and important ethical issues that are arising as the applications of data science permeate more and more aspects of our lives. Because we're entering uncharted territory, reasoning clearly about the ethical implications of data science isn't easy. This course provides students with the tools for doing so, including a conceptual framework for ethical reasoning in professional settings, as well as a procedure for case-study analysis that allows students to practice employing this conceptual framework. Together, these components help prepare students to be ethical professionals and responsible global citizens.

Learning Outcomes: 1. Explain the conceptual framework for ethical reasoning in professional settings as it applies to data science. 2. Analyze case studies to identify and evaluate ethical issues arising from the applications of data science. 3. Assess critically the ethical implications of data science applications and propose well-reasoned solutions. Credits: 3.00

SCLA 50900 - Strategic Intelligence: Organizations, Technologies, Procedures, Policies

Credit hours: 3.00. The present course will examine all facets of strategic intelligence, anchoring the investigation around specific organizations and processes, from the major civilian to the major military-strategic intelligence agencies, the legislation that directs their work, and the supervisory bodies. The course will also include case studies that analyze and operationalize how intelligence agencies contribute to national security. The course aims to provide the students with a rounded and practical education in strategic intelligence, describing who is responsible for its deployment and exploitation and what its benefits are for national security.

Learning Outcomes: 1. Analyze the diplomatic, economic, informational, military, and political elements influencing national strategic intelligence. 2. Evaluate key agencies, institutions, and legislative frameworks that shape U.S. strategic intelligence collection, analysis, and dissemination. 3. Differentiate between various strategic intelligence organizations - civilian and military - and understand their unique contributions and limitations. 4. Assess how political, institutional, and cultural factors affect the development and execution of national strategic intelligence policies. 5. Formulate recommendations for improving strategic intelligence oversight, policymaking, and response mechanisms to current and emerging global threats. Credits: 3.00

OLS 58200 - Leadership and Organizational Change

Credit Hours: 3.00. Explores issues in leadership and organizational change. Included are change theories, utilizing resistance to change, contemporary approaches to change, the future workplace, and researching best practices in organizational change.

Learning Outcomes: 1. Attain an understanding of the major models of change theory. 2. Gain skills in managing change through pragmatic applications of change theories. 3. Complete a major change research project in which they investigate a change initiative, gather data, and

make recommendations for successfully implementing the change. Credits: 3.00

Electives (3 credits)

Program Learning Outcomes

About the Program

Athletic Training, MSAT

About the Program

Program Requirements

Required Courses (69 credits)

HK 59000 - Special Topics In Health And Kinesiology

Credit Hours: 1.00 to 3.00. Individualized readings, topics, or projects in health and kinesiology appropriate for graduate students. Permission of instructor required.

Learning Outcomes: 1. Learning outcomes vary due to special topics nature of course. Credits: 1.00 to 3.00

HK 50000 - Introduction To Athletic Training Practice

Credit Hours: 3.00. This course covering the roles and responsibilities of an athletic trainer as well as the history, governance structure, and regulation of the athletic training profession. Instruction and practical application of taping, wrapping, bracing techniques, and protective equipment is also included. Permission of department required.

Learning Outcomes: 1. Identify and evaluate the role of the NATA, BOC, CAATE, Foundation, and state practice acts in athletic training governance and practice regulation. 2. Compare and differentiate the role of a certified athletic trainer and other professionals in the health care of patients and in the broader health care system. 3. Describe and critique safe athletic training practices (e.g. OSHA standards). 4. Evaluate the fundamental role of evidence-based practice as it relates to athletic training and its use in the clinical decision making process. 5. Explain the theoretical foundation of clinical outcomes assessment (e.g., disablement, health related quality of life) and apply common methods of outcomes assessment in athletic training clinical practice (generic, disease-specific, region-specific, and dimension-specific outcomes instruments). 6. Analyze mechanisms of injury/etiology, recognition, and treatment associated with common injuries and illnesses. 7. Develop skills in adhesive taping and acute injury management. 8. Develop skills in protective pad fabrication and implementation. 9. Develop technical skills in the appropriate management of athletic medical emergencies. 10. Have a working understanding of athletic and medical protective equipment/materials and be able to evaluate patient needs in athletic medical situations. 11. Construct a preparticipation examination as it pertain to the prevention of injuries. Credits: 3.00

HK 50600 - Evidence Based Practice In Athletic Training

Credit Hours: 2.00. Introduction to research methodology, and qualitative and quantitative data analysis as related to evidence-based practice of athletic training. The course addresses formulating clinical questions; searching, reading and appraising research; understanding levels of evidence; and citing and referencing works to become consumers of and designers of evidence. The course introduces students to the selection, application, and interpretation of basic descriptive, correlational, and interferential statistics. Permission of department required.

Learning Outcomes: 1. Understand and compare the types of research commonly undertaken by researchers within the field of athletic training. 2. Appreciate and understand the ethical considerations within the research process. 3. Conduct a review of literature on the research topic allowing the student to organize

and interpret the findings while writing of the review of literature of a paper for publication. 4. Consider the mechanics of designing the research process which allows the student to begin writing an introduction of a paper for publication. 5. Evaluate the concepts of internal and external validity of research design. 6. Weigh the importance of reliable and valid measurements in athletic training research. 7. Distinguish between experimental and non-experimental research designs and the advantages and disadvantages with each type of design. 8. Critique the typical measures utilized by athletic training researchers to report strength, proprioception and kinesthesia, balance, stability, range of motion, etc. results in athletic training research. 9. Create all the different components of the research design concluding with the writing of a methods section of a paper for publication. 10. Understand and apply basic statistical measures such as: descriptive, inferential and probability statistics. 11. Understand and apply the common applied statistical decision making techniques in athletic training research analysis of variance, repeated measures analysis of variance, and correlation analysis, etc. 12. Organize and construct the results section of the research project for both thesis chapter and manuscript formats. 13. Understand the importance of and methods associated with obtaining research funding through grant writing and other mechanisms. Credits: 2.00

HK 51500 - Emergency Medical Management In Athletic Training

Credit Hours: 4.00. This course is designed to teach management concepts and skills used by athletic trainers in emergency situations. Topics addressing prevention, recognition, and management of life-threatening and/or severe injury and illness are included. Application of skills that include the environment, CPR/AED, airway management, immobilization, bleeding control and sudden illness management are also addressed. Students will become certified in CPR/AED. Permission of department required.

Learning Outcomes: 1. Analyze typical administrative policies and procedures that govern first aid and emergency care. 2. Distinguish the different hospital trauma levels and the role of the system in the transportation decision making process. 3. Perform a primary and secondary patient assessment, as well as an assessment of the scene. 4. Obtain and interpret vital signs including pulse, respirations, blood pressure, core body temperature, and oxygen saturation. 5. Distinguish the different types of airway adjuncts and demonstrate airway management skills. 6. Evaluate the indications, application, and treatment parameters for supplemental oxygen administration for emergency situations, and be able to administer supplemental oxygen. 7. Apply proper management strategies for external hemorrhage. 8. Compare different proper positioning, immobilization and transfer techniques for a patient using a spine board. 9. Evaluate and select proper techniques for removing equipment and clothing to access an airway or evaluate an injured part. 10. Evaluate and choose techniques to immobilize injuries to the extremities. 11. Explain and demonstrate the management of medical and sudden illness such as sudden cardiac arrest, asthma, shock, diabetic emergencies, burns, anaphylaxis, and internal bleeding. 12. Recommend strategies to manage environmental emergencies. 13. Distinguish and recommend techniques for infectious control regulations including Universal Precautions. 14. Attain Basic Life Support for Healthcare Providers certification. Credits: 4.00

HK 52000 - Evaluation And Management Of The Lower Quarter

Credit Hours: 3.00. Course covering an in-depth study of the normal anatomical structures in the lower extremities, including joint structure and musculoskeletal/nervous systems. Also discussed are common risk factors and causes of injuries as

identified by contemporary epidemiological studies, common injuries to each body part, typical symptoms, and common clinical signs associated with injuries and illnesses with the physically active. A lab covering the assessment and management techniques for injuries commonly seen will be included. Permission of department required.

Learning Outcomes: 1. Identify specific anatomical structures such as bony landmarks, soft tissue and joint structures in the lower extremities. 2. Apply different methods of prevention for many injuries commonly seen in the lower extremities. 3. Differentiate common risk factors and causes of injury commonly seen in athletics and the physically active. 4. Evaluate gender differences in the musculoskeletal system and their impact on injury management for the lower extremities. 5. Consider anatomical growth and development characteristics of males and females in the following stages: preadolescent and adolescent. 6. Develop general treatment and rehabilitation protocols to use with injuries in the lower extremities. 7. Summarize the role and function of commonly used prescription and non-prescription pharmacological agents in the treatment of Injuries/illness commonly seen in the lower extremities. 8. Demonstrate through low fidelity simulation sound evaluation techniques of lower extremity. 9. Appraise the different psychomotor test characteristics validity, reliability, sensitivity, specificity, likelihood ratios, odds ratios, etc., as they relate to selection of special tests. 10. Synthesize test psychometric data to select appropriate tests and measures during assessment. 11. Formulate a clinical question and perform a literature search to answer the question.
Credits: 3.00

HK 53000 - Evaluation And Management Of The Upper Quarter

Credit Hours: 3.00. Course covering an in-depth study of the normal anatomical structures in the upper extremities, including joint structure and musculoskeletal/nervous systems. Also discussed are common risk factors and causes of injuries as identified by contemporary epidemiological studies, common injuries to each body part, typical symptoms, and common clinical signs associated with injuries and illnesses with the physically active. A lab covering the assessment and management techniques for injuries commonly seen will be included. Permission of department required.

Learning Outcomes: 1. Identify specific anatomical structures such as bony landmarks, soft tissue and joint structures in the upper extremities. 2. Apply different methods of prevention for many injuries commonly seen in the upper extremities. 3. Differentiate common risk factors and causes of injury commonly seen in athletics and the physically active. 4. Evaluate gender differences in the musculoskeletal system and their impact on injury management for the upper extremities. 5. Consider anatomical growth and development characteristics of males and females in the following stages: preadolescent and adolescent. 6. Develop general treatment and rehabilitation protocols to use with injuries in the upper extremities. 7. Summarize the role and function of commonly used prescription and non prescription pharmacological agents in the treatment of Injuries/illness commonly seen in the upper extremities. 8. Demonstrate through low fidelity simulation sound evaluation techniques of upper extremity. 9. Appraise the different psychomotor test characteristics validity, reliability, sensitivity, specificity, likelihood ratios, odds ratios, etc., as they relate to selection of special tests. 10. Synthesize test psychometric data to select appropriate tests and measures during assessment. 11. Formulate a clinical question and perform a literature search to answer the question.
Credits: 3.00

HK 54000 - Evaluation And Management Of The Spine And Head

Credit Hours: 3.00. Course covering an in-depth study of the normal anatomical structures in the spine and head, including

joint structure and musculoskeletal/nervous systems. Also discussed are common risk factors and causes of injuries as identified by contemporary epidemiological studies, common injuries to each body part, typical symptoms, and common clinical signs associated with injuries and illnesses with the physically active. A lab covering the assessment and management techniques for injuries commonly seen will be included. Permission of department required.

Learning Outcomes: 1. Identify specific anatomical structures such as bony landmarks, soft tissue and joint structures in the spine and head. 2. Apply different methods of prevention for many injuries commonly seen in the spine and head. 3. Differentiate common risk factors and causes of injury commonly seen in athletics and the physically active. 4. Evaluate gender differences in the musculoskeletal system and their impact on injury management for the spine and head. 5. Consider anatomical growth and development characteristics of males and females in the following stages: pre-adolescent and adolescent. 6. Develop general treatment and rehabilitation protocols to use with injuries in the spine and head. 7. Summarize the role and function of commonly used prescription and non-prescription pharmacological agents in the treatment of Injuries/illness commonly seen in the spine and head. 8. Demonstrate through low fidelity simulation sound evaluation techniques of lower extremity. 9. Appraise the different psychomotor test characteristics -validity, reliability, sensitivity, specificity, likelihood ratios, odds ratios, etc., as they relate to selection of special tests. 10. Synthesize test psychometric data to select appropriate tests and measures during assessment. 11. Formulate a clinical question and perform a literature search to answer the question. Credits: 3.00

HK 55000 - Evaluation And Management Of Medical Conditions

Credit Hours: 3.00. Course covering an in-depth study of the normal anatomical structures in the thorax and abdomen, including the cardiovascular, digestive, urinary, reproductive, endocrine, and lymphatic systems. Also discussed are common risk factors and causes of injuries as identified by contemporary epidemiological studies, common injuries to each body part, typical symptoms, and common clinical signs associated with injuries and illnesses with the physically active. A lab covering injury assessment techniques of common illnesses and disease most often encountered by allied healthcare professionals will be included. Permission of department required.

Learning Outcomes: 1. Identify specific anatomical structures such as bony landmarks, soft tissue and joint structures in the thorax and abdomen. 2. Apply different methods of prevention for many injuries commonly seen in the thorax and abdomen. 3. Differentiate general treatment and rehabilitation protocols to use with injuries in the thorax and abdomen. 4. Identify the role and function of commonly used prescription and non-prescription pharmacological agents in the treatment of Injuries/illness commonly seen in the thorax and abdomen. 5. Demonstrate through low fidelity simulation sound evaluation techniques of the thorax and abdomen. 6. Explain modifiable and non-modifiable risk factors pertaining to general medical conditions across the life span in the physically active and special populations. 7. Explain and identify the etiology, prevention, recognition and management of conditions leading to sudden death. 8. Explain and identify the etiology, prevention, recognition and management of general medical conditions associated with the systems of the body across the life span in the physically active and special populations. 9. Demonstrate the ability to assess and interpret findings in the evaluation of general medical conditions, using diagnostic accuracy and clinical prediction rules, associated with the systems of the body. 10. Explain the general therapeutic strategy, including drug categories for the treatment of general medical conditions. 11. Use available resources to identify indications, contraindications, precautions, and adverse

reactions of prescription and non-prescription medications. 12. Develop a clinical question, search for, assess, and synthesize evidence related to general medication conditions and pharmacology. Credits: 3.00

HK 66000 - Diagnostic Imaging In Athletic Training

Credit Hours: 1.00. This course provides students with an intensive study of radiology. Students will understand the types of diagnostic images commonly used in sports medicine, as well as basic interpretive techniques used in radiology. The course will emphasize the systematic approach for diagnostic images and interpretation of various diagnostic reports. Permission of department required. Prerequisite: HK 58000 with B- or better.

Learning Outcomes: 1. Understand the importance of imaging technology used in musculoskeletal care. 2. Evaluate the differences and capabilities of radiography, MRI, CT, bone scintigraphy, and ultrasonography. 3. Understand the importance of communicating with other healthcare providers regarding radiological studies. 4. Describe a radiological report and evaluate the findings related to a rehabilitative plan of care. 5. Use terms commonly found in diagnostic radiography, MRI, CT, bone scintigraphy, and ultrasonography. 6. Summarize the fundamental physical principles of radiography, MRI, CT, bone scintigraphy, and ultrasonography. 7. Categorize basic positions utilized for radiography. 8. Identify basic anatomy in routine radiography, MRI, CT, bone scintigraphy, and ultrasonography. 9. Compare the three types of densities usually seen on a radiograph and their significance. 10. Discuss the importance of correlating the study with the patient's history and physical exam. 11. Describe and then compare the different patterns of pathologic processes; including fractures, sprains, strains, effusions, stress reactions, DVT. 12. Differentiate the genetic anomalies commonly seen on radiographs. 13. Interpret routine radiographs and identify abnormalities. Credits: 1.00

HK 53500 - Athletic Training Interventions

Credit Hours: 3.00. This course is designed to provide the student with the foundational theory and techniques related to injury and illness intervention. Included are topics addressing tissue healing, theories of pain and pain control, concepts of kinetic chain stability and mobility, as well as principles related to the use of therapeutic medications. Students will discover how to plan and implement a comprehensive reconditioning program for injuries and conditions sustained by physically active individuals. Permission of department required.

Learning Outcomes: 1. Distinguish the role and types of clinical outcome assessments/measures utilized in clinical practice to determine patient progress. 2. Compare the phases of tissue healing and its implications on intervention design, implementation and progress. 3. Compare common pain control theories and evaluate methods to control pain. 4. Evaluate common indications and contraindications to common therapeutic interventions. 5. Compose a comprehensive rehabilitation program including: determination of therapeutic goals and objectives, selection of therapeutic modalities and exercise, methods of evaluation and documenting rehabilitation progress, and development of criteria for progression and return to activity. 6. Demonstrate and instruct therapeutic exercises and implement a rehabilitation plan. 7. Analyze local, state, and federal standards/law for the safe application of therapeutic modalities, rehabilitation equipment and medications. 8. Generalize concepts related to the administration of therapeutic administration of medication. 9. Use peer reviewed resources to examine a common condition presented to a rehabilitation professional and construct an evidence based injury rehabilitation protocol for return to competitive activities. 10. Perform a professional oral presentation using

professional communication skills. Credits: 3.00

HK 54500 - Therapeutic Modalities

Credit Hours: 3.00. Course covering the physiological effects, indications, contraindications, and precautions of contemporary therapeutic modalities. Students will design and plan therapeutic interventions. Focus will be on the application of therapeutic modalities according to evidence-based protocols. Included in this course will be the role of equipment safety and maintenance of therapeutic modalities. Permission of department required.

Learning Outcomes: 1. Explain the inflammatory response to acute and chronic injury. 2. Select the appropriate modality according to treatment goals and objectives. 3. Compare the prevailing pain control theories and associated rationale for the selection and use of therapeutic modalities for the control of acute and chronic pain. 4. Evaluate the physical properties, biophysics, set-up, indications, contraindications, and specific physiological effects associated with the application of superficial cold and heat; stimulating electrical currents; diathermy; therapeutic ultrasound; intermittent compression units; iontophoresis; traction; massage; biofeedback; and LASER. 5. Administer contemporary therapeutic modalities to a patient using clinically acceptable procedures including patient preparation, set-up, determination of dosage, and operational procedures according to established guidelines. 6. Inspect therapeutic equipment and the treatment environment. 7. Identify various standards that influence the approval, operation, inspection, maintenance and safe application of therapeutic equipment. 8. Use a systemic approach to create and answer a clinical question. 9. Summarize differences between narrative reviews, systematic reviews, and meta-analysis. 10. Search for, find, and document the best evidence to support a problem or clinical problem. 11. Develop a Critically Appraised Topic (CAT) that includes a PICO, creating a search strategy (search terms), using databases to find evidence, appraising evidence, determining levels of evidence, analyzing and synthesizing evidence, and determining a clinical bottom line. 12. Present a Critically Appraised Topic using professional communication skills. Credits: 3.00

HK 55500 - Principles Of Manual Medicine

Credit Hours: 2.00. This course will provide students with the theory, skills, and clinical application of manual medicine. The emphasis will be placed on passive and dynamic joint mobilizations, connective tissue massage, deep friction massage, lymphatic massage, myofascial release, passive range of motion exercises, muscle energy techniques, and nerve mobilization. All skills will be introduced through onsite demonstration and hands-on practice. Permission of department required.

Learning Outcomes: 1. Describe the basic theories and principles of various types of manual medicine. 2. Evaluate the patient indications and contraindications, treatment efficacy, and clinical applications of each kind of manual medicine technique. 3. Summarize and select appropriate manual medicine techniques to match injury pathophysiology. 4. Choose and apply manual medicine treatment techniques, including passive and dynamic joint mobilizations, connective tissue massage, deep friction massage, lymphatic massage, myofascial release, passive range of motion exercises, muscle energy techniques, and nerve mobilization. 5. Create a plan of care including manual medicine in preparation for exercise and recovery from exercise. 6. Compare the role of manual medicine in a multi-disciplinary approach to treatment of soft tissue injuries. Credits: 2.00

HK 56000 - Advanced Procedures In Athletic Training

Credit Hours: 2.00. This course aims to provide students with advanced psychomotor skills in athletic training, such as wound closure, orthopedic casting, orthotic fabrication, biometrics and other emerging techniques and technologies. Skill integration into practice will be considered and practice act concerns will be discussed. Permission of department required.

Learning Outcomes: 1. Recognize different types of wounds and which require advanced management, including wound closure. 2. Compare wound closure techniques to determine appropriate applications. 3. Summarize the differences between casting methods. 4. Evaluate casting techniques relative to patient indications and pathology present. 5. Explain the purpose of foot orthotics as related to the pathomechanical model. 6. Apply wound closure techniques, orthopedic castings, and fabricate orthotics in simulated patients. 7. Consider and summarize emerging technologies and practices in athletic training, such as the use of biometrics to determine use and efficacy in a clinical setting. Credits: 2.00

HK 63000 - Administration Of Athletic Training Programs

Credit Hours: 2.00. Course covering management and supervision of personnel, financial resources, as well as the preparation in planning, designing, developing, organizing, implementing, directing, and evaluating an athletic training health care program and facility. Legal concerns, risk management, insurance, and reimbursement will be discussed. Prerequisites: Completion of HK 50000 with a grade of B- or better. Permission of department required.

Learning Outcomes: 1. Summarize the components associated with professional development and regulation of athletic trainers. 2. Distinguish the roles and responsibilities of health care professionals in the field of sports medicine. 3. Compare the current initiatives, missions, objectives, and professional activities of other allied health and medical organizations and professions. 4. Analyze the major elements of the National Athletic Trainers Association (NATA) Code of Ethics against published case report. 5. Recognize the importance and complexity of the ethical and legal issues associated with medical information, authorization to participate, record keeping, and confidentiality. 6. Appraise and recommend medical and professional liability insurance policies. 7. Develop administrative policy and procedures for operation of an athletic medical facility. 8. Develop a system of records for athletes and general facility operations. 9. Develop a comprehensive pre-participation medical exam. 10. Develop a basic architectural design of an athletic medical facility that is safe and efficient. 11. Develop a budget for operation of an athletic medical facility. Credits: 2.00

HK 63500 - Injury Prevention And Health Promotion

Credit Hours: 3.00. This course emphasizes theory and strategies for behavioral change relating to healthy lifestyles and specific health conditions. Analyses of major injury problems affecting patients in the workplace, community, at home, and in activity along with basic principles of nutrition and exercise as they pertain to individual health and activity are included. Prerequisite: HK 53500 with a grade of B- or better. Permission of department required.

Learning Outcomes: 1. Develop and implement strategies to mitigate the risk for long-term health conditions across the lifespan. 2. Develop, implement, and assess the effectiveness of programs to reduce injury risk. 3. Plan and implement a comprehensive pre-participation examination process to affect health outcomes. 4. Develop, implement, and supervise comprehensive programs to maximize sport performance that are safe and specific to the clients activity. 5. Educate and make recommendations to clients/patients on fluids and nutrients to ingest prior to activity, during activity, and during recovery for a variety of activities and environmental conditions. 6. Educate clients/patients about the effects, participation consequences, and risks of misuse and abuse of alcohol, tobacco, performance-enhancing drugs/substances, and over-the-counter, prescription, and recreational drugs. Credits: 3.00

HK 64000 - Leadership In Athletic Training

Credit Hours: 2.00. This course is designed to prepare students to embark on paths of personal leadership development. The

course will examine leadership theory and research and emphasize the development of leadership and interpersonal skills. Understanding various methods of bringing about change will be provided and researched by learners, and then discussed in our time together. Students in this course will apply foundational business concepts in athletic training through self-assessment case studies and professional experiential exercises. Permission of department required. Prerequisite: HK 63000 with B- or better.

Learning Outcomes: 1. Compare key organizational behavior theories and concepts related to leadership and management. 2. Evaluate the unique of structures, processes, and interactions in health care organizations as they relate to leadership, management and policy. 3. Distinguish the different roles and specific challenges for leadership and management in health care. 4. Differentiate personal leadership orientation, styles and strengths. 5. Practice, hone, and demonstrate teamwork skills (e.g., leadership, collaboration, communication, etc.) in consulting team assignments and case analyses. 6. Develop a professional development plan for long term development as a professional. 7. Evaluate the value model to develop a business case to supply athletic training services. Credits: 2.00

HK 64500 - Psychosocial Interventions In Athletic Training

Credit Hours: 2.00. The focus of this course is on identification, referral, and treatment options for patients with organic and non-organic mental health conditions commonly seen in athletic training. The course will also address cultural competence in patient care and the role of various mental healthcare providers that comprise the mental health referral network. Permission of department required. Prerequisite: HK 535 with B- or better.

Learning Outcomes: 1. Explain the theoretical background of psychological and emotional response to injury and forced inactivity. 2. Identify and select psychosocial techniques into a patients treatment or rehabilitation program. 3. Evaluate which psychosocial techniques are appropriate for a patient in a given clinical scenario. 4. Identify at-risk individuals with psychosocial disorders and/or mental health emergencies. 5. Distinguish appropriate patients requiring referral to mental health care providers. 6. Develop a management plan for at-risk individuals. 7. Explain and demonstrate processes of effective interpersonal and cross-cultural communication. 8. Construct psychological techniques and interventions that are used to facilitate and motivate the patient for return to play. 9. Summarize the importance of Cultural Competence when providing healthcare. 10. Evaluate how psychosocial considerations affect clinical decision-making related to return to activity or participation. Credits: 2.00

HK 65000 - Seminar In Athletic Training

Credit Hours: 3.00. This course is a culminating experience in athletic training that will provide the student with a comprehensive review of athletic training foundational and specific knowledge regarding the Domains of Athletic Training. This course will help the student to prepare for athletic training practice. Permission of department required. Prerequisite: HK 53000 with B- or better.

Learning Outcomes: 1. Access, analyze, and differentiate between the essential documents of the national governing and regulatory bodies, including, but not limited to, the NATA Athletic Training Educational Competencies, BOC Standards of Professional Practice, the NATA Code of Ethics, and the BOC Role Delineation Study/Practice Analysis. 2. Produce a self-assessment of professional competence and create a professional development plan to maintain necessary credentials and promote life-long learning. 3. Summarize the tasks required for entry-level proficiency of athletic trainers within the five domains of the BOC Role Delineation Study/Practice Analysis. 4. Evaluate the recommendations found in the NATA Position Statements, Official Statements, and Consensus Statements against current practice patterns. 5. Appraise current trends at the state, district and national level in athletic training

involving clinical practice and education. Credits: 3.00

HK 54100 - Athletic Training Practicum I

Credit Hours: 2.00. Fieldwork experiences designed to integrate acquired knowledge and skills through live or scenario-based applications. Students will gain clinical experiences under the direct supervision of an athletic training preceptor either on or off campus. Emphasis will be placed on professional and ethical conduct, patient-centered care, interprofessional collaborative practice, evidence-based practice, quality improvement, and healthcare informatics. Permission of department required.

Learning Outcomes: 1. Demonstrate active listening skills and a positive attitude when receiving constructive feedback on performance. 2. Identify own strengths and weaknesses in professional behavior. 3. Modify behavior based on self-evaluation and feedback from others. 4. Demonstrate active listening, neutral body language, and sensitivity to difference in age, gender, and culture. 5. Demonstrate flexibility and timely completion of tasks. 6. Write legibly, using correct grammar, terminology, and spelling. 7. Arrive punctually and dresses appropriately for clinic activities. 8. Practice in a safe manner that minimizes risk to patient, self, and others. 9. Demonstrate professional behavior at all times. 10. Practice in a manner consistent with established legal and professional standards and ethical guidelines. 11. Communicate in ways that are congruent with situational needs. 12. Adapt delivery of athletic training services with consideration for patients' differences, values, preferences, and needs. 13. Participate in self-assessment to improve clinical and professional performance. 14. Apply current knowledge, theory, clinical judgement, and the patient's values and perspective in patient management. 15. Demonstrate the patient's need for further examination or consultation by an athletic trainer or referral to another health care professional. 16. Fit and apply prophylactic protective equipment to a patient, such as shoulder pads, helmet, custom orthoplast splints, etc. in accordance with established manufacturers' guidelines to prevent injury. 17. Fit and apply standard protective equipment to a patient, such as crutches, cane, pneumatic walking boot, ankle braces, etc. in accordance with established manufacturers' guidelines following an injury. 18. Apply upper and lower extremity taping and wrapping procedures consistent with biomechanical principles and appropriate for prophylactic treatment or in accordance with stage of healing. 19. Demonstrate the ability to evaluate a patient with an emergency injury or condition. Credits: 2.00

HK 54200 - Athletic Training Practicum II

Credit Hours: 2.00. Fieldwork experiences designed to integrate acquired knowledge and skills through live or scenario-based applications. Students will gain clinical experiences under the direct supervision of an athletic training preceptor either on or off campus. Emphasis will be placed on professional and ethical conduct, patient-centered care, interprofessional collaborative practice, evidence-based practice, quality improvement, and healthcare informatics. Permission of department required.

Learning Outcomes: 1. Demonstrate active listening skills and a positive attitude when receiving constructive feedback on performance. 2. Identify own strengths and weaknesses in professional behavior. 3. Modify behavior based on self-evaluation and feedback from others. 4. Demonstrate active listening, neutral body language, and sensitivity to difference in age, gender, and culture. 5. Demonstrate flexibility and timely completion of tasks. 6. Write legibly, using correct grammar, terminology, and spelling. 7. Arrive punctually and dresses appropriately for clinic activities. 8. Practice in a safe manner that minimizes risk to patient, self, and others. 9. Demonstrate

professional behavior at all times. 10. Practice in a manner consistent with established legal and professional standards and ethical guidelines. 11. Communicate in ways that are congruent with situational needs. 12. Adapt delivery of athletic training services with consideration for patients' differences, values, preferences, and needs. 13. Participate in self-assessment to improve clinical and professional performance. 14. Apply current knowledge, theory, clinical judgement, and the patient's values and perspective in patient management. 15. Demonstrate the patient's need for further examination or consultation by an athletic trainer or referral to another health care professional. 16. Perform an athletic training examination using evidence-based tests and measures. 17. Evaluate data from the patient examination to make clinical judgements. 18. Determine a diagnosis and prognosis that guides future patient management 19. Educate others using relevant and effective teaching methods. 20. Produce quality documentation in a timely manner to support the delivery of athletic training services. 21. Fit and apply prophylactic protective equipment to a patient, such as shoulder pads, helmet, custom orthoplast splints, etc. in accordance with established manufacturers' guidelines to prevent injury. 22. Fit and apply standard protective equipment to a patient, such as crutches, cane, pneumatic walking boot, ankle braces, etc. in accordance with established manufacturers' guidelines following an injury. 23. Apply upper and lower extremity taping and wrapping procedures consistent with biomechanical principles and appropriate for prophylactic treatment or in accordance with stage of healing. 24. Demonstrate the ability to evaluate injuries and conditions of the lower quarter, including the foot and ankle, knee, and hip. 25. Produce documentation of the patient encounter consistent with contemporary athletic training practice using appropriate terminology and complying with all applicable regulatory standards. Credits: 2.00

HK 54300 - Athletic Training Practicum III

Credit Hours: 2.00. Fieldwork experiences designed to integrate acquired knowledge and skills through live or scenario-based applications. Students will gain clinical experiences under the direct supervision of an athletic training preceptor either on or off campus. Emphasis will be placed on professional and ethical conduct, patient-centered care, interprofessional collaborative practice, evidence-based practice, quality improvement, and healthcare informatics. Permission of department required.

Learning Outcomes: 1. Demonstrate active listening skills and a positive attitude when receiving constructive feedback on performance. 2. Identify own strengths and weaknesses in professional behavior. 3. Modify behavior based on self-evaluation and feedback from others. 4. Demonstrate active listening, neutral body language, and sensitivity to difference in age, gender, and culture. 5. Demonstrate flexibility and timely completion of tasks. 6. Write legibly, using correct grammar, terminology, and spelling. 7. Arrive punctually and dresses appropriately for clinic activities. 8. Practice in a safe manner that minimizes risk to patient, self, and others. 9. Demonstrate professional behavior at all times. 10. Practice in a manner consistent with established legal and professional standards and ethical guidelines. 11. Communicate in ways that are congruent with situational needs. 12. Adapt delivery of athletic training services with consideration for patients' differences, values, preferences, and needs. 13. Participate in self-assessment to improve clinical and professional performance. 14. Apply current knowledge, theory, clinical judgement, and the patient's values and perspective in patient management.

15. Demonstrate the patient's need for further examination or consultation by an athletic trainer or referral to another health care professional. 16. Perform an athletic training examination using evidence-based tests and measures. 17. Evaluate data from the patient examination to make clinical judgements. 18. Determine a diagnosis and prognosis that guides future patient management 19. Establish an athletic training plan of care that is safe, effective, patient-centered, and evidence-based. 20. Perform an athletic training intervention in a competent manner. 21. Educate others using relevant and effective teaching methods. 22. Produce quality documentation in a timely manner to support the delivery of athletic training services. 23. Collect and analyzes data from selected outcome measures in a manner that supports accurate analysis of individual and patient group outcomes. 24. Participate in the financial management of athletic training consistent with regulatory, legal, and facility guidelines. 25. Fit and apply prophylactic protective equipment to a patient, such as shoulder pads, helmet, custom orthoplast splints, etc. in accordance with established manufacturers' guidelines to prevent injury. 26. Fit and apply standard protective equipment to a patient, such as crutches, cane, pneumatic walking boot, ankle braces, etc. in accordance with established manufacturers' guidelines following an injury. 27. Apply upper and lower extremity taping and wrapping procedures consistent with biomechanical principles and appropriate for prophylactic treatment or in accordance with stage of healing. 28. Demonstrate the ability to evaluate injuries and conditions of the upper quarter and spine, including the shoulder, elbow and forearm, wrist and fingers, cervical spine, thoracic spine, lumbar spine, and pelvis. 29. Demonstrate the ability to perform a comprehensive clinical examination of common illnesses and conditions and provides the appropriate referral as indicated. 30. Produce documentation of the patient encounter consistent with contemporary athletic training practice using appropriate terminology and complying with all applicable regulatory standards. Credits: 2.00

HK 64100 - Athletic Training Practicum IV

Credit Hours: 8.00. Fieldwork experiences designed to integrate acquired knowledge and skills through live or scenario-based applications. Students will gain clinical experiences under the direct supervision of an athletic training preceptor either on or off campus. Emphasis will be placed on professional and ethical conduct, patient-centered care, interprofessional collaborative practice, evidence-based practice, quality improvement, and healthcare informatics. Permission of department required. Prerequisite: HK 54300.

Learning Outcomes: 1. Demonstrate active listening skills and a positive attitude when receiving constructive feedback on performance. 2. Identify own strengths and weaknesses in professional behavior. 3. Modify behavior based on self-evaluation and feedback from others. 4. Demonstrate active listening, neutral body language, and sensitivity to difference in age, gender, and culture. 5. Demonstrate flexibility and timely completion of tasks. 6. Write legibly, using correct grammar, terminology, and spelling. 7. Arrive punctually and dresses appropriately for clinic activities. 8. Practice in a safe manner that minimizes risk to patient, self, and others. 9. Demonstrate professional behavior at all times. 10. Practice in a manner consistent with established legal and professional standards and ethical guidelines. 11. Communicate in ways that are congruent with situational needs. 12. Adapt delivery of athletic training services with consideration for patients' differences, values, preferences, and needs. 13. Participate in self-assessment to improve clinical and professional

performance. 14. Apply current knowledge, theory, clinical judgement, and the patient's values and perspective in patient management. 15. Demonstrate the patient's need for further examination or consultation by an athletic trainer or referral to another health care professional. 16. Perform an athletic training examination using evidence-based tests and measures. 17. Evaluate data from the patient examination to make clinical judgements. 18. Determine a diagnosis and prognosis that guides future patient management 19. Establish an athletic training plan of care that is safe, effective, patient-centered, and evidence-based. 20. Perform an athletic training intervention in a competent manner. 21. Educate others using relevant and effective teaching methods. 22. Produce quality documentation in a timely manner to support the delivery of athletic training services. 23. Collect and analyze data from selected outcome measures in a manner that supports accurate analysis of individual and patient group outcomes. 24. Participate in the financial management of athletic training consistent with regulatory, legal, and facility guidelines. 25. Fit and apply prophylactic protective equipment to a patient, such as shoulder pads, helmet, custom orthoplast splints, etc. in accordance with established manufacturers' guidelines to prevent injury. 26. Fit and apply standard protective equipment to a patient, such as crutches, cane, pneumatic walking boot, ankle braces, etc. in accordance with established manufacturers' guidelines following an injury. 27. Apply upper and lower extremity taping and wrapping procedures consistent with biomechanical principles and appropriate for prophylactic treatment or in accordance with stage of healing. 28. Demonstrate the ability to screen a medical record(s) or an individual or group of individuals to allow for safe physical activity and make appropriate recommendation and/or referrals as necessary. 29. Demonstrate the ability to evaluate injuries and conditions of the lower quarter, including the foot and ankle, knee, and hip. 30. Demonstrate the ability to evaluate injuries and conditions of the upper quarter and spine, including the shoulder, elbow and forearm, wrist and fingers, cervical spine, thoracic spine, lumbar spine, and pelvis. 31. Demonstrate the ability to perform a comprehensive clinical examination of common illnesses and conditions and provides the appropriate referral as indicated. 32. Locate community-based resources for psychosocial intervention. 33 Demonstrate appropriate communication skills and use ethnic and cultural sensitivity in communication. 34. Produce documentation of the patient encounter consistent with contemporary athletic training practice using appropriate terminology and complying with all applicable regulatory standards. Credits: 8.00

HK 64200 - Athletic Training Practicum V

Credit Hours: 6.00. Fieldwork experiences designed to integrate acquired knowledge and skills through live or scenario-based applications. Students will gain clinical experiences under the direct supervision of an athletic training preceptor either on or off campus. Emphasis will be placed on professional and ethical conduct, patient-centered care, interprofessional collaborative practice, evidence-based practice, quality improvement, and healthcare informatics. Permission of department required.

Learning Outcomes: 1. Demonstrate active listening skills and a positive attitude when receiving constructive feedback on performance. 2. Identify own strengths and weaknesses in professional behavior. 3. Modify behavior based on self-evaluation and feedback from others. 4. Demonstrate active listening, neutral body language, and sensitivity to difference in age, gender, and culture. 5.

Demonstrate flexibility and timely completion of tasks. 6. Write legibly, using correct grammar, terminology, and spelling. 7. Arrive punctually and dresses appropriately for clinic activities. 8. Practice in a safe manner that minimizes risk to patient, self, and others. 9. Demonstrate professional behavior at all times. 10. Practice in a manner consistent with established legal and professional standards and ethical guidelines. 11. Communicate in ways that are congruent with situational needs. 12. Adapt delivery of athletic training services with consideration for patients' differences, values, preferences, and needs. 13. Participate in self-assessment to improve clinical and professional performance. 14. Apply current knowledge, theory, clinical judgement, and the patient's values and perspective in patient management. 15. Demonstrate the patient's need for further examination or consultation by an athletic trainer or referral to another health care professional. 16. Perform an athletic training examination using evidence-based tests and measures. 17. Evaluate data from the patient examination to make clinical judgements. 18. Determine a diagnosis and prognosis that guides future patient management. 19. Establish an athletic training plan of care that is safe, effective, patient-centered, and evidence-based. 20. Perform an athletic training intervention in a competent manner. 21. Educate others using relevant and effective teaching methods. 22. Produce quality documentation in a timely manner to support the delivery of athletic training services. 23. Collect and analyze data from selected outcome measures in a manner that supports accurate analysis of individual and patient group outcomes. 24. Participate in the financial management of athletic training consistent with regulatory, legal, and facility guidelines. 25. Fit and apply prophylactic protective equipment to a patient, such as shoulder pads, helmet, custom orthoplast splints, etc. in accordance with established manufacturers' guidelines to prevent injury. 26. Fit and apply standard protective equipment to a patient, such as crutches, cane, pneumatic walking boot, ankle braces, etc. in accordance with established manufacturers' guidelines following an injury. 27. Apply upper and lower extremity taping and wrapping procedures consistent with biomechanical principles and appropriate for prophylactic treatment or in accordance with stage of healing. 28. Demonstrate the ability to evaluate injuries and conditions of the lower quarter, including the foot and ankle, knee, and hip. 29. Demonstrate the ability to evaluate injuries and conditions of the upper quarter and spine, including the shoulder, elbow and forearm, wrist and fingers, cervical spine, thoracic spine, lumbar spine, and pelvis. 30. Demonstrate the ability to perform a comprehensive clinical examination of common illnesses and conditions and provides the appropriate referral as indicated. 31. Locate community-based resources for psychosocial intervention. 32. Demonstrate appropriate communication skills and use ethnic and cultural sensitivity in communication. 33. Produce documentation of the patient encounter consistent with contemporary athletic training practice using appropriate terminology and complying with all applicable regulatory standards. Credits: 6.00

HK 58300 - Patient Care Simulation In Athletic Training I

Credit Hours: 2.00. This course is designed to refine psychomotor skills and apply specific athletic training proficiencies integrating cognitive concepts and skills into progressively higher-level practical application. Skill integration will be achieved through successful completion and evaluation of patient care scenarios with emphasis placed on clinical reasoning skills of the student while making point-of-care

decisions. Permission of department required.

Learning Outcomes: 1. Evaluate a patient and then select and apply appropriate taping applications for injury reduction and prevention. 2. Select and apply protective equipment for use by active individuals participating in sport. 3. Apply specialty taping procedures in response to patient indications and treatment goals. 4. Perform a primary and secondary patient assessment for a patient in an emergency situation. 5. Obtain and evaluate vital signs including pulse, respirations, blood pressure, core body temperature, and oxygen saturation. 6. Differentiate and select from the different types of airway adjuncts to demonstrate airway management. 7. Use the indications and treatment parameters in an emergency situation to determine appropriateness of supplemental oxygen administration. 8. Administer supplemental oxygen to patients in an emergency situation. 9. Create a management plan of external hemorrhage and apply this emergent and non-emergent situations. 10. Consider and select proper immobilization and transfer techniques for a patient using a spine board. 11. Evaluate techniques for removing equipment and clothing to access an airway or evaluate an injured part and select the most appropriate for a given situation. 12. Apply corrective intervention techniques for the management of medical and sudden illness such as sudden cardiac arrest, asthma, shock, diabetic emergencies, burns, anaphylaxis, and internal bleeding. 13. Analyze patients and institute a management plan for patients in an environmental emergency. Credits: 2.00

HK 68300 - Patient Care Simulation In Athletic Training II

Credit Hours: 3.00. This course is designed to refine psychomotor skills and apply specific athletic training proficiencies integrating cognitive concepts and skills into progressively higher-level practical application. Skill integration will be achieved through successful completion and evaluation of patient care scenarios with emphasis placed on clinical reasoning skills of the student while making point-of-care decisions. Permission of department required. Prerequisite: HK 56300 with a B- or higher.

Learning Outcomes: 1. Evaluate common orthopedic conditions of the axial and appendicular skeleton, formulate a differential diagnosis, and recommend appropriate treatment strategies. 2. Evaluate patients with medical conditions involving the cardiovascular system, gastrointestinal system, dermatological system, endocrine system and determine a differential diagnosis with appropriate interventions, including potential for referral. 3. Evaluate general medical conditions and common non-orthopedic conditions of the head and face and determine a differential diagnosis with appropriate interventions, including potential for referral. 4. Screen a patients' general health and wellness, fitness, nutrition, gait, posture, and movement to address deficiencies in order to develop treatment strategies and referrals (where indicated). 5. Design an overall program to include fitness and wellness, nutrition, and general injury prevention strategies (including ergonomics). 6. Use baseline evaluation data of mobility, stability, strength, and balance to compose a therapeutic exercise program to address known deficits. 7. Select and incorporate therapeutic modalities into the rehabilitation plan of care. 8. Formulate a progressive rehabilitation plan using evidence-based interventions for common musculoskeletal injuries and conditions. 9. Instruct a patient in corrective exercise and a home exercise program. 10. Use patient and clinician oriented outcomes to make clinical decisions, including recommended interventions, activity progressions, and return to play decisions. 11. Educate and instruct a patient on general health and wellness

behaviors and in the program to address deficiencies identified on a comprehensive fitness evaluation. 12. Communicate patient care status with stakeholders involved on the healthcare team (other providers, parents, coaches, administrators). Credits: 3.00

Required Courses (69 credits)

HK 59000 - Special Topics In Health And Kinesiology

Credit Hours: 1.00 to 3.00. Individualized readings, topics, or projects in health and kinesiology appropriate for graduate students. Permission of instructor required.

Learning Outcomes: 1. Learning outcomes vary due to special topics nature of course. Credits: 1.00 to 3.00

HK 50000 - Introduction To Athletic Training Practice

Credit Hours: 3.00. This course covering the roles and responsibilities of an athletic trainer as well as the history, governance structure, and regulation of the athletic training profession. Instruction and practical application of taping, wrapping, bracing techniques, and protective equipment is also included. Permission of department required.

Learning Outcomes: 1. Identify and evaluate the role of the NATA, BOC, CAATE, Foundation, and state practice acts in athletic training governance and practice regulation. 2. Compare and differentiate the role of a certified athletic trainer and other professionals in the health care of patients and in the broader health care system. 3. Describe and critique safe athletic training practices (e.g. OSHA standards). 4. Evaluate the fundamental role of evidence-based practice as it relates to athletic training and its use in the clinical decision making process. 5. Explain the theoretical foundation of clinical outcomes assessment (e.g., disablement, health related quality of life) and apply common methods of outcomes assessment in athletic training clinical practice (generic, disease-specific, region-specific, and dimension-specific outcomes instruments). 6. Analyze mechanisms of injury/etiology, recognition, and treatment associated with common injuries and illnesses. 7. Develop skills in adhesive taping and acute injury management. 8. Develop skills in protective pad fabrication and implementation. 9. Develop technical skills in the appropriate management of athletic medical emergencies. 10. Have a working understanding of athletic and medical protective equipment/materials and be able to evaluate patient needs in athletic medical situations. 11. Construct a preparticipation examination as it pertain to the prevention of injuries. Credits: 3.00

HK 50600 - Evidence Based Practice In Athletic Training

Credit Hours: 2.00. Introduction to research methodology, and qualitative and quantitative data analysis as related to evidence-based practice of athletic training. The course addresses formulating clinical questions; searching, reading and appraising research; understanding levels of evidence; and citing and referencing works to become consumers of and designers of evidence. The course introduces students to the selection, application, and interpretation of basic descriptive, correlational, and interferential statistics. Permission of department required.

Learning Outcomes: 1. Understand and compare the types of research commonly undertaken by researchers within the field of athletic training. 2. Appreciate and understand the ethical considerations within the research process. 3. Conduct a review of literature on the research topic allowing the student to organize and interpret the findings while writing of the review of literature of a paper for publication. 4. Consider the mechanics of designing the research process which allows the student to begin writing an introduction of a paper for publication. 5. Evaluate the concepts of internal and external validity of research design. 6. Weigh the importance of reliable and valid measurements in athletic training research. 7. Distinguish between experimental and non-experimental research designs and the

advantages and disadvantages with each type of design. 8. Critique the typical measures utilized by athletic training researchers to report strength, proprioception and kinesthesia, balance, stability, range of motion, etc. results in athletic training research. 9. Create all the different components of the research design concluding with the writing of a methods section of a paper for publication. 10. Understand and apply basic statistical measures such as: descriptive, inferential and probability statistics. 11. Understand and apply the common applied statistical decision making techniques in athletic training research analysis of variance, repeated measures analysis of variance, and correlation analysis, etc. 12. Organize and construct the results section of the research project for both thesis chapter and manuscript formats. 13. Understand the importance of and methods associated with obtaining research funding through grant writing and other mechanisms. Credits: 2.00

HK 51500 - Emergency Medical Management In Athletic Training

Credit Hours: 4.00. This course is designed to teach management concepts and skills used by athletic trainers in emergency situations. Topics addressing prevention, recognition, and management of life-threatening and/or severe injury and illness are included. Application of skills that include the environment, CPR/AED, airway management, immobilization, bleeding control and sudden illness management are also addressed. Students will become certified in CPR/AED. Permission of department required.

Learning Outcomes: 1. Analyze typical administrative policies and procedures that govern first aid and emergency care. 2. Distinguish the different hospital trauma levels and the role of the system in the transportation decision making process. 3. Perform a primary and secondary patient assessment, as well as an assessment of the scene. 4. Obtain and interpret vital signs including pulse, respirations, blood pressure, core body temperature, and oxygen saturation. 5. Distinguish the different types of airway adjuncts and demonstrate airway management skills. 6. Evaluate the indications, application, and treatment parameters for supplemental oxygen administration for emergency situations, and be able to administer supplemental oxygen. 7. Apply proper management strategies for external hemorrhage. 8. Compare different proper positioning, immobilization and transfer techniques for a patient using a spine board. 9. Evaluate and select proper techniques for removing equipment and clothing to access an airway or evaluate an injured part. 10. Evaluate and choose techniques to immobilize injuries to the extremities. 11. Explain and demonstrate the management of medical and sudden illness such as sudden cardiac arrest, asthma, shock, diabetic emergencies, burns, anaphylaxis, and internal bleeding. 12. Recommend strategies to manage environmental emergencies. 13. Distinguish and recommend techniques for infectious control regulations including Universal Precautions. 14. Attain Basic Life Support for Healthcare Providers certification. Credits: 4.00

HK 52000 - Evaluation And Management Of The Lower Quarter

Credit Hours: 3.00. Course covering an in-depth study of the normal anatomical structures in the lower extremities, including joint structure and musculoskeletal/nervous systems. Also discussed are common risk factors and causes of injuries as identified by contemporary epidemiological studies, common injuries to each body part, typical symptoms, and common clinical signs associated with injuries and illnesses with the physically active. A lab covering the assessment and management techniques for injuries commonly seen will be included. Permission of department required.

Learning Outcomes: 1. Identify specific anatomical structures such as bony landmarks, soft tissue and joint structures in the lower extremities. 2. Apply different methods of prevention for many injuries commonly seen in the lower extremities. 3. Differentiate common

risk factors and causes of injury commonly seen in athletics and the physically active. 4. Evaluate gender differences in the musculoskeletal system and their impact on injury management for the lower extremities. 5. Consider anatomical growth and development characteristics of males and females in the following stages: preadolescent and adolescent. 6. Develop general treatment and rehabilitation protocols to use with injuries in the lower extremities. 7. Summarize the role and function of commonly used prescription and non-prescription pharmacological agents in the treatment of Injuries/illness commonly seen in the lower extremities. 8. Demonstrate through low fidelity simulation sound evaluation techniques of lower extremity. 9. Appraise the different psychomotor test characteristics validity, reliability, sensitivity, specificity, likelihood ratios, odds ratios, etc., as they relate to selection of special tests. 10. Synthesize test psychometric data to select appropriate tests and measures during assessment. 11. Formulate a clinical question and perform a literature search to answer the question. Credits: 3.00

HK 53000 - Evaluation And Management Of The Upper Quarter

Credit Hours: 3.00. Course covering an in-depth study of the normal anatomical structures in the upper extremities, including joint structure and musculoskeletal/nervous systems. Also discussed are common risk factors and causes of injuries as identified by contemporary epidemiological studies, common injuries to each body part, typical symptoms, and common clinical signs associated with injuries and illnesses with the physically active. A lab covering the assessment and management techniques for injuries commonly seen will be included. Permission of department required.

Learning Outcomes: 1. Identify specific anatomical structures such as bony landmarks, soft tissue and joint structures in the upper extremities. 2. Apply different methods of prevention for many injuries commonly seen in the upper extremities. 3. Differentiate common risk factors and causes of injury commonly seen in athletics and the physically active. 4. Evaluate gender differences in the musculoskeletal system and their impact on injury management for the upper extremities. 5. Consider anatomical growth and development characteristics of males and females in the following stages: preadolescent and adolescent. 6. Develop general treatment and rehabilitation protocols to use with injuries in the upper extremities. 7. Summarize the role and function of commonly used prescription and non prescription pharmacological agents in the treatment of Injuries/illness commonly seen in the upper extremities. 8. Demonstrate through low fidelity simulation sound evaluation techniques of upper extremity. 9. Appraise the different psychomotor test characteristics validity, reliability, sensitivity, specificity, likelihood ratios, odds ratios, etc., as they relate to selection of special tests. 10. Synthesize test psychometric data to select appropriate tests and measures during assessment. 11. Formulate a clinical question and perform a literature search to answer the question. Credits: 3.00

HK 54000 - Evaluation And Management Of The Spine And Head

Credit Hours: 3.00. Course covering an in-depth study of the normal anatomical structures in the spine and head, including joint structure and musculoskeletal/nervous systems. Also discussed are common risk factors and causes of injuries as identified by contemporary epidemiological studies, common injuries to each body part, typical symptoms, and common clinical signs associated with injuries and illnesses with the physically active. A lab covering the assessment and management techniques for injuries commonly seen will be included. Permission of department required.

Learning Outcomes: 1. Identify specific anatomical structures such as bony landmarks, soft tissue and joint structures in the spine and head. 2. Apply different methods of prevention

for many injuries commonly seen in the spine and head. 3. Differentiate common risk factors and causes of injury commonly seen in athletics and the physically active. 4. Evaluate gender differences in the musculoskeletal system and their impact on injury management for the spine and head. 5. Consider anatomical growth and development characteristics of males and females in the following stages: pre-adolescent and adolescent. 6. Develop general treatment and rehabilitation protocols to use with injuries in the spine and head. 7. Summarize the role and function of commonly used prescription and non-prescription pharmacological agents in the treatment of Injuries/illness commonly seen in the spine and head. 8. Demonstrate through low fidelity simulation sound evaluation techniques of lower extremity. 9. Appraise the different psychomotor test characteristics -validity, reliability, sensitivity, specificity, likelihood ratios, odds ratios, etc., as they relate to selection of special tests. 10. Synthesize test psychometric data to select appropriate tests and measures during assessment. 11. Formulate a clinical question and perform a literature search to answer the question. Credits: 3.00

HK 55000 - Evaluation And Management Of Medical Conditions

Credit Hours: 3.00. Course covering an in-depth study of the normal anatomical structures in the thorax and abdomen, including the cardiovascular, digestive, urinary, reproductive, endocrine, and lymphatic systems. Also discussed are common risk factors and causes of injuries as identified by contemporary epidemiological studies, common injuries to each body part, typical symptoms, and common clinical signs associated with injuries and illnesses with the physically active. A lab covering injury assessment techniques of common illnesses and disease most often encountered by allied healthcare professionals will be included. Permission of department required.

Learning Outcomes: 1. Identify specific anatomical structures such as bony landmarks, soft tissue and joint structures in the thorax and abdomen. 2. Apply different methods of prevention for many injuries commonly seen in the thorax and abdomen. 3. Differentiate general treatment and rehabilitation protocols to use with injuries in the thorax and abdomen. 4. Identify the role and function of commonly used prescription and non-prescription pharmacological agents in the treatment of Injuries/illness commonly seen in the thorax and abdomen. 5. Demonstrate through low fidelity simulation sound evaluation techniques of the thorax and abdomen. 6. Explain modifiable and non-modifiable risk factors pertaining to general medical conditions across the life span in the physically active and special populations. 7. Explain and identify the etiology, prevention, recognition and management of conditions leading to sudden death. 8. Explain and identify the etiology, prevention, recognition and management of general medical conditions associated with the systems of the body across the life span in the physically active and special populations. 9. Demonstrate the ability to assess and interpret findings in the evaluation of general medical conditions, using diagnostic accuracy and clinical prediction rules, associated with the systems of the body. 10. Explain the general therapeutic strategy, including drug categories for the treatment of general medical conditions. 11. Use available resources to identify indications, contraindications, precautions, and adverse reactions of prescription and non-prescription medications. 12. Develop a clinical question, search for, assess, and synthesize evidence related to general medication conditions and pharmacology. Credits: 3.00

HK 66000 - Diagnostic Imaging In Athletic Training

Credit Hours: 1.00. This course provides students with an intensive study of radiology. Students will understand the types of diagnostic images commonly used in sports medicine, as well

as basic interpretive techniques used in radiology. The course will emphasize the systematic approach for diagnostic images and interpretation of various diagnostic reports. Permission of department required. Prerequisite: HK 58000 with B- or better.

Learning Outcomes: 1. Understand the importance of imaging technology used in musculoskeletal care. 2. Evaluate the differences and capabilities of radiography, MRI, CT, bone scintigraphy, and ultrasonography. 3. Understand the importance of communicating with other healthcare providers regarding radiological studies. 4. Describe a radiological report and evaluate the findings related to a rehabilitative plan of care. 5. Use terms commonly found in diagnostic radiography, MRI, CT, bone scintigraphy, and ultrasonography. 6. Summarize the fundamental physical principles of radiography, MRI, CT, bone scintigraphy, and ultrasonography. 7. Categorize basic positions utilized for radiography. 8. Identify basic anatomy in routine radiography, MRI, CT, bone scintigraphy, and ultrasonography. 9. Compare the three types of densities usually seen on a radiograph and their significance. 10. Discuss the importance of correlating the study with the patient's history and physical exam. 11. Describe and then compare the different patterns of pathologic processes; including fractures, sprains, strains, effusions, stress reactions, DVT. 12. Differentiate the genetic anomalies commonly seen on radiographs. 13. Interpret routine radiographs and identify abnormalities. Credits: 1.00

HK 53500 - Athletic Training Interventions

Credit Hours: 3.00. This course is designed to provide the student with the foundational theory and techniques related to injury and illness intervention. Included are topics addressing tissue healing, theories of pain and pain control, concepts of kinetic chain stability and mobility, as well as principles related to the use of therapeutic medications. Students will discover how to plan and implement a comprehensive reconditioning program for injuries and conditions sustained by physically active individuals. Permission of department required.

Learning Outcomes: 1. Distinguish the role and types of clinical outcome assessments/measures utilized in clinical practice to determine patient progress. 2. Compare the phases of tissue healing and its implications on intervention design, implementation and progress. 3. Compare common pain control theories and evaluate methods to control pain. 4. Evaluate common indications and contraindications to common therapeutic interventions. 5. Compose a comprehensive rehabilitation program including: determination of therapeutic goals and objectives, selection of therapeutic modalities and exercise, methods of evaluation and documenting rehabilitation progress, and development of criteria for progression and return to activity. 6. Demonstrate and instruct therapeutic exercises and implement a rehabilitation plan. 7. Analyze local, state, and federal standards/law for the safe application of therapeutic modalities, rehabilitation equipment and medications. 8. Generalize concepts related to the administration of therapeutic administration of medication. 9. Use peer reviewed resources to examine a common condition presented to a rehabilitation professional and construct an evidence based injury rehabilitation protocol for return to competitive activities. 10. Perform a professional oral presentation using professional communication skills. Credits: 3.00

HK 54500 - Therapeutic Modalities

Credit Hours: 3.00. Course covering the physiological effects, indications, contraindications, and precautions of contemporary therapeutic modalities. Students will design and plan therapeutic interventions. Focus will be on the application of therapeutic modalities according to evidence-based protocols. Included in this course will be the role of equipment safety and maintenance of therapeutic modalities. Permission of department required.

Learning Outcomes: 1. Explain the inflammatory

response to acute and chronic injury. 2. Select the appropriate modality according to treatment goals and objectives. 3. Compare the prevailing pain control theories and associated rationale for the selection and use of therapeutic modalities for the control of acute and chronic pain. 4. Evaluate the physical properties, biophysics, set-up, indications, contraindications, and specific physiological effects associated with the application of superficial cold and heat; stimulating electrical currents; diathermy; therapeutic ultrasound; intermittent compression units; iontophoresis; traction; massage; biofeedback; and LASER. 5. Administer contemporary therapeutic modalities to a patient using clinically acceptable procedures including patient preparation, set-up, determination of dosage, and operational procedures according to established guidelines. 6. Inspect therapeutic equipment and the treatment environment. 7. Identify various standards that influence the approval, operation, inspection, maintenance and safe application of therapeutic equipment. 8. Use a systemic approach to create and answer a clinical question. 9. Summarize differences between narrative reviews, systematic reviews, and meta-analysis. 10. Search for, find, and document the best evidence to support a problem or clinical problem. 11. Develop a Critically Appraised Topic (CAT) that includes a PICO, creating a search strategy (search terms), using databases to find evidence, appraising evidence, determining levels of evidence, analyzing and synthesizing evidence, and determining a clinical bottom line. 12. Present a Critically Appraised Topic using professional communication skills. Credits: 3.00

HK 55500 - Principles Of Manual Medicine

Credit Hours: 2.00. This course will provide students with the theory, skills, and clinical application of manual medicine. The emphasis will be placed on passive and dynamic joint mobilizations, connective tissue massage, deep friction massage, lymphatic massage, myofascial release, passive range of motion exercises, muscle energy techniques, and nerve mobilization. All skills will be introduced through onsite demonstration and hands-on practice. Permission of department required.

Learning Outcomes: 1. Describe the basic theories and principles of various types of manual medicine. 2. Evaluate the patient indications and contraindications, treatment efficacy, and clinical applications of each kind of manual medicine technique. 3. Summarize and select appropriate manual medicine techniques to match injury pathophysiology. 4. Choose and apply manual medicine treatment techniques, including passive and dynamic joint mobilizations, connective tissue massage, deep friction massage, lymphatic massage, myofascial release, passive range of motion exercises, muscle energy techniques, and nerve mobilization. 5. Create a plan of care including manual medicine in preparation for exercise and recovery from exercise. 6. Compare the role of manual medicine in a multi-disciplinary approach to treatment of soft tissue injuries. Credits: 2.00

HK 56000 - Advanced Procedures In Athletic Training

Credit Hours: 2.00. This course aims to provide students with advanced psychomotor skills in athletic training, such as wound closure, orthopedic casting, orthotic fabrication, biometrics and other emerging techniques and technologies. Skill integration into practice will be considered and practice act concerns will be discussed. Permission of department required.

Learning Outcomes: 1. Recognize different types of wounds and which require advanced management, including wound closure. 2. Compare wound closure techniques to determine appropriate applications. 3. Summarize the differences between casting methods. 4. Evaluate casting techniques relative to patient indications and pathology present. 5. Explain the purpose of foot orthotics

as related to the pathomechanical model. 6. Apply wound closure techniques, orthopedic castings, and fabricate orthotics in simulated patients. 7. Consider and summarize emerging technologies and practices in athletic training, such as the use of biometrics to determine use and efficacy in a clinical setting. Credits: 2.00

HK 63000 - Administration Of Athletic Training Programs

Credit Hours: 2.00. Course covering management and supervision of personnel, financial resources, as well as the preparation in planning, designing, developing, organizing, implementing, directing, and evaluating an athletic training health care program and facility. Legal concerns, risk management, insurance, and reimbursement will be discussed. Prerequisites: Completion of HK 50000 with a grade of B- or better. Permission of department required.

Learning Outcomes: 1. Summarize the components associated with professional development and regulation of athletic trainers. 2. Distinguish the roles and responsibilities of health care professionals in the field of sports medicine. 3. Compare the current initiatives, missions, objectives, and professional activities of other allied health and medical organizations and professions. 4. Analyze the major elements of the National Athletic Trainers Association (NATA) Code of Ethics against published case report. 5. Recognize the importance and complexity of the ethical and legal issues associated with medical information, authorization to participate, record keeping, and confidentiality. 6. Appraise and recommend medical and professional liability insurance policies. 7. Develop administrative policy and procedures for operation of an athletic medical facility. 8. Develop a system of records for athletes and general facility operations. 9. Develop a comprehensive pre-participation medical exam. 10. Develop a basic architectural design of an athletic medical facility that is safe and efficient. 11. Develop a budget for operation of an athletic medical facility. Credits: 2.00

HK 63500 - Injury Prevention And Health Promotion

Credit Hours: 3.00. This course emphasizes theory and strategies for behavioral change relating to healthy lifestyles and specific health conditions. Analyses of major injury problems affecting patients in the workplace, community, at home, and in activity along with basic principles of nutrition and exercise as they pertain to individual health and activity are included. Prerequisite: HK 53500 with a grade of B- or better. Permission of department required.

Learning Outcomes: 1. Develop and implement strategies to mitigate the risk for long-term health conditions across the lifespan. 2. Develop, implement, and assess the effectiveness of programs to reduce injury risk. 3. Plan and implement a comprehensive pre-participation examination process to affect health outcomes. 4. Develop, implement, and supervise comprehensive programs to maximize sport performance that are safe and specific to the clients activity. 5. Educate and make recommendations to clients/patients on fluids and nutrients to ingest prior to activity, during activity, and during recovery for a variety of activities and environmental conditions. 6. Educate clients/patients about the effects, participation consequences, and risks of misuse and abuse of alcohol, tobacco, performance-enhancing drugs/substances, and over-the-counter, prescription, and recreational drugs. Credits: 3.00

HK 64000 - Leadership In Athletic Training

Credit Hours: 2.00. This course is designed to prepare students to embark on paths of personal leadership development. The course will examine leadership theory and research and emphasize the development of leadership and interpersonal skills. Understanding various methods of bringing about change will be provided and researched by learners, and then discussed in our time together. Students in this course will apply foundational business concepts in athletic training through self-assessment case studies and professional experiential exercises. Permission of department required. Prerequisite: HK 63000 with B- or better.

Learning Outcomes: 1. Compare key organizational behavior theories and concepts

related to leadership and management. 2. Evaluate the unique of structures, processes, and interactions in health care organizations as they relate to leadership, management and policy. 3. Distinguish the different roles and specific challenges for leadership and management in health care. 4. Differentiate personal leadership orientation, styles and strengths. 5. Practice, hone, and demonstrate teamwork skills (e.g., leadership, collaboration, communication, etc.) in consulting team assignments and case analyses. 6. Develop a professional development plan for long term development as a professional. 7. Evaluate the value model to develop a business case to supply athletic training services. Credits: 2.00

HK 64500 - Psychosocial Interventions In Athletic Training

Credit Hours: 2.00. The focus of this course is on identification, referral, and treatment options for patients with organic and non-organic mental health conditions commonly seen in athletic training. The course will also address cultural competence in patient care and the role of various mental healthcare providers that comprise the mental health referral network. Permission of department required. Prerequisite: HK 535 with B- or better.

Learning Outcomes: 1. Explain the theoretical background of psychological and emotional response to injury and forced inactivity. 2. Identify and select psychosocial techniques into a patients treatment or rehabilitation program. 3. Evaluate which psychosocial techniques are appropriate for a patient in a given clinical scenario. 4. Identify at-risk individuals with psychosocial disorders and/or mental health emergencies. 5. Distinguish appropriate patients requiring referral to mental health care providers. 6. Develop a management plan for at-risk individuals. 7. Explain and demonstrate processes of effective interpersonal and cross-cultural communication. 8. Construct psychological techniques and interventions that are used to facilitate and motivate the patient for return to play. 9. Summarize the importance of Cultural Competence when providing healthcare. 10. Evaluate how psychosocial considerations affect clinical decision-making related to return to activity or participation. Credits: 2.00

HK 65000 - Seminar In Athletic Training

Credit Hours: 3.00. This course is a culminating experience in athletic training that will provide the student with a comprehensive review of athletic training foundational and specific knowledge regarding the Domains of Athletic Training. This course will help the student to prepare for athletic training practice. Permission of department required. Prerequisite: HK 53000 with B- or better.

Learning Outcomes: 1. Access, analyze, and differentiate between the essential documents of the national governing and regulatory bodies, including, but not limited to, the NATA Athletic Training Educational Competencies, BOC Standards of Professional Practice, the NATA Code of Ethics, and the BOC Role Delineation Study/Practice Analysis. 2. Produce a self-assessment of professional competence and create a professional development plan to maintain necessary credentials and promote life-long learning. 3. Summarize the tasks required for entry-level proficiency of athletic trainers within the five domains of the BOC Role Delineation Study/Practice Analysis. 4. Evaluate the recommendations found in the NATA Position Statements, Official Statements, and Consensus Statements against current practice patterns. 5. Appraise current trends at the state, district and national level in athletic training involving clinical practice and education. Credits: 3.00

HK 54100 - Athletic Training Practicum I

Credit Hours: 2.00. Fieldwork experiences designed to integrate acquired knowledge and skills through live or scenario-based applications. Students will gain clinical experiences under the direct supervision of an athletic training preceptor either on or off campus. Emphasis will be placed on professional and ethical conduct, patient-centered care, interprofessional collaborative practice, evidence-based practice, quality

improvement, and healthcare informatics. Permission of department required.

Learning Outcomes: 1. Demonstrate active listening skills and a positive attitude when receiving constructive feedback on performance. 2. Identify own strengths and weaknesses in professional behavior. 3. Modify behavior based on self-evaluation and feedback from others. 4. Demonstrate active listening, neutral body language, and sensitivity to difference in age, gender, and culture. 5. Demonstrate flexibility and timely completion of tasks. 6. Write legibly, using correct grammar, terminology, and spelling. 7. Arrive punctually and dresses appropriately for clinic activities. 8. Practice in a safe manner that minimizes risk to patient, self, and others. 9. Demonstrate professional behavior at all times. 10. Practice in a manner consistent with established legal and professional standards and ethical guidelines. 11. Communicate in ways that are congruent with situational needs. 12. Adapt delivery of athletic training services with consideration for patients' differences, values, preferences, and needs. 13. Participate in self-assessment to improve clinical and professional performance. 14. Apply current knowledge, theory, clinical judgement, and the patient's values and perspective in patient management. 15. Demonstrate the patient's need for further examination or consultation by an athletic trainer or referral to another health care professional. 16. Fit and apply prophylactic protective equipment to a patient, such as shoulder pads, helmet, custom orthoplast splints, etc. in accordance with established manufacturers' guidelines to prevent injury. 17. Fit and apply standard protective equipment to a patient, such as crutches, cane, pneumatic walking boot, ankle braces, etc. in accordance with established manufacturers' guidelines following an injury. 18. Apply upper and lower extremity taping and wrapping procedures consistent with biomechanical principles and appropriate for prophylactic treatment or in accordance with stage of healing. 19. Demonstrate the ability to evaluate a patient with an emergency injury or condition. Credits: 2.00

HK 54200 - Athletic Training Practicum II

Credit Hours: 2.00. Fieldwork experiences designed to integrate acquired knowledge and skills through live or scenario-based applications. Students will gain clinical experiences under the direct supervision of an athletic training preceptor either on or off campus. Emphasis will be placed on professional and ethical conduct, patient-centered care, interprofessional collaborative practice, evidence-based practice, quality improvement, and healthcare informatics. Permission of department required.

Learning Outcomes: 1. Demonstrate active listening skills and a positive attitude when receiving constructive feedback on performance. 2. Identify own strengths and weaknesses in professional behavior. 3. Modify behavior based on self-evaluation and feedback from others. 4. Demonstrate active listening, neutral body language, and sensitivity to difference in age, gender, and culture. 5. Demonstrate flexibility and timely completion of tasks. 6. Write legibly, using correct grammar, terminology, and spelling. 7. Arrive punctually and dresses appropriately for clinic activities. 8. Practice in a safe manner that minimizes risk to patient, self, and others. 9. Demonstrate professional behavior at all times. 10. Practice in a manner consistent with established legal and professional standards and ethical guidelines. 11. Communicate in ways that are congruent with situational needs. 12. Adapt delivery of athletic training services with consideration for patients' differences, values, preferences, and needs. 13. Participate in self-assessment to improve clinical and professional performance. 14. Apply current knowledge,

theory, clinical judgement, and the patient's values and perspective in patient management. 15. Demonstrate the patient's need for further examination or consultation by an athletic trainer or referral to another health care professional. 16. Perform an athletic training examination using evidence-based tests and measures. 17. Evaluate data from the patient examination to make clinical judgements. 18. Determine a diagnosis and prognosis that guides future patient management 19. Educate others using relevant and effective teaching methods. 20. Produce quality documentation in a timely manner to support the delivery of athletic training services. 21. Fit and apply prophylactic protective equipment to a patient, such as shoulder pads, helmet, custom orthoplast splints, etc. in accordance with established manufacturers' guidelines to prevent injury. 22. Fit and apply standard protective equipment to a patient, such as crutches, cane, pneumatic walking boot, ankle braces, etc. in accordance with established manufacturers' guidelines following an injury. 23. Apply upper and lower extremity taping and wrapping procedures consistent with biomechanical principles and appropriate for prophylactic treatment or in accordance with stage of healing. 24. Demonstrate the ability to evaluate injuries and conditions of the lower quarter, including the foot and ankle, knee, and hip. 25. Produce documentation of the patient encounter consistent with contemporary athletic training practice using appropriate terminology and complying with all applicable regulatory standards. Credits: 2.00

HK 54300 - Athletic Training Practicum III

Credit Hours: 2.00. Fieldwork experiences designed to integrate acquired knowledge and skills through live or scenario-based applications. Students will gain clinical experiences under the direct supervision of an athletic training preceptor either on or off campus. Emphasis will be placed on professional and ethical conduct, patient-centered care, interprofessional collaborative practice, evidence-based practice, quality improvement, and healthcare informatics. Permission of department required.

Learning Outcomes: 1. Demonstrate active listening skills and a positive attitude when receiving constructive feedback on performance. 2. Identify own strengths and weaknesses in professional behavior. 3. Modify behavior based on self-evaluation and feedback from others. 4. Demonstrate active listening, neutral body language, and sensitivity to difference in age, gender, and culture. 5. Demonstrate flexibility and timely completion of tasks. 6. Write legibly, using correct grammar, terminology, and spelling. 7. Arrive punctually and dresses appropriately for clinic activities. 8. Practice in a safe manner that minimizes risk to patient, self, and others. 9. Demonstrate professional behavior at all times. 10. Practice in a manner consistent with established legal and professional standards and ethical guidelines. 11. Communicate in ways that are congruent with situational needs. 12. Adapt delivery of athletic training services with consideration for patients' differences, values, preferences, and needs. 13. Participate in self-assessment to improve clinical and professional performance. 14. Apply current knowledge, theory, clinical judgement, and the patient's values and perspective in patient management. 15. Demonstrate the patient's need for further examination or consultation by an athletic trainer or referral to another health care professional. 16. Perform an athletic training examination using evidence-based tests and measures. 17. Evaluate data from the patient examination to make clinical judgements. 18. Determine a diagnosis and prognosis that guides future patient management 19. Establish an athletic training plan of care that is safe, effective, patient-centered, and evidence-based.

20. Perform an athletic training intervention in a competent manner. 21. Educate others using relevant and effective teaching methods. 22. Produce quality documentation in a timely manner to support the delivery of athletic training services. 23. Collect and analyzes data from selected outcome measures in a manner that supports accurate analysis of individual and patient group outcomes. 24. Participate in the financial management of athletic training consistent with regulatory, legal, and facility guidelines. 25. Fit and apply prophylactic protective equipment to a patient, such as shoulder pads, helmet, custom orthoplast splints, etc. in accordance with established manufacturers' guidelines to prevent injury. 26. Fit and apply standard protective equipment to a patient, such as crutches, cane, pneumatic walking boot, ankle braces, etc. in accordance with established manufacturers' guidelines following an injury. 27. Apply upper and lower extremity taping and wrapping procedures consistent with biomechanical principles and appropriate for prophylactic treatment or in accordance with stage of healing. 28. Demonstrate the ability to evaluate injuries and conditions of the upper quarter and spine, including the shoulder, elbow and forearm, wrist and fingers, cervical spine, thoracic spine, lumbar spine, and pelvis. 29. Demonstrate the ability to perform a comprehensive clinical examination of common illnesses and conditions and provides the appropriate referral as indicated. 30. Produce documentation of the patient encounter consistent with contemporary athletic training practice using appropriate terminology and complying with all applicable regulatory standards. Credits: 2.00

HK 64100 - Athletic Training Practicum IV

Credit Hours: 8.00. Fieldwork experiences designed to integrate acquired knowledge and skills through live or scenario-based applications. Students will gain clinical experiences under the direct supervision of an athletic training preceptor either on or off campus. Emphasis will be placed on professional and ethical conduct, patient-centered care, interprofessional collaborative practice, evidence-based practice, quality improvement, and healthcare informatics. Permission of department required. Prerequisite: HK 54300.

Learning Outcomes: 1. Demonstrate active listening skills and a positive attitude when receiving constructive feedback on performance. 2. Identify own strengths and weaknesses in professional behavior. 3. Modify behavior based on self-evaluation and feedback from others. 4. Demonstrate active listening, neutral body language, and sensitivity to difference in age, gender, and culture. 5. Demonstrate flexibility and timely completion of tasks. 6. Write legibly, using correct grammar, terminology, and spelling. 7. Arrive punctually and dresses appropriately for clinic activities. 8. Practice in a safe manner that minimizes risk to patient, self, and others. 9. Demonstrate professional behavior at all times. 10. Practice in a manner consistent with established legal and professional standards and ethical guidelines. 11. Communicate in ways that are congruent with situational needs. 12. Adapt delivery of athletic training services with consideration for patients' differences, values, preferences, and needs. 13. Participate in self-assessment to improve clinical and professional performance. 14. Apply current knowledge, theory, clinical judgement, and the patient's values and perspective in patient management. 15. Demonstrate the patient's need for further examination or consultation by an athletic trainer or referral to another health care professional. 16. Perform an athletic training examination using evidence-based tests and measures. 17. Evaluate data from the patient examination to make clinical judgements. 18. Determine a diagnosis and prognosis that guides future patient management 19. Establish

an athletic training plan of care that is safe, effective, patient-centered, and evidence-based. 20. Perform an athletic training intervention in a competent manner. 21. Educate others using relevant and effective teaching methods. 22. Produce quality documentation in a timely manner to support the delivery of athletic training services. 23. Collect and analyze data from selected outcome measures in a manner that supports accurate analysis of individual and patient group outcomes. 24. Participate in the financial management of athletic training consistent with regulatory, legal, and facility guidelines. 25. Fit and apply prophylactic protective equipment to a patient, such as shoulder pads, helmet, custom orthoplast splints, etc. in accordance with established manufacturers' guidelines to prevent injury. 26. Fit and apply standard protective equipment to a patient, such as crutches, cane, pneumatic walking boot, ankle braces, etc. in accordance with established manufacturers' guidelines following an injury. 27. Apply upper and lower extremity taping and wrapping procedures consistent with biomechanical principles and appropriate for prophylactic treatment or in accordance with stage of healing. 28. Demonstrate the ability to screen a medical record(s) or an individual or group of individuals to allow for safe physical activity and make appropriate recommendation and/or referrals as necessary. 29. Demonstrate the ability to evaluate injuries and conditions of the lower quarter, including the foot and ankle, knee, and hip. 30. Demonstrate the ability to evaluate injuries and conditions of the upper quarter and spine, including the shoulder, elbow and forearm, wrist and fingers, cervical spine, thoracic spine, lumbar spine, and pelvis. 31. Demonstrate the ability to perform a comprehensive clinical examination of common illnesses and conditions and provides the appropriate referral as indicated. 32. Locate community-based resources for psychosocial intervention. 33 Demonstrate appropriate communication skills and use ethnic and cultural sensitivity in communication. 34. Produce documentation of the patient encounter consistent with contemporary athletic training practice using appropriate terminology and complying with all applicable regulatory standards. Credits: 8.00

HK 64200 - Athletic Training Practicum V

Credit Hours: 6.00. Fieldwork experiences designed to integrate acquired knowledge and skills through live or scenario-based applications. Students will gain clinical experiences under the direct supervision of an athletic training preceptor either on or off campus. Emphasis will be placed on professional and ethical conduct, patient-centered care, interprofessional collaborative practice, evidence-based practice, quality improvement, and healthcare informatics. Permission of department required.

Learning Outcomes: 1. Demonstrate active listening skills and a positive attitude when receiving constructive feedback on performance. 2. Identify own strengths and weaknesses in professional behavior. 3. Modify behavior based on self-evaluation and feedback from others. 4. Demonstrate active listening, neutral body language, and sensitivity to difference in age, gender, and culture. 5. Demonstrate flexibility and timely completion of tasks. 6. Write legibly, using correct grammar, terminology, and spelling. 7. Arrive punctually and dresses appropriately for clinic activities. 8. Practice in a safe manner that minimizes risk to patient, self, and others. 9. Demonstrate professional behavior at all times. 10. Practice in a manner consistent with established legal and professional standards and ethical guidelines. 11. Communicate in ways that are congruent with situational needs. 12. Adapt delivery of athletic training services with

consideration for patients' differences, values, preferences, and needs. 13. Participate in self-assessment to improve clinical and professional performance. 14. Apply current knowledge, theory, clinical judgement, and the patient's values and perspective in patient management. 15. Demonstrate the patient's need for further examination or consultation by an athletic trainer or referral to another health care professional. 16. Perform an athletic training examination using evidence-based tests and measures. 17. Evaluate data from the patient examination to make clinical judgements. 18. Determine a diagnosis and prognosis that guides future patient management. 19. Establish an athletic training plan of care that is safe, effective, patient-centered, and evidence-based. 20. Perform an athletic training intervention in a competent manner. 21. Educate others using relevant and effective teaching methods. 22. Produce quality documentation in a timely manner to support the delivery of athletic training services. 23. Collect and analyze data from selected outcome measures in a manner that supports accurate analysis of individual and patient group outcomes. 24. Participate in the financial management of athletic training consistent with regulatory, legal, and facility guidelines. 25. Fit and apply prophylactic protective equipment to a patient, such as shoulder pads, helmet, custom orthoplast splints, etc. in accordance with established manufacturers' guidelines to prevent injury. 26. Fit and apply standard protective equipment to a patient, such as crutches, cane, pneumatic walking boot, ankle braces, etc. in accordance with established manufacturers' guidelines following an injury. 27. Apply upper and lower extremity taping and wrapping procedures consistent with biomechanical principles and appropriate for prophylactic treatment or in accordance with stage of healing. 28. Demonstrate the ability to evaluate injuries and conditions of the lower quarter, including the foot and ankle, knee, and hip. 29. Demonstrate the ability to evaluate injuries and conditions of the upper quarter and spine, including the shoulder, elbow and forearm, wrist and fingers, cervical spine, thoracic spine, lumbar spine, and pelvis. 30. Demonstrate the ability to perform a comprehensive clinical examination of common illnesses and conditions and provides the appropriate referral as indicated. 31. Locate community-based resources for psychosocial intervention. 32. Demonstrate appropriate communication skills and use ethnic and cultural sensitivity in communication. 33. Produce documentation of the patient encounter consistent with contemporary athletic training practice using appropriate terminology and complying with all applicable regulatory standards. Credits: 6.00

HK 58300 - Patient Care Simulation In Athletic Training I

Credit Hours: 2.00. This course is designed to refine psychomotor skills and apply specific athletic training proficiencies integrating cognitive concepts and skills into progressively higher-level practical application. Skill integration will be achieved through successful completion and evaluation of patient care scenarios with emphasis placed on clinical reasoning skills of the student while making point-of-care decisions. Permission of department required.

Learning Outcomes: 1. Evaluate a patient and then select and apply appropriate taping applications for injury reduction and prevention. 2. Select and apply protective equipment for use by active individuals participating in sport. 3. Apply specialty taping procedures in response to patient indications and treatment goals. 4. Perform a primary and secondary patient assessment for a patient in an emergency situation. 5. Obtain and evaluate vital signs including pulse, respirations, blood

pressure, core body temperature, and oxygen saturation. 6. Differentiate and select from the different types of airway adjuncts to demonstrate airway management. 7. Use the indications and treatment parameters in an emergency situation to determine appropriateness of supplemental oxygen administration. 8. Administer supplemental oxygen to patients in an emergency situation. 9. Create a management plan of external hemorrhage and apply this emergent and non-emergent situations. 10. Consider and select proper immobilization and transfer techniques for a patient using a spine board. 11. Evaluate techniques for removing equipment and clothing to access an airway or evaluate an injured part and select the most appropriate for a given situation. 12. Apply corrective intervention techniques for the management of medical and sudden illness such as sudden cardiac arrest, asthma, shock, diabetic emergencies, burns, anaphylaxis, and internal bleeding. 13. Analyze patients and institute a management plan for patients in an environmental emergency. Credits: 2.00

HK 68300 - Patient Care Simulation In Athletic Training II

Credit Hours: 3.00. This course is designed to refine psychomotor skills and apply specific athletic training proficiencies integrating cognitive concepts and skills into progressively higher-level practical application. Skill integration will be achieved through successful completion and evaluation of patient care scenarios with emphasis placed on clinical reasoning skills of the student while making point-of-care decisions. Permission of department required. Prerequisite: HK 56300 with a B- or higher.

Learning Outcomes: 1. Evaluate common orthopedic conditions of the axial and appendicular skeleton, formulate a differential diagnosis, and recommend appropriate treatment strategies. 2. Evaluate patients with medical conditions involving the cardiovascular system, gastrointestinal system, dermatological system, endocrine system and determine a differential diagnosis with appropriate interventions, including potential for referral. 3. Evaluate general medical conditions and common non-orthopedic conditions of the head and face and determine a differential diagnosis with appropriate interventions, including potential for referral. 4. Screen a patients' general health and wellness, fitness, nutrition, gait, posture, and movement to address deficiencies in order to develop treatment strategies and referrals (where indicated). 5. Design an overall program to include fitness and wellness, nutrition, and general injury prevention strategies (including ergonomics). 6. Use baseline evaluation data of mobility, stability, strength, and balance to compose a therapeutic exercise program to address known deficits. 7. Select and incorporate therapeutic modalities into the rehabilitation plan of care. 8. Formulate a progressive rehabilitation plan using evidence-based interventions for common musculoskeletal injuries and conditions. 9. Instruct a patient in corrective exercise and a home exercise program. 10. Use patient and clinician oriented outcomes to make clinical decisions, including recommended interventions, activity progressions, and return to play decisions. 11. Educate and instruct a patient on general health and wellness behaviors and in the program to address deficiencies identified on a comprehensive fitness evaluation. 12. Communicate patient care status with stakeholders involved on the healthcare team (other providers, parents, coaches, administrators). Credits: 3.00

Additional Information

GPA Requirements

About the Program

Autonomy/Interdisciplinary Engineering, MSE or MS

About the Program

Program Requirements

Required Courses (27 credits)

Core Selectives (9 credits)

Major Courses (9 credits)

AAE 56400 - Systems Analysis And Synthesis

Credit Hours: 3.00. State space methods of analysis and design of continuous and discrete-time linear systems. Coordinate transformations, Jordan canonical forms, digital control, controllability and observability of continuous and discrete systems. Liapunov stability analysis. The linear regulator problem of optimal control via Hamilton Jacobi theory. Pole assignment, stabilizability, detectability. State estimation for deterministic models. Minimal order observers. MA 51100 recommended concurrently.

Credits: 3.00

AAE 56800 - Applied Optimal Control And Estimation

Credit Hours: 3.00. This course introduces students to analysis and synthesis methods of optimal controllers and estimators for (stochastic) dynamical systems. The topics in this course include a review of probability and stochastic processes, classical estimation techniques, Pontryagin's maximum principle, dynamic programming. Linear Quadratic Regulator problems (LQR), Kalman filter, duality of LQR with Kalman filter, Linear Quadratic Gaussian (LQG), and a range of engineering applications.

Learning Outcomes: 1. Study analysis and synthesis methods of optimal controllers and estimators for stochastic dynamical systems. 2. Present a review of probability and random processes, calculus of variations, dynamic programming, Maximum Principles, optimal control and estimation, duality, and optimal stochastic control. 3. Learn how to effectively communicate their ideas and how to formulate a problem and solve it. Credits: 3.00

AAE 59000 - Projects In Aeronautical Engineering

Credit Hours: 1.00 to 6.00. Topics vary - projects in Aeronautical Engineering. Permission of instructor required.

Credits: 1.00 to 6.00

AAE 66600 - Nonlinear Dynamics, Systems, And Control

Credit Hours: 3.00. Fundamental concepts and tools that are useful in the analysis of nonlinear systems and in the design of controllers and estimators for such systems. Results are illustrated by, and applied to, aerospace/mechanical systems. Prerequisite: AAE 56400.

Credits: 3.00

ECE 57000 - Artificial Intelligence

Credit Hours: 3.00. Introduction to the basic concepts and various approaches of artificial intelligence. The first part of the course deals with heuristic search and shows how problems involving search can be solved more efficiently by the use of heuristics and how, in some cases, it is possible to discover heuristics automatically. The next part of the course presents ways to represent knowledge about the world and how to reason logically with that knowledge. The third part of the course introduces the student to advanced topics of AI drawn from machine learning, natural language understanding, computer vision, and reasoning under uncertainty. The emphasis of this part is to illustrate that representation and search are fundamental issues in all aspects of artificial intelligence.

Credits: 3.00

ECE 59500 - Selected Topics In Electrical Engineering

Credit Hours: 1.00 to 3.00. Formal classroom or individualized instruction on topics of current interest. Permission of instructor required.

Credits: 1.00 to 3.00

AAE 56100 - Introduction To Convex Optimization

Credit Hours: 3.00. (IE 56100) Introduction to convex analysis, convex optimization problems, algorithms of convex optimization and measures of their complexity, and application of convex optimization in aerospace engineering. Recognition of

convex optimization problems that arise in scientific and engineering applications. Introduction to software tools to solve convex optimization problems.

Learning Outcomes: 1. Understand the basics of convex analysis and convex optimization problems. 2. Understand and develop algorithms for convex optimization and measures of their capacity. 3. Apply convex optimization to solve engineering problems. Credits: 3.00

ECE 50024 - Machine Learning

Credit Hours: 3.00. An introductory course to machine learning, with a focus on supervised learning using linear models. The course will have four parts: (1) mathematical background on linear algebra, probability, and optimization. (2) classification methods including Bayesian decision, linear regression, logistic, regression,
and support vector machine. (3) robustness of classifier and adversarial examples. (4) learning theory on the feasibility of learning, VC dimension, complexity analysis, bias-variance analysis. Suitable for senior undergraduates and graduates with a background in probability, linear algebra, and programming.

Learning Outcomes: 1. Apply basic linear algebra, probability, and optimization tools to solve machine learning problems. 2. Understand the principles of supervised learning methodologies, and can comment on their advantages and limitations. 3. Explain the trade-os in model complexity, sample complexity, bias, variance, and generalization error in the learning theory. 4. Implement, debug, and execute basic machine learning algorithms on computers. Credits: 3.00

CE 56401 - Data Science For Smart Cities

Credit Hours: 3.00. The availability of low-cost and ubiquitous sensors in city infrastructure provides high granular data at unprecedented spatiotemporal scales. "Smart Cities" is a concept to utilize this data to provide a healthy, happy and sustainable urban ecosystem by integrating the information and communication technology, Internet of things, and citizen participation to effectively manage and utilize city's infrastructure and services. 'Data science' is an interdisciplinary field of scientific methods, processes, algorithms, and systems to extract knowledge from data in various forms. This course will introduce techniques that will allow the analysis, inference, and prediction of large-scale data (e.g., GPS trajectories, individual social networks, etc.) that are present in urban networks. The course will focus both on the methods and their application to smart city problems. Python will be used to demonstrate the application of each method on datasets available to the instructor. Examples of applications that will be discussed as an example of applications of data science for smart city applications include: ridesharing platforms, energy modeling, smart and energy-efficient buildings, evacuation modeling, decision-making during extreme events, and urban resilience.

Learning Outcomes: 1. Understand the different types of data generated by smart cities. 2. Understand the basics of various data mining techniques. 3. Understand what type of data mining analysis is appropriate for various smart city applications. 4. Gain basic knowledge of using Python for data analytics and results visualization. 5. Apply the methods and techniques learned in this course to an applied smart city project. Credits: 3.00

CE 56601 - Network Models For Connected And Autonomous Vehicles

Credit Hours: 3.00. This course provides an introduction to mathematical foundations of the analysis of transportation networks. The course will be divided into two main sections. Section 1 will introduce the basic foundations of network routing problems including user equilibrium (selfish routing) and system optimal games on networks. Various optimization-based formulations, algorithms and extensions will be discussed. A particular emphasis will be on devising efficient algorithms and computation on city networks. Students will be expected to know how to design efficient algorithms for network analysis and implement them on various datasets. The second half of the course will tailor the network models learned in the first half to understanding the impacts of connected and autonomous vehicles (CAVs). This will be done by taking specific example problems such as autonomous intersection control, parking design, network design for CAVs, etc. Recent research papers will form the basis for developing these models. Extensive use of intuitive arguments, counterintuitive phenomenon (paradoxes) and network structures will be utilized to illustrate many situations graphically. In addition, computing the solutions efficiently using various network algorithms will be discussed. The course is research based and students in addition to learning the concepts will extend the concepts to a research project to be finished within the semester.

Learning Outcomes: 1. Analyze transportation systems using game theory and optimization by drawing on analogies between the interactions of supply and demand in economic markets.

Define selfish routing (user equilibrium) and system optimal problems; Develop solution algorithms for large scale networks. 2. Apply specialized network structures to solve selfish routing games efficiently. 3. Formulate and apply various extensions of the selfish routing game rigorously - traffic assignment with elasticity, stochastic user equilibrium, network design and OD estimation. 4. Understand the basic concepts of Connected and Autonomous vehicles (CAVs). 5. Apply the static network models to CAV planning and operations problems. 6. Use software to analyze various large-scale transportation networks and understand issues from real-world practitioners. Credits: 3.00

Core Selectives (9 credits)

Required Courses (27 credits)

Core Selectives (9 credits)

Major Courses (9 credits)

AAE 56400 - Systems Analysis And Synthesis

Credit Hours: 3.00. State space methods of analysis and design of continuous and discrete-time linear systems. Coordinate transformations, Jordan canonical forms, digital control, controllability and observability of continuous and discrete systems. Liapunov stability analysis. The linear regulator problem of optimal control via Hamilton Jacobi theory. Pole assignment, stabilizability, detectability. State estimation for deterministic models. Minimal order observers. MA 51100 recommended concurrently.

Credits: 3.00

AAE 56800 - Applied Optimal Control And Estimation

Credit Hours: 3.00. This course introduces students to analysis and synthesis methods of optimal controllers and estimators for (stochastic) dynamical systems. The topics in this course include a review of probability and stochastic processes, classical estimation techniques, Pontryagin's maximum principle, dynamic programming. Linear Quadratic Regulator problems (LQR), Kalman filter, duality of LQR with Kalman filter, Linear Quadratic Gaussian (LQG), and a range of engineering applications.

Learning Outcomes: 1. Study analysis and synthesis methods of optimal controllers and estimators for stochastic dynamical systems. 2. Present a review of probability and random processes, calculus of variations, dynamic programming, Maximum Principles, optimal control and estimation, duality, and optimal stochastic control. 3. Learn how to effectively communicate their ideas and how to formulate a problem and solve it. Credits: 3.00

AAE 59000 - Projects In Aeronautical Engineering

Credit Hours: 1.00 to 6.00. Topics vary - projects in Aeronautical Engineering. Permission of instructor required.

Credits: 1.00 to 6.00

AAE 66600 - Nonlinear Dynamics, Systems, And Control

Credit Hours: 3.00. Fundamental concepts and tools that are useful in the analysis of nonlinear systems and in the design of controllers and estimators for such systems. Results are illustrated by, and applied to, aerospace/mechanical systems. Prerequisite: AAE 56400.

Credits: 3.00

ECE 57000 - Artificial Intelligence

Credit Hours: 3.00. Introduction to the basic concepts and various approaches of artificial intelligence. The first part of the course deals with heuristic search and shows how problems involving search can be solved more efficiently by the use of heuristics and how, in some cases, it is possible to discover heuristics automatically. The next part of the course presents ways to represent knowledge about the world and how to reason logically with that knowledge. The third part of the course introduces the student to advanced topics of AI drawn from machine learning, natural language understanding, computer vision, and reasoning under uncertainty. The emphasis of this part is to illustrate that representation and search are fundamental issues in all aspects of artificial intelligence.

Credits: 3.00

ECE 59500 - Selected Topics In Electrical Engineering

Credit Hours: 1.00 to 3.00. Formal classroom or individualized instruction on topics of current interest. Permission of instructor

required.

Credits: 1.00 to 3.00

AAE 56100 - Introduction To Convex Optimization

Credit Hours: 3.00. (IE 56100) Introduction to convex analysis, convex optimization problems, algorithms of convex optimization and measures of their complexity, and application of convex optimization in aerospace engineering. Recognition of convex optimization problems that arise in scientific and engineering applications. Introduction to software tools to solve convex optimization problems.

Learning Outcomes: 1. Understand the basics of convex analysis and convex optimization problems. 2. Understand and develop algorithms for convex optimization and measures of their capacity. 3. Apply convex optimization to solve engineering problems. Credits: 3.00

ECE 50024 - Machine Learning

Credit Hours: 3.00. An introductory course to machine learning, with a focus on supervised learning using linear models. The course will have four parts: (1) mathematical background on linear algebra, probability, and optimization. (2) classification methods including Bayesian decision, linear regression, logistic, regression,
and support vector machine. (3) robustness of classifier and adversarial examples. (4) learning theory on the feasibility of learning, VC dimension, complexity analysis, bias-variance analysis. Suitable for senior undergraduates and graduates with a background in probability, linear algebra, and programming.

Learning Outcomes: 1. Apply basic linear algebra, probability, and optimization tools to solve machine learning problems. 2. Understand the principles of supervised learning methodologies, and can comment on their advantages and limitations. 3. Explain the trade-os in model complexity, sample complexity, bias, variance, and generalization error in the learning theory. 4. Implement, debug, and execute basic machine learning algorithms on computers. Credits: 3.00

Professional Skills Courses (9 credits)

AAE 56800 - Applied Optimal Control And Estimation

CE 56401 - Data Science For Smart Cities

Credit Hours: 3.00. The availability of low-cost and ubiquitous sensors in city infrastructure provides high granular data at unprecedented spatiotemporal scales. "Smart Cities" is a concept to utilize this data to provide a healthy, happy and sustainable urban ecosystem by integrating the information and communication technology, Internet of things, and citizen participation to effectively manage and utilize city's infrastructure and services. 'Data science' is an interdisciplinary field of scientific methods, processes, algorithms, and systems to extract knowledge from data in various forms. This course will introduce techniques that will allow the analysis, inference, and prediction of large-scale data (e.g., GPS trajectories, individual social networks, etc.) that are present in urban networks. The course will focus both on the methods and their application to smart city problems. Python will be used to demonstrate the application of each method on datasets available to the instructor. Examples of applications that will be discussed as an example of applications of data science for smart city applications include: ridesharing platforms, energy modeling, smart and energy-efficient buildings, evacuation modeling, decision-making during extreme events, and urban resilience.

Learning Outcomes: 1. Understand the different types of data generated by smart cities. 2. Understand the basics of various data mining techniques. 3. Understand what type of data mining analysis is appropriate for various smart city applications. 4. Gain basic knowledge of using Python for data analytics and results visualization. 5. Apply the methods and techniques learned in this course to an applied smart city project. Credits: 3.00

CE 56601 - Network Models For Connected And Autonomous Vehicles

Credit Hours: 3.00. This course provides an introduction to mathematical foundations of the analysis of transportation networks. The course will be divided into two main sections. Section 1 will introduce the basic foundations of network routing problems including user equilibrium (selfish routing) and system optimal games on networks. Various optimization-based formulations, algorithms and extensions will be discussed. A particular emphasis will be on devising efficient algorithms and computation on city networks. Students will be expected to know how to design efficient algorithms for network analysis and implement them on various datasets. The second half of the course will tailor the network models learned in the first half to understanding the impacts of connected and autonomous vehicles (CAVs). This will be done by taking specific example problems such as autonomous intersection control, parking design, network design for CAVs, etc. Recent research papers will form the basis for developing these models. Extensive use

of intuitive arguments, counterintuitive phenomenon (paradoxes) and network structures will be utilized to illustrate many situations graphically. In addition, computing the solutions efficiently using various network algorithms will be discussed. The course is research based and students in addition to learning the concepts will extend the concepts to a research project to be finished within the semester.

Learning Outcomes: 1. Analyze transportation systems using game theory and optimization by drawing on analogies between the interactions of supply and demand in economic markets. Define selfish routing (user equilibrium) and system optimal problems; Develop solution algorithms for large scale networks. 2. Apply specialized network structures to solve selfish routing games efficiently. 3. Formulate and apply various extensions of the selfish routing game rigorously - traffic assignment with elasticity, stochastic user equilibrium, network design and OD estimation. 4. Understand the basic concepts of Connected and Autonomous vehicles (CAVs). 5. Apply the static network models to CAV planning and operations problems. 6. Use software to analyze various large-scale transportation networks and understand issues from real-world practitioners. Credits: 3.00

Core Selectives (9 credits)

Selective (3 credits)

About the Program

Aviation Technology, MSAAM

About the Program

Program Requirements - Thesis & Non-thesis

Required Courses (24-30 credits)

Core Course (3 credits)

AT 50500 - Research Methods In Aviation

Credit Hours: 3.00. This course explores the practical approach to research as it applies to identifying and exploring pragmatic problems in aviation industry settings. Industry based problems and issues often require a diversity of research skills, both quantitative and qualitative, in order to effectively address dynamic problems in complex and often high-risk work environments. This course offers an overview of mixed research methods which lends itself well to practical problem solving in industry. This course may also be offered in an online format. Permission of instructor required.

Learning Outcomes: 1. Select and develop an appropriate design and investigative methodology for commonly-encountered aviation research problems. 2. Perform, and properly interpret, elementary descriptive statistical analysis. 3. Determine the need for, and correctly apply, appropriate inferential statistical tests for a variety of data. 4. Test research and null hypotheses. 5. Prepare well-written scholarly papers, using specific style instructions. 6. Prepare survey instruments appropriate to differing aviation settings. 7. Utilize an accepted style/publication manual in preparation or written work. Credits: 3.00

TECH 64600 - Analysis Of Research In Industry And Technology

Credit Hours: 3.00. Analysis of research and evaluation of research reports. Emphasis on understanding the application of fundamental statistical methods in design and interpretation of research findings in industrial, technical, and human resource development environments. Prerequisite: Master's student standing.

Credits: 3.00

Statistics Course (3 credits)

STAT 50100 - Experimental Statistics I

Credit Hours: 3.00. Concepts and methods of applied statistics. Exploratory analysis of data. Sample design and experimental design. Normal distributions. Sampling distributions. Confidence intervals and tests of hypotheses for one and two samples. Inference for contingency tables, regression and correlation, and one-way analysis of variance. Use of the SAS statistical software. Intended primarily for students who have not had calculus. Not open to students in mathematical sciences or engineering. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: College Algebra.

Learning Outcomes: 1. Produce and identify basic statistical analyses. 2. Discuss statistical terminology (speak statistics). 3. Use SAS to run basic statistical analyses and interpret corresponding SAS output. Credits: 3.00

STAT 50200 - Experimental Statistics II

Credit Hours: 3.00. Multiple regression including the general linear test, model selection, and regression diagnostics. Analysis of variance for factorial designs, including multiple comparisons. Analysis of covariance. Repeated measures designs. Extensive use of the SAS statistical software. Intended primarily for students who have not had calculus.

Learning Outcomes: 1. Produce and identify advanced statistical analyses. 2. Learn and understand advanced statistical terminology and concepts. 3. Use SAS to run advanced statistical analyses and interpret corresponding SAS output. Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

STAT 51200 - Applied Regression Analysis

Credit Hours: 3.00. Inference in simple and multiple linear regression, residual analysis, transformations, polynomial regression, model building with real data, nonlinear regression. One-way and two-way analysis of variance, multiple comparisons, fixed and random factors, analysis of covariance. Use of existing statistical computer programs. Prerequisite: Coursework in Statistical Methods with a calculus prerequisite.

Learning Outcomes: 1. Learn to build and analyze simple and multiple regression models, analysis of variance and covariance (ANOVA/ANCOVA) for regression, inference for regression, diagnostics and remedial measures for regression, transformations, residual analysis, model building, polynomial and interaction models. Credits: 3.00

AT 50700 - Quantitative Research Methodologies In Transportation

Credit Hours: 3.00. This course provides an introduction to business statistics with a specific focus on data analyses and managerial decision making in the transportation industry. Topics include descriptive statistics, probability models, estimation, hypothesis testing, and regression analysis.

Students use software to perform their own analyses. Permission of instructor required.

Learning Outcomes: 1. Demonstrate proficiency in the use of statistics to describe transportation processes. 2. Employ inferential statistics to facilitate transportation managerial decision making. 3. Demonstrate proficiency in the use of software tools to facilitate statistical analyses. Credits: 3.00

Electives (18-24 credits)

AT 50800 - Quality And Productivity In Industry And Technology

Credit Hours: 3.00. (IT 50800) Examines the contemporary issues of continuous improvement in quality and productivity in manufacturing and service industries. Includes a close examination of the evolving philosophies bearing on the scope, improvement, and costs of quality assurance programs in industry and technology.

Learning Outcomes: 1. Evaluate the key dimensions of quality and their implications for manufacturing and service industries. 2. Assess the philosophies and contributions of prominent thought leaders to the field of quality and productivity critically. 3. Apply core principles of Total Quality Management (TQM) to analyze and improve quality assurance programs. 4. Design and implement process management and improvement methodologies, such as Six Sigma, Lean, and Value Stream Analysis, to enhance productivity. Credits: 3.00

AT 52000 - Operational Assessment And Improvement

Credit Hours: 3.00. This course focuses on developing the skills to analyze, formulate, and apply techniques for work task improvement. Concepts to be studied include workflow enhancement, critical element streamlining, and value added analysis. Students will explore process map construction, process ownership, measurement system validation, standards creation, and decision factors. An industry project will be assigned and used to facilitate course objectives. Permission of instructor required.

Learning Outcomes: 1. Analyze workflows and critical elements using tools such as SWOT analysis, mind mapping, and process map construction to identify opportunities for improvement. 2. Evaluate and validate measurement systems, establish process ownership, and develop standards to support operational efficiency. 3. Calculate and interpret process time, labor costs, and total process costs to inform decision-making and improvement strategies. 4. Develop and justify improvement targets, impact analysis, and value-added analysis to enhance operational effectiveness. 5. Design and implement a comprehensive cycle time analysis, metrics framework, and testing and implementation plan for workflow enhancements. Credits: 3.00

AT 52500 - Process Improvement And Simulation

Credit Hours: 3.00. This course explores process modeling and simulation as applied to decision-making for process design and improvement. Emphasis is placed on understanding the application of process simulations to business problems including using fundamental statistical methods in the solution of an industry relevant problem. By planning and executing a computer-based simulation supporting an aviation or aerospace process design and improvement project, students improve analysis and project management skills. In addition to simulation, preparing visualizations of the process is also included for increased understanding of process interactions.

Learning Outcomes: 1. The student will have the knowledge and skills required to plan and execute a process improvement and simulation project. 2. The student will be able to compose and evaluate process models and simulations in terms of validity, verification, and usefulness in decision-making. 3. The student will be proficient in Arena or another appropriate process modeling and simulation computer application, as assigned. 4. The student will demonstrate appropriate use of process modeling techniques and data collection required to support the models. 5. The student will prepare and present a formal report describing a process design and improvement project, the methodology used in the project,

and the results. 6. Assessment of the objectives is done by: Student's project plan and report; Individual test scores; and Participation in discussion and collaboration with other graduate students. Credits: 3.00

AT 52600 - Aviation Leadership

Credit Hours: 3.00. This course is intended for future aviation and aerospace managers. Using foundational readings, case studies, and critical analysis techniques, the contribution of past and contemporary aviation leaders will be reviewed. Permission of department required.

Learning Outcomes: 1. Perform a situational analysis of an aviation enterprise management or leadership challenge and recommend appropriate courses of action. 2. Form, lead, and support a team in an aeronautical work setting. 3. Distinguish management roles and actions from leadership roles and actions in both an air carrier organization as well as in a general aviation company. 4. Apply appropriate theories of leadership to realistic organizational situations such as an aviation manufacturing company, a corporate flight department, or aerospace industry organization. 5. Identify salient characteristics of individual and organizational behavior; plan courses of action for organizational change. 6. Identify the competencies of past successful airline leaders; plan a leadership development program for an individual leader in a current aeronautical position. 7. Determine the viability and sustainability of vision strategies as they relate to activities such as flight training schools, fixed-base operator, or airport administration. 8. Recognize global cultural differences and assess the impact of those differences on appropriate leadership styles and organizational change initiatives in selected emerging aeronautical enterprises. Credits: 3.00

AT 52800 - Management And Design Of Training Systems

Credit Hours: 3.00. This course will examine the practical applications of managing the training process in industry and educational settings, including the development of instructional materials from an adult learner perspective. Curriculum design using various forms of media and delivery strategies will be emphasized. This course may also be delivered in an online format. Permission of department required.

Learning Outcomes: 1. Gain management knowledge and skills required to develop a training program for industry or education. 2. Able to design a learning module using instructional design principles in his/her interest area. 3. Able to assess the effectiveness of the training design process. 4. Write a comprehensive training plan in an area of his/her field of study. Credits: 3.00

AT 53000 - Multi-Cultural Issues In Team Operations

Credit Hours: 3.00. This course explores the nature and origins of professional, national, and organizational culture and their role in multi-disciplinary team activities. Power distance, individualism/collectivism, gender differences, and uncertainty avoidance are examined in terms of research by Hofstede. Management studies of several international air carriers will be utilized to highlight how cultural differences can affect perceptions. Permission of department required.

Learning Outcomes: 1. Examine the effects of professional, national, and organizational cultures on team dynamics, with an emphasis on aviation operations. 2. Investigate how cultural dimensions, including power distance, individualism versus collectivism, gender roles, and uncertainty avoidance, shape perceptions and influence collaboration. 3. Explore the ways cultural diversity can either support or hinder effective communication and teamwork in multi-disciplinary settings. 4. Implement error management strategies to mitigate the risks of cultural misunderstandings and improve team performance in diverse operational contexts. 5. Assess the implications of globalization on cultural norms and behaviors, particularly in professional environments. 6. Engage with peers in multi-cultural group projects to critically analyze industry challenges and recommend actionable solutions. Credits: 3.00

AT 53100 - International Civil Aviation Regulatory Systems

Credit Hours: 3.00. This course provides extensive multi-modal transportation security experience. Students will receive detailed information on air, maritime, rail, mass transit, trucking and oil pipeline security programs, as well as applicable threat mitigation processes. Completion of an undergraduate course in either aviation law or aviation security is recommended. This course may be applicable to undergraduates with appropriate experience and background in aviation or other transportation systems. There are no citizenship or security clearance requirements for this course.

Learning Outcomes: 1. Discuss the history, organization, and interdependence of international, regional and national civil aviation regulatory systems. 2. Discuss the partnerships and alliances between government, industry, stakeholders and financial organizations to support international civil aviation. 3. Discuss transparency and access to international aviation regulatory oversight programs and efforts to mitigate deficiencies and support efficiency. 4. Identify and conduct research on emerging international aviation issues. 5. Demonstrate critical thinking in developing presentations on emerging international aviation regulatory topics. Credits: 3.00

AT 53200 - Contemporary Issues In Transportation Security

Credit Hours: 3.00. This course provides extensive multi-modal transportation security experience. Students will receive detailed information on air, maritime, rail, mass transit, trucking and oil pipeline security programs, as well as applicable threat mitigation processes. Completion of an undergraduate course in either aviation law or aviation security is recommended. This course may be applicable to undergraduates with appropriate experience and background in aviation or other transportation systems. There are no citizenship or security clearance requirements for this course.

Learning Outcomes: 1. Describe the threats and countermeasures for transportation systems. 2. Describe the legislative and regulatory agencies responsible for security management. 3. Describe the techniques, policies and practices to counter security gaps. 4. Collect and analyze security data and information. 5. Process and disseminate information related to security mitigation programs. 6. Evaluate a security management program for a transportation system. Credits: 3.00

AT 54200 - Aviation Fuels And Exhaust Emissions

Credit Hours: 3.00. This course focuses on aviation fuels, including engine operation with fuel, combustion principles, chemistry, exhaust emissions, and fuel testing procedures. Additionally, the topics of greenhouse gases, global warming, oil reserves, fuel costs, and other factors driving the development of alternative aviation fuels will be covered. Current research in these areas will be discussed and testing procedures will be studied. Students will research new fuels in development, and will analyze the sustainability and potential for success promised by the new technologies in comparison with existing fuels.

Learning Outcomes: 1. Evaluate the relationship of fuel chemistry, properties, and characteristics to the extent necessary to predict impact on performance. 2. Analyze and differentiate the steps in the refining process to determine the characteristics and costs of the various grades of aviation fuels. 3. Analyze fuel test results to predict engine performance utilizing this information. 4. Analyze and compare the exhaust emissions produced by current and new aviation fuels in relation to current and emerging air pollution regulations and policies. 5. Evaluate new fuels and fuel production processes to determine overall sustainability and projected costs under the European Union Emissions Tax Scheme. 6. Analyze the distribution requirements for new fuels in comparison with the existing infrastructure to determine the modifications or accommodations required for system-wide delivery and implementation. Credits: 3.00

AT 54600 - Aviation Financial Instruments And Operations

Credit Hours: 3.00. The course concentrates on increasing the understanding of financial expertise in analyzing trading and hedging programs for application in reducing aviation operational risk exposure. The studies include research into the development and use of operational indexes and their possible

relation to hedging with commodity and security instruments. Emphasis will be placed on the understanding of current operational measurements and correlations to trading and hedging financial instruments in providing improved risk management in operational environments.

Learning Outcomes: 1. Propose and defend an analysis using operational data, trading, and hedging programs to reduce financial and operational risk in a specific business area in airline operations. 2. Collect, assess, organize, and present the relationships between operational data, financial data, and commodity volatility. 3. Develop and present the impact of complexity on airline business operations. Credits: 3.00

AT 55000 - Critical Systems Thinking

Credit Hours: 3.00. This course explores the application of critical systems thinking to complex problems. Using systems theory and case studies developed by technology visionaries, students will investigate alternative solutions to difficult industrial problems with global impact. Outcomes for this course include written assignments, oral presentations, and a final project that addresses a major industrial problem.

Learning Outcomes: 1. Understand how to frame complex issues in terms of systems thinking methodologies. 2. Able to synthesize information from different sources to develop a comprehensive aviation strategy. 3. Critically evaluate options and alternative solutions to complex problems. 4. Develop an appreciation for key aviation industry concerns as visionary aviation industry leaders. 5. Develop an eye to see and seize opportunities for innovation within industry. 6. Effectively articulate solutions to complex systems problems. Credits: 3.00

AT 57200 - Human Error And Safety

Credit Hours: 3.00. Explores the definition and nature of human error, error chains, and causal factors in error generation. Error taxonomies are reviewed in order to provide a classification scheme for grouping errors and assessing error criticality. Methods for assessing risk and predicting error generation potentials are learned, as well as strategies for controlling or eliminating errors. Case studies are utilized throughout the course to illustrate course concepts. Permission of instructor required.

Learning Outcomes: 1. Classify and evaluate types of human error using established taxonomies and assess their criticality in complex systems. 2. Analyze the antecedents and causal factors of human error, including those related to equipment, operators, organizational practices, regulatory frameworks, and cultural influences. 3. Apply error investigation methods, including data collection and analysis, to identify patterns and inform risk reduction strategies. 4. Examine case studies critically to propose evidence-based strategies for mitigating error incidents and improving safety outcomes. 5. Develop and present a scholarly research project on a contemporary human factors issue, demonstrating effective written and oral communication skills for professional contexts. Credits: 3.00

AT 57300 - Managing The Risk Of Organizational Accidents

Credit Hours: 3.00. Examines strategies various industries use to assess the risk of organizational accidents and to develop safety management programs to prevent, capture, and recover from conditions that lead to disastrous outcomes. Strategies such as High Reliability Organizations, Operational Risk Management, Behavioral Based Safety, Tripod Delta, and Safety Cultures are explored as successful methods for improving organizational safety in high-risk environments and endeavors. Permission of instructor required.

Learning Outcomes: 1. Explain Reason's model of Organizational Accidents (OA) and its application in understanding accident causation and prevention. 2. Analyze everyday operational events through the lens of the OA model to identify latent risks and contributory factors. 3. Evaluate best practices from safety frameworks such as High Reliability Organizations, Operational Risk Management, and Safety Cultures to mitigate the risk of organizational accidents. 4. Develop a detailed, evidence-based analysis of selected aviation accidents or incidents, incorporating the principles of the OA model. 5. Propose

strategies to enhance organizational safety by integrating behavioral-based safety and proactive risk management techniques into safety management systems. Credits: 3.00

AT 57400 - Exploratory Studies In Aviation Human Factors

Credit Hours: 3.00. Exploration of contemporary issues and research related to human factors theory and program strategies as they relate to the aviation industry. The course ventures beyond ergonomic issues into more diverse human factors considerations, while discussing an industry-wide and organizational perspective. The course utilizes a combination of lecture, group discussion, and independent study into issues relevant to student interests and career goals. Permission of instructor required.

Learning Outcomes: 1. Examine emerging human factors concepts and issues of critical concern within the aviation industry, beyond traditional ergonomic considerations. 2. Identify and evaluate human factors models and frameworks, such as the Human Factors Analysis and Classification System (HFACS), for investigating safety events. 3. Conduct and present independent exploratory research on a human factors topic, demonstrating analytical, written, and oral communication skills relevant to aviation professionals. 4. Design aviation workspace requirements that integrate human factors principles to enhance safety, performance, and usability. 5. Analyze contemporary aviation safety challenges from organizational and industry-wide perspectives, incorporating insights from human factors theory and program strategies. Credits: 3.00

AT 58100 - Workshop In Aviation Technology

Credit Hours: 0.00 to 8.00. Advanced study of technical and professional topics. Emphasis is on new developments relating to technical, operational, and training aspects of industry and technology education.

Learning Outcomes: 1. Vary based upon individual contract. Credits: 0.00 to 8.00

AT 59000 - Special Problems In Aviation Technology

Credit Hours: 1.00 to 12.00. Independent study of a special problem under the guidance of a member of the staff. Does not substitute for either M.S. thesis or M.S. project credit. Permission of instructor required.

Learning Outcomes: 1. Vary based upon individual contract. Credits: 1.00 to 12.00

AT 69000 - Independent Study In Air Transportation

Credit Hours: 1.00 to 6.00. Intensive individual study of selected current developments and issues in air transportation. A faculty sponsor is required for this course. Prerequisite: Doctoral student standing. Permission of instructor required.

Learning Outcomes: 1. Investigate and report on a focused area of air transportation. Credits: 1.00 to 6.00

AT 64000 - Aviation And Aerospace Sustainability

Credit Hours: 3.00. This course explores sustainability as applied to aviation and aerospace industries and agencies, both in the private sector and public sector. Emphasis is placed on understanding aviation and aerospace sustainability academic literature and on connecting the global and national policies that lead to the regulations and practices. Aviation sustainability is comprised of multiple areas of impact such as economic, environmental, operational, and social. Students develop an understanding of existing sustainability assessment frameworks such as GRI that have general sustainability assessments along with specialized aviation industry frameworks. Using a multiple attribute analysis approach, students develop metrics and analyze the potential impact of sustainability initiatives in the aviation and aerospace industry. Prerequisites: STAT 30100 or STAT 31100 or STAT 50100 or STAT 51100 or IT 50700 or an instructor-approved statistical foundations course. Proficiency in statistical foundations is required to understand and evaluate environmental, economic and social sustainability data, information and methods presented in this course.

Learning Outcomes: 1. Create a well-founded set of metrics for assessing sustainability that consider economic, environmental, social and operational viewpoints. 2. Evaluate projects or initiatives affecting aviation and aerospace sustainability using multi-attribute analysis techniques. 3. Collect, assess, organize and present sustainability information. 4. Demonstrate understanding of sustainability terms, policies, and concepts. 5. Develop, communicate and defend an analysis of a sustainability initiative in the aviation or

aerospace industry. Credits: 3.00

AT 67500 - Aviation Safety Program Development

Credit Hours: 3.00. This course is designed to provide graduate students with essential information and practical activities necessary to develop and manage effective and comprehensive safety programs for a wide variety of aviation operations. Students will conduct safety research, analyze data, and make presentations based on developed safety systems. Instructor permission required.

Learning Outcomes: 1. Describe the regulatory and risk environment in which airline safety offices exist. 2. Describe safety theories and models. 3. Describe human factors and accident causation. 4. Collect and analyze safety related data. 5. Process and disseminate information related to accident prevention and risk minimization. 6. Manage an airline safety office and implement procedures. 7. Design a safety management program for an air career or FBO. Credits: 3.00

AT 53300 - Aviation Graduate Professional Practice Internship

Credit Hours: 1.00 to 3.00. This course involves a practical internship experience within the aviation industry that provides exposure to the roles and duties commensurate with the student's graduate program focus. Prerequisite: Completion of one term of graduate studies and the instructor will validate that the student has an offer letter from an approved company. Permission of assigned graduate chair is required. Permission of instructor required.

Learning Outcomes: 1. Experience and understand aviation workplace roles and responsibilities. Credits: 1.00 to 3.00

AT 54700 - Airline Revenue Management

Credit Hours: 3.00. This course aims to provide students with experience in airline revenue management applications. Primarily focusing on the commercial operation of airlines, this course covers various contemporary topics such as the segmentation, inventory control, forecasting, budgeting and pricing. This course will use simulations to enhance the overall learning-teaching experience.

Learning Outcomes: 1. Summarize the development of revenue management in the airline industry, and explain the importance of revenue management to business operation of airlines. 2. Interpret concepts such as segmentation, forecasting, budgeting, pricing, revenue management, and yield in the domain of the airlines industry and the broader hospitality sector. 3. Evaluate pricing schemes used by airlines on different markets (for instance, long-haul & short-haul, domestic & international, competitive & dominant, peak season & low season) in real world. 4. Implement inventory control in a simulated environment to respond to the dynamic and complex market conditions. 5. Develop appropriate strategies to optimize revenue for a specific airline (either full-service carrier or low-cost carrier) in a certain market (simulated environment). Credits: 3.00

AT 60700 - Aviation Applications Of Bayesian Inference

Credit Hours: 3.00. This course provides a critical foundation necessary for understanding Bayesian theory and employing that theory in the analysis of typical data generated in industry. The course will focus specifically on solutions of aviation-related problems through data analysis. Material includes overview and implementation of relevant statistical software applications. Practical skills in presenting advanced analyses to both professional and scientific audiences is a key component of the course. Prerequisites: AT 50700 OR IT 50700 OR STAT 30100 OR STAT 50100 OR STAT 51100. Permission of instructor required.

Learning Outcomes: 1. Articulate and define basic concepts in probability theory, modeling, and Bayesian reasoning. 2. Create hierarchical models using Bayesian concepts and use appropriate software to implement those models. 3. Demonstrate the differences between Bayesian modeling and null hypothesis significance testing. 4. Apply Bayesian models to solve specific aviation problems using realistic data. Credits: 3.00

AT 54800 - Aircraft Asset Management

Credit Hours: 3.00. This course provides the student with a detailed exploration of aircraft asset management programs in both airlines and business aviation organizations. Students

analyze and study the critical components of an asset management program, the financial methods in aircraft asset management, acquisition proposals, and development plans of aircraft acquisitions in this course. An airline industry-relevant project is used to improve student reasoning and application of industry standard aircraft asset management analysis procedures to include forecasting techniques, present value calculations, and benefit-cost analyses. This course serves as the foundational knowledge required for AT 54900.

Learning Outcomes: 1. Review critically, synthesize, document and summarize relevant research literature in the field of aircraft asset management, expressing themselves clearly and concisely in writing and oral presentation. 2. Recognize the critical components of an aircraft asset management program, thoroughly develop a business case for aircraft acquisition, and manage an in-service fleet of aircraft. 3. Develop a simulated asset management team and work effectively and collaboratively as part of the team. 4. Produce a high-quality airline industry aircraft asset management project, conduct financial analyses of aircraft assets, document findings in a paper, and communicate the key principles regarding their project in a professional presentation. Credits: 3.00

AT 54900 - Aircraft Leasing

Credit Hours: 3.00. This course provides students with training and experience managing aircraft leases using financial and risk management methodologies specific to the airline and business aviation industries. Students conduct financial evaluations of leasing versus ownership programs of airlines, as well as analyze debt, equity and capital markets for aircraft financing. The course includes an examination of taxation issues related to aircraft leasing, maintenance reserves, and auditing of aircraft financial performance. The prerequisite for this course is AT 54800.

Learning Outcomes: 1. Review critically, synthesize, document and present relevant research literature in the field of aircraft leasing and financing, expressing themselves clearly and concisely in writing and oral presentation. 2. Explain the necessary components of an aircraft lease, audit in-service aircraft financial performance, thoroughly analyze aircraft maintenance reserves, and summarize taxation issues with aircraft assets. 3. Develop a simulated aircraft leasing management team and work effectively and collaboratively as part of the team. 4. Generate a high-quality aircraft asset leasing project, conduct financial evaluations of leasing and owning options, document findings in a paper and communicate the key principles regarding their project in a professional presentation. Credits: 3.00

AT 54300 - Contemporary Issues In Airport & Airline Finance

Credit Hours: 3.00. This course provides an overview of aviation financial management and is intended for current and future aviation and aerospace leaders and managers. Taking a global view, the course opens with the tremendous economic impact of the aviation sector that both drives and enables the interdependent global economy. The course material covers the unique business models and best practices in financial management for both the airport and airline industries and analyzes the relationship between the two (including the complications implicit in highly divergent planning horizons). The complexity of aircraft financing decisions is covered that lead up to building a fleet to serve the airlines' forecast growth. The course uses relevant readings and case studies as well as statistical data in time series to demonstrate the way financial management has evolved to improve performance in both the airport and airline industries. Permission of department required.

Learning Outcomes: 1. Recognize the impact of the COVID-19 pandemic on the global aviation sector and impacts on industry finance. 2. Describe the essential link between the enterprise's strategic vision and mission and prudent financial management. 3. Recognize the strengths and weaknesses of an aviation enterprise through an analysis of the balance sheet and income statements. 4. Understand the complexity and the sometimes adversarial nature of the airport/airline relationship. 5. Recognize the changes in the airline business model which have delivered improved financial performance in North America since 2014. 6. Describe the steps involved in re-inventing and rebranding an airport taking the Cincinnati Airport as an example. 7. Understand why

privatization of airports, so common in Europe and Asia, has not caught on in the U.S. 8. Enumerate the hurdles to building new infrastructure. 9. Develop an appreciation for the FAA's role in oversight of the U.S. aviation system. 10. Become familiar with the basic elements of aircraft financing including various scenarios for investing in new aircraft to meet future demand. 11. Discuss the applications of new technology in North American air traffic management. This will focus on both the FAA and NAVCAN. 12. Know the basic roles of key players in aviation including Airports Council International (ACI), International Air Transport Association (IATA), the UN International Civil Aviation Organization (ICAO). Credits: 3.00

AT 51900 - Aviation Geographic Information Science Applications

Credit Hours: 3.00. This course provides a core set of skills essential for understanding geospatial science and using Geographic Information Systems as a tool to conduct research with a spatial component. The student will learn how to acquire, process, analyze, and interpret geospatial data using real-world data sets in applied situations.

Learning Outcomes: 1. Acquire core geospatial and remote sensing technology concepts. 2. Demonstrate an ability to apply GIS data to real-world applied situations. 3. Demonstrate a fundamental understanding of cartography through the creation of map layouts in a GIS. Credits: 3.00

Thesis Research (6 credits)

AT 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required.

Learning Outcomes: 1. Plan, manage, conduct, and report original research using appropriate design and analytical techniques. Credits: 1.00 to 18.00

Selectives (30 credits)

AT 50500 - Research Methods In Aviation

Credit Hours: 3.00. This course explores the practical approach to research as it applies to identifying and exploring pragmatic problems in aviation industry settings. Industry based problems and issues often require a diversity of research skills, both quantitative and qualitative, in order to effectively address dynamic problems in complex and often high-risk work environments. This course offers an overview of mixed research methods which lends itself well to practical problem solving in industry. This course may also be offered in an online format. Permission of instructor required.

Learning Outcomes: 1. Select and develop an appropriate design and investigative methodology for commonly-encountered aviation research problems. 2. Perform, and properly interpret, elementary descriptive statistical analysis. 3. Determine the need for, and correctly apply, appropriate inferential statistical tests for a variety of data. 4. Test research and null hypotheses. 5. Prepare well-written scholarly papers, using specific style instructions. 6. Prepare survey instruments appropriate to differing aviation settings. 7. Utilize an accepted style/publication manual in

preparation or written work. Credits: 3.00

AT 50800 - Quality And Productivity In Industry And Technology

Credit Hours: 3.00. (IT 50800) Examines the contemporary issues of continuous improvement in quality and productivity in manufacturing and service industries. Includes a close examination of the evolving philosophies bearing on the scope, improvement, and costs of quality assurance programs in industry and technology.

Learning Outcomes: 1. Evaluate the key dimensions of quality and their implications for manufacturing and service industries. 2. Assess the philosophies and contributions of prominent thought leaders to the field of quality and productivity critically. 3. Apply core principles of Total Quality Management (TQM) to analyze and improve quality assurance programs. 4. Design and implement process management and improvement methodologies, such as Six Sigma, Lean, and Value Stream Analysis, to enhance productivity. Credits: 3.00

AT 52000 - Operational Assessment And Improvement

Credit Hours: 3.00. This course focuses on developing the skills to analyze, formulate, and apply techniques for work task improvement. Concepts to be studied include workflow enhancement, critical element streamlining, and value added analysis. Students will explore process map construction, process ownership, measurement system validation, standards creation, and decision factors. An industry project will be assigned and used to facilitate course objectives. Permission of instructor required.

Learning Outcomes: 1. Analyze workflows and critical elements using tools such as SWOT analysis, mind mapping, and process map construction to identify opportunities for improvement. 2. Evaluate and validate measurement systems, establish process ownership, and develop standards to support operational efficiency. 3. Calculate and interpret process time, labor costs, and total process costs to inform decision-making and improvement strategies. 4. Develop and justify improvement targets, impact analysis, and value-added analysis to enhance operational effectiveness. 5. Design and implement a comprehensive cycle time analysis, metrics framework, and testing and implementation plan for workflow enhancements. Credits: 3.00

AT 52600 - Aviation Leadership

Credit Hours: 3.00. This course is intended for future aviation and aerospace managers. Using foundational readings, case studies, and critical analysis techniques, the contribution of past and contemporary aviation leaders will be reviewed. Permission of department required.

Learning Outcomes: 1. Perform a situational analysis of an aviation enterprise management or leadership challenge and recommend appropriate courses of action. 2. Form, lead, and support a team in an aeronautical work setting. 3. Distinguish management roles and actions from leadership roles and actions in both an air carrier organization as well as in a general aviation company. 4. Apply appropriate theories of leadership to realistic organizational situations such as an aviation manufacturing company, a corporate flight department, or aerospace industry organization. 5. Identify salient characteristics of individual and organizational behavior; plan courses of action for organizational change. 6. Identify the competencies of past successful airline leaders; plan a leadership development program for an individual leader in a current aeronautical position. 7. Determine the viability and sustainability of vision strategies as they relate to activities such as flight training schools, fixed-base operator, or airport administration. 8. Recognize global cultural differences and assess the impact of those differences on appropriate leadership styles and organizational change initiatives in selected emerging aeronautical enterprises. Credits: 3.00

AT 52800 - Management And Design Of Training Systems

Credit Hours: 3.00. This course will examine the practical

applications of managing the training process in industry and educational settings, including the development of instructional materials from an adult learner perspective. Curriculum design using various forms of media and delivery strategies will be emphasized. This course may also be delivered in an online format. Permission of department required.

Learning Outcomes: 1. Gain management knowledge and skills required to develop a training program for industry or education. 2. Able to design a learning module using instructional design principles in his/her interest area. 3. Able to assess the effectiveness of the training design process. 4. Write a comprehensive training plan in an area of his/her field of study. Credits: 3.00

AT 53100 - International Civil Aviation Regulatory Systems

Credit Hours: 3.00. This course provides extensive multi-modal transportation security experience. Students will receive detailed information on air, maritime, rail, mass transit, trucking and oil pipeline security programs, as well as applicable threat mitigation processes. Completion of an undergraduate course in either aviation law or aviation security is recommended. This course may be applicable to undergraduates with appropriate experience and background in aviation or other transportation systems. There are no citizenship or security clearance requirements for this course.

Learning Outcomes: 1. Discuss the history, organization, and interdependence of international, regional and national civil aviation regulatory systems. 2. Discuss the partnerships and alliances between government, industry, stakeholders and financial organizations to support international civil aviation. 3. Discuss transparency and access to international aviation regulatory oversight programs and efforts to mitigate deficiencies and support efficiency. 4. Identify and conduct research on emerging international aviation issues. 5. Demonstrate critical thinking in developing presentations on emerging international aviation regulatory topics. Credits: 3.00

AT 53200 - Contemporary Issues In Transportation Security

Credit Hours: 3.00. This course provides extensive multi-modal transportation security experience. Students will receive detailed information on air, maritime, rail, mass transit, trucking and oil pipeline security programs, as well as applicable threat mitigation processes. Completion of an undergraduate course in either aviation law or aviation security is recommended. This course may be applicable to undergraduates with appropriate experience and background in aviation or other transportation systems. There are no citizenship or security clearance requirements for this course.

Learning Outcomes: 1. Describe the threats and countermeasures for transportation systems. 2. Describe the legislative and regulatory agencies responsible for security management. 3. Describe the techniques, policies and practices to counter security gaps. 4. Collect and analyze security data and information. 5. Process and disseminate information related to security mitigation programs. 6. Evaluate a security management program for a transportation system. Credits: 3.00

AT 54600 - Aviation Financial Instruments And Operations

Credit Hours: 3.00. The course concentrates on increasing the understanding of financial expertise in analyzing trading and hedging programs for application in reducing aviation operational risk exposure. The studies include research into the development and use of operational indexes and their possible relation to hedging with commodity and security instruments. Emphasis will be placed on the understanding of current operational measurements and correlations to trading and hedging financial instruments in providing improved risk management in operational environments.

Learning Outcomes: 1. Propose and defend an analysis using operational data, trading, and hedging programs to reduce financial and operational risk in a specific business area in airline operations. 2. Collect, assess, organize, and present the relationships between operational data, financial data, and commodity volatility. 3. Develop and present the impact of complexity on airline business operations. Credits: 3.00

AT 57200 - Human Error And Safety

Credit Hours: 3.00. Explores the definition and nature of human error, error chains, and causal factors in error generation. Error taxonomies are reviewed in order to provide a classification scheme for grouping errors and assessing error criticality.

Methods for assessing risk and predicting error generation potentials are learned, as well as strategies for controlling or eliminating errors. Case studies are utilized throughout the course to illustrate course concepts. Permission of instructor required.

Learning Outcomes: 1. Classify and evaluate types of human error using established taxonomies and assess their criticality in complex systems. 2. Analyze the antecedents and causal factors of human error, including those related to equipment, operators, organizational practices, regulatory frameworks, and cultural influences. 3. Apply error investigation methods, including data collection and analysis, to identify patterns and inform risk reduction strategies. 4. Examine case studies critically to propose evidence-based strategies for mitigating error incidents and improving safety outcomes. 5. Develop and present a scholarly research project on a contemporary human factors issue, demonstrating effective written and oral communication skills for professional contexts. Credits: 3.00

AT 57300 - Managing The Risk Of Organizational Accidents

Credit Hours: 3.00. Examines strategies various industries use to assess the risk of organizational accidents and to develop safety management programs to prevent, capture, and recover from conditions that lead to disastrous outcomes. Strategies such as High Reliability Organizations, Operational Risk Management, Behavioral Based Safety, Tripod Delta, and Safety Cultures are explored as successful methods for improving organizational safety in high-risk environments and endeavors. Permission of instructor required.

Learning Outcomes: 1. Explain Reason's model of Organizational Accidents (OA) and its application in understanding accident causation and prevention. 2. Analyze everyday operational events through the lens of the OA model to identify latent risks and contributory factors. 3. Evaluate best practices from safety frameworks such as High Reliability Organizations, Operational Risk Management, and Safety Cultures to mitigate the risk of organizational accidents. 4. Develop a detailed, evidence-based analysis of selected aviation accidents or incidents, incorporating the principles of the OA model. 5. Propose strategies to enhance organizational safety by integrating behavioral-based safety and proactive risk management techniques into safety management systems. Credits: 3.00

AT 57400 - Exploratory Studies In Aviation Human Factors

Credit Hours: 3.00. Exploration of contemporary issues and research related to human factors theory and program strategies as they relate to the aviation industry. The course ventures beyond ergonomic issues into more diverse human factors considerations, while discussing an industry-wide and organizational perspective. The course utilizes a combination of lecture, group discussion, and independent study into issues relevant to student interests and career goals. Permission of instructor required.

Learning Outcomes: 1. Examine emerging human factors concepts and issues of critical concern within the aviation industry, beyond traditional ergonomic considerations. 2. Identify and evaluate human factors models and frameworks, such as the Human Factors Analysis and Classification System (HFACS), for investigating safety events. 3. Conduct and present independent exploratory research on a human factors topic, demonstrating analytical, written, and oral communication skills relevant to aviation professionals. 4. Design aviation workspace requirements that integrate human factors principles to enhance safety, performance, and usability. 5. Analyze contemporary aviation safety challenges from organizational and industry-wide perspectives, incorporating insights from human factors theory and program strategies. Credits: 3.00

AT 67500 - Aviation Safety Program Development

Credit Hours: 3.00. This course is designed to provide graduate students with essential information and practical activities necessary to develop and manage effective and comprehensive safety programs for a wide variety of aviation operations. Students will conduct safety research, analyze data, and make presentations based on developed safety systems. Instructor

permission required.

Learning Outcomes: 1. Describe the regulatory and risk environment in which airline safety offices exist. 2. Describe safety theories and models. 3. Describe human factors and accident causation. 4. Collect and analyze safety related data. 5. Process and disseminate information related to accident prevention and risk minimization. 6. Manage an airline safety office and implement procedures. 7. Design a safety management program for an air career or FBO. Credits: 3.00

AT 50700 - Quantitative Research Methodologies In Transportation

Credit Hours: 3.00. This course provides an introduction to business statistics with a specific focus on data analyses and managerial decision making in the transportation industry. Topics include descriptive statistics, probability models, estimation, hypothesis testing, and regression analysis. Students use software to perform their own analyses. Permission of instructor required.

Learning Outcomes: 1. Demonstrate proficiency in the use of statistics to describe transportation processes. 2. Employ inferential statistics to facilitate transportation managerial decision making. 3. Demonstrate proficiency in the use of software tools to facilitate statistical analyses. Credits: 3.00

AT 54700 - Airline Revenue Management

Credit Hours: 3.00. This course aims to provide students with experience in airline revenue management applications. Primarily focusing on the commercial operation of airlines, this course covers various contemporary topics such as the segmentation, inventory control, forecasting, budgeting and pricing. This course will use simulations to enhance the overall learning-teaching experience.

Learning Outcomes: 1. Summarize the development of revenue management in the airline industry, and explain the importance of revenue management to business operation of airlines. 2. Interpret concepts such as segmentation, forecasting, budgeting, pricing, revenue management, and yield in the domain of the airlines industry and the broader hospitality sector. 3. Evaluate pricing schemes used by airlines on different markets (for instance, long-haul & short-haul, domestic & international, competitive & dominant, peak season & low season) in real world. 4. Implement inventory control in a simulated environment to respond to the dynamic and complex market conditions. 5. Develop appropriate strategies to optimize revenue for a specific airline (either full-service carrier or low-cost carrier) in a certain market (simulated environment). Credits: 3.00

AT 54800 - Aircraft Asset Management

Credit Hours: 3.00. This course provides the student with a detailed exploration of aircraft asset management programs in both airlines and business aviation organizations. Students analyze and study the critical components of an asset management program, the financial methods in aircraft asset management, acquisition proposals, and development plans of aircraft acquisitions in this course. An airline industry-relevant project is used to improve student reasoning and application of industry standard aircraft asset management analysis procedures to include forecasting techniques, present value calculations, and benefit-cost analyses. This course serves as the foundational knowledge required for AT 54900.

Learning Outcomes: 1. Review critically, synthesize, document and summarize relevant research literature in the field of aircraft asset management, expressing themselves clearly and concisely in writing and oral presentation. 2. Recognize the critical components of an aircraft asset management program, thoroughly develop a business case for aircraft acquisition, and manage an in-service fleet of aircraft. 3. Develop a simulated asset management team and work effectively and collaboratively as part of the team. 4. Produce a high-quality airline industry aircraft asset management project, conduct financial analyses of aircraft assets, document findings in a paper, and communicate the key principles regarding their project in a professional presentation. Credits: 3.00

AT 54900 - Aircraft Leasing

Credit Hours: 3.00. This course provides students with training and experience managing aircraft leases using financial and risk management methodologies specific to the airline and business aviation industries. Students conduct financial evaluations of leasing versus ownership programs of airlines, as well as analyze debt, equity and capital markets for aircraft financing. The course includes an examination of taxation issues related to aircraft leasing, maintenance reserves, and auditing of aircraft financial performance. The prerequisite for this course is AT 54800.

Learning Outcomes: 1. Review critically, synthesize, document and present relevant research literature in the field of aircraft leasing and financing, expressing themselves clearly and concisely in writing and oral presentation. 2. Explain the necessary components of an aircraft lease, audit in-service aircraft financial performance, thoroughly analyze aircraft maintenance reserves, and summarize taxation issues with aircraft assets. 3. Develop a simulated aircraft leasing management team and work effectively and collaboratively as part of the team. 4. Generate a high-quality aircraft asset leasing project, conduct financial evaluations of leasing and owning options, document findings in a paper and communicate the key principles regarding their project in a professional presentation. Credits: 3.00

BCHM 60100 - Critical Thinking And Communication In Biochemistry I

Credit Hours: 2.00. The objective of this course is to assist students in acquiring the skills needed to read critically, evaluate, and assimilate the primary scientific literature. This objective will be accomplished by instructor-guided discussions of the hypotheses, experimental data, conclusions, and scientific merit of assigned manuscript(s) taken from the fields of biochemistry and molecular biology. Topics for discussion initially will focus on the structure, organization, review process, and ethical issues related to scientific manuscripts. As the semester progresses, discussions will focus on the hypotheses being tested, quality of the data, and validity of the conclusions. Permission of instructor required.

Learning Outcomes: 1. Understand essential graduate skills for independent research. 2. Enhance oral and written communication skills. 3. Master reading and interpreting scientific literature in biochemistry. 4. Develop critical thinking and creativity in scientific research. Credits: 2.00

BCHM 60200 - Critical Thinking And Communication In Biochemistry II

Credit Hours: 2.00. Builds on the skills developed in BCHM 601. Students will continue to enhance their analytical skills, and

class discussions will be conducted at a more sophisticated level and will go into greater depth. Class discussions will focus more on the analysis and evaluation of current methodologies and hypotheses in the biochemical and molecular biological literature. Students will be evaluated primarily on their preparation and participation in each class discussion. Prerequisite: BCHM 60100. Permission of instructor required.

Learning Outcomes: 1. Understand essential graduate skills for independent research. 2. Enhance oral and written communication skills. 3. Master reading and interpreting scientific literature in biochemistry. 4. Develop critical thinking and creativity in scientific research. Credits: 2.00

BCHM 60501 - Macromolecules

Credit Hours: 3.00. This course will provide students with an understanding of the basic principles that underlie the secondary and tertiary structure of proteins and nucleic acids which contribute to their function. It will inform students of current efforts to engineer macromolecules with novel functions. Students will become familiar with methods used to determine the three-dimensional structures of macromolecules, and they will learn to critically evaluate the accuracy of structural models. Special topics in the current literature, including membrane proteins, drug design and ribozymes, will be covered. The class will typically include students from a variety of departments, graduate programs, and scientific backgrounds. The course will be taught primarily from various textbook and from the primary literature. A biochemistry course designated for majors is a prerequisite of the course. Lack of the prerequisite will require approval of the instructor. Permission of Department required.

Learning Outcomes: 1. Acquire knowledge about the chemical structures and properties of the building blocks of biological macromolecules, including amino acids and nucleic acids. 2. Develop the skills required to visualize and analyze the higher order structures of proteins and nucleic acids. 3. Acquire information literacy by learning to use online resources to explore evolutionary relationships among macromolecules, and to prepare three dimensional models of proteins and nucleic acids. Credits: 3.00

BCHM 69000 - Seminar In Biochemistry

Credit Hours: 1.00. Seminary In Biochemistry. Permission of instructor required.

Credits: 1.00

BIOL 66200 - Seminar Methods And Professional Development I

Credit Hours: 1.00. An introduction for incoming graduate students to methods of seminar presentation and critique and to various guidelines for professional development during their graduate school experience. Topics include research laboratory safety (REM), how to give a talk, acclimating to graduate studies (especially time management), how to select a major professor and an advisory committee, how to prepare for qualifying exams, Purdue University guidelines for responsible conduct of research, how to organize a poster presentation, how to negotiate with mentors, and expectations for success. The course also serves to socialize the incoming cohort of students among themselves and with more senior students in the broad range of research disciplines available.

Credits: 1.00

STAT 50300 - Statistical Methods For Biology

Credit Hours: 3.00. Introductory statistical methods, with emphasis on applications in biology. Topics include descriptive statistics, binomial and normal distributions, confidence interval estimation, hypothesis testing, analysis of variance, introduction to nonparametric testing, linear regression and correlation, goodness-of-fit tests, and contingency tables. Open only to majors related to the life sciences. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100.

Learning Outcomes: 1. Students will be able to identify and choose appropriate ways to graphically and numerically summarize data. 2. Students will be able to use basic statistical methods to perform statistical inference and draw appropriate conclusions. 3. Students will understand the mathematical foundations of statistical inference for random samples so that they can study and utilize additional statistical methods. Credits: 3.00

GRAD 61200 - Responsible Conduct Of Research

Credit Hours: 1.00. Overview of values, professional standards, and regulations that define responsible conduct in research. Students learn the values and standards of responsible research through readings and lecture/discussion and practice application of these values and standards to research situations through class discussion of case studies from life sciences

research. Students must be registered for M.S. or Ph.D. thesis research in their home department.

Credits: 1.00

BCHM 61000 - Regulation Of Eukaryotic Gene Expression

Credit Hours: 3.00. This course will provide students with a basic understanding of gene expression mechanisms with a s specific focus on newly emerging topics. This course will be taught from current primary literature, using a textbook as a background resource. Topics will include transcription, messenger RNA decay, microRNAs and connections between gene expression steps. Students will learn how to read and interpret scientific literature through class presentations, discussions and take home assignments. Additionally, students will gain experience in developing and testing hypotheses within the class topic areas and writing a research proposal. Prerequisites: BCHM 56100 and 56200, or BCHM 60501. Lack of these prerequisites will require approval by the instructor.

Learning Outcomes: 1. Basic knowledge of the molecular mechanisms in gene expression and regulation. 2. Appreciation for post-transcriptional gene regulatory events. 3. Enhancement of oral and written communication skills. 4. Mastery of reading and interpreting scientific literature in gene expression fields. 5. Development of critical thinking and creativity in scientific research. Credits: 3.00

BCHM 60300 - Introduction To Graduate Research In Biochemistry I

Credit Hours: 6.00. This course is intended to provide the opportunity for in-depth, mentored graduate research in two biochemistry laboratories. Students enrolled in this course will learn how to devise hypothesis, design experiments that test their hypotheses, accurately record their data in laboratory notebooks, critically analyze the results of their analyses and present their findings to others in written and oral presentations. They will fully participate in laboratory group meetings, the Biochemistry seminar series, and presentations by other students and postdoctoral fellow. Co-requisites: BCHM 60100 and BCHM 60501. Permission of department required.

Learning Outcomes: 1. Understand the scientific method. Develop hypotheses, design experiments, and critically analyze results to create new knowledge. 2. Communicate scientific knowledge, experiments and conclusions effectively as speakers and writers. 3. Use scientific instrumentation to evaluate the activity or function of biological macromolecules. 4. Demonstrate knowledge of analytical and preparative methods that can be applied to biochemistry. 5. Demonstrate knowledge of accepted safe laboratory practices. 6. Demonstrate laboratory experience working with a diverse group of individuals as part of a research team. 7. Demonstrate the ability to organize and document laboratory procedures and results. 8. Describe research projects in an oral presentation that can be readily understood by a general scientific audience. 9. Appreciate the ethical issues facing professionals in the life sciences. Credits: 6.00

Selectives (2-3 credits)

BCHM 64000 - Metabolic Plant Physiology

Credit Hours: 3.00. (AGRY 64000, BIOL 64000, BTNY 64000 , HORT 64000) Topics include photosynthesis, respiration, carbohydrate and lipid metabolism, and nitrogen, sulfur, and secondary metabolism. This course is the third in a series of core courses in the Purdue Plant Biology Program graduate curriculum. Prerequisite: BCHM 56100, BTNY 55300 or HORT 55300, Prerequisite: BIOL 55100 or HORT 55100.

Learning Outcomes: 1. Knowledge in basic principles of plant metabolism. 2. Skill in presenting complex ideas. 3. Critical and creative thinking skills in evaluating the primary literature. Credits: 3.00

BIOL 59500 - Special Assignments

Credit Hours: 0.00 to 18.00. Special work, such as directed reading, independent study or research, supervised library, laboratory, or field work, or presentation of material not available in the formal courses of the department. The field in which work is offered will be indicated in the student's record. Permission of instructor required.

Credits: 0.00 to 18.00

BIOL 60000 - Bioenergetics

Credit Hours: 2.00. Energy transduction in biological

membranes: physical chemical foundations; electron transfer, proton translocation; and active transport. Atomic structures of integral membrane protein complexes responsible for respiratory, photosynthetic generation of electrochemical potential; ATPase motor, and structure-based mechanisms. Offered in alternate years. Prerequisite: BCHM 56100, BCHM 56200 and CHM 37300.

Credits: 2.00

HORT 64000 - Metabolic Plant Physiology

Credit Hours: 3.00. (BCHM 64000, BTNY 64000) Topics include photosynthesis, respiration, carbohydrate and lipid metabolism, and nitrogen, sulfur, and secondary metabolism. This course is the third in a series of core courses in the Purdue Plant Biology Program graduate curriculum. Prerequisite: BCHM 56100, BTNY 55300 or HORT 55300, Prerequisite: BIOL 55100 or HORT 55100.

Learning Outcomes: 1. Knowledge in basic principles of plant metabolism. 2. Skill in presenting complex ideas. 3. Critical and creative thinking skills in evaluating the primary literature. Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

STAT 51200 - Applied Regression Analysis

Credit Hours: 3.00. Inference in simple and multiple linear regression, residual analysis, transformations, polynomial regression, model building with real data, nonlinear regression. One-way and two-way analysis of variance, multiple comparisons, fixed and random factors, analysis of covariance. Use of existing statistical computer programs. Prerequisite: Coursework in Statistical Methods with a calculus prerequisite.

Learning Outcomes: 1. Learn to build and analyze simple and multiple regression models, analysis of variance and covariance (ANOVA/ANCOVA) for regression, inference for regression, diagnostics and remedial measures for regression, transformations, residual analysis, model building, polynomial and interaction models. Credits: 3.00

BCHM 62000 - Protein Mass Spectrometry And Proteomics

Credit Hours: 2.00. The goals of this course are to introduce students to 1) basic principles of mass spectrometry, 2) the most common instruments used for protein mass spectrometry including the advantages and disadvantages of each, 3) the most common applications of protein mass spectrometry in biological research, 4) current approaches to quantitative protein mass spectrometry and their use in proteomic studies 5) the skills necessary to analyze mass spec data from a variety of experiment types including the ability to use and understand common database search programs, and 6) contemporary issues associated with large-scale proteomics experiments (including technical challenges and limitations) culminating in the ability to design appropriate experiments to answer a specific proteomic question. Prerequisite: Students need to have taken an undergraduate level biochemistry course and be familiar with basic aspects of protein structure that are taught in such courses. In the absence of an undergraduate biochemistry

course, students should discuss their qualifications with the instructor before registering.

Learning Outcomes: 1. Demonstrate an understanding of the fundamental properties and processes controlling the environmental fate of organic contaminants in subsurface environments. 2. Understand how variations in chemical structure change chemical behavior including solubility, volatility, acid-based speciation and reactivity. 3. Quantify chemical distribution between soil-air, soil-air, water-air and liquid-liquid compartments. 4. Understand and quantify how environmental and anthropogenic factors change chemical behavior and distribution in the environment. 5. Apply partition coefficients and mass balance approaches to predict chemical distribution between various environmental compartments. 6. Demonstrate an understanding of how abiotic and biotransformation processes affect chemical fate in the environment. 7. Demonstrate an understanding how chemical, soil and subsurface properties impact choice of remediation strategies. Credits: 2.00

BCHM 61200 - Bioinformatic Analysis Of Genome Scale Data

Credit Hours: 3.00. This course provides a hands-on experience for life science researchers in the bioinformatic analysis of genome-scale data. The various disciplines in the life sciences are generating a wealth of experimental and annotation data. Today's graduate students need experience with modern tools that can help them to access, explore, analyze, interpret and manage the data that they generate in the lab. Students will use the R programming language and packages from Bioconductor, the R bioinformatics project, as their principal tools for this course. Students will develop workflows in R that bridge established algorithms for bioinformatics such as limma, edgeR or DESeq2, incorporating methods to import, QC, transform and visualize genome-scale datasets derived from next generation sequencing experiments. A critical aspect of bioinformatics that is often inadequate is workflow documentation. This course will use Rmarkdown to integrate computer code, data and results to manage complex bioinformatics projects. The class has lecture, lab and distance components. Lectures will focus on the theoretical and biological aspects of bioinformatics analysis using recent examples from the literature. In lab, students will work on programming exercises or projects using published datasets. Advanced students will also have the opportunity to work with their own data. Distance instruction will include R tutorials and videos that students can work through at their own pace (subject to completion deadlines). Particular emphasis will be placed on the theoretical and practical limitations of next generation sequencing data. No prior computer programming experience is required, but it is assumed that students have a firm grasp of the fundamental principles of molecular biology and how they relate to complex processes such as gene expression and genome organization. Permission of instructor required.

Learning Outcomes: 1. Write R scripts that utilize Bioconductor packages for bioinformatic analyses. 2. Access genome-scale data sets from public repositories and import this data into R for further analysis. 3. Visualize genome-scale data sets for both quality control and presentation purposes. 4. Implement strategies to deal with genome-scale datasets including parallel computing. 5. Able to critically evaluate the bioinformatic methods and data from publications. 6. Implement "literate programming" with Rmarkdown to document and share their bioinformatics projects. Credits: 3.00

Thesis Research (5-6 credits)

BCHM 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required.

Credits: 1.00 to 18.00

Required Courses (22 credits)

BCHM 60100 - Critical Thinking And Communication In Biochemistry I

Credit Hours: 2.00. The objective of this course is to assist students in acquiring the skills needed to read critically, evaluate, and assimilate the primary scientific literature. This objective will be accomplished by instructor-guided discussions of the hypotheses, experimental data, conclusions, and scientific merit of assigned manuscript(s) taken from the fields of biochemistry and molecular biology. Topics for discussion initially will focus on the structure, organization, review process, and ethical issues related to scientific manuscripts. As the

semester progresses, discussions will focus on the hypotheses being tested, quality of the data, and validity of the conclusions. Permission of instructor required.

Learning Outcomes: 1. Understand essential graduate skills for independent research. 2. Enhance oral and written communication skills. 3. Master reading and interpreting scientific literature in biochemistry. 4. Develop critical thinking and creativity in scientific research. Credits: 2.00

BCHM 60200 - Critical Thinking And Communication In Biochemistry II

Credit Hours: 2.00. Builds on the skills developed in BCHM 601. Students will continue to enhance their analytical skills, and class discussions will be conducted at a more sophisticated level and will go into greater depth. Class discussions will focus more on the analysis and evaluation of current methodologies and hypotheses in the biochemical and molecular biological literature. Students will be evaluated primarily on their preparation and participation in each class discussion. Prerequisite: BCHM 60100. Permission of instructor required.

Learning Outcomes: 1. Understand essential graduate skills for independent research. 2. Enhance oral and written communication skills. 3. Master reading and interpreting scientific literature in biochemistry. 4. Develop critical thinking and creativity in scientific research. Credits: 2.00

BCHM 60501 - Macromolecules

Credit Hours: 3.00. This course will provide students with an understanding of the basic principles that underlie the secondary and tertiary structure of proteins and nucleic acids which contribute to their function. It will inform students of current efforts to engineer macromolecules with novel functions. Students will become familiar with methods used to determine the three-dimensional structures of macromolecules, and they will learn to critically evaluate the accuracy of structural models. Special topics in the current literature, including membrane proteins, drug design and ribozymes, will be covered. The class will typically include students from a variety of departments, graduate programs, and scientific backgrounds. The course will be taught primarily from various textbook and from the primary literature. A biochemistry course designated for majors is a prerequisite of the course. Lack of the prerequisite will require approval of the instructor. Permission of Department required.

Learning Outcomes: 1. Acquire knowledge about the chemical structures and properties of the building blocks of biological macromolecules, including amino acids and nucleic acids. 2. Develop the skills required to visualize and analyze the higher order structures of proteins and nucleic acids. 3. Acquire information literacy by learning to use online resources to explore evolutionary relationships among macromolecules, and to prepare three dimensional models of proteins and nucleic acids. Credits: 3.00

BCHM 69000 - Seminar In Biochemistry

Credit Hours: 1.00. Seminary In Biochemistry. Permission of instructor required.

Credits: 1.00

BIOL 66200 - Seminar Methods And Professional Development I

Credit Hours: 1.00. An introduction for incoming graduate students to methods of seminar presentation and critique and to various guidelines for professional development during their graduate school experience. Topics include research laboratory safety (REM), how to give a talk, acclimating to graduate studies (especially time management), how to select a major professor and an advisory committee, how to prepare for qualifying exams, Purdue University guidelines for responsible conduct of research, how to organize a poster presentation, how to negotiate with mentors, and expectations for success. The course also serves to socialize the incoming cohort of students among themselves and with more senior students in the broad range of research disciplines available.

Credits: 1.00

STAT 50300 - Statistical Methods For Biology

Credit Hours: 3.00. Introductory statistical methods, with emphasis on applications in biology. Topics include descriptive statistics, binomial and normal distributions, confidence interval estimation, hypothesis testing, analysis of variance, introduction to nonparametric testing, linear regression and correlation, goodness-of-fit tests, and contingency tables. Open only to majors related to the life sciences. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100.

Learning Outcomes: 1. Students will be able to identify and choose appropriate ways to graphically and numerically summarize data. 2. Students will be able to use basic statistical

methods to perform statistical inference and draw appropriate conclusions. 3. Students will understand the mathematical foundations of statistical inference for random samples so that they can study and utilize additional statistical methods. Credits: 3.00

GRAD 61200 - Responsible Conduct Of Research

Credit Hours: 1.00. Overview of values, professional standards, and regulations that define responsible conduct in research. Students learn the values and standards of responsible research through readings and lecture/discussion and practice application of these values and standards to research situations through class discussion of case studies from life sciences research. Students must be registered for M.S. or Ph.D. thesis research in their home department.

Credits: 1.00

BCHM 61000 - Regulation Of Eukaryotic Gene Expression

Credit Hours: 3.00. This course will provide students with a basic understanding of gene expression mechanisms with a s specific focus on newly emerging topics. This course will be taught from current primary literature, using a textbook as a background resource. Topics will include transcription, messenger RNA decay, microRNAs and connections between gene expression steps. Students will learn how to read and interpret scientific literature through class presentations, discussions and take home assignments. Additionally, students will gain experience in developing and testing hypotheses within the class topic areas and writing a research proposal. Prerequisites: BCHM 56100 and 56200, or BCHM 60501. Lack of these prerequisites will require approval by the instructor.

Learning Outcomes: 1. Basic knowledge of the molecular mechanisms in gene expression and regulation. 2. Appreciation for post-transcriptional gene regulatory events. 3. Enhancement of oral and written communication skills. 4. Mastery of reading and interpreting scientific literature in gene expression fields. 5. Development of critical thinking and creativity in scientific research. Credits: 3.00

BCHM 60300 - Introduction To Graduate Research In Biochemistry I

Credit Hours: 6.00. This course is intended to provide the opportunity for in-depth, mentored graduate research in two biochemistry laboratories. Students enrolled in this course will learn how to devise hypothesis, design experiments that test their hypotheses, accurately record their data in laboratory notebooks, critically analyze the results of their analyses and present their findings to others in written and oral presentations. They will fully participate in laboratory group meetings, the Biochemistry seminar series, and presentations by other students and postdoctoral fellow. Co-requisites: BCHM 60100 and BCHM 60501. Permission of department required.

Learning Outcomes: 1. Understand the scientific method. Develop hypotheses, design experiments, and critically analyze results to create new knowledge. 2. Communicate scientific knowledge, experiments and conclusions effectively as speakers and writers. 3. Use scientific instrumentation to evaluate the activity or function of biological macromolecules. 4. Demonstrate knowledge of analytical and preparative methods that can be applied to biochemistry. 5. Demonstrate knowledge of accepted safe laboratory practices. 6. Demonstrate laboratory experience working with a diverse group of individuals as part of a research team. 7. Demonstrate the ability to organize and document laboratory procedures and results. 8. Describe research projects in an oral presentation that can be readily understood by a general scientific audience. 9. Appreciate the ethical issues facing professionals in the life sciences. BIOL 66200 - Seminar Methods And Professional Development I

Credit Hours: 1.00. An introduction for incoming graduate students to methods of seminar presentation and critique and to various guidelines for professional development during their graduate school experience. Topics include research laboratory safety (REM), how to give a talk, acclimating to graduate studies (especially time management), how to select a major professor and an advisory committee, how to prepare for qualifying exams, Purdue University guidelines for responsible conduct of research, how to organize a poster presentation, how to negotiate with mentors, and expectations for success. The course also serves to socialize the incoming cohort of students among themselves and with more senior students in the broad range of research disciplines available.

Credits: 1.00

BIOL 66300 - Seminar Methods And Professional Development II

Credit Hours: 1.00. This course is a continuation of BIOL 66200 and expands the introduction for incoming graduate students to methods of seminar presentation and critique and to various guidelines for professional development during their graduate school experience. Topics include seminar topic selection and 20-minute seminar design, tutorials on electronic services at the PU Library and Citation Management programs, and evaluating classmate presentations. Using the skills learned the previous semester, each student is required to make a 20-minute PowerPoint presentation to the class, based on a pre-approved topic of their choice. The speaker is asked questions and the presentation receives written evaluations by all members of the class. Each student practices with the course instructor prior to the public presentation. The course also continues to socialize the incoming cohort of students among themselves and with more senior students in the broad range of research disciplines available.

Credits: 1.00

BIOL 69500 - Special Assignments

Credit Hours: 0.00 to 18.00. Special work, such as directed reading; independent study or research; supervised library, laboratory, or field work; or presentation of material not available in the formal courses of the department. The field in which work is offered will be indicated in the student's record. Primarily for Ph.D. candidates. Permission of instructor required.

Special work, such as directed reading; independent study or research; supervised library, laboratory, or field work; or presentation of material not available in the formal courses of the department. The field in which work is offered will be indicated in the student's record. Primarily for Ph.D. candidates. Permission of instructor required.

Credits: 0.00 to 18.00

Other Courses (4 credits)

BIOL 69600 - Seminar

Credit Hours: 1.00. Each semester there are several separate seminar offerings. They will likely be on the following topics: biochemistry, crystallography, ecology and population biology, genetics, mechanisms of development, microbiology, neurobiology, and plant physiology. The student's record will indicate the specific seminars in which he/she has participated. Oral presentations required. At least two credits are required of Ph.D. candidates.

Credits: 1.00

Core Courses (8 credits)

BIOL 59500 - Special Assignments

Credit Hours: 0.00 to 18.00. Special work, such as directed reading, independent study or research, supervised library, laboratory, or field work, or presentation of material not available in the formal courses of the department. The field in which work is offered will be indicated in the student's record. Permission of instructor required.

Credits: 0.00 to 18.00

BIOL 66200 - Seminar Methods And Professional Development I

Credit Hours: 1.00. An introduction for incoming graduate students to methods of seminar presentation and critique and to various guidelines for professional development during their graduate school experience. Topics include research laboratory safety (REM), how to give a talk, acclimating to graduate studies (especially time management), how to select a major professor and an advisory committee, how to prepare for qualifying exams, Purdue University guidelines for responsible conduct of research, how to organize a poster presentation, how to negotiate with mentors, and expectations for success. The course also serves to socialize the incoming cohort of students among themselves and with more senior students in the broad range of research disciplines available.

Credits: 1.00

BIOL 66300 - Seminar Methods And Professional Development II

Credit Hours: 1.00. This course is a continuation of BIOL 66200 and expands the introduction for incoming graduate students to methods of seminar presentation and critique and to various guidelines for professional development during their graduate school experience. Topics include seminar topic selection and 20-minute seminar design, tutorials on electronic services at the PU Library and Citation Management programs, and evaluating classmate presentations. Using the skills learned the previous semester, each student is required to make a 20-minute PowerPoint presentation to the class, based on a pre-approved topic of their choice. The speaker is asked questions and the presentation receives written evaluations by all members of the class. Each student practices with the course instructor prior to the public presentation. The course also continues to socialize the incoming cohort of students among themselves and with more senior students in the broad range of research disciplines available.

Credits: 1.00

BIOL 69500 - Special Assignments

Credit Hours: 0.00 to 18.00. Required Courses (11-12 credits)

BTNY 59000 - Special Problems

Credit Hours: 1.00 to 3.00. Open to graduate students and qualified undergraduates who desire to study special problems in plant science not covered in regular coursework. Credit dependent upon work done. Permission of instructor required.

Learning Outcomes: 1. Varies due to nature of the course. Credits: 1.00 to 3.00

BTNY 66000 - Scientific Writing

Credit Hours: 3.00. This is a course on coping with publication in professional journals. It covers the full range of activities involved in carrying a piece of original research to completion as a primary research article in a refereed journal. Emphasis is on principles of clear and concise technical reporting. Topics include: research and writing goals; journals' policies; data presentations; effective style; organizing, writing, revising, and processing manuscripts; proofreading; peer review; ethics; and grant proposals. Students will use their own data to prepare a manuscript as if for publication. Permission of instructor required.

Learning Outcomes: 1. Convey scientific results and concepts to a broad range of audiences effectively and clearly. 2. Order ideas such that they make logical sense to readers. 3. Understand the distinct requirements of different audiences. 4. Understand the differing requirements of review articles, research reports, and grant proposals. 5. Cite scientific literature effectively. Credits: 3.00

BTNY 69700 - Departmental Seminar Series - Botany And Plant Pathology

Credit Hours: 1.00. This is a weekly seminar course that features both external and Purdue speakers. Exposure to research topics outside of a student's immediate research area is an important part of graduate student education. The goal of the seminar series course is to provide opportunities for graduate students to learn about the latest research advances plant biology, plant pathology, and weed science and to interact with visiting seminar speakers.

Learning Outcomes: 1. Learn about recent research advances in Plant Biology, Plant Pathology, and Weed Science. 2. Learn best practices for asking questions and interacting with seminar speakers. 3. Acquire new ideas for giving effective oral presentations by active listening to seminar presentations. Credits: 1.00

HORT 60300 - Grants And Grantsmanship

Credit Hours: 1.00. Focuses on funding opportunities in agricultural research and techniques of writing successful scientific grant proposals. Students will write a proposal on a research topic of their choice during the course, and they will gain experience in the peer review process by preparing written reviews of proposals and participating in a panel meeting in which proposals are discussed and ranked.

Credits: 1.00

STAT 50300 - Statistical Methods For Biology

Credit Hours: 3.00. Introductory statistical methods, with emphasis on applications in biology. Topics include descriptive statistics, binomial and normal distributions, confidence interval estimation, hypothesis testing, analysis of variance, introduction to nonparametric testing, linear regression and correlation, goodness-of-fit tests, and contingency tables. Open only to majors related to the life sciences. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100.

Learning Outcomes: 1. Students will be able to identify and choose appropriate ways to graphically and numerically summarize data. 2. Students will be able to use basic statistical methods to perform statistical inference and draw appropriate conclusions. 3. Students will understand the mathematical foundations of statistical inference for random samples so that

they can study and utilize additional statistical methods. Credits: 3.00

GRAD 61200 - Responsible Conduct Of Research

Credit Hours: 1.00. Overview of values, professional standards, and regulations that define responsible conduct in research. Students learn the values and standards of responsible research through readings and lecture/discussion and practice application of these values and standards to research situations through class discussion of case studies from life sciences research. Students must be registered for M.S. or Ph.D. thesis research in their home department.

Credits: 1.00

BTNY 69100 - Skills For Success In Grad School

Credit Hours: 1.00. This course is aimed at first year graduate students in the Botany department. Its purpose is to introduce the students to the department, teach them what it takes to be a successful graduate students, and to help them develop effective written and oral communication skills.

Learning Outcomes: 1. Advance knowledge and scholarship. 2. Demonstrate critical thinking and problem solving. 3. Exhibit ethical conduct. 4. Communicate effectively. 5. Develop professionalism. Credits: 1.00

Electives (12-13 credits)

Thesis Research (6 credits)

BTNY 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required.

Learning Outcomes: 1. Acquire training in the signature areas of the department of Botany and Plant pathology: plant biology, plant pathology, and weed science, and their subdisciplines. 2. Understand applied and molecular plant pathology. 3. Learn plant biology from cell biology to evolutionary and developmental biology, ecology. 4. Learn weed control and management, weed biology and related areas. 5. Learn how to communicate scientific ideas in written and oral form. 6. Learn best practices for asking research questions and working as part of a scientific team. Credits: 1.00 to 18.00

Required Courses (11-12 credits)

Concentrations

GPA Requirements

About the Program

Business Administration, MBA

About the Program

Program Requirements

Required Courses (31 credits)

Foundational Courses (9 credits)

ECON 60600 - Microeconomics I

Credit Hours: 1.00 to 3.00. An introduction to basic consumer and producer theory, competitive markets (including using the continuum to model competition), basic general equilibrium theory, and basic risk/uncertainty. Co-requisite: ECON 61500.

Learning Outcomes: 1. Demonstrate basic knowledge of both basic consumer and producer theory as used in graduate level economics 2. Develop and use a standard toolkit of mathematical methods to set up and solve problems in these area. 3. Assess through a series of homework and exams. Credits: 1.00 to 3.00

MGMT 62000 - Marketing Management

Credit Hours: 2.00 to 4.00 (West Lafayette and Calumet) 3.00 (North Central). An integrated analysis of major marketing decisions, including product pricing, advertising, distribution, and sales force policies. Prerequisite: Master's student standing and Management majors only.

Credits: 2.00 to 4.00

MGMT 60600 - Seminar In External Reporting I

Credit Hours: 2.00 to 4.00. Seminar examines research issues on the production, dissemination, and use of financial accounting information for economic decisions by external users. The materials covered are primarily empirically oriented. The aim is to expose students to these issues as they are covered in the accounting and related literature. Prerequisite: ECON 60000 .

Credits: 2.00 to 4.00

MGMT 60000 - Accounting For Managers

Credit Hours: 2.00 to 3.00 (West Lafayette) 3.00 (Calumet, North Central). The two-course accounting sequence employs a user's perspective on the firm's database. First, the standard accounting model is developed into a working tool, as no prior study of accounting is assumed. Then illustrative business cases are discussed to show how external reports conform to financial contracts and public regulation. Public reports primarily directed to investors and creditors are analyzed to reconstruct the economic events and managerial decisions underlying generally accepted accounting standards. Prerequisite: Masters student standing and Management majors only.

Credits: 2.00 to 3.00

Core Courses (22 credits)

ECON 51500 - Macroeconomics

Credit Hours: 1.00 to 3.00. Investigation of the causes of macroeconomic fluctuations in the economy. Looks at changes in inflation, unemployment, real output, interest rates, and exchange rates, and explores why they occur, what their effects are, and what, if any, role government should play in dealing with these problems. A mixture of theory and case studies with reference to historical case studies. Current macroeconomic problems will be discussed with a focus on the international aspects of macroeconomic problems.

Learning Outcomes: 1. Predict the macroeconomic impact of fiscal and monetary policies using the mathematical IS/LM models. 2. Demonstrate an understanding of the interdependencies and complexities with respect to international trade of goods and services as well as capital flows. 3. Analyze the possible economic/social impacts of various policy proposals from a historic perspective. Credits: 1.00 to 3.00

MGMT 68300 - Technology-Driven Business

Credit Hours: 2.00 to 3.00. Digital technologies such as the Internet, IoT, and AI are rapidly and fundamentally transforming today's companies and industries. They have enabled completely new ways for companies to organize work, generate innovations, make decisions, and interact with customers, suppliers, and competitors. This course is designed for students who want to deeply analyze digital transformations and, more importantly, manage technology-driven businesses. Applying information economics principles and theoretical rigor, this course studies how digital technologies affect consumer behavior, business model innovations, market design, and competitive outcomes. This course trains students to apply data analytics skills to real business problems and develop a rich understanding of the strategic value of digital transformations.
Learning Outcomes: 1. Develop analytical and quantitative skills to analyze and formulate business decisions. 2. Understand current business technologies and related knowledge to translate data into useful information for decision making. 3. Become familiar with the ethical issues that individuals face in organizations. 4. Develop effective written and oral communication skills. 5. Develop the leadership and teamwork skills to function effectively in a diverse, cross-functional environment. 6. Develop awareness of global and multicultural issues relating to business decisions. Credits: 2.00 to 3.00

MGMT 67000 - Business Analytics

Credit Hours: 2.00 to 4.00. Introduction to quantitative decision procedures under uncertainty. Applications of descriptive statistics, probability models, simulation models, interval estimates, and hypothesis testing to management problems. Managerial-oriented cases are used in instruction. Prerequisite: Master's student standing and Management majors only.

Credits: 2.00 to 4.00

MGMT 66000 - Introduction To Operations Management

Credit Hours: 2.00 to 4.00 (West Lafayette) 3.00 (Calumet, North Central). As goods and services are produced and distributed, they move through a set of inter-related operations or processes in order to match supply with demand. The design of these operations for strategic advantage, investment in improving their efficiency and effectiveness, and controlling these operations to meet performance objectives is the domain of Operations Management. The primary objective of the course is to provide an overview of this important functional area of business. Prerequisite: MGMT 67000 .

Credits: 2.00 to 4.00

MGMT 65000 - Strategic Management I

Credit Hours: 2.00 to 4.00. Concepts and methods that integrate previous training in functional areas of management. The perspective is that of the general manager charged with directing the total enterprise. Emphasis is given to formulation and implementation of strategy. Prerequisite: MGMT 61000 , MGMT 62000 , Master's student standing and Management majors only.

Credits: 2.00 to 4.00

MGMT 63000 - Legal And Social Foundations Of Management

Credit Hours: 2.00 to 4.00. An examination of the nature of the legal environment from the viewpoint of the social and moral bases of law. Emphasis is given to the operation of our legal system and its significance in decision functions of management. Prerequisite: Master's student standing and Management majors only.

Learning Outcomes: 1. Recommend appropriate actions in the business environment based on an understanding sources of law, legal process and procedure, and available remedies determine appropriate actions in the business environment based on an understanding of agency law concepts and employment laws, focusing on Title VII and related laws. 2. Analyze contractual rights, obligations, liabilities, and remedies in the business environment. 3. Evaluate tort rights, obligations, liabilities, and remedies in the business environment. 4. Identify the legal constraints faced by the business professional as well as the legal options available to the business professional in responding to and

resolving legal issues. 5. Recognize and analyze the laws that affect contemporary businesses, including the laws relating to agency and employment, securities regulation, the organization of a business, and the legal liability of accountants. 6. Describe the ways in which various effect governmental regulations affect contemporary business practices. 7. Evaluate ethical problems that are integrally connected to the legal issues. Credits: 2.00 to 4.00

MGMT 61000 - Financial Management

Credit Hours: 0.00 to 4.00. Analysis of short-term working capital needs. Cash budgeting procedures, pro forma statements, major types of short-term loan arrangements, and short-term asset management. Prerequisite: MGMT 60000, Master's student standing or higher and Management and Computational Finance majors only.

Learning Outcomes: 1. Explain how the Statement of Cash Flows can be used to diagnose operating performance and describe the calculation and use of financial ratios. 2. Define financial ratio analysis and explain how ratios reflect financial performance. 3. Examine how a company's financial plan is shaped by a company's operating strategy. 4. Recognize how seasonal patterns of activity affect a company's financial plan. 5. Discuss long-term financial planning. 6. Compare compounding interest rates, discounting cash flows, and bond valuation. 7. Recognize techniques used in project analyses and capital budgeting, as well as incremental cost and revenue in capital project analysis. 8. Apply capital structure theory in practice. Credits: 0.00 to 4.00

ECON 54100 - Managerial Economics & Business Strategy

Credit Hours: 1.00. The course covers topics such as monopolies (price discrimination, optimal pricing strategies), advanced strategic decision-making and imperfect competition (optimal pricing and production), new product introductions, product variety offered on the market, and entry deterrence strategies. The main goal of this course is to provide a basis for a good understanding of the logical mechanics, and to provide a good intuition in managerial economics and business decision-making processes that facilitate the understanding of daily business problems.

Learning Outcomes: 1. Identify and explain logical mechanics that determine individuals' choices and decisions. 2. Evaluate managerial economic problems to better identify daily business problems. 3. Apply key aspects such as marginal concepts and countervailing effects when proposing solutions. 4. Illustrate main mechanisms using graphs and apply basic knowledge of algebra and calculus to business problems. Credits: 1.00

Specialization Courses (6-9 credits)

Finance and Economics

Computational Finance (8 credits)

MGMT 61400 - Investments

Credit Hours: 2.00 to 4.00. Examination of the process of asset valuation. Emphasis on portfolio analysis, security selection, risk-return relationships, and performance evaluation. Additional topics considered include security analysis, option pricing and analysis, futures contracts, and security market operations.

Learning Outcomes: 1. Develop a sound foundation for the main concepts in investment management and portfolio theory. 2. Understand how stock, bond, and option prices are determined. 3. Learn the analytical tools and financial theory necessary to understand how financial assets are used for investment decisions. 4. Take a critical look at the process of investing and relate the topics covered to current real-world problems relevant to practitioners. 5. Prepare students for more advanced courses in investments, portfolio management, and corporate finance. Credits: 2.00 to 4.00

MGMT 57100 - Data Mining

Credit Hours: 2.00. Introduces the concepts, techniques, tools, and applications of data mining. The material is approached from the perspective of a business analyst, with an emphasis on supporting tactical and strategic decisions. Includes a variety of techniques to identify nuggets of information or decision-making knowledge in bodies of data, and extracting these in such a way that they can be put to use in the area, such as decision support, prediction, forecasting, and estimation.

Credits: 2.00

Corporate Finance (8 credits)

MGMT 64500 - Mergers, Acquisitions, And Corporate Control

Credit Hours: 2.00 to 4.00. Focuses on firms' internal governance structures and on pressure from the external market for corporate control, including executive compensation, board of directors' composition, shareholder activism, mergers, and takeovers. Prerequisite: MGMT 61000 .

Credits: 2.00 to 4.00

MGMT 61400 - Investments

Credit Hours: 2.00 to 4.00. Examination of the process of asset valuation. Emphasis on portfolio analysis, security selection, risk-return relationships, and performance evaluation. Additional topics considered include security analysis, option pricing and analysis, futures contracts, and security market operations.

Learning Outcomes: 1. Develop a sound foundation for the main concepts in investment management and portfolio theory. 2. Understand how stock, bond, and option prices are determined. 3. Learn the analytical tools and financial theory necessary to understand how financial assets are used for investment decisions. 4. Take a critical look at the process of investing and relate the topics covered to current real-world problems relevant to practitioners. 5. Prepare students for more advanced courses in investments, portfolio management, and corporate finance. Credits: 2.00 to 4.00

MGMT 61100 - Advanced Corporate Finance

Credit Hours: 2.00 to 4.00 (West Lafayette, Calumet) 3.00 (North Central). Long-term capital structure planning, capital budgeting, treatment of uncertainty in investment decisions, security underwriting, dividend policies, and mergers. Prerequisite: MGMT 61000.

Learning Outcomes: 1. Outline and describe Corporate Financial Policies and understand their potential impact of firm value. 2. Value real options in capital budgeting projects using the Black Scholes, the risk-neutral probability and the duplicating portfolio models. 3. Understand the use of and characteristics of various alternatives to corporate finance including leasing, convertible bonds, and structured finance. Credits: 2.00 to 4.00

MGMT 57100 - Data Mining

Credit Hours: 2.00. Introduces the concepts, techniques, tools, and applications of data mining. The material is approached from the perspective of a business analyst, with an emphasis on supporting tactical and strategic decisions. Includes a variety of techniques to identify nuggets of information or decision-making knowledge in bodies of data, and extracting these in such a way that they can be put to use in the area, such as decision support, prediction, forecasting, and estimation.

Credits: 2.00

Financial Economics (8 credits)

ECON 52000 - Industrial Economics

Credit Hours: 2.00. This course will explore the division of economic activity among industries in developed and less-developed countries. It will examine patterns of private and public ownership in different countries. It will discuss the determinants of market and firm structure, firm conduct, and market performance in imperfectly competitive markets, and different approaches to regulating such markets. Emphasis is placed on using basic economic models of firm and industry behavior to explain and analyze real-world markets. Permission of department required.

Learning Outcomes: 1. Students will be able to apply economic analysis and model to explain real-world firm and industry behavior. Credits: 2.00

ECON 53800 - International Economics

Credit Hours: 2.00 or 3.00. The course covers selected topics in international trade with a focus on real world applications.

Learning Outcomes: 1. Identify the effects of international trade on wages, prices or products and welfare of nations. 2. Develop models as well as a diverse set of academic papers to discuss current policy debates. Credits: 2.00 or 3.00

ECON 53700 - Health Economics

Credit Hours: 2.00 or 3.00. This course is designed to introduce masters' students in economics to the field of health economics. We will analyze health and health care theories, institutions, and key policy issues. The course covers how the markets for health and health services are different from other goods, with a particular emphasis on the role of government and market failure. We will examine the demand for and the production of health and health care, and the behavior and organization of health care providers. We will also explore information asymmetries and the functioning of health insurance markets. We will consider health and healthcare systems around the world, paying particular attention to the U.S. health care system and recent reforms to it.

Learning Outcomes: 1. Know key details relating to the structure of the U.S. health care system, and be able to describe key institutions and programs involved in U.S. health care and health insurance. 2. Discuss the special features of health and health care that present challenges for economic analysis and policy development, including in terms of health care reform. 3. Apply economic concepts and approaches to understanding key health economics issues. 4. Explain, in broad terms, what health care systems look like in other countries and how they differ from the U.S. 5. Apply economic concepts and insights from public health to the current Covid-19 pandemic. Credits: 2.00 or 3.00

ECON 57300 - Financial Econometrics

Credit Hours: 2.00. This course offers an introduction of basic principles of econometric analysis that will help students understand finance theories and their empirical applications. It will also equip students with appropriate statistical techniques for doing applied financial research. The statistical techniques are particularly well suited for analyzing financial time-series data. Permission of department required.

Learning Outcomes: 1. The student will be able to apply Econometric time series methods to analysis financial data. Credits: 2.00

Supply Chain Management

Supply Chain Strategy (10 credits)

MGMT 56600 - Global Supply Chain Management

Credit Hours: 2.00. This course will integrate issues from marketing (channels of distribution), logistics, and operations management to develop a broad understanding of a supply chain in a global context. Students will learn how different factors, including exchange rate risk, custom duty and trading policies, geographic distribution of resources and demand, availability and reliability of local supplier, and characteristics of consumer, affect the design and execution of global supply chain strategies. Prerequisites: Students are expected to have taken a basic course on operations (such as the masters core class MGMT 66000: Introduction to Operations Management) and a basic course on supply chain management (such as the masters elective MGMT 66400: Supply Chain Management). Exposure to a course on optimization is also preferred, but not required. The course requires logical and analytical thinking.

Learning Outcomes: 1. Train the students to understand the issues in managing a global supply chain and to manage them and optimize their performance. It requires critical thinking through the participation of games, case discussions, and presentation of case assignments. Credits: 2.00

MGMT 56500 - Strategic Sourcing And Procurement

Credit Hours: 2.00. This course will address the process of procurement including terminology, metric, and decision making. Additionally, we will investigate the best practices and processes for managing the relationships with suppliers and their performance. We will also explore the sourcing decision and the strategic ramifications of producing/ providing goods and services internally or purchasing them from external organizations. Prerequisites: Students are expected to have taken a basic course on operations (such as the masters core class MGMT 66000: Introduction to Operations Management) and a basic course on supply chain management (such as the masters elective MGMT 66400: Supply Chain Management).

Learning Outcomes: 1. Develop a good understanding of sourcing and procurement

strategies and enhance the student's analytical skills to make optimal sourcing and procurement decisions. It requires critical thinking through the participation of games, case discussions and presentation of case assignments. Credits: 2.00

MGMT 56900 - Ethical And Sustainable Supply Chain Management

Credit Hours: 2.00 or 3.00. This course provides students with knowledge and skills for building and analyzing ethical and sustainable practices in supply chains, taking a holistic view of the interaction between businesses, the environment, and society.

Learning Outcomes: 1. Run life-cycle analysis (LCA) and interpret findings. 2. Analyze product and process performance through life-cycle thinking. 3. Understand the Tragedy of the Commons in the business context and identify the underlying reasons. 4. Assess pros and cons of various solutions to the Tragedy of the Commons problem in business context. 5. Identify and explain various product stewardship practices and their pros and cons. 6. Identify innovative business models, such as Servicizing, based on sustainable use of products and services. 7. Compare and contrast traditional supply chain with closed-loop supply chain. 8. Compare and contrast different types of contracts and practices for incentivizing compliance with ethical and sustainable conduct throughout the supply chain. 9. Identify and analyze opportunities and constraints in building ethical and sustainable supply chains. 10. Compare and contrast alternative ways of complying with environmental and social regulations such as carbon trading. Credits: 2.00 or 3.00

MGMT 56200 - Project Management

Credit Hours: 2.00. Emphasizes the use of PC-based project management software and its applications, particularly in manufacturing organizations and especially new product development projects. Extensive use is made of several case studies to illustrate the planning and monitoring of a project. Class is held in a computer lab.

Learning Outcomes: 1. Understand the importance and challenges of managing projects of various types and sizes. 2. Learn and apply tools for project selection, team formation, and requirements gathering. 3. Create detailed budgets and schedules. 4. Acquire analytical capabilities for monitoring projects and investigating variances in scope, budget, and schedules. 5. Improve their ability to concisely communicate project information to senior management. Credits: 2.00

MGMT 65440 - Change Management

Credit Hours: 2.00. The purpose of this course is to provide you with essential tools and concepts you need to help create and sustain needed change in your personal and/or professional life, in your work teams and in organizations. This course is taught in an executive style format, intended for working future managers with emphasis on knowledge application and experiential learning.

Learning Outcomes: 1. Understand how classic and contemporary change models can be used to create and sustain change in individuals, teams, and organizations. 2. Understand how micro-level barriers to change are often overlooked, and how to overcome them. 3. Learn to influence others when holding them accountable so that they choose to change. 4. Understand fundamental sources of power and how they can be appropriately used to influence others to change. 5. Understand how and when to utilize different leadership to lead change, and how to anticipate blind spots to be more influential. 6. Understand how individual differences within teams impact effectiveness and change. 7. Apply program materials to create a personal leadership development plan, and learn how to avoid regression to the status quo. Credits: 2.00

Supply Chain Analytics (10 credits)

MGMT 56600 - Global Supply Chain Management

Credit Hours: 2.00. This course will integrate issues from marketing (channels of distribution), logistics, and operations management to develop a broad understanding of a supply chain in a global context. Students will learn how different factors, including exchange rate risk, custom duty and trading policies, geographic distribution of resources and demand, availability and reliability of local supplier, and characteristics of consumer, affect the design and execution of global supply chain strategies. Prerequisites: Students are expected to have taken a basic course on operations (such as the masters core class MGMT 66000: Introduction to Operations Management) and a basic course on supply chain management (such as the masters elective MGMT 66400: Supply Chain Management). Exposure to a course on optimization is also preferred, but not required. The course requires logical and analytical thinking.

Learning Outcomes: 1. Train the students to understand the issues in managing a global supply chain and to manage them and optimize their performance. It requires critical thinking through the participation of games, case discussions, and presentation of case assignments. Credits: 2.00

MGMT 56500 - Strategic Sourcing And Procurement

Credit Hours: 2.00. This course will address the process of procurement including terminology, metric, and decision making. Additionally, we will investigate the best practices and processes for managing the relationships with suppliers and their performance. We will also explore the sourcing decision and the strategic ramifications of producing/ providing goods and services internally or purchasing them from external organizations. Prerequisites: Students are expected to have taken a basic course on operations (such as the masters core class MGMT 66000: Introduction to Operations Management) and a basic course on supply chain management (such as the masters elective MGMT 66400: Supply Chain Management).

Learning Outcomes: 1. Develop a good understanding of sourcing and procurement strategies and enhance the student's analytical skills to make optimal sourcing and procurement decisions. It requires critical thinking through the participation of games, case discussions and presentation of case assignments. Credits: 2.00

ECON 57600 - Statistical & Machine Learning

Credit Hours: 2.00 or 3.00. This is an introductory course in statistical and machine learning. It will cover fundamental concepts and essential tools that are critical in understanding cutting-edge machine learning techniques. Students will develop skills in applying a wide
variety of modeling and prediction methods. Topics include linear regression, classification, regularization and shrinkage methods, tree-based methods, and support vector machines. An integral part of this course is the extensive use of the open source statistical software R. Students will gain hands-on experience in analyzing datasets commonly used in business and economics.

Learning Outcomes: 1. Develop skills in applying a wide variety of modeling and prediction methods. Topics include linear regression, classification, regularization and shrinkage methods, tree-based methods, and support vector machines. An integral part of this course is the extensive use of the open source statistical software R. 2. Gain hands-on experience in analyzing datasets commonly used in business and economics. Credits: 2.00 or 3.00

MGMT 56200 - Project Management

Credit Hours: 2.00. Emphasizes the use of PC-based project management software and its applications, particularly in manufacturing organizations and especially new product development projects. Extensive use is made of several case studies to illustrate the planning and monitoring of a project. Class is held in a computer lab.

Learning Outcomes: 1. Understand the importance and challenges of managing projects of various types and sizes. 2. Learn and apply tools for project selection, team formation, and requirements gathering. 3. Create detailed budgets and schedules. 4. Acquire analytical capabilities for monitoring projects and investigating variances in scope, budget, and schedules. 5. Improve their ability to concisely communicate project information to senior management. Credits: 2.00

Leadership

Leadership Fundamentals (6 credits)

MGMT 65430 - Negotiations In Organizations

Credit Hours: 1.00 to 3.00. Decision making examines organizational context, stages, creativity, biases, and group processes. Negotiations examine strategies for preparing and conducting negotiations. The principal focus is on individual and interpersonal aspects of each. Permission of department required.

Learning Outcomes: 1. Understand the basic components of business negotiations through reading and completing assignments based on the textbook chapters. 2. Learn the basic components of a negotiated contract by completing a business transaction in written form. 3. Attain pragmatic negotiations skills using the I-Message method for daily activities encompassing negotiation tactics and the Verbal Skills method for more sophisticated negotiations for a major business transaction. 4. Explore cultural differences in negotiations by completing a study of practice in two countries other than the U.S. and sharing results with other students to expand their cultural knowledge base. 5. Explore and practice alternative dispute resolution techniques including mediation and arbitration. 6. Demonstrate the negotiations skills they are attaining by participating in class role-plays and by completing a final major negotiation in class. Credits: 1.00 to 3.00

MGMT 65420 - Leadership

Credit Hours: 1.00 to 3.00. Examines organizational leadership responsibilities, forms of leadership, the acquisition, use, and consequences of power, critical leader skills, and how corporate environments shape leadership. Emphasis on self-discovery and development of managerial leadership knowledge and skills.

Learning Outcomes: 1. Increase conceptual understanding of key leadership principles and strategies utilized within formal organizations. 2. Have deepening knowledge regarding important interpersonal relationship skills and abilities. 3. Help students discover important insights into oneself as a leader (including strengths and weaknesses/opportunities for personal growth). Credits: 1.00 to 3.00

MGMT 65440 - Change Management

Credit Hours: 2.00. The purpose of this course is to provide you with essential tools and concepts you need to help create and sustain needed change in your personal and/or professional life, in your work teams and in organizations. This course is taught in an executive style format, intended for working future managers with emphasis on knowledge application and experiential learning.

Learning Outcomes: 1. Understand how classic and contemporary change models can be used to create and sustain change in individuals, teams, and organizations. 2. Understand how micro-level barriers to change are often overlooked, and how to overcome them. 3. Learn to influence others when holding them accountable so that they choose to change. 4. Understand fundamental sources of power and how they can be appropriately used to influence others to change. 5. Understand how and when to utilize different leadership to lead change, and how to anticipate blind spots to be more influential. 6. Understand how individual differences within teams impact effectiveness and change. 7. Apply program materials to create a personal leadership development plan, and learn how to avoid regression to the status quo. Credits: 2.00

Leading Change and Innovation (8 credits)

MGMT 64500 - Mergers, Acquisitions, And Corporate Control

Credit Hours: 2.00 to 4.00. Focuses on firms' internal governance structures and on pressure from the external market for corporate control, including executive compensation, board of directors' composition, shareholder activism, mergers, and takeovers. Prerequisite: MGMT 61000 .

Credits: 2.00 to 4.00

MGMT 35500 - Consulting Tools And Skills

Credit Hours: 3.00. This novel course will provide an opportunity for motivated students to gain exposure to the skills and tools necessary to succeed in the consulting industry. There will be a chance to work in small teams to define client problems, collect and analyze data, develop solution proposals, and implement recommendations. Students will also be given an insider's look into the history of consulting, common types of consulting, and professional standards in this specialized area of management. Honing skills in project management, presentation delivery, storytelling, and stakeholder engagement will form the foundation of the tools used to solve client challenges.

Learning Outcomes: 1. Effectively and confidently use specific consulting business language. 2. Critically analyze resumes and case interviews. 3. Effectively research businesses and unfamiliar industries. 4. Use a consulting approach to problem solving. 5. Present a professional, engaging, and authentic persona. Credits: 3.00

MGMT 65330 - HR Strategy

Credit Hours: 2.00 to 3.00. Survey of theory and techniques used in human resource management within organizations. Emphasis is placed on HRM, Strategic HRM, Managing Human Resources Globally, and Strategically Managing Human Resource Functions.

Learning Outcomes: 1. Understand the history of human resource management and how it has evolved to the strategic level. 2. Understand what strategic Human Resource Management means and entails. 3. Understand and complete a Human Resource Management Strategic plan. 4. Make yourself an invaluable resource to upper level management and the CEO by demonstrating the extreme importance and value of Strategic Human Resource management. Credits: 2.00 to 3.00

Leading Technical Teams (8-9 credits)

MGMT 56200 - Project Management

Credit Hours: 2.00. Emphasizes the use of PC-based project management software and its applications, particularly in manufacturing organizations and especially new product development projects. Extensive use is made of several case studies to illustrate the planning and monitoring of a project. Class is held in a computer lab.

Learning Outcomes: 1. Understand the importance and challenges of managing projects of various types and sizes. 2. Learn and apply tools for project selection, team formation, and requirements gathering. 3. Create detailed budgets and schedules. 4. Acquire analytical capabilities for monitoring projects and investigating variances in scope, budget, and schedules. 5. Improve their ability to concisely communicate project information to senior management. Credits: 2.00

Analytics

Business Analytics Fundamentals (21 credits)

MGMT 57000 - Spreadsheet Modeling And Simulation

Credit Hours: 2.00. Covers up-to-date and practical spreadsheet modeling tools, which can be applied to a wide variety of business problems in finance, marketing, and operations. Consists of simulation modeling techniques to analyze risk and uncertainties in business environment, optimization techniques to determine the best managerial actions under internally- and/or externally-imposed constraints, and real-world examples and cases to demonstrate broad applications of spreadsheet modeling and simulations in manufacturing and service operations, supply chain systems, yield management, asset dynamics, option pricing, etc.

Learning Outcomes: 1. Identify the most likely description of the uncertainty in future business with data analysis techniques, such as Pivot Table, PivotChart, fitting probabilities to data, etc. 2. Use deterministic and stochastic optimization techniques to determine the best managerial actions under internally- and/or externally-imposed constraints. 3. Analyze the risk and uncertainty in business environment and process with simulation modeling techniques. 4. Review and criticize peer's

participation in and contribution to group work. Credits: 2.00

MGMT 57100 - Data Mining

Credit Hours: 2.00. Introduces the concepts, techniques, tools, and applications of data mining. The material is approached from the perspective of a business analyst, with an emphasis on supporting tactical and strategic decisions. Includes a variety of techniques to identify nuggets of information or decision-making knowledge in bodies of data, and extracting these in such a way that they can be put to use in the area, such as decision support, prediction, forecasting, and estimation.

Credits: 2.00

MGMT 58700 - Using R For Analytics

Credit Hours: 2.00. R has been one of the leading open-source programming languages used by analytics professionals today. You will develop the ability to interpret and modify R code to perform data analysis using the popular RStudio integrated development environment (IDE). During the first four weeks programming syntax, data structures, logic, functions, data loading, data reshaping, and shiny tool creation will be discussed to establish the necessary foundation to turn your data into insights using R. In every class we will discuss and apply a new R library or set of functions. During the last three weeks of the course you will perform descriptive, predictive, and prescriptive analytics with R. Assignments are both conceptual and hands-on exercises. The culmination of this course entails a final team project where you design, develop, and present a working Shiny application prototype that integrates descriptive, predictive, and prescriptive analytics to support a business problem. Permission of department required.

Learning Outcomes: 1. Ability to interpret and modify R code to perform data analysis. 2. Perform descriptive, predictive, and prescriptive analytics with R. 3. Design, develop, and present a working R-Shiny app that integrates descriptive, predictive, and prescriptive analytics to provide end-user decision support. Credits: 2.00

Marketing Analytics (9 credits)

ECON 52000 - Industrial Economics

Credit Hours: 2.00. This course will explore the division of economic activity among industries in developed and less-developed countries. It will examine patterns of private and public ownership in different countries. It will discuss the determinants of market and firm structure, firm conduct, and market performance in imperfectly competitive markets, and different approaches to regulating such markets. Emphasis is placed on using basic economic models of firm and industry behavior to explain and analyze real-world markets. Permission of department required.

Learning Outcomes: 1. Students will be able to apply economic analysis and model to explain real-world firm and industry behavior. Credits: 2.00

MGMT 52500 - Marketing Analytics

Credit Hours: 2.00. This course introduces modern statistical methods for marketing using big data. Firms are increasingly facing vast amounts of data on their customers and the marketplace, thanks to the rapid development of information technology in the last couple of decades. The challenge is becoming more about how to turn the big data into information and insights to improve firms' marketing decisions and profitability. This course discusses marketing applications for which we may use econometric, statistical, and machine-learning methods to improve and optimize decisions. Students will use RStudio to analyze real-world data and gain hands-on experience on data manipulation, visualization, and analysis. Intro-level Statistics/econometrics (at the level of STAT 35000 or ECON 47200) and R coding experience (comfortable with manipulating data, plotting, defining functions, using for loops, and running linear and logistic regressions in R) are required prerequisites.

Learning Outcomes: 1. Enable students to articulate analytical process and logic for selecting a particular marketing strategy/plan 2. Enable students to do (and also evaluate/critique) good marketing research in their respective careers 3. Marketing knowledge and critical thinking Credits: 2.00

MGMT 58600 - Python Programming

Credit Hours: 2.00 or 3.00. Because data grows exponentially and becomes complex, we need computational methods to collect, store, and analyze them in order to be successful in science, engineering, business, and other professions. Python Programming, is an introductory programming class that meets this need. You will learn how to write computer programs in Python language to solve real-world problems. This class is designed for students that want to learn to computer programming for data science. This course guides students through the basic Python programming language, from initial concepts to final data analysis using python and external packages.

Learning Outcomes: 1. Understand the basic programming concepts. 2. Understand the basic syntax and semantics of the Python language. 3. Understand the primitive data types build into Python. 4. Understand principles of data storage and manipulation. 5. Understand and use computer programming for basic interactive web applications. 6. Able to design, write and debug simple program to handle real-world data. Credits: 2.00 or 3.00

ECON 53800 - International Economics

Credit Hours: 2.00 or 3.00. The course covers selected topics in international trade with a focus on real world applications.

Learning Outcomes: 1. Identify the effects of international trade on wages, prices or products and welfare of nations. 2. Develop models as well as a diverse set of academic papers to discuss current policy debates. Credits: 2.00 or 3.00

ECON 53700 - Health Economics

Credit Hours: 2.00 or 3.00. This course is designed to introduce masters' students in economics to the field of health economics. We will analyze health and health care theories, institutions, and key policy issues. The course covers how the markets for health and health services are different from other goods, with a particular emphasis on the role of government and market failure. We will examine the demand for and the production of health and health care, and the behavior and organization of health care providers. We will also explore information asymmetries and the functioning of health insurance markets. We will consider health and healthcare systems around the world, paying particular attention to the U.S. health care system and recent reforms to it.

Learning Outcomes: 1. Know key details relating to the structure of the U.S. health care system, and be able to describe key institutions and programs involved in U.S. health care and health insurance. 2. Discuss the special features of health and health care that present challenges for economic analysis and policy development, including in terms of health care reform. 3. Apply economic concepts and approaches to understanding key health economics issues. 4. Explain, in broad terms, what health care systems look like in other countries and how they differ from the U.S. 5. Apply economic concepts and insights from public health to the current Covid-19 pandemic. Credits: 2.00 or 3.00

ECON 57300 - Financial Econometrics

Credit Hours: 2.00. This course offers an introduction of basic principles of econometric analysis that will help students understand finance theories and their empirical applications. It will also equip students with appropriate statistical techniques for doing applied financial research. The statistical techniques are particularly well suited for analyzing financial time-series data. Permission of department required.

Learning Outcomes: 1. The student will be able to apply Econometric time series methods to analysis financial data. Credits: 2.00

Capstone Project (2 credits)

Electives (6 credits)

About the Program

Business Analytics, MS

About the Program

Program Requirements

Required Courses (11 credits)

MGMT 68300 - Technology-Driven Business

Credit Hours: 2.00 to 3.00. Digital technologies such as the Internet, IoT, and AI are rapidly and fundamentally transforming today's companies and industries. They have enabled completely new ways for companies to organize work, generate innovations, make decisions, and

interact with customers, suppliers, and competitors. This course is designed for students who want to deeply analyze digital transformations and, more importantly, manage technology-driven businesses. Applying information economics principles and theoretical rigor, this course studies how digital technologies affect consumer behavior, business model innovations, market design, and competitive outcomes. This course trains students to apply data analytics skills to real business problems and develop a rich understanding of the strategic value of digital transformations.
Learning Outcomes: 1. Develop analytical and quantitative skills to analyze and formulate business decisions. 2. Understand current business technologies and related knowledge to translate data into useful information for decision making. 3. Become familiar with the ethical issues that individuals face in organizations. 4. Develop effective written and oral communication skills. 5. Develop the leadership and teamwork skills to function effectively in a diverse, cross-functional environment. 6. Develop awareness of global and multicultural issues relating to business decisions. Credits: 2.00 to 3.00

MGMT 67000 - Business Analytics

Credit Hours: 2.00 to 4.00. Introduction to quantitative decision procedures under uncertainty. Applications of descriptive statistics, probability models, simulation models, interval estimates, and hypothesis testing to management problems. Managerial-oriented cases are used in instruction. Prerequisite: Master's student standing and Management majors only.

Credits: 2.00 to 4.00

MGMT 59000 - Directed Readings In Management

Credit Hours: 1.00 to 4.00 (West Lafayette, North Central) 2.00 to 4.00 (Calumet). Supervised reading and reports in various subjects. Open only to a limited number of seniors and graduate students. Permission of instructor required.

Credits: 1.00 to 4.00

MGMT 58600 - Python Programming

Credit Hours: 2.00 or 3.00. Because data grows exponentially and becomes complex, we need computational methods to collect, store, and analyze them in order to be successful in science, engineering, business, and other professions. Python Programming, is an introductory programming class that meets this need. You will learn how to write computer programs in Python language to solve real-world problems. This class is designed for students that want to learn to computer programming for data science. This course guides students through the basic Python programming language, from initial concepts to final data analysis using python and external packages.

Learning Outcomes: 1. Understand the basic programming concepts. 2. Understand the basic syntax and semantics of the Python language. 3. Understand the primitive data types build into Python. 4. Understand principles of data storage and manipulation. 5. Understand and use computer programming for basic interactive web applications. 6. Able to design, write and debug simple program to handle real-world data. Credits: 2.00 or 3.00

MGMT 57100 - Data Mining

Credit Hours: 2.00. Introduces the concepts, techniques, tools, and applications of data mining. The material is approached from the perspective of a business analyst, with an emphasis on supporting tactical and strategic decisions. Includes a variety of techniques to identify nuggets of information or decision-making knowledge in bodies of data, and extracting these in such a way that they can be put to use in the area, such as decision support, prediction, forecasting, and estimation.

Credits: 2.00

General Business Selectives (5 credits)

ECON 60600 - Microeconomics I

Credit Hours: 1.00 to 3.00. An introduction to basic consumer and producer theory, competitive markets (including using the continuum to model competition), basic general equilibrium theory, and basic risk/uncertainty. Co-requisite: ECON 61500.

Learning Outcomes: 1. Demonstrate basic knowledge of both basic consumer and producer theory as used in graduate level

economics 2. Develop and use a standard toolkit of mathematical methods to set up and solve problems in these area. 3. Assess through a series of homework and exams. Credits: 1.00 to 3.00

ECON 51500 - Macroeconomics

Credit Hours: 1.00 to 3.00. Investigation of the causes of macroeconomic fluctuations in the economy. Looks at changes in inflation, unemployment, real output, interest rates, and exchange rates, and explores why they occur, what their effects are, and what, if any, role government should play in dealing with these problems. A mixture of theory and case studies with reference to historical case studies. Current macroeconomic problems will be discussed with a focus on the international aspects of macroeconomic problems.

Learning Outcomes: 1. Predict the macroeconomic impact of fiscal and monetary policies using the mathematical IS/LM models. 2. Demonstrate an understanding of the interdependencies and complexities with respect to international trade of goods and services as well as capital flows. 3. Analyze the possible economic/social impacts of various policy proposals from a historic perspective. Credits: 1.00 to 3.00

MGMT 66000 - Introduction To Operations Management

Credit Hours: 2.00 to 4.00 (West Lafayette) 3.00 (Calumet, North Central). As goods and services are produced and distributed, they move through a set of inter-related operations or processes in order to match supply with demand. The design of these operations for strategic advantage, investment in improving their efficiency and effectiveness, and controlling these operations to meet performance objectives is the domain of Operations Management. The primary objective of the course is to provide an overview of this important functional area of business. Prerequisite: MGMT 67000 .

Credits: 2.00 to 4.00

MGMT 65000 - Strategic Management I

Credit Hours: 2.00 to 4.00. Concepts and methods that integrate previous training in functional areas of management. The perspective is that of the general manager charged with directing the total enterprise. Emphasis is given to formulation and implementation of strategy. Prerequisite: MGMT 61000 , MGMT 62000 , Master's student standing and Management majors only.

Credits: 2.00 to 4.00

MGMT 63000 - Legal And Social Foundations Of Management

Credit Hours: 2.00 to 4.00. An examination of the nature of the legal environment from the viewpoint of the social and moral bases of law. Emphasis is given to the operation of our legal system and its significance in decision functions of management. Prerequisite: Master's student standing and Management majors only.

Learning Outcomes: 1. Recommend appropriate actions in the business environment based on an understanding sources of law, legal process and procedure, and available remedies determine appropriate actions in the business environment based on an understanding of agency law concepts and employment laws, focusing on Title VII and related laws. 2. Analyze contractual rights, obligations, liabilities, and remedies in the business environment. 3. Evaluate tort rights, obligations, liabilities, and remedies in the business environment. 4. Identify the legal constraints faced by the business professional as well as the legal options available to the business professional in responding to and resolving legal issues. 5. Recognize and analyze the laws that affect contemporary businesses, including the laws relating to agency and employment, securities regulation, the organization of a business, and the legal liability of accountants. 6. Describe the ways in which various effect governmental regulations affect contemporary business practices. 7. Evaluate ethical problems that are integrally connected to the legal issues. Credits: 2.00 to 4.00

MGMT 62000 - Marketing Management

Credit Hours: 2.00 to 4.00 (West Lafayette and Calumet) 3.00 (North Central). An integrated analysis of major marketing decisions, including product pricing, advertising, distribution, and sales force policies. Prerequisite: Master's student standing and Management majors only.

Credits: 2.00 to 4.00

MGMT 61000 - Financial Management

Credit Hours: 0.00 to 4.00. Analysis of short-term working capital needs. Cash budgeting procedures, pro forma statements, major types of short-term loan arrangements, and short-term asset management. Prerequisite: MGMT 60000, Master's student standing or higher and Management and Computational Finance majors only.

Learning Outcomes: 1. Explain how the Statement of Cash Flows can be used to diagnose operating performance and describe the calculation and use of financial ratios. 2. Define financial ratio analysis and explain how ratios reflect financial performance. 3. Examine how a company's financial plan is shaped by a company's operating strategy. 4. Recognize how seasonal patterns of activity affect a company's financial plan. 5. Discuss long-term financial planning. 6. Compare compounding interest rates, discounting cash flows, and bond valuation. 7. Recognize techniques used in project analyses and capital budgeting, as well as incremental cost and revenue in capital project analysis. 8. Apply capital structure theory in practice. Credits: 0.00 to 4.00

MGMT 60000 - Accounting For Managers

Credit Hours: 2.00 to 3.00 (West Lafayette) 3.00 (Calumet, North Central). The two-course accounting sequence employs a user's perspective on the firm's database. First, the standard accounting model is developed into a working tool, as no prior study of accounting is assumed. Then illustrative business cases are discussed to show how external reports conform to financial contracts and public regulation. Public reports primarily directed to investors and creditors are analyzed to reconstruct the economic events and managerial decisions underlying generally accepted accounting standards. Prerequisite: Masters student standing and Management majors only.

Credits: 2.00 to 3.00

MGMT 65430 - Negotiations In Organizations

Credit Hours: 1.00 to 3.00. Decision making examines organizational context, stages, creativity, biases, and group processes. Negotiations examine strategies for preparing and conducting negotiations. The principal focus is on individual and interpersonal aspects of each. Permission of department required.

Learning Outcomes: 1. Understand the basic components of business negotiations through reading and completing assignments based on the textbook chapters. 2. Learn the basic components of a negotiated contract by completing a business transaction in written form. 3. Attain pragmatic negotiations skills using the I-Message method for daily activities encompassing negotiation tactics and the Verbal Skills method for more sophisticated negotiations for a major business transaction. 4. Explore cultural differences in negotiations by completing a study of practice in two countries other than the U.S. and sharing results with other students to expand their cultural knowledge base. 5. Explore and practice alternative dispute resolution techniques including mediation and arbitration. 6. Demonstrate the negotiations skills they are attaining by participating in class role-plays and by completing a final major negotiation in class. Credits: 1.00 to 3.00

MGMT 65420 - Leadership

Credit Hours: 1.00 to 3.00. Examines organizational leadership responsibilities, forms of leadership, the acquisition, use, and consequences of power, critical leader skills, and how corporate environments shape leadership. Emphasis on self-discovery and development of managerial leadership knowledge and skills.

Learning Outcomes: 1. Increase conceptual understanding of key leadership principles and strategies utilized within formal organizations. 2. Have deepening knowledge regarding important interpersonal relationship skills and abilities. 3. Help students discover important insights into oneself as a leader (including strengths and weaknesses/opportunities for personal growth). Credits: 1.00 to 3.00

MGMT 65440 - Change Management

Credit Hours: 2.00. The purpose of this course is to provide you with essential tools and concepts you need to help create and sustain needed change in your personal and/or professional life, in your work teams and in organizations. This course is taught in an executive style format, intended for working future managers with emphasis on knowledge application and experiential learning.

Learning Outcomes: 1. Understand how classic and contemporary change models can be used to create and sustain change in individuals, teams, and organizations. 2. Understand how micro-level barriers to change are often overlooked, and how to overcome them. 3. Learn to influence others when holding them accountable so that they choose to change. 4. Understand fundamental sources of power and how they can be appropriately used to influence others to change. 5. Understand how and when to utilize different leadership to lead change, and how to anticipate blind spots to be more influential. 6. Understand how individual differences within teams impact effectiveness and change. 7. Apply program materials to create a personal leadership development plan, and learn how to avoid regression to the status quo. Credits: 2.00

ECON 54100 - Managerial Economics & Business Strategy

Credit Hours: 1.00. The course covers topics such as monopolies (price discrimination, optimal pricing strategies), advanced strategic decision-making and imperfect competition (optimal pricing and production), new product introductions, product variety offered on the market, and entry deterrence strategies. The main goal of this course is to provide a basis for a good understanding of the logical mechanics, and to provide a good intuition in managerial economics and business decision-making processes that facilitate the understanding of daily business problems.

Learning Outcomes: 1. Identify and explain logical mechanics that determine individuals' choices and decisions. 2. Evaluate managerial economic problems to better identify daily business problems. 3. Apply key aspects such as marginal concepts and countervailing effects when proposing solutions. 4. Illustrate main mechanisms using graphs and apply basic knowledge of algebra and calculus to business problems. Credits: 1.00

Business Analytics Selectives (10 credits)

MGMT 59000 - Directed Readings In Management

Credit Hours: 1.00 to 4.00 (West Lafayette, North Central) 2.00 to 4.00 (Calumet). Supervised reading and reports in various subjects. Open only to a limited number of seniors and graduate students. Permission of instructor required.

Credits: 1.00 to 4.00

MGMT 57000 - Spreadsheet Modeling And Simulation

Credit Hours: 2.00. Covers up-to-date and practical spreadsheet modeling tools, which can be applied to a wide variety of business problems in finance, marketing, and operations. Consists of simulation modeling techniques to analyze risk and uncertainties in business environment, optimization techniques to determine the best managerial actions under internally- and/or externally-imposed constraints, and real-world examples and cases to demonstrate broad applications of spreadsheet modeling and simulations in manufacturing and service operations, supply chain systems, yield management, asset dynamics, option pricing, etc.

Learning Outcomes: 1. Identify the most likely description of the uncertainty in future business with data analysis techniques, such as Pivot Table, PivotChart, fitting probabilities to data, etc. 2. Use deterministic and stochastic optimization techniques to determine the best managerial actions under internally- and/or externally-imposed constraints. 3. Analyze the risk and uncertainty in business environment and process with simulation modeling techniques. 4. Review and criticize peer's participation in and contribution to group work. Credits: 2.00

MGMT 52500 - Marketing Analytics

Credit Hours: 2.00. This course introduces modern statistical methods for marketing using big data. Firms are increasingly facing vast amounts of data on their customers and the marketplace, thanks to the rapid development of information technology in the last couple of decades. The challenge is becoming more about how to turn the big data into information

and insights to improve firms' marketing decisions and profitability. This course discusses marketing applications for which we may use econometric, statistical, and machine-learning methods to improve and optimize decisions. Students will use RStudio to analyze real-world data and gain hands-on experience on data manipulation, visualization, and analysis. Intro-level Statistics/econometrics (at the level of STAT 35000 or ECON 47200) and R coding experience (comfortable with manipulating data, plotting, defining functions, using for loops, and running linear and logistic regressions in R) are required prerequisites.

Learning Outcomes: 1. Enable students to articulate analytical process and logic for selecting a particular marketing strategy/plan 2. Enable students to do (and also evaluate/critique) good marketing research in their respective careers 3. Marketing knowledge and critical thinking Credits: 2.00

STAT 59800 - Topics In Statistical Methods

Credit Hours: 0.00 to 6.00 (West Lafayette, IUPUI) 1.00 to 3.00 (North Central). Directed study and reports for students who wish to undertake individual reading and study on approved topics. Permission of instructor required.

Credits: 0.00 to 6.00

MGMT 56800 - Supply Chain Analytics

Credit Hours: 2.00. There is an exponential growth in the adoption of big data technologies in every walk of life. Organizations are collecting, storing, and analyzing massive amounts of data. This data is commonly referred to as big data because of its large volume, the velocity with which it is collected and transmitted, the variety of forms it takes, and veracity of its origin and content. In order to capitalize on the opportunities presented by big data, businesses are putting in place technologies, people, and processes. Just collecting, transmitting and storing big data creates little value for an organization. For many organizations, the term big data currently represents only a data infrastructure such as the Apache Hadoop family of products. The key to delivering real value from big data is the use of analytics. Data must be analyzed and the results used by decision makers and organizational processes in order to generate value. The main objective of this course is to learn how to collect, process, store, and analyze big data. Assignments could easily be completed in Python or SQL. We assume no familiarity with Linux and will introduce you to all essential Linux commands. Students need access to a computer with a 64 bit operating system and at least 4 GB of RAM. Note: 8 GB or more of RAM is strongly recommended.

Learning Outcomes: 1. Learn a systematic set of current popular analytical methodologies, including (1) data management and exploration (database management, data visualization, etc.), (2) data analysis (statistical methods, time series analysis, etc.), (3) modeling (math models, advanced spreadsheet engineering, etc.), and (4) decision analysis (optimization, simulation, numerical analysis, etc.). 2. Use these methodologies in a large-scale supply chain simulation game and to analyze cases involving multiple supply chain functions, such as forecasting, procurement, inventory, transportation, pricing, contract, revenue management, and reverse supply chain. Credits: 2.00

ECON 57700 - Quantitative Economics With Python

Credit Hours: 2.00 or 3.00. Introduce students to computational and programming in Python.

Learning Outcomes: 1. Learn Python essentials including basic programming techniques and the use of popular packages for data analysis and more advanced programming techniques including numerical methods, dynamic programming, and simulation-based methods. Credits: 2.00 or 3.00

ECON 58700 - Advanced Quantitative Economics With Python

Credit Hours: 3.00. The main goal of this course is to extend the computational and programming toolkit developed in Quantitative Economics with Python course. In particular, we will cover advanced methods for working with, visualizing and analyzing data in Python. In addition, we will consider more advanced programming techniques including stochastic optimization and dynamic programming. Throughout the course, we will consider a number of applications related to microeconomics, macroeconomics, and econometrics covered in the MS Econ program curriculum.

Learning Outcomes: 1. Gain working knowledge of programming techniques in Python. 2. Use scientific computing packages to analyze economic data. 3. Understand numerical methods used to solve economic models. 4. Use visualization tools to communicate

computational results. Credits: 3.00

MGMT 56200 - Project Management

Credit Hours: 2.00. Emphasizes the use of PC-based project management software and its applications, particularly in manufacturing organizations and especially new product development projects. Extensive use is made of several case studies to illustrate the planning and monitoring of a project. Class is held in a computer lab.

Learning Outcomes: 1. Understand the importance and challenges of managing projects of various types and sizes. 2. Learn and apply tools for project selection, team formation, and requirements gathering. 3. Create detailed budgets and schedules. 4. Acquire analytical capabilities for monitoring projects and investigating variances in scope, budget, and schedules. 5. Improve their ability to concisely communicate project information to senior management. Credits: 2.00

MGMT 58700 - Using R For Analytics

Credit Hours: 2.00. R has been one of the leading open-source programming languages used by analytics professionals today. You will develop the ability to interpret and modify R code to perform data analysis using the popular RStudio integrated development environment (IDE). During the first four weeks programming syntax, data structures, logic, functions, data loading, data reshaping, and shiny tool creation will be discussed to establish the necessary foundation to turn your data into insights using R. In every class we will discuss and apply a new R library or set of functions. During the last three weeks of the course you will perform descriptive, predictive, and prescriptive analytics with R. Assignments are both conceptual and hands-on exercises. The culmination of this course entails a final team project where you design, develop, and present a working Shiny application prototype that integrates descriptive, predictive, and prescriptive analytics to support a business problem. Permission of department required.

Learning Outcomes: 1. Ability to interpret and modify R code to perform data analysis. 2. Perform descriptive, predictive, and prescriptive analytics with R. 3. Design, develop, and present a working R-Shiny app that integrates descriptive, predictive, and prescriptive analytics to provide end-user decision support. Credits: 2.00

MGMT 69000 - Advanced Problems In Management

Credit Hours: 1.00 to 4.00. Advanced investigation in a specific management field at the graduate level.

Credits: 1.00 to 4.00

Electives (4 credits)

Business and Technology, MBT

About the Program

Program Requirements

Required Courses (26 credits)

MGMT 68300 - Technology-Driven Business

Credit Hours: 2.00 to 3.00. Digital technologies such as the Internet, IoT, and AI are rapidly and fundamentally transforming today's companies and industries. They have enabled completely new ways for companies to organize work, generate innovations, make decisions, and interact with customers, suppliers, and competitors. This course is designed for students who want to deeply analyze digital transformations and, more importantly, manage technology-driven businesses. Applying information economics principles and theoretical rigor, this course studies how digital technologies affect consumer behavior, business model innovations, market design, and competitive outcomes. This course trains students to apply data analytics skills to real business problems and develop a rich understanding of the strategic value of digital transformations.

Learning Outcomes: 1. Develop analytical and quantitative skills to analyze and formulate business decisions. 2. Understand current

business technologies and related knowledge to translate data into useful information for decision making. 3. Become familiar with the ethical issues that individuals face in organizations. 4. Develop effective written and oral communication skills. 5. Develop the leadership and teamwork skills to function effectively in a diverse, cross-functional environment. 6. Develop awareness of global and multicultural issues relating to business decisions. Credits: 2.00 to 3.00

MGMT 68000 - Economic Analysis Of Technology Markets

Credit Hours: 0.00 to 3.00. The core models of microeconomics are fundamental to day-to-day management decisions. This course will cover economic models that describe firm production, pricing, entry/exit decisions, market efficiency, and welfare. Such economic models will be applied to the analyses of a variety of market conditions, including monopoly, oligopoly, and monopolistic competition. It will provide students with an understanding of the implications of economic theory on technology products, firms, markets, and consumers.

Learning Outcomes: 1. Be able to use economic models to analyze technology markets and make optimal managerial decisions. Credits: 0.00 to 3.00

MGMT 62000 - Marketing Management

Credit Hours: 2.00 to 4.00 (West Lafayette and Calumet) 3.00 (North Central). An integrated analysis of major marketing decisions, including product pricing, advertising, distribution, and sales force policies. Prerequisite: Master's student standing and Management majors only.

Credits: 2.00 to 4.00

MGMT 61000 - Financial Management

Credit Hours: 0.00 to 4.00. Analysis of short-term working capital needs. Cash budgeting procedures, pro forma statements, major types of short-term loan arrangements, and short-term asset management. Prerequisite: MGMT 60000, Master's student standing or higher and Management and Computational Finance majors only.

Learning Outcomes: 1. Explain how the Statement of Cash Flows can be used to diagnose operating performance and describe the calculation and use of financial ratios. 2. Define financial ratio analysis and explain how ratios reflect financial performance. 3. Examine how a company's financial plan is shaped by a company's operating strategy. 4. Recognize how seasonal patterns of activity affect a company's financial plan. 5. Discuss long-term financial planning. 6. Compare compounding interest rates, discounting cash flows, and bond valuation. 7. Recognize techniques used in project analyses and capital budgeting, as well as incremental cost and revenue in capital project analysis. 8. Apply capital structure theory in practice. Credits: 0.00 to 4.00

MGMT 60000 - Accounting For Managers

Credit Hours: 2.00 to 3.00 (West Lafayette) 3.00 (Calumet, North Central). The two-course accounting sequence employs a user's perspective on the firm's database. First, the standard accounting model is developed into a working tool, as no prior study of accounting is assumed. Then illustrative business cases are discussed to show how external reports conform to financial contracts and public regulation. Public reports primarily directed to investors and creditors are analyzed to reconstruct the economic events and managerial decisions underlying generally accepted accounting standards. Prerequisite: Masters student standing and Management majors only.

Credits: 2.00 to 3.00

MGMT 59000 - Directed Readings In Management

Credit Hours: 1.00 to 4.00 (West Lafayette, North Central) 2.00 to 4.00 (Calumet). Supervised reading and reports in various subjects. Open only to a limited number of seniors and graduate students. Permission of instructor required.

Credits: 1.00 to 4.00

MGMT 65430 - Negotiations In Organizations

Credit Hours: 1.00 to 3.00. Decision making examines organizational context, stages, creativity, biases, and group processes. Negotiations examine strategies for preparing and conducting negotiations. The principal focus is on individual and interpersonal aspects of each. Permission of department required.

Learning Outcomes: 1. Understand the basic components of business negotiations through reading and completing assignments based on the textbook chapters. 2. Learn the basic

components of a negotiated contract by completing a business transaction in written form. 3. Attain pragmatic negotiations skills using the I-Message method for daily activities encompassing negotiation tactics and the Verbal Skills method for more sophisticated negotiations for a major business transaction. 4. Explore cultural differences in negotiations by completing a study of practice in two countries other than the U.S. and sharing results with other students to expand their cultural knowledge base. 5. Explore and practice alternative dispute resolution techniques including mediation and arbitration. 6. Demonstrate the negotiations skills they are attaining by participating in class role-plays and by completing a final major negotiation in class. Credits: 1.00 to 3.00

MGMT 65420 - Leadership

Credit Hours: 1.00 to 3.00. Examines organizational leadership responsibilities, forms of leadership, the acquisition, use, and consequences of power, critical leader skills, and how corporate environments shape leadership. Emphasis on self-discovery and development of managerial leadership knowledge and skills.

Learning Outcomes: 1. Increase conceptual understanding of key leadership principles and strategies utilized within formal organizations. 2. Have deepening knowledge regarding important interpersonal relationship skills and abilities. 3. Help students discover important insights into oneself as a leader (including strengths and weaknesses/opportunities for personal growth). Credits: 1.00 to 3.00

MGMT 68200 - Digital Product Design

Credit Hours: 2.00. This course is a comprehensive exploration of designing digital products that can improve the quality of people's daily lives. It covers value creation with technology and a human-centered design process including improv brainstorming, storyboarding, interviewing, sketches, and selling. Students will learn how to ideate and how to iteratively refine ideas with real users. Students will consider factors driving technology product design decisions such as the unique economic characteristics of today's technology-intensive markets and their impact on strategic interactions among firms and consumers. Students will also learn to discover unmet user needs, reframe problematic situations, envision multiple possible product concepts, and assess their feasibility, viability, and desirability. The course culminates in the creation of a business model, a product sketch, and a plan for taking the product to market.

Learning Outcomes: 1. Apply digital business methods and digital information strategies. Credits: 2.00

MGMT 65730 - Technology Strategy

Credit Hours: 2.00 or 3.00. In today's business environment, it is increasingly apparent that business success is driven by a firm's ability to create and capture value through technology and innovation. Thus, the processes used by firms to develop new technologies, the choices they make regarding how to commercialize their technical knowledge, and the strategies they used to position and build a dominate competitive position all are important issues facing the firm. This course seeks to develop tools for understanding industry evolution with respect to new technology, forecast technological change, and understand the basis for technology in competitive advantage. We take an in-depth look at how technological innovation affects the competitive dynamics of markets, how firms can strategically manage these dynamics, and how firms can create and implement strategies to maximize their likelihood of success. The course introduces tools, concepts, and analytical frameworks that will enhance your ability to define and analyze strategic problems that stem from innovation and technological change, and to identify sources of competitive advantage from both an industry and firm-level perspective. Permission of department required.

Learning Outcomes: 1. Assess the degree to which a firm or industry is subject to technological factors. 2. Evaluate the temporal dynamics of an industry, lifecycles and s-curves from both a technological maturity and adoption (installed customer base) perspective. 3. Design firm strategies to capitalize on internal technological capabilities and external opportunities. 4. Formulate collaboration strategies and strategies for protecting innovation. Credits: 2.00 or 3.00

Applying information economics principles and theoretical rigor, this course studies how digital technologies affect consumer behavior, business model innovations, market design, and competitive outcomes. This course trains students to apply data analytics skills to real business problems and develop a rich understanding of the strategic value of digital transformations.
Learning Outcomes: 1. Develop analytical and quantitative skills to analyze and formulate business decisions. 2. Understand current business technologies and related knowledge to translate data into useful information for decision making. 3. Become familiar with the ethical issues that individuals face in organizations. 4. Develop effective written and oral communication skills. 5. Develop the leadership and teamwork skills to function effectively in a diverse, cross-functional environment. 6. Develop awareness of global and multicultural issues relating to business decisions. Credits: 2.00 to 3.00

MGMT 68000 - Economic Analysis Of Technology Markets

Credit Hours: 0.00 to 3.00. The core models of microeconomics are fundamental to day-to-day management decisions. This course will cover economic models that describe firm production, pricing, entry/exit decisions, market efficiency, and welfare. Such economic models will be applied to the analyses of a variety of market conditions, including monopoly, oligopoly, and monopolistic competition. It will provide students with an understanding of the implications of economic theory on technology products, firms, markets, and consumers.
Learning Outcomes: 1. Be able to use economic models to analyze technology markets and make optimal managerial decisions. Credits: 0.00 to 3.00

MGMT 62000 - Marketing Management

Credit Hours: 2.00 to 4.00 (West Lafayette and Calumet) 3.00 (North Central). An integrated analysis of major marketing decisions, including product pricing, advertising, distribution, and sales force policies. Prerequisite: Master's student standing and Management majors only.
Credits: 2.00 to 4.00

MGMT 61000 - Financial Management

Credit Hours: 0.00 to 4.00. Analysis of short-term working capital needs. Cash budgeting procedures, pro forma statements, major types of short-term loan arrangements, and short-term asset management. Prerequisite: MGMT 60000, Master's student standing or higher and Management and Computational Finance majors only.
Learning Outcomes: 1. Explain how the Statement of Cash Flows can be used to diagnose operating performance and describe the calculation and use of financial ratios. 2.

Define financial ratio analysis and explain how ratios reflect financial performance. 3. Examine how a company's financial plan is shaped by a company's operating strategy. 4. Recognize how seasonal patterns of activity affect a company's financial plan. 5. Discuss long-term financial planning. 6. Compare compounding interest rates, discounting cash flows, and bond valuation. 7. Recognize techniques used in project analyses and capital budgeting, as well as incremental cost and revenue in capital project analysis. 8. Apply capital structure theory in practice. Credits: 0.00 to 4.00

MGMT 60000 - Accounting For Managers

Credit Hours: 2.00 to 3.00 (West Lafayette) 3.00 (Calumet, North Central). The two-course accounting sequence employs a user's perspective on the firm's database. First, the standard accounting model is developed into a working tool, as no prior study of accounting is assumed. Then illustrative business cases are discussed to show how external reports conform to financial contracts and public regulation. Public reports primarily directed to investors and creditors are analyzed to reconstruct the economic events and managerial decisions underlying generally accepted accounting standards. Prerequisite: Masters student standing and Management majors only.

Credits: 2.00 to 3.00

MGMT 59000 - Directed Readings In Management

Credit Hours: 1.00 to 4.00 (West Lafayette, North Central) 2.00 to 4.00 (Calumet). Supervised reading and reports in various subjects. Open only to a limited number of seniors and graduate students. Permission of instructor required.

Credits: 1.00 to 4.00

MGMT 65430 - Negotiations In Organizations

Credit Hours: 1.00 to 3.00. Decision making examines organizational context, stages, creativity, biases, and group processes. Negotiations examine strategies for preparing and conducting negotiations. The principal focus is on individual and interpersonal aspects of each. Permission of department required.

Learning Outcomes: 1. Understand the basic components of business negotiations through reading and completing assignments based on the textbook chapters. 2. Learn the basic components of a negotiated contract by completing a business transaction in written form. 3. Attain pragmatic negotiations skills using the I-Message method for daily activities encompassing negotiation tactics and the Verbal Skills method for more sophisticated negotiations for a major business transaction. 4. Explore cultural differences in negotiations by completing a study of practice in two countries other than the U.S. and sharing results with other students to expand their cultural knowledge base. 5. Explore and practice alternative dispute resolution techniques including mediation and arbitration. 6. Demonstrate the negotiations skills they are attaining by participating in class role-plays and by completing a final major negotiation in class. Credits: 1.00 to 3.00

MGMT 65420 - Leadership

Credit Hours: 1.00 to 3.00. Examines organizational leadership responsibilities, forms of leadership, the acquisition, use, and consequences of power, critical leader skills, and how corporate environments shape leadership. Emphasis on self-discovery and development of managerial leadership knowledge and skills.

Learning Outcomes: 1. Increase conceptual understanding of key leadership principles and strategies utilized within formal organizations. 2. Have deepening knowledge regarding important interpersonal relationship skills and abilities. 3. Help students discover important insights into oneself as a leader (including strengths and weaknesses/opportunities for personal growth). Credits: 1.00 to 3.00

MGMT 68200 - Digital Product Design

Credit Hours: 2.00. This course is a comprehensive exploration of designing digital products that can improve the quality of people's daily lives. It covers value creation with technology and a human-centered design process including improv brainstorming, storyboarding, interviewing, sketches, and selling. Students will learn how to ideate and how to iteratively refine ideas with real users. Students will consider factors driving technology product design decisions such as the unique

economic characteristics of today's technology-intensive markets and their impact on strategic interactions among firms and consumers. Students will also learn to discover unmet user needs, reframe problematic situations, envision multiple possible product concepts, and assess their feasibility, viability, and desirability. The course culminates in the creation of a business model, a product sketch, and a plan for taking the product to market.

Learning Outcomes: 1. Apply digital business methods and digital information strategies.

Credits: 2.00

MGMT 65730 - Technology Strategy

Credit Hours: 2.00 or 3.00. In today's business environment, it is increasingly apparent that business success is driven by a firm's ability to create and capture value through technology and innovation. Thus, the processes used by firms to develop new technologies, the choices they make regarding how to commercialize their technical knowledge, and the strategies they used to position and build a dominate competitive position all are important issues facing the firm. This course seeks to develop tools for understanding industry evolution with respect to new technology, forecast technological change, and understand the basis for technology in competitive advantage. We take an in-depth look at how technological innovation affects the competitive dynamics of markets, how firms can strategically manage these dynamics, and how firms can create and implement strategies to maximize their likelihood of success. The course introduces tools, concepts, and analytical frameworks that will enhance your ability to define and analyze strategic problems that stem from innovation and technological change, and to identify sources of competitive advantage from both an industry and firm-level perspective. Permission of department required.

Learning Outcomes: 1. Assess the degree to which a firm or industry is subject to technological factors. 2. Evaluate the temporal dynamics of an industry, lifecycles and s-curves from both a technological maturity and adoption (installed customer base) perspective. 3. Design firm strategies to capitalize on internal technological capabilities and external opportunities. 4. Formulate collaboration strategies and strategies for protecting innovation. Credits: 2.00 or 3.00

Electives (10 Credits)

Program Learning Outcomes

Chemical Engineering, MSCHE

About the Program

Program Requirements - Thesis

Required Courses (15 credits)

CHE 54000 - Transport Phenomena

Credit Hours: 3.00. Continuation of CHE 37700 and CHE 37800 . Topics in fluid mechanics, heat transfer and mass transfer including unsteady state transport problems, stream functions, potential flow, hydrodynamic and thermal layers, turbulence, and multicomponent diffusion.

Credits: 3.00

CHE 54300 - Polymerization Reaction Engineering And Reactor Analysis

Credit Hours: 3.00. Polymerization kinetics, polycondensation, gelation, radical polymerization, ionic polymerization, copolymerizations, Ziegler-Natta polymerizations, polymerization in bulk, solution, suspension and emulsion, modeling, stochastic processes, Z-transforms, batch, CSTR and tubular reactors, stability analysis, computer control, separation, and drying.

Credits: 3.00

CHE 61000 - Advanced Chemical Engineering Thermodynamics

Credit Hours: 3.00. Properties of pure fluids and mixtures are described in the context of classical and statistical thermodynamics. Equations of state and solution theories are developed for this description of fluid phase equilibrium and chemical equilibrium. Fluids encountered in mass transfer and separation operations are treated.

Credits: 3.00

CHE 62000 - Advanced Transport Phenomena I

Credit Hours: 3.00. Analysis of transport of momentum, energy, and mass by molecular and turbulent mechanisms. Prerequisite: CHE 52700.

Credits: 3.00

CHE 63000 - Applied Mathematics For Chemical Engineers

Credit Hours: 3.00. Determinants and matrices: solution of a system of algebraic equations; applications to dimensional analysis, stoichiometry, thermodynamics, kinetics of first order reaction systems, and stagewise operations. Differential equations: series solutions, Sturm-Liouville systems, boundary value problems, applications to heat and mass transfer and chemical reactor problems. Elements of complex variables: LaPlace and infinite Fourier transforms, applications to heat and mass transfer problems. First order partial differential equations: applications to separation processes, chromatography. Prerequisite: MA 26200.

Credits: 3.00

CHE 66000 - Chemical Reaction Engineering

Credit Hours: 3.00. Heat, mass, and momentum transfer in the design and analysis of chemical reactor systems. Optimization techniques applied to reactor design. Prerequisite: CHE 34800 .

Credits: 3.00

CHE 69700 - Special Topics In Chemical Engineering

Credit Hours: 0.00 to 18.00. Topics vary. Permission of instructor required.

Credits: 0.00 to 18.00

Thesis Research (15 credits)

CHE 69000 - Seminar In Chemical Engineering

Credit Hours: 0.00. Required of all graduate students.

Credits: 0.00

CHE 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required.

Credits: 1.00 to 18.00

CHE 65500 - Safety In Chemical Engineering

Credit Hours: 1.00. This course will provide you with necessary safety information to comply with Purdue and other federal requirements (OSHA29 CFR 1910.1450 standard) for working safely in a chemical engineering laboratory setting/environment. The course will cover general safety principles (electrical safety, hazard assessment and controls, etc.) and fundamentals of laboratory safety practices specific to experimental work in chemical engineering laboratories. The course will provide valuable information on how to find, read, interpret and use the information in Safety Data Sheets (SDSs), chemical labels and other printed chemical safety information. Other topics covered include: gas cylinder safety, safety equipment (fume hoods, fire protection systems and building elements, eyewash stations and safety showers, etc.), laboratory equipment safety, hazard assessment and understanding of administrative and engineering controls, selection of suitable personal protective equipment (PPE) necessary for laboratory work with chemicals, etc.

Learning Outcomes: 1. Understand necessary safety information to comply with the Purdue and other federal requirements (OSHA29 CFR 1910.1450 standard) for working safely in a chemical engineering laboratory setting/environment. 2. Understand general safety principles (electrical safety, hazard assessment and controls, etc.) and fundamentals of laboratory safety practices specific to experimental work in chemical engineering laboratories. 3. Understand how to find, read, interpret and use the information in Safety Data Sheets (SDSs), chemical labels and other printed chemical safety information. Other topics covered include: gas cylinder safety, safety equipment (fume hoods, fire protection systems and building elements, eyewash stations and safety showers, etc.), laboratory equipment safety, hazard assessment and understanding of administrative and engineering controls, selection of suitable personal protective equipment (PPE) necessary for laboratory work with chemicals, etc. Credits: 1.00

Required Courses (15 credits)

CHE 54000 - Transport Phenomena

Credit Hours: 3.00. Continuation of CHE 37700 and CHE 37800 . Topics in fluid mechanics, heat transfer and mass transfer including unsteady state transport problems, stream functions, potential flow, hydrodynamic and thermal layers, turbulence, and multicomponent diffusion.

Credits: 3.00

CHE 54300 - Polymerization Reaction Engineering And Reactor Analysis

Credit Hours: 3.00. Polymerization kinetics, polycondensation, gelation, radical polymerization, ionic polymerization, copolymerizations, Ziegler-Natta polymerizations, polymerization in bulk, solution, suspension and emulsion, modeling, stochastic processes, Z-transforms, batch, CSTR and tubular reactors, stability analysis, computer control, separation, and drying.

Credits: 3.00

CHE 61000 - Advanced Chemical Engineering Thermodynamics

Credit Hours: 3.00. Properties of pure fluids and mixtures are described in the context of classical and statistical thermodynamics. Equations of state and solution theories are developed for this description of fluid phase equilibrium and chemical equilibrium. Fluids encountered in mass transfer and separation operations are treated.

Credits: 3.00

MGMT 66000 - Introduction To Operations Management

Credit Hours: 2.00 to 4.00 (West Lafayette) 3.00 (Calumet, North Central). As goods and services are produced and distributed, they move through a set of inter-related operations or processes in order to match supply with demand. The design of these operations for strategic advantage, investment in improving their efficiency and effectiveness, and controlling these operations to meet performance objectives is the domain of Operations Management. The primary objective of the course is to provide an overview of this important functional area of business. Prerequisite: MGMT 67000 .

Credits: 2.00 to 4.00

MGMT 65000 - Strategic Management I

Credit Hours: 2.00 to 4.00. Concepts and methods that integrate previous training in functional areas of management. The perspective is that of the general manager charged with directing the total enterprise. Emphasis is given to formulation and implementation of strategy. Prerequisite: MGMT 61000 , MGMT 62000 , Master's student standing and Management majors only.

Credits: 2.00 to 4.00

CHM 63400 - Biochemistry: Structural Aspects

Credit Hours: 3.00. Chemistry of materials of biochemical interest; carbohydrates, lipids, proteins, amino acids, nucleic acids, porphyrins; biochemistry of blood. Prerequisite: CHM 26200 , CHM 32100 , CHM 37400 .

Credits: 3.00

CHM 64100 - Advanced Inorganic Chemistry

Credit Hours: 3.00. Survey of main group and transition metal chemistry. Main group special topics, bonding and structure of boron hydrides. Coordination chemistry, bonding models in coordination compounds. Transition metal organometallic chemistry, ligand types and reactivity patterns. Survey of inorganic NMR spectroscopy. Prerequisite: CHM 34200 .

Credits: 3.00

CHM 64400 - Solid State Chemistry

Credit Hours: 3.00. The chemistry of solids, including a discussion of ionic crystals, metals, alloys, and binary compounds, and their characterizations by various physical methods. Description of chemical reactions, phase changes, and catalysis in terms of current theories of the solid state. Prerequisite: CHM 34200 , CHM 37400 .

Credits: 3.00

CHM 65100 - Advanced Organic Chemistry

Credit Hours: 3.00. Modern structural organic chemistry, including introductions to molecular orbital theory and reaction mechanisms. Prerequisite: a year's course in organic chemistry.

Credits: 3.00

CHM 67100 - Advanced Physical Chemistry

Credit Hours: 3.00. Selected topics, including atomic and molecular structure and modern theories underlying thermodynamics and chemical kinetics. Prerequisite: CHM 57800.

Credits: 3.00

CHM 69600 - Special Topics In Chemistry

Credit Hours: 1.00 to 3.00. Lectures on selected topics of current interest.

MA 51100 - Linear Algebra With Applications

Credit Hours: 3.00. Real and complex vector spaces; linear transformations; Gram-Schmidt process and projections; least squares; QR and LU factorization; diagonalization, real and complex spectral theorem; Schur triangular form; Jordan canonical form; quadratic forms.

Credits: 3.00

MA 52700 - Advanced Mathematics For Engineers And Physicists I

Credit Hours: 3.00. MA 52700 is not a prerequisite for MA 52800; these courses can be taken independently. Topics in MA 52700 include linear algebra, systems of ordinary differential equations, Laplace transforms, Fourier series and transforms, and partial differential equations. MA 51100 is recommended.

Learning Outcomes: 1. Know the theory of systems of linear equations. 2. Know the theory of eigenvalues and eigenvectors and apply it to solve systems of ordinary differential equations and to analyze qualitative features. 3. Know theoretical properties of Laplace transforms and how to use them. 4. Know the basic theory of Fourier series and transforms, and how to apply these to solve partial differential equations.

Credits: 3.00

MA 52800 - Advanced Mathematics For Engineers And Physicists II

Credit Hours: 3.00. MA 52700 is not a prerequisite for MA 52800; these courses can be taken independently. Topics in MA 52800 include divergence theorem, Stokes theorem, complex variables, contour integration, calculus of residues and applications, conformal mapping, and potential theory. MA 51000 is recommended.

Learning Outcomes: 1. Improve knowledge of

vector calculus and multivariable integral calculus. 2. Know basic theory of functions of a complex variable, including complex integration. 3. Improve knowledge of Taylor series, and extend this to Laurent series. 4. Know applications of complex analysis, including conformal mapping and potential theory. Credits: 3.00

STAT 51200 - Applied Regression Analysis

Credit Hours: 3.00. Inference in simple and multiple linear regression, residual analysis, transformations, polynomial regression, model building with real data, nonlinear regression. One-way and two-way analysis of variance, multiple comparisons, fixed and random factors, analysis of covariance. Use of existing statistical computer programs. Prerequisite: Coursework in Statistical Methods with a calculus prerequisite.

Learning Outcomes: 1. Learn to build and analyze simple and multiple regression models, analysis of variance and covariance (ANOVA/ANCOVA) for regression, inference for regression, diagnostics and remedial measures for regression, transformations, residual analysis, model building, polynomial and interaction models. Credits: 3.00

STAT 51400 - Design Of Experiments

Credit Hours: 3.00. Fundamentals, completely randomized design; randomized complete blocks; latin square; multi-classification; factorial; nested factorial; incomplete block and fractional replications for 2n, 3n, 2m x 3n; confounding; lattice designs; general mixed factorials; split plot; analysis of variance in regression models; optimum design. Use of existing statistical programs.

Learning Outcomes: 1. Understand design principles and use these principles to plan and implement an experiment in such a way that a statistical analysis results in valid and objective conclusions. 2. Know how to choose an appropriate design given the available resources, factors of interest, and information on nuisance factors. 3. Perform the proper statistical analysis and draw valid conclusions from any designed experiment. Credits: 3.00

STAT 51700 - Statistical Inference

Credit Hours: 3.00. A basic course in statistical theory covering standard statistical methods and their application. Estimation including unbiased, maximum likelihood and moment estimation; testing hypotheses for standard distributions and contingency tables; confidence intervals and regions; introduction to nonparametric tests and linear regression.

Learning Outcomes: 1. Understand the basic asymptotic theory including consistency and convergence in distribution. 2. Know how to perform some elementary statistical inference such as estimation, confidence interval and hypothesis testing. 3. Be familiar with the maximum likelihood method to make statistical inference. 4. Know how to judge the quality of different estimators. 5. Know how to perform optimal tests of hypotheses. PSY 60600 - Special Topics In Quantitative Psychology

Credit Hours: 3.00. A seminar covering such topics as linear models, statistical decision-making, and multidimensional scaling. Permission of instructor required.

Credits: 3.00

PSY 63100 - Multiple Regression Analysis For The Behavioral Sciences

Credit Hours: 3.00. This "data analytic" course provides an examination of the conceptual underpinnings and advanced application of multiple regression analyses to psychological data. Permission of instructor required.

Learning Outcomes: 1. Have basic understanding of the General Linear Model, the data requirements for ordinary least squares regression analyses, and the computational details of simple, multiple, and hierarchical regression analyses. 2. Use multiple regression analysis as a general approach to research design and data analysis for studies with multiple predictors, sets, mediators, moderators, and within-subjects factors; 3. Interpret and critique results of correlation and multiple regression analyses appearing in the literature; 4. Apply multiple regression analyses to data of their own; 5. Write-up the results of multiple regression analyses; 6. Prepared to take additional advanced statistics courses that build on multiple regression, including logistic regression, multi-level modeling, and structural equation modeling. Credits: 3.00

Seminar Courses (6 credits)

PSY 69200 - Special Topics In Psychology

Credit Hours: 1.00 to 3.00. Various topics which may change from semester to semester are presented by faculty in the Department of Psychological Sciences.

Credits: 1.00 to 3.00

Clinical Psychology Courses (xx credits)

PSY 64000 - Survey Of Social Psychology I

Credit Hours: 3.00. An extensive survey of methods, research, and theory in social psychology.

Credits: 3.00

PSY 69200 - Special Topics In Psychology

Credit Hours: 1.00 to 3.00. Various topics which may change from semester to semester are presented by faculty in the Department of Psychological Sciences.

Credits: 1.00 to 3.00

PSY 61501 - Systems And Behavioral Neuroscience

Credit Hours: 4.00. This course will provide you with a broad introduction to the field of neuroscience and how it can inform our understanding of behavior. First, we will cover neuroanatomy, synaptic communication, and plasticity. Next, we will cover neuroscience research on a range of major topics relevant to behavior: emotion, motivation, attention, learning, decision-making, and social cognition. This course will also provide a brief introduction to a variety of neuroscience research methods that are commonly used in animal and human research (e.g., electroencephalography, magnetic resonance imaging), including tutorials and live demonstrations. Permission of department required.

Learning Outcomes: 1. Know general neural architecture of core systems relevant to behavior. 2. Know behavioral outcomes for

each major neural system. 3. Know how brain structure and functioning are studied in animal research. 4. Know how brain structure and functioning are studied in human research. 5. Know how brain functioning undergirds cognition, affect, and social processes. 6. Translate basic neuroscience to clinical and other applied research. Credits: 4.00

PSY 67510 - Research Methods In Clinical Psychological Sciences

Credit Hours: 3.00. This course provides an in-depth introduction to the fundamentals of research methods and design, including the scientific approach and its applicability to the science of psychology to the philosophy of science, the role of theory, and hypothesis testing. Philosophical and theoretical fundamentals are discussed, followed by methodological issues. The course includes content on the replication crisis in psychology, the practices that contributed to it, and the means to overcome it, as well as issues in sampling, measurement, and design. The course will examine nonexperimental research as well as experimental and quasi-experimental approaches. Permission of department required.

Learning Outcomes: 1. Understand Open Science practices, basic psychometrics, experimental design, and nonexperimental approaches and identify bad research practices in published research articles. 2. Evaluate special issues faced when studying psychopathology. 3. Evaluate the factors that contribute to replication concerns in the field (i.e., low statistical power, HARKing, p-hacking, and publication bias). 4. Evaluate correct strategies for calculating reliability and demonstrating validity of a psychological assessment. 5. Create a research study working through sampling, assessment, and design. Credits: 3.00

Clinical Assessment Courses (xx credits)

PSY 66700 - Clinical Assessment I

Credit Hours: 4.00. Presentation of general assessment principles and methods. Supervised practice in general diagnostic and treatment procedures as applied to both children and adults. Emphasis is placed on laboratory practice in the administration and interpretation of intelligence tests; behavioral observation techniques and operant remediation procedures. Permission of instructor required.

Learning Outcomes: 1. Display knowledge of basic psychometric theory as evidenced by performance on examinations. 2. List primary instruments and their strengths and weaknesses. 3. Perform accurate administration, scoring, and interpretation of personality assessment instruments in real-time. 4. Display proficiency in writing integrative assessment reports. 5. Dialogue with professional colleagues regarding the professional practice of assessment and diagnosis. Credits: 4.00

PSY 66800 - Clinical Assessment II

Credit Hours: 4.00. Presentation of methods of clinical assessment including structured and unstructured personality tests, physiological recording, behavioral observation, and interview techniques. Emphasis is placed on laboratory practice in the administration and interpretation of personality tests and training in the basic clinical interview techniques. Permission of instructor required.

Credits: 4.00

PSY 67000 - Principles And Techniques Of Psychological Treatment

Credit Hours: 3.00. Discussion and elaboration of the main theories and techniques of psychotherapy, the application of these techniques to the change of behavior, and the analysis of clinical cases for therapy planning.

Learning Outcomes: 1. Understand basic methodological issues related to psychotherapy research. 2. Describe the distinction between process and outcome in psychotherapy. 3. Understand the contributions of specific and common factors in psychotherapy. 4. Demonstrate basic process skills of active listening, empathic responses, and utilization of the therapeutic relationship in interactions with mock clients. 5. Demonstrate basic skills involved in motivational interviewing. 6. Demonstrate practical skills to document

therapeutic interventions (progress notes) and care management (treatment planning). 7. Develop an understanding of the conceptual underpinnings of cognitive behavior therapy, including a) underlying theory of psychopathology; b) proposed mechanisms of change; c) establishment of treatment plans based on mechanisms of change; d) empirical evidence of therapy efficacy and effectiveness. 8. Demonstrate skills to implement basic evidenced-based therapeutic interventions and strategies (CBT). 9. Demonstrate an appreciation for addressing individual differences and diversity in psychotherapy. 10. Demonstrate a sense of self-awareness and ability to relate to diverse clients. Credits: 3.00

PSY 67300 - Psychology Of Behavior Disorders

Credit Hours: 3.00. Advanced abnormal psychology. Consideration will be given to research and theory of psychopathology.

Credits: 3.00

PSY 67900 - Practicum In Clinical Psychology

Credit Hours: 1.00 to 6.00. This is a practicum in clinical psychology, whereby students see individuals for therapy. These cases are supervised by faculty in clinical psychology. This is a requirement for the graduate program, and students must do both adult and child practicum. Students enrolled in this program must register for this course a minimum of four times. Prerequisite: Master's student standing and Psychology majors only. Permission of instructor required.

Credits: 1.00 to 6.00

Practicum Training (12 credits)

PSY 67900 - Practicum In Clinical Psychology

Credit Hours: 1.00 to 6.00. This is a practicum in clinical psychology, whereby students see individuals for therapy. These cases are supervised by faculty in clinical psychology. This is a requirement for the graduate program, and students must do both adult and child practicum. Students enrolled in this program must register for this course a minimum of four times. Prerequisite: Master's student standing and Psychology majors only. Permission of instructor required.

Credits: 1.00 to 6.00

Internal Practica Requirements

Electives (9-24 credits)

Thesis Research (6-12 credits)

PSY 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required.

Credits: 1.00 to 18.00

PSY 69900 - Research PhD Thesis

Credit Hours: 1.00 to 18.00. Research PhD Thesis. Permission of instructor required.

Credits: 1.00 to 18.00

Program Learning Outcomes

Additional Information

GPA Requirements

Cognitive Psychology, MS

About the Program

Program Requirements

Required Courses (xx credits)

Statistics Courses (6 credits)

PSY 60000 - Statistical Inference

Credit Hours: 3.00. Emphasis is given to principles underlying both parametric and nonparametric inference.

Credits: 3.00

PSY 60100 - Correlation And Experimental Design

Credit Hours: 3.00. Continuation of PSY 60000 with emphasis upon the design and analysis of experiments. Prerequisite: PSY 60000 .

Credits: 3.00

PSY 60600 - Special Topics In Quantitative Psychology

Credit Hours: 3.00. A seminar covering such topics as linear models, statistical decision-making, and multidimensional scaling. Permission of instructor required.

Credits: 3.00

PSY 63100 - Multiple Regression Analysis For The Behavioral Sciences

Credit Hours: 3.00. This "data analytic" course provides an examination of the conceptual underpinnings and advanced application of multiple regression analyses to psychological data. Permission of instructor required.

Learning Outcomes: 1. Have basic understanding of the General Linear Model, the data requirements for ordinary least squares regression analyses, and the computational details of simple, multiple, and hierarchical regression analyses. 2. Use multiple regression analysis as a general approach to research design and data analysis for studies with multiple predictors, sets, mediators, moderators, and within-subjects factors; 3. Interpret and critique results of correlation and multiple regression analyses appearing in the literature; 4. Apply multiple regression analyses to data of their own; 5. Write-up the results of multiple regression analyses; 6. Prepared to take additional advanced statistics courses that build on multiple regression, including logistic regression, multi-level modeling, and structural equation modeling. Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

STAT 51200 - Applied Regression Analysis

Credit Hours: 3.00. Inference in simple and multiple linear regression, residual analysis, transformations, polynomial regression, model building with real data, nonlinear regression. One-way and two-way analysis of variance, multiple comparisons, fixed and random factors, analysis of covariance. Use of existing statistical computer programs. Prerequisite: Coursework in Statistical Methods with a calculus prerequisite.

Learning Outcomes: 1. Learn to build and analyze simple and multiple regression models, analysis of variance and covariance (ANOVA/ANCOVA) for regression, inference for regression, diagnostics and remedial measures

for regression, transformations, residual analysis, model building, polynomial and interaction models. Credits: 3.00

STAT 51400 - Design Of Experiments

Credit Hours: 3.00. Fundamentals, completely randomized design; randomized complete blocks; latin square; multi-classification; factorial; nested factorial; incomplete block and fractional replications for 2n, 3n, 2m x 3n; confounding; lattice designs; general mixed factorials; split plot; analysis of variance in regression models; optimum design. Use of existing statistical programs.

Learning Outcomes: 1. Understand design principles and use these principles to plan and implement an experiment in such a way that a statistical analysis results in valid and objective conclusions. 2. Know how to choose an appropriate design given the available resources, factors of interest, and information on nuisance factors. 3. Perform the proper statistical analysis and draw valid conclusions from any designed experiment. Credits: 3.00

Seminar Courses (0-3 credits)

PSY 63300 - Seminar In Experimental Psychology

Credit Hours: 2.00 to 3.00. Critical analysis of current problems in experimental psychology. Emphasis upon reviewing literature, preparing and presenting papers. Permission of instructor required.

Credits: 2.00 to 3.00

PSY 69200 - Special Topics In Psychology

Credit Hours: 1.00 to 3.00. Various topics which may change from semester to semester are presented by faculty in the Department of Psychological Sciences.

Credits: 1.00 to 3.00

Cognitive Psychology Courses (6-9 credits)

PSY 62400 - Human Learning And Memory

Credit Hours: 3.00. Selected survey of important problems in the encoding, storage, and retrieval of laboratory and naturalistic events.

Learning Outcomes: 1. Describe the most common methods and procedures used to carry out research on human learning and memory. 2. Describe and explain foundational findings in the study of human learning and memory. 3. Describe and evaluate key concepts and theories that have been developed to understand the mental processes involved in human learning and memory. Credits: 3.00

PSY 62500 - Complex Cognitive Processes

Credit Hours: 3.00. Surveys research and theory concerned with the nature of the "higher-order" mental processes, including decision making, categorization, problem solving, and language. Fundamental questions regarding the nature of the representations that underlie conceptual and linguistic behavior will be addressed. Permission of instructor required.

Learning Outcomes: 1. Read, critically evaluate, and discuss empirical and theoretical research articles about complex cognitive processes. 2. Integrate learning of course material with their own research interests into a written proposal of a research project, demonstrating effective communication skills and critical thinking skills. Credits: 3.00

PSY 62800 - Perceptual Processes

Credit Hours: 3.00. This course is an advanced introduction to the psychology of perception. The course emphasizes visual and auditory perception, reviewing basic concepts, methodologies, research findings, and theoretical approaches. Theories of direct perception, constructivist perception, and computational vision are discussed in detail.

Credits: 3.00

PSY 63700 - Human Information Processing

Credit Hours: 3.00. This course develops the methodological tools required for an information processing approach to human behavior. These techniques are applied to such topics as reaction time, signal detection, attention, and skilled behavior, with emphasis upon unifying empirical findings. Prerequisite: PSY 60000 , PSY 60100 .

Credits: 3.00

PSY 69200 - Special Topics In Psychology

Credit Hours: 1.00 to 3.00. Various topics which may change

from semester to semester are presented by faculty in the Department of Psychological Sciences.

Credits: 1.00 to 3.00

Colloquium (xx credits)

PSY 63300 - Seminar In Experimental Psychology

Credit Hours: 2.00 to 3.00. Critical analysis of current problems in experimental psychology. Emphasis upon reviewing literature, preparing and presenting papers. Permission of instructor required.

Credits: 2.00 to 3.00

Electives (6-10 credits)

Thesis Research (xx credits)

PSY 69900 - Research PhD Thesis

Credit Hours: 1.00 to 18.00. Research PhD Thesis. Permission of instructor required.

Credits: 1.00 to 18.00

About the Program

Program Requirements - Thesis

Required Courses (24 credits)

Major Area (12-15 credits)

COM 60411 - Seminar In Communication Research Methods

Credit Hours: 3.00. This graduate course serves as the methodological foundation of strategic communication. Students in this class will survey core research methods (qualitative and quantitative) in professional and applied settings. This class is fully online. Students will interact with faculty and other students throughout the week. Permission of department required.

Learning Outcomes: 1. Identify and describe the major elements of the research process. 2. Formulate meaningful research questions and hypotheses. 3. Identify appropriate research methodologies associated with different types of research questions and hypotheses. 4. Conduct a variety of basic analyses of common communication data sets. 5. Design a research proposal to answer a set of research questions or hypotheses. Credits: 3.00

GRAD 61200 - Responsible Conduct Of Research

Credit Hours: 1.00. Overview of values, professional standards, and regulations that define responsible conduct in research. Students learn the values and standards of responsible research through readings and lecture/discussion and practice application of these values and standards to research situations through class discussion of case studies from life sciences research. Students must be registered for M.S. or Ph.D. thesis research in their home department.

Credits: 1.00

Health and Risk Communication

COM 57600 - Health Communication

Credit Hours: 3.00. Survey of health communication theory and research. Examines issues such as patient-provider and everyday communication, broader community-societal discourse, and organizational and mass health communication. Prepares participants for subsequent more specialized seminars and enriched study in allied specialties.

Learning Outcomes: 1. Identify discreet areas of health communication practice and research. 2. Explain communication issues important to patients. 3. Explain communication issues important to care givers. 4. Explain challenges to intercultural communication in the health care setting. 5. Critique media health campaigns. 6. Investigate and critique an area of health communication study. Credits: 3.00

COM 61200 - Seminar: Special Topics In Interpersonal Communication

Credit Hours: 3.00. Intensive study of selected topics, varying from semester to semester, from the theoretical and research literature of interpersonal communication. Topics may include communication models, information theory, systems theory, general semantics, sociolinguistics, etc., as they relate to the study of interpersonal communication. Prerequisite: COM 51200 .

Credits: 3.00

COM 67600 - Seminar: Special Topics In Health Communication

Credit Hours: 3.00. Intensive study of selected topics, varying from semester to semester, from the theoretical and research literature on health communication. Prerequisite: COM 57600

Credits: 3.00

COM 37800 - Introduction To Health Communication

Credit Hours: 3.00. This course will serve as an introduction to the many ways that communication shapes health and health practices. Course content includes: 1) current healthcare structure in the United States; 2) communication in the healthcare organization; 3) provider-patient communication; 4) patient-support provider communication; 5) models of health behavior change and campaigns; and 6) crisis communication and health.

Learning Outcomes: 1. Identify and apply theories relevant to health communication. 2. Identify how communication practices shape and affect health. 3. Provide a comparative analysis of issues of diversity in healthcare. 4. Tailor health communication materials to improve health literacy. 5. Design and implement health campaign. Credits: 3.00

COM 47800 - Health Communication Campaigns

Credit Hours: 3.00. This course is an introduction to the processes and theories that are used to design both informational and persuasive health communication campaigns. The course will also introduce students to proper evaluation procedures to determine a campaign's efficacy. Students will be able to contribute to their portfolios by applying theory and primary research in the construction of a health communication campaign plan for a client.

Learning Outcomes: 1. Identify and perform the various stages of implementing a health communication campaign through course readings, discussions, and the creation of their final projects. 2. Apply formative research techniques and analyze relevant data in the creation of their final projects. 3. Identify the major theories and their essential components used in building health communication campaigns, and apply their components in course assignments. 4. Assess prior and current campaign efforts to understand their effectiveness and also recognize their limitations. Credits: 3.00

COM 64500 - Healthcare Communication

Credit Hours: 3.00. The healthcare environment is increasingly complex, and poses many challenges for communication professionals seeking to improve communication with key health industry stakeholders, including patients, providers, payers, government agencies, and others. This course provides an overview of a broad range of unique communication challenges associated with health and the healthcare industry. Topics include review and discussion of key issues such as, major health communication theories, issues associated with patient-provider interaction, adoption and use of health information and communication technologies, the development and implementation of health campaigns and other behavior change initiatives, and marketing and public relations issues commonly faced by healthcare organizations. Prerequisites: Students must be admitted into the Online Masters of Science of Communication program. COM 60111

Learning Outcomes: 1. Recognize the basic components of the healthcare system and different models of healthcare delivery in the U.S. and other countries. 2. Describe major theories that inform health communication practice. 3. Articulate unique communication challenges facing the healthcare industry. 4. Develop strategies for designing, implementing, and evaluating healthcare-related campaigns. 5. Describe the impact of emerging communication technologies on healthcare practice. Credits: 3.00

COM 65500 - Health Advocacy

Credit Hours: 3.00. This course considers how federal, state, and local policy influence health status and health improvement. Through this course students gain an understanding of the role of health communication campaigns in health advocacy efforts. To engage their understanding, students will apply an advocacy campaign model to address a relevant health issue.

Learning Outcomes: 1. Understand of the role of health communication campaigns in health advocacy efforts. 2. Apply an advocacy campaign model to address relevant health issues. 3. Plan for a needs assessment. 4. Understand how health policy is enacted at different levels of government. 5. Conduct formative research. Credits: 3.00

COM 47900 - Introduction To Risk Communication

Credit Hours: 3.00. This course introduces students to theories that show how people express, perceive, exchange, and deliberate information about risk as well as how this understanding can be used to improve risk communication practice. This course examines risk communication theory and practice from multiple perspectives including social, psychological, cultural, and communicative.

Learning Outcomes: 1. Describe how and why major approaches to risk communication have shifted over time. 2. Explain cognitive and affective processes involved in individuals' risk perception in domains of science, health, and environmental issues. 3. Analyze different communication models and theories applicable to risk communication. 4. Discuss alternative interpersonal communicative public participation practices for deliberating risk information. Credits: 3.00

Interpersonal Communication

COM 50800 - Nonverbal Communication In Human Interaction

Credit Hours: 3.00. An examination of theoretical writings and critical studies in selected areas of nonverbal communication, e.g., the environmental influences, space and territory relationships, physical appearance and dress, physical behavior, and vocal cues. One unit will deal specifically with measurement, recording, or transcription methods used in nonverbal study.

Credits: 3.00

COM 51200 - Theories Of Interpersonal Communication

Credit Hours: 3.00. Review of contemporary theories, analysis of concepts, models, and pertinent research across the broad spectrum of interpersonal communication.

Credits: 3.00

COM 51800 - Theories Of Persuasion

Credit Hours: 3.00. Review of contemporary theories, including analysis of concepts, models, and pertinent research across the broad spectrum of persuasive communication.

Credits: 3.00

COM 58500 - Qualitative Methods In Communication Research

Credit Hours: 3.00. An introduction to qualitative research methods in communication studies. Provides students with an overview of several techniques for, and issues in, gathering, analyzing, writing-up, and using qualitative data. Department permission required.

Learning Outcomes: 1. Examine the philosophical assumptions, theoretical traditions and epistemology of qualitative methods in the field of communication. 2. Understand various approaches to qualitative inquiry, particularly entailing narrative research, phenomenological research, grounded theory research, ethnographic research, and case study research. 3. Critique written qualitative research in communication journals and identify ways to

improve them. 4. Develop skills and techniques to design a qualitative research project, which includes the process of getting IRB approval, collecting and analyzing qualitative data, and writing up qualitative findings. Credits: 3.00

COM 61200 - Seminar: Special Topics In Interpersonal Communication

Credit Hours: 3.00. Intensive study of selected topics, varying from semester to semester, from the theoretical and research literature of interpersonal communication. Topics may include communication models, information theory, systems theory, general semantics, sociolinguistics, etc., as they relate to the study of interpersonal communication. Prerequisite: COM 51200 .

Credits: 3.00

COM 68200 - Seminar: Special Topics In Quantitative Research

Credit Hours: 3.00. Intensive study, varying from semester to semester, of different aspects and applications of quantitative research in communication. Prerequisite: COM 58200

Credits: 3.00

COM 50300 - Cross Cultural Communication

Credit Hours: 3.00. In this course, we examine the scholarly history of intercultural and cross-cultural communication along with conceptual and empirical challenges in doing this type of inquiry. Several contexts will be studied from the point of view of forms of cultural wisdom and variation in practices. Larger questions of idenity, diversity, and intercultural competence will be explored, especially through filters of globalization and ethical issues in intercultural relations. Students will have regular reading assignments, short reaction papers, give oral presentations, and write a final research paper or proposal, depending on their stage in their programs.

Learning Outcomes: 1. Discuss and exemplify how culture is a multimodal, multilayered set of practices, attitudes, and belief. 2. Analyze intercultural communication problems, illustrating the historical, cultural, economic, and political differences that affect their solutions. 3. Recognize a range factors impacting human cultural life, including, but not limited to, class, gender, nation, ethnicity. 4. Develop research ideas and methods to address current problematics in cross-cultural communication. 5. Develop, create, determine how to engage audiences around a global problem. 6. Practice using self-awareness, research, discussion, and peer review to explore cross-cultural challenges. Credits: 3.00

Media, Technology, and Society

COM 62111 - Seminar In Strategic Communication And Social Media

Credit Hours: 3.00. This course will provide an overview of social media and its relationship to strategic communication. Students will learn about the available forms of social media (e.g., Blogs, Social Networks, and Wikis) as well as their uses, strengths and weaknesses for building and managing relationship with stakeholders. Students will also gain exposure to methods for analyzing social media metrics as a framework for evaluating the effectiveness of social media strategies as tools for developing corporate, nonprofit, and governmental images and brands. Permission of department required.

Learning Outcomes: 1. Demonstrate their understanding of current theories of communication technology that bear on the use and impact of social media environments. 2. Articulate changes in strategic communication brought about by changes in technology. 3. Identify and become familiar with the most commonly used social media technologies used in industry to communicate with stakeholders. 4. Demonstrate the ability to use contemporary social media tools. 5. Develop a social media strategy for an organization. 6. Identify, track, and analyze key social media metrics for evaluating the effectiveness of a social media strategy. Credits: 3.00

COM 49702 - Video Games And Society

Credit Hours: 3.00. This course focuses on video games as a form of mass communication. Primarily, this focus entails understanding how video games communicate to mass audiences, using features distinctive to video games, and how that communication might impact game players (i.e., media psychology). There is a secondary focus on how game players communicate with each other. The course will primarily examine these issues from social scientific perspectives. Topics include the influence of society on game creation, the impact of games

on players, gaming cultures, and game industries.

Learning Outcomes: 1. Identify and apply key communication concepts and theories that inform video game creation and consumption. 2. Compare video game features and creation processes. 3. Evaluate positive and negative effects of video games. 4. Describe the video game industry and surrounding culture. Credits: 3.00

Organizational Communication

COM 41900 - Judgment And Decision Making

Credit Hours: 3.00. This course is designed to foster an understanding, critique and analysis on issues related to judgment and decision processes. Permission of instructor required.

Learning Outcomes: 1. Encourage the application of theories of judgment and decision making to applied decision contexts. 2. Explore the interplay between communication and decision-making theories. 3. Acquire some practical, general skills for decision-making that are useful in everyday life and work contexts. Credits: 3.00

COM 57400 - Organizational Communication

Credit Hours: 3.00. Survey of the theoretical and empirical literature dealing with human communication behavior as it occurs within the context of complex organizations. Among topics covered are superior-subordinate communication, communication networks, message distortion, feedback processes, internal corporate mass media, managerial-communication climate, semantic and stylistic dimensions of messages, and communication in decision making.

Credits: 3.00

COM 60811 - Leadership And Global Strategic Communication

Credit Hours: 3.00. Over the last decade, the field of strategic communication has grown rapidly. The work of strategic communication professionals requires coordinated responses between distinct organizational units that are often separated by time and space. These conditions necessitate effective leadership. Further complicating leadership in these contexts is the fact that the work of strategic communication has increasingly become global in nature. This course provides students with theoretical background in leadership and global strategic communication, as well as the opportunity to apply what they learn to strategic communication cases and to their own professional experiences. It also encourages them to think proactively about leadership challenges in these contexts and to articulate theoretically-informed analyses and evaluations of leadership in action. Permission of department required.

Learning Outcomes: 1. Exhibit mastery of theories related to leadership and to strategic communication in global contexts. 2. Articulate the relationship between theory and the practice of leadership as it relates to global strategic communication, and apply theoretical concepts and principles to real world contexts. 3. Explain the role of leadership and culture in global strategic communication. 4. Compare and contrast notions of leadership, corporate social responsibility, and negotiation across cultural contexts. 5. Identify the unique challenges experienced when leaders engage in strategic communication practices globally. 6. Evaluate the current knowledge base and "best practices" in global strategic communication. Credits: 3.00

COM 67400 - Seminar: Special Topics In Organizational Communication

Credit Hours: 3.00. Intensive study of selected topics, varying from semester to semester, from the theoretical and research literature of organizational (including business and industrial) communication; analysis of recurring communication problems in complex organizations; critique of research findings and methodologies.

Credits: 3.00

COM 65000 - Communication And Leadership

Credit Hours: 3.00. Communication is the essence of leadership, and this course aims to identify how communication can fuel productivity, drive consensus and push the organization to a leadership position within a market. At the same time, communication can sabotage one's success or be used as a weapon to silence voices and promote political agendas. This course aims to empower you to shape leadership throughout the organization and to know how to advise other leaders in their efforts to overcome communication challenges. Permission of department required.

Learning Outcomes: 1. Identify relevant theories

and principles of organizational communication. 2. Understand how communication can increase team productivity. 3. Develop comprehensive internal and external communications plans. 4. Use data from an audit to make recommendations and decisions. 5. Construct a communications plan to achieve a leadership position in a marketplace. 6. Advise peers and colleagues as they work through their own communication challenges. 7. Identify communication strategies to communicate with executives when stakes are high. Credits: 3.00

COM 65100 - Organizational Culture And Internal Communication

Credit Hours: 3.00. The modern workplace had transformed well before a global pandemic magnified the paradigm shift already under way. In the United States, both consumers and the first five-generation workforce began to demand more from brand statements and value propositions. Those demands include genuine commitment to inclusion and diversity internally and corporate social responsibility externally. This course highlights the vital role professional communicators have in conveying brand and value statements that emanate from the organization's cultural core and carry forward to the consumer universe.

Learning Outcomes: 1. Explain how an organization's cultural core shapes its brand. 2. Identify channels that organizations use when communicating internally. 3. Discuss the significance and value of employees as brand ambassadors. 4. Recognize how inclusion organically builds a more diverse workforce. 5. Prepare a well-structure, convincing internal communication plan for an organization. Credits: 3.00

Public Relations

COM 49500 - Special Topics In Public Relations And Rhetorical Advocacy

Credit Hours: 3.00. In-depth study of a particular area of public relations and rhetorical advocacy. Students read, discuss, and write about contemporary applications of public relations, advertising and rhetoric. Possible offerings include Integrated Marketing Communication, Persuasion and Social Protest, Communication Campaigns.

Credits: 3.00

COM 60111 - Seminar In Strategic Communication

Credit Hours: 3.00. This graduate course will survey the theories and processes of strategic communication and its practice by business, government, politicians, and non-profits - in domestic and international arenas. The course will emphasize the application of theory to provide an in-depth understanding of planning, executing, and evaluating strategic communication plans. Prerequisite: Graduate student in communication. Permission of department required.

Learning Outcomes: 1. Understand the context in which strategic communication operates and the dynamics changing the profession, its work, and its value to clients and society. 2. Understand the theories which underlie strategic communication. 3. Understand the processes of the development and implementation of comprehensive communication strategies. 4. Strengthen writing and presentation skills relevant to strategic communication through course assignments. Credits: 3.00

COM 60311 - Seminar In Crisis Communication

Credit Hours: 3.00. This graduate course will focus on how to communicate in a time of crisis in order to manage the situation and disseminate key messages to various stakeholders. Prerequisite: Graduate student in Communication and COM 60111 . Permission of department required.

Learning Outcomes: 1. Have a broad understanding of the crisis communication literature. 2. Be able to formulate solutions to crisis situations from multiple perspectives. 3. Anticipate actions and analyze stakeholders involved in crisis situations. 4. Be aware of and challenge critical assumptions in crisis situations. 5. Evaluate crisis plans. Credits: 3.00

COM 60911 - Strategic Public Relations

Credit Hours: 3.00. Strategic communication is composed, in part, of integrated marketing communication (IMC), advertising, and public relations. This course highlights public relations scholarship, which is one of the strengths of the Brian Lamb School of Communication. As such, it builds on the general

strategic communication course by providing an in-depth understanding of public relations. Specifically, the class will cover public relations theories, ethics, concepts, principles, and applications. Permission of department required.

Learning Outcomes: 1. Demonstrate knowledge of public relations theory. 2. Articulate the roles of ethics in public relations. 3. Assess the research, planning, and evaluation used in public relations practices. 4. Identify the unique challenges associated with developing public relations campaigns. 5. Evaluate public relations campaigns and responses. 6. Identify the various publics that public relations scholarship addresses. Credits: 3.00

COM 62411 - Focus Groups And Interviewing For Strategic Communication

Credit Hours: 3.00. This course provides students with an overview of qualitative research in public relations with a particular emphasis on focus group and interview methodologies. The course will consider practical applications of these protocols in strategic communication contexts. Prerequisite: COM 60411 Permission of department required.

Learning Outcomes: 1. Identify the types of questions that qualitative research seeks to answer. 2. Determine the relative value of focus groups or interview data as a mechanism for answering research questions and protocols. 3. Develop interview and focus group protocols for collecting qualitative data in strategic communication contexts. 4. Utilize strategies for interpreting qualitative data and reporting it systematically. 5. Conduct effective interviews and focus groups for a strategic communication project. Credits: 3.00

COM 62511 - Survey Design, Analysis, And Reporting For Strategic Communication

Credit Hours: 3.00. This course provides students with an overview of quantitative research in public relations with a particular emphasis on survey design analysis. The course will cover the design and delivery of questionnaires, the use and interpretation of descriptive and inferential statistical methods, and reporting of quantitative results. The course will consider practical applications of these methods in professional strategic communication contexts. Prerequisite: COM 60411 Permission of department required.

Learning Outcomes: 1. Identify the types of questions that survey research is best suited to answer. 2. Develop effective survey instruments for measuring a wide range of attitudes, behaviors, and beliefs related to strategic communication. 3. Recognize the pros and cons of different sampling and survey distribution methodologies as they apply to different research protocols. 4. Demonstrate an understanding of common statistical approaches for analyzing survey data. 5. Apply survey methodologies to answer practical questions in the context of strategic communication. Credits: 3.00

COM 61000 - Special Topics In Public Relations

Credit Hours: 3.00. Intensive study, varying from semester to semester, in public relations. Permission of instructor required.

Credits: 3.00

COM 64100 - Integrated Marketing Communication

Credit Hours: 3.00. Developing cohesive and integrated external and internal communication initiatives across traditional and social media channels is becoming increasingly important for strategic communication professionals. Traditionally, Public Relations, Marketing, and Advertising/Promotion have had separate functions; increasingly the role of strategic communication practitioners is to ensure the consistency of the brand story and message across all channels of communication. Prerequisites: Students must be admitted into the Online Masters of Science of Communication program. COM 60111.

Learning Outcomes: 1. Identify and describe the different components IMC. 2. Defend the value of IMC for an organization. 3. Understand and appraise the business environment in which IMC operates. 4. Prepare written artifacts of IMC that based on theories of communication, marketing, and public relations, including a SWOT analysis and a media plan. 5. Critique IMC plans from a management perspective. 6. Apply principles and theories of IMC across each IMC function (e.g., public relations, marketing, advertising/promotion, etc.) Credits: 3.00

Health and Risk Communication

COM 57600 - Health Communication

Credit Hours: 3.00. Survey of health communication theory and research. Examines issues such as patient-provider and everyday communication, broader community-societal discourse, and organizational and mass health communication. Prepares participants for subsequent more specialized seminars and enriched study in allied specialties.

Learning Outcomes: 1. Identify discreet areas of health communication practice and research. 2. Explain communication issues important to patients. 3. Explain communication issues important to care givers. 4. Explain challenges to intercultural communication in the health care setting. 5. Critique media health campaigns. 6. Investigate and critique an area of health communication study. Credits: 3.00

COM 61200 - Seminar: Special Topics In Interpersonal Communication

Credit Hours: 3.00. Intensive study of selected topics, varying from semester to semester, from the theoretical and research literature of interpersonal communication. Topics may include communication models, information theory, systems theory, general semantics, sociolinguistics, etc., as they relate to the study of interpersonal communication. Prerequisite: COM 51200 .

Credits: 3.00

COM 67600 - Seminar: Special Topics In Health Communication

Credit Hours: 3.00. Intensive study of selected topics, varying from semester to semester, from the theoretical and research literature on health communication. Prerequisite: COM 57600

Credits: 3.00

COM 37800 - Introduction To Health Communication

Credit Hours: 3.00. This course will serve as an introduction to the many ways that communication shapes health and health practices. Course content includes: 1) current healthcare structure in the United States; 2) communication in the healthcare organization; 3) provider-patient communication; 4) patient-support provider communication; 5) models of health behavior change and campaigns; and 6) crisis communication and health.

Learning Outcomes: 1. Identify and apply theories relevant to health communication. 2. Identify how communication practices shape and affect health. 3. Provide a comparative analysis of issues of diversity in healthcare. 4. Tailor health communication materials to improve health literacy. 5. Design and implement health campaign. Credits: 3.00

COM 47800 - Health Communication Campaigns

Credit Hours: 3.00. This course is an introduction to the processes and theories that are used to design both informational and persuasive health communication campaigns. The course will also introduce students to proper evaluation procedures to determine a campaign's efficacy. Students will be able to contribute to their portfolios by applying theory and primary research in the construction of a health communication campaign plan for a client.

Learning Outcomes: 1. Identify and perform the various stages of implementing a health communication campaign through course readings, discussions, and the creation of their final projects. 2. Apply formative research techniques and analyze relevant data in the creation of their final projects. 3. Identify the major theories and their essential components used in building health communication campaigns, and apply their components in course assignments. 4. Assess prior and current campaign efforts to understand their effectiveness and also recognize their limitations. Credits: 3.00

COM 64500 - Healthcare Communication

Credit Hours: 3.00. The healthcare environment is increasingly complex, and poses many challenges for communication professionals seeking to improve communication with key health industry stakeholders, including patients, providers, payers, government agencies, and others. This course provides an overview of a broad range of unique communication challenges associated with health and the healthcare industry. Topics include review and discussion of key issues such as, major health communication theories, issues associated with patient-provider interaction, adoption and use of health information and communication technologies, the development and implementation of health campaigns and other behavior change initiatives, and marketing and public relations issues commonly faced by healthcare organizations. Prerequisites: Students must

be admitted into the Online Masters of Science of Communication program. COM 60111

Learning Outcomes: 1. Recognize the basic components of the healthcare system and different models of healthcare delivery in the U.S. and other countries. 2. Describe major theories that inform health communication practice. 3. Articulate unique communication challenges facing the healthcare industry. 4. Develop strategies for designing, implementing, and evaluating healthcare-related campaigns. 5. Describe the impact of emerging communication technologies on healthcare practice. Credits: 3.00

COM 65500 - Health Advocacy

Credit Hours: 3.00. This course considers how federal, state, and local policy influence health status and health improvement. Through this course students gain an understanding of the role of health communication campaigns in health advocacy efforts. To engage their understanding, students will apply an advocacy campaign model to address a relevant health issue.

Learning Outcomes: 1. Understand of the role of health communication campaigns in health advocacy efforts. 2. Apply an advocacy campaign model to address relevant health issues. 3. Plan for a needs assessment. 4. Understand how health policy is enacted at different levels of government. 5. Conduct formative research. Credits: 3.00

COM 47900 - Introduction To Risk Communication

Credit Hours: 3.00. This course introduces students to theories that show how people express, perceive, exchange, and deliberate information about risk as well as how this understanding can be used to improve risk communication practice. This course examines risk communication theory and practice from multiple perspectives including social, psychological, cultural, and communicative.

Learning Outcomes: 1. Describe how and why major approaches to risk communication have shifted over time. 2. Explain cognitive and affective processes involved in individuals' risk perception in domains of science, health, and environmental issues. 3. Analyze different communication models and theories applicable to risk communication. 4. Discuss alternative interpersonal communicative public participation practices for deliberating risk information. Credits: 3.00

Minor Area (9-12 credits)

Major Area (12-15 credits)

COM 60411 - Seminar In Communication Research Methods

Credit Hours: 3.00. This graduate course serves as the methodological foundation of strategic communication. Students in this class will survey core research methods (qualitative and quantitative) in professional and applied settings. This class is fully online. Students will interact with faculty and other students throughout the week. Permission of department required.

Learning Outcomes: 1. Identify and describe the major elements of the research process. 2. Formulate meaningful research questions and hypotheses. 3. Identify appropriate research methodologies associated with different types of research questions and hypotheses. 4. Conduct a variety of basic analyses of common communication data sets. 5. Design a research proposal to answer a set of research questions or hypotheses. Credits: 3.00

GRAD 61200 - Responsible Conduct Of Research

Credit Hours: 1.00. Overview of values, professional standards, and regulations that define responsible conduct in research. Students learn the values and standards of responsible research through readings and lecture/discussion and practice application of these values and standards to research situations through class discussion of case studies from life sciences research. Students must be registered for M.S. or Ph.D. thesis research in their home department.

Credits: 1.00

Health and Risk Communication

COM 57600 - Health Communication

Credit Hours: 3.00. Survey of health communication theory and research. Examines issues such as patient-provider and

everyday communication, broader community-societal discourse, and organizational and mass health communication. Prepares participants for subsequent more specialized seminars and enriched study in allied specialties.

Learning Outcomes: 1. Identify discreet areas of health communication practice and research. 2. Explain communication issues important to patients. 3. Explain communication issues important to care givers. 4. Explain challenges to intercultural communication in the health care setting. 5. Critique media health campaigns. 6. Investigate and critique an area of health communication study. Credits: 3.00

COM 61200 - Seminar: Special Topics In Interpersonal Communication

Credit Hours: 3.00. Intensive study of selected topics, varying from semester to semester, from the theoretical and research literature of interpersonal communication. Topics may include communication models, information theory, systems theory, general semantics, sociolinguistics, etc., as they relate to the study of interpersonal communication. Prerequisite: COM 51200 .

Credits: 3.00

COM 67600 - Seminar: Special Topics In Health Communication

Credit Hours: 3.00. Intensive study of selected topics, varying from semester to semester, from the theoretical and research literature on health communication. Prerequisite: COM 57600

Credits: 3.00

COM 37800 - Introduction To Health Communication

Credit Hours: 3.00. This course will serve as an introduction to the many ways that communication shapes health and health practices. Course content includes: 1) current healthcare structure in the United States; 2) communication in the healthcare organization; 3) provider-patient communication; 4) patient-support provider communication; 5) models of health behavior change and campaigns; and 6) crisis communication and health.

Learning Outcomes: 1. Identify and apply theories relevant to health communication. 2. Identify how communication practices shape and affect health. 3. Provide a comparative analysis of issues of diversity in healthcare. 4. Tailor health communication materials to improve health literacy. 5. Design and implement health campaign. Credits: 3.00

COM 47800 - Health Communication Campaigns

Credit Hours: 3.00. This course is an introduction to the processes and theories that are used to design both informational and persuasive health communication campaigns. The course will also introduce students to proper evaluation procedures to determine a campaign's efficacy. Students will be able to contribute to their portfolios by applying theory and primary research in the construction of a health communication campaign plan for a client.

Learning Outcomes: 1. Identify and perform the various stages of implementing a health communication campaign through course readings, discussions, and the creation of their final projects. 2. Apply formative research techniques and analyze relevant data in the creation of their final projects. 3. Identify the major theories and their essential components used in building health communication campaigns, and apply their components in course assignments. 4. Assess prior and current campaign efforts to understand their effectiveness and also recognize their limitations. Credits: 3.00

COM 64500 - Healthcare Communication

Credit Hours: 3.00. The healthcare environment is increasingly complex, and poses many challenges for communication professionals seeking to improve communication with key health industry stakeholders, including patients, providers, payers, government agencies, and others. This course provides an overview of a broad range of unique communication challenges associated with health and the healthcare industry. Topics include review and discussion of key issues such as, major health communication theories, issues associated with patient-provider interaction, adoption and use of health information and communication technologies, the development and implementation of health campaigns and other behavior change initiatives, and marketing and public relations issues commonly faced by healthcare organizations. Prerequisites: Students must be admitted into the Online Masters of Science of Communication program. COM 60111

Learning Outcomes: 1. Recognize the basic components of the healthcare system and different models of healthcare delivery in the

U.S. and other countries. 2. Describe major theories that inform health communication practice. 3. Articulate unique communication challenges facing the healthcare industry. 4. Develop strategies for designing, implementing, and evaluating healthcare-related campaigns. 5. Describe the impact of emerging communication technologies on healthcare practice. Credits: 3.00

COM 65500 - Health Advocacy

Credit Hours: 3.00. This course considers how federal, state, and local policy influence health status and health improvement. Through this course students gain an understanding of the role of health communication campaigns in health advocacy efforts. To engage their understanding, students will apply an advocacy campaign model to address a relevant health issue.

Learning Outcomes: 1. Understand of the role of health communication campaigns in health advocacy efforts. 2. Apply an advocacy campaign model to address relevant health issues. 3. Plan for a needs assessment. 4. Understand how health policy is enacted at different levels of government. 5. Conduct formative research. Credits: 3.00

COM 47900 - Introduction To Risk Communication

Credit Hours: 3.00. This course introduces students to theories that show how people express, perceive, exchange, and deliberate information about risk as well as how this understanding can be used to improve risk communication practice. This course examines risk communication theory and practice from multiple perspectives including social, psychological, cultural, and communicative.

Learning Outcomes: 1. Describe how and why major approaches to risk communication have shifted over time. 2. Explain cognitive and affective processes involved in individuals' risk perception in domains of science, health, and environmental issues. 3. Analyze different communication models and theories applicable to risk communication. 4. Discuss alternative interpersonal communicative public participation practices for deliberating risk information. Credits: 3.00

Interpersonal Communication

COM 50800 - Nonverbal Communication In Human Interaction

Credit Hours: 3.00. An examination of theoretical writings and critical studies in selected areas of nonverbal communication, e.g., the environmental influences, space and territory relationships, physical appearance and dress, physical behavior, and vocal cues. One unit will deal specifically with measurement, recording, or transcription methods used in nonverbal study.

Credits: 3.00

COM 51200 - Theories Of Interpersonal Communication

Credit Hours: 3.00. Review of contemporary theories, analysis of concepts, models, and pertinent research across the broad spectrum of interpersonal communication.

Credits: 3.00

COM 51800 - Theories Of Persuasion

Credit Hours: 3.00. Review of contemporary theories, including analysis of concepts, models, and pertinent research across the broad spectrum of persuasive communication.

Credits: 3.00

COM 58500 - Qualitative Methods In Communication Research

Credit Hours: 3.00. An introduction to qualitative research methods in communication studies. Provides students with an overview of several techniques for, and issues in, gathering, analyzing, writing-up, and using qualitative data. Department permission required.

Learning Outcomes: 1. Examine the philosophical assumptions, theoretical traditions and epistemology of qualitative methods in the field of communication. 2. Understand various approaches to qualitative inquiry, particularly entailing narrative research, phenomenological research, grounded theory research, ethnographic research, and case study research. 3. Critique written qualitative research in communication journals and identify ways to improve them. 4. Develop skills and techniques to design a qualitative research project, which includes the process of getting IRB approval,

collecting and analyzing qualitative data, and writing up qualitative findings. Credits: 3.00

COM 61200 - Seminar: Special Topics In Interpersonal Communication

Credit Hours: 3.00. Intensive study of selected topics, varying from semester to semester, from the theoretical and research literature of interpersonal communication. Topics may include communication models, information theory, systems theory, general semantics, sociolinguistics, etc., as they relate to the study of interpersonal communication. Prerequisite: COM 51200 .

Credits: 3.00

COM 68200 - Seminar: Special Topics In Quantitative Research

Credit Hours: 3.00. Intensive study, varying from semester to semester, of different aspects and applications of quantitative research in communication. Prerequisite: COM 58200

Credits: 3.00

COM 50300 - Cross Cultural Communication

Credit Hours: 3.00. In this course, we examine the scholarly history of intercultural and cross-cultural communication along with conceptual and empirical challenges in doing this type of inquiry. Several contexts will be studied from the point of view of forms of cultural wisdom and variation in practices. Larger questions of idenity, diversity, and intercultural competence will be explored, especially through filters of globalization and ethical issues in intercultural relations. Students will have regular reading assignments, short reaction papers, give oral presentations, and write a final research paper or proposal, depending on their stage in their programs.

Learning Outcomes: 1. Discuss and exemplify how culture is a multimodal, multilayered set of practices, attitudes, and belief. 2. Analyze intercultural communication problems, illustrating the historical, cultural, economic, and political differences that affect their solutions. 3. Recognize a range factors impacting human cultural life, including, but not limited to, class, gender, nation, ethnicity. 4. Develop research ideas and methods to address current problematics in cross-cultural communication. 5. Develop, create, determine how to engage audiences around a global problem. 6. Practice using self-awareness, research, discussion, and peer review to explore cross-cultural challenges. Credits: 3.00

Media, Technology, and Society

COM 62111 - Seminar In Strategic Communication And Social Media

Credit Hours: 3.00. This course will provide an overview of social media and its relationship to strategic communication. Students will learn about the available forms of social media (e.g., Blogs, Social Networks, and Wikis) as well as their uses, strengths and weaknesses for building and managing relationship with stakeholders. Students will also gain exposure to methods for analyzing social media metrics as a framework for evaluating the effectiveness of social media strategies as tools for developing corporate, nonprofit, and governmental images and brands. Permission of department required.

Learning Outcomes: 1. Demonstrate their understanding of current theories of communication technology that bear on the use and impact of social media environments. 2. Articulate changes in strategic communication brought about by changes in technology. 3. Identify and become familiar with the most commonly used social media technologies used in industry to communicate with stakeholders. 4. Demonstrate the ability to use contemporary social media tools. 5. Develop a social media strategy for an organization. 6. Identify, track, and analyze key social media metrics for evaluating the effectiveness of a social media strategy. Credits: 3.00

COM 49702 - Video Games And Society

Credit Hours: 3.00. This course focuses on video games as a form of mass communication. Primarily, this focus entails understanding how video games communicate to mass audiences, using features distinctive to video games, and how that communication might impact game players (i.e., media psychology). There is a secondary focus on how game players communicate with each other. The course will primarily examine these issues from social scientific perspectives. Topics include the influence of society on game creation, the impact of games on players, gaming cultures, and game industries.

Learning Outcomes: 1. Identify and apply key communication concepts and theories that

inform video game creation and consumption. 2. Compare video game features and creation processes. 3. Evaluate positive and negative effects of video games. 4. Describe the video game industry and surrounding culture. Credits: 3.00

Organizational Communication

COM 41900 - Judgment And Decision Making

Credit Hours: 3.00. This course is designed to foster an understanding, critique and analysis on issues related to judgment and decision processes. Permission of instructor required.

Learning Outcomes: 1. Encourage the application of theories of judgment and decision making to applied decision contexts. 2. Explore the interplay between communication and decision-making theories. 3. Acquire some practical, general skills for decision-making that are useful in everyday life and work contexts. Credits: 3.00

COM 57400 - Organizational Communication

Credit Hours: 3.00. Survey of the theoretical and empirical literature dealing with human communication behavior as it occurs within the context of complex organizations. Among topics covered are superior-subordinate communication, communication networks, message distortion, feedback processes, internal corporate mass media, managerial-communication climate, semantic and stylistic dimensions of messages, and communication in decision making.

Credits: 3.00

COM 60811 - Leadership And Global Strategic Communication

Credit Hours: 3.00. Over the last decade, the field of strategic communication has grown rapidly. The work of strategic communication professionals requires coordinated responses between distinct organizational units that are often separated by time and space. These conditions necessitate effective leadership. Further complicating leadership in these contexts is the fact that the work of strategic communication has increasingly become global in nature. This course provides students with theoretical background in leadership and global strategic communication, as well as the opportunity to apply what they learn to strategic communication cases and to their own professional experiences. It also encourages them to think proactively about leadership challenges in these contexts and to articulate theoretically-informed analyses and evaluations of leadership in action. Permission of department required.

Learning Outcomes: 1. Exhibit mastery of theories related to leadership and to strategic communication in global contexts. 2. Articulate the relationship between theory and the practice of leadership as it relates to global strategic communication, and apply theoretical concepts and principles to real world contexts. 3. Explain the role of leadership and culture in global strategic communication. 4. Compare and contrast notions of leadership, corporate social responsibility, and negotiation across cultural contexts. 5. Identify the unique challenges experienced when leaders engage in strategic communication practices globally. 6. Evaluate the current knowledge base and "best practices" in global strategic communication. Credits: 3.00

COM 67400 - Seminar: Special Topics In Organizational Communication

Credit Hours: 3.00. Intensive study of selected topics, varying from semester to semester, from the theoretical and research literature of organizational (including business and industrial) communication; analysis of recurring communication problems in complex organizations; critique of research findings and methodologies.

Credits: 3.00

COM 65000 - Communication And Leadership

Credit Hours: 3.00. Communication is the essence of leadership, and this course aims to identify how communication can fuel productivity, drive consensus and push the organization to a leadership position within a market. At the same time, communication can sabotage one's success or be used as a weapon to silence voices and promote political agendas. This course aims to empower you to shape leadership throughout the organization and to know how to advise other leaders in their efforts to overcome communication challenges. Permission of department required.

Learning Outcomes: 1. Identify relevant theories and principles of organizational communication. 2. Understand how communication can increase team productivity. 3. Develop comprehensive

internal and external communications plans. 4. Use data from an audit to make recommendations and decisions. 5. Construct a communications plan to achieve a leadership position in a marketplace. 6. Advise peers and colleagues as they work through their own communication challenges. 7. Identify communication strategies to communicate with executives when stakes are high. Credits: 3.00

COM 65100 - Organizational Culture And Internal Communication

Credit Hours: 3.00. The modern workplace had transformed well before a global pandemic magnified the paradigm shift already under way. In the United States, both consumers and the first five-generation workforce began to demand more from brand statements and value propositions. Those demands include genuine commitment to inclusion and diversity internally and corporate social responsibility externally. This course highlights the vital role professional communicators have in conveying brand and value statements that emanate from the organization's cultural core and carry forward to the consumer universe.

Learning Outcomes: 1. Explain how an organization's cultural core shapes its brand. 2. Identify channels that organizations use when communicating internally. 3. Discuss the significance and value of employees as brand ambassadors. 4. Recognize how inclusion organically builds a more diverse workforce. 5. Prepare a well-structure, convincing internal communication plan for an organization. Credits: 3.00

Public Relations

COM 49500 - Special Topics In Public Relations And Rhetorical Advocacy

Credit Hours: 3.00. In-depth study of a particular area of public relations and rhetorical advocacy. Students read, discuss, and write about contemporary applications of public relations, advertising and rhetoric. Possible offerings include Integrated Marketing Communication, Persuasion and Social Protest, Communication Campaigns.

Credits: 3.00

COM 60111 - Seminar In Strategic Communication

Credit Hours: 3.00. This graduate course will survey the theories and processes of strategic communication and its practice by business, government, politicians, and non-profits - in domestic and international arenas. The course will emphasize the application of theory to provide an in-depth understanding of planning, executing, and evaluating strategic communication plans. Prerequisite: Graduate student in communication. Permission of department required.

Learning Outcomes: 1. Understand the context in which strategic communication operates and the dynamics changing the profession, its work, and its value to clients and society. 2. Understand the theories which underlie strategic communication. 3. Understand the processes of the development and implementation of comprehensive communication strategies. 4. Strengthen writing and presentation skills relevant to strategic communication through course assignments. Credits: 3.00

COM 60311 - Seminar In Crisis Communication

Credit Hours: 3.00. This graduate course will focus on how to communicate in a time of crisis in order to manage the situation and disseminate key messages to various stakeholders. Prerequisite: Graduate student in Communication and COM 60111 . Permission of department required.

Learning Outcomes: 1. Have a broad understanding of the crisis communication literature. 2. Be able to formulate solutions to crisis situations from multiple perspectives. 3. Anticipate actions and analyze stakeholders involved in crisis situations. 4. Be aware of and challenge critical assumptions in crisis situations. 5. Evaluate crisis plans. Credits: 3.00

COM 60911 - Strategic Public Relations

Credit Hours: 3.00. Strategic communication is composed, in part, of integrated marketing communication (IMC), advertising, and public relations. This course highlights public relations scholarship, which is one of the strengths of the Brian Lamb School of Communication. As such, it builds on the general strategic communication course by providing an in-depth understanding of public relations. Specifically, the class will

cover public relations theories, ethics, concepts, principles, and applications. Permission of department required.

Learning Outcomes: 1. Demonstrate knowledge of public relations theory. 2. Articulate the roles of ethics in public relations. 3. Assess the research, planning, and evaluation used in public relations practices. 4. Identify the unique challenges associated with developing public relations campaigns. 5. Evaluate public relations campaigns and responses. 6. Identify the various publics that public relations scholarship addresses. Credits: 3.00

COM 62411 - Focus Groups And Interviewing For Strategic Communication

Credit Hours: 3.00. This course provides students with an overview of qualitative research in public relations with a particular emphasis on focus group and interview methodologies. The course will consider practical applications of these protocols in strategic communication contexts. Prerequisite: COM 60411 Permission of department required.

Learning Outcomes: 1. Identify the types of questions that qualitative research seeks to answer. 2. Determine the relative value of focus groups or interview data as a mechanism for answering research questions and protocols. 3. Develop interview and focus group protocols for collecting qualitative data in strategic communication contexts. 4. Utilize strategies for interpreting qualitative data and reporting it systematically. 5. Conduct effective interviews and focus groups for a strategic communication project. Credits: 3.00

COM 62511 - Survey Design, Analysis, And Reporting For Strategic Communication

Credit Hours: 3.00. This course provides students with an overview of quantitative research in public relations with a particular emphasis on survey design analysis. The course will cover the design and delivery of questionnaires, the use and interpretation of descriptive and inferential statistical methods, and reporting of quantitative results. The course will consider practical applications of these methods in professional strategic communication contexts. Prerequisite: COM 60411 Permission of department required.

Learning Outcomes: 1. Identify the types of questions that survey research is best suited to answer. 2. Develop effective survey instruments for measuring a wide range of attitudes, behaviors, and beliefs related to strategic communication. 3. Recognize the pros and cons of different sampling and survey distribution methodologies as they apply to different research protocols. 4. Demonstrate an understanding of common statistical approaches for analyzing survey data. 5. Apply survey methodologies to answer practical questions in the context of strategic communication. Credits: 3.00

COM 61000 - Special Topics In Public Relations

Credit Hours: 3.00. Intensive study, varying from semester to semester, in public relations. Permission of instructor required.

Credits: 3.00

COM 64100 - Integrated Marketing Communication

Credit Hours: 3.00. Developing cohesive and integrated external and internal communication initiatives across traditional and social media channels is becoming increasingly important for strategic communication professionals. Traditionally, Public Relations, Marketing, and Advertising/Promotion have had separate functions; increasingly the role of strategic communication practitioners is to ensure the consistency of the brand story and message across all channels of communication. Prerequisites: Students must be admitted into the Online Masters of Science of Communication program. COM 60111.

Learning Outcomes: 1. Identify and describe the different components IMC. 2. Defend the value of IMC for an organization. 3. Understand and appraise the business environment in which IMC operates. 4. Prepare written artifacts of IMC that based on theories of communication, marketing, and public relations, including a SWOT analysis and a media plan. 5. Critique IMC plans from a management perspective. 6. Apply principles and theories of IMC across each IMC function (e.g., public relations, marketing, advertising/promotion, etc.) Credits: 3.00

Health and Risk Communication

COM 57600 - Health Communication

Credit Hours: 3.00. Survey of health communication theory and research. Examines issues such as patient-provider and everyday communication, broader community-societal discourse, and organizational and mass health communication. Prepares participants for subsequent more specialized seminars and enriched study in allied specialties.

Learning Outcomes: 1. Identify discreet areas of health communication practice and research. 2. Explain communication issues important to patients. 3. Explain communication issues important to care givers. 4. Explain challenges to intercultural communication in the health care setting. 5. Critique media health campaigns. 6. Investigate and critique an area of health communication study. Credits: 3.00

COM 61200 - Seminar: Special Topics In Interpersonal Communication

Credit Hours: 3.00. Intensive study of selected topics, varying from semester to semester, from the theoretical and research literature of interpersonal communication. Topics may include communication models, information theory, systems theory, general semantics, sociolinguistics, etc., as they relate to the study of interpersonal communication. Prerequisite: COM 51200 .

Credits: 3.00

COM 67600 - Seminar: Special Topics In Health Communication

Credit Hours: 3.00. Intensive study of selected topics, varying from semester to semester, from the theoretical and research literature on health communication. Prerequisite: COM 57600

Credits: 3.00

COM 37800 - Introduction To Health Communication

Credit Hours: 3.00. This course will serve as an introduction to the many ways that communication shapes health and health practices. Course content includes: 1) current healthcare structure in the United States; 2) communication in the healthcare organization; 3) provider-patient communication; 4) patient-support provider communication; 5) models of health behavior change and campaigns; and 6) crisis communication and health.

Learning Outcomes: 1. Identify and apply theories relevant to health communication. 2. Identify how communication practices shape and affect health. 3. Provide a comparative analysis of issues of diversity in healthcare. 4. Tailor health communication materials to improve health literacy. 5. Design and implement health campaign. Credits: 3.00

COM 47800 - Health Communication Campaigns

Credit Hours: 3.00. This course is an introduction to the processes and theories that are used to design both informational and persuasive health communication campaigns. The course will also introduce students to proper evaluation procedures to determine a campaign's efficacy. Students will be able to contribute to their portfolios by applying theory and primary research in the construction of a health communication campaign plan for a client.

Learning Outcomes: 1. Identify and perform the various stages of implementing a health communication campaign through course readings, discussions, and the creation of their final projects. 2. Apply formative research techniques and analyze relevant data in the creation of their final projects. 3. Identify the major theories and their essential components used in building health communication campaigns, and apply their components in course assignments. 4. Assess prior and current campaign efforts to understand their effectiveness and also recognize their limitations. Credits: 3.00

COM 64500 - Healthcare Communication

Credit Hours: 3.00. The healthcare environment is increasingly complex, and poses many challenges for communication professionals seeking to improve communication with key health industry stakeholders, including patients, providers, payers, government agencies, and others. This course provides an overview of a broad range of unique communication challenges associated with health and the healthcare industry. Topics include review and discussion of key issues such as, major health communication theories, issues associated with patient-provider interaction, adoption and use of health information and communication technologies, the development and implementation of health campaigns and other behavior change initiatives, and marketing and public relations issues commonly faced by healthcare organizations. Prerequisites: Students must

be admitted into the Online Masters of Science of Communication program. COM 60111

Learning Outcomes: 1. Recognize the basic components of the healthcare system and different models of healthcare delivery in the U.S. and other countries. 2. Describe major theories that inform health communication practice. 3. Articulate unique communication challenges facing the healthcare industry. 4. Develop strategies for designing, implementing, and evaluating healthcare-related campaigns. 5. Describe the impact of emerging communication technologies on healthcare practice. Credits: 3.00

COM 65500 - Health Advocacy

Credit Hours: 3.00. This course considers how federal, state, and local policy influence health status and health improvement. Through this course students gain an understanding of the role of health communication campaigns in health advocacy efforts. To engage their understanding, students will apply an advocacy campaign model to address a relevant health issue.

Learning Outcomes: 1. Understand of the role of health communication campaigns in health advocacy efforts. 2. Apply an advocacy campaign model to address relevant health issues. 3. Plan for a needs assessment. 4. Understand how health policy is enacted at different levels of government. 5. Conduct formative research. Credits: 3.00

COM 47900 - Introduction To Risk Communication

Credit Hours: 3.00. This course introduces students to theories that show how people express, perceive, exchange, and deliberate information about risk as well as how this understanding can be used to improve risk communication practice. This course examines risk communication theory and practice from multiple perspectives including social, psychological, cultural, and communicative.

Learning Outcomes: 1. Describe how and why major approaches to risk communication have shifted over time. 2. Explain cognitive and affective processes involved in individuals' risk perception in domains of science, health, and environmental issues. 3. Analyze different communication models and theories applicable to risk communication. 4. Discuss alternative interpersonal communicative public participation practices for deliberating risk information. Credits: 3.00

Thesis Research (6 credits)

COM 69800 - Research MA Or MS Thesis

Credit Hours: 1.00 to 18.00. Research MA Or MS Thesis. Permission of instructor required.

Credits: 1.00 to 18.00

Required Courses (24 credits)

Major Area (12-15 credits)

COM 60411 - Seminar In Communication Research Methods

Credit Hours: 3.00. This graduate course serves as the methodological foundation of strategic communication. Students in this class will survey core research methods (qualitative and quantitative) in professional and applied settings. This class is fully online. Students will interact with faculty and other students throughout the week. Permission of department required.

Learning Outcomes: 1. Identify and describe the major elements of the research process. 2. Formulate meaningful research questions and hypotheses. 3. Identify appropriate research methodologies associated with different types of research questions and hypotheses. 4. Conduct a variety of basic analyses of common communication data sets. 5. Design a research proposal to answer a set of research questions or hypotheses. Credits: 3.00

GRAD 61200 - Responsible Conduct Of Research

Credit Hours: 1.00. Overview of values, professional standards, and regulations that define responsible conduct in research. Students learn the values and standards of responsible research through readings and lecture/discussion and practice application of these values and standards to research situations through class discussion of case studies from life sciences research. Students must be registered for M.S. or Ph.D. thesis

research in their home department.

Credits: 1.00

Health and Risk Communication

COM 57600 - Health Communication

Credit Hours: 3.00. Survey of health communication theory and research. Examines issues such as patient-provider and everyday communication, broader community-societal discourse, and organizational and mass health communication. Prepares participants for subsequent more specialized seminars and enriched study in allied specialties.

Learning Outcomes: 1. Identify discreet areas of health communication practice and research. 2. Explain communication issues important to patients. 3. Explain communication issues important to care givers. 4. Explain challenges to intercultural communication in the health care setting. 5. Critique media health campaigns. 6. Investigate and critique an area of health communication study. Credits: 3.00

COM 61200 - Seminar: Special Topics In Interpersonal Communication

Credit Hours: 3.00. Intensive study of selected topics, varying from semester to semester, from the theoretical and research literature of interpersonal communication. Topics may include communication models, information theory, systems theory, general semantics, sociolinguistics, etc., as they relate to the study of interpersonal communication. Prerequisite: COM 51200 .

Credits: 3.00

COM 67600 - Seminar: Special Topics In Health Communication

Credit Hours: 3.00. Intensive study of selected topics, varying from semester to semester, from the theoretical and research literature on health communication. Prerequisite: COM 57600

Credits: 3.00

COM 37800 - Introduction To Health Communication

Credit Hours: 3.00. This course will serve as an introduction to the many ways that communication shapes health and health practices. Course content includes: 1) current healthcare structure in the United States; 2) communication in the healthcare organization; 3) provider-patient communication; 4) patient-support provider communication; 5) models of health behavior change and campaigns; and 6) crisis communication and health.

Learning Outcomes: 1. Identify and apply theories relevant to health communication. 2. Identify how communication practices shape and affect health. 3. Provide a comparative analysis of issues of diversity in healthcare. 4. Tailor health communication materials to improve health literacy. 5. Design and implement health campaign. Credits: 3.00

COM 47800 - Health Communication Campaigns

Credit Hours: 3.00. This course is an introduction to the processes and theories that are used to design both informational and persuasive health communication campaigns. The course will also introduce students to proper evaluation procedures to determine a campaign's efficacy. Students will be able to contribute to their portfolios by applying theory and primary research in the construction of a health communication campaign plan for a client.

Learning Outcomes: 1. Identify and perform the various stages of implementing a health communication campaign through course readings, discussions, and the creation of their final projects. 2. Apply formative research techniques and analyze relevant data in the creation of their final projects. 3. Identify the major theories and their essential components used in building health communication campaigns, and apply their components in course assignments. 4. Assess prior and current campaign efforts to understand their effectiveness and also recognize their limitations. Credits: 3.00

COM 64500 - Healthcare Communication

Credit Hours: 3.00. The healthcare environment is increasingly complex, and poses many challenges for communication professionals seeking to improve communication with key health industry stakeholders, including patients, providers, payers, government agencies, and others. This course provides an overview of a broad range of unique communication challenges associated with health and the healthcare industry. Topics include review and discussion of key issues such as, major health communication theories, issues associated with patient-provider interaction, adoption and use of health information and communication technologies, the development and

implementation of health campaigns and other behavior change initiatives, and marketing and public relations issues commonly faced by healthcare organizations. Prerequisites: Students must be admitted into the Online Masters of Science of Communication program. COM 60111

Learning Outcomes: 1. Recognize the basic components of the healthcare system and different models of healthcare delivery in the U.S. and other countries. 2. Describe major theories that inform health communication practice. 3. Articulate unique communication challenges facing the healthcare industry. 4. Develop strategies for designing, implementing, and evaluating healthcare-related campaigns. 5. Describe the impact of emerging communication technologies on healthcare practice. Credits: 3.00

COM 65500 - Health Advocacy

Credit Hours: 3.00. This course considers how federal, state, and local policy influence health status and health improvement. Through this course students gain an understanding of the role of health communication campaigns in health advocacy efforts. To engage their understanding, students will apply an advocacy campaign model to address a relevant health issue.

Learning Outcomes: 1. Understand of the role of health communication campaigns in health advocacy efforts. 2. Apply an advocacy campaign model to address relevant health issues. 3. Plan for a needs assessment. 4. Understand how health policy is enacted at different levels of government. 5. Conduct formative research. Credits: 3.00

COM 47900 - Introduction To Risk Communication

Credit Hours: 3.00. This course introduces students to theories that show how people express, perceive, exchange, and deliberate information about risk as well as how this understanding can be used to improve risk communication practice. This course examines risk communication theory and practice from multiple perspectives including social, psychological, cultural, and communicative.

Learning Outcomes: 1. Describe how and why major approaches to risk communication have shifted over time. 2. Explain cognitive and affective processes involved in individuals' risk perception in domains of science, health, and environmental issues. 3. Analyze different communication models and theories applicable to risk communication. 4. Discuss alternative interpersonal communicative public participation practices for deliberating risk information. Credits: 3.00

Interpersonal Communication

COM 50800 - Nonverbal Communication In Human Interaction

Credit Hours: 3.00. An examination of theoretical writings and critical studies in selected areas of nonverbal communication, e.g., the environmental influences, space and territory relationships, physical appearance and dress, physical behavior, and vocal cues. One unit will deal specifically with measurement, recording, or transcription methods used in nonverbal study.

Credits: 3.00

COM 51200 - Theories Of Interpersonal Communication

Credit Hours: 3.00. Review of contemporary theories, analysis of concepts, models, and pertinent research across the broad spectrum of interpersonal communication.

Credits: 3.00

COM 51800 - Theories Of Persuasion

Credit Hours: 3.00. Review of contemporary theories, including analysis of concepts, models, and pertinent research across the broad spectrum of persuasive communication.

Credits: 3.00

COM 58500 - Qualitative Methods In Communication Research

Credit Hours: 3.00. An introduction to qualitative research methods in communication studies. Provides students with an overview of several techniques for, and issues in, gathering, analyzing, writing-up, and using qualitative data. Department permission required.

Learning Outcomes: 1. Examine the philosophical assumptions, theoretical traditions and epistemology of qualitative methods in the field of communication. 2. Understand various approaches to qualitative inquiry, particularly entailing narrative research, phenomenological research, grounded theory research,

ethnographic research, and case study research. 3. Critique written qualitative research in communication journals and identify ways to improve them. 4. Develop skills and techniques to design a qualitative research project, which includes the process of getting IRB approval, collecting and analyzing qualitative data, and writing up qualitative findings. Credits: 3.00

COM 61200 - Seminar: Special Topics In Interpersonal Communication

Credit Hours: 3.00. Intensive study of selected topics, varying from semester to semester, from the theoretical and research literature of interpersonal communication. Topics may include communication models, information theory, systems theory, general semantics, sociolinguistics, etc., as they relate to the study of interpersonal communication. Prerequisite: COM 51200 .

Credits: 3.00

COM 68200 - Seminar: Special Topics In Quantitative Research

Credit Hours: 3.00. Intensive study, varying from semester to semester, of different aspects and applications of quantitative research in communication. Prerequisite: COM 58200

Credits: 3.00

COM 50300 - Cross Cultural Communication

Credit Hours: 3.00. In this course, we examine the scholarly history of intercultural and cross-cultural communication along with conceptual and empirical challenges in doing this type of inquiry. Several contexts will be studied from the point of view of forms of cultural wisdom and variation in practices. Larger questions of idenity, diversity, and intercultural competence will be explored, especially through filters of globalization and ethical issues in intercultural relations. Students will have regular reading assignments, short reaction papers, give oral presentations, and write a final research paper or proposal, depending on their stage in their programs.

Learning Outcomes: 1. Discuss and exemplify how culture is a multimodal, multilayered set of practices, attitudes, and belief. 2. Analyze intercultural communication problems, illustrating the historical, cultural, economic, and political differences that affect their solutions. 3. Recognize a range factors impacting human cultural life, including, but not limited to, class, gender, nation, ethnicity. 4. Develop research ideas and methods to address current problematics in cross-cultural communication. 5. Develop, create, determine how to engage audiences around a global problem. 6. Practice using self-awareness, research, discussion, and peer review to explore cross-cultural challenges. Credits: 3.00

Media, Technology, and Society

COM 62111 - Seminar In Strategic Communication And Social Media

Credit Hours: 3.00. This course will provide an overview of social media and its relationship to strategic communication. Students will learn about the available forms of social media (e.g., Blogs, Social Networks, and Wikis) as well as their uses, strengths and weaknesses for building and managing relationship with stakeholders. Students will also gain exposure to methods for analyzing social media metrics as a framework for evaluating the effectiveness of social media strategies as tools for developing corporate, nonprofit, and governmental images and brands. Permission of department required.

Learning Outcomes: 1. Demonstrate their understanding of current theories of communication technology that bear on the use and impact of social media environments. 2. Articulate changes in strategic communication brought about by changes in technology. 3. Identify and become familiar with the most commonly used social media technologies used in industry to communicate with stakeholders. 4. Demonstrate the ability to use contemporary social media tools. 5. Develop a social media strategy for an organization. 6. Identify, track, and analyze key social media metrics for evaluating the effectiveness of a social media strategy. Credits: 3.00

COM 49702 - Video Games And Society

Credit Hours: 3.00. This course focuses on video games as a form of mass communication. Primarily, this focus entails understanding how video games communicate to mass audiences, using features distinctive to video games, and how that communication might impact game players (i.e., media

psychology). There is a secondary focus on how game players communicate with each other. The course will primarily examine these issues from social scientific perspectives. Topics include the influence of society on game creation, the impact of games on players, gaming cultures, and game industries.

Learning Outcomes: 1. Identify and apply key communication concepts and theories that inform video game creation and consumption. 2. Compare video game features and creation processes. 3. Evaluate positive and negative effects of video games. 4. Describe the video game industry and surrounding culture. Credits: 3.00

Organizational Communication

COM 41900 - Judgment And Decision Making

Credit Hours: 3.00. This course is designed to foster an understanding, critique and analysis on issues related to judgment and decision processes. Permission of instructor required.

Learning Outcomes: 1. Encourage the application of theories of judgment and decision making to applied decision contexts. 2. Explore the interplay between communication and decision-making theories. 3. Acquire some practical, general skills for decision-making that are useful in everyday life and work contexts. Credits: 3.00

COM 57400 - Organizational Communication

Credit Hours: 3.00. Survey of the theoretical and empirical literature dealing with human communication behavior as it occurs within the context of complex organizations. Among topics covered are superior-subordinate communication, communication networks, message distortion, feedback processes, internal corporate mass media, managerial-communication climate, semantic and stylistic dimensions of messages, and communication in decision making.

Credits: 3.00

COM 60811 - Leadership And Global Strategic Communication

Credit Hours: 3.00. Over the last decade, the field of strategic communication has grown rapidly. The work of strategic communication professionals requires coordinated responses between distinct organizational units that are often separated by time and space. These conditions necessitate effective leadership. Further complicating leadership in these contexts is the fact that the work of strategic communication has increasingly become global in nature. This course provides students with theoretical background in leadership and global strategic communication, as well as the opportunity to apply what they learn to strategic communication cases and to their own professional experiences. It also encourages them to think proactively about leadership challenges in these contexts and to articulate theoretically-informed analyses and evaluations of leadership in action. Permission of department required.

Learning Outcomes: 1. Exhibit mastery of theories related to leadership and to strategic communication in global contexts. 2. Articulate the relationship between theory and the practice of leadership as it relates to global strategic communication, and apply theoretical concepts and principles to real world contexts. 3. Explain the role of leadership and culture in global strategic communication. 4. Compare and contrast notions of leadership, corporate social responsibility, and negotiation across cultural contexts. 5. Identify the unique challenges experienced when leaders engage in strategic communication practices globally. 6. Evaluate the current knowledge base and "best practices" in global strategic communication. Credits: 3.00

COM 67400 - Seminar: Special Topics In Organizational Communication

Credit Hours: 3.00. Intensive study of selected topics, varying from semester to semester, from the theoretical and research literature of organizational (including business and industrial) communication; analysis of recurring communication problems in complex organizations; critique of research findings and methodologies.

Credits: 3.00

COM 65000 - Communication And Leadership

Credit Hours: 3.00. Communication is the essence of leadership, and this course aims to identify how communication can fuel productivity, drive consensus and push the organization to a leadership position within a market. At the same time, communication can sabotage one's success or be used as a weapon to silence voices and promote political agendas. This course aims to empower you to shape leadership throughout the organization and to know how to advise other leaders in

their efforts to overcome communication challenges. Permission of department required.

Learning Outcomes: 1. Identify relevant theories and principles of organizational communication. 2. Understand how communication can increase team productivity. 3. Develop comprehensive internal and external communications plans. 4. Use data from an audit to make recommendations and decisions. 5. Construct a communications plan to achieve a leadership position in a marketplace. 6. Advise peers and colleagues as they work through their own communication challenges. 7. Identify communication strategies to communicate with executives when stakes are high. Credits: 3.00

COM 65100 - Organizational Culture And Internal Communication

Credit Hours: 3.00. The modern workplace had transformed well before a global pandemic magnified the paradigm shift already under way. In the United States, both consumers and the first five-generation workforce began to demand more from brand statements and value propositions. Those demands include genuine commitment to inclusion and diversity internally and corporate social responsibility externally. This course highlights the vital role professional communicators have in conveying brand and value statements that emanate from the organization's cultural core and carry forward to the consumer universe.

Learning Outcomes: 1. Explain how an organization's cultural core shapes its brand. 2. Identify channels that organizations use when communicating internally. 3. Discuss the significance and value of employees as brand ambassadors. 4. Recognize how inclusion organically builds a more diverse workforce. 5. Prepare a well-structure, convincing internal communication plan for an organization. Credits: 3.00

Public Relations

COM 49500 - Special Topics In Public Relations And Rhetorical Advocacy

Credit Hours: 3.00. In-depth study of a particular area of public relations and rhetorical advocacy. Students read, discuss, and write about contemporary applications of public relations, advertising and rhetoric. Possible offerings include Integrated Marketing Communication, Persuasion and Social Protest, Communication Campaigns.

Credits: 3.00

COM 60111 - Seminar In Strategic Communication

Credit Hours: 3.00. This graduate course will survey the theories and processes of strategic communication and its practice by business, government, politicians, and non-profits - in domestic and international arenas. The course will emphasize the application of theory to provide an in-depth understanding of planning, executing, and evaluating strategic communication plans. Prerequisite: Graduate student in communication. Permission of department required.

Learning Outcomes: 1. Understand the context in which strategic communication operates and the dynamics changing the profession, its work, and its value to clients and society. 2. Understand the theories which underlie strategic communication. 3. Understand the processes of the development and implementation of comprehensive communication strategies. 4. Strengthen writing and presentation skills relevant to strategic communication through course assignments. Credits: 3.00

COM 60311 - Seminar In Crisis Communication

Credit Hours: 3.00. This graduate course will focus on how to communicate in a time of crisis in order to manage the situation and disseminate key messages to various stakeholders. Prerequisite: Graduate student in Communication and COM 60111 . Permission of department required.

Learning Outcomes: 1. Have a broad understanding of the crisis communication literature. 2. Be able to formulate solutions to crisis situations from multiple perspectives. 3. Anticipate actions and analyze stakeholders involved in crisis situations. 4. Be aware of and challenge critical assumptions in crisis situations. 5. Evaluate crisis plans. Credits: 3.00

COM 60911 - Strategic Public Relations

Credit Hours: 3.00. Strategic communication is composed, in

part, of integrated marketing communication (IMC), advertising, and public relations. This course highlights public relations scholarship, which is one of the strengths of the Brian Lamb School of Communication. As such, it builds on the general strategic communication course by providing an in-depth understanding of public relations. Specifically, the class will cover public relations theories, ethics, concepts, principles, and applications. Permission of department required.

Learning Outcomes: 1. Demonstrate knowledge of public relations theory. 2. Articulate the roles of ethics in public relations. 3. Assess the research, planning, and evaluation used in public relations practices. 4. Identify the unique challenges associated with developing public relations campaigns. 5. Evaluate public relations campaigns and responses. 6. Identify the various publics that public relations scholarship addresses. Credits: 3.00

COM 62411 - Focus Groups And Interviewing For Strategic Communication

Credit Hours: 3.00. This course provides students with an overview of qualitative research in public relations with a particular emphasis on focus group and interview methodologies. The course will consider practical applications of these protocols in strategic communication contexts. Prerequisite: COM 60411 Permission of department required.

Learning Outcomes: 1. Identify the types of questions that qualitative research seeks to answer. 2. Determine the relative value of focus groups or interview data as a mechanism for answering research questions and protocols. 3. Develop interview and focus group protocols for collecting qualitative data in strategic communication contexts. 4. Utilize strategies for interpreting qualitative data and reporting it systematically. 5. Conduct effective interviews and focus groups for a strategic communication project. Credits: 3.00

COM 62511 - Survey Design, Analysis, And Reporting For Strategic Communication

Credit Hours: 3.00. This course provides students with an overview of quantitative research in public relations with a particular emphasis on survey design analysis. The course will cover the design and delivery of questionnaires, the use and interpretation of descriptive and inferential statistical methods, and reporting of quantitative results. The course will consider practical applications of these methods in professional strategic communication contexts. Prerequisite: COM 60411 Permission of department required.

Learning Outcomes: 1. Identify the types of questions that survey research is best suited to answer. 2. Develop effective survey instruments for measuring a wide range of attitudes, behaviors, and beliefs related to strategic communication. 3. Recognize the pros and cons of different sampling and survey distribution methodologies as they apply to different research protocols. 4. Demonstrate an understanding of common statistical approaches for analyzing survey data. 5. Apply survey methodologies to answer practical questions in the context of strategic communication. Credits: 3.00

COM 61000 - Special Topics In Public Relations

Credit Hours: 3.00. Intensive study, varying from semester to semester, in public relations. Permission of instructor required.

Credits: 3.00

COM 64100 - Integrated Marketing Communication

Credit Hours: 3.00. Developing cohesive and integrated external and internal communication initiatives across traditional and social media channels is becoming increasingly important for strategic communication professionals. Traditionally, Public Relations, Marketing, and Advertising/Promotion have had separate functions; increasingly the role of strategic communication practitioners is to ensure the consistency of the brand story and message across all channels of communication. Prerequisites: Students must be admitted into the Online Masters of Science of Communication program. COM 60111.

Learning Outcomes: 1. Identify and describe the different components IMC. 2. Defend the value of IMC for an organization. 3. Understand and appraise the business environment in which IMC operates. 4. Prepare written artifacts of IMC that based on theories of communication, marketing, and public relations, including a SWOT analysis and a media plan. 5. Critique IMC plans from a management perspective. 6. Apply principles and theories of IMC across

each IMC function (e.g., public relations, marketing, advertising/promotion, etc.) Credits: 3.00

Health and Risk Communication

COM 57600 - Health Communication

Credit Hours: 3.00. Survey of health communication theory and research. Examines issues such as patient-provider and everyday communication, broader community-societal discourse, and organizational and mass health communication. Prepares participants for subsequent more specialized seminars and enriched study in allied specialties.

Learning Outcomes: 1. Identify discreet areas of health communication practice and research. 2. Explain communication issues important to patients. 3. Explain communication issues important to care givers. 4. Explain challenges to intercultural communication in the health care setting. 5. Critique media health campaigns. 6. Investigate and critique an area of health communication study. Credits: 3.00

COM 61200 - Seminar: Special Topics In Interpersonal Communication

Credit Hours: 3.00. Intensive study of selected topics, varying from semester to semester, from the theoretical and research literature of interpersonal communication. Topics may include communication models, information theory, systems theory, general semantics, sociolinguistics, etc., as they relate to the study of interpersonal communication. Prerequisite: COM 51200 .

Credits: 3.00

COM 67600 - Seminar: Special Topics In Health Communication

Credit Hours: 3.00. Intensive study of selected topics, varying from semester to semester, from the theoretical and research literature on health communication. Prerequisite: COM 57600

Credits: 3.00

COM 37800 - Introduction To Health Communication

Credit Hours: 3.00. This course will serve as an introduction to the many ways that communication shapes health and health practices. Course content includes: 1) current healthcare structure in the United States; 2) communication in the healthcare organization; 3) provider-patient communication; 4) patient-support provider communication; 5) models of health behavior change and campaigns; and 6) crisis communication and health.

Learning Outcomes: 1. Identify and apply theories relevant to health communication. 2. Identify how communication practices shape and affect health. 3. Provide a comparative analysis of issues of diversity in healthcare. 4. Tailor health communication materials to improve health literacy. 5. Design and implement health campaign. Credits: 3.00

COM 47800 - Health Communication Campaigns

Credit Hours: 3.00. This course is an introduction to the processes and theories that are used to design both informational and persuasive health communication campaigns. The course will also introduce students to proper evaluation procedures to determine a campaign's efficacy. Students will be able to contribute to their portfolios by applying theory and primary research in the construction of a health communication campaign plan for a client.

Learning Outcomes: 1. Identify and perform the various stages of implementing a health communication campaign through course readings, discussions, and the creation of their final projects. 2. Apply formative research techniques and analyze relevant data in the creation of their final projects. 3. Identify the major theories and their essential components used in building health communication campaigns, and apply their components in course assignments. 4. Assess prior and current campaign efforts to understand their effectiveness and also recognize their limitations. Credits: 3.00

COM 64500 - Healthcare Communication

Credit Hours: 3.00. The healthcare environment is increasingly complex, and poses many challenges for communication professionals seeking to improve communication with key health industry stakeholders, including patients, providers, payers, government agencies, and others. This course provides an overview of a broad range of unique communication challenges associated with health and the healthcare industry. Topics include review and discussion of key issues such as, major health communication theories, issues associated with patient-

provider interaction, adoption and use of health information and communication technologies, the development and implementation of health campaigns and other behavior change initiatives, and marketing and public relations issues commonly faced by healthcare organizations. Prerequisites: Students must be admitted into the Online Masters of Science of Communication program. COM 60111

Learning Outcomes: 1. Recognize the basic components of the healthcare system and different models of healthcare delivery in the U.S. and other countries. 2. Describe major theories that inform health communication practice. 3. Articulate unique communication challenges facing the healthcare industry. 4. Develop strategies for designing, implementing, and evaluating healthcare-related campaigns. 5. Describe the impact of emerging communication technologies on healthcare practice. Credits: 3.00

COM 65500 - Health Advocacy

Credit Hours: 3.00. This course considers how federal, state, and local policy influence health status and health improvement. Through this course students gain an understanding of the role of health communication campaigns in health advocacy efforts. To engage their understanding, students will apply an advocacy campaign model to address a relevant health issue.

Learning Outcomes: 1. Understand of the role of health communication campaigns in health advocacy efforts. 2. Apply an advocacy campaign model to address relevant health issues. 3. Plan for a needs assessment. 4. Understand how health policy is enacted at different levels of government. 5. Conduct formative research. Credits: 3.00

COM 47900 - Introduction To Risk Communication

Credit Hours: 3.00. This course introduces students to theories that show how people express, perceive, exchange, and deliberate information about risk as well as how this understanding can be used to improve risk communication practice. This course examines risk communication theory and practice from multiple perspectives including social, psychological, cultural, and communicative.

Learning Outcomes: 1. Describe how and why major approaches to risk communication have shifted over time. 2. Explain cognitive and affective processes involved in individuals' risk perception in domains of science, health, and environmental issues. 3. Analyze different communication models and theories applicable to risk communication. 4. Discuss alternative interpersonal communicative public participation practices for deliberating risk information. Credits: 3.00

Minor Area (9-12 credits)

Major Area (12-15 credits)

COM 60411 - Seminar In Communication Research Methods

Credit Hours: 3.00. This graduate course serves as the methodological foundation of strategic communication. Students in this class will survey core research methods (qualitative and quantitative) in professional and applied settings. This class is fully online. Students will interact with faculty and other students throughout the week. Permission of department required.

Learning Outcomes: 1. Identify and describe the major elements of the research process. 2. Formulate meaningful research questions and hypotheses. 3. Identify appropriate research methodologies associated with different types of research questions and hypotheses. 4. Conduct a variety of basic analyses of common communication data sets. 5. Design a research proposal to answer a set of research questions or hypotheses. Credits: 3.00

GRAD 61200 - Responsible Conduct Of Research

Credit Hours: 1.00. Overview of values, professional standards, and regulations that define responsible conduct in research. Students learn the values and standards of responsible research through readings and lecture/discussion and practice application of these values and standards to research situations through class discussion of case studies from life sciences research. Students must be registered for M.S. or Ph.D. thesis research in their home department.

Credits: 1.00

Health and Risk Communication

COM 57600 - Health Communication

Credit Hours: 3.00. Survey of health communication theory and research. Examines issues such as patient-provider and everyday communication, broader community-societal discourse, and organizational and mass health communication. Prepares participants for subsequent more specialized seminars and enriched study in allied specialties.

Learning Outcomes: 1. Identify discreet areas of health communication practice and research. 2. Explain communication issues important to patients. 3. Explain communication issues important to care givers. 4. Explain challenges to intercultural communication in the health care setting. 5. Critique media health campaigns. 6. Investigate and critique an area of health communication study. Credits: 3.00

COM 61200 - Seminar: Special Topics In Interpersonal Communication

Credit Hours: 3.00. Intensive study of selected topics, varying from semester to semester, from the theoretical and research literature of interpersonal communication. Topics may include communication models, information theory, systems theory, general semantics, sociolinguistics, etc., as they relate to the study of interpersonal communication. Prerequisite: COM 51200 .

Credits: 3.00

COM 67600 - Seminar: Special Topics In Health Communication

Credit Hours: 3.00. Intensive study of selected topics, varying from semester to semester, from the theoretical and research literature on health communication. Prerequisite: COM 57600

Credits: 3.00

COM 37800 - Introduction To Health Communication

Credit Hours: 3.00. This course will serve as an introduction to the many ways that communication shapes health and health practices. Course content includes: 1) current healthcare structure in the United States; 2) communication in the healthcare organization; 3) provider-patient communication; 4) patient-support provider communication; 5) models of health behavior change and campaigns; and 6) crisis communication and health.

Learning Outcomes: 1. Identify and apply theories relevant to health communication. 2. Identify how communication practices shape and affect health. 3. Provide a comparative analysis of issues of diversity in healthcare. 4. Tailor health communication materials to improve health literacy. 5. Design and implement health campaign. Credits: 3.00

COM 47800 - Health Communication Campaigns

Credit Hours: 3.00. This course is an introduction to the processes and theories that are used to design both informational and persuasive health communication campaigns. The course will also introduce students to proper evaluation procedures to determine a campaign's efficacy. Students will be able to contribute to their portfolios by applying theory and primary research in the construction of a health communication campaign plan for a client.

Learning Outcomes: 1. Identify and perform the various stages of implementing a health communication campaign through course readings, discussions, and the creation of their final projects. 2. Apply formative research techniques and analyze relevant data in the creation of their final projects. 3. Identify the major theories and their essential components used in building health communication campaigns, and apply their components in course assignments. 4. Assess prior and current campaign efforts to understand their effectiveness and also recognize their limitations. Credits: 3.00

COM 64500 - Healthcare Communication

Credit Hours: 3.00. The healthcare environment is increasingly complex, and poses many challenges for communication professionals seeking to improve communication with key health industry stakeholders, including patients, providers, payers, government agencies, and others. This course provides an overview of a broad range of unique communication challenges associated with health and the healthcare industry. Topics include review and discussion of key issues such as, major health communication theories, issues associated with patient-provider interaction, adoption and use of health information and communication technologies, the development and implementation of health campaigns and other behavior change initiatives, and marketing and public relations issues commonly faced by healthcare organizations. Prerequisites: Students must

be admitted into the Online Masters of Science of Communication program. COM 60111

Learning Outcomes: 1. Recognize the basic components of the healthcare system and different models of healthcare delivery in the U.S. and other countries. 2. Describe major theories that inform health communication practice. 3. Articulate unique communication challenges facing the healthcare industry. 4. Develop strategies for designing, implementing, and evaluating healthcare-related campaigns. 5. Describe the impact of emerging communication technologies on healthcare practice. Credits: 3.00

COM 65500 - Health Advocacy

Credit Hours: 3.00. This course considers how federal, state, and local policy influence health status and health improvement. Through this course students gain an understanding of the role of health communication campaigns in health advocacy efforts. To engage their understanding, students will apply an advocacy campaign model to address a relevant health issue.

Learning Outcomes: 1. Understand of the role of health communication campaigns in health advocacy efforts. 2. Apply an advocacy campaign model to address relevant health issues. 3. Plan for a needs assessment. 4. Understand how health policy is enacted at different levels of government. 5. Conduct formative research. Credits: 3.00

COM 47900 - Introduction To Risk Communication

Credit Hours: 3.00. This course introduces students to theories that show how people express, perceive, exchange, and deliberate information about risk as well as how this understanding can be used to improve risk communication practice. This course examines risk communication theory and practice from multiple perspectives including social, psychological, cultural, and communicative.

Learning Outcomes: 1. Describe how and why major approaches to risk communication have shifted over time. 2. Explain cognitive and affective processes involved in individuals' risk perception in domains of science, health, and environmental issues. 3. Analyze different communication models and theories applicable to risk communication. 4. Discuss alternative interpersonal communicative public participation practices for deliberating risk information. Credits: 3.00

Interpersonal Communication

COM 50800 - Nonverbal Communication In Human Interaction

Credit Hours: 3.00. An examination of theoretical writings and critical studies in selected areas of nonverbal communication, e.g., the environmental influences, space and territory relationships, physical appearance and dress, physical behavior, and vocal cues. One unit will deal specifically with measurement, recording, or transcription methods used in nonverbal study.

Credits: 3.00

COM 51200 - Theories Of Interpersonal Communication

Credit Hours: 3.00. Review of contemporary theories, analysis of concepts, models, and pertinent research across the broad spectrum of interpersonal communication.

Credits: 3.00

COM 51800 - Theories Of Persuasion

Credit Hours: 3.00. Review of contemporary theories, including analysis of concepts, models, and pertinent research across the broad spectrum of persuasive communication.

Credits: 3.00

COM 58500 - Qualitative Methods In Communication Research

Credit Hours: 3.00. An introduction to qualitative research methods in communication studies. Provides students with an overview of several techniques for, and issues in, gathering, analyzing, writing-up, and using qualitative data. Department permission required.

Learning Outcomes: 1. Examine the philosophical assumptions, theoretical traditions and epistemology of qualitative methods in the field of communication. 2. Understand various approaches to qualitative inquiry, particularly entailing narrative research, phenomenological research, grounded theory research, ethnographic research, and case study research. 3. Critique written qualitative research

in communication journals and identify ways to improve them. 4. Develop skills and techniques to design a qualitative research project, which includes the process of getting IRB approval, collecting and analyzing qualitative data, and writing up qualitative findings. Credits: 3.00

COM 61200 - Seminar: Special Topics In Interpersonal Communication

Credit Hours: 3.00. Intensive study of selected topics, varying from semester to semester, from the theoretical and research literature of interpersonal communication. Topics may include communication models, information theory, systems theory, general semantics, sociolinguistics, etc., as they relate to the study of interpersonal communication. Prerequisite: COM 51200 .

Credits: 3.00

COM 68200 - Seminar: Special Topics In Quantitative Research

Credit Hours: 3.00. Intensive study, varying from semester to semester, of different aspects and applications of quantitative research in communication. Prerequisite: COM 58200

Credits: 3.00

COM 50300 - Cross Cultural Communication

Credit Hours: 3.00. In this course, we examine the scholarly history of intercultural and cross-cultural communication along with conceptual and empirical challenges in doing this type of inquiry. Several contexts will be studied from the point of view of forms of cultural wisdom and variation in practices. Larger questions of idenity, diversity, and intercultural competence will be explored, especially through filters of globalization and ethical issues in intercultural relations. Students will have regular reading assignments, short reaction papers, give oral presentations, and write a final research paper or proposal, depending on their stage in their programs.

Learning Outcomes: 1. Discuss and exemplify how culture is a multimodal, multilayered set of practices, attitudes, and belief. 2. Analyze intercultural communication problems, illustrating the historical, cultural, economic, and political differences that affect their solutions. 3. Recognize a range factors impacting human cultural life, including, but not limited to, class, gender, nation, ethnicity. 4. Develop research ideas and methods to address current problematics in cross-cultural communication. 5. Develop, create, determine how to engage audiences around a global problem. 6. Practice using self-awareness, research, discussion, and peer review to explore cross-cultural challenges. Credits: 3.00

Media, Technology, and Society

COM 62111 - Seminar In Strategic Communication And Social Media

Credit Hours: 3.00. This course will provide an overview of social media and its relationship to strategic communication. Students will learn about the available forms of social media (e.g., Blogs, Social Networks, and Wikis) as well as their uses, strengths and weaknesses for building and managing relationship with stakeholders. Students will also gain exposure to methods for analyzing social media metrics as a framework for evaluating the effectiveness of social media strategies as tools for developing corporate, nonprofit, and governmental images and brands. Permission of department required.

Learning Outcomes: 1. Demonstrate their understanding of current theories of communication technology that bear on the use and impact of social media environments. 2. Articulate changes in strategic communication brought about by changes in technology. 3. Identify and become familiar with the most commonly used social media technologies used in industry to communicate with stakeholders. 4. Demonstrate the ability to use contemporary social media tools. 5. Develop a social media strategy for an organization. 6. Identify, track, and analyze key social media metrics for evaluating the effectiveness of a social media strategy. Credits: 3.00

COM 49702 - Video Games And Society

Credit Hours: 3.00. This course focuses on video games as a form of mass communication. Primarily, this focus entails understanding how video games communicate to mass audiences, using features distinctive to video games, and how that communication might impact game players (i.e., media psychology). There is a secondary focus on how game players communicate with each other. The course will primarily examine these issues from social scientific perspectives. Topics include

the influence of society on game creation, the impact of games on players, gaming cultures, and game industries.

Learning Outcomes: 1. Identify and apply key communication concepts and theories that inform video game creation and consumption. 2. Compare video game features and creation processes. 3. Evaluate positive and negative effects of video games. 4. Describe the video game industry and surrounding culture. Credits: 3.00

Organizational Communication

COM 41900 - Judgment And Decision Making

Credit Hours: 3.00. This course is designed to foster an understanding, critique and analysis on issues related to judgment and decision processes. Permission of instructor required.

Learning Outcomes: 1. Encourage the application of theories of judgment and decision making to applied decision contexts. 2. Explore the interplay between communication and decision-making theories. 3. Acquire some practical, general skills for decision-making that are useful in everyday life and work contexts. Credits: 3.00

COM 57400 - Organizational Communication

Credit Hours: 3.00. Survey of the theoretical and empirical literature dealing with human communication behavior as it occurs within the context of complex organizations. Among topics covered are superior-subordinate communication, communication networks, message distortion, feedback processes, internal corporate mass media, managerial-communication climate, semantic and stylistic dimensions of messages, and communication in decision making.

Credits: 3.00

COM 60811 - Leadership And Global Strategic Communication

Credit Hours: 3.00. Over the last decade, the field of strategic communication has grown rapidly. The work of strategic communication professionals requires coordinated responses between distinct organizational units that are often separated by time and space. These conditions necessitate effective leadership. Further complicating leadership in these contexts is the fact that the work of strategic communication has increasingly become global in nature. This course provides students with theoretical background in leadership and global strategic communication, as well as the opportunity to apply what they learn to strategic communication cases and to their own professional experiences. It also encourages them to think proactively about leadership challenges in these contexts and to articulate theoretically-informed analyses and evaluations of leadership in action. Permission of department required.

Learning Outcomes: 1. Exhibit mastery of theories related to leadership and to strategic communication in global contexts. 2. Articulate the relationship between theory and the practice of leadership as it relates to global strategic communication, and apply theoretical concepts and principles to real world contexts. 3. Explain the role of leadership and culture in global strategic communication. 4. Compare and contrast notions of leadership, corporate social responsibility, and negotiation across cultural contexts. 5. Identify the unique challenges experienced when leaders engage in strategic communication practices globally. 6. Evaluate the current knowledge base and "best practices" in global strategic communication. Credits: 3.00

COM 67400 - Seminar: Special Topics In Organizational Communication

Credit Hours: 3.00. Intensive study of selected topics, varying from semester to semester, from the theoretical and research literature of organizational (including business and industrial) communication; analysis of recurring communication problems in complex organizations; critique of research findings and methodologies.

Credits: 3.00

COM 65000 - Communication And Leadership

Credit Hours: 3.00. Communication is the essence of leadership, and this course aims to identify how communication can fuel productivity, drive consensus and push the organization to a leadership position within a market. At the same time, communication can sabotage one's success or be used as a weapon to silence voices and promote political agendas. This course aims to empower you to shape leadership throughout the organization and to know how to advise other leaders in their efforts to overcome communication challenges. Permission of department required.

Learning Outcomes: 1. Identify relevant theories

and principles of organizational communication. 2. Understand how communication can increase team productivity. 3. Develop comprehensive internal and external communications plans. 4. Use data from an audit to make recommendations and decisions. 5. Construct a communications plan to achieve a leadership position in a marketplace. 6. Advise peers and colleagues as they work through their own communication challenges. 7. Identify communication strategies to communicate with executives when stakes are high. Credits: 3.00

COM 65100 - Organizational Culture And Internal Communication

Credit Hours: 3.00. The modern workplace had transformed well before a global pandemic magnified the paradigm shift already under way. In the United States, both consumers and the first five-generation workforce began to demand more from brand statements and value propositions. Those demands include genuine commitment to inclusion and diversity internally and corporate social responsibility externally. This course highlights the vital role professional communicators have in conveying brand and value statements that emanate from the organization's cultural core and carry forward to the consumer universe.

Learning Outcomes: 1. Explain how an organization's cultural core shapes its brand. 2. Identify channels that organizations use when communicating internally. 3. Discuss the significance and value of employees as brand ambassadors. 4. Recognize how inclusion organically builds a more diverse workforce. 5. Prepare a well-structure, convincing internal communication plan for an organization. Credits: 3.00

Public Relations

COM 49500 - Special Topics In Public Relations And Rhetorical Advocacy

Credit Hours: 3.00. In-depth study of a particular area of public relations and rhetorical advocacy. Students read, discuss, and write about contemporary applications of public relations, advertising and rhetoric. Possible offerings include Integrated Marketing Communication, Persuasion and Social Protest, Communication Campaigns.

Credits: 3.00

COM 60111 - Seminar In Strategic Communication

Credit Hours: 3.00. This graduate course will survey the theories and processes of strategic communication and its practice by business, government, politicians, and non-profits - in domestic and international arenas. The course will emphasize the application of theory to provide an in-depth understanding of planning, executing, and evaluating strategic communication plans. Prerequisite: Graduate student in communication. Permission of department required.

Learning Outcomes: 1. Understand the context in which strategic communication operates and the dynamics changing the profession, its work, and its value to clients and society. 2. Understand the theories which underlie strategic communication. 3. Understand the processes of the development and implementation of comprehensive communication strategies. 4. Strengthen writing and presentation skills relevant to strategic communication through course assignments. Credits: 3.00

COM 60311 - Seminar In Crisis Communication

Credit Hours: 3.00. This graduate course will focus on how to communicate in a time of crisis in order to manage the situation and disseminate key messages to various stakeholders. Prerequisite: Graduate student in Communication and COM 60111 . Permission of department required.

Learning Outcomes: 1. Have a broad understanding of the crisis communication literature. 2. Be able to formulate solutions to crisis situations from multiple perspectives. 3. Anticipate actions and analyze stakeholders involved in crisis situations. 4. Be aware of and challenge critical assumptions in crisis situations. 5. Evaluate crisis plans. Credits: 3.00

COM 60911 - Strategic Public Relations

Credit Hours: 3.00. Strategic communication is composed, in part, of integrated marketing communication (IMC), advertising, and public relations. This course highlights public relations scholarship, which is one of the strengths of the Brian Lamb School of Communication. As such, it builds on the general

strategic communication course by providing an in-depth understanding of public relations. Specifically, the class will cover public relations theories, ethics, concepts, principles, and applications. Permission of department required.

Learning Outcomes: 1. Demonstrate knowledge of public relations theory. 2. Articulate the roles of ethics in public relations. 3. Assess the research, planning, and evaluation used in public relations practices. 4. Identify the unique challenges associated with developing public relations campaigns. 5. Evaluate public relations campaigns and responses. 6. Identify the various publics that public relations scholarship addresses. Credits: 3.00

COM 62411 - Focus Groups And Interviewing For Strategic Communication

Credit Hours: 3.00. This course provides students with an overview of qualitative research in public relations with a particular emphasis on focus group and interview methodologies. The course will consider practical applications of these protocols in strategic communication contexts. Prerequisite: COM 60411 Permission of department required.

Learning Outcomes: 1. Identify the types of questions that qualitative research seeks to answer. 2. Determine the relative value of focus groups or interview data as a mechanism for answering research questions and protocols. 3. Develop interview and focus group protocols for collecting qualitative data in strategic communication contexts. 4. Utilize strategies for interpreting qualitative data and reporting it systematically. 5. Conduct effective interviews and focus groups for a strategic communication project. Credits: 3.00

COM 62511 - Survey Design, Analysis, And Reporting For Strategic Communication

Credit Hours: 3.00. This course provides students with an overview of quantitative research in public relations with a particular emphasis on survey design analysis. The course will cover the design and delivery of questionnaires, the use and interpretation of descriptive and inferential statistical methods, and reporting of quantitative results. The course will consider practical applications of these methods in professional strategic communication contexts. Prerequisite: COM 60411 Permission of department required.

Learning Outcomes: 1. Identify the types of questions that survey research is best suited to answer. 2. Develop effective survey instruments for measuring a wide range of attitudes, behaviors, and beliefs related to strategic communication. 3. Recognize the pros and cons of different sampling and survey distribution methodologies as they apply to different research protocols. 4. Demonstrate an understanding of common statistical approaches for analyzing survey data. 5. Apply survey methodologies to answer practical questions in the context of strategic communication. Credits: 3.00

COM 61000 - Special Topics In Public Relations

Credit Hours: 3.00. Intensive study, varying from semester to semester, in public relations. Permission of instructor required.

Credits: 3.00

COM 64100 - Integrated Marketing Communication

Credit Hours: 3.00. Developing cohesive and integrated external and internal communication initiatives across traditional and social media channels is becoming increasingly important for strategic communication professionals. Traditionally, Public Relations, Marketing, and Advertising/Promotion have had separate functions; increasingly the role of strategic communication practitioners is to ensure the consistency of the brand story and message across all channels of communication. Prerequisites: Students must be admitted into the Online Masters of Science of Communication program. COM 60111.

Learning Outcomes: 1. Identify and describe the different components IMC. 2. Defend the value of IMC for an organization. 3. Understand and appraise the business environment in which IMC operates. 4. Prepare written artifacts of IMC that based on theories of communication, marketing, and public relations, including a SWOT analysis and a media plan. 5. Critique IMC plans from a management perspective. 6. Apply principles and theories of IMC across each IMC function (e.g., public relations, marketing, advertising/promotion, etc.) Credits: 3.00

Health and Risk Communication

COM 57600 - Health Communication

Credit Hours: 3.00. Survey of health communication theory and research. Examines issues such as patient-provider and everyday communication, broader community-societal discourse, and organizational and mass health communication. Prepares participants for subsequent more specialized seminars and enriched study in allied specialties.

Learning Outcomes: 1. Identify discreet areas of health communication practice and research. 2. Explain communication issues important to patients. 3. Explain communication issues important to care givers. 4. Explain challenges to intercultural communication in the health care setting. 5. Critique media health campaigns. 6. Investigate and critique an area of health communication study. Credits: 3.00

COM 61200 - Seminar: Special Topics In Interpersonal Communication

Credit Hours: 3.00. Intensive study of selected topics, varying from semester to semester, from the theoretical and research literature of interpersonal communication. Topics may include communication models, information theory, systems theory, general semantics, sociolinguistics, etc., as they relate to the study of interpersonal communication. Prerequisite: COM 51200 .

Credits: 3.00

COM 67600 - Seminar: Special Topics In Health Communication

Credit Hours: 3.00. Intensive study of selected topics, varying from semester to semester, from the theoretical and research literature on health communication. Prerequisite: COM 57600

Credits: 3.00

COM 37800 - Introduction To Health Communication

Credit Hours: 3.00. This course will serve as an introduction to the many ways that communication shapes health and health practices. Course content includes: 1) current healthcare structure in the United States; 2) communication in the healthcare organization; 3) provider-patient communication; 4) patient-support provider communication; 5) models of health behavior change and campaigns; and 6) crisis communication and health.

Learning Outcomes: 1. Identify and apply theories relevant to health communication. 2. Identify how communication practices shape and affect health. 3. Provide a comparative analysis of issues of diversity in healthcare. 4. Tailor health communication materials to improve health literacy. 5. Design and implement health campaign. Credits: 3.00

COM 47800 - Health Communication Campaigns

Credit Hours: 3.00. This course is an introduction to the processes and theories that are used to design both informational and persuasive health communication campaigns. The course will also introduce students to proper evaluation procedures to determine a campaign's efficacy. Students will be able to contribute to their portfolios by applying theory and primary research in the construction of a health communication campaign plan for a client.

Learning Outcomes: 1. Identify and perform the various stages of implementing a health communication campaign through course readings, discussions, and the creation of their final projects. 2. Apply formative research techniques and analyze relevant data in the creation of their final projects. 3. Identify the major theories and their essential components used in building health communication campaigns, and apply their components in course assignments. 4. Assess prior and current campaign efforts to understand their effectiveness and also recognize their limitations. Credits: 3.00

COM 64500 - Healthcare Communication

Credit Hours: 3.00. The healthcare environment is increasingly complex, and poses many challenges for communication professionals seeking to improve communication with key health industry stakeholders, including patients, providers, payers, government agencies, and others. This course provides an overview of a broad range of unique communication challenges associated with health and the healthcare industry. Topics include review and discussion of key issues such as, major health communication theories, issues associated with patient-provider interaction, adoption and use of health information and communication technologies, the development and implementation of health campaigns and other behavior change initiatives, and marketing and public relations issues commonly faced by healthcare organizations. Prerequisites: Students must

be admitted into the Online Masters of Science of Communication program. COM 60111

Learning Outcomes: 1. Recognize the basic components of the healthcare system and different models of healthcare delivery in the U.S. and other countries. 2. Describe major theories that inform health communication practice. 3. Articulate unique communication challenges facing the healthcare industry. 4. Develop strategies for designing, implementing, and evaluating healthcare-related campaigns. 5. Describe the impact of emerging communication technologies on healthcare practice. Credits: 3.00

COM 65500 - Health Advocacy

Credit Hours: 3.00. This course considers how federal, state, and local policy influence health status and health improvement. Through this course students gain an understanding of the role of health communication campaigns in health advocacy efforts. To engage their understanding, students will apply an advocacy campaign model to address a relevant health issue.

Learning Outcomes: 1. Understand of the role of health communication campaigns in health advocacy efforts. 2. Apply an advocacy campaign model to address relevant health issues. 3. Plan for a needs assessment. 4. Understand how health policy is enacted at different levels of government. 5. Conduct formative research. Credits: 3.00

COM 47900 - Introduction To Risk Communication

Credit Hours: 3.00. This course introduces students to theories that show how people express, perceive, exchange, and deliberate information about risk as well as how this understanding can be used to improve risk communication practice. This course examines risk communication theory and practice from multiple perspectives including social, psychological, cultural, and communicative.

Learning Outcomes: 1. Describe how and why major approaches to risk communication have shifted over time. 2. Explain cognitive and affective processes involved in individuals' risk perception in domains of science, health, and environmental issues. 3. Analyze different communication models and theories applicable to risk communication. 4. Discuss alternative interpersonal communicative public participation practices for deliberating risk information. Credits: 3.00

Program Requirements - Non-Thesis

Required Courses (36 credits)

COM 60000 - Foundations Of Human Communication Inquiry I

Credit Hours: 3.00. Introduces doctoral students to major and emerging approaches to understanding human communication and provides them with the theoretical background and analytic skills needed to navigate the tensions among these approaches. Reviews the intellectual history of communication inquiry, overviews traditional and innovative questions about human communication, examines the ways in which these questions can be addressed from different perspectives, addresses some of the varied forms that knowledge about human communication can take, and explores how different research traditions go about making and warranting knowledge claims.

Credits: 3.00

Major Area (18-27 credits)

Minor Area (9-18 credits)

Internship Option (6 credits)

COM 69500 - Curricular Practical Training

Credit Hours: 1.00 to 3.00. Internship providing practical field experience under professional supervision in selected situations related to the student's area of specialization. Good standing in the graduate program of the Department of Communication and an approved plan of study including the internship. Permission of instructor required.

Learning Outcomes: 1. Apply communication concepts to industry or sector-specific communication problems and projects. 2. Develop communication skills specific to work in a specific sector or industry. 3. Gain valuable experience working alongside communication

and industry leaders in the workplace. Credits: 1.00 to 3.00

Core Courses (9 credits)

COM 60111 - Seminar In Strategic Communication

Credit Hours: 3.00. This graduate course will survey the theories and processes of strategic communication and its practice by business, government, politicians, and non-profits - in domestic and international arenas. The course will emphasize the application of theory to provide an in-depth understanding of planning, executing, and evaluating strategic communication plans. Prerequisite: Graduate student in communication. Permission of department required.

Learning Outcomes: 1. Understand the context in which strategic communication operates and the dynamics changing the profession, its work, and its value to clients and society. 2. Understand the theories which underlie strategic communication. 3. Understand the processes of the development and implementation of comprehensive communication strategies. 4. Strengthen writing and presentation skills relevant to strategic communication through course assignments.

Credits: 3.00

COM 60411 - Seminar In Communication Research Methods

Credit Hours: 3.00. This graduate course serves as the methodological foundation of strategic communication. Students in this class will survey core research methods (qualitative and quantitative) in professional and applied settings. This class is fully online. Students will interact with faculty and other students throughout the week. Permission of department required.

Learning Outcomes: 1. Identify and describe the major elements of the research process. 2. Formulate meaningful research questions and hypotheses. 3. Identify appropriate research methodologies associated with different types of research questions and hypotheses. 4. Conduct a variety of basic analyses of common communication data sets. 5. Design a research proposal to answer a set of research questions or hypotheses. Credits: 3.00

COM 61011 - Strategic Communication And Ethics

Credit Hours: 3.00. This graduate course introduces the application of ethical principles and decision making. In this course, students will study both philosophical and practical ethical questions related to strategic communication. Permission of department required.

Learning Outcomes: 1. Exhibit mastery of diverse philosophical perspectives on ethics. 2. Compare and contrast insights offered by different perspectives when applied to concrete dilemmas encountered in students' own work experience. 3. Synthesize ethical principles embedded in professional codes of ethics, and their implications for the practice of strategic communication. 4. Highlight ethical principles pertaining to working in organizational teams. 5. Evaluate ethical guidelines for gathering, analyzing, and presenting research data. 6. Identify challenges that occur when evaluating what constitutes ethical strategic communication across cultures. 7. Articulate possible relationships between ethical and effective strategic communication. 8. Evaluate new ethical questions about the practice of strategic communication arising from the emergence of new social media. Credits: 3.00

Concentration (0-18 credits)

Selectives (3-21 credits)

COM 57600 - Health Communication

Credit Hours: 3.00. Survey of health communication theory and research. Examines issues such as patient-provider and everyday communication, broader community-societal discourse, and organizational and mass health communication. Prepares participants for subsequent more specialized seminars and enriched study in allied specialties.

Learning Outcomes: 1. Identify discreet areas of health communication practice and research. 2. Explain communication issues important to patients. 3. Explain communication issues important to care givers. 4. Explain challenges to intercultural communication in the health care setting. 5. Critique media health campaigns. 6. Investigate and critique an area of health communication study. Credits: 3.00

COM 60311 - Seminar In Crisis Communication

Credit Hours: 3.00. This graduate course will focus on how to communicate in a time of crisis in order to manage the situation and disseminate key messages to various stakeholders. Prerequisite: Graduate student in Communication and COM 60111 . Permission of department required.

Learning Outcomes: 1. Have a broad understanding of the crisis communication literature. 2. Be able to formulate solutions to crisis situations from multiple perspectives. 3. Anticipate actions and analyze stakeholders involved in crisis situations. 4. Be aware of and challenge critical assumptions in crisis situations. 5. Evaluate crisis plans. Credits: 3.00

COM 60511 - Strategic Communication And Professional Writing

Credit Hours: 3.00. This graduate course covers topics related to professional writing and strategic communication. Topics include grammar basics, audience considerations, credibility

and ethics, and documentation style. In addition, writing will be discussed in a variety of contexts such as media, public relations, advertising, and business communication. Permission of department required.

Learning Outcomes: 1. Demonstrate mastery of writing, grammar, and style as well as various guidelines for academic and professional writing. 2. Articulate the role of credibility and ethics in professional writing. 3. Explain the importance of research and audience analysis in professional writing. 4. Analyze the unique challenges of writing in different contexts (e.g., advertising, public relations, media, business communication, print and online). 5. Evaluate strengths and weaknesses of various forms of written communication. 6. Produce various types of documents related to strategic communication. Credits: 3.00

COM 60711 - Strategic Communication And Fundraising Management

Credit Hours: 3.00. This graduate course serves as an introduction to the concepts, elements, and best practices of fundraising. Permission of department required.

Learning Outcomes: 1. Demonstrate knowledge of communication theory related to fundraising management. 2. Identify best practices of fundraising. 3. Analyze the importance of message design and mediums when creating fundraising campaigns. 4. Assess the implications of an organization's relationships with multiple publics/stakeholder groups for fundraising. 5. Evaluate case studies of fundraising in light of theory and best practices. Credits: 3.00

COM 60911 - Strategic Public Relations

Credit Hours: 3.00. Strategic communication is composed, in part, of integrated marketing communication (IMC), advertising, and public relations. This course highlights public relations scholarship, which is one of the strengths of the Brian Lamb School of Communication. As such, it builds on the general strategic communication course by providing an in-depth understanding of public relations. Specifically, the class will cover public relations theories, ethics, concepts, principles, and applications. Permission of department required.

Learning Outcomes: 1. Demonstrate knowledge of public relations theory. 2. Articulate the roles of ethics in public relations. 3. Assess the research, planning, and evaluation used in public relations practices. 4. Identify the unique challenges associated with developing public relations campaigns. 5. Evaluate public relations campaigns and responses. 6. Identify the various publics that public relations scholarship addresses. Credits: 3.00

COM 62111 - Seminar In Strategic Communication And Social Media

Credit Hours: 3.00. This course will provide an overview of social media and its relationship to strategic communication. Students will learn about the available forms of social media (e.g., Blogs, Social Networks, and Wikis) as well as their uses, strengths and weaknesses for building and managing relationship with stakeholders. Students will also gain exposure to methods for analyzing social media metrics as a framework for evaluating the effectiveness of social media strategies as tools for developing corporate, nonprofit, and governmental images and brands. Permission of department required.

Learning Outcomes: 1. Demonstrate their understanding of current theories of communication technology that bear on the use and impact of social media environments. 2. Articulate changes in strategic communication brought about by changes in technology. 3. Identify and become familiar with the most commonly used social media technologies used in industry to communicate with stakeholders. 4. Demonstrate the ability to use contemporary social media tools. 5. Develop a social media strategy for an organization. 6. Identify, track, and analyze key social media metrics for evaluating the effectiveness of a social media strategy. Credits: 3.00

PUBH 60600 - Design And Analysis Of Public Health Interventions

Credit Hours: 3.00. (CSR 62300) Professional competencies in design, implementation, evaluation and diffusion of health interventions in community settings. Program planning paradigms, determinants of health behavior, and behavior change strategies serve as a basis for analyzing health

interventions. Prerequisite: HS 56500.

Learning Outcomes: 1. Understand how to identify and/or select evidence-based interventions appropriate for defined populations, setting, and health issues. 2. Choose an evidence-based intervention and adapt it for a new population and/or setting. 3. Understand key ethical considerations when implementing interventions for defined public health problems, populations and settings. 4. Create a model to guide the evaluation of a health disparities program and/or intervention. 5. Establish evaluation questions and select an appropriate evaluation design to answer health disparities questions. 6. Identify strengths, limitations, and quality control issues associated with measure selection, data collection, data analysis, and data management of a health disparities intervention. 7. Understand the ethical and political implications of evaluation work regarding health disparities. 8. Identify grant proposals to secure funds to conduct an evaluation of an evidence-based health disparities intervention. Credits: 3.00

PUBH 60200 - Theoretical Foundations Of Health Behavior

Credit Hours: 3.00. Examines the theoretical foundations of health behavior. Emphasizes the development of a conceptual framework for understanding and facilitating behavior enhancement, elimination, and/or maintenance in health promotion and education. Focuses on current theories regarding health-related behaviors. Permission of instructor required.

Learning Outcomes: 1. Assess the strengths and weaknesses of theories, models and best practices used to address public health issues. 2. Design approaches to prevent, mitigate or correct public health problems. 3. Identify and critically evaluate the social, political, policy, economic and environmental trends affecting the health of families and community. 4. Describe health promotion theories, models and best practices to address challenges to the health of families and communities. 5. Develop approaches to prevent, mitigate or correct challenges to the health of families and communities. 6. Identify and critically evaluate the factors that create, perpetuate and ultimately eliminate health disparities. 7. Demonstrate communication skills and strategies for promotion of family and community health. Credits: 3.00

PUBH 60400 - Public Health Administration

Credit Hours: 3.00. An introduction to the principals of management as applied to public health organizations, particularly local health departments. Topics include the organization of the U.S. public health system, legal and ethical obligations of public health administrators, the public health workforce and human resource issues, public health budgeting and finance, and leadership in the public health agency. The course is designed to introduce master's level students in public health to the management skills necessary to successfully implement a public health program.

Learning Outcomes: 1. Understand the transforming integrated health delivery system in the United States to build collaborative network of care providers. 2. Formulate action plans for process improvement that addresses gaps of public health service areas. 3. Appraise effectiveness of initiatives and programs to determine best practices and benchmarks for delivering public health services. Credits: 3.00

COM 64100 - Integrated Marketing Communication

Credit Hours: 3.00. Developing cohesive and integrated external and internal communication initiatives across traditional and social media channels is becoming increasingly important for strategic communication professionals. Traditionally, Public Relations, Marketing, and Advertising/Promotion have had separate functions; increasingly the role of strategic communication practitioners is to ensure the consistency of the brand story and message across all channels of communication. Prerequisites: Students must be admitted into the Online Masters of Science of Communication program. COM 60111.

Learning Outcomes: 1. Identify and describe the different components IMC. 2. Defend the value of IMC for an organization. 3. Understand and appraise the business environment in which IMC operates. 4. Prepare written artifacts of

IMC that based on theories of communication, marketing, and public relations, including a SWOT analysis and a media plan. 5. Critique IMC plans from a management perspective. 6. Apply principles and theories of IMC across each IMC function (e.g., public relations, marketing, advertising/promotion, etc.) Credits: 3.00

COM 64500 - Healthcare Communication

Credit Hours: 3.00. The healthcare environment is increasingly complex, and poses many challenges for communication professionals seeking to improve communication with key health industry stakeholders, including patients, providers, payers, government agencies, and others. This course provides an overview of a broad range of unique communication challenges associated with health and the healthcare industry. Topics include review and discussion of key issues such as, major health communication theories, issues associated with patient-provider interaction, adoption and use of health information and communication technologies, the development and implementation of health campaigns and other behavior change initiatives, and marketing and public relations issues commonly faced by healthcare organizations. Prerequisites: Students must be admitted into the Online Masters of Science of Communication program. COM 60111

Learning Outcomes: 1. Recognize the basic components of the healthcare system and different models of healthcare delivery in the U.S. and other countries. 2. Describe major theories that inform health communication practice. 3. Articulate unique communication challenges facing the healthcare industry. 4. Develop strategies for designing, implementing, and evaluating healthcare-related campaigns. 5. Describe the impact of emerging communication technologies on healthcare practice. Credits: 3.00

COM 64011 - Seminar In Advertising

Credit Hours: 3.00. This course provides an overview of the strategic planning process for advertising including identifying the target audience, determining a positioning strategy and developing a communication media strategy. The course will provide information on theory and best practices that inform the planning and implementation process for successful advertising campaigns.

Learning Outcomes: 1. Create a strategic advertising plan. 2. Identify key aspects of a target audience. 3. Develop a positioning strategy. 4. Articulate communication objectives. 5. Determine a media strategy. Credits: 3.00

ENGT 50700 - Fundamentals Of Collaborative Leadership And Agile Strategy For Engineering Technology

Credit Hours: 3.00. This course will provide students with a foundation in collaborative leadership and agile strategy. The course brings together theories and insights from a variety of disciplines including engineering, management, psychology, and social science. Increasingly manufacturing management is being called upon to apply their technical skills in collaborative environments that cut across organizational units and inter-organizational boundaries. Understanding how to design and guide collaborations and apply agile approaches for meeting strategic objectives is an important skill set and knowledge base in the 21st-century economy, defined more by open networks than the ridged hierarchies of the past.

Learning Outcomes: 1. Describe characteristics of highly effective leaders in engineering and technology-focused teams and organizations. 2. Apply tools and frameworks for highly effective leadership of engineering and technology-focused teams and organizations. 3. Analyze the potential strengths and potential of various leadership approaches and behaviors in engineering and technologically focused teams and organizations. Credits: 3.00

COM 65000 - Communication And Leadership

Credit Hours: 3.00. Communication is the essence of leadership, and this course aims to identify how communication can fuel productivity, drive consensus and push the organization to a leadership position within a market. At the same time, communication can sabotage one's success or be used as a weapon to silence voices and promote political agendas. This course aims to empower you to shape leadership throughout the organization and to know how to advise other leaders in their efforts to overcome communication challenges. Permission of department required.

Learning Outcomes: 1. Identify relevant theories and principles of organizational communication. 2. Understand how communication can increase team productivity. 3. Develop comprehensive

internal and external communications plans. 4. Use data from an audit to make recommendations and decisions. 5. Construct a communications plan to achieve a leadership position in a marketplace. 6. Advise peers and colleagues as they work through their own communication challenges. 7. Identify communication strategies to communicate with executives when stakes are high. Credits: 3.00

COM 65500 - Health Advocacy

Credit Hours: 3.00. This course considers how federal, state, and local policy influence health status and health improvement. Through this course students gain an understanding of the role of health communication campaigns in health advocacy efforts. To engage their understanding, students will apply an advocacy campaign model to address a relevant health issue.

Learning Outcomes: 1. Understand of the role of health communication campaigns in health advocacy efforts. 2. Apply an advocacy campaign model to address relevant health issues. 3. Plan for a needs assessment. 4. Understand how health policy is enacted at different levels of government. 5. Conduct formative research. Credits: 3.00

COM 64600 - Strategic Corporate Branding

Credit Hours: 3.00. This graduate course will survey the theories and processes of business brand design, development, and implementation. The course will examine best practices, trends, and creative strategies used in contemporary business branding. An emphasis will be placed on experiential learning, case study analysis, and the application of relevant theory to provide an in-depth understanding of the development, planning, execution, and evaluation of business brands.

Learning Outcomes: 1. Develop a strong conceptual foundation for formulating creative, meaningful, and effective business brands. 2. Apply strategic branding concepts to a variety of business needs and applications. 3. Demonstrate an understanding of various branding principles, theories, tools, techniques, and models. 4. Critique real-world brands for their efficacy, impact, and creativity. 5. Develop and present a business branding campaign. Credits: 3.00

COM 65100 - Organizational Culture And Internal Communication

Credit Hours: 3.00. The modern workplace had transformed well before a global pandemic magnified the paradigm shift already under way. In the United States, both consumers and the first five-generation workforce began to demand more from brand statements and value propositions. Those demands include genuine commitment to inclusion and diversity internally and corporate social responsibility externally. This course highlights the vital role professional communicators have in conveying brand and value statements that emanate from the organization's cultural core and carry forward to the consumer universe.

Learning Outcomes: 1. Explain how an organization's cultural core shapes its brand. 2. Identify channels that organizations use when communicating internally. 3. Discuss the significance and value of employees as brand ambassadors. 4. Recognize how inclusion organically builds a more diverse workforce. 5. Prepare a well-structure, convincing internal communication plan for an organization. Credits: 3.00

COM 65200 - Communication Education And Training

Credit Hours: 3.00. This course is designed to introduce fundamental concepts related to learning theory and learning design as applied to training and educational settings. The course will examine best practices and strategies with a focus on assessing and enhancing communication-related skills.

Learning Outcomes: 1. Define key communication skills and vocabulary. 2. Understand and apply the basic tenets of learning theory. 3. Design, develop, and evaluate an effective educational workshop or course. Credits: 3.00

PUBH 53500 - Fundamentals Of Epidemiology

Credit Hours: 3.00. This course is an introduction to epidemiology, which is the study of the patterns, causes, and impact of disease in populations. Epidemiology is increasingly important for public health and clinical medicine research and policy. This course will discuss the basic principles and methods of epidemiology, including measurements of disease occurrence and association, study designs, and determination of causality.

Contemporary examples will be used to illustrate the application of these concepts, with an emphasis on environmental causes of disease.

Learning Outcomes: 1. Describe major models of disease causation and prevention. 2. Calculate the extent of disease in populations. 3. Identify and utilize appropriate epidemiologic study designs. 4. Estimate the association between exposure and disease. 5. Differentiate between association and causation. 6. Explain and employ the use of epidemiologic tools in public health and clinical practice. 7. Review and critique basic epidemiology studies. Credits: 3.00

SCLA 52000 - Social And Digital Media Analytics For Strategic Communication

Credit Hours: 3.00. This course provides an overview of how to transform social media and digital media information into business intelligence and actionable insight. Although students are not expected to know a programming language prior to taking the course, students are expected to understand basic statistics and to have a desire to learn the processes, procedures and vocabulary used by data analysts in modern organizations. The goal is not to train them as practicing data scientists, but as knowledgeable data analytics consumers and as informed teammates and leaders of cross-functional teams tasked to make decisions using data.

Learning Outcomes: 1. Differentiate between the opportunities and limitations with social media data. 2. Identify methods for using ready and custom-made tools to transform information into insight, from data collection to analysis, interpretation, and recommendation. 3. Sharpen their quantitative and business analytical skills using spreadsheets and online tools. 4. Write effective reports and draft scorecards. 5. Be prepared to interact with data scientists by speaking their language and understanding their processes for data mining and business intelligence. Credits: 3.00

SCLA 51000 - Data And AI Storytelling

Credit Hours: 3.00. The primary assumption of our course is that the goal of communicating with data is ultimately to identify causal mechanisms and change the status quo due to the obtained insights. All audiences have previous understandings of the world, and meaningful data stories should challenge their assumptions about that world. The communication of this data-based new knowledge violates prior assumptions, shares memorable new information and moves the audience to act based on the new knowledge. This is best accomplished through a story. In other words, this communication assumes the form of a story, which is defined as the narrative of how an unexpected cause creates an effect.

Learning Outcomes: 1. Provide high-quality data story examples and justify why they meet the good story criteria. 2. Identify and extrapolate core relationships between research design and story-building. 3. Generate hypotheses based on data. 4. Create specific data visualizations which maintain casual narratives. 5. Identify story elements that map onto the five tenets of What is a Data Story? 6. Identify in examples the adherence or violation of data transparency, validity and ethics. Credits: 3.00

COM 66111 - Sports Communications

Credit Hours: 3.00. This course provides students a strategic and holistic sports communication approach and framework to solve for communications challenges. The course focuses on understanding the ever-increasingly competitive athletic landscape - collegiate and professional (though the lines are blurring) -- to aid the sports communicator in crafting a strategic communication plan based on quantifiable objectives and desired outcomes. Special topics include crisis and reputation management, leveraging social media, the emergence of AI, and athletes and culture.

Learning Outcomes: 1. Develop a strategic sports communication plan. 2. Integrate social media and AI into strategic communication planning. 3. Apply effective strategies to engage productively with collegiate and professional sports media. 4. Analyze a crisis event to develop strategies for advancing organizational reputation. 5. Articulate the role of sports in culture. Credits: 3.00

COM 66211 - Strategic Sports Media Relations

Credit Hours: 3.00. This course explores how to navigate a media landscape that is evolving at light-speed both in collegiate and professional sports. The course offers students

the tools to engage productively with media members and places particular emphasis on the communicator/media relationship, how media prefer to receive content and the role of the communications leader. Strategic Sports Media Relations also delves into media interaction during crisis events and the rise of AI.

Learning Outcomes: 1. Articulate how sports media relations have evolved across print, radio, TV, online and social media. 2. Explain the roles of collegiate and professional athletics communicators. 3. Demonstrate the ability to facilitate interviews and pitch/write in the sports media relations setting. 4. Respond to crisis and reputation management events. 5. Discuss sports media relations ethics/law and AI's impacts. Credits: 3.00

COM 64400 - Strategic Personal Branding

Credit Hours: 3.00. This graduate course will examine the theories and processes of personal brand development and self-marketing. The course will examine best practices, trends, and creative strategies used in contemporary personal branding. An emphasis will be placed on experiential learning, self-awareness, image and perceptual management, career development, self-promotion, brainstorming, and effective communication.

Learning Outcomes: 1. Convey deep understanding of personal mission, vision, values, personality, skills, and other key attributes and differentiators. 2. Develop a strong conceptual foundation for formulating distinctive, professional, and effective personal brands. 3. Demonstrate an understanding of various personal branding principles, theories, tools, techniques, and models. 4. Critique real-world personal brands for their authenticity, impact, and effectiveness. 5. Develop and present a personal branding and self-marketing campaign. Credits: 3.00

Concentrations

Program Learning Outcomes

GPA Requirements

Comparative Literature, MA

About the Program

Program Requirements - Thesis & Non-thesis

Required Courses (27 credits)

Core Course (3 credits)

ENGL 50100 - Introduction To English Studies

Credit Hours: 3.00. Introduction to graduate studies in English with special emphasis on research and reference tools, methods of bibliography, and the writing of scholarly papers. Prerequisite: Fulfillment of the basic composition requirement and 6 credit hours in English.

Credits: 3.00

CMPL 63000 - Comparative Literature: Function And Methods

Credit Hours: 3.00. (LC 63000) An introduction to methods, problems, and the bibliographical tools pertaining to comparative study.

Credits: 3.00

Major Field (12 credits)

Secondary Field (9 credits)

Third Field (3 credits)

Thesis Research (3 credits)

Additional Requirements

Concentrations

Additional Information

About the Program

Comparative Pathobiology, MS

About the Program

Program Requirements -Thesis

Required Courses (4-6 credits)

CPB 69700 - Research Seminar

Credit Hours: 0.00 or 1.00. Discussion of current concepts and research results in epidemiology, immunology, microbiology, parasitology, pathology, virology, host-parasite relationships, and other aspects of veterinary pathobiology. Each graduate student is expected to register each semester and to make one oral presentation per year. A grade of pass/not-pass and one credit will be awarded for the semester the presentation is given. Permission of instructor required.

Credits: 0.00 or 1.00

CPB 61800 - Ethical Issues In Biomedical Research

Credit Hours: 2.00 or 3.00. Examination of moral reasoning as it applies to epidemiologic inquiry and the methods of biomedical research. Topics include obligations to human and animal research subjects, ethical considerations in research design, data interpretation and fraud, funding of research, and public policy.

Credits: 2.00 or 3.00

STAT 50300 - Statistical Methods For Biology

Credit Hours: 3.00. Introductory statistical methods, with emphasis on applications in biology. Topics include descriptive statistics, binomial and normal distributions, confidence interval estimation, hypothesis testing, analysis of variance, introduction to nonparametric testing, linear regression and correlation, goodness-of-fit tests, and contingency tables. Open only to majors related to the life sciences. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100.

Learning Outcomes: 1. Students will be able to identify and choose appropriate ways to graphically and numerically summarize data. 2. Students will be able to use basic statistical methods to perform statistical inference and draw appropriate conclusions. 3. Students will understand the mathematical foundations of statistical inference for random samples so that they can study and utilize additional statistical methods. Credits: 3.00

GRAD 61200 - Responsible Conduct Of Research

Credit Hours: 1.00. Overview of values, professional standards, and regulations that define responsible conduct in research. Students learn the values and standards of responsible research through readings and lecture/discussion and practice application of these values and standards to research situations through class discussion of case studies from life sciences research. Students must be registered for M.S. or Ph.D. thesis research in their home department.

Credits: 1.00

CPB 62500 - Clinical Biostatistics

Credit Hours: 2.00. Intended for veterinary medical and biological science graduate students, this course is designed to familiarize them with the appropriate usage (and reporting) of different statistical tests in biomedical research. Students are taught the basic theories underlying the different tests, the data assumptions underlying the application of those tests, and review/critique published scientific articles that employed these tests. Students have the opportunity to describe the appropriate statistical methods to be used in their proposed research and/or report the usage or appropriate statistical tests on their own data.

Credits: 2.00

Thesis Research (6 credits)

CPB 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required.

Credits: 1.00 to 18.00

Areas of Study (18-20 credits)

Animal Welfare

CPB 62600 - Design And Analysis Of Epidemiologic Studies

Credit Hours: 3.00. Focuses on epidemiologic study design and applications of statistical software to the analysis of data derived from health research. Includes an overview of epidemiologic study designs, frequency and association measures, generalized linear models and survival analysis. Hands-on computer laboratories are provided using data derived from field studies. Prerequisites: One graduate-level course in biostatistics.

Learning Outcomes: 1. Understand and apply different epidemiologic study designs to their own disciplines and research. 2. Identify and apply appropriate statistical methods to analyze data collected from different epidemiologic studies. 3. Use available software programs to analyze data collected from health research. 4. Interpret results from analysis of epidemiologic data. Credits: 3.00

CPB 58000 - Special Topics

Credit Hours: 1.00 to 4.00. Directed readings, discussions, and other intensive studies in specialized topics of the disciplines of the department. The topic of study will be selected and announced prior to the semester offered and will be indicated in the student's record. Permission of instructor required.

Credits: 1.00 to 4.00

CPB 48000 - Seminar In Animal Welfare And Human-Animal Interaction-VN

Credit Hours: 2.00. This course will be required for students involved in the interdisciplinary Animal Welfare and Societal Concerns program of study. Seminar in Animal Welfare and Human-Animal Interaction is for discussion of current topics in animal welfare and other areas involving the interaction of humans and animals. Outside speakers will present their perspectives in various areas. Journal articles will also be presented and discussed.

Learning Outcomes: 1. Demonstrate the use of human-animal interaction theories and science to explain common human-animal interactions. 2. Demonstrate the use of an animal welfare conceptual framework and scientific components to assess an animal welfare situation (Lord et al., 2017). 3. Synthesize, formulate and communicate an informed view of contemporary or emerging human-animal interaction and animal welfare issues, including scientific and sociological influences and professional responsibilities. Credits: 2.00

ANSC 59500 - Special Topics In Animal Sciences

Credit Hours: 0.00 to 3.00. Lecture presentation of specialized material not available in the formal courses of the department. The specific topic offered is indicated on the student's record. Permission of instructor required.

Credits: 0.00 to 3.00

BIOL 55900 - Endocrinology

Credit Hours: 3.00. The study of hormone function. Consideration will be given to the role of hormones in growth, development, metabolism, homeostasis, and reproduction.

Learning Outcomes: 1. Demonstrate subject-matter competency, including the mastery of biological theories. 2. Demonstrate proficiency with professional skills needed by practicing biologists, including experimental design and execution, biological techniques, data collection and documentation, communication of results, and responsible conduct of science. 3. Demonstrate the ability to discuss ethical issues in the application of biological sciences, and the impact of science on society. 4. Demonstrate skills in critical thinking. These skills include understanding scientific methods, solving biology-related problems, interpreting and analyzing primary literature in biology, and interpreting data in a meaningful way. 5. Demonstrate knowledge of the path leading to specific careers in biology. Credits: 3.00

BIOL 59200 - The Evolution Of Behavior

Credit Hours: 3.00. An investigation of behaviors as adaptations: specializations of sensory and motor mechanisms involved in behavior; animal communication systems; behavioral ecology; patterns of social behavior as solutions to ecological

problems, such as predator avoidance and resource exploitation. Emphasis will be on theoretical principles; examples will be broadly comparative, ranging from microorganisms to mammals. Offered in alternate years.

Credits: 3.00

HDFS 59000 - Special Problems

Credit Hours: 0.00 to 5.00. Special subjects for investigation and experiment according to the individual student's interest and need. Permission of instructor required.

Credits: 0.00 to 5.00

HDFS 68500 - Current Research Topics In Child Development And Family Studies

Credit Hours: 1.00 to 3.00. Consideration of current subjects in child development and family studies research. Particular emphasis will be placed on one topic each semester according to the research interests of the instructor.

Credits: 1.00 to 3.00

PHIL 52400 - Contemporary Ethical Theory

Credit Hours: 3.00. A critical review of twentieth-century developments in ethical and value theory, with particular reference to the dispute between utilitarianism and deontological theories, and to the problem of justification.

Credits: 3.00

PSY 59100 - Topics In Psychology

Credit Hours: 1.00 to 3.00. Various topics that may change from semester to semester are presented by faculty in the Department of Psychological Sciences.

Credits: 1.00 to 3.00

PSY 64400 - Close Relationships

Credit Hours: 3.00. Acquaints participants with the major social psychological approaches to the study of close, interpersonal relationships, including evolutionary, attachment, and interdependence perspectives. Methodological and data analytic issues relevant to relationships research also are examined.

Credits: 3.00

STAT 50300 - Statistical Methods For Biology

Credit Hours: 3.00. Introductory statistical methods, with emphasis on applications in biology. Topics include descriptive statistics, binomial and normal distributions, confidence interval estimation, hypothesis testing, analysis of variance, introduction to nonparametric testing, linear regression and correlation, goodness-of-fit tests, and contingency tables. Open only to majors related to the life sciences. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100.

Learning Outcomes: 1. Students will be able to identify and choose appropriate ways to graphically and numerically summarize data. 2. Students will be able to use basic statistical methods to perform statistical inference and draw appropriate conclusions. 3. Students will understand the mathematical foundations of statistical inference for random samples so that they can study and utilize additional statistical methods. Credits: 3.00

STAT 51400 - Design Of Experiments

Credit Hours: 3.00. Fundamentals, completely randomized design; randomized complete blocks; latin square; multi-classification; factorial; nested factorial; incomplete block and fractional replications for 2n, 3n, 2m x 3n; confounding; lattice designs; general mixed factorials; split plot; analysis of variance in regression models; optimum design. Use of existing statistical programs.

Learning Outcomes: 1. Understand design principles and use these principles to plan and implement an experiment in such a way that a statistical analysis results in valid and objective conclusions. 2. Know how to choose an appropriate design given the available resources, factors of interest, and information on nuisance factors. 3. Perform the proper statistical analysis and draw valid conclusions from any designed experiment. Credits: 3.00

GRAD 59000 - Special Topics

Credit Hours: 1.00 to 3.00. Hours and credits to be arranged. For the use of interdisciplinary programs and in other situations when appropriate departmental courses are not available or general Graduate School identification is desirable. To be used only with the consent of the dean of the Graduate School.

Credits: 1.00 to 3.00

ASEC 59100 - Special Topics

Credit Hours: 1.00 to 4.00. Specialized topics not covered in other courses. Topics, requirements, and credits to be determined yearly. To be arranged with the instructor or departmental representative prior to registering. Permission of

instructor required.

Credits: 1.00 to 4.00

Human-Animal Interaction

CPB 69500 - Seminar In Epidemiology

Credit Hours: 1.00. Discussion of recent research in epidemiology, emphasizing study design, analysis, and public health significance. Discussion topics will be selected from the following areas: clinical epidemiology, infectious disease epidemiology, chronic disease epidemiology, and environmental epidemiology. Required of graduate students with a principal field of study in epidemiology. Prerequisite: Course work in Statistics and Epidemiology.

Credits: 1.00

CPB 62600 - Design And Analysis Of Epidemiologic Studies

Credit Hours: 3.00. Focuses on epidemiologic study design and applications of statistical software to the analysis of data derived from health research. Includes an overview of epidemiologic study designs, frequency and association measures, generalized linear models and survival analysis. Hands-on computer laboratories are provided using data derived from field studies. Prerequisites: One graduate-level course in biostatistics.

Learning Outcomes: 1. Understand and apply different epidemiologic study designs to their own disciplines and research. 2. Identify and apply appropriate statistical methods to analyze data collected from different epidemiologic studies. 3. Use available software programs to analyze data collected from health research. 4. Interpret results from analysis of epidemiologic data. Credits: 3.00

CPB 61800 - Ethical Issues In Biomedical Research

Credit Hours: 2.00 or 3.00. Examination of moral reasoning as it applies to epidemiologic inquiry and the methods of biomedical research. Topics include obligations to human and animal research subjects, ethical considerations in research design, data interpretation and fraud, funding of research, and public policy.

Credits: 2.00 or 3.00

CPB 58000 - Special Topics

Credit Hours: 1.00 to 4.00. Directed readings, discussions, and other intensive studies in specialized topics of the disciplines of the department. The topic of study will be selected and announced prior to the semester offered and will be indicated in the student's record. Permission of instructor required.

Credits: 1.00 to 4.00

CPB 48000 - Seminar In Animal Welfare And Human-Animal Interaction-VN

Credit Hours: 2.00. This course will be required for students involved in the interdisciplinary Animal Welfare and Societal Concerns program of study. Seminar in Animal Welfare and Human-Animal Interaction is for discussion of current topics in animal welfare and other areas involving the interaction of humans and animals. Outside speakers will present their perspectives in various areas. Journal articles will also be presented and discussed.

Learning Outcomes: 1. Demonstrate the use of human-animal interaction theories and science to explain common human-animal interactions. 2. Demonstrate the use of an animal welfare conceptual framework and scientific components to assess an animal welfare situation (Lord et al., 2017). 3. Synthesize, formulate and communicate an informed view of contemporary or emerging human-animal interaction and animal welfare issues, including scientific and sociological influences and professional responsibilities. Credits: 2.00

BIOL 55900 - Endocrinology

Credit Hours: 3.00. The study of hormone function. Consideration will be given to the role of hormones in growth, development, metabolism, homeostasis, and reproduction.

Learning Outcomes: 1. Demonstrate subject-matter competency, including the mastery of biological theories. 2. Demonstrate proficiency with professional skills needed by practicing biologists, including experimental design and execution, biological techniques, data collection and documentation, communication of results, and responsible conduct of science. 3. Demonstrate the ability to discuss ethical issues in the application of biological sciences, and the impact of science on society. 4. Demonstrate skills in critical thinking. These skills include understanding scientific methods, solving

biology-related problems, interpreting and analyzing primary literature in biology, and interpreting data in a meaningful way. 5. Demonstrate knowledge of the path leading to specific careers in biology. Credits: 3.00

BIOL 59200 - The Evolution Of Behavior

Credit Hours: 3.00. An investigation of behaviors as adaptations: specializations of sensory and motor mechanisms involved in behavior; animal communication systems; behavioral ecology; patterns of social behavior as solutions to ecological problems, such as predator avoidance and resource exploitation. Emphasis will be on theoretical principles; examples will be broadly comparative, ranging from microorganisms to mammals. Offered in alternate years.

Credits: 3.00

HDFS 61500 - Research Methods In Child And Family Study

Credit Hours: 4.00. Basic research methods employed in the study of children and families are examined, including quantitative and qualitative designs, data collection, analysis, and interpretation. In the laboratory component, students are afforded supervised practice in the application of various methods using selected statistical analysis programs. Prerequisite: Graduate course in Statistics. Permission of instructor required.

Credits: 4.00

PHIL 52400 - Contemporary Ethical Theory

Credit Hours: 3.00. A critical review of twentieth-century developments in ethical and value theory, with particular reference to the dispute between utilitarianism and deontological theories, and to the problem of justification.

Credits: 3.00

PSY 59100 - Topics In Psychology

Credit Hours: 1.00 to 3.00. Various topics that may change from semester to semester are presented by faculty in the Department of Psychological Sciences.

Credits: 1.00 to 3.00

STAT 51400 - Design Of Experiments

Credit Hours: 3.00. Fundamentals, completely randomized design; randomized complete blocks; latin square; multi-classification; factorial; nested factorial; incomplete block and fractional replications for 2n, 3n, 2m x 3n; confounding; lattice designs; general mixed factorials; split plot; analysis of variance in regression models; optimum design. Use of existing statistical programs.

Learning Outcomes: 1. Understand design principles and use these principles to plan and implement an experiment in such a way that a statistical analysis results in valid and objective conclusions. 2. Know how to choose an appropriate design given the available resources, factors of interest, and information on nuisance factors. 3. Perform the proper statistical analysis and draw valid conclusions from any designed experiment. Credits: 3.00

Epidemiology and Public Health

Microbiology and Immunology

Animal Welfare

CPB 62600 - Design And Analysis Of Epidemiologic Studies

Credit Hours: 3.00. Focuses on epidemiologic study design and applications of statistical software to the analysis of data derived from health research. Includes an overview of epidemiologic study designs, frequency and association measures, generalized linear models and survival analysis. Hands-on computer laboratories are provided using data derived from field studies. Prerequisites: One graduate-level course in biostatistics.

Learning Outcomes: 1. Understand and apply different epidemiologic study designs to their own disciplines and research. 2. Identify and apply appropriate statistical methods to analyze data collected from different epidemiologic studies. 3. Use available software programs to analyze data collected from health research. 4. Interpret results from analysis of epidemiologic data. Credits: 3.00

CPB 58000 - Special Topics

Credit Hours: 1.00 to 4.00. Directed readings, discussions, and other intensive studies in specialized topics of the disciplines of the department. The topic of study will be selected and announced prior to the semester offered and will be indicated in the student's record. Permission of instructor required.

Credits: 1.00 to 4.00

CPB 48000 - Seminar In Animal Welfare And Human-Animal Interaction-VN

Credit Hours: 2.00. This course will be required for students involved in the interdisciplinary Animal Welfare and Societal Concerns program of study. Seminar in Animal Welfare and Human-Animal Interaction is for discussion of current topics in animal welfare and other areas involving the interaction of humans and animals. Outside speakers will present their perspectives in various areas. Journal articles will also be presented and discussed.

Learning Outcomes: 1. Demonstrate the use of human-animal interaction theories and science to explain common human-animal interactions. 2. Demonstrate the use of an animal welfare conceptual framework and scientific components to assess an animal welfare situation (Lord et al., 2017). 3. Synthesize, formulate and communicate an informed view of contemporary or emerging human-animal interaction and animal welfare issues, including scientific and sociological influences and professional responsibilities. Credits: 2.00

ANSC 59500 - Special Topics In Animal Sciences

Credit Hours: 0.00 to 3.00. Lecture presentation of specialized material not available in the formal courses of the department. The specific topic offered is indicated on the student's record. Permission of instructor required.

Credits: 0.00 to 3.00

BIOL 55900 - Endocrinology

Credit Hours: 3.00. The study of hormone function. Consideration will be given to the role of hormones in growth, development, metabolism, homeostasis, and reproduction.

Learning Outcomes: 1. Demonstrate subject-matter competency, including the mastery of biological theories. 2. Demonstrate proficiency with professional skills needed by practicing biologists, including experimental design and execution, biological techniques, data collection and documentation, communication of results, and responsible conduct of science. 3. Demonstrate the ability to discuss ethical issues in the application of biological sciences, and the impact of science on society. 4. Demonstrate skills in critical thinking. These skills include understanding scientific methods, solving biology-related problems, interpreting and analyzing primary literature in biology, and interpreting data in a meaningful way. 5. Demonstrate knowledge of the path leading to specific careers in biology. Credits: 3.00

BIOL 59200 - The Evolution Of Behavior

Credit Hours: 3.00. An investigation of behaviors as adaptations: specializations of sensory and motor mechanisms involved in behavior; animal communication systems; behavioral ecology; patterns of social behavior as solutions to ecological problems, such as predator avoidance and resource exploitation. Emphasis will be on theoretical principles; examples will be broadly comparative, ranging from microorganisms to mammals. Offered in alternate years.

Credits: 3.00

HDFS 59000 - Special Problems

Credit Hours: 0.00 to 5.00. Special subjects for investigation and experiment according to the individual student's interest and need. Permission of instructor required.

Credits: 0.00 to 5.00

HDFS 68500 - Current Research Topics In Child Development And Family Studies

Credit Hours: 1.00 to 3.00. Consideration of current subjects in child development and family studies research. Particular emphasis will be placed on one topic each semester according to the research interests of the instructor.

Credits: 1.00 to 3.00

PHIL 52400 - Contemporary Ethical Theory

Credit Hours: 3.00. A critical review of twentieth-century developments in ethical and value theory, with particular reference to the dispute between utilitarianism and deontological theories, and to the problem of justification.

Credits: 3.00

PSY 59100 - Topics In Psychology

Credit Hours: 1.00 to 3.00. Various topics that may change from semester to semester are presented by faculty in the Department of Psychological Sciences.

Credits: 1.00 to 3.00

PSY 64400 - Close Relationships

Credit Hours: 3.00. Acquaints participants with the major social psychological approaches to the study of close, interpersonal relationships, including evolutionary, attachment, and interdependence perspectives. Methodological and data analytic issues relevant to relationships research also are examined.

Credits: 3.00

STAT 50300 - Statistical Methods For Biology

Credit Hours: 3.00. Introductory statistical methods, with emphasis on applications in biology. Topics include descriptive statistics, binomial and normal distributions, confidence interval estimation, hypothesis testing, analysis of variance, introduction to nonparametric testing, linear regression and correlation, goodness-of-fit tests, and contingency tables. Open only to majors related to the life sciences. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100.

Learning Outcomes: 1. Students will be able to identify and choose appropriate ways to graphically and numerically summarize data. 2. Students will be able to use basic statistical methods to perform statistical inference and draw appropriate conclusions. 3. Students will understand the mathematical foundations of statistical inference for random samples so that they can study and utilize additional statistical methods. Credits: 3.00

STAT 51400 - Design Of Experiments

Credit Hours: 3.00. Fundamentals, completely randomized design; randomized complete blocks; latin square; multi-classification; factorial; nested factorial; incomplete block and fractional replications for 2n, 3n, 2m x 3n; confounding; lattice designs; general mixed factorials; split plot; analysis of variance in regression models; optimum design. Use of existing statistical programs.

Learning Outcomes: 1. Understand design principles and use these principles to plan and implement an experiment in such a way that a statistical analysis results in valid and objective conclusions. 2. Know how to choose an appropriate design given the available resources, factors of interest, and information on nuisance factors. 3. Perform the proper statistical analysis and draw valid conclusions from any designed experiment. Credits: 3.00

GRAD 59000 - Special Topics

Credit Hours: 1.00 to 3.00. Hours and credits to be arranged. For the use of interdisciplinary programs and in other situations when appropriate departmental courses are not available or general Graduate School identification is desirable. To be used only with the consent of the dean of the Graduate School.

Credits: 1.00 to 3.00

ASEC 59100 - Special Topics

Credit Hours: 1.00 to 4.00. Specialized topics not covered in other courses. Topics, requirements, and credits to be determined yearly. To be arranged with the instructor or departmental representative prior to registering. Permission of instructor required.

Credits: 1.00 to 4.00

Required Courses (4-6 credits)

CPB 69700 - Research Seminar

Credit Hours: 0.00 or 1.00. Discussion of current concepts and research results in epidemiology, immunology, microbiology, parasitology, pathology, virology, host-parasite relationships, and other aspects of veterinary pathobiology. Each graduate student is expected to register each semester and to make one oral presentation per year. A grade of pass/not-pass and one credit will be awarded for the semester the presentation is given. Permission of instructor required.

Credits: 0.00 or 1.00

CPB 61800 - Ethical Issues In Biomedical Research

Credit Hours: 2.00 or 3.00. Examination of moral reasoning as it applies to epidemiologic inquiry and the methods of biomedical research. Topics include obligations to human and animal research subjects, ethical considerations in research design, data interpretation and fraud, funding of research, and public policy.

Credits: 2.00 or 3.00

STAT 50300 - Statistical Methods For Biology

Credit Hours: 3.00. Introductory statistical methods, with emphasis on applications in biology. Topics include descriptive statistics, binomial and normal distributions, confidence interval estimation, hypothesis testing, analysis of variance, introduction

to nonparametric testing, linear regression and correlation, goodness-of-fit tests, and contingency tables. Open only to majors related to the life sciences. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100.

Learning Outcomes: 1. Students will be able to identify and choose appropriate ways to graphically and numerically summarize data. 2. Students will be able to use basic statistical methods to perform statistical inference and draw appropriate conclusions. 3. Students will understand the mathematical foundations of statistical inference for random samples so that they can study and utilize additional statistical methods. Credits: 3.00

GRAD 61200 - Responsible Conduct Of Research

Credit Hours: 1.00. Overview of values, professional standards, and regulations that define responsible conduct in research. Students learn the values and standards of responsible research through readings and lecture/discussion and practice application of these values and standards to research situations through class discussion of case studies from life sciences research. Students must be registered for M.S. or Ph.D. thesis research in their home department.

Credits: 1.00

CPB 62500 - Clinical Biostatistics

Credit Hours: 2.00. Intended for veterinary medical and biological science graduate students, this course is designed to familiarize them with the appropriate usage (and reporting) of different statistical tests in biomedical research. Students are taught the basic theories underlying the different tests, the data assumptions underlying the application of those tests, and review/critique published scientific articles that employed these tests. Students have the opportunity to describe the appropriate statistical methods to be used in their proposed research and/or report the usage or appropriate statistical tests on their own data.

Credits: 2.00

Program Requirements - Non-Thesis in Anatomic Pathology

Required Courses (16-24 credits)

CPB 69700 - Research Seminar

Credit Hours: 0.00 or 1.00. Discussion of current concepts and research results in epidemiology, immunology, microbiology, parasitology, pathology, virology, host-parasite relationships, and other aspects of veterinary pathobiology. Each graduate student is expected to register each semester and to make one oral presentation per year. A grade of pass/not-pass and one credit will be awarded for the semester the presentation is given. Permission of instructor required.

Credits: 0.00 or 1.00

CPB 69100 - Seminar In Veterinary Pathology

Credit Hours: 0.00 to 2.00. Discussions of selected current disease problems with emphasis on gross and microscopic tissue changes and pathogenesis. Required of all graduate students in veterinary pathology each semester in residence.

Credits: 0.00 to 2.00

CPB 68000 - Special Topics

Credit Hours: 1.00 to 4.00. Directed readings, discussions, and other intensive studies in specialized topics of the disciplines of the department. The topic of study will be selected and announced prior to the semester offered and will be indicated in the student's record. Permission of instructor required.

Credits: 1.00 to 4.00

CPB 61800 - Ethical Issues In Biomedical Research

Credit Hours: 2.00 or 3.00. Examination of moral reasoning as it applies to epidemiologic inquiry and the methods of biomedical research. Topics include obligations to human and animal research subjects, ethical considerations in research design, data interpretation and fraud, funding of research, and public policy.

Credits: 2.00 or 3.00

CPB 60400 - Neoplastic Diseases Of Animals

Credit Hours: 3.00. Histogenesis and structure of neoplasms of animals; consideration of clinical and pathological entities within groups of neoplasms. Prerequisite: CPB 55600.

Credits: 3.00

CPB 60300 - Graduate Teaching Practicum

Credit Hours: 1.00. Graduate students assist in running the laboratory sessions in a sophomore DVM course. They also grade exams and may give one lecture in or make a scholarly contribution to the course. Permission of instructor required.

Credits: 1.00

CPB 60200 - Advanced Veterinary Anatomic Pathology

Credit Hours: 0.00 to 8.00. Comparative gross and microscopic pathology in the diagnosis of diseases of animals. Prerequisite: DVM degree. Permission of instructor required.

Credits: 0.00 to 8.00

STAT 50300 - Statistical Methods For Biology

Credit Hours: 3.00. Introductory statistical methods, with emphasis on applications in biology. Topics include descriptive statistics, binomial and normal distributions, confidence interval estimation, hypothesis testing, analysis of variance, introduction to nonparametric testing, linear regression and correlation, goodness-of-fit tests, and contingency tables. Open only to majors related to the life sciences. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100.

Learning Outcomes: 1. Students will be able to identify and choose appropriate ways to graphically and numerically summarize data. 2. Students will be able to use basic statistical methods to perform statistical inference and draw appropriate conclusions. 3. Students will understand the mathematical foundations of statistical inference for random samples so that they can study and utilize additional statistical methods. Credits: 3.00

GRAD 61200 - Responsible Conduct Of Research

Credit Hours: 1.00. Overview of values, professional standards, and regulations that define responsible conduct in research. Students learn the values and standards of responsible research through readings and lecture/discussion and practice application of these values and standards to research situations through class discussion of case studies from life sciences research. Students must be registered for M.S. or Ph.D. thesis research in their home department.

Credits: 1.00

CPB 62500 - Clinical Biostatistics

Credit Hours: 2.00. Intended for veterinary medical and biological science graduate students, this course is designed to familiarize them with the appropriate usage (and reporting) of different statistical tests in biomedical research. Students are taught the basic theories underlying the different tests, the data assumptions underlying the application of those tests, and review/critique published scientific articles that employed these tests. Students have the opportunity to describe the appropriate statistical methods to be used in their proposed research and/or report the usage or appropriate statistical tests on their own data.

Credits: 2.00

CPB 61100 - Veterinary Pathology Literature Review Seminar

Credit Hours: 1.00. Understanding of principles of veterinary pathology is required. The class will provide the graduate students with in-depth knowledge in current pathology research and diagnostics. Permission of department required.

Learning Outcomes: 1. Retain new knowledge and be aware of current findings in the veterinary medicine and pathology literature. 2. Critique and appraise data and technical approaches. 3. Formulate an evaluation of the merits of a study and to evaluate its applicability to pathology practice. Credits: 1.00

Selectives List #1 (3 credits)

CPB 68000 - Special Topics

Credit Hours: 1.00 to 4.00. Directed readings, discussions, and other intensive studies in specialized topics of the disciplines of the department. The topic of study will be selected and announced prior to the semester offered and will be indicated in the student's record. Permission of instructor required.

Credits: 1.00 to 4.00

CPB 61400 - Topics In Advanced General Pathology

Credit Hours: 0.50 or 1.00. Discussion of current topics in the following areas of general pathology: cellular injury, fluid and hemodynamic alterations, inflammation, immunopathology, neoplasia, genetic and developmental disorders, pathogenesis of infectious diseases, and nutritional disorders. Class meets one hour in alternate weeks. Prerequisite: DVM degree. Permission of instructor required.

Credits: 0.50 or 1.00

VCS 60400 - Animal Models In Translational Research

Credit Hours: 1.00. This course is designed for students in the Graduate Program in the Department of Veterinary Clinical Sciences. During the course, lectures are presented which help students obtain a working knowledge of the use of animal models in research. Topics covered will explain the principles of using animals in research and as a model for human diseases. Students will also be exposed to the principle elements of

translational research, methods used in translational research and trials, and the principles of data collection, management and interpretation. Prerequisite: VCS 60300 . Permission of department required.

Learning Outcomes: 1. Help students understand the principle elements of translational research. 2. Help students understand issues related to the use of animals in research. 3. Expose students to the methods used in translational research and trials. 4. Understand the principles of using animals as a model for human diseases. 5. Understand the principles of data collection, management and interpretation. Credits: 1.00

Selectives List #2 (3-11 credits)

BIOL 47800 - Introduction To Bioinformatics

Credit Hours: 3.00. (CS 47800) Bioinformatics is broadly defined as the study of molecular biological information, targeting particularly the enormous volume of DNA sequence and functional complexity embedded in entire genomes. Topics will include understanding the evolutionary organization of genes (genomics), the structure and function of gene products (proteomics), and the dynamics of gene expression in biological processes (transcriptomics). Inherently, bioinformatics is interdisciplinary, melding various applications of computational science with biology. This jointly taught course introduces analytical methods from biology, statistics and computer science that are necessary for bioinformatics investigations. The course is intended for junior and senior undergraduates from various science backgrounds. Our objective is to develop the skills of both tool users and tool designers in this important new field of research.

Learning Outcomes: 1. Demonstrate proficiency with professional skills needed by practicing biologists, including experimental design and execution, biological techniques, data collection and documentation, communication of results, and responsible conduct of science. 2. Demonstrate the ability to discuss ethical issues in the application of biological sciences, and the impact of science on society. 3. Demonstrate skills in critical thinking. These skills include understanding scientific methods, solving biology-related problems, interpreting and analyzing primary literature in biology, and interpreting data in a meaningful way. 4. Demonstrate knowledge of the path leading to specific careers in biology. 5. Understand the role of evolution of creating and modifying the macromolecular components of the cell, and in creating biological complexity and variability. 6. Use and understand the scientific method, including how to generate hypotheses and predictions, develop an experimental design, collect data, statistically analyze data, and interpret results. 7. Demonstrate an understanding of laboratory skills used in genetics. 8. Able to demonstrate knowledge of how evolutionary forces impact and shape microbial function and activity. 9. Able to demonstrate an understanding of the scientific method including hypothesis generation and testing, data collection, analysis, and interpretation. Credits: 3.00

CPB 62000 - Advanced Immunology

Credit Hours: 2.00. Teaches advanced concepts in basic immunology and applications to disease prevention and therapy. Emphasis is on recent developments and experimental approaches in this rapidly evolving discipline. Topics include antigen presentation, T-cell development, signal transduction in B and T lymphocytes, immunoglobulin structure, type I hypersensitivity (asthma), neuroendocrine regulation of the immune response, immune response in viral infections (influenza and HIV), and tumor immunology. Permission of instructor required.

Credits: 2.00

BCHM 56100 - General Biochemistry I

Credit Hours: 3.00. This course provides upper-division undergraduate and graduate students with basic understanding of biochemical and structural properties of amino acids, nucleic acids, lipids, and carbohydrates. This course allows students to connect the relationship between structure and function of biomolecules. In addition, students learn to understand enzyme properties, enzyme mechanism of action, and enzyme regulation.

Learning Outcomes: 1. Understand the molecular principles of life based on the core disciplines of biology, chemistry and physics. 2.

Understand the scientific method. They will be able to develop hypotheses, design experiments, and critically analyze results to create new knowledge. 3. Learn to be skilled laboratory scientists. They will perform a wide variety of biochemical and molecular techniques. 4. Understand the contributions of our discipline to society, including improvements to medicine, agriculture, the economy and the environment. Credits: 3.00

BCHM 56200 - General Biochemistry II

Credit Hours: 3.00. This course provides upper-division undergraduate and graduate students with an understanding of core metabolic pathways. Anabolic and catabolic processes of metabolic pathways are studied. Biochemical and structural knowledge is used to determine how enzymes and coenzymes are needed to regulate and control metabolic pathways.

Learning Outcomes: 1. Understand the molecular principles of life based on the core disciplines of biology, chemistry and physics. 2. Understand the contributions of our discipline to society, including improvements to medicine, agriculture, the economy and the environment. Credits: 3.00

BIOL 51600 - Molecular Biology Of Cancer

Credit Hours: 3.00. A detailed course examining the molecular mechanisms controlling the growth of animal cells. Emphasis will be placed on current experimental approaches to defining the molecular basis of growth regulation in developing systems and the uncontrolled proliferation of cells in metabolic disorders, such as cancer.

Credits: 3.00

BIOL 59500 - Special Assignments

Credit Hours: 0.00 to 18.00. Special work, such as directed reading, independent study or research, supervised library, laboratory, or field work, or presentation of material not available in the formal courses of the department. The field in which work is offered will be indicated in the student's record. Permission of instructor required.

Credits: 0.00 to 18.00

BIOL 65001 - Techniques In Molecular Biology

Credit Hours: 1.00. Techniques in Molecular Biology will introduce graduate students to the theory and practice of many commonly used methods. Emphasis will be placed on understanding the theoretical basis for these techniques, their utility in various circumstances, and their limitations. Although taught as a lecture, students should be able to take this knowledge back to the laboratory to help them in their research efforts. The course will be as close as possible to a laboratory experience without being in an actual laboratory setting. This course is designed to prepare students for other in-depth 600-level scientific courses, for their rotations, and for future laboratory work. Exams will be "experimental" in nature (e.g., "design and experiment to do something..." or "in this type of situation, which technique/vector/etc. would best be used, and why...").

Learning Outcomes: 1. Students are expected to learn the theoretical basis for many commonly used molecular biology techniques. An emphasis is placed on how correctly to use these techniques in real-life laboratory situations, and the limitations of each technique. Credits: 1.00

Additional Requirements

Required Courses (16-24 credits)

CPB 69700 - Research Seminar

Credit Hours: 0.00 or 1.00. Discussion of current concepts and research results in epidemiology, immunology, microbiology, parasitology, pathology, virology, host-parasite relationships, and other aspects of veterinary pathobiology. Each graduate student is expected to register each semester and to make one oral presentation per year. A grade of pass/not-pass and one credit will be awarded for the semester the presentation is given. Permission of instructor required.

Credits: 0.00 or 1.00

CPB 69100 - Seminar In Veterinary Pathology

Credit Hours: 0.00 to 2.00. Discussions of selected current disease problems with emphasis on gross and microscopic tissue changes and pathogenesis. Required of all graduate students in veterinary pathology each semester in residence.

Credits: 0.00 to 2.00

CPB 68000 - Special Topics

Credit Hours: 1.00 to 4.00. Directed readings, discussions, and other intensive studies in specialized topics of the disciplines of

the department. The topic of study will be selected and announced prior to the semester offered and will be indicated in the student's record. Permission of instructor required.

Credits: 1.00 to 4.00

CPB 61800 - Ethical Issues In Biomedical Research

Credit Hours: 2.00 or 3.00. Examination of moral reasoning as it applies to epidemiologic inquiry and the methods of biomedical research. Topics include obligations to human and animal research subjects, ethical considerations in research design, data interpretation and fraud, funding of research, and public policy.

Credits: 2.00 or 3.00

CPB 60400 - Neoplastic Diseases Of Animals

Credit Hours: 3.00. Histogenesis and structure of neoplasms of animals; consideration of clinical and pathological entities within groups of neoplasms. Prerequisite: CPB 55600.

Credits: 3.00

CPB 60300 - Graduate Teaching Practicum

Credit Hours: 1.00. Graduate students assist in running the laboratory sessions in a sophomore DVM course. They also grade exams and may give one lecture in or make a scholarly contribution to the course. Permission of instructor required.

Credits: 1.00

CPB 60200 - Advanced Veterinary Anatomic Pathology

Credit Hours: 0.00 to 8.00. Comparative gross and microscopic pathology in the diagnosis of diseases of animals. Prerequisite: DVM degree. Permission of instructor required.

Credits: 0.00 to 8.00

STAT 50300 - Statistical Methods For Biology

Credit Hours: 3.00. Introductory statistical methods, with emphasis on applications in biology. Topics include descriptive statistics, binomial and normal distributions, confidence interval estimation, hypothesis testing, analysis of variance, introduction to nonparametric testing, linear regression and correlation, goodness-of-fit tests, and contingency tables. Open only to majors related to the life sciences. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100.

Learning Outcomes: 1. Students will be able to identify and choose appropriate ways to graphically and numerically summarize data. 2. Students will be able to use basic statistical methods to perform statistical inference and draw appropriate conclusions. 3. Students will understand the mathematical foundations of statistical inference for random samples so that they can study and utilize additional statistical methods. Credits: 3.00

GRAD 61200 - Responsible Conduct Of Research

Credit Hours: 1.00. Overview of values, professional standards, and regulations that define responsible conduct in research. Students learn the values and standards of responsible research through readings and lecture/discussion and practice application of these values and standards to research situations through class discussion of case studies from life sciences research. Students must be registered for M.S. or Ph.D. thesis research in their home department.

Credits: 1.00

CPB 62500 - Clinical Biostatistics

Credit Hours: 2.00. Intended for veterinary medical and biological science graduate students, this course is designed to familiarize them with the appropriate usage (and reporting) of different statistical tests in biomedical research. Students are taught the basic theories underlying the different tests, the data assumptions underlying the application of those tests, and review/critique published scientific articles that employed these tests. Students have the opportunity to describe the appropriate statistical methods to be used in their proposed research and/or report the usage or appropriate statistical tests on their own data.

Credits: 2.00

CPB 61100 - Veterinary Pathology Literature Review Seminar

Credit Hours: 1.00. Understanding of principles of veterinary pathology is required. The class will provide the graduate students with in-depth knowledge in current pathology research and diagnostics. Permission of department required.

Learning Outcomes: 1. Retain new knowledge and be aware of current findings in the veterinary medicine and pathology literature. 2. Critique and appraise data and technical approaches. 3. Formulate an evaluation of the merits of a study and to evaluate its applicability to pathology practice. Credits: 1.00

Program Requirements - Non-Thesis in Comparative Medicine

Required Courses (30 credits)

Required Courses (30 credits)

Concentrations

GPA Requirements

About the Program

Computer and Information Technology, MS

About the Program

Program Requirements - Thesis

Required Courses (6 credits)

CNIT 62300 - Contemporary Computer Technology Problems

Credit Hours: 1.00 to 8.00. Theory and practice in the development of comprehensive solutions to problems in industrial, technical, and human resource development environments. Solutions based on emerging procedures will be emphasized. Permission of instructor required.

Credits: 1.00 to 8.00

EDPS 53300 - Introduction To Educational Research I: Methodology

Credit Hours: 3.00. This course presents a sequence of journal articles and exercises that help introduce the foundational concepts of the course, including: research design, reliability and validity, various methodologies commonly used in educational research, and basic quantitative and qualitative data analyses. In addition, contrasting research conclusions are shown in the articles to help students learn why careful analysis of articles and their theoretical framing is critical to evaluating their conclusions.

Learning Outcomes: 1. Find research literature. 2. Read and critique educational research. 3. Deepen knowledge of at least one research area in education. 4. Design, conduct, analyze, and write a research project. Credits: 3.00

STAT 50100 - Experimental Statistics I

Credit Hours: 3.00. Concepts and methods of applied statistics. Exploratory analysis of data. Sample design and experimental design. Normal distributions. Sampling distributions. Confidence intervals and tests of hypotheses for one and two samples. Inference for contingency tables, regression and correlation, and one-way analysis of variance. Use of the SAS statistical software. Intended primarily for students who have not had calculus. Not open to students in mathematical sciences or engineering. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: College Algebra.

Learning Outcomes: 1. Produce and identify basic statistical analyses. 2. Discuss statistical terminology (speak statistics). 3. Use SAS to run basic statistical analyses and interpret corresponding SAS output. Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between

discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

TECH 69700 - Qualitative Research Methods In Technology Studies

Credit Hours: 3.00. In-depth examination of qualitative methods and frameworks used in technology research. Students learn by application a variety of methods from the qualitative research toolbox such as interviewing, focus groups, observation, and experience analysis. TECH 69700 prepares students to plan, pilot, and assess an original qualitative research study and to integrate qualitative research findings in the technology design and evaluation process. Permission of instructor required.

Learning Outcomes: 1. Explain the epistemological assumptions underlying qualitative research methods. 2. Identify and evaluate various types of qualitative research techniques. 3. Plan a research study using qualitative research methods. 4. Conduct a research study using qualitative research methods. 5. Write up a qualitative research scholarly paper. 6. Assess and analyze the validity of qualitative research. Credits: 3.00

TECH 64600 - Analysis Of Research In Industry And Technology

Credit Hours: 3.00. Analysis of research and evaluation of research reports. Emphasis on understanding the application of fundamental statistical methods in design and interpretation of research findings in industrial, technical, and human resource development environments. Prerequisite: Master's student standing.

Credits: 3.00

CNIT 60100 - Applied Statistics In Information Technology

Credit Hours: 3.00. This course will survey the field of applied statistics in information technology. Students will gain hands-on experience running statistical analyses on samples from a variety of populations. Students will learn the process of data cleaning, data transforming/coding, identifying the appropriate statistical analyses (descriptive and inferential), as well as writing and interpreting the results. Specifically, this course will survey the following statistical approaches: correlations, t-test, analysis of variance, analysis of co-variance, factorial ANOVA, simple regression, multiple regression, logistic regression, chi-square analysis, factor analysis, and nonparametric tests. In this course, students will be able to differentiate statistical analyses and identify appropriate statistical analyses depending on the research question and variables of interest. Permission of instructor required.

Learning Outcomes: 1. Analyze data with different statistical procedure using SPSS. 2. Differentiate between different types of statistical analyses. 3. Evaluate the statistical procedures and results in published journal articles. Credits: 3.00

Foundation Courses (3-15 credits)

CNIT 55000 - Organizational Impact Of Information Technology

Credit Hours: 3.00. An enterprise view of the organizational impact of information technology as the most effective means for achieving "better, faster, cheaper operations" in today's highly competitive business environment. Examines how information technology has enabled new organizational forms and changes in business processes, products, markets, delivery systems, ways of working, and people management issues and challenges. Permission of instructor required.

Learning Outcomes: 1. Articulate methods and algorithms in network security. 2. Evaluate the strengths and weaknesses of different networking security approaches. 3. Describe how to deploy encryption techniques to secure data at rest and in transit. 4. Compare, contrast and critique existing applied research in network security. 5. Propose new ideas/technologies in

network security and systematically assess your proposed work. Credits: 3.00

CNIT 55100 - Information Technology Economics

Credit Hours: 3.00. Examines the economics of information systems and information technology as it relates to business performance. Topics include strategic information technology planning, alignment with business planning, value assessment, and performance measurement. Special emphasis is placed on issues relevant to strategic information technology infrastructure management, both for the information technology unit as well as the business as a whole. Permission of instructor required.

Credits: 3.00

CNIT 55200 - Information Technology Project Management

Credit Hours: 3.00. Explores the necessary skills and knowledge to successfully initiate, plan, manage, control, and report on information technology projects. Special emphasis is placed on learning the PMBOK and its practices concerning integration management, scope management, time management, cost management, quality management, human resource management, communications management, risk management, and procurement management. Practical examples are used to demonstrate the concepts and techniques, plus hands-on experience is received by working on a case study. Permission of instructor required.

Credits: 3.00

CNIT 55300 - Quality Management In Information Technology

Credit Hours: 3.00. This course explores quality and productivity models used to ensure quality in information technology systems development processes. Special emphasis is on learning and understanding process metrics and measurement, as well as initiatives such as Total Quality Management, Continuous Process Improvement, Six Sigma, and the Software Engineering Institute Capability Maturity Model. Permission of instructor required.

Learning Outcomes: 1. Use and apply information technology solutions. 2. Understand and apply high-level tools and emerging technologies. 3. Demonstrate independent critical thinking and problem solving skills. 4. Understand and apply information technology application methodologies. 5. Communicate effectively with customers, supervisors and peers, both orally and in writing. 6. Understand the expectations of an information technology professional. Credits: 3.00

CNIT 55500 - Advanced Network Security

Credit Hours: 3.00. Advanced conceptual and technological aspects of network security for voice and data networks. Deals with the advanced analysis, design, implementation, and management issues surrounding effective network security. Technology research and presentation of results, as well as security technology implementation, are required course outcomes. Permission of department required.

Credits: 3.00

CNIT 55600 - Basic Computer Forensics

Credit Hours: 3.00. Covers the fundamentals of the maturing discipline of computer forensics. The focus of the course is on gaining a broad understanding of the field of study and how technology and law interact to form this forensic science. Emerging standards and current and future issues related to the field are also explored. Examines law and public policy, the computer forensic methodology, report presentation, and expert witness testimony, as well as anti-forensic techniques that can be used to obfuscate evidence. Students are exposed to theory and practice with lab exercises, thought and term papers, and a practical, as well as written, final exam.

Learning Outcomes: 1. Develop their Investigative Environment. 2. Acquire an understanding of how open source intelligence (OSINT) is used for digital forensic examinations. 3. Gain knowledge of how to conduct common investigations related to evidence that is stored on a mobile phone or tablet. 4. Learn the importance of location information and where to locate and how to interpret this information. 5. Understand of how to conduct investigations involving P2P and other Tor related technologies. 6. Explore the various digital forensics visualization methods. 7. Be introduced to a common report format and the ASTM report standard. 8. Understand the importance of Expert Witness (EW), Who can be an EW, and how to be an effective EW. Credits: 3.00

CS 50100 - Computing For Science And Engineering

Credit Hours: 3.00. Credit in this course may not be used toward a graduate degree in Computer Sciences. Computational concepts, tools, and skills for computational

science and engineering scripting for numerical computing, scripting for file processing, high performance computing, and software development. Project may be required.

Learning Outcomes: 1. To prepare graduate students outside Computer Science to write computer programs in support of their studies and research. Credits: 3.00

Electives (6-18 credits)

Thesis Research (6-8 credits)

CNIT 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required.

Learning Outcomes: 1. Varies due to nature of the course. Credits: 1.00 to 18.00

Additional Requirements

Required Courses (6 credits)

CNIT 62300 - Contemporary Computer Technology Problems

Credit Hours: 1.00 to 8.00. Theory and practice in the development of comprehensive solutions to problems in industrial, technical, and human resource development environments. Solutions based on emerging procedures will be emphasized. Permission of instructor required.

Credits: 1.00 to 8.00

EDPS 53300 - Introduction To Educational Research I: Methodology

Credit Hours: 3.00. This course presents a sequence of journal articles and exercises that help introduce the foundational concepts of the course, including: research design, reliability and validity, various methodologies commonly used in educational research, and basic quantitative and qualitative data analyses. In addition, contrasting research conclusions are shown in the articles to help students learn why careful analysis of articles and their theoretical framing is critical to evaluating their conclusions.

Learning Outcomes: 1. Find research literature. 2. Read and critique educational research. 3. Deepen knowledge of at least one research area in education. 4. Design, conduct, analyze, and write a research project. Credits: 3.00

STAT 50100 - Experimental Statistics I

Credit Hours: 3.00. Concepts and methods of applied statistics. Exploratory analysis of data. Sample design and experimental design. Normal distributions. Sampling distributions. Confidence intervals and tests of hypotheses for one and two samples. Inference for contingency tables, regression and correlation, and one-way analysis of variance. Use of the SAS statistical software. Intended primarily for students who have not had calculus. Not open to students in mathematical sciences or engineering. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: College Algebra.

Learning Outcomes: 1. Produce and identify basic statistical analyses. 2. Discuss statistical terminology (speak statistics). 3. Use SAS to run basic statistical analyses and interpret corresponding SAS output. Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5.

Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

TECH 69700 - Qualitative Research Methods In Technology Studies

Credit Hours: 3.00. In-depth examination of qualitative methods and frameworks used in technology research. Students learn by application a variety of methods from the qualitative research toolbox such as interviewing, focus groups, observation, and experience analysis. TECH 69700 prepares students to plan, pilot, and assess an original qualitative research study and to integrate qualitative research findings in the technology design and evaluation process. Permission of instructor required.

Learning Outcomes: 1. Explain the epistemological assumptions underlying qualitative research methods. 2. Identify and evaluate various types of qualitative research techniques. 3. Plan a research study using qualitative research methods. 4. Conduct a research study using qualitative research methods. 5. Write up a qualitative research scholarly paper. 6. Assess and analyze the validity of qualitative research. Credits: 3.00

TECH 64600 - Analysis Of Research In Industry And Technology

Credit Hours: 3.00. Analysis of research and evaluation of research reports. Emphasis on understanding the application of fundamental statistical methods in design and interpretation of research findings in industrial, technical, and human resource development environments. Prerequisite: Master's student standing.

Credits: 3.00

Credits: 3.00

OLS 58000 - Interpersonal Skills For Leaders

Credit Hours: 3.00. Development and improvement of interpersonal and group dynamic skills for effective leadership in organizations. Emphasis on action learning and real-world application of skills. Course may be offered in traditional, distance, or blended format. Open to all graduate students with special consideration given to senior OLS students with 3.0 GPA and School of Technology graduate students.

Credits: 3.00

CNIT 53600 - IT Policy, Law, And Ethics

Credit Hours: 3.00. This course examines the policy, legal, and ethical aspects of information technology. Issues covered include ethical decision making, policy development, professionalism, privacy, freedom of expression, intellectual property, liability, and social responsibility. Included will be the philosophical ethical theories that underpin ethical decision making in the context of executing IT based projects.

Learning Outcomes: 1. Research and assess current related legislation affecting IT and IT based projects (SOX, HIPAA, etc.). 2. Research and assess the importance of Intellectual Property and Copyrights. 3. Research and analyze the key components of process improvement and product quality as related to ethical software development. 4. Research and assess the importance of employee and organizational liability. 5. Discuss the pros and cons in intelligent discourse concerning ethics and acting ethically for both individuals and organizations. 6. Discuss, in intelligent discourse, personal and societal impact of information privacy issues.

Credits: 3.00

CNIT 53700 - Professional Research And Communication

Credit Hours: 1.00. This course explores aspects of research and communications that pertains to technology-based projects and professions as well as informed changes in business process. Specifically, the methods involved in objective driven research within and across technology and business domains, as well as the use of rationale for a concisely written summary of research methods and findings for a working professional.

Learning Outcomes: 1. Explore and discuss in intelligent discourse, the rationale and challenges in contemporary research and communications. 2. Develop, describe, and utilize a research/assessment methodology and understand the techniques used in technical

based industrial research and communications. 3. Apply concepts and techniques common to current employer's practices with emphasis on concise technical writing and formatting.

Required Courses (9 credits)

CGT 50100 - Seminar In Computer Graphics Technology

Credit Hours: 0.00 to 3.00. A variable topics course that addresses contemporary problems and issues related to M.S. students in Computer Graphics Technology. Permission of instructor required.

Learning Outcomes: 1. Understand the transition from undergraduate to graduate study (course approaches, studying, research, assistantship responsibilities). 2. Understand and apply ethics in research and writing. 3. Understand the grant process and agencies that offer grants. 4. Understand the publishing process relative to articles and proceedings. 5. Understand the various publishing formats and methods of citations (APA, Chicago, and MLA versus organizational approaches). 6. Understand the IRB process and method of research approval. 7. Develop a plan of study. 8. Establish a graduate committee. 9. Understand the process for obtaining the MS. 10. Accept grand challenges in Computer Graphics Technology. Credits: 0.00 to 3.00

STAT 50100 - Experimental Statistics I

Credit Hours: 3.00. Concepts and methods of applied statistics. Exploratory analysis of data. Sample design and experimental design. Normal distributions. Sampling distributions. Confidence intervals and tests of hypotheses for one and two samples. Inference for contingency tables, regression and correlation, and one-way analysis of variance. Use of the SAS statistical software. Intended primarily for students who have not had calculus. Not open to students in mathematical sciences or engineering. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: College Algebra.

Learning Outcomes: 1. Produce and identify basic statistical analyses. 2. Discuss statistical terminology (speak statistics). 3. Use SAS to run basic statistical analyses and interpret corresponding SAS output. Credits: 3.00

TECH 69700 - Qualitative Research Methods In Technology Studies

Credit Hours: 3.00. In-depth examination of qualitative methods and frameworks used in technology research. Students learn by application a variety of methods from the qualitative research toolbox such as interviewing, focus groups, observation, and experience analysis. TECH 69700 prepares students to plan, pilot, and assess an original qualitative research study and to integrate qualitative research findings in the technology design and evaluation process. Permission of instructor required.

Learning Outcomes: 1. Explain the epistemological assumptions underlying qualitative research methods. 2. Identify and evaluate various types of qualitative research techniques. 3. Plan a research study using qualitative research methods. 4. Conduct a research study using qualitative research methods. 5. Write up a qualitative research scholarly paper. 6. Credit Hours: 3.00. Analysis of research and evaluation of research reports. Emphasis on understanding the application of fundamental statistical methods in design and interpretation of research findings in industrial, technical, and human resource development environments. Prerequisite: Master's student standing.

Credits: 3.00

Concentration (9 credits)

Information Visualization

CGT 51100 - The Development Of Graphics In Technology

Credit Hours: 3.00. An introduction to the historical development of visual science in western civilization and its effect on computer graphics techniques and practices. Topics include the historical, contemporary, and future developments in computer graphics. Emphasizes the study of visual science and the significance of computer graphics as a communications medium.

Learning Outcomes: 1. Apply the principles attained from course material. Lectures, readings and discussions will be structured around developments and shifts in the selected computer graphics topics. 2. Provide an understanding in research methodologies that are related to different areas in computer graphics. 3. Understand key concepts and techniques of computer graphics. 4. Design and conduct academic research in computer graphics. Credits: 3.00

CGT 58100 - Workshop In Computer Graphics Technology

Credit Hours: 0.00 to 8.00. Advanced study of technical and professional topics. Emphasis is on new developments relating to technical, operational, and training aspects of industry and technology education.

Learning Outcomes: 1. Vary by course offering. Credits: 0.00 to 8.00

CGT 61000 - Visual Intelligence And Perception

Credit Hours: 3.00. This course focuses on the fundamentals of perception and cognition relative to vision and its implications to the field of computer graphics technology and the creation of graphics. Students will examine the foundations of human perception of form, shape, color, and motion, developing an understanding of why and how humans perceive visual information. Permission of instructor required.

Learning Outcomes: 1. Discover the history of investigations into visual perception. 2. Understand how the human vision system constructs an understanding of the 3D world. 3. Know the visual rules that govern the interpretation of form, shape, color and motion. 4. Understand the clinical aspects relative to vision and perception. 5. Learn to apply visual rules in the planning, creation and evaluation of all graphics. Credits: 3.00

CGT 67000 - Applications In Visual Analytics

Credit Hours: 3.00. Visual Analytics (VA) provides a fast way for people to make sense of large number of data, and has applications in many sectors. This course will introduce Visual Analytics through foundational theories and a broad range of techniques and tools, focusing on using visualization methods to reason and solve complex problems in a wide variety of applications. Visual analytics is the science of analytical reasoning facilitated by interactive visual interfaces that synthesize human and computational ability to attack large complex problems. It is concerned with analytical reasoning, interaction, data transformations, data visualization, analytic reporting, and technology transition. While the different visual analytics applications share common theories and strategies, each of them has its unique data composition, visual representations, and analytical needs and strategies. Through survey and study a broad range of visual analytics applications, students will be able to apply visual analytics on their own applications, analyze and break down a complex analytical problem into proper components and steps, evaluate different visual analytic techniques and strategies, and finally design and develop an effective visual analytics solution toward the problem.

Learning Outcomes: 1. Describe the purposes, foundational theories, research components, and process of visual analytics. 2. Select proper visualization forms from visual analytics tools to answer specific reasoning questions. 3. Apply information visualization and visual analytics approaches to analyze complex problems from data processing, transformation, to visualization, and analysis. 4. Compare, analyze and assess different visual analytics approaches from various aspects such as effectiveness, efficiency, scalability, learnability, and user experience. 5. Develop a visual analytics solution and evaluate its efficacy in solving a complex domain problem. Credits: 3.00

CGT 57500 - Data Visualization Tools And Applications

Credit Hours: 3.00. This course provides hands-on experience in data visualization tools and applications. The course is designed for students with little or no background in Data Visualization. It introduces students to design principles for

creating meaningful displays of quantitative and qualitative data to facilitate insight and decision-making. The goal is to introduce visualization as a tool, explore and identify which visualization tools are better suited to visualize different types of data, and understand the role visualization plays in understanding what the data represent. This course gives students an in-depth view of the various branches of visualization and the visualization tools in each area. After taking the course students will be able to evaluate data visualization tools and determine which tool to use for different types of data. This course is targeted towards students interested in using visualization in their own work and future academic courses.

Learning Outcomes: 1. Assess the visualization process. 2. Assess the applicability of various visualization tools. 3. Evaluate different techniques of visual representation. Credits: 3.00

Other Areas

Related Area Courses (12 credits)

Thesis Research or Non-thesis Capstone (6 credits)

CGT 59800 - Directed MS Project

Credit Hours: 1.00 to 3.00. A formal investigation of a particular problem under the guidance of the advisory committee. Not applicable to a thesis option plan of study. Enrollment during at least two consecutive terms for a total of three credits is required. Permission of instructor required.

Learning Outcomes: 1. Vary by course offering. Credits: 1.00 to 3.00

CGT 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required.

Learning Outcomes: 1. Vary by course offering. Credits: 1.00 to 18.00

CGT 59700 - Directed MS Capstone

Credit Hours: 3.00 to 6.00. An original investigation of a particular problem under the guidance of the instructor(s). The resulting product is a substantial project report with an evaluation or research component. Not applicable to a thesis option plan of study. Enrollment for a total of six credits is required. Permission of department required.

Learning Outcomes: 1. Independently identify a problem or opportunity and conduct a substantial project relevant to the student's focus area. 2. Iteratively evaluate project outcomes using appropriate research methods. 3. Communicate project process, outcomes, and relevant forms of evaluation through written and oral outputs. Credits: 3.00 to 6.00

Required Courses (9 credits)

CGT 50100 - Seminar In Computer Graphics Technology

Credit Hours: 0.00 to 3.00. A variable topics course that addresses contemporary problems and issues related to M.S. students in Computer Graphics Technology. Permission of instructor required.

Learning Outcomes: 1. Understand the transition from undergraduate to graduate study (course approaches, studying, research, assistantship responsibilities). 2. Understand and apply ethics in research and writing. 3. Understand the grant process and agencies that offer grants. 4. Understand the publishing process relative to articles and proceedings. 5. Understand the various publishing formats and methods of citations (APA, Chicago, and MLA versus organizational approaches). 6. Understand the IRB process and method of research approval. 7. Develop a plan of study. 8. Establish a graduate committee. 9. Understand the process for obtaining the MS. 10. Accept grand challenges in Computer Graphics Technology. Credits: 0.00 to 3.00

STAT 50100 - Experimental Statistics I

Credit Hours: 3.00. Concepts and methods of applied statistics. Exploratory analysis of data. Sample design and experimental design. Normal distributions. Sampling distributions. Confidence intervals and tests of hypotheses for one and two samples. Inference for contingency tables, regression and correlation, and one-way analysis of variance. Use of the SAS statistical software. Intended primarily for students who have not had calculus. Not open to students in mathematical sciences or

engineering. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: College Algebra.

Learning Outcomes: 1. Produce and identify basic statistical analyses. 2. Discuss statistical terminology (speak statistics). 3. Use SAS to run basic statistical analyses and interpret corresponding SAS output. Credits: 3.00

TECH 69700 - Qualitative Research Methods In Technology Studies

Credit Hours: 3.00. In-depth examination of qualitative methods and frameworks used in technology research. Students learn by application a variety of methods from the qualitative research toolbox such as interviewing, focus groups, observation, and experience analysis. TECH 69700 prepares students to plan, pilot, and assess an original qualitative research study and to integrate qualitative research findings in the technology design and evaluation process. Permission of instructor required.

Learning Outcomes: 1. Explain the epistemological assumptions underlying qualitative research methods. 2. Identify and evaluate various types of qualitative research techniques. 3. Plan a research study using qualitative research methods. 4. Conduct a research study using qualitative research methods. 5. Write up a qualitative research scholarly paper. 6. Assess and analyze the validity of qualitative research. Credits: 3.00

TECH 64600 - Analysis Of Research In Industry And Technology

Credit Hours: 3.00. Analysis of research and evaluation of research reports. Emphasis on understanding the application of fundamental statistical methods in design and interpretation of research findings in industrial, technical, and human resource development environments. Prerequisite: Master's student standing.

Core Courses (9 credits)

CS 50200 - Compiling And Programming Systems

Credit Hours: 3.00. Basic principles of compilers and compiler design; control of translation, loading, and execution; symbolic coding systems; lexical and syntactic analysis, design and operation of assemblers and macroprocessors; design of interpretive systems. Students are expected to complete a large programming project as part of the course.

Learning Outcomes: 1. Deeper understanding of the syntactic rules and the functionality of modern programming languages, as well as the use of the compiler for enhancing program quality. 2. Opportunity to practice the implementation of certain key components in the compiler front-end and back-end. Credits: 3.00

CS 50300 - Operating Systems

Credit Hours: 3.00. Basic principles of operating systems: addressing modes, indexing, relative addressing, indirect addressing, stack maintenance; implementation of multitask systems; control and coordination of tasks, deadlocks, synchronization, mutual exclusion; storage management, segmentation, paging, virtual memory; protection, sharing, access control; file systems; resource management; evaluation and prediction of performance. Students are expected to spend at least three hours per week gaining hands-on experience in using and modifying a small operating system.

Credits: 3.00

CS 53600 - Data Communication And Computer Networks

Credit Hours: 3.00. Data communications: communication hardware technologies including local area and longhaul network hardware, circuit and packet switching, interfaces between computer and network hardware, and performance issues. Network architecture: protocol software and conceptual layering, reliable delivery over an unreliable channel, transport protocols, virtual circuits, datagrams, internetworking as a fundamental design concept, the client-server paradigm, naming and name binding, name servers, addressing and address resolution, routing and routing algorithms, congestion and flow control techniques, network file systems, distribution of computation, and DARPA internet protocols (TCP/IP) as examples of protocol organization.

Learning Outcomes: 1. Network services and applications, including DNS and HTTP . 2. The socket API . 3. Network transport architectures, TCP, UDP and TCP congestion control. 4. Routing and forwarding, intra-domain and inter-domain routing algorithms. Credits: 3.00

CS 56500 - Programming Languages

Credit Hours: 3.00. An exploration of modern or unconventional concepts of programming languages, their semantics, and their implementations; abstract data types; axiomatic semantics using Hoare's logic and Dijkstra's predicate transformers; denotational semantics; functional, object-oriented, and logic programming; concurrency and Owicki-Gries theory. Example languages include ML, Ada, Oberon, LISP, PROLOG, and CSP.

Credits: 3.00

CS 58000 - Algorithm Design, Analysis, And Implementation

Credit Hours: 3.00. Basic techniques for designing and analyzing algorithms: dynamic programming, divide and conquer, balancing. Upper and lower bounds on time and space costs, worst case and expected cost measures. A selection of applications such as disjoint set union/find, graph algorithms, search trees, pattern matching. The polynomial complexity classes P, NP, and co-NP; intractable problems.

Credits: 3.00

CS 63600 - Internetworking

Credit Hours: 3.00. Principles of Internetwork architecture and communication protocols underlying interoperable systems. Topics include universal interconnection, Internet addressing and routing, address binding, control of Internet congestion and flow, examples of Internet protocol suites (TCP/IP and XNS), round trip time estimation, naming and name resolution, Internet applications programs, and the ISO/OSI model. Prerequisite: CS 50300 .

Credits: 3.00

CS 63800 - Multimedia Networking And Operating Systems

Credit Hours: 3.00. For graduate students in computer sciences who have a background in networking and operating systems and are interested in research in networked multimedia systems. The course consists of a selection of networking and operating system topics for realizing high performance, predictable, scalable, flexible, and secure multimedia systems. Topics may vary to reflect timely research issues and the current interests of the instructor(s). Students are expected to complete a term project. Presentations also may be required. Undergraduate background in computer science required. Prerequisite: CS 53600 or CS 50300 .

Credits: 3.00

CS 56000 - Reasoning About Programs

Credit Hours: 3.00. The course focuses on the logical foundations and algorithmic techniques used to ensure program correctness. With an emphasis on automated program verification and synthesis, the course covers classical concepts and techniques such as Hoare logic, abstract interpretation, abstraction-refinement and bounded model checking. The course also exposes students to approaches for program synthesis, a new frontier for program reasoning, such as inductive synthesis, synthesis using version space algebras, constraint-based synthesis and synthesis based on machine-learning techniques. The courses emphasizes both theoretical foundations as well as hands-on experience with verification/synthesis tools and SAT/SMT solvers. Students are expected to have completed undergraduate coursework in Foundations of Computer Science (CS 18200) or equivalent, Systems Programming (CS 25200) or equivalent, and Introduction to the Analysis of Algorithms (CS 38100) or equivalent. Mathematical maturity is expected.

Learning Outcomes: 1. Express the expected behavior of programs in logic. 2. Able to manually reason about satisfiability and validity of formulas in first-order logic (modulo theories). 3. Use SAT/SMT solvers to check satisfiability and validity of formulas in first-order logic (modulo theories). 4. Specify properties of programs using pre/postconditions, safety properties and assertions in first-order logic (modulo theories). 5. Describe and apply core approaches for program verification. 6. Explain and apply Hoare logic, invariant generation,

abstract interpretation, abstraction-refinement, and bounded model checking. 7. Ability to verify programs using tools such as Dafny and the Z3 SMT solver. 8. Conduct original research in program synthesis. 9. Explain and apply inductive synthesis and functional synthesis, different search techniques (enumerative, explicit, constraint-based), and some recent approaches based on machine learning. 10. Choose and apply appropriate synthesis techniques to a problem domain of their choice. 11. Ability to critically review and present current research in program synthesis. Credits: 3.00

CS 58800 - Randomized Algorithms

Credit Hours: 3.00. The area of randomized algorithms has grown from being a tool in computational number theory to finding widespread application in algorithms in all areas of computer science. Two practical benefits of randomization are its simplicity and speed. Deep and important computational complexity connections have been developed, from bridging the gap between discrete and continuous optimization, bypassing deterministic barriers in online settings, summarizing massive data in polylogarithmic space, probabilistically checkable proofs, privacy enhancing techniques, modeling the web and other large networks, and sparsifying and compressing complicated combinatorial structures such as graphs. Randomization is an essential key ingredient in the algorithmic breakthroughs today and in the future. This course presents the basic concepts in the design and analysis of randomized algorithms and shows how to apply them to algorithms for a wide range of problems. The course covers a broad range of problems benefitting from randomized computation including data structures, graph algorithms, online algorithms, geometric algorithms, streaming algorithms, derandomization techniques, and tools for probabilistic analysis of algorithms.

Learning Outcomes: 1. Describe the main principles underlying the design and analysis of a randomized algorithm. 2. Explain concepts of randomized algorithms used in specific domains; e.g., graph-theory, number theory, and linear algebra problems. 3. Apply measure concentration results from probability theory to analyze a given randomized algorithm. 4. Determine the running times, failure probabilities, and accuracy guarantees of a randomized algorithm. 5. Apply learned design techniques and analysis tools to design and analyze new randomized algorithms. 6. Explain material from published research in the area of randomized algorithms using field-specific language. Credits: 3.00

CS 55100 - Cloud Computing Fundamentals

Credit Hours: 3.00. A comprehensive course that investigates all aspects of cloud computing, including: cloud data centers and infrastructure (equipment for processing, storage, communication, and special-purpose facilities); the use of virtualized servers (virtual machines and containers), virtualized storage (Storage Area Networks, Network Attached Storage, object storage), and virtual networks; automation; orchestration systems, such as Kubernetes; programming paradigms used to construct cloud-native software, such as MapReduce, microservices, controllerbased computing, and serverless computing; edge computing; security and privacy in cloud systems; software models. The course emphasizes researching new ways to use cloud computing and research into new ways to design and build cloud systems. The course includes a project. Students should have completed coursework in or have equivalent familiarity with operating systems and computer networks.

Learning Outcomes: 1. Identify underlying cloud facilities and infrastructure features. 2. Assess and compare algorithms and architectures used to design cloud-native software systems. 3. Plan, implement, and deploy cloud-native software systems that use available technologies. 4. Articulate the scientific and technical principles that led to cloud computing. 5. Devise measurements and evaluate the performance of cloud systems. Credits: 3.00

Selectives (12 credits)

CS 50500 - Distributed Systems

Credit Hours: 3.00. Foundations for building reliable distributed systems, including failure and system models, and basic communication and agreement problems; crash failures, recovery, partition, Byzantine failures; asynchronous systems, failure detectors, communication channels, wireless and sensor networks; software clocks, causality, and cuts. Examples of problems include reliable broadcast consensus, leader election,

group communication, and replication. Permission of department required.

Credits: 3.00

CS 51000 - Software Engineering

Credit Hours: 3.00. Software life cycles, requirements engineering, software design, design of distributed systems, verification and validation, software architecture, process metrics and models, and research methods in software engineering.

Credits: 3.00

CS 51400 - Numerical Analysis

Credit Hours: 3.00. (MA 51400) Alternative methods for solving nonlinear equations; linear difference equations, applications to solution of polynomial equations; differentiation and integration formulas; numerical solution of ordinary differential equations; roundoff error bounds.

Credits: 3.00

CS 51500 - Numerical Linear Algebra

Credit Hours: 3.00. Direct and iterative solvers of dense and sparse linear systems of equations, numerical schemes for handling symmetric algebraic eigenvalue problems, and the singular-value decomposition and its applications in linear least squares problems.

Learning Outcomes: 1. Become knowledgeable about major kernels and algorithms underlying matrix computations for dense and sparse matrices including linear systems of equation, symmetric eigenvalue problems, and the singular-value decomposition. 2. Be able to implement basic versions of these kernels and algorithms. 3. Learn about the difference between direct and iterative methods for linear systems. 4. Gain expertise in the design of iterative methods and preconditioning techniques for large-scale sparse linear systems. 5. Be able to implement eigenvalue and singular-value problem solvers. Credits: 3.00

CS 52000 - Computational Methods In Optimization

Credit Hours: 3.00. A treatment of numerical algorithms and software for optimization problems with a secondary emphasis on linear and nonlinear systems of equations: unconstrained and constrained optimization; line search methods; trust region methods; Quasi-Newton methods; linear programming; calculating derivatives; quadratic programming; global optimization, including simulated annealing.

Credits: 3.00

CS 52500 - Parallel Computing

Credit Hours: 3.00. Parallel computing for science and engineering applications: parallel programming and performance evaluation, parallel libraries and problem-solving environments, models of parallel computing and run-time support systems, and selected applications.

Credits: 3.00

CS 52600 - Information Security

Credit Hours: 3.00. (CSCI 52600) Basic notions of confidentiality, integrity, availability; authentication models; protection models; security kernels; secure programming; audit; intrusion detection and response; operational security issues; physical security issues; personnel security; policy formation and enforcement; access controls; information flow; legal and social issues; identification and authentication in local and distributed systems; classification and trust modeling; and risk assessment.

Credits: 3.00

CS 53000 - Introduction To Scientific Visualization

Credit Hours: 3.00. Teaches the fundamentals of scientific visualization and prepares students to apply these techniques in fields such as astronomy, biology, chemistry, engineering, and physics. Emphasis is on the representation of scalar, vector, and tensor fields; data sampling and resampling; and reconstruction using multivariate finite elements (surfaces, volumes, and surfaces on surfaces).

Learning Outcomes: 1. Learn basic notions of human vision and color perception that inform the design of effective visual representations. 2. Know different models of color perception and understand their connection to the anatomy of the visual system. 3. Be familiar with several color spaces and know their perceptual properties. 4. Know how to devise effective color scales suitable for different data mapping needs. 5. Learn the data structures and data reconstruction techniques that are needed to create continuous visual representations of discrete simulation or experimental datasets. 6.

Be familiar with the main grid types used in numerical simulations, know what data structures can be used to represent them in memory, and the associated footprint. 7. Know various data interpolation methods and understand their relationship with grid topology. 8. Know how to efficiently solve the point location problem, whereby the cell must be determined that encloses an arbitrary spatial location. 9. Learn the main visualization techniques for scalar, vector, and tensor datasets. Credits: 3.00

CS 53100 - Computational Geometry

Credit Hours: 3.00. Computational geometry studies how to compute with and reason about geometric objects. The subject is playing an increasingly important role in computer graphics, game software, geometric modeling, geographic information systems, and many other applications. Course topics include convex hull, segment manipulations, triangulations, range searching, Voronoi diagrams, window queries, Delaunay triangulation, and duality. Some key algorithms are implemented. Questions of floating-point accuracy and robust algorithm design are considered throughout the course.

Credits: 3.00

CS 53500 - Interactive Computer Graphics

Credit Hours: 3.00. The principles of computer graphics and interactive graphical methods for problem solving. Emphasis placed on both development and use of graphical tools for various display devices. Several classes of graphics hardware considered in detail. Topics include pen plotting, storage tubes, refresh, dynamic techniques, three dimensions, color, modeling of geometry, and hidden surface removal. Part of the laboratory involves use of an interactive minicomputer graphics system. Knowledge of programming required.

Learning Outcomes: 1. Learn the algorithms underlying the interactive graphics pipeline, including algorithms for geometric modeling, projection, rasterization, shading, lighting, texture mapping, projective texture mapping, shadow mapping, and environment mapping. 2. Gain experience implementing the interactive graphics pipeline through projects. 3. Gain initial experience programming Graphics Processing units through shaders. 4. Learn and implement algorithms for advanced rendering techniques. Credits: 3.00

CS 54100 - Database Systems

Credit Hours: 3.00. Fundamentals for the logical design of database systems. The entity-relationship model, semantic model, relational model, hierarchical model, network model. Implementations of the models. Design theory for relational databases. Design of query languages and the use of semantics for query optimization. Design and verification of integrity assertions, and security. Introduction to intelligent query processing and database machines.

Credits: 3.00

CS 54200 - Distributed Database Systems

Credit Hours: 3.00. Fundamental issues in distributed database systems that are motivated by the computer networking and distribution of processors and databases. The theory, design, specification, implementation, and performance of distributed database systems.

Credits: 3.00

CS 54300 - Introduction To Simulation And Modeling Of Computer Systems

Credit Hours: 3.00. Simulation: discrete event simulation, process oriented simulation, generating random numbers, simulation languages, simulation examples of complex systems. Nondeterministic models: random variables, Poisson process, moment generating functions, statistical inference and data analysis. Modeling: elementary queuing models, networks of queues, applications to performance evaluation of computer systems.

Credits: 3.00

CS 54701 - Information Retrieval

Credit Hours: 3.00. Basic principles and practical algorithms used for information retrieval and text mining: statistical characteristics of text, several important retrieval models, text categorization, recommendation system, clustering, federated text search, link analysis, etc.

Learning Outcomes: 1. Learn the theories and techniques behind Web search engines, E-commerce recommendation systems, etc. 2. Get hands on project experience by developing real-world applications, such as intelligent tools for improving search accuracy from user feedback, email spam detection, recommendation system, or scientific literature

organization and mining. 3. Learn tools and techniques to do cutting-edge research in the area of information retrieval or text mining. Credits: 3.00

CS 55500 - Cryptography

Credit Hours: 3.00. (CSCI 55500) Concepts and principles of cryptography and data security. Cryptography (secret codes): principles of secrecy systems; classical cryptographic systems, including Vigenere and Vernam ciphers; the Data Encryption Standard (DES); public-key encryption; privacy-enhanced email; digital signatures. Proprietary software protection; information theory and number theory; complexity bounds on encryption; key escrow; traffic analysis; attacks against encryption; basic legal issues; e-commerce; and the role of protocols.

Credits: 3.00

CS 57300 - Data Mining

Credit Hours: 3.00. (CSCI 57300) Data Mining has emerged at the confluence of artificial intelligence, statistics, and databases as a technique for automatically discovering summary knowledge in large datasets. This course introduces students to the process and main techniques in data mining, including classification, clustering, and pattern mining approaches. Data mining systems and applications are also covered, along with selected topics in current research. Offered in alternate years.

Learning Outcomes: 1. Learn Data mining techniques. 2. Learn how to summarize large data sets. 3. Learn current research topics. Credits: 3.00

CS 57900 - Bioinformatics Algorithms

Credit Hours: 3.00. Review of Genomes, DNA, RNA, proteins, proteomes. Biological Sequences: dynamic programming; pairwise global, local, and semi-global alignments of genes and proteins; constant, affine, and general gap penalties; RNA alignments; BLOSUM and PAM scoring matrices. Multiple alignment of proteins: approximation algorithms; iterative and progressive alignment methods. Database search for sequences: BLAST and variants. Phylogenetic Trees: distance-based methods, ultrametric and additive distance functions; parsimony, and maximum likelihood methods. Whole Genome Alignment: suffix trees and suffix arrays. Systems Biology: Module discovery in biological networks, spectral algorithms for graph clustering. Network alignment: quadratic programming formulations and graph matching. Genetic Variation: haplotype inference, the perfect phylogeny problem and chordal graphs. Additional topics such as next-generation sequencing, analysis of multidimensional data from flow cytometry, and gene expression data, if time permits.

Learning Outcomes: 1. Students will learn how to design algorithms. 2. Students will learn how to solve computational problems from the new biology, the data-rich field that biological sciences is becoming. Credits: 3.00

CS 58400 - Theory Of Computation And Computational Complexity

Credit Hours: 3.00. The theory of general purpose programming systems. Recursive and partial-recursive functions; recursive and recursively enumerable sets. The Church-Turing thesis. The recursion theorem, Rogers' translation theorem, Rice's undecidability theorem. The general theory of computational complexity: there are no general solutions to natural optimization problems. Complexity for specific models of computation: the polynomial complexity classes P, NP, and PSPACE; NP-hard and PSPACE-hard problems, inherently exponential problems.

Credits: 3.00

CS 61500 - Numerical Methods For Partial Differential Equations I

Credit Hours: 3.00. (MA 61500) Finite element method for elliptic partial differential equations; weak formulation; finite-dimensional approximations; error bounds; algorithmic issues; solving sparse linear systems; finite element method for parabolic partial differential equations; backward difference and Crank-Nicolson time-stepping; introduction to finite difference methods for elliptic, parabolic, and hyperbolic equations; stability, consistency, and convergence; discrete maximum principles. Prerequisite: CS 51400, MA 52300.

Credits: 3.00

CS 62600 - Advanced Information Assurance

Credit Hours: 3.00. Advanced topics in information assurance, including selections from the following: penetration testing, formal verification of systems, formal models of information flow and protection, distributed system authentication, protocol design and attack, computer viruses and malware, intrusion and anomaly detection models, multi-level security, active defenses, investigation and forensics, network firewalls, anonymity and identity, e-commerce support, and database security models and mechanisms. Offered every third semester. Prerequisite: CS 52600 , CS 55500 .

Credits: 3.00

CS 64100 - Multimedia Database Systems

Credit Hours: 3.00. Prepares students for research in multimedia database systems. Students are exposed to a variety of emerging innovative techniques to store, manipulate,

communicate, visualize, and reason with multimedia systems. Prerequisite: CS 54100 or CS 54200 .

Credits: 3.00

CS 65500 - Advanced Cryptology

Credit Hours: 3.00. Advanced topics in cryptography and cryptanalysis, including selections from the following: Steganographic methods, Cryptanalytic techniques, including differential cryptanalysis, and chosen plaintext attacks. Message digest algorithm construction. Digital cash. Quantum cryptography. N-key systems. Minimal and zero-knowledge systems. Protocol design and failure. Verification of algorithms. Key generation and management. Traffic analysis. VPN construction and operation. Politics, espionage, and law enforcement concerns. Offered every third semester. Prerequisite: CS 52600 , CS 55500 .

Credits: 3.00

CS 52700 - Software Security

Credit Hours: 3.00. This course focuses on software security fundamentals, secure coding guidelines and principles, and advanced software security concepts. Students will learn to assess and understand threats, learn how to design and implement secure software systems, and get hands-on experience with common security pitfalls. Restricted to CS MS and CS PHD students. Significant programming experience and skills are required to complete the labs and projects.

Learning Outcomes: 1. Explain the top 20 most common weaknesses in software security (CWE top 20) and understand how such problems can be avoided in software. 2. Know limitations of existing defense mechanisms and how to overcome them. 3. Explain and identify common security threats, risks, and attack vectors for software systems. 4. Evaluate and assess current security best practices and defense mechanisms for current software systems. 5. Identify security problems in source code and binaries, assess the associated risks, and reason about their severity and exploitability. 6. Assess the security of given source code or applications. Credits: 3.00

CS 52800 - Network Security

Credit Hours: 3.00. The course focuses on the principles and foundations of building secure network systems and on security and privacy challenges in existing and emerging networks. The course compares and analyzes network architectures and network protocols from the physical layer to the access control, network, transport and application layer from an adversarial standpoint to understand how to build more secure protocols that can withstand attacks. Restricted to CS MS and CS PHD students. Significant programming experience and skills are required to complete the projects.

Learning Outcomes: 1. Describe the different categories of network threats and attacks. 2. Examine the strengths and weaknesses of security technologies at each layer of the network protocol stack. 3. Identify the appropriate defense mechanism(s) and its (their) limitations, given a network threat. 4. Demonstrate the ability to discuss security properties, limitations, and threats in wireless networks and emerging technologies. 5. Demonstrate the ability to summarize defenses against network censorship, and network anonymity and privacy protocols. Credits: 3.00

CS 57700 - Natural Language Processing

Credit Hours: 3.00. This course will cover the key concepts and methods used in modern Natural Language Processing (NLP). Throughout the course several core NLP tasks, such as sentiment analysis, information extraction, syntactic and semantic analysis, will be discussed. The course will emphasize machine-learning and data-driven algorithms and techniques, and will compare several different approaches to these problems in terms of their performance, supervision effort and computational complexity. Prerequisites: A background in linear algebra, calculus, statistics and probability, and completion of CS 57800 or equivalent are highly recommended. Strong programming skills in any modem language (Python, Java, C++) are required.

Learning Outcomes: 1. Describe and analyze the key challenges in dealing with natural language data and other fundamental areas of NLP. 2. Analyze and implement the key algorithms and techniques used in NLP. 3. Identify algorithmic techniques that can be applied to new problems and evaluate other possible solutions. 4. Conduct experiments using proper methodology for training and testing NLP systems using data. 5. Critically review current research work in the NLP field.

Credits: 3.00

CS 57100 - Artificial Intelligence

Credit Hours: 3.00. Artificial Intelligence (AI) systems are increasingly being deployed in many real-world tasks. This course provides an introduction to the fundamental principles and applications of AI. The course covers classic material including search-based methods, probabilistic reasoning, game playing, decision making, exact and approximate inference, causal learning, and reinforcement learning as well as selected advanced topics. The focus of the course is on foundational methods and current techniques for building AI systems that exhibit 'intelligent' behavior and can 'learn' from experience. The course assumes students are familiar with basic concepts in analysis, linear algebra, optimization, discrete mathematics, elementary probability, statistics, data structures, and algorithms. Students are expected to have good programming and software development skills and have a working knowledge of Python and Java.

Learning Outcomes: 1. Assess and explain the applicability, strengths, and weaknesses of the basic knowledge representation, problem-solving, and learning methods in solving a particular problem. (E,W) 2. Predict the behavior and estimate the cost (in time and space) of different heuristic and optimal search methods, and choose the appropriate method for particular problems. (W,P) 3. Develop small logic-based, rule-based, and search-based systems; be able to predict performance characteristics. (P) 4. Predict the behavior of basic machine-learning methods, and choose the appropriate method for particular problems. (W,P) 5. Communicate critical key issues in AI-related to knowledge representation, problem-solving, and learning for a specific problem. (W) 6. Propose, evaluate, and implement effective solutions to problems requiring AI techniques. (P) 7. Articulate key problems, both technical and philosophical, in the development of artificial intelligence systems. (E,W) Credits: 3.00

CS 55600 - Data Security And Privacy

Credit Hours: 3.00. Data security and privacy is an important part of information security. This course provides an introduction to the fundamental principles and techniques for data security and privacy. The course covers fundamental theories of access control, discretionary access control, mandatory access control, and role-based access control, database access control approaches including grant revoke, virtual private databases and labelled databases, database encryption. On privacy, it covers data anonymization, re-identification attacks, definition, primitives, and applications of differential privacy.

Learning Outcomes: 1. Explain the limitation of discretionary access control and the impacts to security. (E,Q,W) 2. Explain the definition, enforcement, and challenges for multi-level security, including the Bell LaPadula model, non-interference, and covert channels. (E,Q,W) 3. Articulate integrity models (Biba and Clark-Wilson), and the difference between integrity and confidentiality. (E,Q,W) 4. Explain the main database security mechanism, including grant revoke model, content-based and context-based access control, virtual private databases, labelled databases, and data encryption. (E,Q,W) 5. Articulate the limitations of data anonymization for achieving privacy, and the strengths and limitations of privacy notions including differential privacy. (EQW) 6. Identify, implement, and deploy differential privacy mechanisms for problem settings. (P) Credits: 3.00

CS 57800 - Statistical Machine Learning

Credit Hours: 3.00. This introductory course will cover many concepts, models, and algorithms in machine learning. Topics include classical supervised learning (e.g., regression and classification), unsupervised learning (e.g., principle component analysis and K-means), and recent development in the machine learning field such as variational Bayes, expectation propagation, and Gaussian processes. While this course will give students the basic ideas and intuition behind modern machine learning methods, the underlying theme in the course is probabilistic inference.

Learning Outcomes: 1. Learn the theory and key algorithms used in machine learning. 2. Get hands-on machine learning experience by implementing several algorithms, applying them to datasets and analyzing their performance. 3. Understand how to use machine learning

methods to their research projects, formulate the learning tasks and match them with appropriate solutions. Credits: 3.00

Core Courses (9 credits)

CS 50200 - Compiling And Programming Systems

Credit Hours: 3.00. Basic principles of compilers and compiler design; control of translation, loading, and execution; symbolic coding systems; lexical and syntactic analysis, design and operation of assemblers and macroprocessors; design of interpretive systems. Students are expected to complete a large programming project as part of the course.

Learning Outcomes: 1. Deeper understanding of the syntactic rules and the functionality of modern programming languages, as well as the use of the compiler for enhancing program quality. 2. Opportunity to practice the implementation of certain key components in the compiler front-end and back-end. Credits: 3.00

CS 50300 - Operating Systems

Credit Hours: 3.00. Basic principles of operating systems: addressing modes, indexing, relative addressing, indirect addressing, stack maintenance; implementation of multitask systems; control and coordination of tasks, deadlocks, synchronization, mutual exclusion; storage management, segmentation, paging, virtual memory; protection, sharing, access control; file systems; resource management; evaluation and prediction of performance. Students are expected to spend at least three hours per week gaining hands-on experience in using and modifying a small operating system.

Credits: 3.00

CS 53600 - Data Communication And Computer Networks

Credit Hours: 3.00. Data communications: communication hardware technologies including local area and longhaul network hardware, circuit and packet switching, interfaces between computer and network hardware, and performance issues. Network architecture: protocol software and conceptual layering, reliable delivery over an unreliable channel, transport protocols, virtual circuits, datagrams, internetworking as a fundamental design concept, the client-server paradigm, naming and name binding, name servers, addressing and address resolution, routing and routing algorithms, congestion and flow control techniques, network file systems, distribution of computation, and DARPA internet protocols (TCP/IP) as examples of protocol organization.

Learning Outcomes: 1. Network services and applications, including DNS and HTTP . 2. The socket API . 3. Network transport architectures, TCP, UDP and TCP congestion control. 4. Routing and forwarding, intra-domain and inter-domain routing algorithms. Credits: 3.00

CS 56500 - Programming Languages

Credit Hours: 3.00. An exploration of modern or unconventional concepts of programming languages, their semantics, and their implementations; abstract data types; axiomatic semantics using Hoare's logic and Dijkstra's predicate transformers; denotational semantics; functional, object-oriented, and logic programming; concurrency and Owicki-Gries theory. Example languages include ML, Ada, Oberon, LISP, PROLOG, and CSP.

Credits: 3.00

CS 58000 - Algorithm Design, Analysis, And Implementation

Credit Hours: 3.00. Basic techniques for designing and analyzing algorithms: dynamic programming, divide and conquer, balancing. Upper and lower bounds on time and space costs, worst case and expected cost measures. A selection of applications such as disjoint set union/find, graph algorithms, search trees, pattern matching. The polynomial complexity classes P, NP, and co-NP; intractable problems.

Credits: 3.00

CS 63600 - Internetworking

Credit Hours: 3.00. Principles of Internetwork architecture and communication protocols underlying interoperable systems. Topics include universal interconnection, Internet addressing and routing, address binding, control of Internet congestion and flow, examples of Internet protocol suites (TCP/IP and XNS), round trip time estimation, naming and name resolution, Internet applications programs, and the ISO/OSI model. Prerequisite: CS 50300 .

Credits: 3.00

CS 63800 - Multimedia Networking And Operating Systems

Credit Hours: 3.00. For graduate students in computer sciences who have a background in networking and operating systems and are interested in research in networked multimedia systems. The course consists of a selection of networking and operating system topics for realizing high performance, predictable, scalable, flexible, and secure multimedia systems. Topics may vary to reflect timely research issues and the current interests of the instructor(s). Students are expected to complete a term project. Presentations also may be required.

Undergraduate background in computer science required. Prerequisite: CS 53600 or CS 50300 .

Credits: 3.00

CS 56000 - Reasoning About Programs

Credit Hours: 3.00. The course focuses on the logical foundations and algorithmic techniques used to ensure program correctness. With an emphasis on automated program verification and synthesis, the course covers classical concepts and techniques such as Hoare logic, abstract interpretation, abstraction-refinement and bounded model checking. The course also exposes students to approaches for program synthesis, a new frontier for program reasoning, such as inductive synthesis, synthesis using version space algebras, constraint-based synthesis and synthesis based on machine-learning techniques. The courses emphasizes both theoretical foundations as well as hands-on experience with verification/synthesis tools and SAT/SMT solvers. Students are expected to have completed undergraduate coursework in Foundations of Computer Science (CS 18200) or equivalent, Systems Programming (CS 25200) or equivalent, and Introduction to the Analysis of Algorithms (CS 38100) or equivalent. Mathematical maturity is expected.

Learning Outcomes: 1. Express the expected behavior of programs in logic. 2. Able to manually reason about satisfiability and validity of formulas in first-order logic (modulo theories). 3. Use SAT/SMT solvers to check satisfiability and validity of formulas in first-order logic (modulo theories). 4. Specify properties of programs using pre/postconditions, safety properties and assertions in first-order logic (modulo theories). 5. Describe and apply core approaches for program verification. 6. Explain and apply Hoare logic, invariant generation, abstract interpretation, abstraction-refinement, and bounded model checking. 7. Ability to verify programs using tools such as Dafny and the Z3 SMT solver. 8. Conduct original research in program synthesis. 9. Explain and apply inductive synthesis and functional synthesis, different search techniques (enumerative, explicit, constraint-based), and some recent approaches based on machine learning. 10. Choose and apply appropriate synthesis techniques to a problem domain of their choice. 11. Ability to critically review and present current research in program synthesis. Credits: 3.00

CS 58800 - Randomized Algorithms

Credit Hours: 3.00. The area of randomized algorithms has grown from being a tool in computational number theory to finding widespread application in algorithms in all areas of computer science. Two practical benefits of randomization are its simplicity and speed. Deep and important computational complexity connections have been developed, from bridging the gap between discrete and continuous optimization, bypassing deterministic barriers in online settings, summarizing massive data in polylogarithmic space, probabilistically checkable proofs, privacy enhancing techniques, modeling the web and other large networks, and sparsifying and compressing complicated combinatorial structures such as graphs. Randomization is an essential key ingredient in the algorithmic breakthroughs today and in the future. This course presents the basic concepts in the design and analysis of randomized algorithms and shows how to apply them to algorithms for a wide range of problems. The course covers a broad range of problems benefitting from randomized computation including data structures, graph algorithms, online algorithms, geometric algorithms, streaming algorithms, derandomization techniques, and tools for probabilistic analysis of algorithms.

Learning Outcomes: 1. Describe the main principles underlying the design and analysis of a randomized algorithm. 2. Explain concepts of randomized algorithms used in specific domains; e.g., graph-theory, number theory, and linear algebra problems. 3. Apply measure concentration results from probability theory to analyze a given randomized algorithm. 4. Determine the running times, failure probabilities, and accuracy guarantees of a randomized algorithm. 5. Apply learned design techniques and analysis tools to design and analyze new randomized algorithms. 6. Explain material from published research in the area of randomized algorithms using field-specific language. Credits: 3.00

CS 55100 - Cloud Computing Fundamentals

Credit Hours: 3.00. A comprehensive course that investigates all aspects of cloud computing, including: cloud data centers and infrastructure (equipment for processing, storage,

communication, and special-purpose facilities); the use of virtualized servers (virtual machines and containers), virtualized storage (Storage Area Networks, Network Attached Storage, object storage), and virtual networks; automation; orchestration systems, such as Kubernetes; programming paradigms used to construct cloud-native software, such as MapReduce, microservices, controllerbased computing, and serverless computing; edge computing; security and privacy in cloud systems; software models. The course emphasizes researching new ways to use cloud computing and research into new ways to design and build cloud systems. The course includes a project. Students should have completed coursework in or have equivalent familiarity with operating systems and computer networks.

Learning Outcomes: 1. Identify underlying cloud facilities and infrastructure features. 2. Assess and compare algorithms and architectures used to design cloud-native software systems. 3. Plan, implement, and deploy cloud-native software systems that use available technologies. 4. Articulate the scientific and technical principles that led to cloud computing. 5. Devise measurements and evaluate the performance of cloud systems. Credits: 3.00

Electives (3-9 credits)

CS Courses

CS 50200 - Compiling And Programming Systems

Credit Hours: 3.00. Basic principles of compilers and compiler design; control of translation, loading, and execution; symbolic coding systems; lexical and syntactic analysis, design and operation of assemblers and macroprocessors; design of interpretive systems. Students are expected to complete a large programming project as part of the course.

Learning Outcomes: 1. Deeper understanding of the syntactic rules and the functionality of modern programming languages, as well as the use of the compiler for enhancing program quality. 2. Opportunity to practice the implementation of certain key components in the compiler front-end and back-end. Credits: 3.00

CS 50500 - Distributed Systems

Credit Hours: 3.00. Foundations for building reliable distributed systems, including failure and system models, and basic communication and agreement problems; crash failures, recovery, partition, Byzantine failures; asynchronous systems, failure detectors, communication channels, wireless and sensor networks; software clocks, causality, and cuts. Examples of problems include reliable broadcast consensus, leader election, group communication, and replication. Permission of department required.

Credits: 3.00

CS 51400 - Numerical Analysis

Credit Hours: 3.00. (MA 51400) Alternative methods for solving nonlinear equations; linear difference equations, applications to solution of polynomial equations; differentiation and integration formulas; numerical solution of ordinary differential equations; roundoff error bounds.

Credits: 3.00

CS 52000 - Computational Methods In Optimization

Credit Hours: 3.00. A treatment of numerical algorithms and software for optimization problems with a secondary emphasis on linear and nonlinear systems of equations: unconstrained and constrained optimization; line search methods; trust region methods; Quasi-Newton methods; linear programming; calculating derivatives; quadratic programming; global optimization, including simulated annealing.

Credits: 3.00

CS 52500 - Parallel Computing

Credit Hours: 3.00. Parallel computing for science and engineering applications: parallel programming and performance evaluation, parallel libraries and problem-solving environments, models of parallel computing and run-time support systems, and selected applications.

Credits: 3.00

CS 53000 - Introduction To Scientific Visualization

Credit Hours: 3.00. Teaches the fundamentals of scientific visualization and prepares students to apply these techniques in fields such as astronomy, biology, chemistry, engineering, and physics. Emphasis is on the representation of scalar, vector, and tensor fields; data sampling and resampling; and reconstruction using multivariate finite elements (surfaces, volumes, and surfaces on surfaces).

Learning Outcomes: 1. Learn basic notions of human vision and color perception that inform

the design of effective visual representations. 2. Know different models of color perception and understand their connection to the anatomy of the visual system. 3. Be familiar with several color spaces and know their perceptual properties. 4. Know how to devise effective color scales suitable for different data mapping needs. 5. Learn the data structures and data reconstruction techniques that are needed to create continuous visual representations of discrete simulation or experimental datasets. 6. Be familiar with the main grid types used in numerical simulations, know what data structures can be used to represent them in memory, and the associated footprint. 7. Know various data interpolation methods and understand their relationship with grid topology. 8. Know how to efficiently solve the point location problem, whereby the cell must be determined that encloses an arbitrary spatial location. 9. Learn the main visualization techniques for scalar, vector, and tensor datasets. Credits: 3.00

CS 53600 - Data Communication And Computer Networks

Credit Hours: 3.00. Data communications: communication hardware technologies including local area and longhaul network hardware, circuit and packet switching, interfaces between computer and network hardware, and performance issues. Network architecture: protocol software and conceptual layering, reliable delivery over an unreliable channel, transport protocols, virtual circuits, datagrams, internetworking as a fundamental design concept, the client-server paradigm, naming and name binding, name servers, addressing and address resolution, routing and routing algorithms, congestion and flow control techniques, network file systems, distribution of computation, and DARPA internet protocols (TCP/IP) as examples of protocol organization.

Learning Outcomes: 1. Network services and applications, including DNS and HTTP . 2. The socket API . 3. Network transport architectures, TCP, UDP and TCP congestion control. 4. Routing and forwarding, intra-domain and inter-domain routing algorithms. Credits: 3.00

CS 55500 - Cryptography

Credit Hours: 3.00. (CSCI 55500) Concepts and principles of cryptography and data security. Cryptography (secret codes): principles of secrecy systems; classical cryptographic systems, including Vigenere and Vernam ciphers; the Data Encryption Standard (DES); public-key encryption; privacy-enhanced email; digital signatures. Proprietary software protection; information theory and number theory; complexity bounds on encryption; key escrow; traffic analysis; attacks against encryption; basic legal issues; e-commerce; and the role of protocols.

Credits: 3.00

CS 56500 - Programming Languages

Credit Hours: 3.00. An exploration of modern or unconventional concepts of programming languages, their semantics, and their implementations; abstract data types; axiomatic semantics using Hoare's logic and Dijkstra's predicate transformers; denotational semantics; functional, object-oriented, and logic programming; concurrency and Owicki-Gries theory. Example languages include ML, Ada, Oberon, LISP, PROLOG, and CSP.

Credits: 3.00

CS 57300 - Data Mining

Credit Hours: 3.00. (CSCI 57300) Data Mining has emerged at the confluence of artificial intelligence, statistics, and databases as a technique for automatically discovering summary knowledge in large datasets. This course introduces students to the process and main techniques in data mining, including classification, clustering, and pattern mining approaches. Data mining systems and applications are also covered, along with selected topics in current research. Offered in alternate years.

Learning Outcomes: 1. Learn Data mining techniques. 2. Learn how to summarize large data sets. 3. Learn current research topics. Credits: 3.00

CS 58000 - Algorithm Design, Analysis, And Implementation

Credit Hours: 3.00. Basic techniques for designing and analyzing algorithms: dynamic programming, divide and conquer, balancing. Upper and lower bounds on time and space costs, worst case and expected cost measures. A selection of applications such as disjoint set union/find, graph algorithms, search trees, pattern matching. The polynomial complexity classes P, NP, and co-NP; intractable problems.

Credits: 3.00

CS 58400 - Theory Of Computation And Computational Complexity

Credit Hours: 3.00. The theory of general purpose programming systems. Recursive and partial-recursive functions; recursive and recursively enumerable sets. The Church-Turing thesis. The recursion theorem, Rogers' translation theorem, Rice's undecidability theorem. The general theory of computational complexity: there are no general solutions to natural optimization problems. Complexity for specific models of computation: the polynomial complexity classes P, NP, and PSPACE; NP-hard and PSPACE-hard problems, inherently exponential problems.

Credits: 3.00

CS 59100 - Seminar

Credit Hours: 1.00. A weekly seminar presented by faculty and invited speakers, normally in a specific area.

Credits: 1.00

CS 61500 - Numerical Methods For Partial Differential Equations I

Credit Hours: 3.00. (MA 61500) Finite element method for elliptic partial differential equations; weak formulation; finite-dimensional approximations; error bounds; algorithmic issues; solving sparse linear systems; finite element method for parabolic partial differential equations; backward difference and Crank-Nicolson time-stepping; introduction to finite difference methods for elliptic, parabolic, and hyperbolic equations; stability, consistency, and convergence; discrete maximum principles. Prerequisite: CS 51400, MA 52300.

Credits: 3.00

CS 63500 - Capturing And Rendering Real-World Scenes

Credit Hours: 3.00. Advanced techniques for automated modeling and visualization of complex environments, such as rooms, buildings, urban scenes, and landscapes. Topics covered are at the confluence of computer graphics, computer vision and engineering, and include: capture technologies, acquisition device calibration, view registration, panoramic images, 3D reconstruction from images, view morphing, 3D image warping, lightfield modeling and rendering, visual hulls, point-based modeling and rendering, view dependent texture mapping, and application development issues and examples. Prerequisite: CS 58000 , CS 53500 or a solid foundation in computer graphics, programming proficiency in C or C++ and basic linear algebra.

Credits: 3.00

CS 65500 - Advanced Cryptology

Credit Hours: 3.00. Advanced topics in cryptography and cryptanalysis, including selections from the following: Steganographic methods, Cryptanalytic techniques, including differential cryptanalysis, and chosen plaintext attacks. Message digest algorithm construction. Digital cash. Quantum cryptography. N-key systems. Minimal and zero-knowledge systems. Protocol design and failure. Verification of algorithms. Key generation and management. Traffic analysis. VPN construction and operation. Politics, espionage, and law enforcement concerns. Offered every third semester. Prerequisite: CS 52600 , CS 55500 .

Credits: 3.00

CS 52700 - Software Security

Credit Hours: 3.00. This course focuses on software security fundamentals, secure coding guidelines and principles, and advanced software security concepts. Students will learn to assess and understand threats, learn how to design and implement secure software systems, and get hands-on experience with common security pitfalls. Restricted to CS MS and CS PHD students. Significant programming experience and skills are required to complete the labs and projects.

Learning Outcomes: 1. Explain the top 20 most common weaknesses in software security (CWE top 20) and understand how such problems can be avoided in software. 2. Know limitations of existing defense mechanisms and how to overcome them. 3. Explain and identify common security threats, risks, and attack vectors for software systems. 4. Evaluate and assess current security best practices and defense mechanisms for current software systems. 5. Identify security problems in source code and binaries, assess the associated risks, and reason about their severity and exploitability. 6. Assess the security of given source code or applications. Credits: 3.00

CS 52800 - Network Security

Credit Hours: 3.00. The course focuses on the principles and foundations of building secure network systems and on security and privacy challenges in existing and emerging networks. The course compares and analyzes network architectures and network protocols from the physical layer to the access control, network, transport and application layer from an adversarial standpoint to understand how to build more secure protocols that can withstand attacks. Restricted to CS MS and CS PHD students. Significant programming experience and skills are required to complete the projects.

Learning Outcomes: 1. Describe the different categories of network threats and attacks. 2.

Examine the strengths and weaknesses of security technologies at each layer of the network protocol stack. 3. Identify the appropriate defense mechanism(s) and its (their) limitations, given a network threat. 4. Demonstrate the ability to discuss security properties, limitations, and threats in wireless networks and emerging technologies. 5. Demonstrate the ability to summarize defenses against network censorship, and network anonymity and privacy protocols. Credits: 3.00

CS 52300 - Social, Economic, And Legal Aspects Of Security

Credit Hours: 3.00. This course focuses on social, legal, and economic aspects of information security and privacy, also including ethics, policies, and human behavioral issues. The course covers the interactions between non-technological aspects of information security as well as relevant technological aspects. It focuses on how non-technological facets can inform and guide technological choices, and how technological choices can enhance or detract from the broader organizational and societal goals.

Learning Outcomes: 1. Identify and describe the legal, organizational, and financial ramifications of security-related design and management decisions. 2. Explain how to respond to a security incident, including recovery and cleanup, damage assessment, forensics and the handling of digital evidence so that it is admissible in court, and satisfying government requirements on the reporting of the incident. 3. Identify, evaluate and assess the risks faced by an organization, and their impact and consequences should they materialize (including liability, reputational damage, disruption to operations, loss of customers). Recommend effective and appropriate measures to mitigate those risks. 4. Explain the role of incentives in information security, and be capable of evaluating and modifying an organizational and reward structure so that it better aligns the interests of employees with those of the organization. 5. Ensure compliance with privacy and data protection laws. Detect and remedy practices that have potential to give rise to violations of these laws. 6. Identify major national laws that affect the practice of information security and explain potential interactions. 7. Evaluate and improve an e-policy's in security and privacy aspects. Credits: 3.00

CS 57700 - Natural Language Processing

Credit Hours: 3.00. This course will cover the key concepts and methods used in modern Natural Language Processing (NLP). Throughout the course several core NLP tasks, such as sentiment analysis, information extraction, syntactic and semantic analysis, will be discussed. The course will emphasize machine-learning and data-driven algorithms and techniques, and will compare several different approaches to these problems in terms of their performance, supervision effort and computational complexity. Prerequisites: A background in linear algebra, calculus, statistics and probability, and completion of CS 57800 or equivalent are highly recommended. Strong programming skills in any modem language (Python, Java, C++) are required.

Learning Outcomes: 1. Describe and analyze the key challenges in dealing with natural language data and other fundamental areas of NLP. 2. Analyze and implement the key algorithms and techniques used in NLP. 3. Identify algorithmic techniques that can be applied to new problems and evaluate other possible solutions. 4. Conduct experiments using proper methodology for training and testing NLP systems using data. 5. Critically review current research work in the NLP field. Credits: 3.00

CS 59200 - Computer Science Seminar

Credit Hours: 3.00. A seminar course for in-depth exploration of a specific topic. Topics vary. Classes consist of both instructor and student presentations. Students read, present and discuss research papers, and may complete and present a research project in the area. For each offering, inclusion on a plan of study is determined by the CS Graduate Study Committee. If approved, may be included on a CS MS or PhD plan of study according to relevant ruleset.

Learning Outcomes: 1. Vary due to nature of

course. Credits: 3.00

CS 58500 - Theoretical Computer Science Toolkit

Credit Hours: 3.00. This course covers fundamental techniques and a range of mathematical tools that underlie today's research in theoretical computer science. The course material is essential for research in theoretical computer science as well as machine learning theory. The course is targeted at students who plan to pursue research in these areas. Topics will be chosen from four core areas: Convex Analysis and Optimization, Spectral Methods, Concentration Inequalities, and Discrete Fourier Analysis. Depending on student and instructor interest, additional topics will be chosen and may include applied analysis, coding theory, probabilistic proofs, and more advanced topics in discrete Fourier analysis. Students will read papers in theoretical computer science and machine learning theory using, exploring and extending the covered techniques and tools. Students are expected to be proficient in probability theory, have the maturity to follow and carry out basic analysis proofs, and have completed courses in calculus, linear algebra, discrete mathematics, and analysis of algorithms. More specifically, the course expects mastery of the material covered in Calculus III, Linear Algebra, Probability, Foundations of CS, and Analysis of Algorithms.

Learning Outcomes: 1. Explain and justify the merits and limitations of convex optimization algorithms. 2. Describe the characteristics and the role of convexity in optimization. 3. Formulate mathematically problems that have solutions based on convex optimization or matric analysis tools and analyze them effectively. 4. Predict typicality of the outcome in experiments. 5. Explain how to use and apply concentration bounds, including Chernoff-Hoeffding Bound, Martingales and Azuma's Inequality, and applications of the Talagrand inequality. 6. Develop precise mathematical formulation of problems and analyze using frameworks related to concentration of measure. 7. Apply Discrete Fourier Transform to determine properties of functions. 8. Explain why Fourier Analysis of Boolean Functions is a major tool in theoretical CS and describe application scenarios including property testing, cryptography, complexity, learning theory, pseudorandomness, hardness of approximation, and random graph theory. 9. Identify properties of functions based on the properties of their spectrum. 10. Explain the basic ideas underlying the tradeoff between the amount of redundancy used and the number of errors that can be corrected by a code. 11. Describe achieving the optimal tradeoff between redundancy and error correction for codes that come equipped with efficient encoding and decoding. 12. Illustrate how and why concatenated codes support the construction of asymptotically good codes. Credits: 3.00

CS 55600 - Data Security And Privacy

Credit Hours: 3.00. Data security and privacy is an important part of information security. This course provides an introduction to the fundamental principles and techniques for data security and privacy. The course covers fundamental theories of access control, discretionary access control, mandatory access control, and role-based access control, database access control approaches including grant revoke, virtual private databases and labelled databases, database encryption. On privacy, it covers data anonymization, re-identification attacks, definition, primitives, and applications of differential privacy.

Learning Outcomes: 1. Explain the limitation of discretionary access control and the impacts to security. (E,Q,W) 2. Explain the definition, enforcement, and challenges for multi-level security, including the Bell LaPadula model, non-interference, and covert channels. (E,Q,W) 3. Articulate integrity models (Biba and Clark-Wilson), and the difference between integrity and confidentiality. (E,Q,W) 4. Explain the main database security mechanism, including grant revoke model, content-based and context-based access control, virtual private databases, labelled databases, and data encryption. (E,Q,W) 5. Articulate the limitations of data anonymization for achieving privacy, and the strengths and limitations of privacy notions including differential privacy. (EQW) 6. Identify, implement, and deploy differential privacy mechanisms for problem settings. (P) Credits: 3.00

CS 55800 - Introduction To Robot Learning

Credit Hours: 3.00. Introduction To Robot Learning

Learning Outcomes: 1. Formulate the robot motion planning and control problems and solve them using standard tools. (W, P, E) 2. Identify the robot constraints, define their degree of freedom, and formulate their dynamical models for control. (W, P, E) 3. Apply classical and modern robot planning and control techniques to complex robot systems like manipulators, autonomous cars, etc. (W, P, E) 4. Identify limitations in existing classical robot algorithms and understand how to avoid the musing Machine Learning. (W, P) 5. Understand and apply Deep Reinforcement Learning approaches to complex robot systems. (W, P, E) 6. Evaluate and assess current best practices and mechanisms for robot programming. (W, P) 7. Develop a skill for robot programming from perception to low-level control using state-of-the art methods. (W, P) Credits: 3.00

CS 58700 - Foundations Of Deep Learning

Credit Hours: 3.00. This course provides an integrated view of the key concepts of deep learning (representation learning) methods. This course focuses on teaching principles and methods needed to design and deploy novel deep learning models, emphasizing the relationship between traditional statistical models, causality, invariant theory, and the algorithmic challenges of designing and deploying deep learning models in real-world applications. This course has both a theoretical and coding component. The course assumes familiarity with coding in the language used for state-of-the-art deep learning libraries, linear algebra, probability theory, and statistical machine learning. Credit Hours: 3.00. This course provides an integrated view of the key concepts of deep learning (representation learning) methods. This course has both a theoretical and coding component. The course assumes familiarity with coding in the language used for state-of-the-art deep learning libraries, linear algebra, probability theory, and statistical machine learning.

Learning Outcomes: 1. Understand statistical Foundations of Deep Learning. 2. Understand feedforward Networks. 3. Understand stochastic optimization of neural network models. 4. Understand Bayesian Neural Networks. 5. Understand invariant & Equivariant Representation Learning. 6. Understand task-invariant representations. 7. Understand meta Learning. 8. Understand multi-task Learning. 9. Understand transfer Learning. 10. Understand implicit generative models (probabilistic models without explicit likelihoods). 11. Understand variational Auto-Encoders. 12. Understand generative Adversarial Networks. 13. Understand stable Diffusion Generative models. 14. Understand how to evaluate the

performance of neural networks, as well as formulate and test hypotheses. 15. Understand how theory and algorithmic elements interact to impact performance. Credits: 3.00

CS 57800 - Statistical Machine Learning

Credit Hours: 3.00. This introductory course will cover many concepts, models, and algorithms in machine learning. Topics include classical supervised learning (e.g., regression and classification), unsupervised learning (e.g., principle component analysis and K-means), and recent development in the machine learning field such as variational Bayes, expectation propagation, and Gaussian processes. While this course will give students the basic ideas and intuition behind modern machine learning methods, the underlying theme in the course is probabilistic inference.

Learning Outcomes: 1. Learn the theory and key algorithms used in machine learning. 2. Get hands-on machine learning experience by implementing several algorithms, applying them to datasets and analyzing their performance. 3. Understand how to use machine learning methods to their research projects, formulate the learning tasks and match them with appropriate solutions. Credits: 3.00

CS 59000 - Topics In Computer Sciences

Credit Hours: 1.00 to 5.00. Directed study for students who wish to undertake individual reading and study on approved topics. Permission of instructor required.

Credits: 1.00 to 5.00

Non-CS Courses

BIOL 51700 - Molecular Biology: Proteins

Credit Hours: 2.00. Principles of protein three-dimensional architecture. The molecular and structural basis of protein folding, function, and evolution.

Credits: 2.00

BIOL 54100 - Molecular Genetics Of Bacteria

Credit Hours: 3.00. Advanced bacterial genetics, with emphasis on the use of genetics as a powerful and creative intellectual activity that enables us to discover biological functions and to construct new organisms by the manipulation of DNA. Major topics include: mutations, genetic selections, recombination, regulatory mechanisms, and genomic evolution.

Credits: 3.00

CHM 69600 - Special Topics In Chemistry

Credit Hours: 1.00 to 3.00. Lectures on selected topics of current interest.

Credits: 1.00 to 3.00

MA 51100 - Linear Algebra With Applications

Credit Hours: 3.00. Real and complex vector spaces; linear transformations; Gram-Schmidt process and projections; least squares; QR and LU factorization; diagonalization, real and complex spectral theorem; Schur triangular form; Jordan canonical form; quadratic forms.

Credits: 3.00

MA 51400 - Numerical Analysis

Credit Hours: 3.00. (CS 51400) Iterative methods for solving nonlinear; linear difference equations, applications to solution of polynomial equations; differentiation and integration formulas; numerical solution of ordinary differential equations; roundoff error bounds.

Credits: 3.00

MA 51800 - Advanced Discrete Mathematics

Credit Hours: 3.00. The course covers mathematics useful in analyzing computer algorithms. Topics include recurrence relations, evaluation of sums, integer functions, elementary number theory, binomial coefficients, generating functions, discrete probability, and asymptotic methods.

Credits: 3.00

MA 52000 - Boundary Value Problems Of Differential Equations

Credit Hours: 3.00. Separation of variables; Fourier series; boundary value problems; Fourier transforms; Bessel functions; Legendre polynomials.

Credits: 3.00

MA 52300 - Introduction To Partial Differential Equations

Credit Hours: 3.00. First order quasi-linear equations and their applications to physical and social sciences; the Cauchy-Kovalevsky theorem; characteristics, classification and canonical forms of linear equations; equations of mathematical physics; study of Laplace, wave and heat equations; methods of solution.

Credits: 3.00

MA 52500 - Introduction To Complex Analysis

Credit Hours: 3.00. Complex numbers and complex-valued functions of one complex variable; differentiation and contour integration; Cauchy's theorem; Taylor and Laurent series; residues; conformal mapping; applications. Not open to students with credit in MA 42500.

Credits: 3.00

MA 53200 - Elements Of Stochastic Processes

Credit Hours: 3.00. (STAT 53200) A basic course in stochastic models, including discrete and continuous time Markov chains and Brownian motion, as well as an introduction to topics such as Gaussian processes, queues, epidemic models, branching processes, renewal processes, replacement, and reliability problems.

Credits: 3.00

MA 58500 - Mathematical Logic I

Credit Hours: 3.00. Propositional and predicate calculus; the Gdel completeness and compactness theorem, primitive recursive and recursive functions; the Gdel incompleteness theorem; Tarski's theorem; Church's theorem; recursive undecidability; special topics such as nonstandard analysis.

Credits: 3.00

MA 59800 - Topics In Mathematics

Credit Hours: 1.00 to 5.00. Supervised reading courses as well as dual-level special topics courses are given under this number. Permission of instructor required.

Credits: 1.00 to 5.00

MA 61100 - Methods Of Applied Mathematics I

Credit Hours: 3.00. Banach and Hilbert spaces; linear operators; spectral theory of compact linear operators; applications to linear integral equations and to regular Sturm-Liouville problems for ordinary differential equations. Prerequisite: MA 51100, MA 54400.

Credits: 3.00

MA 61500 - Numerical Methods For Partial Differential Equations I

Credit Hours: 3.00. (CS 61500) Finite element method for elliptic partial differential equations; weak formulation; finite-dimensional approximations; error bounds; algorithmic issues; solving sparse linear systems; finite element method for parabolic partial differential equations; backward difference and Crank-Nicholson time-stepping; introduction to finite difference methods for elliptic, parabolic, and hyperbolic equations; stability, consistency, and convergence; discrete maximum principles. Prerequisite: MA 51400, MA 52300.

Credits: 3.00

STAT 51900 - Introduction To Probability

Credit Hours: 3.00. (MA 51900) Algebra of sets, sample spaces, combinatorial problems, independence, random variables, distribution functions, moment generating functions, special continuous and discrete distributions, distribution of a function of a random variable, limit theorems.

Credits: 3.00

STAT 52200 - Sampling And Survey Techniques

Credit Hours: 3.00. This course covers basic sampling design and analysis techniques. Sampling designs include: simple random, stratified, clustered, multi-staged, and systematic samples. Methods of estimation appropriate to design features and efficiency and costs related to sample design are covered.

Learning Outcomes: 1. Develop a basic understanding of probability and inferential theory underlying sampling statistics. 2. Understand and apply complex sample design features to sampling plans. 3. Apply proper statistical analyses to data collected using complex sample designs. 4. Interpret statistical estimates and tests. 5. Analyze data from complex samples using SAS, R, STATA or other software. Credits: 3.00

STAT 52600 - Advanced Statistical Methodology

Credit Hours: 3.00. As a sequel to STAT 52500, this course introduces statistical modeling tools for situations where standard least-squares techniques may not apply. This includes an extensive coverage of generalized linear models (GLM) for non-Gaussian responses, mixed effects models to describe correlated data, nonparametric regression, and lastly, parametric and nonparametric survival models for the analysis of (possibly censored) time-to-event data. Among issues to be discussed are the estimation of the models, the testing of hypotheses, and the checking of model adequacy. Data examples will be used throughout the course to illustrate the methodologies and the related software tools in R.

Learning Outcomes: 1. Understand the concepts and methods in generalized linear models, survival analysis, linear mixed models and GEE methods. 2. Apply these methods properly to real data using R, drawing valid

conclusions, and presenting the results concisely. Credits: 3.00

STAT 52800 - Introduction To Mathematical Statistics

Credit Hours: 3.00. The course introduces the fundamental frameworks of statistical theory, from which statistical methods can be derived. This includes the framework of data and statistical models, decision theory (risk functions, Bayes and minimax criteria), sufficient statistics, exponential distribution families, estimation methods, unbiased estimators and information inequality (Cramer-Rao), the Neyman-Pearson framework of hypothesis testing, monotone likelihood ratio families and likelihood ratio tests, and an introduction of asymptotic approximations. Students will need background in advanced calculus, linear algebra, probability, and some mathematical analysis.

Learning Outcomes: 1. Understand the framework of statistical models and be able to define a statistical model for a data analysis problem. 2. Use the decision theory to compare different data analysis methods. 3. Derive theoretical properties of some statistical methods. 4. Be able to justify some commonly used statistical methods through theory. Credits: 3.00

STAT 52900 - Applied Decision Theory And Bayesian Statistics

Credit Hours: 3.00. Bayesian and decision-theoretic formulation of problems; construction of utility functions and quantifications of prior information; methods of Bayesian decision and inference, with applications; empirical Bayes; combination of evidence; Bayesian design and sequential analysis; comparisons of statistical paradigms.

Credits: 3.00

STAT 53200 - Elements Of Stochastic Processes

Credit Hours: 3.00. (MA 53200) A basic course in stochastic models, including discrete and continuous time Markov chains and Brownian motion, as well as an introduction to topics such as Gaussian processes, queues, epidemic models, branching processes, renewal processes, replacement, and reliability problems.

Credits: 3.00

ECE 54700 - Introduction To Computer Communication Networks

Credit Hours: 3.00. A qualitative and quantitative study of the issues in design, analysis, and operation of computer communication and telecommunication networks as they evolve toward the integrated networks of the future, employing both packet and circuit switching technology. The course covers packet and circuit switching, the OSI standards architecture and protocols, elementary queuing theory for performance evaluation, random access techniques, local area networks, reliability and error recovery, and integrated networks.

Learning Outcomes: 1. Demonstrate an understanding of the fundamental principles underlying computer communication networks. [1,3,4;a,e] 2. Demonstrate an ability to obtain mathematical models of networking systems. [1,2,4;a,e] 3. Demonstrate an ability to perform queueing analysis of simpler queueing networks, convergence analysis of routing protocols, and stability analysis of random access mechanisms. [1,2,4;a,e,k] 4. Demonstrate an ability to solve simple network design and optimization problems to meet specifications in though put and delay. [1,4;a,c,e,k] 5. Demonstrate an ability to use simulation tools for network analysis and design. [1,3,4;a,c,e,k] Credits: 3.00

ECE 56300 - Programming Parallel Machines

Credit Hours: 3.00. This course presents methods and techniques for programming parallel computers, such as multicore and high-end parallel architectures. Various parallel algorithms will be presented to demonstrate different techniques for identifying parallel tasks and mapping them onto parallel machines. Realistic science/engineering applications and their characteristics will be discussed. Parallel architectures to be considered are shared-memory and distributed-memory multiprocessor systems. Programming paradigms for these machines will be compared, including directive-based (OpenMP), message passing (MPI) and thread-based (Posix threads) methods. Methodologies for analyzing and improving the performance of parallel programs will be discussed. There will be a class project in which each student parallelizes and tunes the performance of a large computation application or develops/improves a tool that helps this process. Each student will prepare one lecture for a selected topic. Offered during odd years.

Credits: 3.00

ECE 56500 - Computer Architecture

Credit Hours: 3.00. An introduction to the problems involved in

designing and analyzing current machine architectures. Major topics include performance and cost analysis, pipeline processing, vector machines and numerical applications, hierarchical memory design, and multiprocessor architectures. A quantitative approach allowing a computer system designer to determine the extent to which a design meets design goals is emphasized.

Credits: 3.00

ECE 57000 - Artificial Intelligence

Credit Hours: 3.00. Introduction to the basic concepts and various approaches of artificial intelligence. The first part of the course deals with heuristic search and shows how problems involving search can be solved more efficiently by the use of heuristics and how, in some cases, it is possible to discover heuristics automatically. The next part of the course presents ways to represent knowledge about the world and how to reason logically with that knowledge. The third part of the course introduces the student to advanced topics of AI drawn from machine learning, natural language understanding, computer vision, and reasoning under uncertainty. The emphasis of this part is to illustrate that representation and search are fundamental issues in all aspects of artificial intelligence.

Credits: 3.00

ECE 60000 - Random Variables And Signals

Credit Hours: 3.00. Engineering applications of probability theory. Problems on events, independence, random variables, distribution and density functions, expectations, and characteristic functions. Dependence, correlation, and regression; multivariate Gaussian distribution. Stochastic processes, stationarity, ergodicity, correlation functions, spectral densities, random inputs to linear systems; Gaussian processes. Prerequisite: Master's student standing or higher.

Learning Outcomes: 1. Problems on events, independence, random variables, distribution and density functions, expectations, and characteristic functions. 2. Dependence, correlation, and regression; multi-variate Gaussian distribution. 3. Stochastic processes, stationarity, ergodicity, correlation functions, spectral densities, random inputs to linear systems; Gaussian processes. Credits: 3.00

ECE 62900 - Introduction To Neural Networks

Credit Hours: 3.00. Information processing with neural networks, biological and engineering implications, learning algorithms, current neural network models and architectures, implementational topics, applications in areas such as signal/image processing, pattern recognition, optimization, simulation, system identification, nonlinear prediction, communications, and control. Concurrent prerequisite: ECE 60000 .

Credits: 3.00

ECE 63700 - Digital Image Processing I

Credit Hours: 3.00. Introduction to digital image processing techniques for enhancement, compression, restoration, reconstruction, and analysis. Lecture and experiments covering a wide range of topics. 2-D signals and systems, image analysis, and image segmentation. Achromatic vision, color image processing, color imaging systems, image sharpening, interpolation, decimation, linear and nonlinear filtering, printing and display of images. Image compression, image restoration, and tomography. Offered every third semester.

Credits: 3.00

ECE 66100 - Computer Vision

Credit Hours: 3.00. This course deals with how an autonomous or a semi-autonomous system can be endowed with visual perception. The issues discussed include: sampling from a topological standpoint; grouping processes; data structures, especially hierarchical types such as pyramids, quadtrees, octrees, etc.; graphic theoretic methods for structural description and consistent labeling; issues in 3-D vision such as object representation by Gaussian spheres, generalized cylinders, etc. Prerequisite: ECE 57000 .

Credits: 3.00

ECE 67300 - Distributed Computing Systems

Credit Hours: 3.00. Discussions of the design issues of distributed computing systems (DCS). The general theory of distributed transaction management, reliability, and resource management is discussed. Various algorithms and specification methodologies for DCS are introduced. A general coverage of the three major areas of DCS, namely: distributed operating systems, distributed databases, and distributed AI is provided. The discussion is augmented with various case studies. Prerequisite: ECE 46900 or introductory course in operating systems.

Credits: 3.00

IE 53500 - Linear Programming

Credit Hours: 3.00. Optimization of linear objective functions subject to linear constraints. Development of theory and algorithmic strategies for solving linear programming problems.

Credits: 3.00

IE 53800 - Nonlinear Optimization Algorithms And Models

Credit Hours: 3.00. Survey of computational tools for solving constrained and unconstrained nonlinear optimization problems. Emphasis on algorithmic strategies and characteristic structures of nonlinear problems.

Credits: 3.00

IE 58000 - Systems Simulation

Credit Hours: 3.00. Philosophy and elements of digital simulation language. Practical application of simulation to diverse systems. Computer simulation exercises and applications are required.

Credits: 3.00

IE 63500 - Theoretical Foundations Of Optimization

Credit Hours: 3.00. An advanced course in theoretical foundations of mathematical programming. Convex analysis, global and local duality and optimality, general algorithmic convergence. Offered in alternate years. Prerequisite: IE 53500 .

Credits: 3.00

IE 67400 - Cyber Methods For Advanced Production Control

Credit Hours: 3.00. The study of the theoretical foundation and relevance of advanced cyber methods in the planning and control of intelligent production operations; manufacturing operating systems; synchronization in decentralized systems; recovery in decentralized systems; parallel processing; distributed databases; factory networks; reasoning and logic for production control. Prerequisite: IE 57400 or 57500 or 57900.

Learning Outcomes: 1. Know theoretical foundation and relevance of advanced cyber, real-time control, computing, communication, and brain models for robotics. 2. Know automation of planning and decisions in distributed production and supply installations, global supply, logistics, and service systems/networks. 3. Know the current and emerging functions, algorithms, protocols, and models and how to apply them to research projects and presentations in the field. Credits: 3.00

LING 59300 - Special Topics In Semantics

Credit Hours: 3.00. Investigation of an advanced topic in semantics. Topic varies from semester to semester. Permission of instructor required.

Credits: 3.00

STAT 54600 - Computational Statistics

Credit Hours: 3.00. The course focuses on two fundamental aspects in computational statistics: (1) what to compute and (2) how to compute. The first is covered with a brief review of advanced topics in statistical inference, including Fisher's fiducial inference, Bayesian and frequenstist methods, and the Dempster-Shafer (DS) Theory. The second is discussed in detail by examining exact, approximation, and interactive simulation methods for statistical inference with a variety of commonly used statistical models. The emphasis is on the EM-type and quasi-Newton algorithms, numerical differentiation and integration, and Markov chain Monte Carlo methods.

Learning Outcomes: 1. Master commonly used numerical matrix operations, including the sweep operator, Cholesky decomposition, eigenvalue decomposition, and single value decomposition. 2. Understand statistical thinking in development of interactive numerical methods. 3. Apply optimization algorithms such as quasi-Newton and conjugate gradient methods. 4. Implement EM-type algorithms for maximum likelihood estimation when expanded complete-data models are available, including commonly used statistical models. 5. Create random number generators. 6. Implement the Gibbs sampler and Metropolis-Hastings algorithms for Bayesian data analysis. Credits: 3.00

STAT 59800 - Topics In Statistical Methods

Credit Hours: 0.00 to 6.00 (West Lafayette, IUPUI) 1.00 to 3.00 (North Central). Directed study and reports for students who wish to undertake individual reading and study on approved topics. Permission of instructor required.

Credits: 0.00 to 6.00

STAT 69500 - Seminar In Mathematical Statistics

Credit Hours: 1.00 to 3.00. Topics vary. Permission of instructor required.

Credits: 1.00 to 3.00

ECE 51012 - Electromechanics

Credit Hours: 3.00. The general theory of electromechanical motion devices relating electric variables and electromagnetic forces. The basic concepts and operational behavior of dc, induction, brushless dc, and stepper motors used in control applications are presented. Prerequisite by Topic: Basic circuit analysis; Elementary electromagnetics; Elementary mechanics.

Learning Outcomes: 1. Acquire knowledge of magnetics and magnetic materials as it relates to electromechanical devices. 2. Understand the energy conversion process including field energy, co-energy, force and torque production. 3. Be familiar with the use in reference frame theory in the analysis of rotational electromechanical devices. 4. Understand the operation of rotating electric machines including stepper motors, permanent magnet ac machine, and induction machines. 5. Understand the acceptable and unacceptable practice with regard to taking exams, working on homework, working on the project, and the implications of unacceptable practices. Credits: 3.00

ECE 60872 - Reliable And Secure Computer Systems

Credit Hours: 3.00. The course provides an introduction to the hardware and software methodologies for specifying, modeling and designing fault-tolerant systems supported by case studies of real systems. The material presents a broad spectrum of hardware and software error detection and recovery techniques that can be used to build reliable networked systems. The lectures discuss how the hardware and software techniques interplay, what techniques can be provided in COTS hardware, what can be embedded into operating system and network communication layers, and what can be provided via a distributed software layer and in the application itself. Prerequisite by Topic: Any one high level programming language experience; A basic background in probability.

Learning Outcomes: 1. Formulate design principles for dependable systems. 2. Analyze mathematically a system for its dependability properties. 3. Understand and apply hardware dependability techniques. 4. Understand and apply software dependability techniques. 5. Understand and apply networking dependability techniques. 6. Design, develop, and present an innovative project on dependable systems. Credits: 3.00

MA 57500 - Graph Theory

Credit Hours: 3.00. Introduction to graph theory with applications.

Credits: 3.00

ME 53500 - Design And Modeling Of Fluid Power Systems

Credit Hours: 3.00. Introduction to fluid power technology. Design of hydraulic systems for mobile and industrial application for functionality, cost and energy efficiency. Modeling strategies for fluid power systems. Labs and class projects are given to reinforce the design and modeling learning projects.

Learning Outcomes: 1. Interpret and design hydraulic systems according to ISO standard of representation. 2. Describe the principle of operation of basic components such as pumps, motors, hydraulic control valves, pipes, linear actuators (cylinders) and recognize the technologies available for each component. 3. Model the operation of hydraulic components through lumped or distributed numerical approaches. 4. Discuss the features of the hydraulic control technologies commonly available for mobile machinery and industrial applications, particularly in terms of cost, functionality and energy consumption. 5. Formulate, design, simulate and present the most energy efficient solution for the hydraulic control system of a fluid power application, given the functional requirements. Credits: 3.00

CS Courses

CS 50200 - Compiling And Programming Systems

Credit Hours: 3.00. Basic principles of compilers and compiler design; control of translation, loading, and execution; symbolic coding systems; lexical and syntactic analysis, design and operation of assemblers and macroprocessors; design of interpretive systems. Students are expected to complete a large programming project as part of the course.

Learning Outcomes: 1. Deeper understanding of the syntactic rules and the functionality of modern programming languages, as well as the use of the compiler for enhancing program

quality. 2. Opportunity to practice the implementation of certain key components in the compiler front-end and back-end. Credits: 3.00

CS 50500 - Distributed Systems

Credit Hours: 3.00. Foundations for building reliable distributed systems, including failure and system models, and basic communication and agreement problems; crash failures, recovery, partition, Byzantine failures; asynchronous systems, failure detectors, communication channels, wireless and sensor networks; software clocks, causality, and cuts. Examples of problems include reliable broadcast consensus, leader election, group communication, and replication. Permission of department required.

Credits: 3.00

CS 51400 - Numerical Analysis

Credit Hours: 3.00. (MA 51400) Alternative methods for solving nonlinear equations; linear difference equations, applications to solution of polynomial equations; differentiation and integration formulas; numerical solution of ordinary differential equations; roundoff error bounds.

Credits: 3.00

CS 52000 - Computational Methods In Optimization

Credit Hours: 3.00. A treatment of numerical algorithms and software for optimization problems with a secondary emphasis on linear and nonlinear systems of equations: unconstrained and constrained optimization; line search methods; trust region methods; Quasi-Newton methods; linear programming; calculating derivatives; quadratic programming; global optimization, including simulated annealing.

Credits: 3.00

CS 52500 - Parallel Computing

Credit Hours: 3.00. Parallel computing for science and engineering applications: parallel programming and performance evaluation, parallel libraries and problem-solving environments, models of parallel computing and run-time support systems, and selected applications.

Credits: 3.00

CS 53000 - Introduction To Scientific Visualization

Credit Hours: 3.00. Teaches the fundamentals of scientific visualization and prepares students to apply these techniques in fields such as astronomy, biology, chemistry, engineering, and physics. Emphasis is on the representation of scalar, vector, and tensor fields; data sampling and resampling; and reconstruction using multivariate finite elements (surfaces, volumes, and surfaces on surfaces).

Learning Outcomes: 1. Learn basic notions of human vision and color perception that inform the design of effective visual representations. 2. Know different models of color perception and understand their connection to the anatomy of the visual system. 3. Be familiar with several color spaces and know their perceptual properties. 4. Know how to devise effective color scales suitable for different data mapping needs. 5. Learn the data structures and data reconstruction techniques that are needed to create continuous visual representations of discrete simulation or experimental datasets. 6. Be familiar with the main grid types used in numerical simulations, know what data structures can be used to represent them in memory, and the associated footprint. 7. Know various data interpolation methods and understand their relationship with grid topology. 8. Know how to efficiently solve the point location problem, whereby the cell must be determined that encloses an arbitrary spatial location. 9. Learn the main visualization techniques for scalar, vector, and tensor datasets. Credits: 3.00

CS 53600 - Data Communication And Computer Networks

Credit Hours: 3.00. Data communications: communication hardware technologies including local area and longhaul network hardware, circuit and packet switching, interfaces between computer and network hardware, and performance issues. Network architecture: protocol software and conceptual layering, reliable delivery over an unreliable channel, transport protocols, virtual circuits, datagrams, internetworking as a fundamental design concept, the client-server paradigm, naming and name binding, name servers, addressing and address resolution, routing and routing algorithms, congestion and flow control techniques, network file systems, distribution of computation, and DARPA internet protocols (TCP/IP) as examples of protocol organization.

Learning Outcomes: 1. Network services and applications, including DNS and HTTP . 2. The

socket API . 3. Network transport architectures, TCP, UDP and TCP congestion control. 4. Routing and forwarding, intra-domain and inter-domain routing algorithms. Credits: 3.00

CS 55500 - Cryptography

Credit Hours: 3.00. (CSCI 55500) Concepts and principles of cryptography and data security. Cryptography (secret codes): principles of secrecy systems; classical cryptographic systems, including Vigenere and Vernam ciphers; the Data Encryption Standard (DES); public-key encryption; privacy-enhanced email; digital signatures. Proprietary software protection; information theory and number theory; complexity bounds on encryption; key escrow; traffic analysis; attacks against encryption; basic legal issues; e-commerce; and the role of protocols.

Credits: 3.00

CS 56500 - Programming Languages

Credit Hours: 3.00. An exploration of modern or unconventional concepts of programming languages, their semantics, and their implementations; abstract data types; axiomatic semantics using Hoare's logic and Dijkstra's predicate transformers; denotational semantics; functional, object-oriented, and logic programming; concurrency and Owicki-Gries theory. Example languages include ML, Ada, Oberon, LISP, PROLOG, and CSP.

Credits: 3.00

CS 57300 - Data Mining

Credit Hours: 3.00. (CSCI 57300) Data Mining has emerged at the confluence of artificial intelligence, statistics, and databases as a technique for automatically discovering summary knowledge in large datasets. This course introduces students to the process and main techniques in data mining, including classification, clustering, and pattern mining approaches. Data mining systems and applications are also covered, along with selected topics in current research. Offered in alternate years.

Learning Outcomes: 1. Learn Data mining techniques. 2. Learn how to summarize large data sets. 3. Learn current research topics.

Credits: 3.00

CS 58000 - Algorithm Design, Analysis, And Implementation

Credit Hours: 3.00. Basic techniques for designing and analyzing algorithms: dynamic programming, divide and conquer, balancing. Upper and lower bounds on time and space costs, worst case and expected cost measures. A selection of applications such as disjoint set union/find, graph algorithms, search trees, pattern matching. The polynomial complexity classes P, NP, and co-NP; intractable problems.

Credits: 3.00

CS 58400 - Theory Of Computation And Computational Complexity

Credit Hours: 3.00. The theory of general purpose programming systems. Recursive and partial-recursive functions; recursive and recursively enumerable sets. The Church-Turing thesis. The recursion theorem, Rogers' translation theorem, Rice's undecidability theorem. The general theory of computational complexity: there are no general solutions to natural optimization problems. Complexity for specific models of computation: the polynomial complexity classes P, NP, and PSPACE; NP-hard and PSPACE-hard problems, inherently exponential problems.

Credits: 3.00

CS 59100 - Seminar

Credit Hours: 1.00. A weekly seminar presented by faculty and invited speakers, normally in a specific area.

Credits: 1.00

CS 61500 - Numerical Methods For Partial Differential Equations I

Credit Hours: 3.00. (MA 61500) Finite element method for elliptic partial differential equations; weak formulation; finite-dimensional approximations; error bounds; algorithmic issues; solving sparse linear systems; finite element method for parabolic partial differential equations; backward difference and Crank-Nicolson time-stepping; introduction to finite difference methods for elliptic, parabolic, and hyperbolic equations; stability, consistency, and convergence; discrete maximum principles. Prerequisite: CS 51400, MA 52300.

Credits: 3.00

CS 63500 - Capturing And Rendering Real-World Scenes

Credit Hours: 3.00. Advanced techniques for automated modeling and visualization of complex environments, such as rooms, buildings, urban scenes, and landscapes. Topics covered are at the confluence of computer graphics, computer vision and engineering, and include: capture technologies, acquisition device calibration, view registration, panoramic images, 3D reconstruction from images, view morphing, 3D image warping, lightfield modeling and rendering, visual hulls, point-based modeling and rendering, view dependent texture mapping, and application development issues and examples. Prerequisite: CS 58000 , CS 53500 or a solid foundation in computer graphics, programming proficiency in C or C++ and basic linear algebra.

Credits: 3.00

CS 65500 - Advanced Cryptology

Credit Hours: 3.00. Advanced topics in cryptography and cryptanalysis, including selections from the following: Steganographic methods, Cryptanalytic techniques, including differential cryptanalysis, and chosen plaintext attacks. Message digest algorithm construction. Digital cash. Quantum cryptography. N-key systems. Minimal and zero-knowledge systems. Protocol design and failure. Verification of algorithms. Key generation and management. Traffic analysis. VPN construction and operation. Politics, espionage, and law enforcement concerns. Offered every third semester. Prerequisite: CS 52600 , CS 55500 .

Credits: 3.00

CS 52700 - Software Security

Credit Hours: 3.00. This course focuses on software security fundamentals, secure coding guidelines and principles, and advanced software security concepts. Students will learn to assess and understand threats, learn how to design and implement secure software systems, and get hands-on experience with common security pitfalls. Restricted to CS MS and CS PHD students. Significant programming experience and skills are required to complete the labs and projects.

Learning Outcomes: 1. Explain the top 20 most common weaknesses in software security (CWE top 20) and understand how such problems can be avoided in software. 2. Know limitations of existing defense mechanisms and how to overcome them. 3. Explain and identify common security threats, risks, and attack vectors for software systems. 4. Evaluate and assess current security best practices and defense mechanisms for current software systems. 5. Identify security problems in source code and binaries, assess the associated risks, and reason about their severity and exploitability. 6. Assess the security of given source code or applications. Credits: 3.00

CS 52800 - Network Security

Credit Hours: 3.00. The course focuses on the principles and foundations of building secure network systems and on security and privacy challenges in existing and emerging networks. The course compares and analyzes network architectures and network protocols from the physical layer to the access control, network, transport and application layer from an adversarial standpoint to understand how to build more secure protocols that can withstand attacks. Restricted to CS MS and CS PHD students. Significant programming experience and skills are required to complete the projects.

Learning Outcomes: 1. Describe the different categories of network threats and attacks. 2. Examine the strengths and weaknesses of security technologies at each layer of the network protocol stack. 3. Identify the appropriate defense mechanism(s) and its (their) limitations, given a network threat. 4. Demonstrate the ability to discuss security properties, limitations, and threats in wireless networks and emerging technologies. 5. Demonstrate the ability to summarize defenses against network censorship, and network anonymity and privacy protocols. Credits: 3.00

CS 52300 - Social, Economic, And Legal Aspects Of Security

Credit Hours: 3.00. This course focuses on social, legal, and economic aspects of information security and privacy, also including ethics, policies, and human behavioral issues. The course covers the interactions between non-technological aspects of information security as well as relevant technological aspects. It focuses on how non-technological facets can inform and guide technological choices, and how technological choices can enhance or detract from the broader organizational and societal goals.

Learning Outcomes: 1. Identify and describe the legal, organizational, and financial ramifications of security-related design and management decisions. 2. Explain how to respond to a security incident, including recovery and cleanup, damage assessment, forensics and the handling of digital evidence so that it is admissible in court, and satisfying government requirements on the reporting of the incident. 3. Identify, evaluate and assess the risks faced by an organization, and their impact and consequences should they materialize (including liability, reputational damage, disruption to operations, loss of customers). Recommend effective and appropriate measures to mitigate those risks. 4. Explain the

role of incentives in information security, and be capable of evaluating and modifying an organizational and reward structure so that it better aligns the interests of employees with those of the organization. 5. Ensure compliance with privacy and data protection laws. Detect and remedy practices that have potential to give rise to violations of these laws. 6. Identify major national laws that affect the practice of information security and explain potential interactions. 7. Evaluate and improve an e-policy's in security and privacy aspects. Credits: 3.00

CS 57700 - Natural Language Processing

Credit Hours: 3.00. This course will cover the key concepts and methods used in modern Natural Language Processing (NLP). Throughout the course several core NLP tasks, such as sentiment analysis, information extraction, syntactic and semantic analysis, will be discussed. The course will emphasize machine-learning and data-driven algorithms and techniques, and will compare several different approaches to these problems in terms of their performance, supervision effort and computational complexity. Prerequisites: A background in linear algebra, calculus, statistics and probability, and completion of CS 57800 or equivalent are highly recommended. Strong programming skills in any modem language (Python, Java, C++) are required.

Learning Outcomes: 1. Describe and analyze the key challenges in dealing with natural language data and other fundamental areas of NLP. 2. Analyze and implement the key algorithms and techniques used in NLP. 3. Identify algorithmic techniques that can be applied to new problems and evaluate other possible solutions. 4. Conduct experiments using proper methodology for training and testing NLP systems using data. 5. Critically review current research work in the NLP field. Credits: 3.00

CS 59200 - Computer Science Seminar

Credit Hours: 3.00. A seminar course for in-depth exploration of a specific topic. Topics vary. Classes consist of both instructor and student presentations. Students read, present and discuss research papers, and may complete and present a research project in the area. For each offering, inclusion on a plan of study is determined by the CS Graduate Study Committee. If approved, may be included on a CS MS or PhD plan of study according to relevant ruleset.

Learning Outcomes: 1. Vary due to nature of course. Credits: 3.00

CS 58500 - Theoretical Computer Science Toolkit

Credit Hours: 3.00. This course covers fundamental techniques and a range of mathematical tools that underlie today's research in theoretical computer science. The course material is essential for research in theoretical computer science as well as machine learning theory. The course is targeted at students who plan to pursue research in these areas. Topics will be chosen from four core areas: Convex Analysis and Optimization, Spectral Methods, Concentration Inequalities, and Discrete Fourier Analysis. Depending on student and instructor interest, additional topics will be chosen and may include applied analysis, coding theory, probabilistic proofs, and more advanced topics in discrete Fourier analysis. Students will read papers in theoretical computer science and machine learning theory using, exploring and extending the covered techniques and tools. Students are expected to be proficient in probability theory, have the maturity to follow and carry out basic analysis proofs, and have completed courses in calculus, linear algebra, discrete mathematics, and analysis of algorithms. More specifically, the course expects mastery of the material covered in Calculus III, Linear Algebra, Probability, Foundations of CS, and Analysis of Algorithms.

Learning Outcomes: 1. Explain and justify the merits and limitations of convex optimization algorithms. 2. Describe the characteristics and the role of convexity in optimization. 3. Formulate mathematically problems that have solutions based on convex optimization or matric analysis tools and analyze them effectively. 4. Predict typicality of the outcome in experiments. 5. Explain how to use and apply concentration bounds, including Chernoff-Hoeffding Bound, Martingales and Azuma's Inequality, and applications of the Talagrand inequality. 6. Develop precise mathematical formulation of problems and analyze using frameworks related to concentration of measure. 7. Apply Discrete Fourier Transform to determine properties of functions. 8. Explain why Fourier Analysis of Boolean Functions is a

major tool in theoretical CS and describe application scenarios including property testing, cryptography, complexity, learning theory, pseudorandomness, hardness of approximation, and random graph theory. 9. Identify properties of functions based on the properties of their spectrum. 10. Explain the basic ideas underlying the tradeoff between the amount of redundancy used and the number of errors that can be corrected by a code. 11. Describe achieving the optimal tradeoff between redundancy and error correction for codes that come equipped with efficient encoding and decoding. 12. Illustrate how and why concatenated codes support the construction of asymptotically good codes. Credits: 3.00

CS 55600 - Data Security And Privacy

Credit Hours: 3.00. Data security and privacy is an important part of information security. This course provides an introduction to the fundamental principles and techniques for data security and privacy. The course covers fundamental theories of access control, discretionary access control, mandatory access control, and role-based access control, database access control approaches including grant revoke, virtual private databases and labelled databases, database encryption. On privacy, it covers data anonymization, re-identification attacks, definition, primitives, and applications of differential privacy.

Learning Outcomes: 1. Explain the limitation of discretionary access control and the impacts to security. (E,Q,W) 2. Explain the definition, enforcement, and challenges for multi-level security, including the Bell LaPadula model, non-interference, and covert channels. (E,Q,W) 3. Articulate integrity models (Biba and Clark-Wilson), and the difference between integrity and confidentiality. (E,Q,W) 4. Explain the main database security mechanism, including grant revoke model, content-based and context-based access control, virtual private databases, labelled databases, and data encryption. (E,Q,W) 5. Articulate the limitations of data anonymization for achieving privacy, and the strengths and limitations of privacy notions including differential privacy. (EQW) 6. Identify, implement, and deploy differential privacy mechanisms for problem settings. (P) Credits: 3.00

CS 55800 - Introduction To Robot Learning

Credit Hours: 3.00. Introduction To Robot Learning

Learning Outcomes: 1. Formulate the robot motion planning and control problems and solve them using standard tools. (W, P, E) 2. Identify the robot constraints, define their degree of freedom, and formulate their dynamical models for control. (W, P, E) 3. Apply classical and modern robot planning and control techniques to complex robot systems like manipulators, autonomous cars, etc. (W, P, E) 4. Identify limitations in existing classical robot algorithms and understand how to avoid the musing Machine Learning. (W, P) 5. Understand and apply Deep Reinforcement Learning approaches to complex robot systems. (W, P, E) 6. Evaluate and assess current best practices and mechanisms for robot programming. (W, P) 7. Develop a skill for robot programming from perception to low-level control using state-of-the art methods. (W, P) Credits: 3.00

CS 58700 - Foundations Of Deep Learning

Credit Hours: 3.00. This course provides an integrated view of the key concepts of deep learning (representation learning) methods. This course focuses on teaching principles and methods needed to design and deploy novel deep learning models, emphasizing the relationship between traditional statistical models, causality, invariant theory, and the algorithmic challenges of designing and deploying deep learning models in real-world applications. This course has both a theoretical and coding component. The course assumes familiarity with coding in the language used for state-of-the-art deep learning libraries, linear algebra, probability theory, and statistical machine learning. Credit Hours: 3.00. This course provides an integrated view of the key concepts of deep learning (representation learning) methods. This course focuses on teaching principles and methods needed to design and deploy novel deep learning models, emphasizing the relationship between traditional statistical models, causality, invariant theory,

and the algorithmic challenges of designing and deploying deep learning models in real-world applications. This course has both a theoretical and coding component. The course assumes familiarity with coding in the language used for state-of-the-art deep learning libraries, linear algebra, probability theory, and statistical machine learning.

Learning Outcomes: 1. Understand statistical Foundations of Deep Learning. 2. Understand feedforward Networks. 3. Understand stochastic optimization of neural network models. 4. Understand Bayesian Neural Networks. 5. Understand invariant & Equivariant Representation Learning. 6. Understand task-invariant representations. 7. Understand meta Learning. 8. Understand multi-task Learning. 9. Understand transfer Learning. 10. Understand implicit generative models (probabilistic models without explicit likelihoods). 11. Understand variational Auto-Encoders. 12. Understand generative Adversarial Networks. 13. Understand stable Diffusion Generative models. 14. Understand how to evaluate the performance of neural networks, as well as formulate and test hypotheses. 15. Understand how theory and algorithmic elements interact to impact performance. Credits: 3.00

CS 57800 - Statistical Machine Learning

Credit Hours: 3.00. This introductory course will cover many concepts, models, and algorithms in machine learning. Topics include classical supervised learning (e.g., regression and classification), unsupervised learning (e.g., principle component analysis and K-means), and recent development in the machine learning field such as variational Bayes, expectation propagation, and Gaussian processes. While this course will give students the basic ideas and intuition behind modern machine learning methods, the underlying theme in the course is probabilistic inference.

Learning Outcomes: 1. Learn the theory and key algorithms used in machine learning. 2. Get hands-on machine learning experience by implementing several algorithms, applying them to datasets and analyzing their performance. 3. Understand how to use machine learning methods to their research projects, formulate the learning tasks and match them with appropriate solutions. Credits: 3.00

CS 59000 - Topics In Computer Sciences

Credit Hours: 1.00 to 5.00. Directed study for students who wish to undertake individual reading and study on approved topics. Permission of instructor required.

Credits: 1.00 to 5.00

Specialization: Information and Cybersecurity (30 credits)

Required Courses (12 credits)

CS 52600 - Information Security

Credit Hours: 3.00. (CSCI 52600) Basic notions of confidentiality, integrity, availability; authentication models;

protection models; security kernels; secure programming; audit; intrusion detection and response; operational security issues; physical security issues; personnel security; policy formation and enforcement; access controls; information flow; legal and social issues; identification and authentication in local and distributed systems; classification and trust modeling; and risk assessment.

Credits: 3.00

CS 55500 - Cryptography

Credit Hours: 3.00. (CSCI 55500) Concepts and principles of cryptography and data security. Cryptography (secret codes): principles of secrecy systems; classical cryptographic systems, including Vigenere and Vernam ciphers; the Data Encryption Standard (DES); public-key encryption; privacy-enhanced email; digital signatures. Proprietary software protection; information theory and number theory; complexity bounds on encryption; key escrow; traffic analysis; attacks against encryption; basic legal issues; e-commerce; and the role of protocols.

Credits: 3.00

CS 50010 - Foundational Principles Of Information Security

Credit Hours: 3.00. This course covers foundational principles relevant to information security including data structures, algorithm design, computational complexity, probability theory, number theory, and basics of cryptography. This course is restricted to CS graduate students. This course is required for students in the Master of Science in Computer Science Concentration in Information Security for Professionals Program. The course may not be used on the Plan of Study for any CS graduate students other than those in the Concentration in Information Security for Professionals program. Programming experience and computer science knowledge equivalent to that of a minor in CS. Incoming students are expected to have programming skills in at least one procedural programming languages, e.g., C,C++,Java, or Python.

Learning Outcomes: 1. Identify and explain the basic data structures. 2. Identify and explain algorithm design techniques. 3. Explain computational complexity and decidability concepts and their relevance to information security. 4. Apply basic probability tools to analyze problems involving uncertainty and randomness. 5. Explain basic concepts of modular arithmetic and their application to cryptography. Credits: 3.00

CS 50011 - Introduction To Systems For Information Security

Credit Hours: 3.00. The course covers computer systems principles relevant to information security and it serves as a prerequisite for the later courses in the MS in IS program. The material includes features in the C/C++ programming languages for understanding security-critical software vulnerabilities, basic knowledge in computer architecture and assembly languages, knowledge of the compiling process, operating systems, networking, databases, and web applications relevant to information security. This course is restricted to CS graduate students. This course is required for students in the Master of Science in Computer Science Concentration in Information Security for Professionals Program. The course may not be used on the Plan of Study for any CS graduate students other than those in the Concentration in Information Security for Processionals program. Programming experience and computer science knowledge equivalent to that of a minor in CS. Incoming students are expected to have programming skills in at least one procedural programming languages, e.g., C,C++,Java, or Python.

Learning Outcomes: 1. Understand C/C++ code with security-relevant features such as pointers, string operations, function pointers, dynamic memory allocation, etc., laying the foundations for understanding software vulnerabilities in C/C++. 2. Explain common programming errors in C/C++ programs. 3. Explain how C/C++ programs are compiled into assembly and how call stack works in function calls, laying the foundation for understanding stack based buffer overflow. 4. Explain basic concepts in computer architecture, such as instruction set, assembly code, CPU modes, registers, MMU, paging. 5. Explain basic concepts in operating systems, such as processes, system calls, virtual memory, file system structure. 6. Explain basic concepts in networking, databases, and web applications. Credits: 3.00

Selectives (12 credits)

CS 52700 - Software Security

Credit Hours: 3.00. This course focuses on software security fundamentals, secure coding guidelines and principles, and advanced software security concepts. Students will learn to assess and understand threats, learn how to design and implement secure software systems, and get hands-on experience with common security pitfalls. Restricted to CS MS and CS PHD students. Significant programming experience and

skills are required to complete the labs and projects.

Learning Outcomes: 1. Explain the top 20 most common weaknesses in software security (CWE top 20) and understand how such problems can be avoided in software. 2. Know limitations of existing defense mechanisms and how to overcome them. 3. Explain and identify common security threats, risks, and attack vectors for software systems. 4. Evaluate and assess current security best practices and defense mechanisms for current software systems. 5. Identify security problems in source code and binaries, assess the associated risks, and reason about their severity and exploitability. 6. Assess the security of given source code or applications. Credits: 3.00

CS 52800 - Network Security

Credit Hours: 3.00. The course focuses on the principles and foundations of building secure network systems and on security and privacy challenges in existing and emerging networks. The course compares and analyzes network architectures and network protocols from the physical layer to the access control, network, transport and application layer from an adversarial standpoint to understand how to build more secure protocols that can withstand attacks. Restricted to CS MS and CS PHD students. Significant programming experience and skills are required to complete the projects.

Learning Outcomes: 1. Describe the different categories of network threats and attacks. 2. Examine the strengths and weaknesses of security technologies at each layer of the network protocol stack. 3. Identify the appropriate defense mechanism(s) and its (their) limitations, given a network threat. 4. Demonstrate the ability to discuss security properties, limitations, and threats in wireless networks and emerging technologies. 5. Demonstrate the ability to summarize defenses against network censorship, and network anonymity and privacy protocols. Credits: 3.00

CS 52300 - Social, Economic, And Legal Aspects Of Security

Credit Hours: 3.00. This course focuses on social, legal, and economic aspects of information security and privacy, also including ethics, policies, and human behavioral issues. The course covers the interactions between non-technological aspects of information security as well as relevant technological aspects. It focuses on how non-technological facets can inform and guide technological choices, and how technological choices can enhance or detract from the broader organizational and societal goals.

Learning Outcomes: 1. Identify and describe the legal, organizational, and financial ramifications of security-related design and management decisions. 2. Explain how to respond to a security incident, including recovery and cleanup, damage assessment, forensics and the handling of digital evidence so that it is admissible in court, and satisfying government requirements on the reporting of the incident. 3. Identify, evaluate and assess the risks faced by an organization, and their impact and consequences should they materialize (including liability, reputational damage, disruption to operations, loss of customers). Recommend effective and appropriate measures to mitigate those risks. 4. Explain the role of incentives in information security, and be capable of evaluating and modifying an organizational and reward structure so that it better aligns the interests of employees with those of the organization. 5. Ensure compliance with privacy and data protection laws. Detect and remedy practices that have potential to give rise to violations of these laws. 6. Identify major national laws that affect the practice of information security and explain potential interactions. 7. Evaluate and improve an e-policy's in security and privacy aspects. Credits: 3.00

CS 52900 - Security Analytics

Credit Hours: 3.00. This course focuses on applied data mining, machine learning, data analytics techniques, and their application and relevance in information security. The course covers basic concepts of data mining and machine learning, computation platforms in support of big data analytics including Map-Reduce and Spark, machine learning algorithms such as

classification trees, logistic regression, naive Bayes, k Nearest Neighbors, Support Vector Machines, Artificial Neural Networks (including Feed Forward, Convolutional, and Recurrence), the application of these algorithms to security tasks such as Spam/Phishing detection, malware detection, intrusion detection, and situational awareness. The future and potential role of applying machine learning techniques in information and data security is explored.

Learning Outcomes: 1. Explain commonly used machine learning algorithms relevant to information security; identity their strengths and weaknesses, and illustrate their relevance through examples. 2. Identify security problems that can be solved by using machine learning (including deep learning) techniques. 3. Explain the concepts of artificial neural networks, including feed forward networks, convolutional neural networks, and recurrent neural networks. 4. Deploy machine learning algorithms (including artificial neural networks) using software such as NumPy, SciPy, and TensorFlow. 5. Apply Spark and HDFS to perform data analysis. 6. Apply machine learning algorithms to security problems. 7. Assess the effectiveness of applying data analytics techniques to different security problems and explain existing shortcomings of ML techniques. 8. Explain what type of data visualization can be effective for security problems (e.g., in fraud detection). 9. Explain the concept of adversarial machine learning and the common attacks/defenses. Credits: 3.00

CS 55600 - Data Security And Privacy

Credit Hours: 3.00. Data security and privacy is an important part of information security. This course provides an introduction to the fundamental principles and techniques for data security and privacy. The course covers fundamental theories of access control, discretionary access control, mandatory access control, and role-based access control, database access control approaches including grant revoke, virtual private databases and labelled databases, database encryption. On privacy, it covers data anonymization, re-identification attacks, definition, primitives, and applications of differential privacy.

Learning Outcomes: 1. Explain the limitation of discretionary access control and the impacts to security. (E,Q,W) 2. Explain the definition, enforcement, and challenges for multi-level security, including the Bell LaPadula model, non-interference, and covert channels. (E,Q,W) 3. Articulate integrity models (Biba and Clark-Wilson), and the difference between integrity and confidentiality. (E,Q,W) 4. Explain the main database security mechanism, including grant revoke model, content-based and context-based access control, virtual private databases, labelled databases, and data encryption. (E,Q,W) 5. Articulate the limitations of data anonymization for achieving privacy, and the strengths and limitations of privacy notions including differential privacy. (EQW) 6. Identify, implement, and deploy differential privacy mechanisms for problem settings. (P) Credits: 3.00

Electives (6 credits)

Required Courses (12 credits)

CS 52600 - Information Security

Credit Hours: 3.00. (CSCI 52600) Basic notions of confidentiality, integrity, availability; authentication models; protection models; security kernels; secure programming; audit; intrusion detection and response; operational security issues; physical security issues; personnel security; policy formation and enforcement; access controls; information flow; legal and social issues; identification and authentication in local and distributed systems; classification and trust modeling; and risk assessment.

Credits: 3.00

CS 55500 - Cryptography

Credit Hours: 3.00. (CSCI 55500) Concepts and principles of cryptography and data security. Cryptography (secret codes): principles of secrecy systems; classical cryptographic systems, including Vigenere and Vernam ciphers; the Data Encryption Standard (DES); public-key encryption; privacy-enhanced email; digital signatures. Proprietary software protection; information theory and number theory; complexity bounds on encryption; key escrow; traffic analysis; attacks against encryption; basic legal issues; e-commerce; and the role of protocols.

Credits: 3.00

CS 50010 - Foundational Principles Of Information Security

Credit Hours: 3.00. This course covers foundational principles relevant to information security including data structures, algorithm design, computational complexity, probability theory, number theory, and basics of cryptography. This course is restricted to CS graduate students. This course is required for students in the Master of Science in Computer Science Concentration in Information Security for Professionals Program. The course may not be used on the Plan of Study for any CS graduate students other than those in the Concentration in Information Security for Professionals program. Programming experience and computer science knowledge equivalent to that of a minor in CS. Incoming students are expected to have programming skills in at least one procedural programming languages, e.g., C,C++,Java, or Python.

Learning Outcomes: 1. Identify and explain the basic data structures. 2. Identify and explain algorithm design techniques. 3. Explain computational complexity and decidability concepts and their relevance to information security. 4. Apply basic probability tools to analyze problems involving uncertainty and randomness. 5. Explain basic concepts of modular arithmetic and their application to cryptography. Credits: 3.00

CS 50011 - Introduction To Systems For Information Security

Credit Hours: 3.00. The course covers computer systems principles relevant to information security and it serves as a prerequisite for the later courses in the MS in IS program. The material includes features in the C/C++ programming languages for understanding security-critical software vulnerabilities, basic knowledge in computer architecture and assembly languages, knowledge of the compiling process, operating systems, networking, databases, and web applications relevant to information security. Explain basic concepts in operating systems, such as processes, system calls, virtual memory, file system structure. 6. Explain basic concepts in networking, databases, and web applications. Credits: 3.00

Thesis Research (6 credits)

CS 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. The student is expected to follow safe research practices, to follow ethical research practices, to maintain communication with the instructor, to formulate a set of reasonable semester research progress milestones with instructor, optionally in writing. Permission of instructor required.

Credits: 1.00 to 18.00

Required Courses (21 credits)

Core Courses (9 credits)

CS 50200 - Compiling And Programming Systems

Credit Hours: 3.00. Basic principles of compilers and compiler design; control of translation, loading, and execution; symbolic coding systems; lexical and syntactic analysis, design and operation of assemblers and macroprocessors; design of interpretive systems. Students are expected to complete a large programming project as part of the course.

Learning Outcomes: 1. Deeper understanding of the syntactic rules and the functionality of modern programming languages, as well as the

use of the compiler for enhancing program quality. 2. Opportunity to practice the implementation of certain key components in the compiler front-end and back-end. Credits: 3.00

CS 50300 - Operating Systems

Credit Hours: 3.00. Basic principles of operating systems: addressing modes, indexing, relative addressing, indirect addressing, stack maintenance; implementation of multitask systems; control and coordination of tasks, deadlocks, synchronization, mutual exclusion; storage management, segmentation, paging, virtual memory; protection, sharing, access control; file systems; resource management; evaluation and prediction of performance. Students are expected to spend at least three hours per week gaining hands-on experience in using and modifying a small operating system.

Credits: 3.00

CS 53600 - Data Communication And Computer Networks

Credit Hours: 3.00. Data communications: communication hardware technologies including local area and longhaul network hardware, circuit and packet switching, interfaces between computer and network hardware, and performance issues. Network architecture: protocol software and conceptual layering, reliable delivery over an unreliable channel, transport protocols, virtual circuits, datagrams, internetworking as a fundamental design concept, the client-server paradigm, naming and name binding, name servers, addressing and address resolution, routing and routing algorithms, congestion and flow control techniques, network file systems, distribution of computation, and DARPA internet protocols (TCP/IP) as examples of protocol organization.

Learning Outcomes: 1. Network services and applications, including DNS and HTTP . 2. The socket API . 3. Network transport architectures, TCP, UDP and TCP congestion control. 4. Routing and forwarding, intra-domain and inter-domain routing algorithms. Credits: 3.00

CS 56500 - Programming Languages

Credit Hours: 3.00. An exploration of modern or unconventional concepts of programming languages, their semantics, and their implementations; abstract data types; axiomatic semantics using Hoare's logic and Dijkstra's predicate transformers; denotational semantics; functional, object-oriented, and logic programming; concurrency and Owicki-Gries theory. Example languages include ML, Ada, Oberon, LISP, PROLOG, and CSP.

Credits: 3.00

CS 58000 - Algorithm Design, Analysis, And Implementation

Credit Hours: 3.00. Basic techniques for designing and analyzing algorithms: dynamic programming, divide and conquer, balancing. Upper and lower bounds on time and space costs, worst case and expected cost measures. A selection of applications such as disjoint set union/find, graph algorithms, search trees, pattern matching. The polynomial complexity classes P, NP, and co-NP; intractable problems.

Credits: 3.00

CS 63600 - Internetworking

Credit Hours: 3.00. Principles of Internetwork architecture and communication protocols underlying interoperable systems. Topics include universal interconnection, Internet addressing and routing, address binding, control of Internet congestion and flow, examples of Internet protocol suites (TCP/IP and XNS), round trip time estimation, naming and name resolution, Internet applications programs, and the ISO/OSI model. Prerequisite: CS 50300 .

Credits: 3.00

CS 63800 - Multimedia Networking And Operating Systems

Credit Hours: 3.00. For graduate students in computer sciences who have a background in networking and operating systems and are interested in research in networked multimedia systems. The course consists of a selection of networking and operating system topics for realizing high performance, predictable, scalable, flexible, and secure multimedia systems. Topics may vary to reflect timely research issues and the current interests of the instructor(s). Students are expected to complete a term project. Presentations also may be required. Undergraduate background in computer science required. Prerequisite: CS 53600 or CS 50300 .

Credits: 3.00

CS 56000 - Reasoning About Programs

Credit Hours: 3.00. The course focuses on the logical foundations and algorithmic techniques used to ensure program correctness. With an emphasis on automated program verification and synthesis, the course covers classical concepts and techniques such as Hoare logic, abstract interpretation, abstraction-refinement and bounded model checking. The course also exposes students to approaches for program synthesis, a new frontier for program reasoning, such as inductive synthesis, synthesis using version space algebras, constraint-based synthesis and synthesis based on machine-learning techniques. The courses emphasizes both theoretical foundations as well as hands-on experience with verification/synthesis tools and SAT/SMT solvers. Students are

expected to have completed undergraduate coursework in Foundations of Computer Science (CS 18200) or equivalent, Systems Programming (CS 25200) or equivalent, and Introduction to the Analysis of Algorithms (CS 38100) or equivalent. Mathematical maturity is expected.

Learning Outcomes: 1. Express the expected behavior of programs in logic. 2. Able to manually reason about satisfiability and validity of formulas in first-order logic (modulo theories). 3. Use SAT/SMT solvers to check satisfiability and validity of formulas in first-order logic (modulo theories). 4. Specify properties of programs using pre/postconditions, safety properties and assertions in first-order logic (modulo theories). 5. Describe and apply core approaches for program verification. 6. Explain and apply Hoare logic, invariant generation, abstract interpretation, abstraction-refinement, and bounded model checking. 7. Ability to verify programs using tools such as Dafny and the Z3 SMT solver. 8. Conduct original research in program synthesis. 9. Explain and apply inductive synthesis and functional synthesis, different search techniques (enumerative, explicit, constraint-based), and some recent approaches based on machine learning. 10. Choose and apply appropriate synthesis techniques to a problem domain of their choice. 11. Ability to critically review and present current research in program synthesis. Credits: 3.00

CS 58800 - Randomized Algorithms

Credit Hours: 3.00. The area of randomized algorithms has grown from being a tool in computational number theory to finding widespread application in algorithms in all areas of computer science. Two practical benefits of randomization are its simplicity and speed. Deep and important computational complexity connections have been developed, from bridging the gap between discrete and continuous optimization, bypassing deterministic barriers in online settings, summarizing massive data in polylogarithmic space, probabilistically checkable proofs, privacy enhancing techniques, modeling the web and other large networks, and sparsifying and compressing complicated combinatorial structures such as graphs. Randomization is an essential key ingredient in the algorithmic breakthroughs today and in the future. This course presents the basic concepts in the design and analysis of randomized algorithms and shows how to apply them to algorithms for a wide range of problems. The course covers a broad range of problems benefitting from randomized computation including data structures, graph algorithms, online algorithms, geometric algorithms, streaming algorithms, derandomization techniques, and tools for probabilistic analysis of algorithms.

Learning Outcomes: 1. Describe the main principles underlying the design and analysis of a randomized algorithm. 2. Explain concepts of randomized algorithms used in specific domains; e.g., graph-theory, number theory, and linear algebra problems. 3. Apply measure concentration results from probability theory to analyze a given randomized algorithm. 4. Determine the running times, failure probabilities, and accuracy guarantees of a randomized algorithm. 5. Apply learned design techniques and analysis tools to design and analyze new randomized algorithms. 6. Explain material from published research in the area of randomized algorithms using field-specific language. Credits: 3.00

CS 55100 - Cloud Computing Fundamentals

Credit Hours: 3.00. A comprehensive course that investigates all aspects of cloud computing, including: cloud data centers and infrastructure (equipment for processing, storage, communication, and special-purpose facilities); the use of virtualized servers (virtual machines and containers), virtualized storage (Storage Area Networks, Network Attached Storage, object storage), and virtual networks; automation; orchestration systems, such as Kubernetes; programming paradigms used to construct cloud-native software, such as MapReduce, microservices, controllerbased computing, and serverless computing; edge computing; security and privacy in cloud systems; software models. The course emphasizes researching new ways to use cloud computing and research into new ways to design and build cloud systems. The course includes a project. Students should have completed coursework in or have equivalent familiarity with operating systems and computer networks.

Learning Outcomes: 1. Identify underlying cloud facilities and infrastructure features. 2. Assess and compare algorithms and architectures used to design cloud-native software systems. 3.

Plan, implement, and deploy cloud-native software systems that use available technologies. 4. Articulate the scientific and technical principles that led to cloud computing. 5. Devise measurements and evaluate the performance of cloud systems. Credits: 3.00

Selectives (12 credits)

CS 50500 - Distributed Systems

Credit Hours: 3.00. Foundations for building reliable distributed systems, including failure and system models, and basic communication and agreement problems; crash failures, recovery, partition, Byzantine failures; asynchronous systems, failure detectors, communication channels, wireless and sensor networks; software clocks, causality, and cuts. Examples of problems include reliable broadcast consensus, leader election, group communication, and replication. Permission of department required.

Credits: 3.00

CS 51000 - Software Engineering

Credit Hours: 3.00. Software life cycles, requirements engineering, software design, design of distributed systems, verification and validation, software architecture, process metrics and models, and research methods in software engineering.

Credits: 3.00

CS 51400 - Numerical Analysis

Credit Hours: 3.00. (MA 51400) Alternative methods for solving nonlinear equations; linear difference equations, applications to solution of polynomial equations; differentiation and integration formulas; numerical solution of ordinary differential equations; roundoff error bounds.

Credits: 3.00

CS 51500 - Numerical Linear Algebra

Credit Hours: 3.00. Direct and iterative solvers of dense and sparse linear systems of equations, numerical schemes for handling symmetric algebraic eigenvalue problems, and the singular-value decomposition and its applications in linear least squares problems.

Learning Outcomes: 1. Become knowledgeable about major kernels and algorithms underlying matrix computations for dense and sparse matrices including linear systems of equation, symmetric eigenvalue problems, and the singular-value decomposition. 2. Be able to implement basic versions of these kernels and algorithms. 3. Learn about the difference between direct and iterative methods for linear systems. 4. Gain expertise in the design of iterative methods and preconditioning techniques for large-scale sparse linear systems. 5. Be able to implement eigenvalue and singular-value problem solvers. Credits: 3.00

CS 52000 - Computational Methods In Optimization

Credit Hours: 3.00. A treatment of numerical algorithms and software for optimization problems with a secondary emphasis on linear and nonlinear systems of equations: unconstrained and constrained optimization; line search methods; trust region methods; Quasi-Newton methods; linear programming; calculating derivatives; quadratic programming; global optimization, including simulated annealing.

Credits: 3.00

CS 52500 - Parallel Computing

Credit Hours: 3.00. Parallel computing for science and engineering applications: parallel programming and performance evaluation, parallel libraries and problem-solving environments, models of parallel computing and run-time support systems, and selected applications.

Credits: 3.00

CS 52600 - Information Security

Credit Hours: 3.00. (CSCI 52600) Basic notions of confidentiality, integrity, availability; authentication models; protection models; security kernels; secure programming; audit; intrusion detection and response; operational security issues; physical security issues; personnel security; policy formation and enforcement; access controls; information flow; legal and social issues; identification and authentication in local and distributed systems; classification and trust modeling; and risk assessment.

Credits: 3.00

CS 53000 - Introduction To Scientific Visualization

Credit Hours: 3.00. Teaches the fundamentals of scientific visualization and prepares students to apply these techniques in fields such as astronomy, biology, chemistry, engineering, and

physics. Emphasis is on the representation of scalar, vector, and tensor fields; data sampling and resampling; and reconstruction using multivariate finite elements (surfaces, volumes, and surfaces on surfaces).

Learning Outcomes: 1. Learn basic notions of human vision and color perception that inform the design of effective visual representations. 2. Know different models of color perception and understand their connection to the anatomy of the visual system. 3. Be familiar with several color spaces and know their perceptual properties. 4. Know how to devise effective color scales suitable for different data mapping needs. 5. Learn the data structures and data reconstruction techniques that are needed to create continuous visual representations of discrete simulation or experimental datasets. 6. Be familiar with the main grid types used in numerical simulations, know what data structures can be used to represent them in memory, and the associated footprint. 7. Know various data interpolation methods and understand their relationship with grid topology. 8. Know how to efficiently solve the point location problem, whereby the cell must be determined that encloses an arbitrary spatial location. 9. Learn the main visualization techniques for scalar, vector, and tensor datasets. Credits: 3.00

CS 53100 - Computational Geometry

Credit Hours: 3.00. Computational geometry studies how to compute with and reason about geometric objects. The subject is playing an increasingly important role in computer graphics, game software, geometric modeling, geographic information systems, and many other applications. Course topics include convex hull, segment manipulations, triangulations, range searching, Voronoi diagrams, window queries, Delaunay triangulation, and duality. Some key algorithms are implemented. Questions of floating-point accuracy and robust algorithm design are considered throughout the course.

Credits: 3.00

CS 53500 - Interactive Computer Graphics

Credit Hours: 3.00. The principles of computer graphics and interactive graphical methods for problem solving. Emphasis placed on both development and use of graphical tools for various display devices. Several classes of graphics hardware considered in detail. Topics include pen plotting, storage tubes, refresh, dynamic techniques, three dimensions, color, modeling of geometry, and hidden surface removal. Part of the laboratory involves use of an interactive minicomputer graphics system. Knowledge of programming required.

Learning Outcomes: 1. Learn the algorithms underlying the interactive graphics pipeline, including algorithms for geometric modeling, projection, rasterization, shading, lighting, texture mapping, projective texture mapping, shadow mapping, and environment mapping. 2. Gain experience implementing the interactive graphics pipeline through projects. 3. Gain initial experience programming Graphics Processing units through shaders. 4. Learn and implement algorithms for advanced rendering techniques. Credits: 3.00

CS 54100 - Database Systems

Credit Hours: 3.00. Fundamentals for the logical design of database systems. The entity-relationship model, semantic model, relational model, hierarchical model, network model. Implementations of the models. Design theory for relational databases. Design of query languages and the use of semantics for query optimization. Design and verification of integrity assertions, and security. Introduction to intelligent query processing and database machines.

Credits: 3.00

CS 54200 - Distributed Database Systems

Credit Hours: 3.00. Fundamental issues in distributed database systems that are motivated by the computer networking and distribution of processors and databases. The theory, design, specification, implementation, and performance of distributed database systems.

Credits: 3.00

CS 54300 - Introduction To Simulation And Modeling Of Computer Systems

Credit Hours: 3.00. Simulation: discrete event simulation, process oriented simulation, generating random numbers, simulation languages, simulation examples of complex systems. Nondeterministic models: random variables, Poisson process, moment generating functions, statistical inference and data analysis. Modeling: elementary queuing models, networks of

queues, applications to performance evaluation of computer systems.

Credits: 3.00

CS 54701 - Information Retrieval

Credit Hours: 3.00. Basic principles and practical algorithms used for information retrieval and text mining: statistical characteristics of text, several important retrieval models, text categorization, recommendation system, clustering, federated text search, link analysis, etc.

Learning Outcomes: 1. Learn the theories and techniques behind Web search engines, E-commerce recommendation systems, etc. 2. Get hands on project experience by developing real-world applications, such as intelligent tools for improving search accuracy from user feedback, email spam detection, recommendation system, or scientific literature organization and mining. 3. Learn tools and techniques to do cutting-edge research in the area of information retrieval or text mining. Credits: 3.00

CS 55500 - Cryptography

Credit Hours: 3.00. (CSCI 55500) Concepts and principles of cryptography and data security. Cryptography (secret codes): principles of secrecy systems; classical cryptographic systems, including Vigenere and Vernam ciphers; the Data Encryption Standard (DES); public-key encryption; privacy-enhanced email; digital signatures. Proprietary software protection; information theory and number theory; complexity bounds on encryption; key escrow; traffic analysis; attacks against encryption; basic legal issues; e-commerce; and the role of protocols.

Credits: 3.00

CS 57300 - Data Mining

Credit Hours: 3.00. (CSCI 57300) Data Mining has emerged at the confluence of artificial intelligence, statistics, and databases as a technique for automatically discovering summary knowledge in large datasets. This course introduces students to the process and main techniques in data mining, including classification, clustering, and pattern mining approaches. Data mining systems and applications are also covered, along with selected topics in current research. Offered in alternate years.

Learning Outcomes: 1. Learn Data mining techniques. 2. Learn how to summarize large data sets. 3. Learn current research topics.

Credits: 3.00

CS 57900 - Bioinformatics Algorithms

Credit Hours: 3.00. Review of Genomes, DNA, RNA, proteins, proteomes. Biological Sequences: dynamic programming; pairwise global, local, and semi-global alignments of genes and proteins; constant, affine, and general gap penalties; RNA alignments; BLOSUM and PAM scoring matrices. Multiple alignment of proteins: approximation algorithms; iterative and progressive alignment methods. Database search for sequences: BLAST and variants. Phylogenetic Trees: distance-based methods, ultrametric and additive distance functions; parsimony, and maximum likelihood methods. Whole Genome Alignment: suffix trees and suffix arrays. Systems Biology: Module discovery in biological networks, spectral algorithms for graph clustering. Network alignment: quadratic programming formulations and graph matching. Genetic Variation: haplotype inference, the perfect phylogeny problem and chordal graphs. Additional topics such as next-generation sequencing, analysis of multidimensional data from flow cytometry, and gene expression data, if time permits.

Learning Outcomes: 1. Students will learn how to design algorithms. 2. Students will learn how to solve computational problems from the new biology, the data-rich field that biological sciences is becoming. Credits: 3.00

CS 58400 - Theory Of Computation And Computational Complexity

Credit Hours: 3.00. The theory of general purpose programming systems. Recursive and partial-recursive functions; recursive and recursively enumerable sets. The Church-Turing thesis. The recursion theorem, Rogers' translation theorem, Rice's undecidability theorem. The general theory of computational complexity: there are no general solutions to natural optimization problems. Complexity for specific models of computation: the polynomial complexity classes P, NP, and PSPACE; NP-hard and PSPACE-hard problems, inherently exponential problems.

Credits: 3.00

CS 61500 - Numerical Methods For Partial Differential Equations I

Credit Hours: 3.00. (MA 61500) Finite element method for elliptic partial differential equations; weak formulation; finite-dimensional approximations; error bounds; algorithmic issues; solving sparse linear systems; finite element method for parabolic partial differential equations; backward difference and Crank-Nicolson time-stepping; introduction to finite difference methods for elliptic, parabolic, and hyperbolic equations; stability, consistency, and convergence; discrete maximum

principles. Prerequisite: CS 51400, MA 52300.

Credits: 3.00

CS 62600 - Advanced Information Assurance

Credit Hours: 3.00. Advanced topics in information assurance, including selections from the following: penetration testing, formal verification of systems, formal models of information flow and protection, distributed system authentication, protocol design and attack, computer viruses and malware, intrusion and anomaly detection models, multi-level security, active defenses, investigation and forensics, network firewalls, anonymity and identity, e-commerce support, and database security models and mechanisms. Offered every third semester. Prerequisite: CS 52600 , CS 55500 .

Credits: 3.00

CS 64100 - Multimedia Database Systems

Credit Hours: 3.00. Prepares students for research in multimedia database systems. Students are exposed to a variety of emerging innovative techniques to store, manipulate, communicate, visualize, and reason with multimedia systems. Prerequisite: CS 54100 or CS 54200 .

Credits: 3.00

CS 65500 - Advanced Cryptology

Credit Hours: 3.00. Advanced topics in cryptography and cryptanalysis, including selections from the following: Steganographic methods, Cryptanalytic techniques, including differential cryptanalysis, and chosen plaintext attacks. Message digest algorithm construction. Digital cash. Quantum cryptography. N-key systems. Minimal and zero-knowledge systems. Protocol design and failure. Verification of algorithms. Key generation and management. Traffic analysis. VPN construction and operation. Politics, espionage, and law enforcement concerns. Offered every third semester. Prerequisite: CS 52600 , CS 55500 .

Credits: 3.00

CS 52700 - Software Security

Credit Hours: 3.00. This course focuses on software security fundamentals, secure coding guidelines and principles, and advanced software security concepts. Students will learn to assess and understand threats, learn how to design and implement secure software systems, and get hands-on experience with common security pitfalls. Restricted to CS MS and CS PHD students. Significant programming experience and skills are required to complete the labs and projects.

Learning Outcomes: 1. Explain the top 20 most common weaknesses in software security (CWE top 20) and understand how such problems can be avoided in software. 2. Know limitations of existing defense mechanisms and how to overcome them. 3. Explain and identify common security threats, risks, and attack vectors for software systems. 4. Evaluate and assess current security best practices and defense mechanisms for current software systems. 5. Identify security problems in source code and binaries, assess the associated risks, and reason about their severity and exploitability. 6. Assess the security of given source code or applications. Credits: 3.00

CS 52800 - Network Security

Credit Hours: 3.00. The course focuses on the principles and foundations of building secure network systems and on security and privacy challenges in existing and emerging networks. The course compares and analyzes network architectures and network protocols from the physical layer to the access control, network, transport and application layer from an adversarial standpoint to understand how to build more secure protocols that can withstand attacks. Restricted to CS MS and CS PHD students. Significant programming experience and skills are required to complete the projects.

Learning Outcomes: 1. Describe the different categories of network threats and attacks. 2. Examine the strengths and weaknesses of security technologies at each layer of the network protocol stack. 3. Identify the appropriate defense mechanism(s) and its (their) limitations, given a network threat. 4. Demonstrate the ability to discuss security properties, limitations, and threats in wireless networks and emerging technologies. 5. Demonstrate the ability to summarize defenses against network censorship, and network anonymity and privacy protocols. Credits: 3.00

CS 57700 - Natural Language Processing

Credit Hours: 3.00. This course will cover the key concepts and methods used in modern Natural Language Processing (NLP). Throughout the course several core NLP tasks, such as sentiment analysis, information extraction, syntactic and semantic analysis, will be discussed. The course will emphasize machine-learning and data-driven algorithms and techniques,

and will compare several different approaches to these problems in terms of their performance, supervision effort and computational complexity. Prerequisites: A background in linear algebra, calculus, statistics and probability, and completion of CS 57800 or equivalent are highly recommended. Strong programming skills in any modem language (Python, Java, C++) are required.

Learning Outcomes: 1. Describe and analyze the key challenges in dealing with natural language data and other fundamental areas of NLP. 2. Analyze and implement the key algorithms and techniques used in NLP. 3. Identify algorithmic techniques that can be applied to new problems and evaluate other possible solutions. 4. Conduct experiments using proper methodology for training and testing NLP systems using data. 5. Critically review current research work in the NLP field. Credits: 3.00

CS 57100 - Artificial Intelligence

Credit Hours: 3.00. Artificial Intelligence (AI) systems are increasingly being deployed in many real-world tasks. This course provides an introduction to the fundamental principles and applications of AI. The course covers classic material including search-based methods, probabilistic reasoning, game playing, decision making, exact and approximate inference, causal learning, and reinforcement learning as well as selected advanced topics. The focus of the course is on foundational methods and current techniques for building AI systems that exhibit 'intelligent' behavior and can 'learn' from experience. The course assumes students are familiar with basic concepts in analysis, linear algebra, optimization, discrete mathematics, elementary probability, statistics, data structures, and algorithms. Students are expected to have good programming and software development skills and have a working knowledge of Python and Java.

Learning Outcomes: 1. Assess and explain the applicability, strengths, and weaknesses of the basic knowledge representation, problem-solving, and learning methods in solving a particular problem. (E,W) 2. Predict the behavior and estimate the cost (in time and space) of different heuristic and optimal search methods, and choose the appropriate method for particular problems. (W,P) 3. Develop small logic-based, rule-based, and search-based systems; be able to predict performance characteristics. (P) 4. Predict the behavior of basic machine-learning methods, and choose the appropriate method for particular problems. (W,P) 5. Communicate critical key issues in AI-related to knowledge representation, problem-solving, and learning for a specific problem. (W) 6. Propose, evaluate, and implement effective solutions to problems requiring AI techniques. (P) 7. Articulate key problems, both technical and philosophical, in the development of artificial intelligence systems. (E,W) Credits: 3.00

CS 55600 - Data Security And Privacy

Credit Hours: 3.00. Data security and privacy is an important part of information security. This course provides an introduction to the fundamental principles and techniques for data security and privacy. The course covers fundamental theories of access control, discretionary access control, mandatory access control, and role-based access control, database access control approaches including grant revoke, virtual private databases and labelled databases, database encryption. On privacy, it covers data anonymization, re-identification attacks, definition, primitives, and applications of differential privacy.

Learning Outcomes: 1. Explain the limitation of discretionary access control and the impacts to security. (E,Q,W) 2. Explain the definition, enforcement, and challenges for multi-level security, including the Bell LaPadula model, non-interference, and covert channels. (E,Q,W) 3. Articulate integrity models (Biba and Clark-Wilson), and the difference between integrity and confidentiality. (E,Q,W) 4. Explain the main database security mechanism, including grant revoke model, content-based and context-based access control, virtual private databases, labelled databases, and data encryption. (E,Q,W) 5. Articulate the limitations of data anonymization for achieving privacy, and the strengths and limitations of privacy notions including differential privacy. (EQW) 6. Identify, implement, and deploy differential privacy mechanisms for problem settings. (P) Credits:

3.00

CS 57800 - Statistical Machine Learning

Credit Hours: 3.00. This introductory course will cover many concepts, models, and algorithms in machine learning. Topics include classical supervised learning (e.g., regression and classification), unsupervised learning (e.g., principle component analysis and K-means), and recent development in the machine learning field such as variational Bayes, expectation propagation, and Gaussian processes. While this course will give students the basic ideas and intuition behind modern machine learning methods, the underlying theme in the course is probabilistic inference.

Learning Outcomes: 1. Learn the theory and key algorithms used in machine learning. 2. Get hands-on machine learning experience by implementing several algorithms, applying them to datasets and analyzing their performance. 3. Understand how to use machine learning methods to their research projects, formulate the learning tasks and match them with appropriate solutions. Credits: 3.00

Core Courses (9 credits)

CS 50200 - Compiling And Programming Systems

Credit Hours: 3.00. Basic principles of compilers and compiler design; control of translation, loading, and execution; symbolic coding systems; lexical and syntactic analysis, design and operation of assemblers and macroprocessors; design of interpretive systems. Students are expected to complete a large programming project as part of the course.

Learning Outcomes: 1. Deeper understanding of the syntactic rules and the functionality of modern programming languages, as well as the use of the compiler for enhancing program quality. 2. Opportunity to practice the implementation of certain key components in the compiler front-end and back-end. Credits: 3.00

CS 50300 - Operating Systems

Credit Hours: 3.00. Basic principles of operating systems: addressing modes, indexing, relative addressing, indirect addressing, stack maintenance; implementation of multitask systems; control and coordination of tasks, deadlocks, synchronization, mutual exclusion; storage management, segmentation, paging, virtual memory; protection, sharing, access control; file systems; resource management; evaluation and prediction of performance. Students are expected to spend at least three hours per week gaining hands-on experience in using and modifying a small operating system.

Credits: 3.00

CS 53600 - Data Communication And Computer Networks

Credit Hours: 3.00. Data communications: communication hardware technologies including local area and longhaul network hardware, circuit and packet switching, interfaces between computer and network hardware, and performance issues. Network architecture: protocol software and conceptual layering, reliable delivery over an unreliable channel, transport protocols, virtual circuits, datagrams, internetworking as a fundamental design concept, the client-server paradigm, naming and name binding, name servers, addressing and address resolution, routing and routing algorithms, congestion and flow control techniques, network file systems, distribution of computation, and DARPA internet protocols (TCP/IP) as examples of protocol organization.

Learning Outcomes: 1. Network services and applications, including DNS and HTTP . 2. The socket API . 3. Network transport architectures, TCP, UDP and TCP congestion control. 4. Routing and forwarding, intra-domain and inter-domain routing algorithms. Credits: 3.00

CS 56500 - Programming Languages

Credit Hours: 3.00. An exploration of modern or unconventional concepts of programming languages, their semantics, and their implementations; abstract data types; axiomatic semantics using Hoare's logic and Dijkstra's predicate transformers; denotational semantics; functional, object-oriented, and logic programming; concurrency and Owicki-Gries theory. Example languages include ML, Ada, Oberon, LISP, PROLOG, and CSP.

Credits: 3.00

CS 58000 - Algorithm Design, Analysis, And Implementation

Credit Hours: 3.00. Basic techniques for designing and analyzing algorithms: dynamic programming, divide and conquer, balancing. Upper and lower bounds on time and space costs, worst case and expected cost measures. A selection of applications such as disjoint set union/find, graph algorithms, search trees, pattern matching. The polynomial complexity classes P, NP, and co-NP; intractable problems.

Credits: 3.00

CS 63600 - Internetworking

Credit Hours: 3.00. Principles of Internetwork architecture and communication protocols underlying interoperable systems. Topics include universal interconnection, Internet addressing and routing, address binding, control of Internet congestion and flow, examples of Internet protocol suites (TCP/IP and XNS), round trip time estimation, naming and name resolution, Internet applications programs, and the ISO/OSI model. Prerequisite: CS 50300 .

Credits: 3.00

CS 63800 - Multimedia Networking And Operating Systems

Credit Hours: 3.00. For graduate students in computer sciences who have a background in networking and operating systems and are interested in research in networked multimedia systems. The course consists of a selection of networking and operating system topics for realizing high performance, predictable, scalable, flexible, and secure multimedia systems. Topics may vary to reflect timely research issues and the current interests of the instructor(s). Students are expected to complete a term project. Presentations also may be required. Undergraduate background in computer science required. Prerequisite: CS 53600 or CS 50300 .

Credits: 3.00

CS 56000 - Reasoning About Programs

Credit Hours: 3.00. The course focuses on the logical foundations and algorithmic techniques used to ensure program correctness. With an emphasis on automated program verification and synthesis, the course covers classical concepts and techniques such as Hoare logic, abstract interpretation, abstraction-refinement and bounded model checking. The course also exposes students to approaches for program synthesis, a new frontier for program reasoning, such as inductive synthesis, synthesis using version space algebras, constraint-based synthesis and synthesis based on machine-learning techniques. The courses emphasizes both theoretical foundations as well as hands-on experience with verification/synthesis tools and SAT/SMT solvers. Students are expected to have completed undergraduate coursework in Foundations of Computer Science (CS 18200) or equivalent, Systems Programming (CS 25200) or equivalent, and Introduction to the Analysis of Algorithms (CS 38100) or equivalent. Mathematical maturity is expected.

Learning Outcomes: 1. Express the expected behavior of programs in logic. 2. Able to manually reason about satisfiability and validity of formulas in first-order logic (modulo theories). 3. Use SAT/SMT solvers to check satisfiability and validity of formulas in first-order logic (modulo theories). 4. Specify properties of programs using pre/postconditions, safety properties and assertions in first-order logic (modulo theories). 5. Describe and apply core approaches for program verification. 6. Explain and apply Hoare logic, invariant generation, abstract interpretation, abstraction-refinement, and bounded model checking. 7. Ability to verify programs using tools such as Dafny and the Z3 SMT solver. 8. Conduct original research in program synthesis. 9. Explain and apply inductive synthesis and functional synthesis, different search techniques (enumerative, explicit, constraint-based), and some recent approaches based on machine learning. 10. Choose and apply appropriate synthesis techniques to a problem domain of their choice. 11. Ability to critically review and present current research in program synthesis. Credits: 3.00

CS 58800 - Randomized Algorithms

Credit Hours: 3.00. The area of randomized algorithms has grown from being a tool in computational number theory to finding widespread application in algorithms in all areas of computer science. Two practical benefits of randomization are its simplicity and speed. Deep and important computational complexity connections have been developed, from bridging the gap between discrete and continuous optimization, bypassing deterministic barriers in online settings, summarizing massive data in polylogarithmic space, probabilistically checkable proofs, privacy enhancing techniques, modeling the web and other large networks, and sparsifying and compressing complicated combinatorial structures such as graphs. Randomization is an essential key ingredient in the algorithmic breakthroughs today and in the future. This course presents the basic concepts in the design and analysis of randomized algorithms and shows how to apply them to algorithms for a wide range of problems. The course covers a broad range of problems benefitting from randomized computation including data structures, graph algorithms, online algorithms, geometric algorithms, streaming algorithms, derandomization techniques, and tools for probabilistic analysis of algorithms.

Learning Outcomes: 1. Describe the main principles underlying the design and analysis of

a randomized algorithm. 2. Explain concepts of randomized algorithms used in specific domains; e.g., graph-theory, number theory, and linear algebra problems. 3. Apply measure concentration results from probability theory to analyze a given randomized algorithm. 4. Determine the running times, failure probabilities, and accuracy guarantees of a randomized algorithm. 5. Apply learned design techniques and analysis tools to design and analyze new randomized algorithms. 6. Explain material from published research in the area of randomized algorithms using field-specific language. Credits: 3.00

CS 55100 - Cloud Computing Fundamentals

Credit Hours: 3.00. A comprehensive course that investigates all aspects of cloud computing, including: cloud data centers and infrastructure (equipment for processing, storage, communication, and special-purpose facilities); the use of virtualized servers (virtual machines and containers), virtualized storage (Storage Area Networks, Network Attached Storage, object storage), and virtual networks; automation; orchestration systems, such as Kubernetes; programming paradigms used to construct cloud-native software, such as MapReduce, microservices, controllerbased computing, and serverless computing; edge computing; security and privacy in cloud systems; software models. The course emphasizes researching new ways to use cloud computing and research into new ways to design and build cloud systems. The course includes a project. Students should have completed coursework in or have equivalent familiarity with operating systems and computer networks.

Learning Outcomes: 1. Identify underlying cloud facilities and infrastructure features. 2. Assess and compare algorithms and architectures used to design cloud-native software systems. 3. Plan, implement, and deploy cloud-native software systems that use available technologies. 4. Articulate the scientific and technical principles that led to cloud computing. 5. Devise measurements and evaluate the performance of cloud systems. Credits: 3.00

Concentrations

GPA Requirements

About the Program

Construction Management Technology, MSCMT

About the Program

Program Requirements - Thesis & Non-thesis

Required Courses (15 credits)

Statistics Course (3 credits)

PSY 60000 - Statistical Inference

Credit Hours: 3.00. Emphasis is given to principles underlying both parametric and nonparametric inference.

Credits: 3.00

STAT 50100 - Experimental Statistics I

Credit Hours: 3.00. Concepts and methods of applied statistics. Exploratory analysis of data. Sample design and experimental design. Normal distributions. Sampling distributions. Confidence intervals and tests of hypotheses for one and two samples. Inference for contingency tables, regression and correlation, and one-way analysis of variance. Use of the SAS statistical software. Intended primarily for students who have not had calculus. Not open to students in mathematical sciences or engineering. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: College Algebra.

Learning Outcomes: 1. Produce and identify basic statistical analyses. 2. Discuss statistical terminology (speak statistics). 3. Use SAS to run basic statistical analyses and interpret corresponding SAS output. Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

Primary Area Selectives (12 credits)

CM 51000 - Topics In Environmentally Sustainable Construction, Design And Development

Credit Hours: 3.00. This course explores environmental sustainability in all its forms, starting with the historical and theoretical basis and continuing through an understanding of sustainable building construction, design, development, and renewable energy strategies/management tools and how these can be applied in practice.

Learning Outcomes: 1. Recognize human population trends and their effects on associated resource demands. 2. Identify and evaluate energy use trends, including status quo, business-as-usual (BAU) and alternative production and delivery approaches. 3. Interpret and analyze regional and global climate trends and implications, including policy alternatives. 4. Illustrate economic and social drivers, including triple bottom line business practices. 5. Discuss trends and management alternatives in land and ocean ecosystems. 6. Examine food and water security issues including production, management, and distribution alternatives. 7. Distinguish behavior psychology including examination of constraints and opportunities for sustainable practices. 8. Compare market and other incentives designed to stimulate best practices for building design and community planning. 9. Demonstrate knowledge of the conceptual history and controversies involving sustainability. 10. Apply current sustainability principles. 11. Debate common sustainability issues from multiple perspectives. 12. Recognize uncertainty envelopes and constraints on predictive knowledge. 13. Apply best practices in sustainability to their specific field of interest. 14. Employ interdisciplinary approaches to sustainability outside of their own field. 15. Recognize the challenges and opportunities of applying science and technology to governance. 16. Formulate messaging skills needed to deliver scientific information to popular audiences. 17. Practice abstract theoretical evaluation of sustainability challenges and solutions. 18. Employ critical reading and writing skills within scientific, policy and popular media. 19. Prepare action research projects to transform sector-specific practices

for sustainability. 20. Construct a broad range of delivery and assessment strategies to support change for sustainability. Credits: 3.00

CM 51100 - Energy Conserving Building Retrofit

Credit Hours: 3.00. This course introduces energy related reconstruction of buildings with an emphasis on light commercial buildings. Retrofit topics include: Basic thermodynamics, Energy conserving technologies, Impact of site characteristics, Indoor air quality, Water conservation measures, Measuring and benchmarking energy performance, Cost/Benefit Analysis, Financing energy improvements, as well as Building operation and management to reduce energy and water use.

Learning Outcomes: 1. Identify and describe opportunities for energy conservation in existing light commercial buildings through energy related reconstruction activities, commissioning, onsite power generation, as well as building operation and management strategies. 2. Apply basic thermodynamics to energy related retrofit strategies. 3. Identify, classify, and describe techniques and technologies that can be utilized in building envelop, building site, or HVAC systems for energy or water conservation. 4. Apply problem solving and decision making for cost vs. benefit analysis of retrofit strategies. 5. Apply basic energy measurement and benchmarking simulation models. 6. Identify the ways indoor air quality is impacted by vent. Credits: 3.00

CM 52000 - Preconstruction Project Management

Credit Hours: 3.00. Management and control of projects from authorization to start of construction. Project success factors, conceptual and parametric estimating, design planning and management constructability review techniques and value engineering methods. Real estate transactions. Land zoning, platting, development and pro forma calculations.

Learning Outcomes: 1. Appreciate the real estate site selection process. 2. Understand the zoning and platting process. 3. Develop an understanding of the real estate transaction process. 4. Compare and contrast project delivery systems. 5. Understand the design process. 6. Identify project success factors. 7. Utilize value engineering and constructability concepts. 8. Understand the role of preconstruction in the project life cycle. 9. Employ early estimating techniques. 10. Analyze projects from a time-value of money perspective. 11. Evaluate the viability of a construction project before authorization. 12. Appreciate roles played by the various participants in the preconstruction process. 13. Ensure adequate risk management measures have been employed. 14. Apply real estate development rules and consider regulatory issues. Credits: 3.00

CM 52500 - Managing Construction Quality And Production

Credit Hours: 3.00. Advanced techniques for assessing the success of construction project management including schedule cost, safety and quality measurements. Impacts of pre planning, human factors, and communication systems on quality and productivity. Statistical methods for analysis of construction operations.

Learning Outcomes: 1. Define construction productivity and quality. 2. Understand the project owner's role, the designer's role, and the construction firm's role in construction, productivity and quality. 3. Demonstrate the ability to manage productivity at the following enterprise levels - company, project, and construction site. 4. Demonstrate the ability to manage construction labor productivity, equipment productivity, and subcontractor productivity. 5. Measure construction labor productivity. 6. Understand the impact that changes have on productivity. 7. Quantify lost productivity. 8. Implement a Total Quality Management (TQM) system. Credits: 3.00

CM 53000 - Construction Operations And Strategic Management

Credit Hours: 3.00. Principles of construction company business management for U.S. companies. Executive-level construction functions including strategic planning, organizational structure, and ownership structure including

succession planning.

Learning Outcomes: 1. Undertake company strategic planning. 2. Prepare a company business plan. 3. Create organizational structure. 4. Develop policies and procedures. 5. Manage change. 6. Manage equipment utilization. 7. Ensure contract profitability. 8. Identify and manage other operational concerns. 9. Develop succession plans. 10. Implement succession plans. Credits: 3.00

CM 53500 - Construction Accounting And Financial Management

Credit Hours: 3.00. Accounting techniques, financial methods, and financial management for construction firm management. Analysis techniques for contemporary construction company accounting and finance practice with an emphasis on cash flow analysis and cash management.

Learning Outcomes: 1. Identify and explain the use of various revenue recognition methods available to the construction company. 2. Explain the progress billing terms retainage and front loading and discuss the reasons for and against such practice. 3. Identify the accounts applied and their use when the percentage of completion method of accounting is applied. 4. Explain the difference between underbilling and overbilling, discuss why they occur and their impact on cash flow. 5. Apply the following financial analysis techniques to financial statements: line-item analysis, horizontal analysis, vertical analysis, use-source analysis, ratio analysis, cost-volume-profit analysis, and profit center analysis. 6. Prepare the budgeted income statement and develop rates for overhead and profit mark-up, exercise control over company cost, and prepare a cash plan. 7. Apply time value of money principles to various decision making tools when seeking company and project financing and the acquisition of capital assets. Credits: 3.00

CM 54000 - Law For Construction Managers

Credit Hours: 3.00. A study of the legal system and its impact on the construction process. The focus is on the legal obligations, rights and remedies pertaining to the construction company. Topics include bidding, contracts, and construction changes.

Learning Outcomes: 1. Describe agency relationships, contracts, torts, professional liability, risk management, indemnification, risk sharing and surety bonds. 2. Explain the concept of the design professional as judge. 3. Recognize the procedures for legally terminating a construction contract. 4. Plan the project with a contract law viewpoint. 5. Comply with the legal requirements for competitive bidding. 6. Create as well as to comply with the rights & duties of the construction contract. 7. Demonstrate the ability to apply construction law concepts to subcontracting, changes, payments, performance problems, defects, subsurface problems, time and claims. Credits: 3.00

CM 54500 - Construction Management Training And Development

Credit Hours: 3.00. Identification, training and development of future company leaders. Mentorship as a required, managerial activity, effective delegation of responsibility, and empowerment of subordinates to take initiative.

Learning Outcomes: 1. Interpret the role of the training department in meeting an organization's strategic goals. 2. Analyze the broader organizational context and business environment in order to ensure that training meets business needs and achieves stakeholder support. 3. Use effective investigative and analytical methods to advise and assist clients in identifying needs, at organizational levels, to which training is the most appropriate response. 4. Work with stakeholders to design training events (including formal programs) that are grounded in the principles of learning, are accessible, effective and make timely use of available resources. 5. Incorporate new technology as appropriate into

both training and learning processes, and the effective management of the training and development function. 6. Carry out appropriate monitoring and evaluation of training programs, and coordinate with stakeholders on any necessary changes to training provision and practice. 7. Explore models and research relating to the core competencies and behavioral characteristics of effective trainers. Credits: 3.00

CM 55000 - Risk Management In Construction

Credit Hours: 3.00. Analysis of the depth and breadth of risk in construction. Defining key terms and concepts used in various risk management arenas - legal statutes, precedent and case studies relevant to construction risk management, insurance, and surety bonding. Subjects include: contracts, torts, insurance, surety, safety laws, quality, and risk management models. Analysis of case studies to utilize risk management tools and identify issues and possible approaches. Project risk control including management of foreseeable hazards as well as unforeseen conditions.

Learning Outcomes: 1. Overview of risk fundamentals - and how liability drives outcomes. 2. Understand the relationships between insurance, sureties, contractual risk transfer and risk financing. 3. Understand how safety covers direct employees, other parties, and member of the public. 4. Understand the role of incident investigation, and management of claims of various types. 5. Understand quality and how to deliver acceptable project results. 6. Understand the value of Business Continuity Planning and other Crisis Management methods and tools. 7. Understand the value of corporate compliance programs for satisfaction of regulatory and other legal requirements. 8. Understand standards of care, and their evolutionary nature, compelling "compliance as you go." 9. Ability to critically evaluate existing risk management approaches, and apply risk management models to promote successful project outcomes. Credits: 3.00

CM 55500 - Construction Leadership And Marketing

Credit Hours: 3.00. Analysis of organizational leadership at the executive level. The goals of this course are to introduce and stimulate thought and discussion of leadership theories, characteristics and behaviors of successful leaders, contextual factors affecting leader effectiveness, dynamics of leader-follower relationships, communication, decision-making and contemporary challenges confronting organizational leaders as well as marketing theory, marketing vs. business development, the marketing process, and an introduction to a construction marketing dashboard.

Learning Outcomes: 1. Understand the essential principles of leadership theories and apply the theories in construction management. 2. Comprehend the characteristics and behaviors of successful leaders in the field of construction. 3. Grasp the main contextual factors affecting leader effectiveness. 4. Apply the dynamics of leader-follower relationships in daily operations. 5. Acquire communication, decision-making and other key leadership skills. 6. Recognize the contemporary challenges confronting organizational leaders. 7. Understand the marketing theory, the market process, and marketing vs. business development. 8. Understand and utilize construction marketing dashboard. Credits: 3.00

CM 57000 - Analysis Of Research In Construction

Credit Hours: 4.00. Analysis of research and evaluation of research reports. Emphasis on understanding the application of business research procedures including fundamental statistical methods in the solution of a construction industry relevant problem.

Learning Outcomes: 1. Acquire research knowledge and skills required to produce scholarly work for the construction industry. 2. Adapt the scientific research model to solve problems in a construction company. 3. Demonstrate proficiency at library usage, EndNote, and citing references using APA format. 4. Demonstrate related academic writing through individual and group exercises suitable to their individual research. 5. Demonstrate

appropriate samples of academic writing though sample reports on the Purdue College of Technology Epubs. 6. Advance expectations of academic writing. Credits: 4.00

CM 59000 - Special Problems In Building Construction Management Technology

Credit Hours: 1.00 to 6.00. Independent study of a special problem under the guidance of a member of the staff. Does not substitute for either M.S. thesis or M.S. project credit. Permission of instructor required

Learning Outcomes: 1. Develop an increased knowledge in select topics related design and/or construction management. Credits: 1.00 to 6.00

CM 52600 - Value Engineering - Functional Analysis Of Systems And Techniques

Credit Hours: 3.00. This course applies value engineering principles and life cycle costs to the built environment with particular focus on the effect of the decisions made in the design, construction, operation and maintenance of the built environment on the quality and cost.

Learning Outcomes: 1. Synthesize and articulate the core principles of life cycle cost and apply engineering economics principles to calculate costs. 2. Synthesize and articulate the core principles of functional analysis of systems and techniques (FAST) methodology. 3. Conduct analysis of systems, articulate client needs and problems, define problem statements, compare design alternatives, and suggest solutions that address the issues in the problem statement. 4. Develop weighting criteria for decision making to meet problem statement and demonstrate advantages of proposed solution in comparison with initial design. Credits: 3.00

CM 51800 - Building Information Modeling And Sustainability

Credit Hours: 3.00. This course explores environmental sustainability in all its forms, starting with the historical and theoretical basis and continuing through an understanding of sustainable building construction, design, development, and renewable energy strategies/management tools. In this course students explore Building Information modeling technology to assess and compare the design impact on the environment.

Learning Outcomes: 1. Explain and apply LEED Principles. 2. Explain and apply Life Cycle Analysis principles. 3. Compare design alternatives. 4. Solve a real construction problem. Credits: 3.00

CM 54700 - Collaborative Project Delivery Models And Practices

Credit Hours: 3.00. A project-focused course covering advanced topics on collaborative project delivery models such as Integrated Project Delivery (IPD), Design-Build (DB), and Partnering. Collaborative project delivery methodologies aim to integrate project teams, stakeholders, systems, business structures, and practices to facilitate collaboration at all levels within a project and to produce the most optimal project outcomes. Students will develop and expand their interdisciplinary collaborative team working skills, communication, and understanding of essential elements underlying collaborative project delivery models.

Learning Outcomes: 1. Describe, analyze, and select the most appropriate delivery method for a project. 2. Engage in team-building processes and analyses that are intended to establish collaborative working environments. 3. Analyze case study documents including RFP's, RFQ's, contracts, and other managerial documents used in collaborative project delivery practices. 4. Research and analyze construction management processes to develop collaborative project teams and collaborative work environments. Credits: 3.00

CM 54900 - Advanced Topics In Mechanical And Electrical Construction

Credit Hours: 3.00. A project-focused course covering advanced topics on mechanical and electrical construction installation practices and processes. This course teaches the student how to plan, organize, and execute mechanical and electrical construction operations. Students will develop and expand their knowledge about mechanical and electrical work sequencing, coordination, commissioning, and relationship to facility operations and management.

Learning Outcomes: 1. Describe and analyze mechanical and electrical scopes of work. 2. Engage in team-building processes and analyses that involve developing work sequencing and coordination. 3. Analyze case

study documents including construction schedules to determine best practices and recommendations for improvement. 4. Research and analyze commissioning programs to develop key performance indicators and implementation strategies. Credits: 3.00

CM 50500 - Construction Finance And Company Management

Credit Hours: 3.00. This course provides students with knowledge and research training to construction finance and company management.

Learning Outcomes: 1. Learn about concepts, principles, and practices of construction finance. 2. Learn about company marketing, customer relationship and trust development. 3. Learn about the methods, technologies and statistical approaches used for construction finance and company management. 4. Apply the accounting knowledge to prepare and analyze financial statements. 5. Become a critical thinker of current company management practices and apply what they have learnt to identify and solve challenges of construction management. Credits: 3.00

CM 53600 - Highway Construction And Quality Control

Credit Hours: 3.00. This course provides students with knowledge of methods, materials, equipment, and procedures in construction of highways. Students will acquire the concepts and applications of quality control and quality assurance in construction of highways. Students will learn to design appropriate work zones to improve efficiency and safety of highway construction. This course will provide graduate students with a much-needed venue to gain the theory, technology, and practice of highway construction, rehabilitation, maintenance, and quality control.

Learning Outcomes: 1. Acquire the characteristics of various types of highway materials and highway designs and highway construction specifications. 2. Acquire the quality control and assurance principles, and techniques, and methods. 3. Determine the optimal strategy for pavement preservation. 4. Apply quality control and safety improvement techniques in highway construction. 5. Design work zones to improve efficiency and safety of highway construction. Credits: 3.00

CM 53800 - Roadway Infrastructure Management

Credit Hours: 3.00. This course provides students with theories and practices of managing roadways to achieve maximum benefit in the system and network level with limited available funds and resources. Students will learn the concepts of roadway performance measures in terms of physical conditions, service levels, and safety. As a graduate level course, this course will introduce basic methods to find optimal solutions for real-world problems and provide graduate students analytical and mathematical tools for effectively conducting research related to problem formulation, optimal decision-making, and maximizing benefits/effectiveness and minimizing costs.

Learning Outcomes: 1. Acquire roadway systems and performance measures. 2. Acquire the frameworks and principles of management systems. 3. Conduct data analysis and establish condition prediction models. 4. Perform life cycle benefit/cost analysis of infrastructure projects. 5. Create decision-making models to maximize benefit of infrastructure systems with limited resources. Credits: 3.00

CM 50800 - Human Factors In Construction And Transportation

Credit Hours: 3.00. This course provides students with knowledge and research training to identify and solve design problems and safety issues of human factors specifically in construction and transportation.

Learning Outcomes: 1. Learn the concepts, theories, methods and technologies of human factors (HF), human information processing, and cognitive psychology. 2. Apply the HF knowledge to study and discuss HF issues in the design and safety of construction and transportation. 3. Develop critical thinking ability to identify HF issues and factors in research and real world. 4. Apply HF knowledge to explore, research and solve the problems in the areas of their interests in construction and transportation. 5. Communicate the design and safety from HF perspective. Credits: 3.00

Research Courses (3 credits)

CM 56000 - Academic Writing Seminar I

Credit Hours: 1.00. Analysis of the requirements of research reports. Emphasis on research methods and concepts, identifying major issues, academic literature reviews, data collection and presentation methods, and selecting a research topic.

Learning Outcomes: "1. Increase the student's skills related to research and academic writing through the introduction of resources available through the Purdue Library System and the Purdue Online Writing Lab (OWL). 2. Demonstrate appropriate samples of academic writing through sample reports on the Purdue College of Technology EPubs. 3. Develop the student's knowledge and application of PAP version 6 formatting. 4. Advance the student's expectations of academic writing. Credits: 1.00

CM 56500 - Academic Writing Seminar II

Credit Hours: 1.00. Provides a higher level understanding of scholarly writing as it is applied to the individual student's research. Students also learn to present his or her technical work to an audience in a clear, easily understandable form.

Learning Outcomes: 1. Demonstrate develop of the student's skills related to academic writing through individual and group exercises related to their individual research. 2. Demonstrate appropriate samples of academic writing through sample reports on the Purdue College of Technology Epubs. 3. Appropriate student knowledge and application of APA version 6 formatting. 4. Advance the student's expectations of academic writing. 5. Increase the rate of successful completion of the masters program scholarly writing requirements. Credits: 1.00

CM 58100 - Workshop In Building Construction Management Technology

Credit Hours: 0.00 to 8.00. Advanced study of technical and professional topics. Emphasis is on new developments relating to technical, operational, and training aspects of industry and technology education.

Learning Outcomes: 1. Vary due to nature of course. Credits: 0.00 to 8.00

Thesis Research (6 credits)

CM 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required.

Learning Outcomes: 1. Vary due to nature of course. Credits: 1.00 to 18.00

Related Area Electives (9-18 credits)

Concentrations

About the Program

Construction Management Technology, MSCMT (OL)

About the Program

Program Requirements

Required Courses (33 credits)

CM 52000 - Preconstruction Project Management

Credit Hours: 3.00. Management and control of projects from authorization to start of construction. Project success factors, conceptual and parametric estimating, design planning and management constructability review techniques and value engineering methods. Real estate transactions. Land zoning, platting, development and pro forma calculations.

Learning Outcomes: 1. Appreciate the real estate site selection process. 2. Understand the

zoning and platting process. 3. Develop an understanding of the real estate transaction process. 4. Compare and contrast project delivery systems. 5. Understand the design process. 6. Identify project success factors. 7. Utilize value engineering and constructability concepts. 8. Understand the role of preconstruction in the project life cycle. 9. Employ early estimating techniques. 10. Analyze projects from a time-value of money perspective. 11. Evaluate the viability of a construction project before authorization. 12. Appreciate roles played by the various participants in the preconstruction process. 13. Ensure adequate risk management measures have been employed. 14. Apply real estate development rules and consider regulatory issues. Credits: 3.00

CM 52500 - Managing Construction Quality And Production

Credit Hours: 3.00. Advanced techniques for assessing the success of construction project management including schedule cost, safety and quality measurements. Impacts of pre planning, human factors, and communication systems on quality and productivity. Statistical methods for analysis of construction operations.

Learning Outcomes: 1. Define construction productivity and quality. 2. Understand the project owner's role, the designer's role, and the construction firm's role in construction, productivity and quality. 3. Demonstrate the ability to manage productivity at the following enterprise levels - company, project, and construction site. 4. Demonstrate the ability to manage construction labor productivity, equipment productivity, and subcontractor productivity. 5. Measure construction labor productivity. 6. Understand the impact that changes have on productivity. 7. Quantify lost productivity. 8. Implement a Total Quality Management (TQM) system. Credits: 3.00

CM 53000 - Construction Operations And Strategic Management

Credit Hours: 3.00. Principles of construction company business management for U.S. companies. Executive-level construction functions including strategic planning, organizational structure, and ownership structure including succession planning.

Learning Outcomes: 1. Undertake company strategic planning. 2. Prepare a company business plan. 3. Create organizational structure. 4. Develop policies and procedures. 5. Manage change. 6. Manage equipment utilization. 7. Ensure contract profitability. 8. Identify and manage other operational concerns. 9. Develop succession plans. 10. Implement succession plans. Credits: 3.00

CM 53500 - Construction Accounting And Financial Management

Credit Hours: 3.00. Accounting techniques, financial methods, and financial management for construction firm management. Analysis techniques for contemporary construction company accounting and finance practice with an emphasis on cash flow analysis and cash management.

Learning Outcomes: 1. Identify and explain the use of various revenue recognition methods available to the construction company. 2. Explain the progress billing terms retainage and front loading and discuss the reasons for and against such practice. 3. Identify the accounts applied and their use when the percentage of completion method of accounting is applied. 4. Explain the difference between underbilling and overbilling, discuss why they occur and their impact on cash flow. 5. Apply the following financial analysis techniques to financial statements: line-item analysis, horizontal analysis, vertical analysis, use-source analysis, ratio analysis, cost-volume-profit analysis, and profit center analysis. 6. Prepare the budgeted income statement and develop rates for overhead and profit mark-up, exercise control over company cost, and prepare a cash plan. 7. Apply time value of money principles to various

decision making tools when seeking company and project financing and the acquisition of capital assets. Credits: 3.00

CM 54000 - Law For Construction Managers

Credit Hours: 3.00. A study of the legal system and its impact on the construction process. The focus is on the legal obligations, rights and remedies pertaining to the construction company. Topics include bidding, contracts, and construction changes.

Learning Outcomes: 1. Describe agency relationships, contracts, torts, professional liability, risk management, indemnification, risk sharing and surety bonds. 2. Explain the concept of the design professional as judge. 3. Recognize the procedures for legally terminating a construction contract. 4. Plan the project with a contract law viewpoint. 5. Comply with the legal requirements for competitive bidding. 6. Create as well as to comply with the rights & duties of the construction contract. 7. Demonstrate the ability to apply construction law concepts to subcontracting, changes, payments, performance problems, defects, subsurface problems, time and claims. Credits: 3.00

CM 54500 - Construction Management Training And Development

Credit Hours: 3.00. Identification, training and development of future company leaders. Mentorship as a required, managerial activity, effective delegation of responsibility, and empowerment of subordinates to take initiative.

Learning Outcomes: 1. Interpret the role of the training department in meeting an organization's strategic goals. 2. Analyze the broader organizational context and business environment in order to ensure that training meets business needs and achieves stakeholder support. 3. Use effective investigative and analytical methods to advise and assist clients in identifying needs, at organizational levels, to which training is the most appropriate response. 4. Work with stakeholders to design training events (including formal programs) that are grounded in the principles of learning, are accessible, effective and make timely use of available resources. 5. Incorporate new technology as appropriate into both training and learning processes, and the effective management of the training and development function. 6. Carry out appropriate monitoring and evaluation of training programs, and coordinate with stakeholders on any necessary changes to training provision and practice. 7. Explore models and research relating to the core competencies and behavioral characteristics of effective trainers. Credits: 3.00

CM 55000 - Risk Management In Construction

Credit Hours: 3.00. Analysis of the depth and breadth of risk in construction. Defining key terms and concepts used in various risk management arenas - legal statutes, precedent and case studies relevant to construction risk management, insurance, and surety bonding. Subjects include: contracts, torts, insurance, surety, safety laws, quality, and risk management models. Analysis of case studies to utilize risk management tools and identify issues and possible approaches. Project risk control including management of foreseeable hazards as well as unforeseen conditions.

Learning Outcomes: 1. Overview of risk fundamentals - and how liability drives outcomes. 2. Understand the relationships between insurance, sureties, contractual risk transfer and risk financing. 3. Understand how safety covers direct employees, other parties, and member of the public. 4. Understand the role of incident investigation, and management of claims of various types. 5. Understand quality and how to deliver acceptable project results. 6. Understand the value of Business Continuity Planning and other Crisis Management methods and tools. 7. Understand the value of corporate compliance programs for satisfaction of regulatory and other legal requirements. 8. Understand standards of care, and their evolutionary nature, compelling "compliance as

you go." 9. Ability to critically evaluate existing risk management approaches, and apply risk management models to promote successful project outcomes. Credits: 3.00

CM 55500 - Construction Leadership And Marketing

Credit Hours: 3.00. Analysis of organizational leadership at the executive level. The goals of this course are to introduce and stimulate thought and discussion of leadership theories, characteristics and behaviors of successful leaders, contextual factors affecting leader effectiveness, dynamics of leader-follower relationships, communication, decision-making and contemporary challenges confronting organizational leaders as well as marketing theory, marketing vs. business development, the marketing process, and an introduction to a construction marketing dashboard.

Learning Outcomes: 1. Understand the essential principles of leadership theories and apply the theories in construction management. 2. Comprehend the characteristics and behaviors of successful leaders in the field of construction. 3. Grasp the main contextual factors affecting leader effectiveness. 4. Apply the dynamics of leader-follower relationships in daily operations. 5. Acquire communication, decision-making and other key leadership skills. 6. Recognize the contemporary challenges confronting organizational leaders. 7. Understand the marketing theory, the market process, and marketing vs. business development. 8. Understand and utilize construction marketing dashboard. Credits: 3.00

CM 58100 - Workshop In Building Construction Management Technology

Credit Hours: 0.00 to 8.00. Advanced study of technical and professional topics. Emphasis is on new developments relating to technical, operational, and training aspects of industry and technology education.

Learning Outcomes: 1. Vary due to nature of course. Credits: 0.00 to 8.00

Consumer Science, MS

About the Program

Program Requirements - Thesis

Required Courses (27 credits)

Core Courses (21 credits)

HTM 51400 - Business Analytics For Service Industries

Credit Hours: 3.00. In today's highly dynamic business environment, decision-makers often encounter problems that are complex and data intensive. This course focuses on a variety of techniques from the field of business statistics and exposes students to statistical and decision analytics to solve data-driven decision-making problems. The course adopts a practical spreadsheet-based approach to facilitate decision-making and explores the practical applications of these techniques across various functional fields, with a specific focus on service industries.

Learning Outcomes: 1. Identify and evaluate managerial problems requiring data-based decision-making. 2. Apply quantitative methods to model and analyze real-world situations. 3. Employ analytic software tools to solve problems from various functional fields. 4. Communicate solutions and managerial implications across different stakeholders. Credits: 3.00

HTM 50800 - Cultivating A Service Excellence Mindset

Credit Hours: 3.00. Understanding the fundamental principles of service management is essential to successfully manage service organizations in a complex market environment. This course utilizes major theoretical frameworks, such as Service-Dominant Logic, to address key issues in managing service organizations, including creating service culture, motivating a service-minded workforce, co-creating service value, and achieving service excellence. Students develop managerial skills through a thorough understanding of service strategies, systems, and processes to optimize service value.

Learning Outcomes: 1. Demonstrate an understanding of the strategic implications for managing the service experience. 2. Explain the critical role of managing the employee-customer interface in the service delivery process. 3.

Evaluate various service management strategies to enhance service excellence. 4. Construct key service management systems and processes to solve issues in complex service environments. Credits: 3.00

HTM 50600 - Leading People In Service Industries

Credit Hours: 3.00. Leadership requires an understanding of human behavior, organizational culture, and strategy. In this class, students are exposed to leadership theory through the extant literature. Facilitated by readings and class discussion, students develop critical and analytical understanding of how theory informs and connects to practice. The course topics include human resources functions, organizational and human behavior, human values and motivations, team dynamics, decision-making, and change management. This course takes an interdisciplinary approach, with student learning drawn from different fields.

Learning Outcomes: 1. Understand the role of leadership in successful organizations. 2. Explain how human resource practices contribute to organizational effectiveness. 3. Analyze theories and practices in human resources, organizational behaviors, and leadership. 4. Connect leadership theories to organizational practices. 5. Synthesize different theoretical perspectives within/across service industries. Credits: 3.00

HTM 50700 - Integrated Marketing Communications For Service Industries

Credit Hours: 3.00. This course addresses the unique challenges and opportunities in marketing the intangible, inseparable, variable, and perishable service products. Balancing theoretical research and practical applications, this course provides a systematic review of key components and processes for an effective integrated marketing communication for service industries. Students will learn how to leverage both long-standing and emerging marketing communication approaches (e.g., strategic marketing and promotion, branding, public relations, digital marketing, social media, influencer marketing and artificial intelligence application) to create customer awareness, manage customer expectations, build customer relationships, and ensure customer satisfaction and loyalty.

Learning Outcomes: 1. Evaluate the role of marketing communications in achieving success for service organizations. 2. Identify critical metrics to understand customer expectations and manage customer perceptions. 3. Apply customer-centric approach to leverage various marketing communication methods and tools to meet customer needs, wants and demands. 4. Develop, promote, and manage service promises through both external and internal marketing. Credits: 3.00

HTM 50900 - Service Experience Design

Credit Hours: 3.00. The success of service organizations requires well-planned design of the service environment and customer experience journey to enhance operational efficiency and excellence, drive customer satisfaction and loyalty, and differentiate from competitors. Addressing the importance of developing and providing optimal customer experience in service industries, this course aims to inspire a design-thinking approach to create contemporary customer experiences in various service settings. By gaining insights from the service design theories, students will gain knowledge to effectively manage the physical environment, service interactions, and service delivery processes to enhance the overall service experience quality. Learning by practice, students will apply the learned design tools to envisage, blueprint, and devise innovative service experience solutions.

Learning Outcomes: 1. Articulate the role of service experience design for the strategic success of service organizations in the marketplace. 2. Conduct critical quantitative and qualitative analyses of customer service experience. 3. Design service experiences for customers by utilizing various experience design tools. 4. Communicate the service design process to service industry professionals and relevant stakeholders. Credits: 3.00

HTM 51300 - Strategy In Service Industries

Credit Hours: 3.00. Strategic management plays a pivotal role in helping industry leaders gain a competitive advantage and accomplish business goals in an ever-changing marketplace. This course centers on the exploration of various theories, frameworks, and models to understand contemporary issues and challenges in service industries. Through the application of strategic management principles and strategy-oriented tasks, students comprehend essential topics in strategic management, including environmental and competitor analysis, strategic planning, strategy formulation, strategy execution, and strategic evaluation and control.

Learning Outcomes: 1. Articulate the theoretical principles and tactical practices in strategy management. 2. Analyze external and internal factors to effectively manage service organizations. 3. Evaluate the strategic planning process for service organizations. 4. Apply strategic theories, frameworks, and models to management practices in service organizations. Credits: 3.00

HTM 50400 - Consumer Behavior

Credit Hours: 3.00. Understanding how and why consumers make decisions about purchasing goods, services, and experiences allows companies to tailor their business strategies, product development, and customer service efforts to meet the specific needs and preferences of their target customer base. This course addresses the growing demand for professionals to better understand psychological, social and situational influences of consume behavior. This course provides students not only with an understanding of consumer behavior concepts and theories, but also with the tools and methodologies that can be directly applied to real-world scenarios to navigate dynamic markets, effectively engage customers, and drive business success in today's competitive marketplace.

Learning Outcomes: 1. Explain how consumer behavior contributes to customer acquisition, satisfaction, and retention for relevant businesses and organizations. 2. Evaluate psychological, social, and situational influences on consumer behavior. 3. Interpret and predict consumer behavior in diverse industry contexts. 4. Synthesize current trends in consumer behavior to identify opportunities for creating customer satisfaction, engagement, and enriched experiences. 5. Formulate effective strategies to build and maintain consumer loyalty. Credits: 3.00

Statistics Courses (6 credits)

SOC 58000 - Methods Of Social Research I

Credit Hours: 3.00. An intermediate-level examination of research designs, measurement, and sampling with emphasis on issues of problem formulation and the logic and application of methodological procedures.

Credits: 3.00

SOC 58100 - Methods of Social Research II

Credit Hours: 3.00. Emphasis on statistical inference applied to sociological problems; topics include the binomial distribution and the logic of inference, one and two sample tests, confidence intervals, and chi-square. Introduction to bivariate correlation and regression, analysis of variance.

Credits: 3.00

STAT 50100 - Experimental Statistics I

Credit Hours: 3.00. Concepts and methods of applied statistics. Exploratory analysis of data. Sample design and experimental design. Normal distributions. Sampling distributions. Confidence intervals and tests of hypotheses for one and two samples. Inference for contingency tables, regression and correlation, and one-way analysis of variance. Use of the SAS statistical software. Intended primarily for students who have not had calculus. Not open to students in mathematical sciences or engineering. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: College Algebra.

Learning Outcomes: 1. Produce and identify basic statistical analyses. 2. Discuss statistical terminology (speak statistics). 3. Use SAS to run basic statistical analyses and interpret corresponding SAS output. Credits: 3.00

STAT 50200 - Experimental Statistics II

Credit Hours: 3.00. Multiple regression including the general linear test, model selection, and regression diagnostics. Analysis of variance for factorial designs, including multiple comparisons. Analysis of covariance. Repeated measures designs. Extensive use of the SAS statistical software. Intended primarily for students who have not had calculus.

Learning Outcomes: 1. Produce and identify advanced statistical analyses. 2. Learn and understand advanced statistical terminology and concepts. 3. Use SAS to run advanced statistical analyses and interpret corresponding SAS output. Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson,

hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

STAT 51200 - Applied Regression Analysis

Credit Hours: 3.00. Inference in simple and multiple linear regression, residual analysis, transformations, polynomial regression, model building with real data, nonlinear regression. One-way and two-way analysis of variance, multiple comparisons, fixed and random factors, analysis of covariance. Use of existing statistical computer programs. Prerequisite: Coursework in Statistical Methods with a calculus prerequisite.

Learning Outcomes: 1. Learn to build and analyze simple and multiple regression models, analysis of variance and covariance (ANOVA/ANCOVA) for regression, inference for regression, diagnostics and remedial measures for regression, transformations, residual analysis, model building, polynomial and interaction models. Credits: 3.00

Thesis Research (6 credits)

HTM 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required.

Learning Outcomes: 1. Vary by topic due to the nature of the course. Credits: 1.00 to 18.00

Additional Requirements (0-1 credit)

HTM 59001 - Graduate Professional Industry Internship

Credit Hours: 1.00. The Graduate Professional Industry Internship allows graduate students to gain valuable experience through paid employment with a company in the hospitality and tourism industry or a related industry. In addition, each student will research an issue and provide a potential solution to a problem faced by the employer. This course is not repeatable without special permission from the HTM Graduate Policy Committee and is only open to HTM graduate students who have completed a minimum of two semesters and 16 hours of graduate coursework in HTM. Credit is not allowed for both HTM 59001 and HTM 59002. Permission from Graduate Professional Industry Internship Coordinator is required to enroll in this course. Permission of instructor required.

Learning Outcomes: 1. Understand how to effectively manage a service industry business. 2. Develop critical thinking, creativity, and problem solving skills. Credits: 1.00

Program Requirements - Non-Thesis

Required Courses (21 credits)

Core Courses (21 credits)

HTM 51400 - Business Analytics For Service Industries

Credit Hours: 3.00. In today's highly dynamic business

environment, decision-makers often encounter problems that are complex and data intensive. This course focuses on a variety of techniques from the field of business statistics and exposes students to statistical and decision analytics to solve data-driven decision-making problems. The course adopts a practical spreadsheet-based approach to facilitate decision-making and explores the practical applications of these techniques across various functional fields, with a specific focus on service industries.

Learning Outcomes: 1. Identify and evaluate managerial problems requiring data-based decision-making. 2. Apply quantitative methods to model and analyze real-world situations. 3. Employ analytic software tools to solve problems from various functional fields. 4. Communicate solutions and managerial implications across different stakeholders. Credits: 3.00

HTM 50800 - Cultivating A Service Excellence Mindset

Credit Hours: 3.00. Understanding the fundamental principles of service management is essential to successfully manage service organizations in a complex market environment. This course utilizes major theoretical frameworks, such as Service-Dominant Logic, to address key issues in managing service organizations, including creating service culture, motivating a service-minded workforce, co-creating service value, and achieving service excellence. Students develop managerial skills through a thorough understanding of service strategies, systems, and processes to optimize service value.

Learning Outcomes: 1. Demonstrate an understanding of the strategic implications for managing the service experience. 2. Explain the critical role of managing the employee-customer interface in the service delivery process. 3. Evaluate various service management strategies to enhance service excellence. 4. Construct key service management systems and processes to solve issues in complex service environments. Credits: 3.00

HTM 50600 - Leading People In Service Industries

Credit Hours: 3.00. Leadership requires an understanding of human behavior, organizational culture, and strategy. In this class, students are exposed to leadership theory through the extant literature. Facilitated by readings and class discussion, students develop critical and analytical understanding of how theory informs and connects to practice. The course topics include human resources functions, organizational and human behavior, human values and motivations, team dynamics, decision-making, and change management. This course takes an interdisciplinary approach, with student learning drawn from different fields.

Learning Outcomes: 1. Understand the role of leadership in successful organizations. 2. Explain how human resource practices contribute to organizational effectiveness. 3. Analyze theories and practices in human resources, organizational behaviors, and leadership. 4. Connect leadership theories to organizational practices. 5. Synthesize different theoretical perspectives within/across service industries. Credits: 3.00

HTM 50700 - Integrated Marketing Communications For Service Industries

Credit Hours: 3.00. This course addresses the unique challenges and opportunities in marketing the intangible, inseparable, variable, and perishable service products. Balancing theoretical research and practical applications, this course provides a systematic review of key components and processes for an effective integrated marketing communication for service industries. Students will learn how to leverage both long-standing and emerging marketing communication approaches (e.g., strategic marketing and promotion, branding, public relations, digital marketing, social media, influencer marketing and artificial intelligence application) to create customer awareness, manage customer expectations, build customer relationships, and ensure customer satisfaction and loyalty.

Learning Outcomes: 1. Evaluate the role of marketing communications in achieving success for service organizations. 2. Identify critical metrics to understand customer expectations and manage customer perceptions. 3. Apply customer-centric approach to leverage various marketing communication methods and tools to meet customer needs, wants and demands. 4. Develop, promote, and manage service promises through both external and internal marketing. Credits: 3.00

HTM 50900 - Service Experience Design

Credit Hours: 3.00. The success of service organizations

requires well-planned design of the service environment and customer experience journey to enhance operational efficiency and excellence, drive customer satisfaction and loyalty, and differentiate from competitors. Addressing the importance of developing and providing optimal customer experience in service industries, this course aims to inspire a design-thinking approach to create contemporary customer experiences in various service settings. By gaining insights from the service design theories, students will gain knowledge to effectively manage the physical environment, service interactions, and service delivery processes to enhance the overall service experience quality. Learning by practice, students will apply the learned design tools to envisage, blueprint, and devise innovative service experience solutions.

Learning Outcomes: 1. Articulate the role of service experience design for the strategic success of service organizations in the marketplace. 2. Conduct critical quantitative and qualitative analyses of customer service experience. 3. Design service experiences for customers by utilizing various experience design tools. 4. Communicate the service design process to service industry professionals and relevant stakeholders. Credits: 3.00

HTM 51300 - Strategy In Service Industries

Credit Hours: 3.00. Strategic management plays a pivotal role in helping industry leaders gain a competitive advantage and accomplish business goals in an ever-changing marketplace. This course centers on the exploration of various theories, frameworks, and models to understand contemporary issues and challenges in service industries. Through the application of strategic management principles and strategy-oriented tasks, students comprehend essential topics in strategic management, including environmental and competitor analysis, strategic planning, strategy formulation, strategy execution, and strategic evaluation and control.

Learning Outcomes: 1. Articulate the theoretical principles and tactical practices in strategy management. 2. Analyze external and internal factors to effectively manage service organizations. 3. Evaluate the strategic planning process for service organizations. 4. Apply strategic theories, frameworks, and models to management practices in service organizations. Credits: 3.00

HTM 50400 - Consumer Behavior

Credit Hours: 3.00. Understanding how and why consumers make decisions about purchasing goods, services, and experiences allows companies to tailor their business strategies, product development, and customer service efforts to meet the specific needs and preferences of their target customer base. This course addresses the growing demand for professionals to better understand psychological, social and situational influences of consume behavior. This course provides students not only with an understanding of consumer behavior concepts and theories, but also with the tools and methodologies that can be directly applied to real-world scenarios to navigate dynamic markets, effectively engage customers, and drive business success in today's competitive marketplace.

Learning Outcomes: 1. Explain how consumer behavior contributes to customer acquisition, satisfaction, and retention for relevant businesses and organizations. 2. Evaluate psychological, social, and situational influences on consumer behavior. 3. Interpret and predict consumer behavior in diverse industry contexts. 4. Synthesize current trends in consumer behavior to identify opportunities for creating customer satisfaction, engagement, and enriched experiences. 5. Formulate effective strategies to build and maintain consumer loyalty. Credits: 3.00

Electives (9 credits)

Additional Requirements

HTM 59001 - Graduate Professional Industry Internship

Credit Hours: 1.00. The Graduate Professional Industry Internship allows graduate students to gain valuable experience through paid employment with a company in the hospitality and tourism industry or a related industry. In addition, each student will research an issue and provide a potential solution to a problem faced by the employer. This course is not repeatable without special permission from the HTM Graduate Policy Committee and is only open to HTM graduate students who have completed a minimum of two semesters and 16 hours of graduate coursework in HTM. Credit is not allowed for both HTM 59001 and HTM 59002. Permission from Graduate Professional Industry Internship Coordinator is required to enroll

in this course. Permission of instructor required.

Learning Outcomes: 1. Understand how to effectively manage a service industry business. 2. Develop critical thinking, creativity, and problem solving skills. Credits: 1.00

Concentrations

GPA Requirements

About the Program

Corporate Training and Communication, MS

About the Program

Program Requirements

Required Courses (30 credits)

Learning Design and Technology Courses (12 credits)

EDCI 56900 - Introduction To E-Learning

Credit Hours: 3.00. This course examines how the design and development of instruction are impacted by the use of the computer as delivery system. A primary focus is on effective learning design strategies for e-learning. Learners will identify and apply effective design practices with emphasis on project management, planning, and implementation. Education or training materials will be developed using appropriate authoring tools as determined by the instructional context. Learners will design an E-Learning module with end-to-end documentation of the design process (Project Plan, Design Document, Storyboard). Opportunities for collaborative feedback and evaluation will also be featured elements of the course experience.

Learning Outcomes: 1. Identify and implement sound design processes for e-learning. 2. Integrate relevant learning theory into e-learning design decisions. 3. Design, develop, and evaluate an effective e-learning module. Credits: 3.00

EDCI 57200 - Introduction To Learning Systems Design

Credit Hours: 3.00. An introduction to the principles of designing instructional materials and to instructional communication theory and techniques. Topics include objectives, student characteristics, media selection, communication variables, message design, and systematic evaluation.

Learning Outcomes: 1. Describe and apply the components of a systematic design process, their rationales, and uses. 2. Use a systematic design process and instructional psychology principles in performing an analysis of learning context analysis of learners, analysis of learning tasks, in design and development of assessments, and in design of formative and summative evaluation of the instruction itself. Credits: 3.00

EDCI 57700 - Strategic Assessment And Evaluation

Credit Hours: 3.00. This course explores principles and techniques that can be used to carry out evaluations within an organization. The course also examines several aspects of conducting evaluations, including planning and designing an evaluation, developing appropriate instruments, using various methods to collect information, analyzing information obtained from those methods, and communicating results and recommendations. This course is designed to help learners understand the multiple ways that evaluation is used in instructional systems and provides opportunities to design various types of evaluation instruments. A portion of the course will examine the study of learner assessment as part of the evaluation of instructional programs; however, the course's focus is dedicated to the study of program evaluation.

Learning Outcomes: 1. Define evaluation within the context of human performance and learning. 2. Develop prototype evaluation tools and frameworks useful in training/education or workplace performance improvement. 3. Synthesize knowledge by developing an evaluation plan and tools for an actual setting. Credits: 3.00

EDCI 53100 - Learning Theories And Instructional Design

Credit Hours: 3.00. This course has been designed to help you learn how theories of human learning and motivation can be applied to the instructional process in order to make the process more effective, efficient, and/or appealing. The focus of the course is on two areas: 1) the theoretical principles that have contributed to the field of Instructional Design (ID), and 2) how those principles can be applied within practical settings.

Learning Outcomes: 1. Identify, describe, and explain the basic tenets of behavioral, cognitive, and constructivist learning theories. 2. Compare and contrast the contributions of various learning theories to the field of instructional design. 3. Identify and describe the basic components within various motivational theories and their impact upon the learning process. 4. Select appropriate principles derived from given theories and apply those within practical learning situations. Credits: 3.00

Communication Courses (15 credits)

COM 60111 - Seminar In Strategic Communication

Credit Hours: 3.00. This graduate course will survey the theories and processes of strategic communication and its practice by business, government, politicians, and non-profits - in domestic and international arenas. The course will emphasize the application of theory to provide an in-depth understanding of planning, executing, and evaluating strategic communication plans. Prerequisite: Graduate student in communication. Permission of department required.

Learning Outcomes: 1. Understand the context in which strategic communication operates and the dynamics changing the profession, its work, and its value to clients and society. 2. Understand the theories which underlie strategic communication. 3. Understand the processes of the development and implementation of comprehensive communication strategies. 4. Strengthen writing and presentation skills relevant to strategic communication through course assignments. Credits: 3.00

COM 60311 - Seminar In Crisis Communication

Credit Hours: 3.00. This graduate course will focus on how to communicate in a time of crisis in order to manage the situation and disseminate key messages to various stakeholders. Prerequisite: Graduate student in Communication and COM 60111 . Permission of department required.

Learning Outcomes: 1. Have a broad understanding of the crisis communication literature. 2. Be able to formulate solutions to crisis situations from multiple perspectives. 3. Anticipate actions and analyze stakeholders involved in crisis situations. 4. Be aware of and challenge critical assumptions in crisis situations. 5. Evaluate crisis plans. Credits: 3.00

COM 60511 - Strategic Communication And Professional Writing

Credit Hours: 3.00. This graduate course covers topics related to professional writing and strategic communication. Topics include grammar basics, audience considerations, credibility and ethics, and documentation style. In addition, writing will be discussed in a variety of contexts such as media, public relations, advertising, and business communication. Permission of department required.

Learning Outcomes: 1. Demonstrate mastery of writing, grammar, and style as well as various guidelines for academic and professional writing. 2. Articulate the role of credibility and ethics in professional writing. 3. Explain the importance of research and audience analysis in professional writing. 4. Analyze the unique challenges of writing in different contexts (e.g., advertising, public relations, media, business communication, print and online). 5. Evaluate strengths and weaknesses of various forms of written communication. 6. Produce various types of documents related to strategic communication. Credits: 3.00

COM 62111 - Seminar In Strategic Communication And Social Media

Credit Hours: 3.00. This course will provide an overview of social media and its relationship to strategic communication. Students will learn about the available forms of social media (e.g., Blogs, Social Networks, and Wikis) as well as their uses,

strengths and weaknesses for building and managing relationship with stakeholders. Students will also gain exposure to methods for analyzing social media metrics as a framework for evaluating the effectiveness of social media strategies as tools for developing corporate, nonprofit, and governmental images and brands. Permission of department required.

Learning Outcomes: 1. Demonstrate their understanding of current theories of communication technology that bear on the use and impact of social media environments. 2. Articulate changes in strategic communication brought about by changes in technology. 3. Identify and become familiar with the most commonly used social media technologies used in industry to communicate with stakeholders. 4. Demonstrate the ability to use contemporary social media tools. 5. Develop a social media strategy for an organization. 6. Identify, track, and analyze key social media metrics for evaluating the effectiveness of a social media strategy. Credits: 3.00

COM 65000 - Communication And Leadership

Credit Hours: 3.00. Communication is the essence of leadership, and this course aims to identify how communication can fuel productivity, drive consensus and push the organization to a leadership position within a market. At the same time, communication can sabotage one's success or be used as a weapon to silence voices and promote political agendas. This course aims to empower you to shape leadership throughout the organization and to know how to advise other leaders in their efforts to overcome communication challenges. Permission of department required.

Learning Outcomes: 1. Identify relevant theories and principles of organizational communication. 2. Understand how communication can increase team productivity. 3. Develop comprehensive internal and external communications plans. 4. Use data from an audit to make recommendations and decisions. 5. Construct a communications plan to achieve a leadership position in a marketplace. 6. Advise peers and colleagues as they work through their own communication challenges. 7. Identify communication strategies to communicate with executives when stakes are high. Credits: 3.00

Practicum Course (3 credits)

EDCI 57300 - Instructional Development Practicum

Credit Hours: 2.00 or 3.00. Provides supervised field experience in programs involving instructional design development activities. Students participate in ongoing projects in the design, development, and evaluation of instructional materials and training programs in business and industry, medical facilities, or other settings deemed appropriate. Recommended prerequisites: EDCI 56900, EDCI 57200, and EDCI 67200. Permission of instructor required.

Learning Outcomes: 1. Design, develop, and evaluate a major instructional design project within a professional work setting/environment. 2. Create and manage an instructional design project within a professional setting following a specific timeline. Management of the process may require collaboration with supervisors, subject matter experts, and others to complete the project in the most effective manner. Credits: 2.00 or 3.00

Program Learning Outcomes

About the Program

Curriculum and Instruction: Agricultural and Extension Education Concentration, MSED or MS or PHD

About the Program

Program Requirements

Required Courses (15 credits)

Core Courses (9 credits)

EDPS 53300 - Introduction To Educational Research I: Methodology

Credit Hours: 3.00. This course presents a sequence of journal articles and exercises that help introduce the foundational concepts of the course, including: research design, reliability and validity, various methodologies commonly used in educational research, and basic quantitative and qualitative data analyses. In addition, contrasting research conclusions are shown in the articles to help students learn why careful analysis of articles and their theoretical framing is critical to evaluating their conclusions.

Learning Outcomes: 1. Find research literature. 2. Read and critique educational research. 3. Deepen knowledge of at least one research area in education. 4. Design, conduct, analyze, and write a research project. Credits: 3.00

EDCI 58500 - Multicultural Education

Credit Hours: 3.00. The course aims to develop understanding of multicultural education as an on-going reform process that addresses social justice issues through an examination of race, class, gender, ethnicity, language, sexual orientation, etc.

Learning Outcomes: 1. Develop awareness of multicultural issues in education and other fields. 2. Increase knowledge of multicultural education and applications of multicultural theories to education and other disciplines. 3. Develop skills in meeting the needs of diverse populations. Credits: 3.00

ASEC 52000 - Foundations Of Agricultural Education, Extension, And Communication

Credit Hours: 3.00. Critical analysis of the historical and philosophical assumptions, current strategic intents and relevant policies underpinning the discipline of agricultural education - inclusive of Extension education and agricultural communication - and project the impact existing economic, social and political issues may have in this field in the next 15 to 25 years. Instructor permission required.

Learning Outcomes: 1. Explain how social and economic conditions in the 19th century helped shape AEEC. 2. Identify and discuss how key events, leaders, driving forces, and policies (i.e., legislation) that shaped AEEC. 3. Compare and contrast similarities and differences among school-based agricultural education, non-formal (Extension) education, and agricultural communication regarding their purpose, development as a field, structure and stakeholders. 4. Discuss the philosophies of pragmatism, behaviorism, and constructivism, and how these philosophical assumptions influenced the policies and practices of AEEC. 5. Identify leaders and what role they played in helping shape AEEC. 6. Discuss how principles of community-based education support the development of human, cultural and social capital in AEEC. 7. Examine current trends regarding existing organizational structures, enrollment, funding, and collaborative partners of AEEC, and project how current social and economic conditions in the 21st century may impact AEEC. 8. Discuss contemporary leadership and program models for the next 25 years, and analyze visions in AEEC are positioned to address grand challenges visions in AEEC. Credits: 3.00

Selectives (6 credits)

EDPS 53000 - Cognition And Learning In Context

Credit Hours: 3.00. Theories of learning and development, research on instruction and learning, and principles of measurement applied to educational problems.

Learning Outcomes: 1. Understand the central components of Behaviorism, differentiate between classical and operant conditioning, and apply the theories to teaching and learning. 2. Understand the central tenets of constructivism, identify a range of constructivist theories or perspectives, and distinguish constructivism from behaviorism. 3. Understand the central components of theories of learning and development developed by Bandura, Piaget, and Vygotsky, and apply them to teaching and

learning. 4. Understand the roles of memory, expertise, transfer, conceptual change, meta-cognition, and self-regulated learning for student learning, and their implications for teaching. 5. Identify the central characteristics of instructional scaffolding, and cooperative and collaborative learning, how they are associated with learning, and how they may be instantiated. 6. Understand central tenets of sociocultural (or sociohistorical) and situated theories of learning and development and apply them to teaching and learning. 7. Understand the central characteristics of inquiry (or project-based learning) and their affordances and limitations with respect to teaching and learning. 8. Understand how policies (educational and otherwise), political priorities, beliefs, and national and international factors affect affordances for teaching and learning. Credits: 3.00

EDPS 54000 - Gifted, Creative And Talented Children

Credit Hours: 3.00. This course is an introduction to the intellectual, social, and emotional characteristics of gifted youth; philosophies of gifted education; and programmatic and classroom approaches for supporting gifted students generally and within different domains (e.g., intellectual, academic, creative, artistic, leadership).

Learning Outcomes: 1. Understand who gifted, creative, and talented children are and how their talent development needs can be met in the school setting. 2. Recognize the diversity that exists within the gifted, creative, and talented population. 3. Understand the history, philosophical traditions, and paradigms of practice in gifted education. 4. Develop awareness of specific strategies for supporting gifted, creative, and talented students within the school context. 5. Develop awareness of key professional resources in the field of gifted education and talent development. 6. Develop a personal identity as a practitioner of gifted education. Credits: 3.00

EDPS 59100 - Special Topics In Education

Credit Hours: 1.00 to 4.00. Group study of a current problem or special topic of interest to professional educational personnel. Intensive study of research, theory, or practical aspects of a particular issue within the usual graduate class format.

Credits: 1.00 to 4.00

EDST 60000 - Seminar In The Foundations Of Education

Credit Hours: 3.00. Recommended for those who have had a prior foundations course. Specialized studies in such areas as educational history, educational philosophy, educational sociology, religion and public education, current educational issues, and classical literature of education.

Credits: 3.00

EDCI 58000 - Foundations Of Curriculum

Credit Hours: 3.00. Introduction to the major historical and philosophical sources of curriculum ideas. Significant forces influencing curriculum decision making. Different theoretical approaches to the construction and analysis of curriculum.

Learning Outcomes: 1. Engage critically with germinal thinkers and thought in curriculum. 2. Examine various curriculum approaches and traditions within their historical and social contexts. 3. Explore the major philosophies that undergirds curriculum approaches and deliberation. 4. Analyze the political origins and implications of differing traditions within the curriculum field and within educational policy and practice. 5. Integrate learning from curriculum history, theory, and research into one's teaching, scholarship, and/or engagement. Credits: 3.00

AEE Electives (9 credits)

Electives (6 credits)

Curriculum and Instruction: Career and Technical Education Concentration, MSED or MS or PHD

About the Program

Program Requirements

Required Courses (xx credits)

Core Courses (xx credits)

EDCI 54100 - Contemporary Issues In Career And Technical Education

Credit Hours: 3.00. Identification, analysis, synthesis, and implications of current issues and problems in career and technical education at the elementary, secondary, postsecondary, and adult levels; policy and literature review; formulation of alternatives and solutions.

Learning Outcomes: 1. Identify and analyze existing policy and programmatic problems and issues in career and technical education and related disciplines and fields. 2. Synthesize and summarize contemporary literature relating to problems and issues. 3. Formulate alternatives and solutions to existing problems and issues. 4. Examine the implications and potential impact (short- and long-range) of problems and issues in career and technical education for society and education in general. Credits: 3.00

EDCI 55000 - Career Education

Credit Hours: 3.00. An overview of contemporary legislation, educational reform, trends, and issues; career education program models; vocational and technical education, technology prep, and school-to-work systems; partnerships; foundations of career education; career development; curriculum; career guidance and counseling; career assessment; career planning practices; learning styles and instructional strategies; career information sources and resources; exemplary programs; and special needs populations and practices.

Learning Outcomes: 1. Describe the major legislative provisions and educational reforms affecting the delivery of career education. 2. Evaluate significant trends in career education, and professional and social issues. 3. Identify and adapt (a) career education model(s). 4. Describe the Career and Technical Education, Tech Prep, Career Pathways, and School-to-Career delivery systems. 5. Discuss effective partnerships between and among the school, the community, and business and industry. 6. Describe the foundations of career education. 7. Explain the career development process. 8. Identify the roles of elementary, middle, high school, postsecondary, and adult education; and business and industry in career education. 9. Develop career education curriculum; career clusters and pathways; and occupational, job, and task analysis. 10. Apply career guidance and counseling practices and procedures. 11. Utilize career assessment strategies. 12. Implement career planning practices and procedures. 13. Adapt appropriate learning styles and instructional strategies for individual learners. 14. Locate and use career information sources. 15. Identify, select, and utilize appropriate career information resources related to the school, community, governmental agency, occupational, and professional resources. 16. Identify, compare, contrast, and adapt exemplary career education programs. 17. Identify special needs populations and effective practices. Credits: 3.00

EDCI 64500 - Organization And Administration Of Career And Technical Education

Credit Hours: 3.00. Organizational structure and delivery systems at the national, regional, state, and local levels; program areas and services; legislative initiatives; federal, state, and local planning; administrative functions and practices; leadership development; trends; and issues.

Learning Outcomes: 1. Develop an understanding of the organizational structure and delivery systems at the national, regional, state, and local levels in career and technical education (CTE). 2. Provide an overview of the CTE program areas, career clusters, career pathways, and services and their relationships

to academic and special education. 3. Review federal and state legislation related to CTE. 4. Examine federal, state, regional, and local planning and funding activities. 5. Analyze administrative functions and practices and management systems. 6. Critique leadership and staff development initiatives in CTE. 7. Evaluate current trends and issues in the field. Credits: 3.00

Curriculum and Instruction Courses (xx credits)

EDCI 54300 - Instruction In Career And Technical Education

Credit Hours: 3.00. Contemporary trends and methods in teaching career and technical programs, learning styles and teaching styles, and a variety of creative instructional strategies for different educational contexts will be identified and analyzed.

Learning Outcomes: 1. Develop an understanding of the instructional process and learning theory in career and technical education and business and industry training. 2. Provide an overview of the major influences on learning and learning environments. 3. Acquire skills in instructional planning, implementation, and evaluation. 4. Analyze a variety of instructional strategies and resources in career and technical education and training. 5. Review and analyze instructional literature and research in career and technical education. 6. Gain experience in instructional planning and delivery. Credits: 3.00

EDCI 54400 - Career And Technical Education For Special Needs Learners

Credit Hours: 3.00. Legislative initiatives; identification of special needs learners at the elementary, secondary, postsecondary, and adult levels; learning characteristics; assessment; individualized planning; instructional adaptations; school and community resources; exemplary program models; research, trends, and issues; and evaluation.

Learning Outcomes: 1. Describe the major historical and contemporary legislative provisions affecting the delivery of career and technical education to special needs learners. 2. Identify and describe the educational characteristics of special needs learners, including students with disabilities, disadvantaged students, gifted and talented learners, non-traditional learners, and limited-English proficient speakers. 3. Describe and use appropriate strategies for assessment of the career needs, learning styles, and progress of special needs learners. 4. Develop and evaluate individualized education, career, and transition plans for a special needs learner. 5. Select and use appropriate instructional strategies, procedures, and materials. 6. Identify and select appropriate community, business, industry, school, governmental agency, occupational, and professional resources. 7. Compare and contrast various exemplary program models for special needs learners. 8. Evaluate the major professional trends, issues, and implications for career and technical education programs for special needs learners. Credits: 3.00

EDCI 55200 - Generalizable Skills Instruction In Career And Technical Education

Credit Hours: 3.00. Curriculum, assessment, planning, implementation, and evaluation relating to generalizable skills (also known as generic, transferable, or workplace skills) in career and technical education, other content areas, and special education programs; philosophical, historical, social, economic, political, and educational influencing factors; analysis and synthesis of current research and conceptual models; practical applications for programs; instructional strategies; resources and support services, interdisciplinary collaboration approaches; applications for special needs learners; learning styles and characteristics.

Learning Outcomes: 1. Identify and analyze the philosophical, historical, social, economic, political, and educational factors influencing generalizable skills instruction in career and technical education programs. 2. Locate, analyze, and synthesize contemporary generalizable skills literature and research and its application in career and technical programs.

3. Identify, analyze, and apply a conceptual model for generalizable skills instruction regarding curriculum, assessment, planning, implementation, and evaluation. 4. Identify generalizable skills curriculum. 5. Examine and apply methods of generalizable skills curriculum development and revision. 6. Review and analyze functional, curriculum-based assessment, instruments, strategies, and procedures. 7. Describe and use procedures for using generalizable skills assessment data/information in individualized educational planning. 8. Identify the individual learning styles and characteristics of, and apply appropriate instructional approaches for, individual students in career and technical programs. 9. Identify, locate, select, and evaluate instructional resource materials and support services useful in generalizable skills instruction. 10. Identify, adapt, and develop methods for teaching generalizable skills in career and technical programs. 11. Develop and implement interagency collaboration strategies among career and technical education, special education, support/remedial services, and content related (e.g., mathematics, reading) school personnel. 12. Identify and select appropriate evaluation methods and procedures for determining the adequacy, quality, and effectiveness of generalizable skills instruction and support services in career and technical education programs. Credits: 3.00

EDCI 64800 - Curriculum In Career And Technical Education

Credit Hours: 3.00. Overview of curriculum in career and technical education programs; business and industry training programs; curriculum planning, development, implementation, and evaluation; review and analysis of curriculum models.

Learning Outcomes: 1. Develop an understanding of curriculum and its relationship to other instructional phases in career and technical education and training. 2. Provide an overview of curriculum processes and procedures in career and technical education and business and industry training programs. 3. Review and analyze curriculum development research in career and technical education. 4. Acquire skills in curriculum needs assessment, planning, implementation, and evaluation. 5. Explore the theoretical, ethical, political, social, and economic factors related to curriculum development in career and technical education and training. 6. Gain experience in designing a curriculum plan and curriculum development. Credits: 3.00

EDCI 65300 - Seminar In Career And Technical Education

Credit Hours: 1.00 to 9.00. Current trends, theory, and practices related to educational contexts and careers.

Learning Outcomes: 1. Review, synthesize, analyze, and critique current research in education, career and technical education, and related fields and disciplines. 2. Identify significant research problem areas and researchable problems in education. 3. Examine and evaluate research methods used and applicable in education fields and related disciplines. 4. Explore various research dissemination strategies. 5. Network with researchers in education and related fields. Credits: 1.00 to 9.00

EDCI 69500 - Internship In Education

Credit Hours: 1.00 to 10.00. Amount of credit to be determined by nature and extent of the assignment. A special course in selected areas of education, designed to provide practical field experience under professional supervision in selected situations related to the candidate's area of specialization. Permission of instructor required.

Credits: 1.00 to 10.00

Administration and Policy Courses (xx credits)

EDCI 54500 - Planning In Career And Technical Education

Credit Hours: 3.00. Principles and strategies in planning new

and improving existing career and technical education programs, strategic planning, needs assessment, community and workforce market research, information and data analysis, program improvement. Permission of Department required.

Learning Outcomes: 1. Develop an understanding of the principles and strategies in planning CTE and workforce education programs. 2. Provide an overview of the CTE district program plan. 3. Review Federal CTE and workforce education legislative planning regulations and guidelines. 4. Examine State CTE and workforce education legislative planning regulations and guidelines. 5. Critique various strategic planning models, strategies, and procedures. 6. Describe strategies for advocating for diversity and access and equity for special needs populations in CTE program planning policy and practice. 7. Evaluate local and CTE district planning factors and considerations. 8. Discuss community needs assessment and workforce market research, information and data analysis, and use of findings in decision-making. 9. Describe strategies for organizing and collaborating with program advisory committees. 10. Explain continuous program evaluation and improvement. Credits: 3.00

EDCI 55300 - Leadership Development In Career And Technical Education

Credit Hours: 3.00. Design, development, implementation, and evaluation of systems and strategies for enhancing the skills and knowledge of personnel seeking to become leaders in the field of Career and Technical Education (CTE); research related to critical and emerging leadership issues, strategies, policies, and resources are examined and applied to program improvement initiatives in schools, the workplace, agencies, and other organizations that serve a wide variety of youth, adolescents, young adults, and adults.

Learning Outcomes: 1. Identify and adapt models of staff development, in-service education, and program improvement. 2. Use organizational, adult learning, motivational, leadership, and social systems therapy in staff development and school-or agency-based program improvement activities. 3. Develop and implement organizational communications and group-related interactions effectively. 4. Evaluate the principles related to leadership style; organizational development, initiation and management of change, needs analysis, and consultation strategies; and program improvement activities. 5. Locate current and emerging funding sources, as well as effective procedures for developing grant seeking and project management strategies. 6. Implement comprehensive strategies for developing assessing and improving programs, policies, practices, and services related to career and technical education programs. 7. Design and implement effective interagency collaboration initiatives. Credits: 3.00

EDCI 64400 - Legal Issues In Career And Technical Education

Credit Hours: 3.00. Comprehensive examination of contemporary federal, state, and local legislation; rules, policy, regulations, provisions, guidelines, and initiatives affecting the nature, establishment, and implementation of state and local programs at the secondary and postsecondary levels in career and technical education; need for legislation and initiatives and the reauthorization of existing legislation; social, political, and economic aspects of legislation; advocacy for legislation; and public policy and policy development. Approval of Department required.

Learning Outcomes: 1. Discuss the importance and impact of statutory law on the development and nature of career and technical education in the United States. 2. Describe and contrast the legislative process and policies at the national and state levels. 3. Review, articulate, and analyze critically the history of CTE and related legislation from 1862 to the present. 4. Explain and apply the major provisions of the current CTE and workforce federal legislation. 5. Relate and apply the content of the current Indiana State Plan for CTE to the provisions, requirements, and legal interpretation of Federal CTE legislation. 6. Examine critically and apply Indiana legislation and initiatives that provide

authority, support, structure, and administration for CTE in the State. 7. Refine conceptual, analysis, synthesis, and evaluation skills. 8. Enhance their written and oral communication skills. Credits: 3.00

EDCI 64600 - Supervision In Career And Technical Education

Credit Hours: 3.00. Purposes, principles, strategies, and procedures of supervision and management in career and technical education and related workforce education and development contexts: theory and practice: human resource development: environment, education, and management. Approval of Department required.

Learning Outcomes: 1. Define and describe contemporary supervision concepts. 2. Identify and explain principles of educational supervision. 3. Relate and analyze critically emerging concepts in supervision to social, political, economic, and cultural factors. 4. Describe and discuss a sequence of (clinical) experiences that provide optimum opportunity for developing educator competencies. 5. Identify and apply best practices experiences that have potential for practica, internships, and other work-based learning programs. 6. Identify and describe the stages of supervision. 7. Identify, evaluate, select, and apply techniques and strategies appropriate to the implementation of each stage of supervision. 8. Implement methods of supervision in pre-observation, conference, observation, analysis and strategy, conference, and post-conference contexts. 9. Develop awareness and participate in professional development opportunities in CTE and education. Credits: 3.00

EDCI 69500 - Internship In Education

Credit Hours: 1.00 to 10.00. Amount of credit to be determined by nature and extent of the assignment. A special course in selected areas of education, designed to provide practical field experience under professional supervision in selected situations related to the candidate's area of specialization. Permission of instructor required.

Credits: 1.00 to 10.00

Disciplined Inquiry Courses (xx credits)

EDCI 50000 - Foundations Of Literacy

Credit Hours: 3.00. Survey course in the acquisition of and instruction in reading, writing, and other aspects of language.

Learning Outcomes: 1. Develop a broad background and comprehensive understanding of literacy history, theory, and the socio-cultural influences that have shaped research and practice in the field. 2. Examine the constructs of reading and literacy from multiple theoretical perspectives, and in differing historical contexts. 3. Use new understandings to critically examine current theoretical perspectives and instructional practices. Credits: 3.00

EDCI 59000 - Individual Research Problems

Credit Hours: 1.00 to 6.00. Opportunities for students to study particular problems under the guidance of a member of the This plan of individualized instruction may be used in any field of education or vocational education. Does not include thesis work. Permission of instructor required.

Credits: 1.00 to 6.00

EDCI 64700 - Research In Career And Technical Education

Credit Hours: 3.00. Rationale for and history of research in career and technical education; analysis of the research process and research methods; examination of the environment and support required for research; proposal development, and strategies for dissemination and utilization of research. Offered in alternate years.

Learning Outcomes: 1. Develop a rationale for disciplined inquiry in career and technical education. 2. Examine the history of research in career and technical education. 3. Analyze the research process and research methods. 4. Identify the environment and support required for research. 5. Describe strategies for the dissemination, utilization, and evaluation of research. Credits: 3.00

EDCI 64900 - Assessment In Career And Technical Education

Credit Hours: 3.00. Goals and rationale for evaluation in

education and work training contexts; assessment and measurement methods, techniques, and procedures; reliability, validity, and accuracy; construction and selection of instruments; data and information collection, analysis, and interpretation; meta evaluation; adaptations and modifications for special needs populations; and using assessment data and information.

Learning Outcomes: 1. Provide an overview of assessment in career and technical education and training programs. 2. Identify goals and a rationale for evaluation. 3. Explore contemporary assessment trends and practices. 4. Develop an understanding of career assessment and measurement methods, techniques, and procedures in career and technical education and training. 5. Examine several methods for estimating instrument reliability, validity, and accuracy. 6. Develop skills in the construction, analysis, and selection of assessment and measurement instruments and procedures in career and technical education and training programs. 7. Explore the ethical, psychological, political, social, economic, and educational issues related to assessment in career and technical education and training. 8. Gain experience in the collection and analysis of assessment data and information. 9. Develop skills in the evaluation of assessment and measurement instruments. 10. Explore a variety of appropriate procedures to interpret, disseminate, and use assessment data and information in career and technical education and training programs. Credits: 3.00

EDCI 65000 - Program Evaluation In Career And Technical Education

Credit Hours: 3.00. Goals and objectives of, and criteria for, program evaluation in career and technical education; evaluation models and methods; design and planning; issues; development and selection of instruments and procedures; data and information collection and analysis; preparing program evaluation reports; and using program evaluation results for program improvement.

Learning Outcomes: 1. Provide an overview of program evaluation. 2. Develop an understanding of the major concepts, principles, models, theories, and techniques of evaluation. 3. Acquire knowledge and skills in designing and planning program evaluations. 4. Explore the ethical, political, social, and economic issues related to evaluation. 5. Experience implementing the methods, procedures, and activities of a program evaluation plan. 6. Participate in the reporting, dissemination, and use of findings of program evaluations. Credits: 3.00

EDCI 65300 - Seminar In Career And Technical Education

Credit Hours: 1.00 to 9.00. Current trends, theory, and practices related to educational contexts and careers.

Learning Outcomes: 1. Review, synthesize, analyze, and critique current research in education, career and technical education, and related fields and disciplines. 2. Identify significant research problem areas and researchable problems in education. 3. Examine and evaluate research methods used and applicable in education fields and related disciplines. 4. Explore various research dissemination strategies. 5. Network with researchers in education and related fields. Credits: 1.00 to 9.00

EDCI 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required.

Credits: 1.00 to 18.00

EDCI 69900 - Research PhD Thesis

Credit Hours: 1.00 to 18.00. Research PhD Thesis. Permission of instructor required.

Credits: 1.00 to 18.00

Additional Requirements

Curriculum and Instruction: Curriculum Studies

Concentration, MSED or MS

About the Program

Program Requirements - Thesis

Required Courses (9 credits)

EDCI 58000 - Foundations Of Curriculum

Credit Hours: 3.00. Introduction to the major historical and philosophical sources of curriculum ideas. Significant forces influencing curriculum decision making. Different theoretical approaches to the construction and analysis of curriculum.

Learning Outcomes: 1. Engage critically with germinal thinkers and thought in curriculum. 2. Examine various curriculum approaches and traditions within their historical and social contexts. 3. Explore the major philosophies that undergirds curriculum approaches and deliberation. 4. Analyze the political origins and implications of differing traditions within the curriculum field and within educational policy and practice. 5. Integrate learning from curriculum history, theory, and research into one's teaching, scholarship, and/or engagement. Credits: 3.00

EDCI 58500 - Multicultural Education

Credit Hours: 3.00. The course aims to develop understanding of multicultural education as an on-going reform process that addresses social justice issues through an examination of race, class, gender, ethnicity, language, sexual orientation, etc.

Learning Outcomes: 1. Develop awareness of multicultural issues in education and other fields. 2. Increase knowledge of multicultural education and applications of multicultural theories to education and other disciplines. 3. Develop skills in meeting the needs of diverse populations. Credits: 3.00

EDCI 59000 - Individual Research Problems

Credit Hours: 1.00 to 6.00. Opportunities for students to study particular problems under the guidance of a member of the This plan of individualized instruction may be used in any field of education or vocational education. Does not include thesis work. Permission of instructor required.

Credits: 1.00 to 6.00

EDCI 68200 - Contemporary Curriculum Theory

Credit Hours: 3.00. Critical examination of contemporary concepts of curriculum theory. Rational/technical curriculum, social needs/child centered curriculum. Socio-political curriculum theory; curriculum as existential, aesthetic, and phenomenological. Implications for current practice, school reform, and educational research.

Learning Outcomes: 1. Develop an understanding of the social theories and philosophies that inform contemporary curriculum theorizing. 2. Articulate the role of curriculum theorizing in defining and analyzing educational phenomena. 3. To utilize curriculum theory toward the development of educative responses to issues of ethics, equity, power, and privilege. 4. To synthesize the complexity and tensions of various curriculum theories into frameworks for educational research. Credits: 3.00

EDCI 68400 - Seminar In Curriculum Studies

Credit Hours: 3.00. A course designed to allow for the in-depth exploration of specialized and timely topics in curriculum theory, practice, and reform. Though all specialized topics address both theory and practice, some topics focus more heavily on practice, and others focus more heavily on theory.

Learning Outcomes: 1. Explore and develop awareness of specialized and timely topics in curriculum theory, practice, and reform. 2. Increase knowledge of specialized and timely topics in curriculum theory, practice, and reform. 3. Develop skills of critical thinking and reflection in relationship to specialized and timely topics in curriculum theory, practice, and reform. Credits: 3.00

Curriculum Studies Electives (12 credits)

Humanities/Social Science Elective (3 credits)

Thesis Research (9 credits)

EDPS 53300 - Introduction To Educational Research I: Methodology

Credit Hours: 3.00. This course presents a sequence of journal articles and exercises that help introduce the foundational concepts of the course, including: research design, reliability and validity, various methodologies commonly used in educational research, and basic quantitative and qualitative data analyses. In addition, contrasting research conclusions are shown in the articles to help students learn why careful analysis of articles and their theoretical framing is critical to evaluating their conclusions.

Learning Outcomes: 1. Find research literature. 2. Read and critique educational research. 3. Deepen knowledge of at least one research area in education. 4. Design, conduct, analyze, and write a research project. Credits: 3.00

EDCI 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required.

Credits: 1.00 to 18.00

Program Requirements - Non-thesis

Required Courses (9 credits)

Curriculum Studies Electives (15 credits)

Humanities/Social Science Elective (3 credits)

Portfolio Research (3 credits)

EDPS 53300 - Introduction To Educational Research I: Methodology

Credit Hours: 3.00. This course presents a sequence of journal articles and exercises that help introduce the foundational concepts of the course, including: research design, reliability and validity, various methodologies commonly used in educational research, and basic quantitative and qualitative data analyses. In addition, contrasting research conclusions are shown in the articles to help students learn why careful analysis of articles and their theoretical framing is critical to evaluating their conclusions.

Learning Outcomes: 1. Find research literature. 2. Read and critique educational research. 3. Deepen knowledge of at least one research area in education. 4. Design, conduct, analyze, and write a research project. Credits: 3.00

Curriculum and Instruction: Educational Technology Concentration, MSED

About the Program

Program Requirements

Required Courses (23 credits)

Core Courses (11 credits)

EDCI 58500 - Multicultural Education

Credit Hours: 3.00. The course aims to develop understanding of multicultural education as an on-going reform process that addresses social justice issues through an examination of race, class, gender, ethnicity, language, sexual orientation, etc.

Learning Outcomes: 1. Develop awareness of multicultural issues in education and other fields. 2. Increase knowledge of multicultural education and applications of multicultural theories to education and other disciplines. 3. Develop skills in meeting the needs of diverse populations. Credits: 3.00

EDCI 52001 - Curriculum And Instruction Online MS Seminar I

Credit Hours: 1.00. This boot camp is designed to help you to understand the knowledge and skills necessary for your

successful online learning in the Curriculum and Instruction program. In this orientation, you will explore what online learning entails and reflect on how you can best set yourself up to succeed in your studies. You will also learn about various learning strategies and online resources that you can utilize in your courses. In this seminar, you will be responsible for completing all assignments on time over the course of the semester. Read the guidelines for each week and complete the assignments. NOTE: This course is a core course in the C&I online masters program. A grade of B- or better is required (if a lower grade is received, the course must be retaken). Permission of department required.

Learning Outcomes: 1. Exhibit knowledge of academic integrity by completing plagiarism, statement of commitment, and APA tutorials. 2. Effectively explain your professional goals for the program by writing an initial reflection. 3. Identify essential components of the Curriculum and Instruction Handbook, including what is required for the final portfolio. 4. Develop and apply group project skills and management techniques to make you successful in future courses and your career. 5. Demonstrate digital skills and competence with various digital tools (i.e., blogs, screencasting, Google docs, file sharing). 6. Be aware of current trends in the field of distance education and how they relate to your focus. Credits: 1.00

EDCI 52002 - Curriculum And Instruction Online MS Seminar II

Credit Hours: 1.00. This seminar is designed to help you to understand the knowledge and skills necessary for your success throughout the Curriculum and Instruction program. In addition to providing you with information that will help you succeed in the program, you are also asked to think about ways to make yourself more marketable to current and future employers. Permission of department required.

Learning Outcomes: 1. Investigate the skills and knowledge needed to be successful in a relevant career within the C&I field. 2. Describe program and career goals. 3. Apply research skills required to compose an annotated bibliography. 4. Create the foundation of a C&I portfolio displaying programmatic achievements and course competencies. Credits: 1.00

EDCI 52003 - Theories And Trends In Curriculum And Instruction

Credit Hours: 3.00. This course focuses on current theories and trends influencing curriculum and instruction. A theory is a plausible or scientifically acceptable general principle or body of principles offered to explain phenomena. It is a belief, policy, or procedure proposed or followed as the basis of action. A trend, on the other hand, is a pattern of gradual change in a condition, output, or process. It reflects a general tendency of a series of moves in a certain direction over time. We will focus on understanding sources of current theories and trends and how they may influence work in curriculum and instruction. Permission of department required.

Learning Outcomes: 1. Examine and clarify the educational beliefs, values, and knowledge guiding your curricular and instructional decisions. 2. Utilize and evaluate multiple appropriate sources in researching current curriculum and instruction trends and issues. 3. Interpret, critique, and synthesize relevant research related to current curriculum and instruction trends. 4. Assess the implications of research relative to your curricular and instructional practices. 5. Interpret, critique, and synthesize relevant educational theories related to current curriculum and instruction trends. 6. Assess the implications of educational theories relative to your curricular and instructional practices. 7. Interpret, critique, and synthesize relevant state and national policy decisions related to current curriculum and instruction trends. 8. Assess the implications of state and national policy decisions relative to your curricular and instructional practices. 9. Communicate effectively in oral and written formats. 10. Demonstrate the disposition for life-long learning and continuous professional development. 11. Identify communities of practice within discipline and participate within these communities according to the ethical standards of the discipline. 12. Examine and clarify how your educational beliefs, values, and knowledge guide your curricular and

instructional decisions address the diversity of students, schools, and communities. 13. Advocate for values of diversity, inclusivity, and social justice. Credits: 3.00

EDCI 52004 - Teachers As Leaders

Credit Hours: 3.00. This course focuses on teacher leadership in instruction. Participants will examine the history of teacher leadership. Instructional coaching models will be examined and compared. Students will identify the various theories that support each coaching model and examine what is most present in their school contexts. Permission of department required.

Learning Outcomes: 1. Investigate the construct of school leadership. 2. Evaluate potential leadership roles in classrooms, schools, or other organizations. 3. Research teacher leadership praxis to impact future praxis. 4. Synthesize leadership research in conjunction with theories of social justice and equity. 5. Analyze the skills of effective teacher leadership through collaboration and inquiry. 6. Explore the critical role teachers play in creating conditions for continuous and systematic improvements in education. Credits: 3.00

Educational Technology Courses (12 credits)

EDCI 51300 - Foundations Of Learning Design And Technology

Credit Hours: 3.00. Provides an historical overview of the field and delineates the foundational knowledge, skills, and attitudes needed by professionals in the field of educational technology and instructional design. Students explore the field by engaging in collaborative projects, along with thinking and writing about various aspects of educational technology and the underlying instructional design theories.

Learning Outcomes: 1. Explain/describe the history and foundations of the field. 2. Define learning design and technology and distinguish among its components and related fields. 3. Identify and describe current and emerging issues in the field. 4. Initiate steps toward becoming a professional in the field of learning design and technology. Credits: 3.00

EDCI 52800 - Human Performance Technology

Credit Hours: 3.00. This course provides an introduction to the field of human performance technology (HPT). It examines basic concepts and principles of human performance, the theoretical underpinnings of the field, research and application literature, and various approaches to solving human performance problems. A systematic approach to the analysis, design, development, implementation and evaluation of performance improvement interventions within organizations is emphasized.

Learning Outcomes: 1. Identify the major theoretical underpinnings of the field of HPT. 2. Describe the relationship between the systematic development of instruction and HPT. 3. Analyze a human performance system in order to diagnose a performance gap. 4. Determine whether training, a non-training performance intervention, or a combination is most appropriate for a given situation. 5. Construct a systemic plan to address performance issue(s), including coordinated interventions and evaluation strategies. 6. Design appropriate interventions to address specific performance gaps. Credits: 3.00

EDCI 56400 - Integration And Management Of Technology For Learning

Credit Hours: 3.00. This course focuses on techniques for and issues related to integrating technology in learning environments in a meaningful way. Topics covered stem from literature in the field and include (1) theoretical foundations of technology integration, including how technology can support a more personalized approach to learning, (2) instructional and learning issues with technology integration, (3) designing for the integration of technologies for in learning environments, and (4) emerging issues in research and practice with technology integration. Class activities are designed to model applications of learning technology, while class projects allow individuals to develop skills and knowledge in areas of your personal need or interest. The goal of the course is to help you develop an understanding of important issues associated with the integration and management of learning technology and to effectively plan, design, implement, and evaluate technology-based learning.

Learning Outcomes: 1. Apply educational technology to enhance professional growth and productivity. 2. Use technology to communicate,

collaborate, conduct research, and solve problems. 3. Apply the information from this course into authentic settings. 4. Successfully integrate technology into different forms of instruction. Credits: 3.00

EDCI 57200 - Introduction To Learning Systems Design

Credit Hours: 3.00. An introduction to the principles of designing instructional materials and to instructional communication theory and techniques. Topics include objectives, student characteristics, media selection, communication variables, message design, and systematic evaluation.

Learning Outcomes: 1. Describe and apply the components of a systematic design process, their rationales, and uses. 2. Use a systematic design process and instructional psychology principles in performing an analysis of learning context analysis of learners, analysis of learning tasks, in design and development of assessments, and in design of formative and summative evaluation of the instruction itself. Credits: 3.00

EDCI 53100 - Learning Theories And Instructional Design

Credit Hours: 3.00. This course has been designed to help you learn how theories of human learning and motivation can be applied to the instructional process in order to make the process more effective, efficient, and/or appealing. The focus of the course is on two areas: 1) the theoretical principles that have contributed to the field of Instructional Design (ID), and 2) how those principles can be applied within practical settings.

Learning Outcomes: 1. Identify, describe, and explain the basic tenets of behavioral, cognitive, and constructivist learning theories. 2. Compare and contrast the contributions of various learning theories to the field of instructional design. 3. Identify and describe the basic components within various motivational theories and their impact upon the learning process. 4. Select appropriate principles derived from given theories and apply those within practical learning situations. Credits: 3.00

Selective (3 credits)

EDCI 51300 - Foundations Of Learning Design And Technology

Credit Hours: 3.00. Provides an historical overview of the field and delineates the foundational knowledge, skills, and attitudes needed by professionals in the field of educational technology and instructional design. Students explore the field by engaging in collaborative projects, along with thinking and writing about various aspects of educational technology and the underlying instructional design theories.

Learning Outcomes: 1. Explain/describe the history and foundations of the field. 2. Define learning design and technology and distinguish among its components and related fields. 3. Identify and describe current and emerging issues in the field. 4. Initiate steps toward becoming a professional in the field of learning design and technology. Credits: 3.00

EDCI 52800 - Human Performance Technology

Credit Hours: 3.00. This course provides an introduction to the field of human performance technology (HPT). It examines basic concepts and principles of human performance, the theoretical underpinnings of the field, research and application literature, and various approaches to solving human performance problems. A systematic approach to the analysis, design, development, implementation and evaluation of performance improvement interventions within organizations is emphasized.

Learning Outcomes: 1. Identify the major theoretical underpinnings of the field of HPT. 2. Describe the relationship between the systematic development of instruction and HPT. 3. Analyze a human performance system in order to diagnose a performance gap. 4. Determine whether training, a non-training performance intervention, or a combination is most appropriate for a given situation. 5. Construct a systemic plan to address performance issue(s), including coordinated interventions and evaluation strategies. 6. Design appropriate interventions to address specific performance gaps. Credits: 3.00

EDCI 56000 - Educational Technology For Teaching And Learning

Credit Hours: 3.00. This course addresses the fundamentals of educational/learning technologies within both the traditional classroom, as well as the corporate/business training environments. Students will explore and evaluate various tools/technologies and determine how, when, and why such technologies can/should be infused into normal, hybrid, or fully online learning situations. The goal of the course is to help the student plan, implement, and evaluate technology for teaching and learning.

Learning Outcomes: 1. Demonstrate the ability to access, generate, and manipulate information through the use of various software and technology apps. 2. Apply educational technology to communicate, collaborate, conduct research, and solve problems, as well as promote equitable, ethical, and legal use of computer/technology resources. 3. Apply and integrate educational technology to support instruction in selected developmental and content areas. Credits: 3.00

EDCI 56400 - Integration And Management Of Technology For Learning

Credit Hours: 3.00. This course focuses on techniques for and issues related to integrating technology in learning environments in a meaningful way. Topics covered stem from literature in the field and include (1) theoretical foundations of technology integration, including how technology can support a more personalized approach to learning, (2) instructional and learning issues with technology integration, (3) designing for the integration of technologies for in learning environments, and (4) emerging issues in research and practice with technology integration. Class activities are designed to model applications of learning technology, while class projects allow individuals to develop skills and knowledge in areas of your personal need or interest. The goal of the course is to help you develop an understanding of important issues associated with the integration and management of learning technology and to effectively plan, design, implement, and evaluate technology-based learning.

Learning Outcomes: 1. Apply educational technology to enhance professional growth and productivity. 2. Use technology to communicate, collaborate, conduct research, and solve problems. 3. Apply the information from this course into authentic settings. 4. Successfully integrate technology into different forms of instruction. Credits: 3.00

EDCI 56600 - Educational Applications Of Multimedia

Credit Hours: 3.00. Examination of educational applications of hypermedia tools and related research. Creation of hypermedia instructional materials. Incorporation of digitized media (sound, photographs, and motion clips) in hypermedia is explored.

Learning Outcomes: 1. Explain the effectiveness of a specific instructional design principle in educational multimedia design. 2. Demonstrate when and how to use specific instructional design principles within a given educational multimedia learning environment. 3. Address the key principles and methods for evaluating student outcomes in a multimedia learning environment. 4. Develop educational computer-based multimedia instructional materials with various software and tools. 5. Be familiar with the history of multimedia research and design and underlying assumptions from relevant theorists. 6. Explain variations in usability testing and its role in multimedia development. Credits: 3.00

EDCI 58800 - Motivation And Instructional Design

Credit Hours: 3.00. This course has been designed to provide an in-depth study of motivation as one of the fundamental variables underlying human learning, behavior, and instructional design. The focus of the course is on two areas: 1) theories of motivation and the general principles that have contributed to the field of instructional design, and 2) how those principles are applied within practical design settings.

Learning Outcomes: 1. Identify and describe the basic tenets of various theories of motivation. 2. Compare and contrast the contributions that the various motivational theories offer to the field of instructional design. 3. Select appropriate principles derived from given theories and apply those principles within practical design situations. 4. Analyze motivational problems in learning and performance and design effective solutions. 5. Consider motivational theories and their relation to current research in Education

and Instructional Design. Credits: 3.00

EDPS 55500 - Differentiating Curriculum & Instruction

Credit Hours: 3.00. This course provides a solid foundation and set of principles for differentiating curriculum and instruction in any classroom at any grade level. Students will explore a variety of evidence-based strategies, tools, and curriculum models that effectively meet the diverse needs of all learners. Through readings, online class meetings and discussions, case studies, differentiated instruction examples, direct application, and reflection, students will deepen their understanding and need to differentiate. With an overarching goal of increasing achievement and developing student talents, this course includes the following major components: creating positive learning environments that support a) high-quality curriculum; b) diagnostic, formative, and summative assessments to inform instructional decision-making; and c) flexible grouping; addressing student differences in readiness, interest, and learning profile (including learning preference, intelligence preference, gender, culture, language preference, locale, and opportunities to learn) and appreciating how these differences influence the ways in which students learn and are motivated; understanding that the process of differentiation involves modifying content, process, product, learning environment, and/or affect; incorporating higher-order thinking skills, creative problem solving, project-based learning, authentic/respectful tasks, collaborative learning, and other evidence-based strategies to promote student achievement and talent development; understanding how differentiation of curriculum and instruction fits within specific educational interventions and models, such as scaffolding, flexible grouping, Response to Intervention (RTI), and Multi-Tiered System of Support (MTSS).

Learning Outcomes: 1. Deconstruct the concept of differentiation as a response to the readiness levels; interests; learning preferences and strengths; and academic, social, emotional needs of learners by modifying curriculum, instruction, learning environment, and/or affect. 2. Assess students' readiness, interests, and learning profiles to create differentiated lessons that utilize instructional strategies and technologies that motivate and engage students in learning, including those from special populations. 3. Develop, implement, and evaluate various differentiated instructional plans designed to maximize learning and demonstrate proficiency in analyzing and evaluating differentiated lessons taught by other teachers. 4. Evaluate and reflect upon your course experience and your plan to implement differentiation knowledge and skills gained in this course. Credits: 3.00

Portfolio Course (1 credit)

EDCI 68000 - Curriculum & Instruction MS Portfolio

Credit Hours: 1.00. This course was created to help guide C&I students near completion of their coursework to develop their competency portfolio. A competency portfolio reflects the depth and breadth of a student's educational growth since entering the graduate program. The purpose of the C&I competency portfolio is to demonstrate that students have mastered the graduate competencies for the C&I online Master's program. The portfolio will contain student projects aligned with C&I competencies and will be reviewed by committee members. The competencies are based on the Curriculum & Instruction departmental competencies and several program-specific competencies. The competency portfolio is a requirement for graduation from the C&I Master's program. (Multiple media are welcome.) Permission of department required.

Learning Outcomes: 1. Develop an online version of your competency portfolio based on artifacts as evidence. 2. Compose reflective narratives that explain how your artifacts demonstrate each competency. 3. Develop an updated resume or vita suitable for job searching. 4. Deconstruct relevant job postings in the field. Credits: 1.00

Capstone Course (3 credits)

EDCI 67900 - Capstone: Inquiry Into Practice

Credit Hours: 3.00. This course conceptually centers on the Ghanaian Sankofa symbol of a bird retrieving an egg from its back while facing forward. This metaphor represents the need to "go back to the past and bring forward that which is useful" (About the Sankofa [n.d.]. Retrieved from https://cola.siu.edu/africanastudies/about-us/sankofa.php). The twin aspect of looking back with the future in mind plays out in consonance with the Portfolio course generally taken in tandem with this course. In this course, students will reinforce and extend their learning of key concepts across the program and deepen their engagement with a topic of interest to them through an action research project. Permission of department

required.

Learning Outcomes: 1. Evaluate how your program's experiences, knowledge, and skills will inform your future action and pedagogical practices through reflection and self-critical inquiry. 2. Articulate where you are situated epistemologically, ontologically, and methodologically as educators and researchers within and across disciplines. 3. Demonstrate a commitment to ongoing development as knowledgeable and engaged advocates for equitable education through the exploration of intersectionality. 4. Conduct an action research project that identifies a problem within your classroom or school community and seeks to ameliorate it. 5. Communicate research findings with a broader audience of stakeholders. Credits: 3.00

GPA Requirements

Curriculum and Instruction: English Education Concentration, MSED or MS or EDS

About the Program

Program Requirements

Required Courses (15 credits)

Core Courses (9 credits)

EDCI 50000 - Foundations Of Literacy

Credit Hours: 3.00. Survey course in the acquisition of and instruction in reading, writing, and other aspects of language.

Learning Outcomes: 1. Develop a broad background and comprehensive understanding of literacy history, theory, and the socio-cultural influences that have shaped research and practice in the field. 2. Examine the constructs of reading and literacy from multiple theoretical perspectives, and in differing historical contexts. 3. Use new understandings to critically examine current theoretical perspectives and instructional practices. Credits: 3.00

EDPS 53300 - Introduction To Educational Research I: Methodology

Credit Hours: 3.00. This course presents a sequence of journal articles and exercises that help introduce the foundational concepts of the course, including: research design, reliability and validity, various methodologies commonly used in educational research, and basic quantitative and qualitative data analyses. In addition, contrasting research conclusions are shown in the articles to help students learn why careful analysis of articles and their theoretical framing is critical to evaluating their conclusions.

Learning Outcomes: 1. Find research literature. 2. Read and critique educational research. 3. Deepen knowledge of at least one research area in education. 4. Design, conduct, analyze, and write a research project. Credits: 3.00

EDCI 58500 - Multicultural Education

Credit Hours: 3.00. The course aims to develop understanding of multicultural education as an on-going reform process that addresses social justice issues through an examination of race, class, gender, ethnicity, language, sexual orientation, etc.

Learning Outcomes: 1. Develop awareness of multicultural issues in education and other fields. 2. Increase knowledge of multicultural education and applications of multicultural theories to education and other disciplines. 3. Develop skills in meeting the needs of diverse populations. Credits: 3.00

Selectives (6 credits)

EDPS 53000 - Cognition And Learning In Context

Credit Hours: 3.00. Theories of learning and development, research on instruction and learning, and principles of measurement applied to educational problems.

Learning Outcomes: 1. Understand the central components of Behaviorism, differentiate between classical and operant conditioning, and apply the theories to teaching and learning. 2. Understand the central tenets of constructivism, identify a range of constructivist theories or perspectives, and distinguish constructivism from behaviorism. 3. Understand the central components of theories of learning and development developed by Bandura, Piaget, and Vygotsky, and apply them to teaching and learning. 4. Understand the roles of memory, expertise, transfer, conceptual change, meta-cognition, and self-regulated learning for student learning, and their implications for teaching. 5. Identify the central characteristics of instructional scaffolding, and cooperative and collaborative learning, how they are associated with learning, and how they may be instantiated. 6. Understand central tenets of sociocultural (or sociohistorical) and situated theories of learning and development and apply them to teaching and learning. 7. Understand the central characteristics of inquiry (or project-based learning) and their affordances and limitations with respect to teaching and learning. 8. Understand how policies (educational and otherwise), political priorities, beliefs, and national and international factors affect affordances for teaching and learning. Credits: 3.00

EDPS 53300 - Introduction To Educational Research I: Methodology

Credit Hours: 3.00. This course presents a sequence of journal articles and exercises that help introduce the foundational concepts of the course, including: research design, reliability and validity, various methodologies commonly used in educational research, and basic quantitative and qualitative data analyses. In addition, contrasting research conclusions are shown in the articles to help students learn why careful analysis of articles and their theoretical framing is critical to evaluating their conclusions.

Learning Outcomes: 1. Find research literature. 2. Read and critique educational research. 3. Deepen knowledge of at least one research area in education. 4. Design, conduct, analyze, and write a research project. Credits: 3.00

EDPS 54000 - Gifted, Creative And Talented Children

Credit Hours: 3.00. This course is an introduction to the intellectual, social, and emotional characteristics of gifted youth; philosophies of gifted education; and programmatic and classroom approaches for supporting gifted students generally and within different domains (e.g., intellectual, academic, creative, artistic, leadership).

Learning Outcomes: 1. Understand who gifted, creative, and talented children are and how their talent development needs can be met in the school setting. 2. Recognize the diversity that exists within the gifted, creative, and talented population. 3. Understand the history, philosophical traditions, and paradigms of practice in gifted education. 4. Develop awareness of specific strategies for supporting gifted, creative, and talented students within the school context. 5. Develop awareness of key professional resources in the field of gifted education and talent development. 6. Develop a personal identity as a practitioner of gifted education. Credits: 3.00

EDPS 59100 - Special Topics In Education

Credit Hours: 1.00 to 4.00. Group study of a current problem or special topic of interest to professional educational personnel. Intensive study of research, theory, or practical aspects of a particular issue within the usual graduate class format.

Credits: 1.00 to 4.00

EDST 60000 - Seminar In The Foundations Of Education

Credit Hours: 3.00. Recommended for those who have had a prior foundations course. Specialized studies in such areas as educational history, educational philosophy, educational sociology, religion and public education, current educational issues, and classical literature of education.

Credits: 3.00

EDCI 58000 - Foundations Of Curriculum

Credit Hours: 3.00. Introduction to the major historical and

philosophical sources of curriculum ideas. Significant forces influencing curriculum decision making. Different theoretical approaches to the construction and analysis of curriculum.

Learning Outcomes: 1. Engage critically with germinal thinkers and thought in curriculum. 2. Examine various curriculum approaches and traditions within their historical and social contexts. 3. Explore the major philosophies that undergirds curriculum approaches and deliberation. 4. Analyze the political origins and implications of differing traditions within the curriculum field and within educational policy and practice. 5. Integrate learning from curriculum history, theory, and research into one's teaching, scholarship, and/or engagement. Credits: 3.00

Literacy and Language English Electives (9 credits)

Electives (0-6 credits)

Thesis Research (3-6 credits)

EDCI 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required.

Credits: 1.00 to 18.00

Curriculum and Instruction: English Language Learning Concentration, MSED

About the Program

Program Requirements

Required Courses (26 credits)

Core Courses (11 credits)

EDCI 51300 - Foundations Of Learning Design And Technology

Credit Hours: 3.00. Provides an historical overview of the field and delineates the foundational knowledge, skills, and attitudes needed by professionals in the field of educational technology and instructional design. Students explore the field by engaging in collaborative projects, along with thinking and writing about various aspects of educational technology and the underlying instructional design theories.

Learning Outcomes: 1. Explain/describe the history and foundations of the field. 2. Define learning design and technology and distinguish among its components and related fields. 3. Identify and describe current and emerging issues in the field. 4. Initiate steps toward becoming a professional in the field of learning design and technology. Credits: 3.00

EDCI 52600 - Language Study For Educators

Credit Hours: 3.00. (ENGL 52900) Covers foundational knowledge in language and linguistics for teachers and educational researchers. Topics include structure and functions of language, language acquisition and development, language diversity, classroom discourse, language and media, and literacy-language arts curriculum. A foundation for work in Literacy and Language Education.

Learning Outcomes: 1. Understand the concepts and theories of how second (and more) languages are acquired and processed through an examination of current research into second language acquisition. 2. Examine this research to develop a greater understanding of the issues and challenges faced by students as they learn English as a New Language, and how teachers can develop practice which address these needs. Credits: 3.00

EDCI 53000 - English Language Development

Credit Hours: 3.00. Focuses on theoretical and practical knowledge for teachers about how second languages are learned, and on the educational and philosophical basis for second language teaching and learning. Links English language development to teaching and learning strategies and is

designed for undergraduate and graduate students in education and practicing teachers.

Learning Outcomes: 1. Develop increased understanding of the English language development process by English language learners (ELLSs). 2. Describe the importance of the changing demographics in the U.S. and Indiana as they relate to ELLs. 3. Explore the literacy development of ELLs in broader sociocultural contexts. 4. Describe the importance of explicit teaching and the oral and written language development for ELLs. 5. Develop understanding of the nature and role of culture in language development and academic achievement, considering the development of literacy and biliteracy by ELLS. 6. Explore how individual differences affect English language development. 7. Gain experience in identifying the learning challenges of ELLs and assessing ELLs' learning in P-12 classrooms. 8. Collaborate with colleagues in activities and assignments and in planning to build partnerships with ELLs' families. 9. Develop understanding of their roles as ELL teachers and professionals in advocating on behalf of ELLs. 10. Discuss the role of the teacher in the English language development of ELLs. Credits: 3.00

EDCI 58500 - Multicultural Education

Credit Hours: 3.00. The course aims to develop understanding of multicultural education as an on-going reform process that addresses social justice issues through an examination of race, class, gender, ethnicity, language, sexual orientation, etc.

Learning Outcomes: 1. Develop awareness of multicultural issues in education and other fields. 2. Increase knowledge of multicultural education and applications of multicultural theories to education and other disciplines. 3. Develop skills in meeting the needs of diverse populations. Credits: 3.00

EDCI 55700 - Assessment Of Culturally And Linguistically Diverse Students

Credit Hours: 3.00. Critical review of research and practice in language proficiency and content-area assessment of culturally and linguistically diverse students in K-12 education, and the sociocultural dimensions of standardized testing, academic achievement, and accountability. Critical analysis of standardized language proficiency and literacy tests. Development of authentic alternative language, literacy and content-area assessments. Prerequisites: Background in K-12 education.

Learning Outcomes: 1. Describe and critically analyze historical foundations, current research issues, national and state policies, and current practices in the testing and assessment of culturally and linguistically diverse students. 2. Critically analyze the results of standardized language proficiency and academic achievement tests and their use in accountability programs. 3. Design, utilize, and critically analyze the results of alternative authentic language and content-area assessments. 4. Describe the impact of linguistic and cultural factors on the assessment process of linguistically diverse students. Credits: 3.00

EDCI 51900 - Teaching English Language Learners

Credit Hours: 3.00. This course focuses on current issues and techniques in ESL instruction and assessment for students at the beginning or intermediate stages of English language acquisition Pre-K-12. Emphasis is on the design of materials and instruction that foster English language development in the content areas of the curriculum (i.e., Specially Designed Academic Instruction in English or SDAIE). Some familiarity with elementary and/or secondary teaching methods is assumed.

Learning Outcomes: 1. Design materials and instruction that foster English language development in the ENL classroom environment as well as in content areas of the curriculum. Credits: 3.00

EDCI 52001 - Curriculum And Instruction Online MS Seminar I

Credit Hours: 1.00. This boot camp is designed to help you to understand the knowledge and skills necessary for your

successful online learning in the Curriculum and Instruction program. In this orientation, you will explore what online learning entails and reflect on how you can best set yourself up to succeed in your studies. You will also learn about various learning strategies and online resources that you can utilize in your courses. In this seminar, you will be responsible for completing all assignments on time over the course of the semester. Read the guidelines for each week and complete the assignments. NOTE: This course is a core course in the C&I online masters program. A grade of B- or better is required (if a lower grade is received, the course must be retaken). Permission of department required.

Learning Outcomes: 1. Exhibit knowledge of academic integrity by completing plagiarism, statement of commitment, and APA tutorials. 2. Effectively explain your professional goals for the program by writing an initial reflection. 3. Identify essential components of the Curriculum and Instruction Handbook, including what is required for the final portfolio. 4. Develop and apply group project skills and management techniques to make you successful in future courses and your career. 5. Demonstrate digital skills and competence with various digital tools (i.e., blogs, screencasting, Google docs, file sharing). 6. Be aware of current trends in the field of distance education and how they relate to your focus. Credits: 1.00

EDCI 52002 - Curriculum And Instruction Online MS Seminar II

Credit Hours: 1.00. This seminar is designed to help you to understand the knowledge and skills necessary for your success throughout the Curriculum and Instruction program. In addition to providing you with information that will help you succeed in the program, you are also asked to think about ways to make yourself more marketable to current and future employers. Permission of department required.

Learning Outcomes: 1. Investigate the skills and knowledge needed to be successful in a relevant career within the C&I field. 2. Describe program and career goals. 3. Apply research skills required to compose an annotated bibliography. 4. Create the foundation of a C&I portfolio displaying programmatic achievements and course competencies. Credits: 1.00

EDCI 52003 - Theories And Trends In Curriculum And Instruction

Credit Hours: 3.00. This course focuses on current theories and trends influencing curriculum and instruction. A theory is a plausible or scientifically acceptable general principle or body of principles offered to explain phenomena. It is a belief, policy, or procedure proposed or followed as the basis of action. A trend, on the other hand, is a pattern of gradual change in a condition, output, or process. It reflects a general tendency of a series of moves in a certain direction over time. We will focus on understanding sources of current theories and trends and how they may influence work in curriculum and instruction. Permission of department required.

Learning Outcomes: 1. Examine and clarify the educational beliefs, values, and knowledge guiding your curricular and instructional decisions. 2. Utilize and evaluate multiple appropriate sources in researching current curriculum and instruction trends and issues. 3. Interpret, critique, and synthesize relevant research related to current curriculum and instruction trends. 4. Assess the implications of research relative to your curricular and instructional practices. 5. Interpret, critique, and synthesize relevant educational theories related to current curriculum and instruction trends. 6. Assess the implications of educational theories relative to your curricular and instructional practices. 7. Interpret, critique, and synthesize relevant state and national policy decisions related to current curriculum and instruction trends. 8. Assess the implications of state and national policy decisions relative to your curricular and instructional practices. 9. Communicate effectively in oral and written formats. 10. Demonstrate the disposition for life-long learning and continuous professional development. 11. Identify communities of practice within discipline and participate within these communities according to the ethical standards of the discipline. 12. Examine and clarify how your educational beliefs, values, and knowledge guide your curricular and

instructional decisions address the diversity of students, schools, and communities. 13. Advocate for values of diversity, inclusivity, and social justice. Credits: 3.00

EDCI 52004 - Teachers As Leaders

Credit Hours: 3.00. This course focuses on teacher leadership in instruction. Participants will examine the history of teacher leadership. Instructional coaching models will be examined and compared. Students will identify the various theories that support each coaching model and examine what is most present in their school contexts. Permission of department required.

Learning Outcomes: 1. Investigate the construct of school leadership. 2. Evaluate potential leadership roles in classrooms, schools, or other organizations. 3. Research teacher leadership praxis to impact future praxis. 4. Synthesize leadership research in conjunction with theories of social justice and equity. 5. Analyze the skills of effective teacher leadership through collaboration and inquiry. 6. Explore the critical role teachers play in creating conditions for continuous and systematic improvements in education. Credits: 3.00

EDCI 67900 - Capstone: Inquiry Into Practice

Credit Hours: 3.00. This course conceptually centers on the Ghanaian Sankofa symbol of a bird retrieving an egg from its back while facing forward. This metaphor represents the need to "go back to the past and bring forward that which is useful" (About the Sankofa [n.d.]. Retrieved from https://cola.siu.edu/africanastudies/about-us/sankofa.php). The twin aspect of looking back with the future in mind plays out in consonance with the Portfolio course generally taken in tandem with this course. In this course, students will reinforce and extend their learning of key concepts across the program and deepen their engagement with a topic of interest to them through an action research project. Permission of department required.

Learning Outcomes: 1. Evaluate how your program's experiences, knowledge, and skills will inform your future action and pedagogical practices through reflection and self-critical inquiry. 2. Articulate where you are situated epistemologically, ontologically, and methodologically as educators and researchers within and across disciplines. 3. Demonstrate a commitment to ongoing development as knowledgeable and engaged advocates for equitable education through the exploration of intersectionality. 4. Conduct an action research project that identifies a problem within your classroom or school community and seeks to ameliorate it. 5. Communicate research findings with a broader audience of stakeholders. Credits: 3.00

ELL Courses (15 credits)

EDCI 52600 - Language Study For Educators

Credit Hours: 3.00. (ENGL 52900) Covers foundational knowledge in language and linguistics for teachers and educational researchers. Topics include structure and functions of language, language acquisition and development, language diversity, classroom discourse, language and media, and literacy-language arts curriculum. A foundation for work in Literacy and Language Education.

Learning Outcomes: 1. Understand the concepts and theories of how second (and more) languages are acquired and processed through an examination of current research into second language acquisition. 2. Examine this research to develop a greater understanding of the issues and challenges faced by students as they learn English as a New Language, and how teachers can develop practice which address these needs. Credits: 3.00

EDCI 53000 - English Language Development

Credit Hours: 3.00. Focuses on theoretical and practical knowledge for teachers about how second languages are learned, and on the educational and philosophical basis for second language teaching and learning. Links English language development to teaching and learning strategies and is designed for undergraduate and graduate students in education and practicing teachers.

Learning Outcomes: 1. Develop increased understanding of the English language development process by English language

learners (ELLSs). 2. Describe the importance of the changing demographics in the U.S. and Indiana as they relate to ELLs. 3. Explore the literacy development of ELLs in broader sociocultural contexts. 4. Describe the importance of explicit teaching and the oral and written language development for ELLs. 5. Develop understanding of the nature and role of culture in language development and academic achievement, considering the development of literacy and biliteracy by ELLS. 6. Explore how individual differences affect English language development. 7. Gain experience in identifying the learning challenges of ELLs and assessing ELLs' learning in P-12 classrooms. 8. Collaborate with colleagues in activities and assignments and in planning to build partnerships with ELLs' families. 9. Develop understanding of their roles as ELL teachers and professionals in advocating on behalf of ELLs. 10. Discuss the role of the teacher in the English language development of ELLs. Credits: 3.00

EDCI 55900 - Academic Language And Content Area Learning

Credit Hours: 3.00. (ENGL 59900) Course focuses on theoretical and practical knowledge for teachers about how second languages are learned, and on the educational and philosophical basis for second language teaching and learning. The course links English language development to teaching and learning strategies and is designed for undergraduate and graduate students in education and practicing teachers.

Learning Outcomes: 1. Develop an understanding of the linguistic challenges of academic language in the content areas of science, language arts, mathematics, and the social studies for ELLs. 2. Gain experience in determining academic tasks that require advanced levels of reading and writing. 3. Learn about the development of academic literacy as ELLs move from elementary into secondary and post secondary education. Credits: 3.00

EDCI 55700 - Assessment Of Culturally And Linguistically Diverse Students

Credit Hours: 3.00. Critical review of research and practice in language proficiency and content-area assessment of culturally and linguistically diverse students in K-12 education, and the sociocultural dimensions of standardized testing, academic achievement, and accountability. Critical analysis of standardized language proficiency and literacy tests. Development of authentic alternative language, literacy and content-area assessments. Prerequisites: Background in K-12 education.

Learning Outcomes: 1. Describe and critically analyze historical foundations, current research issues, national and state policies, and current practices in the testing and assessment of culturally and linguistically diverse students. 2. Critically analyze the results of standardized language proficiency and academic achievement tests and their use in accountability programs. 3. Design, utilize, and critically analyze the results of alternative authentic language and content-area assessments. 4. Describe the impact of linguistic and cultural factors on the assessment process of linguistically diverse students. Credits: 3.00

EDCI 51900 - Teaching English Language Learners

Credit Hours: 3.00. This course focuses on current issues and techniques in ESL instruction and assessment for students at the beginning or intermediate stages of English language acquisition Pre-K-12. Emphasis is on the design of materials and instruction that foster English language development in the content areas of the curriculum (i.e., Specially Designed Academic Instruction in English or SDAIE). Some familiarity with elementary and/or secondary teaching methods is assumed.

Learning Outcomes: 1. Design materials and instruction that foster English language development in the ENL classroom environment as well as in content areas of the curriculum. Credits: 3.00

Portfolio Course (1 credit)

EDCI 68000 - Curriculum & Instruction MS Portfolio

Credit Hours: 1.00. This course was created to help guide C&I students near completion of their coursework to develop their competency portfolio. A competency portfolio reflects the depth and breadth of a student's educational growth since entering the graduate program. The purpose of the C&I competency portfolio is to demonstrate that students have mastered the graduate competencies for the C&I online Master's program. The portfolio will contain student projects aligned with C&I competencies and will be reviewed by committee members. The competencies are based on the Curriculum & Instruction departmental competencies and several program-specific competencies. The competency portfolio is a requirement for graduation from the C&I Master's program. (Multiple media are welcome.) Permission of department required.

Learning Outcomes: 1. Develop an online version of your competency portfolio based on artifacts as evidence. 2. Compose reflective narratives that explain how your artifacts demonstrate each competency. 3. Develop an updated resume or vita suitable for job searching. 4. Deconstruct relevant job postings in the field. Credits: 1.00

Capstone Course (3 credits)

EDCI 67900 - Capstone: Inquiry Into Practice

Credit Hours: 3.00. This course conceptually centers on the Ghanaian Sankofa symbol of a bird retrieving an egg from its back while facing forward. This metaphor represents the need to "go back to the past and bring forward that which is useful" (About the Sankofa [n.d.]. Retrieved from https://cola.siu.edu/africanastudies/about-us/sankofa.php). The twin aspect of looking back with the future in mind plays out in consonance with the Portfolio course generally taken in tandem with this course. In this course, students will reinforce and extend their learning of key concepts across the program and deepen their engagement with a topic of interest to them through an action research project. Permission of department required.

Learning Outcomes: 1. Evaluate how your program's experiences, knowledge, and skills will inform your future action and pedagogical practices through reflection and self-critical inquiry. 2. Articulate where you are situated epistemologically, ontologically, and methodologically as educators and researchers within and across disciplines. 3. Demonstrate a commitment to ongoing development as knowledgeable and engaged advocates for equitable education through the exploration of intersectionality. 4. Conduct an action research project that identifies a problem within your classroom or school community and seeks to ameliorate it. 5. Communicate research findings with a broader audience of stakeholders. Credits: 3.00

GPA Requirements

Curriculum and Instruction: Gifted, Creative, and Talented Studies Concentration, MSED

About the Program

Program Requirements

Required Courses (23 credits)

EDPS 54000 - Gifted, Creative And Talented Children

Credit Hours: 3.00. This course is an introduction to the intellectual, social, and emotional characteristics of gifted youth; philosophies of gifted education; and programmatic and classroom approaches for supporting gifted students generally and within different domains (e.g., intellectual, academic, creative, artistic, leadership).

Learning Outcomes: 1. Understand who gifted, creative, and talented children are and how their talent development needs can be met in the school setting. 2. Recognize the diversity that exists within the gifted, creative, and talented population. 3. Understand the history, philosophical traditions, and paradigms of practice in gifted education. 4. Develop awareness of specific strategies for supporting

gifted, creative, and talented students within the school context. 5. Develop awareness of key professional resources in the field of gifted education and talent development. 6. Develop a personal identity as a practitioner of gifted education. Credits: 3.00

EDPS 54200 - Curriculum And Program Development In Gifted Education

Credit Hours: 3.00. This course is an introduction to the curriculum development and program design for meeting the needs of gifted, creative, and talented students. Students will be exposed to established program and curriculum models, as well as the nuts and bolts of developing curricular plans, materials, and specialized programs that support the advanced learning needs of gifted students.

Learning Outcomes: 1. Students will think strategically about gifted program design, including such design components as mission statements, program goals, building a continuum of services, and designing student selection procedures. 2. Students will become familiar with major program and curriculum models in gifted education. 3. Students will practice designing and revising lessons to incorporate instructional strategies well suited for high-ability students. 4. Students will become critical evaluators of educational materials and practices to assess their suitability for use with high-ability students. Credits: 3.00

EDPS 54500 - Social And Affective Development Of Gifted Students

Credit Hours: 3.00. This course focuses on the social and emotional development of gifted and talented students. An overview of the characteristics and needs of gifted subpopulations, diversity issues, and family/parenting concerns along with an introduction to current educational approaches and counseling interventions are provided. The course is designed to complement EDPS 54000.

Learning Outcomes: 1. Analyze, synthesize, and evaluate current research literature on the social and affective development of gifted students. 2. Discuss characteristics and needs of subpopulations of gifted and talented learners and the implications for academic instruction and/or counseling interventions. 3. Increase knowledge of issues related to the social and affective development of gifted students through class discussion, interaction with gifted students, and completion of CORE assignments. Credits: 3.00

EDPS 69500 - Internship In Education

Credit Hours: 1.00 to 10.00. Amount of credit to be determined by nature and extent of the assignment. A special course in selected areas of education, designed to provide practical field experience under professional supervision in selected situations related to the candidate's area of specialization. Permission of instructor required.

Learning Outcomes: 1. Measure and evaluate one's professional growth and case conceptualization skills through use of audio tapes and case notes. 2. Demonstrate respect, understanding, and tolerance of multicultural and diversity issues as they relate to clients' need and concerns. 3. Demonstrate ethical and professional behavior in accord with the ACA Code of Ethics. Credits: 1.00 to 10.00

Core Courses (11 credits)

EDCI 58500 - Multicultural Education

Credit Hours: 3.00. The course aims to develop understanding of multicultural education as an on-going reform process that addresses social justice issues through an examination of race, class, gender, ethnicity, language, sexual orientation, etc.

Learning Outcomes: 1. Develop awareness of multicultural issues in education and other fields. 2. Increase knowledge of multicultural education and applications of multicultural theories to education and other disciplines. 3. Develop skills in meeting the needs of diverse populations. Credits: 3.00

EDCI 52001 - Curriculum And Instruction Online MS Seminar I

Credit Hours: 1.00. This boot camp is designed to help you to understand the knowledge and skills necessary for your successful online learning in the Curriculum and Instruction

program. In this orientation, you will explore what online learning entails and reflect on how you can best set yourself up to succeed in your studies. You will also learn about various learning strategies and online resources that you can utilize in your courses. In this seminar, you will be responsible for completing all assignments on time over the course of the semester. Read the guidelines for each week and complete the assignments. NOTE: This course is a core course in the C&I online masters program. A grade of B- or better is required (if a lower grade is received, the course must be retaken). Permission of department required.

Learning Outcomes: 1. Exhibit knowledge of academic integrity by completing plagiarism, statement of commitment, and APA tutorials. 2. Effectively explain your professional goals for the program by writing an initial reflection. 3. Identify essential components of the Curriculum and Instruction Handbook, including what is required for the final portfolio. 4. Develop and apply group project skills and management techniques to make you successful in future courses and your career. 5. Demonstrate digital skills and competence with various digital tools (i.e., blogs, screencasting, Google docs, file sharing). 6. Be aware of current trends in the field of distance education and how they relate to your focus. Credits: 1.00

EDCI 52002 - Curriculum And Instruction Online MS Seminar II

Credit Hours: 1.00. This seminar is designed to help you to understand the knowledge and skills necessary for your success throughout the Curriculum and Instruction program. In addition to providing you with information that will help you succeed in the program, you are also asked to think about ways to make yourself more marketable to current and future employers. Permission of department required.

Learning Outcomes: 1. Investigate the skills and knowledge needed to be successful in a relevant career within the C&I field. 2. Describe program and career goals. 3. Apply research skills required to compose an annotated bibliography. 4. Create the foundation of a C&I portfolio displaying programmatic achievements and course competencies. Credits: 1.00

EDCI 52003 - Theories And Trends In Curriculum And Instruction

Credit Hours: 3.00. This course focuses on current theories and trends influencing curriculum and instruction. A theory is a plausible or scientifically acceptable general principle or body of principles offered to explain phenomena. It is a belief, policy, or procedure proposed or followed as the basis of action. A trend, on the other hand, is a pattern of gradual change in a condition, output, or process. It reflects a general tendency of a series of moves in a certain direction over time. We will focus on understanding sources of current theories and trends and how they may influence work in curriculum and instruction. Permission of department required.

Learning Outcomes: 1. Examine and clarify the educational beliefs, values, and knowledge guiding your curricular and instructional decisions. 2. Utilize and evaluate multiple appropriate sources in researching current curriculum and instruction trends and issues. 3. Interpret, critique, and synthesize relevant research related to current curriculum and instruction trends. 4. Assess the implications of research relative to your curricular and instructional practices. 5. Interpret, critique, and synthesize relevant educational theories related to current curriculum and instruction trends. 6. Assess the implications of educational theories relative to your curricular and instructional practices. 7. Interpret, critique, and synthesize relevant state and national policy decisions related to current curriculum and instruction trends. 8. Assess the implications of state and national policy decisions relative to your curricular and instructional practices. 9. Communicate effectively in oral and written formats. 10. Demonstrate the disposition for life-long learning and continuous professional development. 11. Identify communities of practice within discipline and participate within these communities according to the ethical standards of the discipline. 12. Examine and clarify how your educational beliefs, values, and knowledge guide your curricular and

instructional decisions address the diversity of students, schools, and communities. 13. Advocate for values of diversity, inclusivity, and social justice. Credits: 3.00

EDCI 52004 - Teachers As Leaders

Credit Hours: 3.00. This course focuses on teacher leadership in instruction. Participants will examine the history of teacher leadership. Instructional coaching models will be examined and compared. Students will identify the various theories that support each coaching model and examine what is most present in their school contexts. Permission of department required.

Learning Outcomes: 1. Investigate the construct of school leadership. 2. Evaluate potential leadership roles in classrooms, schools, or other organizations. 3. Research teacher leadership praxis to impact future praxis. 4. Synthesize leadership research in conjunction with theories of social justice and equity. 5. Analyze the skills of effective teacher leadership through collaboration and inquiry. 6. Explore the critical role teachers play in creating conditions for continuous and systematic improvements in education. Credits: 3.00

Gifted, Creative, and Talented Courses (12 credits)

EDPS 54000 - Gifted, Creative And Talented Children

Credit Hours: 3.00. This course is an introduction to the intellectual, social, and emotional characteristics of gifted youth; philosophies of gifted education; and programmatic and classroom approaches for supporting gifted students generally and within different domains (e.g., intellectual, academic, creative, artistic, leadership).

Learning Outcomes: 1. Understand who gifted, creative, and talented children are and how their talent development needs can be met in the school setting. 2. Recognize the diversity that exists within the gifted, creative, and talented population. 3. Understand the history, philosophical traditions, and paradigms of practice in gifted education. 4. Develop awareness of specific strategies for supporting gifted, creative, and talented students within the school context. 5. Develop awareness of key professional resources in the field of gifted education and talent development. 6. Develop a personal identity as a practitioner of gifted education. Credits: 3.00

EDPS 54200 - Curriculum And Program Development In Gifted Education

Credit Hours: 3.00. This course is an introduction to the curriculum development and program design for meeting the needs of gifted, creative, and talented students. Students will be exposed to established program and curriculum models, as well as the nuts and bolts of developing curricular plans, materials, and specialized programs that support the advanced learning needs of gifted students.

Learning Outcomes: 1. Students will think strategically about gifted program design, including such design components as mission statements, program goals, building a continuum of services, and designing student selection procedures. 2. Students will become familiar with major program and curriculum models in gifted education. 3. Students will practice designing and revising lessons to incorporate instructional strategies well suited for high-ability students. 4. Students will become critical evaluators of educational materials and practices to assess their suitability for use with high-ability students. Credits: 3.00

EDPS 54500 - Social And Affective Development Of Gifted Students

Credit Hours: 3.00. This course focuses on the social and emotional development of gifted and talented students. An overview of the characteristics and needs of gifted subpopulations, diversity issues, and family/parenting concerns along with an introduction to current educational approaches and counseling interventions are provided. The course is designed to complement EDPS 54000.

Learning Outcomes: 1. Analyze, synthesize, and evaluate current research literature on the social and affective development of gifted students. 2. Discuss characteristics and needs

of subpopulations of gifted and talented learners and the implications for academic instruction and/or counseling interventions. 3. Increase knowledge of issues related to the social and affective development of gifted students through class discussion, interaction with gifted students, and completion of CORE assignments. Credits: 3.00

EDPS 69500 - Internship In Education

Credit Hours: 1.00 to 10.00. Amount of credit to be determined by nature and extent of the assignment. A special course in selected areas of education, designed to provide practical field experience under professional supervision in selected situations related to the candidate's area of specialization. Permission of instructor required.

Learning Outcomes: 1. Measure and evaluate one's professional growth and case conceptualization skills through use of audio tapes and case notes. 2. Demonstrate respect, understanding, and tolerance of multicultural and diversity issues as they relate to clients' need and concerns. 3. Demonstrate ethical and professional behavior in accord with the ACA Code of Ethics. Credits: 1.00 to 10.00

Selective (3 credits)

EDCI 51300 - Foundations Of Learning Design And Technology

Credit Hours: 3.00. Provides an historical overview of the field and delineates the foundational knowledge, skills, and attitudes needed by professionals in the field of educational technology and instructional design. Students explore the field by engaging in collaborative projects, along with thinking and writing about various aspects of educational technology and the underlying instructional design theories.

Learning Outcomes: 1. Explain/describe the history and foundations of the field. 2. Define learning design and technology and distinguish among its components and related fields. 3. Identify and describe current and emerging issues in the field. 4. Initiate steps toward becoming a professional in the field of learning design and technology. Credits: 3.00

EDCI 52800 - Human Performance Technology

Credit Hours: 3.00. This course provides an introduction to the field of human performance technology (HPT). It examines basic concepts and principles of human performance, the theoretical underpinnings of the field, research and application literature, and various approaches to solving human performance problems. A systematic approach to the analysis, design, development, implementation and evaluation of performance improvement interventions within organizations is emphasized.

Learning Outcomes: 1. Identify the major theoretical underpinnings of the field of HPT. 2. Describe the relationship between the systematic development of instruction and HPT. 3. Analyze a human performance system in order to diagnose a performance gap. 4. Determine whether training, a non-training performance intervention, or a combination is most appropriate for a given situation. 5. Construct a systemic plan to address performance issue(s), including coordinated interventions and evaluation strategies. 6. Design appropriate interventions to address specific performance gaps. Credits: 3.00

EDCI 56000 - Educational Technology For Teaching And Learning

Credit Hours: 3.00. This course addresses the fundamentals of educational/learning technologies within both the traditional classroom, as well as the corporate/business training environments. Students will explore and evaluate various tools/technologies and determine how, when, and why such technologies can/should be infused into normal, hybrid, or fully online learning situations. The goal of the course is to help the student plan, implement, and evaluate technology for teaching and learning.

Learning Outcomes: 1. Demonstrate the ability to access, generate, and manipulate information through the use of various software and technology apps. 2. Apply educational technology to communicate, collaborate, conduct research, and solve problems, as well as promote equitable, ethical, and legal use of computer/technology resources. 3. Apply and

integrate educational technology to support instruction in selected developmental and content areas. Credits: 3.00

EDCI 56400 - Integration And Management Of Technology For Learning

Credit Hours: 3.00. This course focuses on techniques for and issues related to integrating technology in learning environments in a meaningful way. Topics covered stem from literature in the field and include (1) theoretical foundations of technology integration, including how technology can support a more personalized approach to learning, (2) instructional and learning issues with technology integration, (3) designing for the integration of technologies for in learning environments, and (4) emerging issues in research and practice with technology integration. Class activities are designed to model applications of learning technology, while class projects allow individuals to develop skills and knowledge in areas of your personal need or interest. The goal of the course is to help you develop an understanding of important issues associated with the integration and management of learning technology and to effectively plan, design, implement, and evaluate technology-based learning.

Learning Outcomes: 1. Apply educational technology to enhance professional growth and productivity. 2. Use technology to communicate, collaborate, conduct research, and solve problems. 3. Apply the information from this course into authentic settings. 4. Successfully integrate technology into different forms of instruction. Credits: 3.00

EDCI 56600 - Educational Applications Of Multimedia

Credit Hours: 3.00. Examination of educational applications of hypermedia tools and related research. Creation of hypermedia instructional materials. Incorporation of digitized media (sound, photographs, and motion clips) in hypermedia is explored.

Learning Outcomes: 1. Explain the effectiveness of a specific instructional design principle in educational multimedia design. 2. Demonstrate when and how to use specific instructional design principles within a given educational multimedia learning environment. 3. Address the key principles and methods for evaluating student outcomes in a multimedia learning environment. 4. Develop educational computer-based multimedia instructional materials with various software and tools. 5. Be familiar with the history of multimedia research and design and underlying assumptions from relevant theorists. 6. Explain variations in usability testing and its role in multimedia development. Credits: 3.00

EDCI 58800 - Motivation And Instructional Design

Credit Hours: 3.00. This course has been designed to provide an in-depth study of motivation as one of the fundamental variables underlying human learning, behavior, and instructional design. The focus of the course is on two areas: 1) theories of motivation and the general principles that have contributed to the field of instructional design, and 2) how those principles are applied within practical design settings.

Learning Outcomes: 1. Identify and describe the basic tenets of various theories of motivation. 2. Compare and contrast the contributions that the various motivational theories offer to the field of instructional design. 3. Select appropriate principles derived from given theories and apply those principles within practical design situations. 4. Analyze motivational problems in learning and performance and design effective solutions. 5. Consider motivational theories and their relation to current research in Education and Instructional Design. Credits: 3.00

EDPS 55500 - Differentiating Curriculum & Instruction

Credit Hours: 3.00. This course provides a solid foundation and set of principles for differentiating curriculum and instruction in any classroom at any grade level. Students will explore a variety of evidence-based strategies, tools, and curriculum models that effectively meet the diverse needs of all learners. Through readings, online class meetings and discussions, case studies, differentiated instruction examples, direct application, and reflection, students will deepen their understanding and need to differentiate. With an overarching goal of increasing achievement and developing student talents, this course includes the following major components: creating positive learning environments that support a) high-quality curriculum; b) diagnostic, formative, and summative assessments to inform instructional decision-making; and c) flexible grouping; addressing student differences in readiness, interest, and learning profile (including learning preference, intelligence preference, gender, culture, language preference, locale, and opportunities to learn) and appreciating how these differences influence the ways in which students learn and are motivated;

understanding that the process of differentiation involves modifying content, process, product, learning environment, and/or affect; incorporating higher-order thinking skills, creative problem solving, project-based learning, authentic/respectful tasks, collaborative learning, and other evidence-based strategies to promote student achievement and talent development; understanding how differentiation of curriculum and instruction fits within specific educational interventions and models, such as scaffolding, flexible grouping, Response to Intervention (RTI), and Multi-Tiered System of Support (MTSS).

Learning Outcomes: 1. Deconstruct the concept of differentiation as a response to the readiness levels; interests; learning preferences and strengths; and academic, social, emotional needs of learners by modifying curriculum, instruction, learning environment, and/or affect. 2. Assess students' readiness, interests, and learning profiles to create differentiated lessons that utilize instructional strategies and technologies that motivate and engage students in learning, including those from special populations. 3. Develop, implement, and evaluate various differentiated instructional plans designed to maximize learning and demonstrate proficiency in analyzing and evaluating differentiated lessons taught by other teachers. 4. Evaluate and reflect upon your course experience and your plan to implement differentiation knowledge and skills gained in this course. Credits: 3.00

Portfolio Course (1 credit)

EDCI 68000 - Curriculum & Instruction MS Portfolio

Credit Hours: 1.00. This course was created to help guide C&I students near completion of their coursework to develop their competency portfolio. A competency portfolio reflects the depth and breadth of a student's educational growth since entering the graduate program. The purpose of the C&I competency portfolio is to demonstrate that students have mastered the graduate competencies for the C&I online Master's program. The portfolio will contain student projects aligned with C&I competencies and will be reviewed by committee members. The competencies are based on the Curriculum & Instruction departmental competencies and several program-specific competencies. The competency portfolio is a requirement for graduation from the C&I Master's program. (Multiple media are welcome.) Permission of department required.

Learning Outcomes: 1. Develop an online version of your competency portfolio based on artifacts as evidence. 2. Compose reflective narratives that explain how your artifacts demonstrate each competency. 3. Develop an updated resume or vita suitable for job searching. 4. Deconstruct relevant job postings in the field. Credits: 1.00

Capstone Course (3 credits)

EDCI 67900 - Capstone: Inquiry Into Practice

Credit Hours: 3.00. This course conceptually centers on the Ghanaian Sankofa symbol of a bird retrieving an egg from its back while facing forward. This metaphor represents the need to "go back to the past and bring forward that which is useful" (About the Sankofa [n.d.]. Retrieved from https://cola.siu.edu/africanastudies/about-us/sankofa.php). The twin aspect of looking back with the future in mind plays out in consonance with the Portfolio course generally taken in tandem with this course. In this course, students will reinforce and extend their learning of key concepts across the program and deepen their engagement with a topic of interest to them through an action research project. Permission of department required.

Learning Outcomes: 1. Evaluate how your program's experiences, knowledge, and skills will inform your future action and pedagogical practices through reflection and self-critical inquiry. 2. Articulate where you are situated epistemologically, ontologically, and methodologically as educators and researchers within and across disciplines. 3. Demonstrate a commitment to ongoing development as knowledgeable and engaged advocates for equitable education through the exploration of intersectionality. 4. Conduct an action research project that identifies a problem within your classroom or school community and seeks to ameliorate it. 5. Communicate research findings with a broader audience of stakeholders.

Credits: 3.00

GPA Requirements

Curriculum and Instruction: Integrated STEM Education Concentration, MSED

About the Concentration

Required Courses (12 credits)

EDCI 54900 - Assessment In STEM Education

Credit Hours: 3.00. This course is designed to help teachers of STEM recognize the link between productive assessment and productive instruction, using the STEM education standards for teacher competence in educational assessment. This course is designed to help teachers meet those professional standards and understand the public pressure as well as instructional need for effective formative and summative assessment.

Learning Outcomes: 1. Choose appropriate assessment methods. 2. Develop appropriate assessment methods. 3. Administer scoring and interpreting assessment results. 4. Use assessment results to make decisions about individual students, plan teaching and develop curriculum. 5. Communicate assessment results to students, parents, and other educators. 6. Recognize inappropriate assessment methods and uses of assessment information. Credits: 3.00

EDCI 53900 - Introduction To K-12 Integrated Science, Technology, Engineering And Mathematics (STEM) Education

Credit Hours: 3.00. This course will provide students with a conceptual understanding of integrated K-12 Science, Technology, Engineering and Mathematics (STEM) education and the nature of the disciplines of STEM. Students will explore implications for the teaching and learning of integrated STEM in a K-12 context through an evaluation of integrated approaches to STEM, national teaching standards and current research.

Learning Outcomes: 1. Explore the nature of the disciplines of STEM and their roles in a K-12 integrated STEM context. 2. Identify current approaches to integrated STEM education. 3. Explore issues related to diversity and equity in STEM education. 4. Define and describe how reform-based teaching and learning relates to nature of the disciplines of STEM. 5. Summarize the current research on teaching and learning through integrated STEM approaches. 6. Develop STEM integration activities for K-12 settings. 7. Develop an action research proposal to study a problem of interest in teaching or learning in K-12 STEM settings. Credits: 3.00

EDCI 55800 - Integrated Science, Technology, Engineering And Mathematics (STEM) Education Methods-Secondary

Credit Hours: 3.00. Focuses on operationalizing the theoretical pedagogical approaches to integrated Science, Engineering, Mathematics and Agriculture (STEM) education. Collaboratively and cooperatively investigate, plan and deliver integrated learning experiences appropriate for secondary education. Course content will blend philosophical considerations with practical application. Permission of instructor required.

Learning Outcomes: 1. Engage in instructional conversations, collaboratively share instructional resources, and develop a sense of community for integrated STEM learning and teaching. 2. Contextualize STEM learning in authentic contexts. 3. Explain and apply socially and culturally relevant pedagogy in the context of STEM learning. 4. Discuss levels and types of integrated STEM content, pedagogy, and ways of knowing. 5. Develop and disseminate integrated STEM learning experiences. 6. Implement, assess and reflect on integrated STEM learning experiences in public school classrooms. 7. Articulate a framework explaining integrated STEM education. 8. Adapt existing singular discipline curriculum resources to leverage connections across disciplines to facilitate integration. Credits: 3.00

EDCI 55850 - Introduction To Teaching Engineering And Technology Design In The Context Of K-12 Integrated STEM

Credit Hours: 3.00. Engineering and technology design has gained considerable traction in many K-12 schools. In this course, we will examine principals of engineering design and technology as well as where and how engineering and technology design best fits in a K-12 integrated STEM curriculum. Course participants will engage in authentic engineering and technology design experiences. Course participants will also design, develop, deliver integrated lessons that help K-12 students develop the knowledge, skills, and practices of engineering and technology design.

Learning Outcomes: 1. Demonstrate a broad understanding of engineering and technology education disciplines and concepts. 2. Scaffold engineering practices that support diverse learners and describe conceptual understanding and content knowledge of engineering and technology design skills through problem-based learning in i-STEM environments. 3. Comprehend and elaborate data-driven decision-making skills as practiced by engineering and technology professionals to develop solutions to design briefs that support K-12 learning in diverse learning environments. 4. Examine and evaluate the engineering design process in the context of integrated STEM education at the K-12 learning. 5. Collaborate and prepare pedagogical practices in integrated engineering and technology design through integrated STEM that support K-12 learning for a diverse group of learners. Credits: 3.00

Curriculum and Instruction: Learning Design and Technology Concentration, MSED or MS

About the Program

Program Requirements

Required Courses (24 credits)

Prerequisite Courses (0-9 credits)

EDCI 56900 - Introduction To E-Learning

Credit Hours: 3.00. This course examines how the design and development of instruction are impacted by the use of the computer as delivery system. A primary focus is on effective learning design strategies for e-learning. Learners will identify and apply effective design practices with emphasis on project management, planning, and implementation. Education or training materials will be developed using appropriate authoring tools as determined by the instructional context. Learners will design an E-Learning module with end-to-end documentation of the design process (Project Plan, Design Document, Storyboard). Opportunities for collaborative feedback and evaluation will also be featured elements of the course experience.

Learning Outcomes: 1. Identify and implement sound design processes for e-learning. 2. Integrate relevant learning theory into e-learning design decisions. 3. Design, develop, and evaluate an effective e-learning module. Credits: 3.00

EDCI 57200 - Introduction To Learning Systems Design

Credit Hours: 3.00. An introduction to the principles of designing instructional materials and to instructional communication theory and techniques. Topics include objectives, student characteristics, media selection, communication variables, message design, and systematic evaluation.

Learning Outcomes: 1. Describe and apply the components of a systematic design process, their rationales, and uses. 2. Use a systematic design process and instructional psychology principles in performing an analysis of learning context analysis of learners, analysis of learning tasks, in design and development of assessments, and in design of formative and summative evaluation of the instruction itself. Credits: 3.00

EDCI 67200 - Advanced Practices In Learning Systems Design

Credit Hours: 3.00. This course focuses on the application of learning systems design to real-world educational situations through the in-depth consideration of key instructional design

processes (e.g., analysis, design, development, implementation, evaluation). Additionally, a key focus of the course is on the development of instructional design expertise. Prerequisite: EDCI 57200.

Learning Outcomes: 1. Analyze complex instructional design case situations and identify key components (e.g., issues, stakeholders, contextual variables, perspectives, alterative solutions, potential consequences). 2. Propose and/or develop relevant intervention strategies (instructional or non-instructional) to the issues presented in a case situation that are consistent with arguments and evidence presented. 3. Identify and apply key characteristics of expert problem solving to ill-structured ID problems. 4. Identify and discuss current issues, trends, and controversies in the profession. 5. Develop a case study of a specific instructional design problem. 6. Facilitate a case study of a specific instructional design problem. Credits: 3.00

Core Courses (24 credits)

EDCI 51300 - Foundations Of Learning Design And Technology

Credit Hours: 3.00. Provides an historical overview of the field and delineates the foundational knowledge, skills, and attitudes needed by professionals in the field of educational technology and instructional design. Students explore the field by engaging in collaborative projects, along with thinking and writing about various aspects of educational technology and the underlying instructional design theories.

Learning Outcomes: 1. Explain/describe the history and foundations of the field. 2. Define learning design and technology and distinguish among its components and related fields. 3. Identify and describe current and emerging issues in the field. 4. Initiate steps toward becoming a professional in the field of learning design and technology. Credits: 3.00

EDCI 56900 - Introduction To E-Learning

Credit Hours: 3.00. This course examines how the design and development of instruction are impacted by the use of the computer as delivery system. A primary focus is on effective learning design strategies for e-learning. Learners will identify and apply effective design practices with emphasis on project management, planning, and implementation. Education or training materials will be developed using appropriate authoring tools as determined by the instructional context. Learners will design an E-Learning module with end-to-end documentation of the design process (Project Plan, Design Document, Storyboard). Opportunities for collaborative feedback and evaluation will also be featured elements of the course experience.

Learning Outcomes: 1. Identify and implement sound design processes for e-learning. 2. Integrate relevant learning theory into e-learning design decisions. 3. Design, develop, and evaluate an effective e-learning module. Credits: 3.00

EDCI 57200 - Introduction To Learning Systems Design

Credit Hours: 3.00. An introduction to the principles of designing instructional materials and to instructional communication theory and techniques. Topics include objectives, student characteristics, media selection, communication variables, message design, and systematic evaluation.

Learning Outcomes: 1. Describe and apply the components of a systematic design process, their rationales, and uses. 2. Use a systematic design process and instructional psychology principles in performing an analysis of learning context analysis of learners, analysis of learning tasks, in design and development of assessments, and in design of formative and summative evaluation of the instruction itself. Credits: 3.00

EDCI 57300 - Instructional Development Practicum

Credit Hours: 2.00 or 3.00. Provides supervised field experience in programs involving instructional design development activities. Students participate in ongoing projects in the design, development, and evaluation of instructional materials and training programs in business and industry, medical facilities, or other settings deemed appropriate. Recommended prerequisites: EDCI 56900, EDCI 57200, and EDCI 67200. Permission of instructor required.

Learning Outcomes: 1. Design, develop, and evaluate a major instructional design project within a professional work setting/environment.

2. Create and manage an instructional design project within a professional setting following a specific timeline. Management of the process may require collaboration with supervisors, subject matter experts, and others to complete the project in the most effective manner. Credits: 2.00 or 3.00

EDCI 57700 - Strategic Assessment And Evaluation

Credit Hours: 3.00. This course explores principles and techniques that can be used to carry out evaluations within an organization. The course also examines several aspects of conducting evaluations, including planning and designing an evaluation, developing appropriate instruments, using various methods to collect information, analyzing information obtained from those methods, and communicating results and recommendations. This course is designed to help learners understand the multiple ways that evaluation is used in instructional systems and provides opportunities to design various types of evaluation instruments. A portion of the course will examine the study of learner assessment as part of the evaluation of instructional programs; however, the course's focus is dedicated to the study of program evaluation.

Learning Outcomes: 1. Define evaluation within the context of human performance and learning. 2. Develop prototype evaluation tools and frameworks useful in training/education or workplace performance improvement. 3. Synthesize knowledge by developing an evaluation plan and tools for an actual setting. Credits: 3.00

EDCI 66000 - Learning Design And Technology Seminar

Credit Hours: 1.00. This course is an investigation of trends, developments, and issues in learning design and technology with a focus on current practices, problems, and research. This one-credit seminar is designed to help students learn about applications of instructional design and educational technology in various settings and to interact with faculty and guest speakers about topics related to the field and the LDT program.

Learning Outcomes: 1. Become familiar with resources available to support progression through your LDT graduate program. 2. Learn the specifics of the program and its requirements, including reviewing targeted learning competencies, portfolio requirements, program faculty, and the graduate handbook. 3. Identify and work towards fulfilling short and long-term professional goals. 4. Identify a career pathway that is appropriate for you including the skills, knowledge, and attitudes you will need to be successful. 5. Gain real-world insights into LDT field. Credits: 1.00

EDCI 67000 - Learning Design And Technology Portfolio

Credit Hours: 1.00 to 2.00. This course was created to help guide LDT students near completion of their coursework to develop their competency portfolio. The competency portfolio is a requirement for graduation from the traditional LDT Master's program.

Learning Outcomes: 1. Develop an electronic version of your competency portfolio based on artifacts as evidence. 2. Compose narratives that explain how your artifacts demonstrate each competency. 3. Develop an updated resume or vita suitable for job searching. 4. Deconstruct relevant job postings in the field. Credits: 1.00 or 2.00

EDCI 67200 - Advanced Practices In Learning Systems Design

Credit Hours: 3.00. This course focuses on the application of learning systems design to real-world educational situations through the in-depth consideration of key instructional design processes (e.g., analysis, design, development, implementation, evaluation). Additionally, a key focus of the course is on the development of instructional design expertise. Prerequisite: EDCI 57200.

Learning Outcomes: 1. Analyze complex instructional design case situations and identify key components (e.g., issues, stakeholders, contextual variables, perspectives, alterative solutions, potential consequences). 2. Propose and/or develop relevant intervention strategies (instructional or non-instructional) to the issues presented in a case situation that are consistent with arguments and evidence presented. 3. Identify and apply key characteristics of expert problem solving to ill-structured ID problems. 4. Identify and discuss current issues, trends, and controversies in the profession. 5. Develop a

case study of a specific instructional design problem. 6. Facilitate a case study of a specific instructional design problem. Credits: 3.00

EDCI 53100 - Learning Theories And Instructional Design

Credit Hours: 3.00. This course has been designed to help you learn how theories of human learning and motivation can be applied to the instructional process in order to make the process more effective, efficient, and/or appealing. The focus of the course is on two areas: 1) the theoretical principles that have contributed to the field of Instructional Design (ID), and 2) how those principles can be applied within practical settings.

Learning Outcomes: 1. Identify, describe, and explain the basic tenets of behavioral, cognitive, and constructivist learning theories. 2. Compare and contrast the contributions of various learning theories to the field of instructional design. 3. Identify and describe the basic components within various motivational theories and their impact upon the learning process. 4. Select appropriate principles derived from given theories and apply those within practical learning situations. Credits: 3.00

Selectives (9 credits)

EDPS 53300 - Introduction To Educational Research I: Methodology

Credit Hours: 3.00. This course presents a sequence of journal articles and exercises that help introduce the foundational concepts of the course, including: research design, reliability and validity, various methodologies commonly used in educational research, and basic quantitative and qualitative data analyses. In addition, contrasting research conclusions are shown in the articles to help students learn why careful analysis of articles and their theoretical framing is critical to evaluating their conclusions.

Learning Outcomes: 1. Find research literature. 2. Read and critique educational research. 3. Deepen knowledge of at least one research area in education. 4. Design, conduct, analyze, and write a research project. Credits: 3.00

EDCI 52800 - Human Performance Technology

Credit Hours: 3.00. This course provides an introduction to the field of human performance technology (HPT). It examines basic concepts and principles of human performance, the theoretical underpinnings of the field, research and application literature, and various approaches to solving human performance problems. A systematic approach to the analysis, design, development, implementation and evaluation of performance improvement interventions within organizations is emphasized.

Learning Outcomes: 1. Identify the major theoretical underpinnings of the field of HPT. 2. Describe the relationship between the systematic development of instruction and HPT. 3. Analyze a human performance system in order to diagnose a performance gap. 4. Determine whether training, a non-training performance intervention, or a combination is most appropriate for a given situation. 5. Construct a systemic plan to address performance issue(s), including coordinated interventions and evaluation strategies. 6. Design appropriate interventions to address specific performance gaps. Credits: 3.00

EDCI 53300 - Teaching And Learning Number And Operations

Credit Hours: 3.00. This course is designed to provide opportunities for mathematics educators to develop understanding of teaching and learning in the domain of number and operation. Central to this work is the construction of models of learners' understanding of number and operation and the use of those models to build and select curriculum. While curricular efforts have historically taken as central a formal view of mathematics and its construction, more recently curriculum has been written to engage learners and to build from knowledge of learners' understanding. In this course we will develop models of learner's understandings of different facets of number and operation and then use those models and our emerging understanding of curriculum to explore challenges in teaching and learning.

Learning Outcomes: 1. Develop models of learner's understandings of number and operation. 2. Use models of learner's understandings of number and operation to design and select appropriate and productive learning opportunities. 3. Develop knowledge of key curricular development in mathematics education in the United States. 4. Associate teaching and curriculum with understandings of

number and operation they might generate. 5. Use technology to support the development of ideas in number and operation. 6. Synthesize existing research to support inquiry in the teaching and learning of number operation. Credits: 3.00

EDCI 55600 - Educational Video Game Design

Credit Hours: 3.00. Designed to provide an introduction to the design of educational video games. The focus of the course is on two areas: 1) the learning, instructional design, and game design theories which can inform the design of effective and engage in educational video games, and 2) how to apply those theories within practical settings.

Learning Outcomes: 1. Become comfortable with the history, concepts, terminology, culture, and classification of educational video and computer games. 2. Explore current research on educational computer and video games. 3. Examine learning, instructional design, and game design theories for relevance to the design of educational computer and video games. 4. Apply theory be designing, developing, and implementing a prototype of an educational computer or video game as teams. Credits: 3.00

EDCI 56000 - Educational Technology For Teaching And Learning

Credit Hours: 3.00. This course addresses the fundamentals of educational/learning technologies within both the traditional classroom, as well as the corporate/business training environments. Students will explore and evaluate various tools/technologies and determine how, when, and why such technologies can/should be infused into normal, hybrid, or fully online learning situations. The goal of the course is to help the student plan, implement, and evaluate technology for teaching and learning.

Learning Outcomes: 1. Demonstrate the ability to access, generate, and manipulate information through the use of various software and technology apps. 2. Apply educational technology to communicate, collaborate, conduct research, and solve problems, as well as promote equitable, ethical, and legal use of computer/technology resources. 3. Apply and integrate educational technology to support instruction in selected developmental and content areas. Credits: 3.00

EDCI 56400 - Integration And Management Of Technology For Learning

Credit Hours: 3.00. This course focuses on techniques for and issues related to integrating technology in learning environments in a meaningful way. Topics covered stem from literature in the field and include (1) theoretical foundations of technology integration, including how technology can support a more personalized approach to learning, (2) instructional and learning issues with technology integration, (3) designing for the integration of technologies for in learning environments, and (4) emerging issues in research and practice with technology integration. Class activities are designed to model applications of learning technology, while class projects allow individuals to develop skills and knowledge in areas of your personal need or interest. The goal of the course is to help you develop an understanding of important issues associated with the integration and management of learning technology and to effectively plan, design, implement, and evaluate technology-based learning.

Learning Outcomes: 1. Apply educational technology to enhance professional growth and productivity. 2. Use technology to communicate, collaborate, conduct research, and solve problems. 3. Apply the information from this course into authentic settings. 4. Successfully integrate technology into different forms of instruction. Credits: 3.00

EDCI 56600 - Educational Applications Of Multimedia

Credit Hours: 3.00. Examination of educational applications of hypermedia tools and related research. Creation of hypermedia instructional materials. Incorporation of digitized media (sound, photographs, and motion clips) in hypermedia is explored.

Learning Outcomes: 1. Explain the effectiveness of a specific instructional design principle in educational multimedia design. 2. Demonstrate when and how to use specific instructional design principles within a given educational multimedia learning environment. 3. Address the key principles and methods for evaluating student outcomes in a multimedia learning environment. 4. Develop educational

computer-based multimedia instructional materials with various software and tools. 5. Be familiar with the history of multimedia research and design and underlying assumptions from relevant theorists. 6. Explain variations in usability testing and its role in multimedia development. Credits: 3.00

EDCI 56800 - Partnering With Web-Based Tools For Learner Centered Environments

Credit Hours: 3.00. Provides an in-depth look at Web-based digital tools for teaching and learning, with a focus on learner-centered activities and environments. Emphasis is given to applying the knowledge and skills necessary to create a Web-based, student-centered lesson/unit that provides diverse learners with opportunities for formal and informal learning. Course content is applicable to both independent and collaborative learning, as well as use of the Web as the sole educational delivery system or in combination with other approaches, including traditional classroom instruction.

Learning Outcomes: 1. Create a personal vision of 21st century schools or workplace and a personal definition of a 21st century learner. 2. Examine, in depth, a specific student-centered approach (e.g. project-based learning, problem-based learning, inquiry learning, authentic instruction, etc.) and discuss the similarities and differences among different approaches. 3. Create a video tutorial that teaches others how to use a specific Web 2.0 tool. 4. Design a learner-centered lesson that incorporates relevant Web 2.0 tools for the purpose of broadening and/or deepening students' understanding of specific curricular content. 5. Develop an implementation plan and create appropriate assessment measures to determine student learning in your own learner-centered lesson. Credits: 3.00

EDCI 57500 - Foundations Of Distance Learning

Credit Hours: 3.00. An introduction to the field of distance learning/education. Examination of basic concepts and principles of distance learning, the theoretical underpinnings of the field, research and application literature, and distance education delivery technologies. Focus is on integration of distance education technologies for learning and teaching.

Learning Outcomes: 1. Discuss common distance education (DE) definitions and theories. 2. Understand how distance education has evolved including the history, research and current trends of DE. 3. Select and demonstrate appropriate technologies for use in DE environments. 4. Identify appropriate instructional design methods. 5. Apply appropriate instructional design methods to DE scenarios. 6. Demonstrate understanding of unique challenges of teaching at a distance. 7. Appreciate common assessment and evaluation methods and incorporate them into DE scenarios. 8. Discuss potential issues and barriers faced by learners and instructors in DE environments. 9. Be aware of and discuss policies that relate to DE. 10. Be aware of current trends in the field of distance education and how they relate to your focus. Credits: 3.00

EDCI 58800 - Motivation And Instructional Design

Credit Hours: 3.00. This course has been designed to provide an in-depth study of motivation as one of the fundamental variables underlying human learning, behavior, and instructional design. The focus of the course is on two areas: 1) theories of motivation and the general principles that have contributed to the field of instructional design, and 2) how those principles are applied within practical design settings.

Learning Outcomes: 1. Identify and describe the basic tenets of various theories of motivation. 2. Compare and contrast the contributions that the various motivational theories offer to the field of instructional design. 3. Select appropriate principles derived from given theories and apply those principles within practical design situations. 4. Analyze motivational problems in learning and performance and design effective solutions. 5. Consider motivational theories and their relation to current research in Education and Instructional Design. Credits: 3.00

EDCI 67200 - Advanced Practices In Learning Systems Design

Credit Hours: 3.00. This course focuses on the application of

learning systems design to real-world educational situations through the in-depth consideration of key instructional design processes (e.g., analysis, design, development, implementation, evaluation). Additionally, a key focus of the course is on the development of instructional design expertise. Prerequisite: EDCI 57200.

Learning Outcomes: 1. Analyze complex instructional design case situations and identify key components (e.g., issues, stakeholders, contextual variables, perspectives, alterative solutions, potential consequences). 2. Propose and/or develop relevant intervention strategies (instructional or non-instructional) to the issues presented in a case situation that are consistent with arguments and evidence presented. 3. Identify and apply key characteristics of expert problem solving to ill-structured ID problems. 4. Identify and discuss current issues, trends, and controversies in the profession. 5. Develop a case study of a specific instructional design problem. 6. Facilitate a case study of a specific instructional design problem. Credits: 3.00

Curriculum and Instruction: Learning Design and Technology Concentration, MSED or MS (OL)

About the Program

Program Requirements

Required Courses (26 credits)

EDCI 51300 - Foundations Of Learning Design And Technology

Credit Hours: 3.00. Provides an historical overview of the field and delineates the foundational knowledge, skills, and attitudes needed by professionals in the field of educational technology and instructional design. Students explore the field by engaging in collaborative projects, along with thinking and writing about various aspects of educational technology and the underlying instructional design theories.

Learning Outcomes: 1. Explain/describe the history and foundations of the field. 2. Define learning design and technology and distinguish among its components and related fields. 3. Identify and describe current and emerging issues in the field. 4. Initiate steps toward becoming a professional in the field of learning design and technology. Credits: 3.00

EDCI 52800 - Human Performance Technology

Credit Hours: 3.00. This course provides an introduction to the field of human performance technology (HPT). It examines basic concepts and principles of human performance, the theoretical underpinnings of the field, research and application literature, and various approaches to solving human performance problems. A systematic approach to the analysis, design, development, implementation and evaluation of performance improvement interventions within organizations is emphasized.

Learning Outcomes: 1. Identify the major theoretical underpinnings of the field of HPT. 2. Describe the relationship between the systematic development of instruction and HPT. 3. Analyze a human performance system in order to diagnose a performance gap. 4. Determine whether training, a non-training performance intervention, or a combination is most appropriate for a given situation. 5. Construct a systemic plan to address performance issue(s), including coordinated interventions and evaluation strategies. 6. Design appropriate interventions to address specific performance gaps. Credits: 3.00

EDCI 56900 - Introduction To E-Learning

Credit Hours: 3.00. This course examines how the design and development of instruction are impacted by the use of the computer as delivery system. A primary focus is on effective learning design strategies for e-learning. Learners will identify and apply effective design practices with emphasis on project management, planning, and implementation. Education or training materials will be developed using appropriate authoring tools as determined by the instructional context. Learners will design an E-Learning module with end-to-end documentation of the design process (Project Plan, Design Document, Storyboard). Opportunities for collaborative feedback and evaluation will also be featured elements of the course experience.

Learning Outcomes: 1. Identify and implement sound design processes for e-learning. 2. Integrate relevant learning theory into e-learning design decisions. 3. Design, develop, and evaluate an effective e-learning module. Credits: 3.00

EDCI 57200 - Introduction To Learning Systems Design

Credit Hours: 3.00. An introduction to the principles of designing instructional materials and to instructional communication theory and techniques. Topics include objectives, student characteristics, media selection, communication variables, message design, and systematic evaluation.

Learning Outcomes: 1. Describe and apply the components of a systematic design process, their rationales, and uses. 2. Use a systematic design process and instructional psychology principles in performing an analysis of learning context analysis of learners, analysis of learning tasks, in design and development of assessments, and in design of formative and summative evaluation of the instruction itself. Credits: 3.00

EDCI 57300 - Instructional Development Practicum

Credit Hours: 2.00 or 3.00. Provides supervised field experience in programs involving instructional design development activities. Students participate in ongoing projects in the design, development, and evaluation of instructional materials and training programs in business and industry, medical facilities, or other settings deemed appropriate. Recommended prerequisites: EDCI 56900, EDCI 57200, and EDCI 67200. Permission of instructor required.

Learning Outcomes: 1. Design, develop, and evaluate a major instructional design project within a professional work setting/environment. 2. Create and manage an instructional design project within a professional setting following a specific timeline. Management of the process may require collaboration with supervisors, subject matter experts, and others to complete the project in the most effective manner. Credits: 2.00 or 3.00

EDCI 57700 - Strategic Assessment And Evaluation

Credit Hours: 3.00. This course explores principles and techniques that can be used to carry out evaluations within an organization. The course also examines several aspects of conducting evaluations, including planning and designing an evaluation, developing appropriate instruments, using various methods to collect information, analyzing information obtained from those methods, and communicating results and recommendations. This course is designed to help learners understand the multiple ways that evaluation is used in instructional systems and provides opportunities to design various types of evaluation instruments. A portion of the course will examine the study of learner assessment as part of the evaluation of instructional programs; however, the course's focus is dedicated to the study of program evaluation.

Learning Outcomes: 1. Define evaluation within the context of human performance and learning. 2. Develop prototype evaluation tools and frameworks useful in training/education or workplace performance improvement. 3. Synthesize knowledge by developing an evaluation plan and tools for an actual setting. Credits: 3.00

EDCI 67200 - Advanced Practices In Learning Systems Design

Credit Hours: 3.00. This course focuses on the application of learning systems design to real-world educational situations through the in-depth consideration of key instructional design processes (e.g., analysis, design, development, implementation, evaluation). Additionally, a key focus of the course is on the development of instructional design expertise. Prerequisite: EDCI 57200.

Learning Outcomes: 1. Analyze complex instructional design case situations and identify key components (e.g., issues, stakeholders, contextual variables, perspectives, alterative solutions, potential consequences). 2. Propose and/or develop relevant intervention strategies (instructional or non-instructional) to the issues presented in a case situation that are consistent with arguments and evidence presented. 3. Identify and apply key characteristics of expert problem solving to ill-structured ID problems. 4. Identify and discuss current issues, trends, and controversies in the profession. 5. Develop a

case study of a specific instructional design problem. 6. Facilitate a case study of a specific instructional design problem. Credits: 3.00

EDCI 53100 - Learning Theories And Instructional Design

Credit Hours: 3.00. This course has been designed to help you learn how theories of human learning and motivation can be applied to the instructional process in order to make the process more effective, efficient, and/or appealing. The focus of the course is on two areas: 1) the theoretical principles that have contributed to the field of Instructional Design (ID), and 2) how those principles can be applied within practical settings.

Learning Outcomes: 1. Identify, describe, and explain the basic tenets of behavioral, cognitive, and constructivist learning theories. 2. Compare and contrast the contributions of various learning theories to the field of instructional design. 3. Identify and describe the basic components within various motivational theories and their impact upon the learning process. 4. Select appropriate principles derived from given theories and apply those within practical learning situations. Credits: 3.00

EDCI 60001 - Intro To Demonstrating Professional Competencies In LDT

Credit Hours: 1.00. This course is designed to help you to understand the knowledge and skills necessary for your successful online learning in the Learning Design and Technology program, with a focus on the process of earning digital badges aligned with professional competencies. In this orientation, you will explore what online learning entails and reflect on how you can best set yourself up to succeed in your studies. You will also learn and apply the process of both earning digital badges within the program and evaluating your peers' work as part of the badge earning process.

Learning Outcomes: 1. Students will learn the specifics of the LDT Master's program and its requirements familiarize yourself with resources, review targeted learning competencies, and program requirements. 2. Students will examine skills and approaches to obtain competency badges critical to your success as a student in the online program, including peer review, self-editing, effective time management, avoiding plagiarism, utilizing proper online etiquette and incorporating a positive disposition in your interactions with peer students, faculty and staff. 3. Students will become familiar with the badge earning process in LDT and progress in earning your first digital badges. Credits: 1.00

EDCI 60003 - LDT Professional Competencies Portfolio

Credit Hours: 1.00. This course will focus on completion of the competency portfolio reflecting on the depth and breadth of your educational growth since entering the Master's program. The purpose of the LDT competency portfolio is to demonstrate that you have mastered the graduate competencies. The portfolio will contain student evidence aligned with LDT competencies and will be reviewed by your committee. The completed competency portfolio is a requirement for graduation from the LDT Master's program. Prerequisites: EDCI 60001 and 60002.

Learning Outcomes: 1. Finalize students' competency-based portfolio. 2. Compose reflective narratives on Professional Foundations of LDT, Planning and Analysis, Design and Development, and Evaluation and Implementation. 3. Update and finalize resume or vita suitable for job searching. Credits: 1.00

Technology Selective (3-6 credits)

EDCI 55600 - Educational Video Game Design

Credit Hours: 3.00. Designed to provide an introduction to the design of educational video games. The focus of the course is on two areas: 1) the learning, instructional design, and game design theories which can inform the design of effective and engage in educational video games, and 2) how to apply those theories within practical settings.

Learning Outcomes: 1. Become comfortable with the history, concepts, terminology, culture, and classification of educational video and computer games. 2. Explore current research on educational computer and video games. 3. Examine learning, instructional design, and game design theories for relevance to the design of educational computer and video games. 4. Apply theory be designing, developing, and implementing a prototype of an

educational computer or video game as teams. Credits: 3.00

EDCI 56000 - Educational Technology For Teaching And Learning

Credit Hours: 3.00. This course addresses the fundamentals of educational/learning technologies within both the traditional classroom, as well as the corporate/business training environments. Students will explore and evaluate various tools/technologies and determine how, when, and why such technologies can/should be infused into normal, hybrid, or fully online learning situations. The goal of the course is to help the student plan, implement, and evaluate technology for teaching and learning.

Learning Outcomes: 1. Demonstrate the ability to access, generate, and manipulate information through the use of various software and technology apps. 2. Apply educational technology to communicate, collaborate, conduct research, and solve problems, as well as promote equitable, ethical, and legal use of computer/technology resources. 3. Apply and integrate educational technology to support instruction in selected developmental and content areas. Credits: 3.00

EDCI 56400 - Integration And Management Of Technology For Learning

Credit Hours: 3.00. This course focuses on techniques for and issues related to integrating technology in learning environments in a meaningful way. Topics covered stem from literature in the field and include (1) theoretical foundations of technology integration, including how technology can support a more personalized approach to learning, (2) instructional and learning issues with technology integration, (3) designing for the integration of technologies for in learning environments, and (4) emerging issues in research and practice with technology integration. Class activities are designed to model applications of learning technology, while class projects allow individuals to develop skills and knowledge in areas of your personal need or interest. The goal of the course is to help you develop an understanding of important issues associated with the integration and management of learning technology and to effectively plan, design, implement, and evaluate technology-based learning.

Learning Outcomes: 1. Apply educational technology to enhance professional growth and productivity. 2. Use technology to communicate, collaborate, conduct research, and solve problems. 3. Apply the information from this course into authentic settings. 4. Successfully integrate technology into different forms of instruction. Credits: 3.00

EDCI 56600 - Educational Applications Of Multimedia

Credit Hours: 3.00. Examination of educational applications of hypermedia tools and related research. Creation of hypermedia instructional materials. Incorporation of digitized media (sound, photographs, and motion clips) in hypermedia is explored.

Learning Outcomes: 1. Explain the effectiveness of a specific instructional design principle in educational multimedia design. 2. Demonstrate when and how to use specific instructional design principles within a given educational multimedia learning environment. 3. Address the key principles and methods for evaluating student outcomes in a multimedia learning environment. 4. Develop educational computer-based multimedia instructional materials with various software and tools. 5. Be familiar with the history of multimedia research and design and underlying assumptions from relevant theorists. 6. Explain variations in usability testing and its role in multimedia development. Credits: 3.00

EDCI 59100 - Special Topics In Education

Credit Hours: 1.00 to 4.00. Group study of a current problem or special topic of interest to professional educational personnel. Intensive study of research, theory, or practical aspects of a particular issue within the usual graduate class format.

Credits: 1.00 to 4.00

General Selective (0-3 credits)

EDCI 57500 - Foundations Of Distance Learning

Credit Hours: 3.00. An introduction to the field of distance learning/education. Examination of basic concepts and principles of distance learning, the theoretical underpinnings of the field, research and application literature, and distance education delivery technologies. Focus is on integration of distance education technologies for learning and teaching.

Learning Outcomes: 1. Discuss common

distance education (DE) definitions and theories. 2. Understand how distance education has evolved including the history, research and current trends of DE. 3. Select and demonstrate appropriate technologies for use in DE environments. 4. Identify appropriate instructional design methods. 5. Apply appropriate instructional design methods to DE scenarios. 6. Demonstrate understanding of unique challenges of teaching at a distance. 7. Appreciate common assessment and evaluation methods and incorporate them into DE scenarios. 8. Discuss potential issues and barriers faced by learners and instructors in DE environments. 9. Be aware of and discuss policies that relate to DE. 10. Be aware of current trends in the field of distance education and how they relate to your focus. Credits: 3.00

EDCI 58800 - Motivation And Instructional Design

Credit Hours: 3.00. This course has been designed to provide an in-depth study of motivation as one of the fundamental variables underlying human learning, behavior, and instructional design. The focus of the course is on two areas: 1) theories of motivation and the general principles that have contributed to the field of instructional design, and 2) how those principles are applied within practical design settings.

Learning Outcomes: 1. Identify and describe the basic tenets of various theories of motivation. 2. Compare and contrast the contributions that the various motivational theories offer to the field of instructional design. 3. Select appropriate principles derived from given theories and apply those principles within practical design situations. 4. Analyze motivational problems in learning and performance and design effective solutions. 5. Consider motivational theories and their relation to current research in Education and Instructional Design. Credits: 3.00

EDCI 63300 - Instructional Design Project Management

Credit Hours: 3.00. This course focuses on the application of project management ideas, concepts, and strategies in instructional design settings. Students will be asked to consider the relationship between instructional design and project management, tools that can assist with managing instructional design projects, and factors influencing the instructional design project management process. Students will explore these topics by creating deliverables for instructional design cases and other interactive assignments.

Learning Outcomes: 1. Explain and reflect upon common project management terminology's role in instructional design projects. 2. Analyze and articulate the relationship between project management and instructional design. 3. Propose and/or develop relevant intervention strategies (instructional design and project management) to real-world instructional design issues that are consistent with arguments and evidence presented. 4. Integrate project management technologies and tools in the development of instructional design project management. 5. Interpret the role of interpersonal skills in and factors impacting project management instructional design initiatives. Credits: 3.00

Curriculum and Instruction: Literacy and Language Education Concentration, MSED or MS

About the Program

Program Requirements - Thesis & Non-thesis

Required Courses (15 credits)

EDCI 50000 - Foundations Of Literacy

Credit Hours: 3.00. Survey course in the acquisition of and instruction in reading, writing, and other aspects of language.

Learning Outcomes: 1. Develop a broad background and comprehensive understanding of literacy history, theory, and the socio-cultural influences that have shaped research and practice in the field. 2. Examine the constructs

of reading and literacy from multiple theoretical perspectives, and in differing historical contexts. 3. Use new understandings to critically examine current theoretical perspectives and instructional practices. Credits: 3.00

EDPS 53000 - Cognition And Learning In Context

Credit Hours: 3.00. Theories of learning and development, research on instruction and learning, and principles of measurement applied to educational problems.

Learning Outcomes: 1. Understand the central components of Behaviorism, differentiate between classical and operant conditioning, and apply the theories to teaching and learning. 2. Understand the central tenets of constructivism, identify a range of constructivist theories or perspectives, and distinguish constructivism from behaviorism. 3. Understand the central components of theories of learning and development developed by Bandura, Piaget, and Vygotsky, and apply them to teaching and learning. 4. Understand the roles of memory, expertise, transfer, conceptual change, meta-cognition, and self-regulated learning for student learning, and their implications for teaching. 5. Identify the central characteristics of instructional scaffolding, and cooperative and collaborative learning, how they are associated with learning, and how they may be instantiated. 6. Understand central tenets of sociocultural (or sociohistorical) and situated theories of learning and development and apply them to teaching and learning. 7. Understand the central characteristics of inquiry (or project-based learning) and their affordances and limitations with respect to teaching and learning. 8. Understand how policies (educational and otherwise), political priorities, beliefs, and national and international factors affect affordances for teaching and learning. Credits: 3.00

EDPS 53300 - Introduction To Educational Research I: Methodology

Credit Hours: 3.00. This course presents a sequence of journal articles and exercises that help introduce the foundational concepts of the course, including: research design, reliability and validity, various methodologies commonly used in educational research, and basic quantitative and qualitative data analyses. In addition, contrasting research conclusions are shown in the articles to help students learn why careful analysis of articles and their theoretical framing is critical to evaluating their conclusions.

Learning Outcomes: 1. Find research literature. 2. Read and critique educational research. 3. Deepen knowledge of at least one research area in education. 4. Design, conduct, analyze, and write a research project. Credits: 3.00

EDCI 58000 - Foundations Of Curriculum

Credit Hours: 3.00. Introduction to the major historical and philosophical sources of curriculum ideas. Significant forces influencing curriculum decision making. Different theoretical approaches to the construction and analysis of curriculum.

Learning Outcomes: 1. Engage critically with germinal thinkers and thought in curriculum. 2. Examine various curriculum approaches and traditions within their historical and social contexts. 3. Explore the major philosophies that undergirds curriculum approaches and deliberation. 4. Analyze the political origins and implications of differing traditions within the curriculum field and within educational policy and practice. 5. Integrate learning from curriculum history, theory, and research into one's teaching, scholarship, and/or engagement. Credits: 3.00

EDCI 58500 - Multicultural Education

Credit Hours: 3.00. The course aims to develop understanding of multicultural education as an on-going reform process that addresses social justice issues through an examination of race, class, gender, ethnicity, language, sexual orientation, etc.

Learning Outcomes: 1. Develop awareness of multicultural issues in education and other fields. 2. Increase knowledge of multicultural education and applications of multicultural

theories to education and other disciplines. 3. Develop skills in meeting the needs of diverse populations. Credits: 3.00

Literacy and Language Electives (9 credits)

Electives (0-6 credits)

Thesis Research (6 credits)

Curriculum and Instruction: Mathematics Education Concentration, MSED or MS or PHD

About the Program

Program Requirements

Required Courses (26 credits)

Core Courses (11 credits)

EDCI 58500 - Multicultural Education

Credit Hours: 3.00. The course aims to develop understanding of multicultural education as an on-going reform process that addresses social justice issues through an examination of race, class, gender, ethnicity, language, sexual orientation, etc.
Learning Outcomes: 1. Develop awareness of multicultural issues in education and other fields. 2. Increase knowledge of multicultural education and applications of multicultural theories to education and other disciplines. 3. Develop skills in meeting the needs of diverse populations. Credits: 3.00

EDCI 52001 - Curriculum And Instruction Online MS Seminar I

Credit Hours: 1.00. This boot camp is designed to help you to understand the knowledge and skills necessary for your successful online learning in the Curriculum and Instruction program. In this orientation, you will explore what online learning entails and reflect on how you can best set yourself up to succeed in your studies. You will also learn about various learning strategies and online resources that you can utilize in your courses. In this seminar, you will be responsible for completing all assignments on time over the course of the semester. Read the guidelines for each week and complete the assignments. NOTE: This course is a core course in the C&I online masters program. A grade of B- or better is required (if a lower grade is received, the course must be retaken). Permission of department required.
Learning Outcomes: 1. Exhibit knowledge of academic integrity by completing plagiarism, statement of commitment, and APA tutorials. 2. Effectively explain your professional goals for the program by writing an initial reflection. 3. Identify essential components of the Curriculum and Instruction Handbook, including what is required for the final portfolio. 4. Develop and apply group project skills and management techniques to make you successful in future courses and your career. 5. Demonstrate digital skills and competence with various digital tools (i.e., blogs, screencasting, Google docs, file sharing). 6. Be aware of current trends in the field of distance education and how they relate to your focus. Credits: 1.00

EDCI 52002 - Curriculum And Instruction Online MS Seminar II

Credit Hours: 1.00. This seminar is designed to help you to understand the knowledge and skills necessary for your success throughout the Curriculum and Instruction program. In addition to providing you with information that will help you succeed in the program, you are also asked to think about ways to make yourself more marketable to current and future employers. Permission of department required.
Learning Outcomes: 1. Investigate the skills and knowledge needed to be successful in a relevant career within the C&I field. 2. Describe program and career goals. 3. Apply research skills required to compose an annotated bibliography. 4. Create the foundation of a C&I portfolio displaying programmatic achievements and course competencies. Credits: 1.00

EDCI 52003 - Theories And Trends In Curriculum And Instruction

Credit Hours: 3.00. This course focuses on current theories and trends influencing curriculum and instruction. A theory is a plausible or scientifically acceptable general principle or body of principles offered to explain phenomena. It is a belief, policy, or procedure proposed or followed as the basis of action. A trend, on the other hand, is a pattern of gradual change in a condition, output, or process. It reflects a general tendency of a series of moves in a certain direction over time. We will focus on understanding sources of current theories and trends and how they may influence work in curriculum and instruction. Permission of department required.

Learning Outcomes: 1. Examine and clarify the educational beliefs, values, and knowledge guiding your curricular and instructional decisions. 2. Utilize and evaluate multiple appropriate sources in researching current curriculum and instruction trends and issues. 3. Interpret, critique, and synthesize relevant research related to current curriculum and instruction trends. 4. Assess the implications of research relative to your curricular and instructional practices. 5. Interpret, critique, and synthesize relevant educational theories related to current curriculum and instruction trends. 6. Assess the implications of educational theories relative to your curricular and instructional practices. 7. Interpret, critique, and synthesize relevant state and national policy decisions related to current curriculum and instruction trends. 8. Assess the implications of state and national policy decisions relative to your curricular and instructional practices. 9. Communicate effectively in oral and written formats. 10. Demonstrate the disposition for life-long learning and continuous professional development. 11. Identify communities of practice within discipline and participate within these communities according to the ethical standards of the discipline. 12. Examine and clarify how your educational beliefs, values, and knowledge guide your curricular and instructional decisions address the diversity of students, schools, and communities. 13. Advocate for values of diversity, inclusivity, and social justice. Credits: 3.00

EDCI 52004 - Teachers As Leaders

Credit Hours: 3.00. This course focuses on teacher leadership in instruction. Participants will examine the history of teacher leadership. Instructional coaching models will be examined and compared. Students will identify the various theories that support each coaching model and examine what is most present in their school contexts. Permission of department required.

Learning Outcomes: 1. Investigate the construct of school leadership. 2. Evaluate potential leadership roles in classrooms, schools, or other organizations. 3. Research teacher leadership praxis to impact future praxis. 4. Synthesize leadership research in conjunction with theories of social justice and equity. 5. Analyze the skills of effective teacher leadership through collaboration and inquiry. 6. Explore the critical role teachers play in creating conditions for continuous and systematic improvements in education. Credits: 3.00

Mathematics Education Courses (15 credits)

EDCI 53300 - Teaching And Learning Number And Operations

Credit Hours: 3.00. This course is designed to provide opportunities for mathematics educators to develop understanding of teaching and learning in the domain of number and operation. Central to this work is the construction of models of learners' understanding of number and operation and the use of those models to build and select curriculum. While curricular efforts have historically taken as central a formal view of mathematics and its construction, more recently curriculum has been written to engage learners and to build from knowledge of learners' understanding. In this course we will develop models of learner's understandings of different facets of number and operation and then use those models and our emerging understanding of curriculum to explore challenges in teaching and learning.

Learning Outcomes: 1. Develop models of learner's understandings of number and operation. 2. Use models of learner's

understandings of number and operation to design and select appropriate and productive learning opportunities. 3. Develop knowledge of key curricular development in mathematics education in the United States. 4. Associate teaching and curriculum with understandings of number and operation they might generate. 5. Use technology to support the development of ideas in number and operation. 6. Synthesize existing research to support inquiry in the teaching and learning of number operation. Credits: 3.00

EDCI 53400 - Teaching And Learning Geometry And Measurement

Credit Hours: 3.00. This course is designed to provide opportunities for mathematics educators to develop understanding of teaching and learning in the related domains of geometry and measurement. Central to this work is the construction of models of learners' understandings of geometry and measurement and the use of models to design instruction. Geometry, as a discipline in school mathematics, has historically and more currently been debated. In this course we will explore research in the teaching and learning of geometry and measurement. A synthesis of select literature will inform our efforts to develop models of learners' geometric reasoning and understanding of measurement. We will move past the development of models to the design of instruction meant to support understandings of concepts that utilizes technology.

Learning Outcomes: 1. Develop models of learner's understanding of measurement and concepts in geometry. 2. Use models of learner's understanding to design and select appropriate and productive learning opportunities. 3. Develop knowledge of the history of geometry as a school mathematics subject in the United States. 4. Develop and articulate a perspective on teaching and learning geometry and measurement with technology. 5. Synthesize existing research to support inquiry in the teaching and learning of geometry and measurement. Credits: 3.00

EDCI 53500 - Teaching And Learning Algebra And Functions

Credit Hours: 3.00. This is a course for current or prospective mathematics teachers wishing to explore ways of teaching algebra with a focus on addressing concerns related to student performance in algebra and increasing algebraic reasoning skills in the classroom. The course includes experiences with inquiry-based learning by engaging participants in algebra activities from two secondary National Council of Teachers of Mathematics (NCTM) standards-based curricula. The course will provide opportunities for participants to collaborate on the development of algebraic thinking in mathematics classrooms and will address pedagogical approaches to students' learning of algebra.

Learning Outcomes: 1. Content and pedagogical knowledge for teaching algebra. 2. Familiarity with NCTM standards-based mathematics curricular. 3. Disposition that values students' contributions and desires to motivate students to learn algebra using a variety of strategies, including engaging them in making sense of algebraic concepts and making use of their life experiences to find relevant contexts for algebra. Credits: 3.00

EDCI 53600 - Teaching And Learning Data Analysis And Probability

Credit Hours: 3.00. This course will provide opportunities for the growth of middle school mathematics teachers understanding of data analysis and probability as a means to help analyze and interpret experienced events. The course will address the following: selecting and using appropriate statistical methods to analyze data, developing and evaluating inferences and predictions that are based on data, and understanding and applying the basic concepts of probability. This course will also address pedagogical approaches to students' learning of data analysis and probability.

Learning Outcomes: 1. Employ research-based instructional strategies to develop statistical understanding in middle, secondary and tertiary settings, and for teacher professional development. 2. Develop tasks, questions, and lessons that can be used to assess as well as further develop students' understanding of statistics and probability. 3. Read and interpret research results and classroom-based articles that describe students' statistical and probabilistic reasoning. 4. Reflect on course readings and their practical teaching experience to consider how to best teach statistical and probability concepts. Credits: 3.00

EDCI 54800 - Teaching Mathematics To Diverse Learners

Credit Hours: 3.00. This course is designed to provide opportunities for in-service teachers to engage around issues of equity in mathematics education. Equity here is used as a broad construct intended to help us think about how to provide meaningful opportunities to learn for all the students in our mathematics classrooms. The notion of "diverse" here is also taken broadly. All students have special needs, but it is sometimes helpful to think about the needs of particular groups of students while at the same time avoiding reducing differences among students to stereotypes. Issues of diversity here include, but are not limited to race, culture, gender, disabilities, language, SES, and sexual orientation.

Learning Outcomes: 1. Increased awareness of diverse learners' challenges in mathematics education. 2. Developed discourse for equity issues in mathematics education. 3. Knowledge of strategies to facilitate diverse learners' mathematical learning. Credits: 3.00

EDCI 54900 - Assessment In STEM Education

Credit Hours: 3.00. This course is designed to help teachers of STEM recognize the link between productive assessment and productive instruction, using the STEM education standards for teacher competence in educational assessment. This course is designed to help teachers meet those professional standards and understand the public pressure as well as instructional need for effective formative and summative assessment.

Learning Outcomes: 1. Choose appropriate assessment methods. 2. Develop appropriate assessment methods. 3. Administer scoring and interpreting assessment results. 4. Use assessment results to make decisions about individual students, plan teaching and develop curriculum. 5. Communicate assessment results to students, parents, and other educators. 6. Recognize inappropriate assessment methods and uses of assessment information. Credits: 3.00

Selective (0-3 credits)

EDCI 51300 - Foundations Of Learning Design And Technology

Credit Hours: 3.00. Provides an historical overview of the field and delineates the foundational knowledge, skills, and attitudes needed by professionals in the field of educational technology and instructional design. Students explore the field by engaging in collaborative projects, along with thinking and writing about various aspects of educational technology and the underlying instructional design theories.

Learning Outcomes: 1. Explain/describe the history and foundations of the field. 2. Define learning design and technology and distinguish among its components and related fields. 3. Identify and describe current and emerging issues in the field. 4. Initiate steps toward becoming a professional in the field of learning design and technology. Credits: 3.00

EDCI 52800 - Human Performance Technology

Credit Hours: 3.00. This course provides an introduction to the field of human performance technology (HPT). It examines basic concepts and principles of human performance, the theoretical underpinnings of the field, research and application literature, and various approaches to solving human performance problems. A systematic approach to the analysis, design, development, implementation and evaluation of performance improvement interventions within organizations is emphasized.

Learning Outcomes: 1. Identify the major theoretical underpinnings of the field of HPT. 2. Describe the relationship between the systematic development of instruction and HPT. 3. Analyze a human performance system in order to diagnose a performance gap. 4. Determine whether training, a non-training performance intervention, or a combination is most appropriate for a given situation. 5. Construct a systemic plan to address performance issue(s), including coordinated interventions and evaluation strategies. 6. Design appropriate interventions to address specific performance gaps. Credits: 3.00

EDCI 56000 - Educational Technology For Teaching And Learning

Credit Hours: 3.00. This course addresses the fundamentals of educational/learning technologies within both the traditional classroom, as well as the corporate/business training environments. Students will explore and evaluate various tools/technologies and determine how, when, and why such

technologies can/should be infused into normal, hybrid, or fully online learning situations. The goal of the course is to help the student plan, implement, and evaluate technology for teaching and learning.

Learning Outcomes: 1. Demonstrate the ability to access, generate, and manipulate information through the use of various software and technology apps. 2. Apply educational technology to communicate, collaborate, conduct research, and solve problems, as well as promote equitable, ethical, and legal use of computer/technology resources. 3. Apply and integrate educational technology to support instruction in selected developmental and content areas. Credits: 3.00

EDCI 56400 - Integration And Management Of Technology For Learning

Credit Hours: 3.00. This course focuses on techniques for and issues related to integrating technology in learning environments in a meaningful way. Topics covered stem from literature in the field and include (1) theoretical foundations of technology integration, including how technology can support a more personalized approach to learning, (2) instructional and learning issues with technology integration, (3) designing for the integration of technologies for in learning environments, and (4) emerging issues in research and practice with technology integration. Class activities are designed to model applications of learning technology, while class projects allow individuals to develop skills and knowledge in areas of your personal need or interest. The goal of the course is to help you develop an understanding of important issues associated with the integration and management of learning technology and to effectively plan, design, implement, and evaluate technology-based learning.

Learning Outcomes: 1. Apply educational technology to enhance professional growth and productivity. 2. Use technology to communicate, collaborate, conduct research, and solve problems. 3. Apply the information from this course into authentic settings. 4. Successfully integrate technology into different forms of instruction. Credits: 3.00

EDCI 56600 - Educational Applications Of Multimedia

Credit Hours: 3.00. Examination of educational applications of hypermedia tools and related research. Creation of hypermedia instructional materials. Incorporation of digitized media (sound, photographs, and motion clips) in hypermedia is explored.

Learning Outcomes: 1. Explain the effectiveness of a specific instructional design principle in educational multimedia design. 2. Demonstrate when and how to use specific instructional design principles within a given educational multimedia learning environment. 3. Address the key principles and methods for evaluating student outcomes in a multimedia learning environment. 4. Develop educational computer-based multimedia instructional materials with various software and tools. 5. Be familiar with the history of multimedia research and design and underlying assumptions from relevant theorists. 6. Explain variations in usability testing and its role in multimedia development. Credits: 3.00

EDCI 58800 - Motivation And Instructional Design

Credit Hours: 3.00. This course has been designed to provide an in-depth study of motivation as one of the fundamental variables underlying human learning, behavior, and instructional design. The focus of the course is on two areas: 1) theories of motivation and the general principles that have contributed to the field of instructional design, and 2) how those principles are applied within practical design settings.

Learning Outcomes: 1. Identify and describe the basic tenets of various theories of motivation. 2. Compare and contrast the contributions that the various motivational theories offer to the field of instructional design. 3. Select appropriate principles derived from given theories and apply those principles within practical design situations. 4. Analyze motivational problems in learning and performance and design effective solutions. 5. Consider motivational theories and their relation to current research in Education and Instructional Design. Credits: 3.00

EDPS 55500 - Differentiating Curriculum & Instruction

Credit Hours: 3.00. This course provides a solid foundation and set of principles for differentiating curriculum and instruction in any classroom at any grade level. Students will explore a variety of evidence-based strategies, tools, and curriculum models that

effectively meet the diverse needs of all learners. Through readings, online class meetings and discussions, case studies, differentiated instruction examples, direct application, and reflection, students will deepen their understanding and need to differentiate. With an overarching goal of increasing achievement and developing student talents, this course includes the following major components: creating positive learning environments that support a) high-quality curriculum; b) diagnostic, formative, and summative assessments to inform instructional decision-making; and c) flexible grouping; addressing student differences in readiness, interest, and learning profile (including learning preference, intelligence preference, gender, culture, language preference, locale, and opportunities to learn) and appreciating how these differences influence the ways in which students learn and are motivated; understanding that the process of differentiation involves modifying content, process, product, learning environment, and/or affect; incorporating higher-order thinking skills, creative problem solving, project-based learning, authentic/respectful tasks, collaborative learning, and other evidence-based strategies to promote student achievement and talent development; understanding how differentiation of curriculum and instruction fits within specific educational interventions and models, such as scaffolding, flexible grouping, Response to Intervention (RTI), and Multi-Tiered System of Support (MTSS).

Learning Outcomes: 1. Deconstruct the concept of differentiation as a response to the readiness levels; interests; learning preferences and strengths; and academic, social, emotional needs of learners by modifying curriculum, instruction, learning environment, and/or affect. 2. Assess students' readiness, interests, and learning profiles to create differentiated lessons that utilize instructional strategies and technologies that motivate and engage students in learning, including those from special populations. 3. Develop, implement, and evaluate various differentiated instructional plans designed to maximize learning and demonstrate proficiency in analyzing and evaluating differentiated lessons taught by other teachers. 4. Evaluate and reflect upon your course experience and your plan to implement differentiation knowledge and skills gained in this course. Credits: 3.00

Portfolio Course (1 credit)

EDCI 68000 - Curriculum & Instruction MS Portfolio

Credit Hours: 1.00. This course was created to help guide C&I students near completion of their coursework to develop their competency portfolio. A competency portfolio reflects the depth and breadth of a student's educational growth since entering the graduate program. The purpose of the C&I competency portfolio is to demonstrate that students have mastered the graduate competencies for the C&I online Master's program. The portfolio will contain student projects aligned with C&I competencies and will be reviewed by committee members. The competencies are based on the Curriculum & Instruction departmental competencies and several program-specific competencies. The competency portfolio is a requirement for graduation from the C&I Master's program. (Multiple media are welcome.) Permission of department required.

Learning Outcomes: 1. Develop an online version of your competency portfolio based on artifacts as evidence. 2. Compose reflective narratives that explain how your artifacts demonstrate each competency. 3. Develop an updated resume or vita suitable for job searching. 4. Deconstruct relevant job postings in the field. Credits: 1.00

Capstone Course (3 credits)

EDCI 67900 - Capstone: Inquiry Into Practice

Credit Hours: 3.00. This course conceptually centers on the Ghanaian Sankofa symbol of a bird retrieving an egg from its back while facing forward. This metaphor represents the need to "go back to the past and bring forward that which is useful" (About the Sankofa [n.d.]. Retrieved from https://cola.siu.edu/africanastudies/about-us/sankofa.php). The twin aspect of looking back with the future in mind plays out in consonance with the Portfolio course generally taken in tandem with this course. In this course, students will reinforce and extend their learning of key concepts across the program and deepen their engagement with a topic of interest to them through an action research project. Permission of department required.

Learning Outcomes: 1. Evaluate how your program's experiences, knowledge, and skills will inform your future action and pedagogical

practices through reflection and self-critical inquiry. 2. Articulate where you are situated epistemologically, ontologically, and methodologically as educators and researchers within and across disciplines. 3. Demonstrate a commitment to ongoing development as knowledgeable and engaged advocates for equitable education through the exploration of intersectionality. 4. Conduct an action research project that identifies a problem within your classroom or school community and seeks to ameliorate it. 5. Communicate research findings with a broader audience of stakeholders. Credits: 3.00

GPA Requirements

Curriculum and Instruction: Science Education Concentration, MSED or MS

About the Program

Program Requirements - Thesis & Non-thesis

Required Courses (13 credits)

EDPS 53300 - Introduction To Educational Research I: Methodology

Credit Hours: 3.00. This course presents a sequence of journal articles and exercises that help introduce the foundational concepts of the course, including: research design, reliability and validity, various methodologies commonly used in educational research, and basic quantitative and qualitative data analyses. In addition, contrasting research conclusions are shown in the articles to help students learn why careful analysis of articles and their theoretical framing is critical to evaluating their conclusions.

Learning Outcomes: 1. Find research literature. 2. Read and critique educational research. 3. Deepen knowledge of at least one research area in education. 4. Design, conduct, analyze, and write a research project. Credits: 3.00

EDCI 51000 - Colloquium In Science And Mathematics Education

Credit Hours: 1.00. Weekly colloquia on individual research topics of interest to science and mathematics education faculty and graduate students. Colloquia will describe research programs in education. Course will be required of first-year graduate students.

Credits: 1.00

EDCI 51700 - Survey Of Science Education

Credit Hours: 3.00. Introduction to current issues and research in science education, broadly organized under themes of learning, teaching, and science curriculum.

Credits: 3.00

EDCI 51800 - The Nature Of Science In Science Teaching

Credit Hours: 3.00. Explores philosophical issues related to the scientific enterprise, such as the production and validation of scientific knowledge; the role of the scientific community; and the influence of gender and culture on doing science. Also examines the implications of these issues for science teaching and learning, as well as for research in science education.

Learning Outcomes: 1. Develop an understanding of various philosophical positions on the nature of science. 2. Develop an understanding of your own views of the nature of science. 3. Develop an understanding of the roles of scientists, the greater society, culture, and gender in the creation and validation of scientific knowledge. 4. Develop an understanding of students' and teachers' ideas about the nature of science. 5. Develop an understanding of the implications of various perspectives on the nature of science teaching and learning. Credits: 3.00

EDCI 58500 - Multicultural Education

Credit Hours: 3.00. The course aims to develop understanding of multicultural education as an on-going reform process that addresses social justice issues through an examination of race, class, gender, ethnicity, language, sexual orientation, etc.

Learning Outcomes: 1. Develop awareness of multicultural issues in education and other

fields. 2. Increase knowledge of multicultural education and applications of multicultural theories to education and other disciplines. 3. Develop skills in meeting the needs of diverse populations. Credits: 3.00

Science Education Selectives (6 credits)

CHM 61000 - Topics In Chemical Education

Credit Hours: 2.00 or 3.00. A variable topics course for graduate students in chemistry, chemical engineering, medicinal chemistry, and biochemistry. This course provides an overview of the literature in one of the areas of chemical education, such as: chemistry misconceptions and conceptual change; theories of learning, from Piaget and Vygotsky to radical constructivism; distributed cognition; and developing and assessing instructional materials. Offered in alternate years.

Credits: 2.00 or 3.00

EDCI 50600 - Environmental Education

Credit Hours: 3.00. Synthesis of philosophies, scientific principles and methods for environmental education programs in forests, camps, and schools. Students conduct and summarize literature research on scientific and educational principles. In interdisciplinary teams, they develop, implement, and evaluate curricula for schools, nature centers, interpretive and outdoor education programs.

Learning Outcomes: 1. Become knowledgeable of national environmental educational programs and curriculum. 2. Develop the knowledge and skills to plan, implement, and evaluate environmental education programs, curriculum and materials. 3. Develop an understanding about learners and pedagogical methods for teaching about the environment and assessing learners. Credits: 3.00

EDCI 51600 - Seminar In Environmental Education

Credit Hours: 3.00. The seminar covers current research and literature in environmental education, focusing on teaching children and adults about the environment. Topics vary by semester and student interest.

Learning Outcomes: 1. Develop an understanding of the research literature in environmental education pertaining to the topic of study. 2. Develop critical thinking and analysis skills for evaluating environmental education research, programs, and curriculum. 3. Develop an understanding of environmental issues. Credits: 3.00

EDCI 56700 - Action Research In Science Education

Credit Hours: 3.00. An introduction to various models and conceptions of teacher action research in science education. Students review literature on action research, participate in small research cohorts, and plan and conduct action research within their respective educational situations.

Learning Outcomes: 1. Develop an understanding of what action research is, how it is conducted, and what role it plays in the construction of teacher knowledge in science education. 2. Plan and conduct action research within your respective educational situation. 3. Examine various models for action research in pre-service, in-service, and independent projects in science education. 4. Gain insight into the role action research plays in science education and science teacher education. Credits: 3.00

EDCI 60500 - Teaching Integrated Science, Technology, Engineering And Math

Credit Hours: 3.00. Analysis of historical developments and present trends in science education; the designing, implementation, and evaluation of science programs; the role of research in present and future developments.

Learning Outcomes: 1. Identify, describe, and explain the fundamental tenets of different constructivist learning theories and their relevancy to STEM education. 2. Clarify and refine beliefs about teaching and learning in STEM education. 3. Identify and characterize students' ideas about STEM and how they influence learning. 4. Explore students' thinking and understanding of STEM through multiple strategies. 5. Describe ways to assess student learning in STEM. 6. Identify, practice, and reflect upon teaching strategies commensurate with teaching beliefs and knowledge about how

students learn STEM through an integrated approach. 7. Compare and evaluate curriculum resources for integrating STEM instruction. 8. Devise a comprehensive lesson plan for integrating STEM instruction based on science and engineering practices and teaching for all learners. 9. Teach and reflect upon an integrated STEM lesson employing multiple instructional strategies. 10. Evaluate student learning in the context of an integrated STEM lesson. Credits: 3.00

EDCI 61800 - Gender And Culture In Science Education

Credit Hours: 3.00. An examination of the different perspectives on issues of gender, culture, and science. Major topics include feminist critiques of scientific theories and methods, the work of women and minorities in science, the role science has played in the construction of race and gender, and topics in science education, such as girls' learning in science and the potential of inclusive practices in the science classroom. Prerequisite: EDCI 51800 or EDCI 58500 .

Learning Outcomes: 1. Develop an in-depth understanding of the role of gender and culture in science and science education. 2. Examine feminist and cross-cultural studies in science and science education. 3. Apply feminist and critical frameworks of analysis to various studies in science education. 4. Identify and evaluate the strengths and limitations of feminist and cultural critiques of science. 5. Synthesize related literature in an effort to gain in-depth knowledge about one or more areas of gender and culture in science and science education. Credits: 3.00

EDCI 61900 - Learning Science

Credit Hours: 3.00. The course provides a holistic study of how children and adults learn science; how the learner's ideas, ways of thinking, abilities to do science, and their attitudes towards and beliefs about science learning influence how they learn science.

Learning Outcomes: 1. Develop an increased understanding of the research literature in science education as it pertains to science learners. 2. Gain an appreciation of science learners and the different perspectives about how individuals learn science. 3. Apply science education research about science learners to instructional, curricular, and assessment development. Credits: 3.00

EDCI 62000 - Seminar In Mathematics Education

Credit Hours: 1.00 to 6.00. Selected topics in mathematics education. Typical topics considered are: (1) problem solving; (2) instructional strategies; (3) cognitive structure; (4) current curriculum; (5) current research. Permission of instructor required.

Learning Outcomes: 1. Examine, synthesize, and communicate a view of the state of mathematics education and situate one's research in it. 2. Create knowledge for the field of mathematics education and communicate findings to the professional community. 3. Communicate and act upon professional feedback in the processes of designing and conducting research and writing conference proposals and research reports. 4. Report on various stages and types of research (e.g., project design, data analysis, findings). Credits: 1.00 to 6.00

EDCI 53900 - Introduction To K-12 Integrated Science, Technology, Engineering And Mathematics (STEM) Education

Credit Hours: 3.00. This course will provide students with a conceptual understanding of integrated K-12 Science, Technology, Engineering and Mathematics (STEM) education and the nature of the disciplines of STEM. Students will explore implications for the teaching and learning of integrated STEM in a K-12 context through an evaluation of integrated approaches to STEM, national teaching standards and current research.

Learning Outcomes: 1. Explore the nature of the disciplines of STEM and their roles in a K-12 integrated STEM context. 2. Identify current approaches to integrated STEM education. 3. Explore issues related to diversity and equity in STEM education. 4. Define and describe how reform-based teaching and learning relates to nature of the disciplines of STEM. 5. Summarize the current research on teaching

and learning through integrated STEM approaches. 6. Develop STEM integration activities for K-12 settings. 7. Develop an action research proposal to study a problem of interest in teaching or learning in K-12 STEM settings. Credits: 3.00

EDCI 55800 - Integrated Science, Technology, Engineering And Mathematics (STEM) Education Methods-Secondary

Credit Hours: 3.00. Focuses on operationalizing the theoretical pedagogical approaches to integrated Science, Engineering, Mathematics and Agriculture (STEM) education. Collaboratively and cooperatively investigate, plan and deliver integrated learning experiences appropriate for secondary education. Course content will blend philosophical considerations with practical application. Permission of instructor required.

Learning Outcomes: 1. Engage in instructional conversations, collaboratively share instructional resources, and develop a sense of community for integrated STEM learning and teaching. 2. Contextualize STEM learning in authentic contexts. 3. Explain and apply socially and culturally relevant pedagogy in the context of STEM learning. 4. Discuss levels and types of integrated STEM content, pedagogy, and ways of knowing. 5. Develop and disseminate integrated STEM learning experiences. 6. Implement, assess and reflect on integrated STEM learning experiences in public school classrooms. 7. Articulate a framework explaining integrated STEM education. 8. Adapt existing singular discipline curriculum resources to leverage connections across disciplines to facilitate integration. Credits: 3.00

Science Elective (6 credits)

Curriculum and Instruction Elective (3 credits)

Thesis Research (0-6 credits)

EDCI 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required.

Credits: 1.00 to 18.00

Portfolio Research (0-6 credits)

EDCI 59000 - Individual Research Problems

Credit Hours: 1.00 to 6.00. Opportunities for students to study particular problems under the guidance of a member of the This plan of individualized instruction may be used in any field of education or vocational education. Does not include thesis work. Permission of instructor required.

Credits: 1.00 to 6.00

Curriculum and Instruction: Special Education Concentration, MSED or MS (OL)

About the Program

Program Requirements

Required Courses (26 credits)

Core Courses (11 credits)

EDCI 58500 - Multicultural Education

Credit Hours: 3.00. The course aims to develop understanding of multicultural education as an on-going reform process that addresses social justice issues through an examination of race, class, gender, ethnicity, language, sexual orientation, etc.

Learning Outcomes: 1. Develop awareness of multicultural issues in education and other fields. 2. Increase knowledge of multicultural education and applications of multicultural theories to education and other disciplines. 3. Develop skills in meeting the needs of diverse populations. Credits: 3.00

EDCI 52001 - Curriculum And Instruction Online MS Seminar I

Credit Hours: 1.00. This boot camp is designed to help you to understand the knowledge and skills necessary for your successful online learning in the Curriculum and Instruction program. In this orientation, you will explore what online learning entails and reflect on how you can best set yourself up to succeed in your studies. You will also learn about various learning strategies and online resources that you can utilize in your courses. In this seminar, you will be responsible for completing all assignments on time over the course of the semester. Read the guidelines for each week and complete the assignments. NOTE: This course is a core course in the C&I online masters program. A grade of B- or better is required (if a lower grade is received, the course must be retaken). Permission of department required.

Learning Outcomes: 1. Exhibit knowledge of academic integrity by completing plagiarism, statement of commitment, and APA tutorials. 2. Effectively explain your professional goals for the program by writing an initial reflection. 3. Identify essential components of the Curriculum and Instruction Handbook, including what is required for the final portfolio. 4. Develop and apply group project skills and management techniques to make you successful in future courses and your career. 5. Demonstrate digital skills and competence with various digital tools (i.e., blogs, screencasting, Google docs, file sharing). 6. Be aware of current trends in the field of distance education and how they relate to your focus. Credits: 1.00

EDCI 52002 - Curriculum And Instruction Online MS Seminar II

Credit Hours: 1.00. This seminar is designed to help you to understand the knowledge and skills necessary for your success throughout the Curriculum and Instruction program. In addition to providing you with information that will help you succeed in the program, you are also asked to think about ways to make yourself more marketable to current and future employers. Permission of department required.

Learning Outcomes: 1. Investigate the skills and knowledge needed to be successful in a relevant career within the C&I field. 2. Describe program and career goals. 3. Apply research skills required to compose an annotated bibliography. 4. Create the foundation of a C&I portfolio displaying programmatic achievements and course competencies. Credits: 1.00

EDCI 52003 - Theories And Trends In Curriculum And Instruction

Credit Hours: 3.00. This course focuses on current theories and trends influencing curriculum and instruction. A theory is a plausible or scientifically acceptable general principle or body of principles offered to explain phenomena. It is a belief, policy, or procedure proposed or followed as the basis of action. A trend, on the other hand, is a pattern of gradual change in a condition, output, or process. It reflects a general tendency of a series of moves in a certain direction over time. We will focus on understanding sources of current theories and trends and how they may influence work in curriculum and instruction. Permission of department required.

Learning Outcomes: 1. Examine and clarify the educational beliefs, values, and knowledge guiding your curricular and instructional decisions. 2. Utilize and evaluate multiple appropriate sources in researching current curriculum and instruction trends and issues. 3. Interpret, critique, and synthesize relevant research related to current curriculum and instruction trends. 4. Assess the implications of research relative to your curricular and instructional practices. 5. Interpret, critique, and synthesize relevant educational theories related to current curriculum and instruction trends. 6. Assess the implications of educational theories relative to your curricular and instructional practices. 7. Interpret, critique, and synthesize relevant state and national policy decisions related to current curriculum and instruction trends. 8. Assess the implications of state and national policy decisions relative to your curricular and instructional practices. 9. Communicate effectively in oral and written formats. 10. Demonstrate the disposition for life-long learning and continuous professional development. 11. Identify communities of practice within discipline and participate within these communities according to the ethical

standards of the discipline. 12. Examine and clarify how your educational beliefs, values, and knowledge guide your curricular and instructional decisions address the diversity of students, schools, and communities. 13. Advocate for values of diversity, inclusivity, and social justice. Credits: 3.00

EDCI 52004 - Teachers As Leaders

Credit Hours: 3.00. This course focuses on teacher leadership in instruction. Participants will examine the history of teacher leadership. Instructional coaching models will be examined and compared. Students will identify the various theories that support each coaching model and examine what is most present in their school contexts. Permission of department required.

Learning Outcomes: 1. Investigate the construct of school leadership. 2. Evaluate potential leadership roles in classrooms, schools, or other organizations. 3. Research teacher leadership praxis to impact future praxis. 4. Synthesize leadership research in conjunction with theories of social justice and equity. 5. Analyze the skills of effective teacher leadership through collaboration and inquiry. 6. Explore the critical role teachers play in creating conditions for continuous and systematic improvements in education. Credits: 3.00

Special Education Courses (15 credits)

EDPS 51500 - Foundations Of Applied Behavioral Analysis In School Settings

Credit Hours: 3.00. Application of learning theory, measurement procedures, verification of functional relationships, and developing knowledge of current significant research in applied behavior analysis.

Learning Outcomes: 1. Introduced to specific methods and teaching strategies for working with children with emotional and behavioral disabilities. 2. Prepared to systematically monitor student performance. 3. Prepare teachers to devise and implement usable functional behavior analysis and behavior management plans for students with emotional and behavioral disabilities. Credits: 3.00

EDPS 56800 - Social, Legal, And Ethical Issues Across The Lifespan

Credit Hours: 3.00. Survey of difference and similarities of children with exceptionality, including their nature and characteristics related to their developmental and educational needs. Analysis and practical application of social, legal, and ethical issues in the field of special education.

Learning Outcomes: 1. Explain the historical perspectives and foundations of general and special education policy, current issues, and research (REPA 1.1, 1.2; CEC Int. 1.1; CEC Adv. 3.3, 4.2, 6.1). 2. Apply ethical guidelines, state and federal laws and policies, and utilize the rights, roles, and responsibilities of stakeholders and organizations concerning the education of students with exceptionalities (REPA 1.3, 1.4, 1.5; CEC Int. 1.1, 2.2; CEC Adv 3.3, 4.2, 5.1, 6.1, 6.2, 6.3). 3. Evaluate the influence of cultural, linguistic, and socioeconomic factors on the disproportionate identification of individuals from diverse groups. (REPA 2.8.; CEC Int. 1.2, 2.2; CEC Adv. 2.3, 3.2, 4.2, 5.2). 4. Examine the roles and responsibilities of team members (RtI, multidisciplinary, Case Conference Committee (CCC), families, student) to facilitate in developing, implementing, monitoring, and amending individualized programs for students with exceptionalities (IEPs, transition plans, health-care plans, and behavioral and academic intervention plans) setting goals, and monitoring progress toward goal each grading period. (REPA 4.3, 4.4, 4.5; CEC Int. 2.1, 2.2, 2.3, 7.1; CEC Adv. 4.2, 5.3). 5. Evaluate eligibility (including students from culturally and/or linguistically diverse backgrounds and/or referred for interventions through the Response to Instruction (RtI) process), program (strategies for prioritizing areas of the general education curriculum and sequencing, implementing, and

evaluating individualized learning objectives), and placement decisions (continuum of services: general education classroom, advantages and disadvantages of various placement options and programs) for students with mild and/or intense exceptional needs. (REPA 4.1, 4.2, 4.7; CEC Int. 1.1, 1.2, 2.1, 2.3, 3.1, 3.2; CEC Adv 4.2, 5.1, 5.2). 6. Engage in professional development activities and professional organizations relevant to teaching students with exceptional needs, and knowledge of professional resources, organizations, and publications for enhancing one's professional skills and for engaging in lifelong professional development (REPA 10.4/10.5; CEC Int 1.2; CEC Adv. 5.4, 5.5, 6.4, 6.5). 7. Apply strategies for engaging in reflection and self-assessment activities to address one's own strengths and weaknesses, to become aware of one's own cultural biases and differences and dispositions toward students with intense exceptional needs and their families, to improve instruction, and to determine personal goals for professional growth (REPA 10.6/10.7; CEC Int 2.2, 2.3, 4.2, 5.1; CEC Adv. 6.3, 7.1). Credits: 3.00

EDPS 52400 - Effective Instruction For Students With Significant Reading Difficulties

Credit Hours: 3.00. This course will explore significant reading difficulties, such as dyslexia, and essential components of effective reading instruction. This course will investigate scientifically-based reading research (SBRR), evidence-based and developmentally appropriate reading instruction and interventions to support students with exceptionalities.

Learning Outcomes: 1. Identify the foundations of language acquisition and literacy development, including cognitive, linguistic, cultural, social, and motivational factors that affect language acquisition and literacy development; and major components of reading development, including phonemic awareness, phonics, fluency, vocabulary, and text comprehension. 2. Explore the history, origins, and underlying causes of significant reading difficulties, including dyslexia. 3. Synthesize principles of scientifically based reading research (SBRR) and evidence-based reading instruction and intervention, such as applying data-based decision making, setting individual student learning goals, and using instruction grounded in SBRR. 4. Explain key concepts of phonemic awareness: the critical role of phonemic awareness in learning to read an alphabetic language; the distinction between phonological awareness (i.e., the awareness that oral language is composed of smaller units, such as spoken words and syllables) and phonemic awareness (i.e., a specific type of phonological awareness involving the ability to distinguish the separate phonemes in spoken words); and knowledge of the continuum of phonological- and phonemic-awareness skills development. 5. Summarize key concepts of phonics in developing accurate decoding and automaticity in word recognition; the importance of sequencing phonics instruction according to the increasing complexity of linguistic units; the reciprocity between decoding and encoding; and the continuum of phonics skills. 6. Create SBRR-based, evidence-based, and developmentally appropriate assessment, instruction, intervention, or extension lesson plan, and ongoing progress monitoring in phonemic awareness, phonics, fluency, vocabulary and academic language, comprehension and analysis of informational, persuasive, and literary texts, including response to literature. Credits: 3.00

EDPS 52700 - Literacy Curricula For Learners With Exceptionalities

Credit Hours: 3.00. This course will explore research-supported general and specialized literacy curricula to prepare candidates to design and/or adapt instructional lessons and materials to meet the needs of students with exceptionalities.

Learning Outcomes: 1. Apply principles of UDL when selecting, adapting, and modifying assessments to accommodate student(s) with exceptionalities, including students who are nonverbal or English Learners. 2. Evaluate research-supported instructional strategies and materials appropriate to the strengths, needs, and characteristics of students with exceptionalities within the areas of literacy development, reading fluency, concepts of vocabulary and academic language, and comprehension and analysis of informational, persuasive, and literary text. 3. Apply strategies to work effectively with general education teachers and support staff to provide services that incorporate differentiated instruction, transition assessments, and assistive technology that facilitate student learning and the students' learning environment. 4. Create lesson plans, based on national, state, and/or local curricula standards and the scope and sequence of grade-level/chronologically-aged appropriate general education content-area curriculum that incorporate UDL, research-supported instructional strategies and materials, and provide meaning-filled learning opportunities. 5. Design lesson plans that incorporate UDL and apply research-supported strategies to provide specially designed reading and writing instruction, including strategies for providing explicit and systematic instruction and strategies for using technology to support various aspects of the reading and writing process and include instructional and assistive strategies to teach students to monitor errors in reading comprehension and writing. 6. Evaluate instruction, monitor progress, and make instructional changes to support student learning. Credits: 3.00

EDPS 55800 - Transition Education And Services

Credit Hours: 3.00. This course will explore a variety of resources, strategies, and techniques for promoting successful life transitions for students with mild and intense intervention needs before and throughout the school years and into postsecondary and adult settings.

Learning Outcomes: 1. Apply ethical guidelines, state and federal transition laws and policies (REPA 9.6, 9.7; CEC Int 1.1, 2.3: CEC Adv 2.2, 2.3, 3.3, 4.1, 5.1, 5.2, 6.1) 2. Evaluate state, school, and private resources (e.g. Individual Family Service Plans, Medicaid Waivers, Vocational Rehabilitation, Special Needs Trusts, Issues of Guardianship, Bureau of Developmental Disability Services) that promote successful life transitions (REPA 9.6, 9.7; CEC Int 2.1, 2.2, 2.3, 3.2, 5.2, 5.3, 5.6, 6.1, 6.2; CEC Adv 2.3, 3.2, 3.3, 3.4, 4.2, 5.1, 5.2). 3. Examine the rights, roles, and responsibilities of stakeholders and organizational resources concerning the transition process of students with exceptionalities (REPA 1.3, 1.4, 1.5, 9.6, 9.7; CEC Int. 1.1, 2.2, 2.3; CEC Adv 2.2, 2.3, 3.3, 4.2, 5.1, 6.1, 6.2, 6.3). 4. Create a transition-related lesson/activity to support positive, life-long transition outcomes (REPA 3.9, 9.2, 9.4, 9.5; CEC Int 2.1, 2.2, 2.3, 3.2, 5.2, 5.3, 5.6, 6.1, 6.2; CEC Adv 2.3, 3.2, 3.3, 3.4, 4.2, 5.1, 5.2). 5. Apply strategies to collaborate effectively with general education teachers, support staff, families and community/organizational resources to identify services that incorporate differentiated instruction, transition assessments, and assistive technology that facilitate student learning and promote positive transition outcomes. (REPA 4.6, 4.8, 9.3, 9.4, 9.5; CEC Int 1.1, 1.2, 2.3, 3.2, 4.2, 4.3, 5.2, 7.1, 7.2, 7.3; CEC Adv 1.1, 2.3, 3.2, 3.3, 4.2, 5.1, 5.2, 5.3, 6.2, 6.3, 7.1, 7.2, 7.3). 6. Apply strategies to support students with exceptionalities to develop and strengthen self-determination skills (REPA 7.8; CEC Int 1.1, 1.2, 2.1, 2.2, 2.3, 3.2, 5.2, 5.6, 6.1, 6.2; CEC Adv 1.1, 2.3, 3.2, 3.3,

3.4, 4.2, 5.1, 5.2, 6.2, 6.3). Credits: 3.00

Portfolio Course (1 credit)

EDCI 68000 - Curriculum & Instruction MS Portfolio

Credit Hours: 1.00. This course was created to help guide C&I students near completion of their coursework to develop their competency portfolio. A competency portfolio reflects the depth and breadth of a student's educational growth since entering the graduate program. The purpose of the C&I competency portfolio is to demonstrate that students have mastered the graduate competencies for the C&I online Master's program. The portfolio will contain student projects aligned with C&I competencies and will be reviewed by committee members. The competencies are based on the Curriculum & Instruction departmental competencies and several program-specific competencies. The competency portfolio is a requirement for graduation from the C&I Master's program. (Multiple media are welcome.) Permission of department required.

Learning Outcomes: 1. Develop an online version of your competency portfolio based on artifacts as evidence. 2. Compose reflective narratives that explain how your artifacts demonstrate each competency. 3. Develop an updated resume or vita suitable for job searching. 4. Deconstruct relevant job postings in the field. Credits: 1.00

Capstone Course (3 credits)

EDCI 67900 - Capstone: Inquiry Into Practice

Credit Hours: 3.00. This course conceptually centers on the Ghanaian Sankofa symbol of a bird retrieving an egg from its back while facing forward. This metaphor represents the need to "go back to the past and bring forward that which is useful" (About the Sankofa [n.d.]. Retrieved from https://cola.siu.edu/africanastudies/about-us/sankofa.php). The twin aspect of looking back with the future in mind plays out in consonance with the Portfolio course generally taken in tandem with this course. In this course, students will reinforce and extend their learning of key concepts across the program and deepen their engagement with a topic of interest to them through an action research project. Permission of department required.

Learning Outcomes: 1. Evaluate how your program's experiences, knowledge, and skills will inform your future action and pedagogical practices through reflection and self-critical inquiry. 2. Articulate where you are situated epistemologically, ontologically, and methodologically as educators and researchers within and across disciplines. 3. Demonstrate a commitment to ongoing development as knowledgeable and engaged advocates for equitable education through the exploration of intersectionality. 4. Conduct an action research project that identifies a problem within your classroom or school community and seeks to ameliorate it. 5. Communicate research findings with a broader audience of stakeholders. Credits: 3.00

GPA Requirements

Cybersecurity and Trusted Systems, MS (Indianapolis)

About the Program

Program Requirements - Non-Thesis/Coursework Only & Directed Project Track

Required Courses (18 credits)

Statistics or Quantitative Methods Course (3 credits)

CIT 50700 - Measurement And Evaluation In Industry And Technology

Credit Hours: 3.00. This course is an introduction to measurement strategies and evaluation of data in industry and technology within the context of research design and implementation. Students will learn not only basic statistics in this course but will also learn about the research process by designing, conducting, and analyzing the data for a small empirical research project using real world data. The material in this course is directly relevant to student professional

development. Data collection and interpretation are key day-to-day aspects of social and behavioral science, humanities, communication, economics, physical science, biological and medical science, technology, education, psychology, business, environmental science, education and government. In addition, the ability to use computers and other technologies around data has become a critical element in most professional decision-making processes.

Credits: 3.00

Foundation Courses (15 credits)

CIT 51600 - Database Security

Credit Hours: 3.00. This course provides a strong foundation in database security and auditing. It will cover topics on security, profiles, password policies, privileges and roles, Virtual Private Databases, and auditing. The course also covers advanced topics such as SQL injection, database management security issues such as securing the DBMS, enforcing access controls, and related issues. Permission of instructor required.

Credits: 3.00

CIT 52800 - Information Security Risk Assessment

Credit Hours: 3.00. (CNIT 52800) Covers information security risk assessment, including the following topics: steps in performing information security risk assessment, threats to information security, technical, managerial, and operational vulnerabilities, methods for analyzing controls, methods for determining likelihood of and impact from an information security breach, and methods for determining risk. Emphasizes the development and utilization of security metrics in the risk assessment process.

Credits: 3.00

CIT 53200 - Wireless Security And Technology

Credit Hours: 3.00. This course will provide in-depth coverage of wireless communications and security. Fundamentals and state of the art developments in the wireless security area will be covered, including advances in cellular, personal communications systems (PCS), wireless LANs, and fixed wireless networks. Significant details of wireless devices and corresponding security issues will be addressed. Emerging challenges and solutions in wireless vulnerabilities, attacks, and solutions at various layers of the protocol stack, spanning the stack from aspects of physical communication to application and service security issues, will also be covered.

Credits: 3.00

Electives (9 or 12 credits)*

Directed Project Course (3 credits)

CNIT 59800 - Directed MS Project

Credit Hours: 1.00 to 3.00. A formal investigation of a particular problem under the guidance of the advisory committee. Not applicable to a thesis option plan of study. Enrollment during at least two consecutive terms for a total of three credits is required. Permission of instructor required.

Learning Outcomes: 1.

Varies due to nature of the course. Credits: 1.00 to 3.00

GPA Requirements

Data Science in Finance, MS

About the Program

Program Requirements

Required Courses (27 credits)

Core Courses (15 credits)

STAT 51700 - Statistical Inference

Credit Hours: 3.00. A basic course in statistical theory covering standard statistical methods and their application. Estimation including unbiased, maximum likelihood and moment estimation; testing hypotheses for standard distributions and contingency tables; confidence intervals and regions; introduction to nonparametric tests and linear regression.

Learning Outcomes: 1. Understand the basic asymptotic theory including consistency and convergence in distribution. 2. Know how to perform some elementary statistical inference such as estimation, confidence interval and hypothesis testing. 3. Be familiar with the maximum likelihood method to make statistical inference. 4. Know how to judge the quality of different estimators. 5. Know how to perform

optimal tests of hypotheses. Credits: 3.00

STAT 51900 - Introduction To Probability

Credit Hours: 3.00. (MA 51900) Algebra of sets, sample spaces, combinatorial problems, independence, random variables, distribution functions, moment generating functions, special continuous and discrete distributions, distribution of a function of a random variable, limit theorems.

Credits: 3.00

STAT 52000 - Time Series And Applications

Credit Hours: 3.00. An introductory course in stationary time series with applications. Topics include stationarity, autocovariance function, ARIMA (Autoregressive Integrated Moving Average) models, and basic spectral analysis (periodograms and their estimation, tapering, linear filtering). Extensive use of R is incorporated for building time series models and estimating the time series spectrum.

Learning Outcomes: 1. Recognize basic properties of stationary time series and various aspects and representations of ARMA and ARIMA models. 2. Understand and apply standard time domain techniques for the identification, estimation, and forecasting of ARIMA models. 3. Identify elementary concepts and techniques for spectral analysis. 4. Use R facilities to analyze real life time series data. Credits: 3.00

STAT 52500 - Intermediate Statistical Methodology

Credit Hours: 3.00. Statistical methods for analyzing data based on general/generalized linear models, including linear regression, analysis of variance (ANOVA), analysis of covariance (ANCOVA), random and mixed effects models, and logistic/loglinear regression models. Application of these methods to real-world problems using SAS statistical software.

Credits: 3.00

STAT 52600 - Advanced Statistical Methodology

Credit Hours: 3.00. As a sequel to STAT 52500, this course introduces statistical modeling tools for situations where standard least-squares techniques may not apply. This includes an extensive coverage of generalized linear models (GLM) for non-Gaussian responses, mixed effects models to describe correlated data, nonparametric regression, and lastly, parametric and nonparametric survival models for the analysis of (possibly censored) time-to-event data. Among issues to be discussed are the estimation of the models, the testing of hypotheses, and the checking of model adequacy. Data examples will be used throughout the course to illustrate the methodologies and the related software tools in R.

Learning Outcomes: 1. Understand the concepts and methods in generalized linear models, survival analysis, linear mixed models and GEE methods. 2. Apply these methods properly to real data using R, drawing valid conclusions, and presenting the results concisely. Credits: 3.00

STAT 52800 - Introduction To Mathematical Statistics

Credit Hours: 3.00. The course introduces the fundamental frameworks of statistical theory, from which statistical methods can be derived. This includes the framework of data and statistical models, decision theory (risk functions, Bayes and minimax criteria), sufficient statistics, exponential distribution families, estimation methods, unbiased estimators and information inequality (Cramer-Rao), the Neyman-Pearson framework of hypothesis testing, monotone likelihood ratio families and likelihood ratio tests, and an introduction of asymptotic approximations. Students will need background in advanced calculus, linear algebra, probability, and some mathematical analysis.

Learning Outcomes: 1. Understand the framework of statistical models and be able to define a statistical model for a data analysis problem. 2. Use the decision theory to compare different data analysis methods. 3. Derive theoretical properties of some statistical methods. 4. Be able to justify some commonly used statistical methods through theory. Credits: 3.00

STAT 54500 - Introduction To Computational Statistics

Credit Hours: 3.00. This introductory course covers the fundamentals of computing for statistics and data analysis. It starts with a brief overview of programming using a general purpose compiled language (C) and a statistics-oriented interpreted language (R). The course proceeds to cover data structures and algorithms that are directly relevant to statistics and data analysis and concludes with a computing-oriented introduction to selected statistical methods. A significant part of the course involves programming and hands-on experimentation demonstrating the covered techniques, ration, and Markov chain Monte Carlo methods.

Learning Outcomes: 1. Given a straightforward data manipulation problem, decide on what

elementary data structures to use, write down an algorithm for a solution as a pseudocode, and analyze its computational complexity. 2. Implement an algorithm using C and/or R code, understand, modify, and if needed perform basic debugging of the existing code. 3. Understand and implement the computational techniques of numerical optimization, matrix manipulation, sampling, logistic regression, and EM algorithm. Credits: 3.00

Computational Finance Courses (6 credits)

STAT 54000 - Computational Finance I

Credit Hours: 3.00. An introduction to the mathematical tools and techniques of modern finance theory, in the context of Black-Scholes option pricing. Brownian motion and its stochastic calculus, Ito's formula, and Feynman-Kac formula. Pricing and hedging of claims on Black-Scholes assets. Incomplete markets. Path-dependent options. Stochastic portfolio optimization.

Learning Outcomes: 1. Obtain necessary mathematical background necessary to study quantitative methods in finance. 2. Understand mathematical models of modern financial markets. Credits: 3.00

STAT 54100 - Computational Finance II

Credit Hours: 3.00. Stochastic interest rate models. American options from the probabilistic and PDE points of view. Numerical methods for European and American options, including binomial, trinomial, and Monte-Carlo methods.

Learning Outcomes: 1. Learn advanced topics in quantitative finance. Credits: 3.00

Data Science in Finance Courses (6 credits)

STAT 57900 - Foundations Of Statistical Machine Learning

Credit Hours: 3.00. This course provides a comprehensive treatment of modern statistical machine learning topics. These include linear regression, kernel method, trees, boosting, and deep neural networks. We understand these subjects from a statistical perspective with some mathematical rigorousness.

Learning Outcomes: 1. Understand classical supervised learning methods such as linear regression, nonlinear regression, random forest, and boosting. 2. Understand classical unsupervised learning methods such as K-means clustering and PCA. 3. Understand modern AI techniques using deep neural networks, such as manifold learning and deep generative models. 4. Practice complex and high dimensional data analysis using the methodology and software packages. Credits: 3.00

STAT 58700 - Machine Learning In Finance

Credit Hours: 3.00. This graduate course on Machine Learning in Finance explores contemporary topics in quantitative finance, including optimal execution, dynamics of limit order books, optimal portfolio selection, and more. The course focuses on illustrating how machine learning methods are applied in these specific areas.

Learning Outcomes: 1. Gain a comprehensive understanding of the latest advancements in machine learning methodologies. 2. Apply these methodologies using practical applications within the context of financial markets. Credits: 3.00

Selectives (6 credits)

CS 54300 - Introduction To Simulation And Modeling Of Computer Systems

Credit Hours: 3.00. Simulation: discrete event simulation, process oriented simulation, generating random numbers, simulation languages, simulation examples of complex systems. Nondeterministic models: random variables, Poisson process, moment generating functions, statistical inference and data analysis. Modeling: elementary queuing models, networks of queues, applications to performance evaluation of computer systems.

Credits: 3.00

CS 57300 - Data Mining

Credit Hours: 3.00. (CSCI 57300) Data Mining has emerged at the confluence of artificial intelligence, statistics, and databases as a technique for automatically discovering summary knowledge in large datasets. This course introduces students to the process and main techniques in data mining, including

classification, clustering, and pattern mining approaches. Data mining systems and applications are also covered, along with selected topics in current research. Offered in alternate years.

Learning Outcomes: 1. Learn Data mining techniques. 2. Learn how to summarize large data sets. 3. Learn current research topics. Credits: 3.00

STAT 53200 - Elements Of Stochastic Processes

Credit Hours: 3.00. (MA 53200) A basic course in stochastic models, including discrete and continuous time Markov chains and Brownian motion, as well as an introduction to topics such as Gaussian processes, queues, epidemic models, branching processes, renewal processes, replacement, and reliability problems.

Credits: 3.00

STAT 54600 - Computational Statistics

Credit Hours: 3.00. The course focuses on two fundamental aspects in computational statistics: (1) what to compute and (2) how to compute. The first is covered with a brief review of advanced topics in statistical inference, including Fisher's fiducial inference, Bayesian and frequenstist methods, and the Dempster-Shafer (DS) Theory. The second is discussed in detail by examining exact, approximation, and interactive simulation methods for statistical inference with a variety of commonly used statistical models. The emphasis is on the EM-type and quasi-Newton algorithms, numerical differentiation and integration, and Markov chain Monte Carlo methods.

Learning Outcomes: 1. Master commonly used numerical matrix operations, including the sweep operator, Cholesky decomposition, eigenvalue decomposition, and single value decomposition. 2. Understand statistical thinking in development of interactive numerical methods. 3. Apply optimization algorithms such as quasi-Newton and conjugate gradient methods. 4. Implement EM-type algorithms for maximum likelihood estimation when expanded complete-data models are available, including commonly used statistical models. 5. Create random number generators. 6. Implement the Gibbs sampler and Metropolis-Hastings algorithms for Bayesian data analysis. Credits: 3.00

STAT 59800 - Topics In Statistical Methods

Credit Hours: 0.00 to 6.00 (West Lafayette, IUPUI) 1.00 to 3.00 (North Central). Directed study and reports for students who wish to undertake individual reading and study on approved topics. Permission of instructor required.

Credits: 0.00 to 6.00

STAT 69500 - Seminar In Mathematical Statistics

Credit Hours: 1.00 to 3.00. Topics vary. Permission of instructor required.

Credits: 1.00 to 3.00

STAT 57900 - Foundations Of Statistical Machine Learning

Credit Hours: 3.00. This course provides a comprehensive treatment of modern statistical machine learning topics. These include linear regression, kernel method, trees, boosting, and deep neural networks. We understand these subjects from a statistical perspective with some mathematical rigorousness.

Learning Outcomes: 1. Understand classical supervised learning methods such as linear regression, nonlinear regression, random forest, and boosting. 2. Understand classical unsupervised learning methods such as K-means clustering and PCA. 3. Understand modern AI techniques using deep neural networks, such as manifold learning and deep generative models. 4. Practice complex and high dimensional data analysis using the methodology and software packages. Credits: 3.00

STAT 58700 - Machine Learning In Finance

Credit Hours: 3.00. This graduate course on Machine Learning in Finance explores contemporary topics in quantitative finance, including optimal execution, dynamics of limit order books, optimal portfolio selection, and more. The course focuses on illustrating how machine learning methods are applied in these specific areas.

Learning Outcomes: 1. Gain a comprehensive understanding of the latest advancements in machine learning methodologies. 2. Apply these methodologies using practical applications within the context of financial markets. Credits: 3.00

CS 57800 - Statistical Machine Learning

Credit Hours: 3.00. This introductory course will cover many concepts, models, and algorithms in machine learning. Topics include classical supervised learning (e.g., regression and classification), unsupervised learning (e.g., principle component analysis and K-means), and recent development in the machine learning field such as variational Bayes, expectation propagation, and Gaussian processes. While this course will give students the basic ideas and intuition behind modern machine learning methods, the underlying theme in the course is probabilistic inference.

Learning Outcomes: 1. Learn the theory and key algorithms used in machine learning. 2. Get hands-on machine learning experience by implementing several algorithms, applying them to datasets and analyzing their performance. 3. Understand how to use machine learning methods to their research projects, formulate the learning tasks and match them with appropriate solutions. Credits: 3.00

About the Program

Data Science, MSDS (OL)

About the Program

Program Requirements

Required Courses (30 credits)

Core Courses (15 credits)

GRAD 58900 - Master Of Science In Artificial Intelligence Capstone

Credit Hours: 3.00. The capstone course aims to provide students with an opportunity to integrate their accumulated knowledge, technical, and social skills to identify and solve a realistic or real-world artificial intelligence problem, with an emphasis on the application domain. The capstone course for the MSAI provides students with practical experience applying the collective set of skills developed through the MSAI program to complete a professional project in support of a private, public, or non-profit partner. Students, in teams, will select a target beneficiary, arrange a consultation, develop a problem statement, a project plan that will yield benefits, and a strategy for measuring the outcome of the project compared to a baseline.

Learning Outcomes: 1. Identify the public, non-profit, or business objectives in a complex problem. 2. Evaluate and define an applied problem using AI that requires practical analysis and recommendations / and analytic output to a stakeholder. 3. Design a professional-level applied project that provides meaningful input to a targeted beneficiary. 4. Evaluate the proposed solution and interpret results concerning the "business" objectives. 5. Demonstrate an understanding of translational communication skills by communicating technical information to both technical and non-technical audiences. Credits: 3.00

GRAD 58800 - Online Master Of Science In Data Science-Capstone

Credit Hours: 3.00. The capstone course aims to provide students with an opportunity to integrate their accumulated knowledge, technical, and social skills to identify and solve a real-world data science problem, with an emphasis on the application domain. The capstone course for the OMSDS provides students with practical experience applying the collective set of skills developed through the OMSDS program to complete a professional project in support of a private, public, or non-profit partner. Students, in teams of 3-5 students each, will work with a product owner to scope out the project via a project charter that will include a timeline, milestones, and metrics that will yield benefits and a strategy for measuring the outcome of the project compared to a baseline.

Learning Outcomes: 1. Identify the public, non-profit, or business objectives in a complex problem. 2. Evaluate and define an applied problem using data science that requires practical analysis and recommendations / and analytic output to a stakeholder. 3. Design a professional-level applied project that provides meaningful input to a targeted beneficiary. 4. Evaluate the proposed solution and interpret results concerning the "business" objectives. 5. Demonstrate an understanding of translational

communication skills by communicating technical information to both technical and non-technical audiences. Credits: 3.00

GRAD 50600 - Big Data Tools And Technologies

Credit Hours: 3.00. This course is designed to equip students with the essential skills to handle big data effectively. It covers proficiency in big data technologies, scalable data processing techniques, and the integration of big data tools into data science workflows.

Learning Outcomes: 1. Demonstrate proficiency in big data technologies. 2. Apply scalable data processing techniques to handle large datasets. 3. Integrate big data tools into comprehensive data science workflows. 4. Demonstrate proficiency with cloud computing. Credits: 3.00

GRAD 50500 - Foundations In Data Science

Credit Hours: 3.00. This course is the inaugural course in the Master of Science in Data Science program. Tailored for students with a technical background, this course provides a comprehensive introduction to key concepts, statistical techniques, and tools foundational to the field of data science. The syllabus integrates hands-on experience, ethical considerations, programming refresher, and agile project management principles to equip students with a robust foundation for their data science journey.

Learning Outcomes: 1. Demonstrate a comprehensive understanding of core data science concepts and articulate the significance of data in various domains. 2. Acquire skills to perform exploratory data analysis, identify patterns, and make informed decisions based on statistical inference. 3. Analyze ethical dilemmas arising in data-driven contexts, apply ethical decision-making models, and navigate the legal implications of data handling and analysis. 4. Demonstrate a comprehensive understanding of programming fundamentals and the application of agile methodologies to manage and execute data science projects. 5. Access, navigate, and employ Purdue's computing resources available through Purdue's Rosen Center for Advanced Computing (RCAC). Credits: 3.00

GRAD 50700 - Cross Domain Data Communication And Visualization

Credit Hours: 3.00. This course focuses on the proficient use of data communication strategies and competencies. The course will focus on identifying data narratives, generating stories from data, illustrating with powerful and self-explanatory visualization, and basic principles of ethical use of non-data narrative frames for data communication. Designed for students with a technical background pursuing a Master of Science in Data Science, this course aims to enhance students' ability to extract and communicate meaning and narratives from raw data and visually represent it.

Learning Outcomes: 1. Create effective and aesthetically pleasing data visualizations. 2. Communicate complex data findings clearly to diverse audiences. 3. Utilize interactive visualization techniques for dynamic exploration of datasets. 4. Develop the ability to integrate ethics and data privacy considerations effectively when communicating with data. Credits: 3.00

GRAD 50800 - Data Analytics

Credit Hours: 3.00. This course provides an in-depth exploration of advanced data analysis techniques, predictive modeling, ensemble methods, and proficiency in data manipulation and transformation. It is designed for students with a technical background pursuing a Master of Science in Data Science.

Learning Outcomes: 1. Apply advanced data analysis techniques to extract meaningful insights from complex datasets. 2. Implement predictive modeling and ensemble methods for accurate data-driven predictions. 3. Demonstrate proficiency in data manipulation and transformation techniques. Credits: 3.00

GRAD 50900 - Applied Machine Learning: From Foundations To Latest Advances

Credit Hours: 3.00. This course provides an in-depth exploration of machine learning algorithms and data mining techniques, building on the foundational concepts introduced in the Foundations of Data Science course. Students will develop a comprehensive understanding of various machine learning algorithms, focusing on practical applications and hands-on experience. Additionally, the course will cover data mining techniques for dimension reduction and pattern discovery.

Learning Outcomes: 1. Demonstrate a comprehensive understanding of popular machine learning algorithms, including supervised and unsupervised learning techniques. 2. Demonstrate the ability to analyze mathematical foundations and principles behind machine learning models. 3. Understand the nuances of applying various machine learning models, emphasizing the trade-offs between performance, computational complexity, and interpretability. 4. Students will actively explore unsupervised learning techniques, emphasizing clustering algorithms, and recognizing their vital role in solving real-world challenges. 5. Demonstrate proficiency into the fundamental principles of deep learning and investigate recent advancements, such as optimization using diffusion models, learning from unlabeled data using consistency models, and decentralized data processing through federated learning. Credits: 3.00

Data Visualization Course (2-3 credits)

MGMT 59000 - Directed Readings In Management

Credit Hours: 1.00 to 4.00 (West Lafayette, North Central) 2.00 to 4.00 (Calumet). Supervised reading and reports in various subjects. Open only to a limited number of seniors and graduate students. Permission of instructor required.

Credits: 1.00 to 4.00

CGT 57500 - Data Visualization Tools And Applications

Credit Hours: 3.00. This course provides hands-on experience in data visualization tools and applications. The course is designed for students with little or no background in Data Visualization. It introduces students to design principles for creating meaningful displays of quantitative and qualitative data to facilitate insight and decision-making. The goal is to introduce visualization as a tool, explore and identify which visualization tools are better suited to visualize different types of data, and understand the role visualization plays in understanding what the data represent. This course gives students an in-depth view of the various branches of visualization and the visualization tools in each area. After taking the course students will be able to evaluate data visualization tools and determine which tool to use for different types of data. This course is targeted towards students interested in using visualization in their own work and future academic courses.

Learning Outcomes: 1. Assess the visualization process. 2. Assess the applicability of various visualization tools. 3. Evaluate different techniques of visual representation. Credits: 3.00

SCLA 51000 - Data And AI Storytelling

Credit Hours: 3.00. The primary assumption of our course is that the goal of communicating with data is ultimately to identify causal mechanisms and change the status quo due to the obtained insights. All audiences have previous understandings of the world, and meaningful data stories should challenge their assumptions about that world. The communication of this data-based new knowledge violates prior assumptions, shares memorable new information and moves the audience to act based on the new knowledge. This is best accomplished through a story. In other words, this communication assumes the form of a story, which is defined as the narrative of how an unexpected cause creates an effect.

Learning Outcomes: 1. Provide high-quality data story examples and justify why they meet the good story criteria. 2. Identify and extrapolate core relationships between research design and story-building. 3. Generate hypotheses based on data. 4. Create specific data visualizations which maintain casual narratives. 5. Identify story elements that map onto the five tenets of What is a Data Story? 6. Identify in examples the adherence or violation of data transparency, validity and ethics. Credits: 3.00

MGMT 69000 - Advanced Problems In Management

Credit Hours: 1.00 to 4.00. Advanced investigation in a specific management field at the graduate level.

Credits: 1.00 to 4.00

Industry Aligned Focus Areas (0-12 credits)

Selectives (0-12 credits)

COM 60311 - Seminar In Crisis Communication

Credit Hours: 3.00. This graduate course will focus on how to communicate in a time of crisis in order to manage the situation and disseminate key messages to various stakeholders. Prerequisite: Graduate student in Communication and COM 60111 . Permission of department required.

Learning Outcomes: 1. Have a broad understanding of the crisis communication literature. 2. Be able to formulate solutions to crisis situations from multiple perspectives. 3. Anticipate actions and analyze stakeholders involved in crisis situations. 4. Be aware of and challenge critical assumptions in crisis situations. 5. Evaluate crisis plans. Credits: 3.00

ABE 65100 - Environmental Informatics

Credit Hours: 3.00. This course will educate students in the use, manipulation and analysis of environmental data by introducing them to scripting languages (e.g. c-shell, python), data types (e.g. ASCII, binary, NetCDF), databases (e.g. XML, DBF) and data visualization software (e.g. GMT, ArcMap) as well as techniques for checking data quality, working with missing data, and handling large diverse sources of time series and spatial data. Students will manipulate, check and insert data from a variety of sources, use that data as input to distributed hydrologic model, analyze model output and learn methods for properly documenting their data use (creation of metadata) and long-term archival storage of those data. Skills learned should be applicable to most computer operating systems, but the majority of work for this class will be done within the Unix/Linux environment. Students taking this course should have experience with one or more programming languages, including but not limited to C, Fortran, Perl, Python, java, Basic, or two writing scripts or macros within programs such as MATLAB, S-Plus, R, SAS.

Learning Outcomes: 1. Demonstrate use of the scientific method to identify problems, formulate and test hypotheses, conduct experiments and analyze data, and derive conclusions. 2. Demonstrate critical thinking by using data and reasoning to develop sound responses to complex problems. 3. Demonstrate the ability to write and speak with effectiveness while considering audience and purpose. 4. Demonstrate the ability to work effectively as part of a problem-solving team. 5. Demonstrate skills necessary for lifelong learning. 6. An ability to apply knowledge of mathematics, science, and engineering. 7. Ability to design and conduct experiments, as well as to analyze and interpret data. 8. An ability to function on multidisciplinary teams. 9. An ability to communicate effectively. 10. A recognition of the need for, and an ability to engage in life-long learning. 11. An ability to use the techniques, skills, and modern engineering tools necessary for engineering practice. Credits: 3.00

AGEC 68700 - Problem Solving And Project Management For Decision Makers

Credit Hours: 3.00. Develops a structured approach to problem solving, including problem definition, development of alternatives, identifying consequences, assessing trade-offs, and making informed choices. Research methods and project management concepts will be addressed. A major business analysis project will be framed during the course, to be completed as part of the capstone course in business analysis. Permission of department required.

Learning Outcomes: 1. Identify and conduct original research, scholarship and creative endeavors. 2. Effectively communicate their field of study. 3. Think critically, creatively and solve problems in their field of study. 4. Conduct research in an ethical and responsible manner. 5. Demonstrate attributes of professional development consistent with expectations within their field of study. Credits: 3.00

ASM 54000 - Geographic Information System Application

Credit Hours: 3.00. Fundamentals of GIS analysis applied to environmental, agricultural, and engineering-related problems. Topics include data sources, spatial analysis; projections; creating data and metadata, and conceptualizing and solving spatial problems using GIS.

Learning Outcomes: 1. Apply fundamental geographic information system concepts for organizing, symbolizing, and visualizing spatial and temporal data. 2. Demonstrate proficiency with spatial data manipulation methods for creating and editing geodatabases, geocoding, and performing geoprocessing operations on

spatial data. 3. Apply spatial analysis tools to process vector and raster data for decision-making. 4. Create models to automate GIS workflow and build custom geoprocessing tools. 5. Construct user-friendly dashboards/web apps/StoryMaps for sharing developed solutions. 6. Research publicly available GIS data and use it for the final project or demonstrate Python programming skills to analyze publicly available data. Credits: 3.00

AGRY 54500 - Remote Sensing Of Land Resources

Credit Hours: 3.00. Application of remote sensing and spatial databases for observing and managing land resources within the Earth System; analysis and interpretation of remotely sensed data in combination with field observations and other data sources; conceptualization and design of a global earth resources information system.

Learning Outcomes: 1. Evaluate, analyze, and apply the fundamentals of remote sensing related to sensor technologies, Multispectral/hyperspectral imaging, active and passive radar, LIDAR, GPS, preprocessing of remote sensing image data, Radiometric and geometric correction, data enhancement for visual interpretation, extraction of information from data, spatial and spectral feature extraction for analysis, Unsupervised and supervised classification, terrain modeling and sources of remote sensing data/information. Credits: 3.00

CNIT 58100 - Workshop In Computer Technology

Credit Hours: 0.00 to 8.00. Advanced study of technical and professional topics. Emphasis is on new developments relating to technical, operational, and training aspects of industry and technology education.

Credits: 0.00 to 8.00

EDPS 53100 - Introduction To Measurement And Instrument Design

Credit Hours: 3.00. An application-oriented introduction to constructing educational and psychological tests and surveys. Class sessions include guided practice with the process of instrument development, from trait and test task domain definition, item writing and revision, and item analysis, to score interpretation and validation.

Learning Outcomes: 1. Explain fundamental concepts and terminology in educational measurement. 2. Evaluate existing measurement instruments and score uses. 3. Contribute to development of instruments for measuring educational outcomes. 4. Interpret descriptive statistics for test and test item scores. Credits: 3.00

MA 51100 - Linear Algebra With Applications

Credit Hours: 3.00. Real and complex vector spaces; linear transformations; Gram-Schmidt process and projections; least squares; QR and LU factorization; diagonalization, real and complex spectral theorem; Schur triangular form; Jordan canonical form; quadratic forms.

Credits: 3.00

POL 50100 - Political Science: Methodology

Credit Hours: 3.00. Introduction to the basic techniques of statistical analysis applicable to political science data. Elementary descriptive statistics and statistical inference. Introduction to multivariate analysis. Permission of instructor required.

Credits: 3.00

STAT 50100 - Experimental Statistics I

Credit Hours: 3.00. Concepts and methods of applied statistics. Exploratory analysis of data. Sample design and experimental design. Normal distributions. Sampling distributions. Confidence intervals and tests of hypotheses for one and two samples. Inference for contingency tables, regression and correlation, and one-way analysis of variance. Use of the SAS statistical software. Intended primarily for students who have not had calculus. Not open to students in mathematical sciences or engineering. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: College Algebra.

Learning Outcomes: 1. Produce and identify basic statistical analyses. 2. Discuss statistical terminology (speak statistics). 3. Use SAS to run basic statistical analyses and interpret corresponding SAS output. Credits: 3.00

STAT 50600 - Statistical Programming And Data Management

Credit Hours: 3.00. Use of the SAS software system for managing statistical data. How to write programs to access, explore, prepare, and analyze data. Using the DATA step and procedures to access, transform, and summarize data. Introduction to the SAS macro language. Prepares students for the base SAS certification exam.

Learning Outcomes: 1. Proficient in SAS Programming 1: Essentials. 2. Proficient in SAS Programming 2: Data Manipulation Techniques. 3. Proficient in Macro Language 1: Essentials. 4. Optional: Learn SQL 1: Essentials. Credits: 3.00

STAT 51200 - Applied Regression Analysis

Credit Hours: 3.00. Inference in simple and multiple linear regression, residual analysis, transformations, polynomial regression, model building with real data, nonlinear regression. One-way and two-way analysis of variance, multiple comparisons, fixed and random factors, analysis of covariance. Use of existing statistical computer programs. Prerequisite: Coursework in Statistical Methods with a calculus prerequisite.

Learning Outcomes: 1. Learn to build and analyze simple and multiple regression models, analysis of variance and covariance (ANOVA/ANCOVA) for regression, inference for regression, diagnostics and remedial measures for regression, transformations, residual analysis, model building, polynomial and interaction models. Credits: 3.00

STAT 51700 - Statistical Inference

Credit Hours: 3.00. A basic course in statistical theory covering standard statistical methods and their application. Estimation including unbiased, maximum likelihood and moment estimation; testing hypotheses for standard distributions and contingency tables; confidence intervals and regions; introduction to nonparametric tests and linear regression.

Learning Outcomes: 1. Understand the basic asymptotic theory including consistency and convergence in distribution. 2. Know how to perform some elementary statistical inference such as estimation, confidence interval and hypothesis testing. 3. Be familiar with the maximum likelihood method to make statistical inference. 4. Know how to judge the quality of different estimators. 5. Know how to perform optimal tests of hypotheses. Credits: 3.00

STAT 52600 - Advanced Statistical Methodology

Credit Hours: 3.00. As a sequel to STAT 52500, this course introduces statistical modeling tools for situations where standard least-squares techniques may not apply. This includes an extensive coverage of generalized linear models (GLM) for non-Gaussian responses, mixed effects models to describe correlated data, nonparametric regression, and lastly, parametric and nonparametric survival models for the analysis of (possibly censored) time-to-event data. Among issues to be discussed are the estimation of the models, the testing of hypotheses, and the checking of model adequacy. Data examples will be used throughout the course to illustrate the methodologies and the related software tools in R.

Learning Outcomes: 1. Understand the concepts and methods in generalized linear models, survival analysis, linear mixed models and GEE methods. 2. Apply these methods properly to real data using R, drawing valid conclusions, and presenting the results concisely. Credits: 3.00

CE 59700 - Civil Engineering Projects

Credit Hours: 0.00 to 18.00. Hours and credits to be arranged. Permission of instructor required.

Credits: 0.00 to 18.00

ECE 56900 - Introduction To Robotic Systems

Credit Hours: 3.00. The topics to be covered include: basic components of robotic systems; selection of coordinate frames; homogeneous transformations; solutions to kinematic equations; velocity and force/torque relations; manipulator dynamics in Lagrange's formulation; digital simulation of manipulator motion; motion planning; obstacle avoidance; controller design using the computed torque method; and classical controllers for manipulators. Basic knowledge of vector-matrix manipulations required.

Credits: 3.00

ECE 59500 - Selected Topics In Electrical Engineering

Credit Hours: 1.00 to 3.00. Formal classroom or individualized instruction on topics of current interest. Permission of instructor required.

Credits: 1.00 to 3.00

ECE 69500 - Advanced Topics In Electrical And Computer Engineering

Credit Hours: 1.00 to 3.00. Formal classroom or individualized instruction on advanced topics of current interest. Permission of instructor required.

Credits: 1.00 to 3.00

MGMT 52500 - Marketing Analytics

Credit Hours: 2.00. This course introduces modern statistical methods for marketing using big data. Firms are increasingly facing vast amounts of data on their customers and the marketplace, thanks to the rapid development of information technology in the last couple of decades. The challenge is becoming more about how to turn the big data into information and insights to improve firms' marketing decisions and profitability. This course discusses marketing applications for which we may use econometric, statistical, and machine-learning methods to improve and optimize decisions. Students will use RStudio to analyze real-world data and gain hands-on experience on data manipulation, visualization, and analysis. Intro-level Statistics/econometrics (at the level of STAT 35000 or ECON 47200) and R coding experience (comfortable with manipulating data, plotting, defining functions, using for loops, and running linear and logistic regressions in R) are required prerequisites.

Learning Outcomes: 1. Enable students to articulate analytical process and logic for selecting a particular marketing strategy/plan 2. Enable students to do (and also evaluate/critique) good marketing research in their respective careers 3. Marketing knowledge and critical thinking Credits: 2.00

STAT 58200 - Statistical Consulting And Collaboration

Credit Hours: 3.00. This course is designed to emphasize and develop the skills needed by a statistical consultant/collaborator. Topics include: problem solving, consulting session management, written and oral communication, research ethics, design of experiments, collection of data, and application of statistical methods to real problems. Class activities include actively participating in consulting sessions held by the Statistical Consulting Service, small group projects, short papers, and oral presentations. Permission of instructor required.

Learning Outcomes: 1. Be aware of the skills necessary to be an effective statistical consultant/collaborator. These skills include consulting session management, written and oral communication with clients, interpreting facial and body language, handling personality conflicts, practicing sound research ethics, properly designing an experiment and determining an appropriate sample size, and choosing an appropriate statistical method whose analysis addresses the client's questions given the available data. 2. Know how to recognize problematic issues in the consulting/collaboration process and implement various strategies to address them. Credits: 3.00

CS 57700 - Natural Language Processing

Credit Hours: 3.00. This course will cover the key concepts and methods used in modern Natural Language Processing (NLP). Throughout the course several core NLP tasks, such as sentiment analysis, information extraction, syntactic and semantic analysis, will be discussed. The course will emphasize machine-learning and data-driven algorithms and techniques, and will compare several different approaches to these problems in terms of their performance, supervision effort and computational complexity. Prerequisites: A background in linear algebra, calculus, statistics and probability, and completion of CS 57800 or equivalent are highly recommended. Strong programming skills in any modem language (Python, Java, C++) are required.

Learning Outcomes: 1. Describe and analyze the key challenges in dealing with natural language data and other fundamental areas of NLP. 2. Analyze and implement the key algorithms and techniques used in NLP. 3. Identify algorithmic techniques that can be applied to new problems and evaluate other possible solutions. 4. Conduct experiments using proper methodology for training and testing NLP systems using data. 5. Critically review current research work in the NLP field. Credits: 3.00

ILS 69500 - Special Topics In Information And Data Science

Credit Hours: 1.00 to 4.00. Intensive study of selected topics varying from semester to semester, from the practice of information and data sciences. Topics may include data management and organization, digital scholarship, data visualization, computer languages for data and information

science, information literacy, archival literacy, and emerging trends in information and data science.

Learning Outcomes: 1. Critically examine and apply information and data sciences to various disciplines. 2. Develop practical skills and apply them to their disciplinary research. Credits: 1.00 to 4.00

MGMT 56800 - Supply Chain Analytics

Credit Hours: 2.00. There is an exponential growth in the adoption of big data technologies in every walk of life. Organizations are collecting, storing, and analyzing massive amounts of data. This data is commonly referred to as big data because of its large volume, the velocity with which it is collected and transmitted, the variety of forms it takes, and veracity of its origin and content. In order to capitalize on the opportunities presented by big data, businesses are putting in place technologies, people, and processes. Just collecting, transmitting and storing big data creates little value for an organization. For many organizations, the term big data currently represents only a data infrastructure such as the Apache Hadoop family of products. The key to delivering real value from big data is the use of analytics. Data must be analyzed and the results used by decision makers and organizational processes in order to generate value. The main objective of this course is to learn how to collect, process, store, and analyze big data. Assignments could easily be completed in Python or SQL. We assume no familiarity with Linux and will introduce you to all essential Linux commands. Students need access to a computer with a 64 bit operating system and at least 4 GB of RAM. Note: 8 GB or more of RAM is strongly recommended.

Learning Outcomes: 1. Learn a systematic set of current popular analytical methodologies, including (1) data management and exploration (database management, data visualization, etc.), (2) data analysis (statistical methods, time series analysis, etc.), (3) modeling (math models, advanced spreadsheet engineering, etc.), and (4) decision analysis (optimization, simulation, numerical analysis, etc.). 2. Use these methodologies in a large-scale supply chain simulation game and to analyze cases involving multiple supply chain functions, such as forecasting, procurement, inventory, transportation, pricing, contract, revenue management, and reverse supply chain. Credits: 2.00

MGMT 58600 - Python Programming

Credit Hours: 2.00 or 3.00. Because data grows exponentially and becomes complex, we need computational methods to collect, store, and analyze them in order to be successful in science, engineering, business, and other professions. Python Programming, is an introductory programming class that meets this need. You will learn how to write computer programs in Python language to solve real-world problems. This class is designed for students that want to learn to computer programming for data science. This course guides students through the basic Python programming language, from initial concepts to final data analysis using python and external packages.

Learning Outcomes: 1. Understand the basic programming concepts. 2. Understand the basic syntax and semantics of the Python language. 3. Understand the primitive data types build into Python. 4. Understand principles of data storage and manipulation. 5. Understand and use computer programming for basic interactive web applications. 6. Able to design, write and debug simple program to handle real-world data. Credits: 2.00 or 3.00

FNR 58700 - Advanced Spatial Ecology And GIS

Credit Hours: 3.00. Introduction to the principles of landscape ecology and biogeography with a laboratory devoted to the analysis of spatial data using geographic information systems and other database tools. Landscape ecology focuses on the important relationships of landscape structure (pattern, heterogeneity) and ecological processes (movement of animals, hydrologic dynamics) and how this information is used for natural resource management. Biogeography examines ecological patterns and processes at larger scales (generally at subcontinental to global) for the purposes of managing plants and animals of global importance. In the last 15 years, tremendous efforts have been made to create spatial databases that help support research and management of natural resources at various scales. The lab will focus on the use and application of these databases that are common in natural resource management settings.

Learning Outcomes: 1. Apply the principles of landscape ecology to the analysis of spatial change in urban, agricultural and forested landscapes for the purposes of natural resource management. 2. Calculate change in landscape

patterns using a variety of geospatial tools such as geographic information systems, spatial models, and geostatistics. 3. Prepare reports using the traditional scientific journal article format, on the analysis of landscape-scale change, focusing on problems common to watershed management. 4. Compare and contrast the ways that biodiversity can be calculated using standard indices of organismal diversity. 5. Calculate ecological footprints and evaluate why these vary across geopolitical and/or ecological units. Credits: 3.00

CS 50023 - Data Engineering I

Credit Hours: 1.00. The course introduces students to the fundamentals of Data Engineering with a focus on tools and computational techniques to gather, construct, manipulate, summarize, and visualize data sets as a means to extract knowledge from the underlying data. Python and Python libraries are used. Completion of the course will allow learners to perform basic data analysis on data sets. Experience in Python Programming and Linear Algebra is required. The course also prepares learners for additional instruction in the courses Data Engineering II and Foundations of Decision Making.

Learning Outcomes: 1. Identify key file types (TXT, CSV, HTML) and their characteristics. Using Python, read data in these formats. 2. Create and execute Python scripts to parse, select, transform, summarize, and visualize data. 3. Explain how to identify and fill in missing values in data values. 4. Create informative visualizations from given data and recognize the key qualities of good visualizations. 5. Apply Pandas functions to slice, dice, and summarize datasets. 6. Apply the process of sampling data and sample probabilistically. 7. Demonstrate how to transform and construct features (e.g., standardization, distances). 8. Compute summary statistics from data (e.g., covariance, correlation). 9. Explain how to solve simple data analysis problems. Credits: 1.00

CS 50025 - Foundations Of Decision Making

Credit Hours: 1.00. This course provides an overview of data science methods used for data-driven discovery, extraction of knowledge, and informed decision making. The course covers fundamental computational methods and statistical techniques used to correctly reason about uncertainty, conduct hypothesis tests, infer causal relationships, and apply and evaluate predictive models. The course highlights how sampling biases can impact fairness in decision making. Throughout, students get hands-on experience on how to make correct and explainable inferences from data. Experience in Python Progamming, Probability, Statistics and Linear Algebra is required.

Learning Outcomes: 1. Support and justify claims with evidence from data and discuss how human biases can impact interpretations. 2. Recognize the basic approach to formulating statistical hypothesis tests and apply parametric hypothesis tests for both discrete and continuous data. 3. Interpret p-values and apply them effectively to support claims about data. 4. Formulate and test conjectures with controlled experiments, including A/B testing. 5. Recognize the types of errors encountered when conducting multiple hypothesis tests. 6. Use computational approaches based on randomization for hypothesis testing and uncertainty quantification. 7. Discuss ethical issues such as privacy and fairness that can be associated with automating decisions based on machine learning methods. 8. Apply the basic components of classification methods using Python libraries. 9. Evaluate the performance of learned models with learning curves and k-fold cross validation and assess significance with hypothesis tests. Credits: 1.00

ECON 57700 - Quantitative Economics With Python

Credit Hours: 2.00 or 3.00. Introduce students to computational and programming in Python.

Learning Outcomes: 1. Learn Python essentials including basic programming techniques and the use of popular packages for data analysis and more advanced programming techniques

including numerical methods, dynamic programming, and simulation-based methods. Credits: 2.00 or 3.00

STAT 52700 - Introduction To Computing For Statistics

Credit Hours: 3.00. This course provides a thorough introduction to the R programming language, and its use for statistical computing and data science. The course will first look at the fundamentals of R, including different data-structures, control-flow, and the basic vocabulary. An emphasis will be placed on learning idiomatic and efficient R, covering ideas such as recycling, vectorization and functional programming. The course will then look at principles and tools for tasks like organizing data ('tidy data'), manipulating data ('data carpentry'), querying data (through topics like regular expressions) as well as visualizing data (including interactive visualizations). The material and the homework will encourage development of modular reusable code and reproducible research through ideas such as object-oriented programming and dynamic documents in R Markdown. The last part of the course will study statistical procedures such as least-squares regression, LASSO, Monte Carlo sampling and Markov chain Monte Carlo. Besides exams and homeworks, the course will involve a final project that students can collaborate together on.

Learning Outcomes: 1. Read and write idiomatic R code. 2. Be familiar with the entire data science pipeline, from organizing, manipulating, querying and visualizing data. 3. Introduce computational tools like optimization and simulation in the context of statistical algorithms. Credits: 3.00

SCLA 52000 - Social And Digital Media Analytics For Strategic Communication

Credit Hours: 3.00. This course provides an overview of how to transform social media and digital media information into business intelligence and actionable insight. Although students are not expected to know a programming language prior to taking the course, students are expected to understand basic statistics and to have a desire to learn the processes, procedures and vocabulary used by data analysts in modern organizations. The goal is not to train them as practicing data scientists, but as knowledgeable data analytics consumers and as informed teammates and leaders of cross-functional teams tasked to make decisions using data.

Learning Outcomes: 1. Differentiate between the opportunities and limitations with social media data. 2. Identify methods for using ready and custom-made tools to transform information into insight, from data collection to analysis, interpretation, and recommendation. 3. Sharpen their quantitative and business analytical skills using spreadsheets and online tools. 4. Write effective reports and draft scorecards. 5. Be prepared to interact with data scientists by speaking their language and understanding their processes for data mining and business intelligence. Credits: 3.00

SCLA 51000 - Data And AI Storytelling

Credit Hours: 3.00. The primary assumption of our course is that the goal of communicating with data is ultimately to identify causal mechanisms and change the status quo due to the obtained insights. All audiences have previous understandings of the world, and meaningful data stories should challenge their assumptions about that world. The communication of this data-based new knowledge violates prior assumptions, shares memorable new information and moves the audience to act based on the new knowledge. This is best accomplished through a story. In other words, this communication assumes the form of a story, which is defined as the narrative of how an unexpected cause creates an effect.

Learning Outcomes: 1. Provide high-quality data story examples and justify why they meet the good story criteria. 2. Identify and extrapolate core relationships between research design and story-building. 3. Generate hypotheses based on data. 4. Create specific data visualizations which maintain casual narratives. 5. Identify story elements that map onto the five tenets of What is a Data Story? 6. Identify in examples the adherence or violation of data transparency, validity and ethics. Credits: 3.00

GRAD 50200 - Interdisciplinary AI Fundamentals: Bridging Knowledge

Credit Hours: 1.00. This course provides foundational concepts for AI for those in both MSAI majors. This course covers the history of AI, the foundations of artificial reasoning and knowledge, and practical skills for communicating about AI technology, projects, and workflow. This graduate course, designed to be accessible to learners with diverse backgrounds, serves as a foundational introduction to the field of AI. Whether you come from a technical or non-technical background, this course will provide you with a solid grasp of AI concepts,

principles, and their real-world applications. To be successful in this course, we encourage students to know math (e.g., algebra and calculus) and a basic understanding of programming (e.g., R, Python, or Java).

Learning Outcomes: 1. Describe the foundations of artificial reasoning, knowledge, and trace the historical development of AI. 2. Explain the basic concepts, terminologies, and applications of different AI algorithms, developing a problem-solving mindset applicable to various domains. 3. Examine the diverse range of AI applications across varied industries. 4. Explain the role human factors and social context play in the development of artificial intelligence. Credits: 1.00

MGMT 56200 - Project Management

Credit Hours: 2.00. Emphasizes the use of PC-based project management software and its applications, particularly in manufacturing organizations and especially new product development projects. Extensive use is made of several case studies to illustrate the planning and monitoring of a project. Class is held in a computer lab.

Learning Outcomes: 1. Understand the importance and challenges of managing projects of various types and sizes. 2. Learn and apply tools for project selection, team formation, and requirements gathering. 3. Create detailed budgets and schedules. 4. Acquire analytical capabilities for monitoring projects and investigating variances in scope, budget, and schedules. 5. Improve their ability to concisely communicate project information to senior management. Credits: 2.00

POL 50601 - Data, Machine Learning, And Artificial Intelligence For The Public Sector

Credit Hours: 3.00. This course examines how machine learning algorithms and tools related to artificial intelligence can be used to advance our understanding in public sector domains. Students will develop a comprehensive understanding of how to apply AI and various machine learning algorithms, focusing on practical applications and hands-on experience. It provides an overview public sector data sources and addresses ethical and privacy issues associated with this type of data.

Learning Outcomes: 1. Identify, construct, and manipulate public data ethically and appropriately for use in AI and machine learning applications. 2. Explain privacy and ethical considerations associated with the use of public sector data, including issues that arise when combining public and private sector data. 3. Demonstrate a comprehensive understanding of popular AI and machine learning algorithms, including supervised and unsupervised learning techniques. 4. Apply AI and machine learning techniques to real-world data sets, emphasizing those techniques commonly used in government, policy, and political settings. 5. Assess, interpret, and report AI and machine learning output to audiences commonly found in government, policy, and political settings. Credits: 3.00

CNIT 51000 - Data Literacy

Credit Hours: 3.00. This course examines concepts, models, and methods useful for applying data analytics in business environments. Focusing on hypothesis generation, the capturing, storage and expression of data, analysis for research and visualizations.

Learning Outcomes: 1. Apply critical thinking abilities and analytical thought. 2. Recognize diverse range of data types/storage strategies and demonstrate the ability to analyze and debate the applications of each proficiently. 3. Examine aspects of the analytical thinking process and formulate individualized opinions surrounding the approach to data analytics. 4. Analyze a set of data yielding actionable insights that can be applied to research or business. 5. Gain a wide perspective on data analytics utilizing article reviews and up to the week content. Credits: 3.00

CNIT 57500 - Data Analysis

Credit Hours: 3.00. This course will teach students how data analysis can inform decision-making. Students will develop analytical skills and focus is placed on predictive analysis to evaluate business decision. Students will develop logical reasoning and communication skills related to quantitative

outputs. This course will also develop the ability to collect large datasets, organize, and combine them using Tableau software.

Learning Outcomes: 1. Recognize the pervasiveness and breadth of data collection options available in today's world. 2. Discern and defend ethical applications of how collected data can be used for marketing. 3. Discuss how to find, download, clean and combine data sets. 4. Identify and evaluate trends in data sets. 5. Build models to make predictions about future events based upon historic data. Credits: 3.00

MGMT 58700 - Using R For Analytics

Credit Hours: 2.00. R has been one of the leading open-source programming languages used by analytics professionals today. You will develop the ability to interpret and modify R code to perform data analysis using the popular RStudio integrated development environment (IDE). During the first four weeks programming syntax, data structures, logic, functions, data loading, data reshaping, and shiny tool creation will be discussed to establish the necessary foundation to turn your data into insights using R. In every class we will discuss and apply a new R library or set of functions. During the last three weeks of the course you will perform descriptive, predictive, and prescriptive analytics with R. Assignments are both conceptual and hands-on exercises. The culmination of this course entails a final team project where you design, develop, and present a working Shiny application prototype that integrates descriptive, predictive, and prescriptive analytics to support a business problem. Permission of department required.

Learning Outcomes: 1. Ability to interpret and modify R code to perform data analysis. 2. Perform descriptive, predictive, and prescriptive analytics with R. 3. Design, develop, and present a working R-Shiny app that integrates descriptive, predictive, and prescriptive analytics to provide end-user decision support. Credits: 2.00

PHRM 50000 - Artificial Intelligence And Its Use In Clinical Care

Credit Hours: 2.00. The course comprehensively covers key topics such as the mechanisms behind how AI functions, the capabilities and limitations of current technologies, and important considerations around data privacy, bias, and health equity. Ethical issues are also explored through analyses of real-world case studies. The course equips participants with a solid foundation to thoughtfully engage with, evaluate, and contribute to the ongoing integration of AI into clinical practice and beyond.

Learning Outcomes: 1. Identify various applications and settings where AI is being utilized in healthcare today and where it will migrate to in the future. 2. Describe the technical underpinnings of how AI tools are built and function. 3. Analyze the clinical and social impacts of AI for patient care including how patients are using these tools as well as various ethical and regulatory issues. 4. Synthesize a solution to clinical cases using AI tools to improve your skills in the healthcare industry. Credits: 2.00

PHIL 50000 - Advanced Ethics For Technology, Engineering, And Design

Credit Hours: 3.00. This graduate seminar is designed to increase your understanding of professional and ethical responsibilities in national, international, and cross-cultural environments, helping you to anticipate, understand, and navigate issues that will likely arise in your working life. The focus of the course is on developing the ability to apply a general ethical framework to new and unique situations, including those arising from the global cultural context of modern engineering. The course covers how this ethical framework should be constituted, and provides practice in applying this framework to specific, concrete cases. Together, these components work toward your development as a better engineer and a more responsible global citizen.

Learning Outcomes: 1. Recall and describe key concepts of professional and ethical responsibilities in national, international, and cross-cultural environments. 2. Apply the general ethical framework to analyze and resolve specific, concrete cases in engineering. 3. Develop a well-researched original case study that integrates professional and ethical considerations, informed by personal experiences and future aspirations in engineering. Credits: 3.00

PHIL 50800 - Advanced Ethics Of Data Science

Credit Hours: 3.00. This graduate seminar is designed to examine the new and important ethical issues that are arising as the applications of data science permeate more and more

aspects of our lives. Because we're entering uncharted territory, reasoning clearly about the ethical implications of data science isn't easy. This course provides students with the tools for doing so, including a conceptual framework for ethical reasoning in professional settings, as well as a procedure for case-study analysis that allows students to practice employing this conceptual framework. Together, these components help prepare students to be ethical professionals and responsible global citizens.

Learning Outcomes: 1. Explain the conceptual framework for ethical reasoning in professional settings as it applies to data science. 2. Analyze case studies to identify and evaluate ethical issues arising from the applications of data science. 3. Assess critically the ethical implications of data science applications and propose well-reasoned solutions. Credits: 3.00

POL 52801 - Organizational Governance Of Technology And AI

Credit Hours: 3.00. This course examines the impact of technology policy on organizations and their organizational governance strategies for AI and technology. It explores the incentives, strategies, and activities of the private and non-profit sector in governing AI, as well as the relationship between the private, public, and non-governmental sectors.

Learning Outcomes: 1. Describe and evaluate the impact of legal, regulatory, and ethical frameworks (soft laws and hard laws) on organizational governance of AI, including how legal, technological, and social factors can advance and hinder AI governance in organizations. 2. Analyze different considerations for companies using and governing AI, depending on their size and stage, industry, and jurisdiction. 3. Evaluate strategies that AI practitioners in AI governance functions of organizations have used to manage AI systems and their risks. 4. Develop and communicate strategies to advance AI governance objectives in different organizational contexts, including through policies, assessments, procurement strategies, and/or education. Credits: 3.00

SCLA 50900 - Strategic Intelligence: Organizations, Technologies, Procedures, Policies

Credit hours: 3.00. The present course will examine all facets of strategic intelligence, anchoring the investigation around specific organizations and processes, from the major civilian to the major military-strategic intelligence agencies, the legislation that directs their work, and the supervisory bodies. The course will also include case studies that analyze and operationalize how intelligence agencies contribute to national security. The course aims to provide the students with a rounded and practical education in strategic intelligence, describing who is responsible for its deployment and exploitation and what its benefits are for national security.

Learning Outcomes: 1. Analyze the diplomatic, economic, informational, military, and political elements influencing national strategic intelligence. 2. Evaluate key agencies, institutions, and legislative frameworks that shape U.S. strategic intelligence collection, analysis, and dissemination. 3. Differentiate between various strategic intelligence organizations - civilian and military - and understand their unique contributions and limitations. 4. Assess how political, institutional, and cultural factors affect the development and execution of national strategic intelligence policies. 5. Formulate recommendations for improving strategic intelligence oversight, policymaking, and response mechanisms to current and emerging global threats. Credits: 3.00

AD 55000 - Research Methods In Art And Design

Credit Hours: 3.00. An intensive course in research methods to assist students in developing a topic for directed study. Introduction to various research tools; exercises exploring issues of style, content, and organization; research methods and how they pertain to art and design. Permission of department required.

Learning Outcomes: 1. Identify and develop effective research skills and methods as they apply to individual thesis projects. 2. Analyze and critique existing scholarship. 3. Design an effective thesis statement, devise a research plan and begin conducting research. 4. Practice critical writing skills through peer review of section drafts. Credits: 3.00

AD 60300 - Theory In Art Seminar

Credit Hours: 3.00. Study of critical issues in modern and postmodern art and relevant methodologies: formalism, iconography, biography and autobiography. Marxism (cultural studies), semiotics, and psychoanalyses. Elements of contemporary professional art practice discussed, including writing of artists' and designers' statements, biographies, and resumes. Prerequisite: Admission to the M.F.A. program in Art and Design. Permission of department required.

Credits: 3.00

Directed Project Courses (18 credits)

AD 56800 - Directed Project Research In Design

Credit Hours: 1.00 to 3.00. Initial M.F.A. project research and production in design. Permission of instructor required.

Learning Outcomes: 1. Varies due to nature of the course. Credits: 1.00 to 3.00

AD 66800 - MFA Project Research In Design

Credit Hours: 1.00 to 6.00. Intensive M.F.A. project production and thesis research in design. Prerequisite: Three credit hours of AD 56800 with a minimum B- grade. Permission of instructor required.

Credits: 1.00 to 12.00

AD 69700 - MFA Graduate Exhibition

Credit Hours: 3.00. Completion of M.F.A. thesis, oral defense, gallery installation of M.F.A. exhibition, public presentation, and documentation of exhibition. Prerequisite: Admission to the M.F.A. program in Art and Design. Concurrent Prerequisite: Must complete 12 credit hours of AD 65800 or AD 66800 during the same or prior session. Only open to M.F.A. graduate students in Art and Design. Permission of instructor required.

Credits: 3.00

Core Courses (7 credits)

ENGT 50100 - Graduate Research Seminar

Credit Hours: 0.00 or 1.00. This course is intended to orient new graduate students to the Engineering Technology (ET) program and faculty. This includes PhD students and students pursuing a Master's degree through a thesis or directed project option. This does not include students pursuing a Master's degree with coursework only. Research activities within ET and throughout Purdue University are discussed. Student resources and opportunities are reviewed to give the students the tools they need to be successful. In addition, this course provides a way to develop a natural cohort of graduate students. This course is a graduate seminar course focused on the ET program. Graduate status or upper-division undergraduate. Permission of department required.

Learning Outcomes: 1. Summarize research interests of ET graduate faculty. 2. Interpret Purdue University research activities and resources and apply this knowledge to their particular research plan. 3. Generate MS or PhD preliminary documents based on ET specific requirements. 4. Implement effective use of library resources and ability to write scholarly information in accepted format styles.

Credits: 0.00 or 1.00

ENGT 59000 - Special Problems In Engineering Technology

Credit Hours: 1.00 to 3.00. The ENGT 59000 course code is intended primarily for students to undertake targeted study or projects to develop depth in an area related to their area of research, where no other comparable course is available at Purdue or conveniently elsewhere. You may take up to 9 credits of ENGT 59000 as part of your Plan of Study. Requests to extend the number of credits must be decided within your graduate committee and documented with the Graduate Chair. Permission of instructor required.

Learning Outcomes: 1. Vary by course offering.

Credits: 1.00 to 3.00

ENGT 58300 - Applied Engineering Statistics For Industry

Credit Hours: 3.00. The purpose of this course is to teach the practitioner how to use and make better-informed decisions as a manager for making optimum process, business, or personnel decisions. Emphasis will be placed on Verification, Validation in R&D, Manufacturing, QA/QC, basic probability, Summarizing Data, Basic Tools (flowcharts, fishbone diagrams, Pareto charts), Process Capability - Cp/Cpk. Upper and lower control limits/charts, Use of Control Charts for Continual Improvement, Six Sigma, Design of Experiments, Taguchi Methodology and Data Analytics will also be covered.

Learning Outcomes: 1. Demonstrate the importance of the Central Limit Theorem and its

application. 2. Evaluate the capability of a process using the process capability index (CPI). 3. Analyze variation reduction in relation to process capability and design of experiments. 4. Articulate how single-piece flow, standard work, and continuous improvement processes enable variation reduction. 5. Determine the expected number of defects from a given process. 6. Explain the statistical meaning of Six Sigma. 7. Differentiate between Type I and Type II errors. 8. Calculate the sample size based on specified Type I and Type II Error. 9. Calculate a confidence interval. 10. Define direct run rate I first time through and its calculation. 11. Develop a hypothesis test. 12. Calculate regression and correlation of data and distinguish between correlation and causation. 13. Select and evaluate the test statistic for different kinds of hypothesis tests and make statistical inference decisions. 14. Construct and evaluate an ANOVA table and make statistical inference decisions. 15. Differentiate among different types of experimental designs and design an experiment. 16. Demonstrate the Taguchi quality loss function and how to make quality loss calculations. 17. Classify the procedural errors that can occur in experimental design, such as confirmation bias. 18. Explain data mining and Big Data and their role in the future of experimental design. Credits: 3.00

ENGT 60500 - Engineering Technology Research Writing Strategies

Credit Hours: 2.00 to 3.00. The stated Master of Science in Engineering Technology graduate course teaches research literature mining and analysis found in Purdue licensed databases. Focuses on detail, a measurable topic, literature review, reporting, citation, data visualization using APA. Requires research paper writing aligned with ARWE specifications for in-depth research preparation and reporting. Students will research a topic relevant to a workplace problem in their industry. For example, a new technology, a process (Giga Casting for example), a material, supply chain, digitization, industry 4/5.0, sustainability, workforce diversity, aging workforce, ethics in the workplace, offshoring vs. onshoring, direct part marking, inventory/project management, cybersecurity risks, facility management, energy management, patents/intellectual property or environmental compliance. Keep in mind, Before You Start, that whichever topic you choose, the problem must be measurable. Measurable either from a quantitative or qualitative statistic perspective. Your topic will have to be tied to a global grand engineering challenge we face as a society and/or industry.

Learning Outcomes: 1. Evaluate the data you collected by completing the Workplace Information Literacy Strategies (WILS) activity to determine your research topic. 2. Analyze research topic/focus gained from the WILS, correlate a measurable research problem statement, and relate it to one of the 14 global, grand engineering challenges. 3. Create an Introduction to the problem statement. 4. Synthesize collected data by writing a review of the literature which supports the research problem topic. 5. Evaluate different research measures for the problem, choosing one to assess the problem. 6. Analyze the research measure(s) by using ChatGPT to help determine optimum research measure to write up. 7. Create a research methodology by writing a detailed script on how you intend to measure the research problem. 8. Submit expected deliverables in a timely manner after evaluating your final analysis report, synthesizing the introduction, research problem statement, review of literature, and research measure. 9. Present a compelling oration of your research topic and significance as to why the topic should be pursued or funded. The creation of a three-minute video debriefing is not an exercise in "watering down" research but forcing you to consolidate your ideas and concisely explain your research discoveries for senior leadership approval and funding. 10. Complete written assignments using APA format and NO passive wording or adverbs. Adhere to the MET 527 Academic Research Writing Expectations (ARWE) handout

document. Failure to not read and follow the ARWE document will prove to be an unsuccessful assignment/course experience. 11. Perform individually AND not fall into the plagiarism trap. Credits: 2.00 to 3.00

ENGT 50200 - Developmental Testing And Innovation Seminar

Credit Hours: 0.50 or 1.00. The course introduces Engineering Technology and the requirements to fulfill the master's and/or Ph.D. Technology degrees. The seminar can include graduate faculty from the SoET, the NAVY, and other Engineering and Technology related disciplines from the Purdue Polytechnic, College of Engineering, and other STEM-related disciplines across campus.

Learning Outcomes: 1. Interpret Purdue University and Navy research activities and resources applying the knowledge to their particular research plan. 2. Generate M.S. or Ph.D. preliminary documents based on Engineering Technology or NAVY-specific research requirements. 3. Implement effective intellectual use of Purdue library and Navy resources for the ability to write scholarly information in accepted university and/or Navy format styles. Credits: 0.50 or 1.00

Math Course (3 credits)

MA 52700 - Advanced Mathematics For Engineers And Physicists I

Credit Hours: 3.00. MA 52700 is not a prerequisite for MA 52800; these courses can be taken independently. Topics in MA 52700 include linear algebra, systems of ordinary differential equations, Laplace transforms, Fourier series and transforms, and partial differential equations. MA 51100 is recommended.

Learning Outcomes: 1. Know the theory of systems of linear equations. 2. Know the theory of eigenvalues and eigenvectors and apply it to solve systems of ordinary differential equations and to analyze qualitative features. 3. Know theoretical properties of Laplace transforms and how to use them. 4. Know the basic theory of Fourier series and transforms, and how to apply these to solve partial differential equations. Credits: 3.00

Capstone Course (2 credits)

ENGT 59000 - Special Problems In Engineering Technology

Credit Hours: 1.00 to 3.00. The ENGT 59000 course code is intended primarily for students to undertake targeted study or projects to develop depth in an area related to their area of research, where no other comparable course is available at Purdue or conveniently elsewhere. You may take up to 9 credits of ENGT 59000 as part of your Plan of Study. Requests to extend the number of credits must be decided within your graduate committee and documented with the Graduate Chair. Permission of instructor required.

Learning Outcomes: 1. Vary by course offering. Credits: 1.00 to 3.00

Electives (18 credits)

GPA Requirements

Earth, Atmospheric, and Planetary Sciences, MS

About the Program

Program Requirements

Required Courses (6 credits)

EAPS 52100 - Atmospheric Chemistry

Credit Hours: 3.00. An introduction to the chemistry of the earth's atmosphere. Covers evolution of the earth's atmosphere, its physical and chemical structure, its natural chemical composition and oxidative properties, and human impacts, including increasing tropospheric ozone, decreasing stratospheric ozone, climate change, and acidic deposition.

Credits: 3.00

EAPS 52600 - Introductory Geofluid Dynamics

Credit Hours: 3.00. Provides a fluid dynamics background for graduate students interested in atmospheric sciences,

oceanography, mantle convection, hydrology, turbulence, or pollution. Topics covered include: basic assumptions and deviations of Navier Stokes equations, conservation laws, vorticity, divergence, waves, and applications in atmosphere, ocean, and geophysics.

Learning Outcomes: 1. Provide students a rigorous foundation in geofluid dynamics as well as the connections among math, physics, and real natural phenomena. 2. Students will become accustomed to applying the physical equations to real phenomena, and to presenting them in a concise way. 3. Understand the basic equations and physics in existing models which provides a broader and deeper understanding of the earth sciences. Credits: 3.00

EAPS 53200 - Atmospheric Physics I

Credit Hours: 3.00. Cloud and precipitation physics and basic atmospheric radiative transfer. Introduction to computer-aided problem solving.

Learning Outcomes: 1. Understand the basic physics of cloud and precipitation formation and evolution in the atmosphere and their connections to atmospheric thermodynamics and dynamics. 2. Describe these processes qualitatively and solve associated problems quantitatively. 3. Describe and explain the observed microphysical structure of various precipitation systems (such as squall lines, hailstorms, supercells, frontal rainbands, and others). 4. Understand the basics of how cloud and precipitation processes are represented in numerical models. 5. Demonstrate a basic knowledge of various remote sensing methods. Credits: 3.00

EAPS 69100 - Colloquium In Earth, Atmospheric, And Planetary Sciences

Credit Hours: 1.00. This course is intended to expose students to the wide range of topics studied throughout the Department of Earth, Atmospheric, and Planetary Sciences, allows for interactions with outside experts and networking, and provides the opportunity for students to synthesize high level topics that may not be directly related to their scientific endeavors.

Learning Outcomes: 1. Gain exposure to new scientific topics. 2. Summarize and discuss potentially new and unfamiliar scientific topics. 3. Identify relevant information from scientific talks and presentations. 4. Engage with the important questions that stimulate discussion and debate in EAPS fields. 5. Listen attentively and actively. 6. Use critical thinking and questioning. Credits: 1.00

GRAD 61200 - Responsible Conduct Of Research

Credit Hours: 1.00. Overview of values, professional standards, and regulations that define responsible conduct in research. Students learn the values and standards of responsible research through readings and lecture/discussion and practice application of these values and standards to research situations through class discussion of case studies from life sciences research. Students must be registered for M.S. or Ph.D. thesis research in their home department.

Credits: 1.00

EAPS 50700 - Introduction To Analysis And Computing With Geoscience Data

Credit Hours: 3.00. Course teaches computing techniques including error analysis, line and surface fitting, interpolation, map projections, geospatial and temporal correlations, signal processing, and visualization with discussions on specific and practical geoscience applications. Lectures with computer exercises and team project reporting using open-source computer software. Cannot get credit for both EAPS 50900 and EAPS 50700.

Learning Outcomes: 1. Carry out computational solutions to a given range of geoscience data analysis problems. 2. Select the appropriate analysis approaches when given a set of data. 3. Appraise and conclude the analysis results professionally. Credits: 3.00

EAPS 60200 - New Graduate Student Seminar

Credit Hours: 3.00. This course will provide students with the tools to succeed as a graduate student in the Department of Earth, Atmospheric, and Planetary Sciences, which include good communication with their advisors, graduate fellowship proposal writing, giving good talks and posters, giving and receiving critical reviews, an understanding of regulations and graduate timelines, formulating a plan of study, and resources available to help graduate students succeed. Permission of instructor required.

Learning Outcomes: 1. Communicate effectively

with their adviser. 2. Understand how to develop a compelling research question. 3. Organize their planned research into a graduate fellowship proposal. 4. Provide and receive constructive criticism to and from colleagues, including understanding peer review. 5. Understand how to give well-organized talks and eye-catching posters for department seminars and national meetings. 6. Assemble an advisory committee, formulate a plan of study, and know the department regulations and what is required to graduate in a timely manner. Credits: 3.00

Concentration (18 credits)

Thesis Research (6 credits)

EAPS 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required.

Credits: 1.00 to 18.00

Required Courses (6 credits)

Economics, MS

About the Program

Program Requirements

Required Courses (9 credits)

ECON 56200 - Econometrics I

Credit Hours: 3.00. This masters-level course in econometrics covers the tools that will enable students to conduct empirical analysis using economics data. The course examines the

statistical techniques used in testing economic theories, estimating casual effects, and making predictions. Emphasis is placed on estimating a single equation (e.g., a demand function) and the problems associated with such estimation. As part of the course, students will estimate equations using STATA, a statistical software package. Permission of department required.

Learning Outcomes: 1. Students will have the tools to perform simple econometric analysis of Economic problems. Credits: 3.00

ECON 51500 - Macroeconomics

Credit Hours: 1.00 to 3.00. Investigation of the causes of macroeconomic fluctuations in the economy. Looks at changes in inflation, unemployment, real output, interest rates, and exchange rates, and explores why they occur, what their effects are, and what, if any, role government should play in dealing with these problems. A mixture of theory and case studies with reference to historical case studies. Current macroeconomic problems will be discussed with a focus on the international aspects of macroeconomic problems.

Learning Outcomes: 1. Predict the macroeconomic impact of fiscal and monetary policies using the mathematical IS/LM models. 2. Demonstrate an understanding of the interdependencies and complexities with respect to international trade of goods and services as well as capital flows. 3. Analyze the possible economic/social impacts of various policy proposals from a historic perspective. Credits: 1.00 to 3.00

ECON 50100 - Statistical Analysis For Economists

Credit Hours: 1.00 to 3.00. A master's level course in statistics and its application to economics. Course will familiarize students with the elements of statistics needed to perform econometrics.

Learning Outcomes: 1. Apply algebra and basic calculus to econom(etr)ic models. 2. Calculate and interpret univariate and multivariate statistics. 3. Describe and identify properties of random variables. 4. Select methods of and perform statistical inference. Credits: 1.00 to 3.00

ECON 50000 - Mathematics For Economists

Credit Hours: 2.00 or 3.00. This is a Master's level course in mathematics and its application to economics. Students in this class will review and practice the mathematical methods required to solve micro and macroeconomic theoretical models, especially constrained optimization problems. Content covers algebra, univariate and multivariate calculus and constrained optimization methods

Learning Outcomes: 1. Solve problems requiring algebra and (uni-) multivariate calculus. 2. Apply algebra and calculus to solving (un)constrained optimization problems required by economic theoretical models. 3. Analyze assumptions embedded in economic theoretical models, e.g., functional forms and parameter values, using algebra and calculus. Credits: 2.00 or 3.00

ECON 53300 - Econometrics

Credit Hours: 2.00. This masters-level course in econometrics covers the tools that will enable students to conduct empirical analysis using economic data. The course examines the statistical techniques used in testing economic theories, estimating causal effects, and making predictions. Emphasis is placed on estimating a single equation and the problems associated with such estimation. In addition to multivariate OLS regression, students will be introduced to other regression methods including: instrumental variables estimation, time series estimation, and panel data methods. As part of the course, students will use Stata, a statistical software package.

Learning Outcomes: 1. Understand the theoretical foundations of linear regression methods. 2. Estimate linear regression model parameters and perform basic tests using Stata. 3. Interpret regression results and identify the sources of estimation bias. Credits: 2.00

ECON 52100 - Consumer & Producer Theory

Credit Hours: 2.00. In this course, we will develop and apply some of the basic theories of consumer and producer choices. You will learn how to approach issues from an economic perspective and gain an understanding of the microeconomic models and tools that will be used in subsequent courses.

Learning Outcomes: 1. Analyze key aspects of consumer and producer choices. 2. Understand how markets allocate resources. 3. Apply insights from microeconomic theory to public and economic policy. Credits: 2.00

ECON 51600 - Introduction To Mathematics For Economics

Credit Hours: 2.00. This is a Master's level course in mathematics and its application to economics. Students in this class will review and practice the mathematical methods required to solve micro and macroeconomic theoretical models, especially constrained optimization problems. The content covers a review of algebra, univariate and multivariate calculus, and constrained optimization methods, e.g., LaGrange multipliers. Mastering these methods is instrumental to preparing for ECON 51100 & 51200 (micro and macro theory).

Learning Outcomes: 1. Solve problems requiring algebra and (uni-) multivariate calculus. 2. Apply algebra and calculus to solving (un)constrained optimization problems required by economic theoretical models. 3. Analyze assumptions embedded in economic theoretical models, e.g., functional forms and parameter values, using algebra and calculus. Credits: 2.00

Specialty Areas (13-21 credits)

Business and Economics Data Analytics Selectives

ECON 67200 - Econometrics II

Credit Hours: 1.00 to 3.00. Topics include generalized method of moments, estimation and inference with weak instruments, panel data models and bootstrap methods. Prerequisite: ECON 67100.

Learning Outcomes: 1. Identify important econometric issues of interest in practical scenarios. 2. Demonstrate the application of state of the art methods to relevant economic questions. 3. Outline a broad picture of the subject by logically connecting the various topics. 4. Criticize the use of inadequate methods through discussion of published work. Credits: 1.00 to 3.00

ECON 57600 - Statistical & Machine Learning

Credit Hours: 2.00 or 3.00. This is an introductory course in statistical and machine learning. It will cover fundamental concepts and essential tools that are critical in understanding cutting-edge machine learning techniques. Students will develop skills in applying a wide
variety of modeling and prediction methods. Topics include linear regression, classification, regularization and shrinkage methods, tree-based methods, and support vector machines. An integral part of this course is the extensive use of the open source statistical software R. Students will gain hands-on experience in analyzing datasets commonly used in business and economics.

Learning Outcomes: 1. Develop skills in applying a wide variety of modeling and prediction methods. Topics include linear regression, classification, regularization and shrinkage methods, tree-based methods, and support vector machines. An integral part of this course is the extensive use of the open source statistical software R. 2. Gain hands-on experience in analyzing datasets commonly used in business and economics. Credits: 2.00 or 3.00

ECON 57700 - Quantitative Economics With Python

Credit Hours: 2.00 or 3.00. Introduce students to computational and programming in Python.

Learning Outcomes: 1. Learn Python essentials including basic programming techniques and the use of popular packages for data analysis and more advanced programming techniques including numerical methods, dynamic programming, and simulation-based methods. Credits: 2.00 or 3.00

ECON 57300 - Financial Econometrics

Credit Hours: 2.00. This course offers an introduction of basic principles of econometric analysis that will help students understand finance theories and their empirical applications. It will also equip students with appropriate statistical techniques for doing applied financial research. The statistical techniques are particularly well suited for analyzing financial time-series data. Permission of department required.

Learning Outcomes: 1. The student will be able to apply Econometric time series methods to analysis financial data. Credits: 2.00

ECON 57800 - Statistical & Machine Learning II

Credit Hours: 2.00. This is a second course in machine learning. After studying the fundamental concepts and essential machine learning tools in Machine Learning I, this follow-up course will go over a range of more advanced topics and learning methods. Topics include support vector machines, deep learning and neural networks, principal components analysis and other unsupervised learning methods. As in the first course, we will be using the statistical software R and its packages extensively to implement various learning methods.

Learning Outcomes: 1. Explain how common learning methods are implemented. 2. Train a range of deep learning models. 3. Perform dimension reduction techniques to summarize high-dimensional data in an efficient manner. 4. Select appropriate models and learning methods for a particular application. Credits: 2.00

ECON 51000 - Applied Game Theory

Credit Hours: 2.00. Game theory is a powerful tool that facilitates a decision making process of individuals. Games are characterized usually by two or more players where any player's action has an impact on other player's payoff. Players are decision making units, e.g. individuals, firms, workers, managers, countries etc. Game theory analyzes situations in which people (or other animals) interact by breaking these situations down into basic descriptions of the set of players, the strategies available to these players, and the payoffs that the players receive for different combinations of strategy choices. Permission of department required.

Learning Outcomes: 1. Understanding of the logical mechanics, provide good intuition and to apply tools to explain events. Credits: 2.00

Financial Economics Selectives

ECON 58500 - Behavioral Economics

Credit Hours: 2.00 or 3.00. This course explores human economic behavior, with a strong emphasis on laboratory and field experiment methodology used in behavioral economics research. Topics considered include behavior in markets for financial assets and auction markets, and behavior in social dilemmas that arise when people try to provide public goods voluntarily or increase economic surplus through trust. Students will also study how people bargain with and exhibit social preferences towards others. Decision-making and anomalies for risky uncertain choices will also be covered.

Credits: 2.00 or 3.00

ECON 57200 - Econometrics II

Credit Hours: 2.00. This course reviews basic concepts in probability, mathematical statistics and linear algebra in order to obtain a more rigorous understanding of the linear regression model, its representation and assumptions, procedures for estimation and properties associated with the OLS estimator. We move on and apply what we have learned to the linear regression model. We discuss estimation and prediction, establish properties such as efficiency, unbiasedness, consistency and convergence in mean square. We conclude by considering a few nonlinear models appropriate for modeling binary outcomes. Permission of department required.

Learning Outcomes: 1. A student will be able to apply Econometric analysis to specific economic questions using MATLAB. Credits: 2.00

ECON 57600 - Statistical & Machine Learning

Credit Hours: 2.00 or 3.00. This is an introductory course in statistical and machine learning. It will cover fundamental concepts and essential tools that are critical in understanding cutting-edge machine learning techniques. Students will develop skills in applying a wide
variety of modeling and prediction methods. Topics include linear regression, classification, regularization and shrinkage methods, tree-based methods, and support vector machines. An integral part of this course is the extensive use of the open source statistical software R. Students will gain hands-on experience in analyzing datasets commonly used in business and economics.

Learning Outcomes: 1. Develop skills in applying a wide variety of modeling and prediction methods. Topics include linear regression, classification, regularization and shrinkage methods, tree-based methods, and support vector machines. An integral part of this course is the extensive use of the open source statistical software R. 2. Gain hands-on experience in analyzing datasets commonly used in business and economics. Credits: 2.00 or 3.00

ECON 59100 - Financial Valuation And Decision Making

Credit Hours: 2.00 or 3.00. A comprehensive introduction to finance. The object of this course is to provide the computational framework necessary to appreciate and understand how to make decisions based on sound financial

reasoning.

Learning Outcomes: 1. Develop skills in investment decisions and financing decisions. Credits: 2.00 or 3.00

ECON 58400 - Experimental Economics

Credit Hours: 2.00 or 3.00. This course introduces you to the experimental methods used by economists to study human behavior. These methods analyze data collected in controlled laboratory experiments. Throughout the course, we will discuss different types of experiments that have been extensively researched by experimental economists. To help introduce and motivate each topic, you will participate in weekly synchronous experiments with your classmates over the internet. You will then complete an assignment analyzing the data generated by your class in the online experiment. The following lecture will provide an overview of the theoretical framework and experimental predictions. We will also discuss commonly observed behavior and any relevant explanations for such behavior.

Learning Outcomes: 1. Demonstrate an understanding of the experimental methodology used by economists to study human behavior. 2. Evaluate economic behavior by analyzing and interpreting experimental data and its relationship to common economic models. 3. Identify and explain common insights that experiments provide regarding people's behavior in strategic situations. Credits: 2.00 or 3.00

ECON 57300 - Financial Econometrics

Credit Hours: 2.00. This course offers an introduction of basic principles of econometric analysis that will help students understand finance theories and their empirical applications. It will also equip students with appropriate statistical techniques for doing applied financial research. The statistical techniques are particularly well suited for analyzing financial time-series data. Permission of department required.

Learning Outcomes: 1. The student will be able to apply Econometric time series methods to analysis financial data. Credits: 2.00

ECON 57800 - Statistical & Machine Learning II

Credit Hours: 2.00. This is a second course in machine learning. After studying the fundamental concepts and essential machine learning tools in Machine Learning I, this follow-up course will go over a range of more advanced topics and learning methods. Topics include support vector machines, deep learning and neural networks, principal components analysis and other unsupervised learning methods. As in the first course, we will be using the statistical software R and its packages extensively to implement various learning methods.

Learning Outcomes: 1. Explain how common learning methods are implemented. 2. Train a range of deep learning models. 3. Perform dimension reduction techniques to summarize high-dimensional data in an efficient manner. 4. Select appropriate models and learning methods for a particular application. Credits: 2.00

ECON 55500 - Economic Forecasting

Credit Hours: 2.00. This course provides an introduction to forecasting methods of current interest in economics. The goal is to equip students with a working knowledge of state-of-the-art techniques that are useful for forecasting macroeconomic variables. The strengths and weaknesses of the techniques will be analyzed and their empirical relevance will be demonstrated through a variety of applications to real data sets. The topics will include univariate prediction models, vector autoregressions, forecasting with large data sets, forecast combinations and forecast evaluation. Particular emphasis will be placed on applications and the issues involved with implementation of the various methods in practice.

Learning Outcomes: 1. Identify the statistical issues involved in forecasting economic data. 2. Analyze the strengths and weaknesses of a variety of forecasting techniques commonly used in economics. 3. Demonstrate the empirical relevance of each forecasting approach through applications to real-world data sets. Credits: 2.00

ECON 51000 - Applied Game Theory

Credit Hours: 2.00. Game theory is a powerful tool that facilitates a decision making process of individuals. Games are characterized usually by two or more players where any player's action has an impact on other player's payoff. Players are decision making units, e.g. individuals, firms, workers, managers, countries etc. Game theory analyzes situations in which people (or other animals) interact by breaking these situations down into basic descriptions of the set of players, the strategies available to these players, and the payoffs that the players receive for different combinations of strategy choices.

Permission of department required.

Learning Outcomes: 1. Understanding of the logical mechanics, provide good intuition and to apply tools to explain events. Credits: 2.00

Public Economics and Policy Selectives

ECON 56500 - Law And Economics

Credit Hours: 2.00. This course is designed to give the student an understanding of both legal and economic principles and the relationship between them. It will also show the student how to access various data bases, Lexis/Nexis, to get a formal statement of the law and how the laws have actually been interpreted and enforced. Finally, through the use of economic analysis, the student will acquire the tools to predict the likely outcomes of particular laws and how they will affect their family and business decisions. Permission of department required.

Learning Outcomes: 1. The student is expected to understand the interplay between Economics and Law. Credits: 2.00

ECON 52000 - Industrial Economics

Credit Hours: 2.00. This course will explore the division of economic activity among industries in developed and less-developed countries. It will examine patterns of private and public ownership in different countries. It will discuss the determinants of market and firm structure, firm conduct, and market performance in imperfectly competitive markets, and different approaches to regulating such markets. Emphasis is placed on using basic economic models of firm and industry behavior to explain and analyze real-world markets. Permission of department required.

Learning Outcomes: 1. Students will be able to apply economic analysis and model to explain real-world firm and industry behavior. Credits: 2.00

ECON 53800 - International Economics

Credit Hours: 2.00 or 3.00. The course covers selected topics in international trade with a focus on real world applications.

Learning Outcomes: 1. Identify the effects of international trade on wages, prices or products and welfare of nations. 2. Develop models as well as a diverse set of academic papers to discuss current policy debates. Credits: 2.00 or 3.00

ECON 53700 - Health Economics

Credit Hours: 2.00 or 3.00. This course is designed to introduce masters' students in economics to the field of health economics. We will analyze health and health care theories, institutions, and key policy issues. The course covers how the markets for health and health services are different from other goods, with a particular emphasis on the role of government and market failure. We will examine the demand for and the production of health and health care, and the behavior and organization of health care providers. We will also explore information asymmetries and the functioning of health insurance markets. We will consider health and healthcare systems around the world, paying particular attention to the U.S. health care system and recent reforms to it.

Learning Outcomes: 1. Know key details relating to the structure of the U.S. health care system, and be able to describe key institutions and programs involved in U.S. health care and health insurance. 2. Discuss the special features of health and health care that present challenges for economic analysis and policy development, including in terms of health care reform. 3. Apply economic concepts and approaches to understanding key health economics issues. 4. Explain, in broad terms, what health care systems look like in other countries and how they differ from the U.S. 5. Apply economic concepts and insights from public health to the current Covid-19 pandemic. Credits: 2.00 or 3.00

ECON 53900 - Wage Discrimination

Credit Hours: 1.00. This course is an applied economics course that focuses on racial discrimination in the labor market. We will use the tools you have developed so far in the MA program to study the extent, causes and consequences of disparities in wages and employment by race.

Learning Outcomes: 1. Quantify racial and gender disparities in economic outcomes. 2. Recognize leading theories for those disparities. 3. Evaluate empirical evidence for these theories. 4. Assess policy responses to alleviate disparities. Credits: 1.00

ECON 53600 - Public Economics

Credit Hours: 2.00. This course is designed to introduce masters' students in economics to the field of health economics. We will analyze health and health care theories, institutions, and key policy issues. The course covers how the markets for health and health services are different from other goods, with a particular emphasis on the role of government and market failure. We will examine the demand for and the production of health and health care, and the behavior and organization of health care providers. We will also explore information asymmetries and the functioning of health insurance markets. We will consider health and healthcare systems around the world, paying particular attention to the U.S. health care system and recent reforms to it.

Learning Outcomes: 1. Know key details relating to the structure of the U.S. health care system, and be able to describe key institutions and programs involved in U.S. health care and health insurance. 2. Discuss the special features of health and health care that present challenges for economic analysis and policy development, including in terms of health care reform. 3. Apply economic concepts and approaches to understanding key health economics issues. 4. Explain, in broad terms, what health care systems look like in other countries and how they differ from the U.S. 5. Apply economic concepts and insights from public health to the current Covid-19 pandemic. Credits: 2.00

ECON 51000 - Applied Game Theory

Credit Hours: 2.00. Game theory is a powerful tool that facilitates a decision making process of individuals. Games are characterized usually by two or more players where any player's action has an impact on other player's payoff. Players are decision making units, e.g. individuals, firms, workers, managers, countries etc. Game theory analyzes situations in which people (or other animals) interact by breaking these situations down into basic descriptions of the set of players, the strategies available to these players, and the payoffs that the players receive for different combinations of strategy choices. Permission of department required.

Learning Outcomes: 1. Understanding of the logical mechanics, provide good intuition and to apply tools to explain events. Credits: 2.00

Business and Economics Data Analytics Selectives

ECON 67200 - Econometrics II

Credit Hours: 1.00 to 3.00. Topics include generalized method of moments, estimation and inference with weak instruments, panel data models and bootstrap methods. Prerequisite: ECON 67100.

Learning Outcomes: 1. Identify important econometric issues of interest in practical scenarios. 2. Demonstrate the application of state of the art methods to relevant economic questions. 3. Outline a broad picture of the subject by logically connecting the various topics. 4. Criticize the use of inadequate methods through discussion of published work. Credits: 1.00 to 3.00

ECON 57600 - Statistical & Machine Learning

Credit Hours: 2.00 or 3.00. This is an introductory course in statistical and machine learning. It will cover fundamental concepts and essential tools that are critical in understanding cutting-edge machine learning techniques. Students will develop skills in applying a wide
variety of modeling and prediction methods. Topics include linear regression, classification, regularization and shrinkage methods, tree-based methods, and support vector machines. An integral part of this course is the extensive use of the open source statistical software R. Students will gain hands-on experience in analyzing datasets commonly used in business and economics.

Learning Outcomes: 1. Develop skills in applying a wide variety of modeling and prediction methods. Topics include linear regression, classification, regularization and shrinkage methods, tree-based methods, and support vector machines. An integral part of this course is the extensive use of the open source statistical software R. 2. Gain hands-on experience in analyzing datasets commonly used in business and economics. Credits: 2.00 or 3.00

ECON 57700 - Quantitative Economics With Python

Credit Hours: 2.00 or 3.00. Introduce students to computational and programming in Python.

Learning Outcomes: 1. Learn Python essentials including basic programming techniques and the use of popular packages for data analysis and more advanced programming techniques including numerical methods, dynamic programming, and simulation-based methods. Credits: 2.00 or 3.00

ECON 57300 - Financial Econometrics

Credit Hours: 2.00. This course offers an introduction of basic principles of econometric analysis that will help students understand finance theories and their empirical applications. It will also equip students with appropriate statistical techniques for doing applied financial research. The statistical techniques are particularly well suited for analyzing financial time-series data. Permission of department required.

Learning Outcomes: 1. The student will be able to apply Econometric time series methods to analysis financial data. Credits: 2.00

ECON 57800 - Statistical & Machine Learning II

Credit Hours: 2.00. This is a second course in machine learning. After studying the fundamental concepts and essential machine learning tools in Machine Learning I, this follow-up course will go over a range of more advanced topics and learning methods. Topics include support vector machines, deep learning and neural networks, principal components analysis and other unsupervised learning methods. As in the first course, we will be using the statistical software R and its packages extensively to implement various learning methods.

Learning Outcomes: 1. Explain how common learning methods are implemented. 2. Train a range of deep learning models. 3. Perform dimension reduction techniques to summarize high-dimensional data in an efficient manner. 4. Select appropriate models and learning methods for a particular application. Credits: 2.00

ECON 51000 - Applied Game Theory

Credit Hours: 2.00. Game theory is a powerful tool that facilitates a decision making process of individuals. Games are characterized usually by two or more players where any player's action has an impact on other player's payoff. Players are decision making units, e.g. individuals, firms, workers, managers, countries etc. Game theory analyzes situations in which people (or other animals) interact by breaking these situations down into basic descriptions of the set of players, the strategies available to these players, and the payoffs that the players receive for different combinations of strategy choices. Permission of department required.

Learning Outcomes: 1. Understanding of the logical mechanics, provide good intuition and to apply tools to explain events. Credits: 2.00

Electives (0-8 credits)

MGMT 67000 - Business Analytics

Credit Hours: 2.00 to 4.00. Introduction to quantitative decision procedures under uncertainty. Applications of descriptive statistics, probability models, simulation models, interval estimates, and hypothesis testing to management problems. Managerial-oriented cases are used in instruction. Prerequisite: Master's student standing and Management majors only.

Credits: 2.00 to 4.00

MGMT 66400 - Supply Chain Management

Credit Hours: 2.00 to 4.00. Continues the examination of the linkage between a firm's product-market strategy and the role of the operations (i.e., production) function initiated in MGMT 660. Topics include material requirements planning, production activity control, and just-in-time systems. Prerequisite: MGMT 66000.

Learning Outcomes: 1. Learn tools and methodologies to model and analyze supply chain processes. 2. Learn how to manage uncertainty and risk, both within the firm and across the supply chain. 3. Learn how to effectively coordinate supply chains using contracts. 4. Understand how companies have used the principles from this course to significantly enhance their competitiveness and to innovate business models. Credits: 2.00 to 4.00

MGMT 66000 - Introduction To Operations Management

Credit Hours: 2.00 to 4.00 (West Lafayette) 3.00 (Calumet, North Central). As goods and services are produced and distributed, they move through a set of inter-related operations or processes in order to match supply with demand. The design of these operations for strategic advantage, investment in

improving their efficiency and effectiveness, and controlling these operations to meet performance objectives is the domain of Operations Management. The primary objective of the course is to provide an overview of this important functional area of business. Prerequisite: MGMT 67000 .

Credits: 2.00 to 4.00

MGMT 62000 - Marketing Management

Credit Hours: 2.00 to 4.00 (West Lafayette and Calumet) 3.00 (North Central). An integrated analysis of major marketing decisions, including product pricing, advertising, distribution, and sales force policies. Prerequisite: Master's student standing and Management majors only.

Credits: 2.00 to 4.00

MGMT 60000 - Accounting For Managers

Credit Hours: 2.00 to 3.00 (West Lafayette) 3.00 (Calumet, North Central). The two-course accounting sequence employs a user's perspective on the firm's database. First, the standard accounting model is developed into a working tool, as no prior study of accounting is assumed. Then illustrative business cases are discussed to show how external reports conform to financial contracts and public regulation. Public reports primarily directed to investors and creditors are analyzed to reconstruct the economic events and managerial decisions underlying generally accepted accounting standards. Prerequisite: Masters student standing and Management majors only.

Credits: 2.00 to 3.00

MGMT 59000 - Directed Readings In Management

Credit Hours: 1.00 to 4.00 (West Lafayette, North Central) 2.00 to 4.00 (Calumet). Supervised reading and reports in various subjects. Open only to a limited number of seniors and graduate students. Permission of instructor required.

Credits: 1.00 to 4.00

OBHR 69000 - Advanced Problems In Organizational Behavior And Human Resource Management

Credit Hours: 2.00 to 4.00. Advanced investigation in a specific organizational behavior or human resource field at the graduate level.

Credits: 2.00 to 4.00

MGMT 65430 - Negotiations In Organizations

Credit Hours: 1.00 to 3.00. Decision making examines organizational context, stages, creativity, biases, and group processes. Negotiations examine strategies for preparing and conducting negotiations. The principal focus is on individual and interpersonal aspects of each. Permission of department required.

Learning Outcomes: 1. Understand the basic components of business negotiations through reading and completing assignments based on the textbook chapters. 2. Learn the basic components of a negotiated contract by completing a business transaction in written form. 3. Attain pragmatic negotiations skills using the I-Message method for daily activities encompassing negotiation tactics and the Verbal Skills method for more sophisticated negotiations for a major business transaction. 4. Explore cultural differences in negotiations by completing a study of practice in two countries other than the U.S. and sharing results with other students to expand their cultural knowledge base. 5. Explore and practice alternative dispute resolution techniques including mediation and arbitration. 6. Demonstrate the negotiations skills they are attaining by participating in class role-plays and by completing a final major negotiation in class. Credits: 1.00 to 3.00

Required Courses (9 credits)

ECON 56200 - Econometrics I

Credit Hours: 3.00. This masters-level course in econometrics covers the tools that will enable students to conduct empirical analysis using economics data. The course examines the statistical techniques used in testing economic theories, estimating casual effects, and making predictions. Emphasis is placed on estimating a single equation (e.g., a demand function) and the problems associated with such estimation. As part of the course, students will estimate equations using STATA, a statistical software package. Permission of department required.

Learning Outcomes: 1. Students will have the tools to perform simple econometric analysis of Economic problems. Credits: 3.00

ECON 51500 - Macroeconomics

Credit Hours: 1.00 to 3.00. Investigation of the causes of macroeconomic fluctuations in the economy. Looks at changes in inflation, unemployment, real output, interest rates, and exchange rates, and explores why they occur, what their effects

are, and what, if any, role government should play in dealing with these problems. A mixture of theory and case studies with reference to historical case studies. Current macroeconomic problems will be discussed with a focus on the international aspects of macroeconomic problems.

Learning Outcomes: 1. Predict the macroeconomic impact of fiscal and monetary policies using the mathematical IS/LM models. 2. Demonstrate an understanding of the interdependencies and complexities with respect to international trade of goods and services as well as capital flows. 3. Analyze the possible economic/social impacts of various policy proposals from a historic perspective. Credits: 1.00 to 3.00

ECON 50100 - Statistical Analysis For Economists

Credit Hours: 1.00 to 3.00. A master's level course in statistics and its application to economics. Course will familiarize students with the elements of statistics needed to perform econometrics.

Learning Outcomes: 1. Apply algebra and basic calculus to econom(etr)ic models. 2. Calculate and interpret univariate and multivariate statistics. 3. Describe and identify properties of random variables. 4. Select methods of and perform statistical inference. Credits: 1.00 to 3.00

ECON 50000 - Mathematics For Economists

Credit Hours: 2.00 or 3.00. This is a Master's level course in mathematics and its application to economics. Students in this class will review and practice the mathematical methods required to solve micro and macroeconomic theoretical models, especially constrained optimization problems. Content covers algebra, univariate and multivariate calculus and constrained optimization methods

Learning Outcomes: 1. Solve problems requiring algebra and (uni-) multivariate calculus. 2. Apply algebra and calculus to solving (un)constrained optimization problems required by economic theoretical models. 3. Analyze assumptions embedded in economic theoretical models, e.g., functional forms and parameter values, using algebra and calculus. Credits: 2.00 or 3.00

ECON 53300 - Econometrics

Credit Hours: 2.00. This masters-level course in econometrics covers the tools that will enable students to conduct empirical analysis using economic data. The course examines the statistical techniques used in testing economic theories, estimating causal effects, and making predictions. Emphasis is placed on estimating a single equation and the problems associated with such estimation. In addition to multivariate OLS regression, students will be introduced to other regression methods including: instrumental variables estimation, time series estimation, and panel data methods. As part of the course, students will use Stata, a statistical software package.

Learning Outcomes: 1. Understand the theoretical foundations of linear regression methods. 2. Estimate linear regression model parameters and perform basic tests using Stata. 3. Interpret regression results and identify the sources of estimation bias. Credits: 2.00

ECON 52100 - Consumer & Producer Theory

Credit Hours: 2.00. In this course, we will develop and apply some of the basic theories of consumer and producer choices. You will learn how to approach issues from an economic perspective and gain an understanding of the microeconomic models and tools that will be used in subsequent courses.

Learning Outcomes: 1. Analyze key aspects of consumer and producer choices. 2. Understand how markets allocate resources. 3. Apply insights from microeconomic theory to public and economic policy. Credits: 2.00

ECON 51600 - Introduction To Mathematics For Economics

Credit Hours: 2.00. This is a Master's level course in mathematics and its application to economics. Students in this class will review and practice the mathematical methods required to solve micro and macroeconomic theoretical models, especially constrained optimization problems. The content covers a review of algebra, univariate and multivariate calculus, and constrained optimization methods, e.g., LaGrange multipliers. Mastering these methods is instrumental to preparing for ECON 51100 & 51200 (micro and macro theory).

Learning Outcomes: 1. Solve problems requiring algebra and (uni-) multivariate calculus. 2. Apply algebra and calculus to solving (un)constrained optimization problems required by economic theoretical models. 3.

Analyze assumptions embedded in economic theoretical models, e.g., functional forms and parameter values, using algebra and calculus. Credits: 2.00

Concentrations

Additional Information

About the Program

Educational Studies: Applied Behavior Analysis Accelerated Professional Concentration, MSED

About the Program

Program Requirements

Required Courses (39 credits)

Core Courses (33 credits)

EDPS 53300 - Introduction To Educational Research I: Methodology

Credit Hours: 3.00. This course presents a sequence of journal articles and exercises that help introduce the foundational concepts of the course, including: research design, reliability and validity, various methodologies commonly used in educational research, and basic quantitative and qualitative data analyses. In addition, contrasting research conclusions are shown in the articles to help students learn why careful analysis of articles and their theoretical framing is critical to evaluating their conclusions.

Learning Outcomes: 1. Find research literature. 2. Read and critique educational research. 3. Deepen knowledge of at least one research area in education. 4. Design, conduct, analyze, and write a research project. Credits: 3.00

EDPS 61200 - Advanced Applied Behavior Analysis

Credit Hours: 3.00. The purpose of this course is to expand knowledge and understanding of advanced applied behavior analytic theories and interventions. Specifically, this course will focus on interventions aimed at developing new skills as well as increasing and decreasing behaviors. Procedures for identifying and designing function based interventions will be addressed. Prerequisite: EDPS 36200 or 51500 and EDPS 58800.

Learning Outcomes: 1. Demonstrate knowledge of methods for increasing and decreasing behaviors such as antecedent and consequence-based interventions and group contingencies. 2. Demonstrate knowledge and skill in developing new behaviors through advanced techniques such as shaping, chaining, and differential reinforcement procedures. 3. Demonstrate knowledge and skill in procedures for assessing the function of behaviors including function based assessment and functional analysis. 4. Demonstrate knowledge of guiding principles and procedures to program for maintenance and generalization of behaviors. Credits: 3.00

EDPS 68800 - Single Subject Research Design

Credit Hours: 0.00 to 3.00. Designed to introduce advanced level students to single subject research methodology in context of a science of human behavior, including design theory and application, measurement, experimental validity, applied behavior analysis, and data analysis procedures.

Learning Outcomes: 1. Demonstrate knowledge about the various single subject research designs and variations of each. 2. Demonstrate the ability to conduct reliable visual analysis, understand value of effect size for single subject design, and calculate effect size. 3. Demonstrate knowledge of the criteria for designing and evaluating high-quality, rigorous single subject design studies. 4. Demonstrate knowledge of the application of single subject research methodology in clinical and educational settings including designing,

conducting, and analyzing a single subject study. Credits: 0.00 to 3.00

EDPS 54700 - Foundations And Principles Of Applied Behavior Analysis

Credit Hours: 3.00. This course will provide a historical perspective of Applied Behavior Analysis as well as the core principles of ABA. The learner will be exposed to the foundational concepts and methods of ABA including defining behaviors, collecting data, and understanding the three-term contingency of behavior. Permission of instructor required.

Learning Outcomes: 1. Identify and define the basic concepts of applied behavior analysis including the foundations of ABA, interrelated domains, and dimensions of ABA. 2. Identify factors to consider when selecting target goals including client and environmental factors. 3. Define behavior utilizing observable and measurable terms including all components of an appropriate behavior goal. 4. Identify measurable dimensions of behavior and appropriate measurement procedures, including advantages and disadvantages of each. 5. Construct and interpret graphic displays of behavioral data. 6. Describe the key components of visual analysis and a strong experimental design including interobserver agreement and treatment fidelity. 7. Define reinforcement and punishment including application procedures, schedules of delivery, and key considerations. 8. Identify the types of preference assessments including similarity and differences in procedures. Credits: 3.00

EDPS 54800 - Ethics And Professional Practice Of Applied Behavior Analysis

Credit Hours: 3.00. This course will address the professional and ethical responsibilities of behavior analysts. Key issues of responsible conduct as it relates to areas such as confidentiality, consent, consultation, treatment planning, and research will be discussed and applied through case studies. Learners will be able to apply ABA techniques within the bounds of both legal and ethical frameworks. Permission of instructor required.

Learning Outcomes: 1. Demonstrate understanding of BACB guidelines for the responsible conduct of applied behavior analysis. 2. Discuss scenarios involving ethical issues and describe appropriate solutions using BACB guidelines. 3. Identify appropriate ethical practices in ABA research. 4. Demonstrate and describe methods used to protect client/student confidentiality. 5. Demonstrate understanding of empirically validated practices vs. pseudoscience and non- validated practices within the context of service delivery. Credits: 3.00

EDPS 54900 - Verbal Behavior And Social Communication

Credit Hours: 3.00. This course will explore the development of verbal and social behavior as explained through tenets of applied behavior analysis. Students will identify the similarities and differences between verbal operants as well as appropriate function-based interventions to develop each including augmentative communication systems and functional communication training. Measurement and intervention for more complex social-communication skills will also be addressed. Permission of instructor required.

Learning Outcomes: 1. Understand and describe the historical perspective of Verbal Behavior in relation to Applied Behavior Analysis including differences between structural and functional approaches. 2. Describe verbal behavior in terms of the three term contingencies. 3. Define, describe, and differentiate the basic verbal operants. 4. Assess, interpret results and develop appropriate treatment plan to address target skills utilizing the VB-MAPP. 5. Identify and describe evidence-based practices for addressing communication for individuals with complex communication needs 6. Identify and describe evidence-based practices for increasing social-communication skills including intraverbal and listener behaviors. 7. Summarize and critically evaluate research on verbal and communication interventions for individuals with disabilities. Credits: 3.00

EDPS 55100 - Practicum In Applied Behavior Analysis

Credit Hours: 3.00. University-supervised fieldwork in applied behavior analysis. This practicum will facilitate development and fluency of essential professional and ethical skills necessary for the delivery of high-quality ABA services. Permission of instructor required.

Learning Outcomes: 1. Conduct assessment to determine the need for ABA services and guide intervention decision-making. 2. Design, implement, and monitor applied behavior interventions designed to increase or reduce target behaviors. 3. Explain, both verbally and in writing, behavioral analytic techniques, in technical and non-technical language appropriate for the audience. 4. Consult with and provide behavior skills training for behavior-change agents responsible for carrying out ABA program. 5. Demonstrate ability to analyze the incorporate findings from research into applied settings. Credits: 3.00

EDPS 55200 - Basic Concepts Of Applied Behavior Analysis

Credit Hours: 3.00. This course is the first in a sequence of courses for the Applied Behavior Analysis Certificate Program. This course, in combination with the other courses, will provide fundamental knowledge and experiences for understanding Applied Behavior Analysis principles, concepts, and techniques, including observational analysis, data-based instruction, and social validity to increase students' social and task related behavior. Students learn procedures to increase or decrease target behavior, to facilitate behavior maintenance and generalization, and to evaluate effectiveness of instruction. Permission of instructor required.

Learning Outcomes: 1. Identify the goals of behavior analysis as a science (i.e., description, prediction, control) (A-1). 2. Explain the philosophical assumptions underlying the science of behavior analysis (e.g., selectionism, determinism, empiricism, parsimony, pragmatism) (A-2). 3. Describe and explain behavior from the perspective of radical behaviorism (A-3). 4. Distinguish among behaviorism, the experimental analysis of behavior, applied behavior analysis, and professional practice guided by the science of behavior analysis (A-4). 5. Describe and define the dimensions of applied behavior analysis (Baer, Wolf, & Risley, 1968) (A-5). 6. Define and provide examples of behavior, response, and response class (B-1). 7. Define and provide examples of stimulus and stimulus class (B-2). 8. Define and provide examples of respondent and operant conditioning (B-3). 9. Define and provide examples of positive and negative reinforcement contingencies (B-4). 10. Define and provide examples of schedules of reinforcement (B-5). 11. Define and provide examples of positive and negative punishment contingencies (B-6). 12. Define and provide examples of automatic and socially mediated contingencies (B-7). 13. Define and provide examples of unconditioned, conditioned, and generalized reinforcers and punishers (B-8). 14. Define and provide examples of operant extinction (B-9). 15. Define and provide examples of stimulus control (B-10). 16. Define and provide examples of discrimination, generalization, and maintenance (B-11). 17. Define and provide examples of motivating operations (B-12). 18. Define and provide examples of rule-governed and contingency-shaped behavior (B-13). 19. Define and provide examples of the verbal operants (B-14). 20. Define and provide examples of derived stimulus relations (B-15). Credits: 3.00

EDPS 55300 - Application Of Applied Behavior Analysis To Manage And Support Personnel

Credit Hours: 3.00. This course will teach students how to use applied behavior analysis to maximize the potential of an organization. Students will learn the role of a Behavior Analyst in implementing principles of applied behavior analysis to motivate employees, intervene with challenges in the organization, evaluate the program, and collect and deliver ongoing performance feedback. Permission of instructor required.

Learning Outcomes: 1. Define Organizational Behavior Management (OBM) and explain how

it differs from other management approaches. 2. State three specialty areas of application of OBM. 3. Define Pinpoint and state the four components of behavior pinpointing. 4. Describe methods and tools for measurement in OBM. 5. Describe types of analysis in OBM. 6. State common intervention procedures used in organizations. 7. Apply OBM knowledge to assess targeted concern(s) and provide recommendations within an organization. 8. State characteristics of effective feedback. 9. Describe steps for evaluating reinforcers and delivering reinforcers. 10. Describe tools for evaluating performance change. Credits: 3.00

EDPS 62800 - The Behavior Analyst As Supervisor

Credit Hours: 0.00 to 3.00. This course will address the provision of supervision of behavior analysis trainees and technicians utilizing principles and procedures of applied behavior analysis. Application of goal development, behavioral skills training, and progress monitoring within a behavioral analytic framework will be explored. Must be enrolled in ABA Certificate or Masters Program. Pre-requisite: EDPS 61200. Permission of instructor required.

Learning Outcomes: 1. Describe reasons for effective evidence-based supervision and outcomes of ineffective supervision. 2. Describe necessary components of the supervisory relationship. 3. Assess and select performance expectations for the supervisee and supervisor. 4. Describe components of behavioral skills training. 5. Apply supervision skills to teach assessment and intervention procedures as relevant to task list competencies. 6. State features of performance monitoring and performance feedback . 7. Evaluate supervisor effectiveness. 8. Describe ethics of and methods for providing ongoing professional development. Credits: 0.00 to 3.00

EDPS 50800 - Cultural And Linguistic Diversity In Special Education Programs

Credit Hours: 3.00. Living in a diverse society provides special education teachers and support personnel the opportunity to encounter a wide array of cultures in their educational settings. The course, designed for special education stakeholders (i.e., teachers, staff, support personnel, administrators), considers issues of human diversity, broadly defined to include ability, ethnicity, culture, gender identity, linguistic background, race, religion, socioeconomic status, and sexual orientation. This course challenges biased assumptions that influence the provision of educational services, and examines issues related to promoting equal learning opportunities in the classroom and other educational settings. It is designed to facilitate student examination of how diversity and diverse experiences shape systems that affect individuals, families, communities, and society. It allows students to explore their own cultures and the biases and internalized messages about those who are different from themselves. Students will be introduced to specific approaches to practice, and frameworks for equity, advocacy, and empowerment to support students who receive special education and/or applied behavior analysis (ABA) service, as well as their families. The course also includes information and discussion topics pertaining to the culturo-behavior science (CBS) specialization of the Association for Behavior Analysis International (ABAI) and to interpersonal communication skills - to include speaking, listening, reading, and writing - and their effect on students and families. Permission of instructor required.

Learning Outcomes: 1. Demonstrate a conscious awareness and working knowledge of diverse populations within education settings. 2. Demonstrate the knowledge to create safe, inclusive, culturally responsive learning environments and classroom management systems. 3. Demonstrate the ability to identify funds of knowledge and how they interact to form meaningful relationships with students and families. 4. Engage with others around identity and difference, and apply self-awareness to identify and manage the influence of personal biases and values in working in diverse settings. 5. Analyze and interpret historical and contemporary dynamics of privilege and oppression in society that lead to inequalities in access to educational resources. 6. Analyze, evaluate, and propose solutions to contemporary social problems found in schools, school districts, and ABA settings (E.g., culturally responsive PB IS, restorative justice, etc. 7. Implement strategies that encourage students' to value their own heritage; value

richness of cultural diversity and commonality; respect diverse cultural groups; and reduce stereotyping. Credits: 3.00

EDPS 59200 - Principles & Philosophy Of Applied Behavior Analysis

Credit Hours: 3.00. The purpose of this course is to provide students with a working understanding of the conceptual framework of behavior analysis and the underlying theoretical and philosophical foundation of behavior analysis. The course will provide advanced coverage of the history, philosophical underpinnings, and advanced concepts and principles of behaviorism and behavior analysis. Permission of instructor required.

Learning Outcomes: 1. Identify and evaluate the goals of behavior analysis as a science. 2. Synthesize the philosophical assumptions underlying the science of behavior analysis. 3. Analyze behavior from the perspective of radical behaviorism. 4. Differentiate among the experimental analysis of behavior, applied behavior analysis, and professional practice guided by the science of behavior analysis. 5. Distinguish the dimensions of applied behavior analysis. Credits: 3.00

Practicum Course (6 credits)

EDPS 55100 - Practicum In Applied Behavior Analysis

Credit Hours: 3.00. University-supervised fieldwork in applied behavior analysis. This practicum will facilitate development and fluency of essential professional and ethical skills necessary for the delivery of high-quality ABA services. Permission of instructor required.

Learning Outcomes: 1. Conduct assessment to determine the need for ABA services and guide intervention decision-making. 2. Design, implement, and monitor applied behavior interventions designed to increase or reduce target behaviors. 3. Explain, both verbally and in writing, behavioral analytic techniques, in technical and non-technical language appropriate for the audience. 4. Consult with and provide behavior skills training for behavior-change agents responsible for carrying out ABA program. 5. Demonstrate ability to analyze the incorporate findings from research into applied settings. Credits: 3.00

GPA Requirements

Educational Studies: Applied Behavior Analysis Concentration, MSED

About the Program

Program Requirements

Selectives (33 credits)

EDPS 53300 - Introduction To Educational Research I: Methodology

Credit Hours: 3.00. This course presents a sequence of journal articles and exercises that help introduce the foundational concepts of the course, including: research design, reliability and validity, various methodologies commonly used in educational research, and basic quantitative and qualitative data analyses. In addition, contrasting research conclusions are shown in the articles to help students learn why careful analysis of articles and their theoretical framing is critical to evaluating their conclusions.

Learning Outcomes: 1. Find research literature. 2. Read and critique educational research. 3. Deepen knowledge of at least one research area in education. 4. Design, conduct, analyze, and write a research project. Credits: 3.00

EDPS 61200 - Advanced Applied Behavior Analysis

Credit Hours: 3.00. The purpose of this course is to expand knowledge and understanding of advanced applied behavior analytic theories and interventions. Specifically, this course will focus on interventions aimed at developing new skills as well as increasing and decreasing behaviors. Procedures for identifying and designing function based interventions will be addressed. Prerequisite: EDPS 36200 or 51500 and EDPS 58800.

Learning Outcomes: 1. Demonstrate knowledge

of methods for increasing and decreasing behaviors such as antecedent and consequence-based interventions and group contingencies. 2. Demonstrate knowledge and skill in developing new behaviors through advanced techniques such as shaping, chaining, and differential reinforcement procedures. 3. Demonstrate knowledge and skill in procedures for assessing the function of behaviors including function based assessment and functional analysis. 4. Demonstrate knowledge of guiding principles and procedures to program for maintenance and generalization of behaviors. Credits: 3.00

EDPS 68800 - Single Subject Research Design

Credit Hours: 0.00 to 3.00. Designed to introduce advanced level students to single subject research methodology in context of a science of human behavior, including design theory and application, measurement, experimental validity, applied behavior analysis, and data analysis procedures.

Learning Outcomes: 1. Demonstrate knowledge about the various single subject research designs and variations of each. 2. Demonstrate the ability to conduct reliable visual analysis, understand value of effect size for single subject design, and calculate effect size. 3. Demonstrate knowledge of the criteria for designing and evaluating high-quality, rigorous single subject design studies. 4. Demonstrate knowledge of the application of single subject research methodology in clinical and educational settings including designing, conducting, and analyzing a single subject study. Credits: 0.00 to 3.00

EDPS 54700 - Foundations And Principles Of Applied Behavior Analysis

Credit Hours: 3.00. This course will provide a historical perspective of Applied Behavior Analysis as well as the core principles of ABA. The learner will be exposed to the foundational concepts and methods of ABA including defining behaviors, collecting data, and understanding the three-term contingency of behavior. Permission of instructor required.

Learning Outcomes: 1. Identify and define the basic concepts of applied behavior analysis including the foundations of ABA, interrelated domains, and dimensions of ABA. 2. Identify factors to consider when selecting target goals including client and environmental factors. 3. Define behavior utilizing observable and measurable terms including all components of an appropriate behavior goal. 4. Identify measurable dimensions of behavior and appropriate measurement procedures, including advantages and disadvantages of each. 5. Construct and interpret graphic displays of behavioral data. 6. Describe the key components of visual analysis and a strong experimental design including interobserver agreement and treatment fidelity. 7. Define reinforcement and punishment including application procedures, schedules of delivery, and key considerations. 8. Identify the types of preference assessments including similarity and differences in procedures. Credits: 3.00

EDPS 54800 - Ethics And Professional Practice Of Applied Behavior Analysis

Credit Hours: 3.00. This course will address the professional and ethical responsibilities of behavior analysts. Key issues of responsible conduct as it relates to areas such as confidentiality, consent, consultation, treatment planning, and research will be discussed and applied through case studies. Learners will be able to apply ABA techniques within the bounds of both legal and ethical frameworks. Permission of instructor required.

Learning Outcomes: 1. Demonstrate understanding of BACB guidelines for the responsible conduct of applied behavior analysis. 2. Discuss scenarios involving ethical issues and describe appropriate solutions using BACB guidelines. 3. Identify appropriate ethical practices in ABA research. 4. Demonstrate and describe methods used to protect client/student confidentiality. 5. Demonstrate understanding of empirically validated practices vs. pseudoscience and non- validated practices

within the context of service delivery. Credits: 3.00

EDPS 55100 - Practicum In Applied Behavior Analysis

Credit Hours: 3.00. University-supervised fieldwork in applied behavior analysis. This practicum will facilitate development and fluency of essential professional and ethical skills necessary for the delivery of high-quality ABA services. Permission of instructor required.

Learning Outcomes: 1. Conduct assessment to determine the need for ABA services and guide intervention decision-making. 2. Design, implement, and monitor applied behavior interventions designed to increase or reduce target behaviors. 3. Explain, both verbally and in writing, behavioral analytic techniques, in technical and non-technical language appropriate for the audience. 4. Consult with and provide behavior skills training for behavior-change agents responsible for carrying out ABA program. 5. Demonstrate ability to analyze the incorporate findings from research into applied settings. Credits: 3.00

EDPS 55200 - Basic Concepts Of Applied Behavior Analysis

Credit Hours: 3.00. This course is the first in a sequence of courses for the Applied Behavior Analysis Certificate Program. This course, in combination with the other courses, will provide fundamental knowledge and experiences for understanding Applied Behavior Analysis principles, concepts, and techniques, including observational analysis, data-based instruction, and social validity to increase students' social and task related behavior. Students learn procedures to increase or decrease target behavior, to facilitate behavior maintenance and generalization, and to evaluate effectiveness of instruction. Permission of instructor required.

Learning Outcomes: 1. Identify the goals of behavior analysis as a science (i.e., description, prediction, control) (A-1). 2. Explain the philosophical assumptions underlying the science of behavior analysis (e.g., selectionism, determinism, empiricism, parsimony, pragmatism) (A-2). 3. Describe and explain behavior from the perspective of radical behaviorism (A-3). 4. Distinguish among behaviorism, the experimental analysis of behavior, applied behavior analysis, and professional practice guided by the science of behavior analysis (A-4). 5. Describe and define the dimensions of applied behavior analysis (Baer, Wolf, & Risley, 1968) (A-5). 6. Define and provide examples of behavior, response, and response class (B-1). 7. Define and provide examples of stimulus and stimulus class (B-2). 8. Define and provide examples of respondent and operant conditioning (B-3). 9. Define and provide examples of positive and negative reinforcement contingencies (B-4). 10. Define and provide examples of schedules of reinforcement (B-5). 11. Define and provide examples of positive and negative punishment contingencies (B-6). 12. Define and provide examples of automatic and socially mediated contingencies (B-7). 13. Define and provide examples of unconditioned, conditioned, and generalized reinforcers and punishers (B-8). 14. Define and provide examples of operant extinction (B-9). 15. Define and provide examples of stimulus control (B-10). 16. Define and provide examples of discrimination, generalization, and maintenance (B-11). 17. Define and provide examples of motivating operations (B-12). 18. Define and provide examples of rule-governed and contingency-shaped behavior (B-13). 19. Define and provide examples of the verbal operants (B-14). 20. Define and provide examples of derived stimulus relations (B-15). Credits: 3.00

EDPS 55300 - Application Of Applied Behavior Analysis To Manage And Support Personnel

Credit Hours: 3.00. This course will teach students how to use applied behavior analysis to maximize the potential of an organization. Students will learn the role of a Behavior Analyst in implementing principles of applied behavior analysis to motivate employees, intervene with challenges in the organization, evaluate the program, and collect and deliver ongoing performance feedback. Permission of instructor required.

Learning Outcomes: 1. Define Organizational Behavior Management (OBM) and explain how it differs from other management approaches. 2. State three specialty areas of application of OBM. 3. Define Pinpoint and state the four components of behavior pinpointing. 4. Describe methods and tools for measurement in OBM. 5. Describe types of analysis in OBM. 6. State common intervention procedures used in organizations. 7. Apply OBM knowledge to assess targeted concern(s) and provide recommendations within an organization. 8. State characteristics of effective feedback. 9. Describe steps for evaluating reinforcers and delivering reinforcers. 10. Describe tools for evaluating performance change. Credits: 3.00

EDPS 62800 - The Behavior Analyst As Supervisor

Credit Hours: 0.00 to 3.00. This course will address the provision of supervision of behavior analysis trainees and technicians utilizing principles and procedures of applied behavior analysis. Application of goal development, behavioral skills training, and progress monitoring within a behavioral analytic framework will be explored. Must be enrolled in ABA Certificate or Masters Program. Pre-requisite: EDPS 61200. Permission of instructor required.

Learning Outcomes: 1. Describe reasons for effective evidence-based supervision and outcomes of ineffective supervision. 2. Describe necessary components of the supervisory relationship. 3. Assess and select performance expectations for the supervisee and supervisor. 4. Describe components of behavioral skills training. 5. Apply supervision skills to teach assessment and intervention procedures as relevant to task list competencies. 6. State features of performance monitoring and performance feedback . 7. Evaluate supervisor effectiveness. 8. Describe ethics of and methods for providing ongoing professional development. Credits: 0.00 to 3.00

EDPS 50800 - Cultural And Linguistic Diversity In Special Education Programs

Credit Hours: 3.00. Living in a diverse society provides special education teachers and support personnel the opportunity to encounter a wide array of cultures in their educational settings. The course, designed for special education stakeholders (i.e., teachers, staff, support personnel, administrators), considers issues of human diversity, broadly defined to include ability, ethnicity, culture, gender identity, linguistic background, race, religion, socioeconomic status, and sexual orientation. This course challenges biased assumptions that influence the provision of educational services, and examines issues related to promoting equal learning opportunities in the classroom and other educational settings. It is designed to facilitate student examination of how diversity and diverse experiences shape systems that affect individuals, families, communities, and society. It allows students to explore their own cultures and the biases and internalized messages about those who are different from themselves. Students will be introduced to specific approaches to practice, and frameworks for equity, advocacy, and empowerment to support students who receive special education and/or applied behavior analysis (ABA) service, as well as their families. The course also includes information and discussion topics pertaining to the culturo-behavior science (CBS) specialization of the Association for Behavior Analysis International (ABAI) and to interpersonal communication skills - to include speaking, listening, reading, and writing - and their effect on students and families. Permission of instructor required.

Learning Outcomes: 1. Demonstrate a conscious awareness and working knowledge of diverse populations within education settings. 2. Demonstrate the knowledge to create safe, inclusive, culturally responsive learning environments and classroom management systems. 3. Demonstrate the ability to identify funds of knowledge and how they interact to form meaningful relationships with students and families. 4. Engage with others around identity and difference, and apply self-awareness to identify and manage the influence of personal biases and values in working in diverse settings. 5. Analyze and interpret historical and contemporary dynamics of privilege and oppression in society that lead to inequalities in access to educational resources. 6. Analyze, evaluate, and propose solutions to contemporary social problems found in schools, school districts, and ABA settings (E.g., culturally responsive PB IS, restorative justice,

etc. 7. Implement strategies that encourage students' to value their own heritage; value richness of cultural diversity and commonality; respect diverse cultural groups; and reduce stereotyping. Credits: 3.00

EDPS 59200 - Principles & Philosophy Of Applied Behavior Analysis

Credit Hours: 3.00. The purpose of this course is to provide students with a working understanding of the conceptual framework of behavior analysis and the underlying theoretical and philosophical foundation of behavior analysis. The course will provide advanced coverage of the history, philosophical underpinnings, and advanced concepts and principles of behaviorism and behavior analysis. Permission of instructor required.

Learning Outcomes: 1. Identify and evaluate the goals of behavior analysis as a science. 2. Synthesize the philosophical assumptions underlying the science of behavior analysis. 3. Analyze behavior from the perspective of radical behaviorism. 4. Differentiate among the experimental analysis of behavior, applied behavior analysis, and professional practice guided by the science of behavior analysis. 5. Distinguish the dimensions of applied behavior analysis. Credits: 3.00

EDPS 55900 - Introduction To The Experimental Analysis Of Behavior

Credit Hours: 3.00. This course introduces students to the theories, principles, and research conducted in experimental analysis of behavior (EAB). EAB began with highly controlled animal studies and has expanded to translational work with humans. Applied Behavior Analysis (ABA), the study of human behavior and the application of behavioral principles on socially significant behavior has evolved from EAB. Permission of instructor required.

Learning Outcomes: 1. Identify and analyze the major conceptual frameworks from the Experimental Analysis of Behavior (EAB). 2. Analyze areas of overlap between EAB and applied behavior analysis. 3. Apply the process of reading and extracting critical information from peer-reviewed empirical and conceptual papers in EAB. 4. Differentiate among the experimental analysis of behavior, applied behavior analysis, and professional practice guided by the science of behavior analysis. 5. Evaluate research methods used in EAB and how these are utilized to examine environmental determinants of behavior under experimental conditions. Credits: 3.00

GPA Requirements

Educational Studies: Educational Leadership and Policy Studies Concentration, MSED or MS

About the Program

Program Requirements

Required Courses (24 credits)

EDPS 53300 - Introduction To Educational Research I: Methodology

Credit Hours: 3.00. This course presents a sequence of journal articles and exercises that help introduce the foundational concepts of the course, including: research design, reliability and validity, various methodologies commonly used in educational research, and basic quantitative and qualitative data analyses. In addition, contrasting research conclusions are shown in the articles to help students learn why careful analysis of articles and their theoretical framing is critical to evaluating their conclusions.

Learning Outcomes: 1. Find research literature. 2. Read and critique educational research. 3. Deepen knowledge of at least one research area in education. 4. Design, conduct, analyze, and write a research project. Credits: 3.00

Course Set One (7 credits)

EDST 60200 - Seminar: The School Principalship

Credit Hours: 3.00. Individual exploration in depth of selected

aspects of the school principalship and critical analysis of related issues. Prerequisite: EDST 51200 .

Learning Outcomes: 1. Acquired proficiency in the Indiana Standards for School Leaders - Building Level content and skills. The Indiana Department of Education believes these content standards define those skills and abilities that school leaders must possess to produce greater levels of success for all students. The learning outcomes in this course are based on the Indiana standards focused on the students acquiring proficiency in: Leadership, Supervision, Vision and Mission, Change, Staff Recruitment & Selection, Staff Evaluation, Staff/Administrative Relations, Curriculum Leadership and Management, Student Discipline, Pupil Personnel Services, Professional Development, Ethics, Decision Making, Planning, Time Management and Teaching and Learning. Credits: 3.00

EDST 60700 - Administration Of Educational Systems

Credit Hours: 3.00. An examination of administrative function, process, structure, and practice. Special emphasis given to theory development in administration. Exploration of system analysis applications to educational administration. Prerequisite: EDST 51200 .

Learning Outcomes: 1. Acquired proficiency in the Indiana Standards for School Leaders - Building Level content and skills. The Indiana Department of Education believes these content standards define those skills and abilities that school leaders must possess to produce greater levels of success for all students. The learning outcomes in this course are based on the Indiana Standards focused on students acquiring proficiency in organizational and resource management, including using data to identify needs and priorities within the organization; identifying and addressing organizational barriers to student achievement; using technological tools to manage information and support effective management of the organization; and using practices for the safe, efficient and effective operation of school's physical plant, equipment and auxiliary services. Credits: 3.00

EDST 69400 - Intern In Educational Administration: Building Administrator

Credit Hours: 1.00 to 3.00. (EDFA 69400) Field experience in educational administration under university supervision in selected situations related to school building administration. Amount of credit to be determined by nature and extent of assignment. Permission of instructor required.

Learning Outcomes: * Credits: 1.00 to 3.00

Course Set Two (7 credits)

EDST 60900 - Legal Aspects Of American Education

Credit Hours: 3.00. (EDFA 60900) Legal foundations of education as established by constitutional provisions, court decisions, opinions of attorney generals, administrative rulings, and executive directives. Emphasis on legal theory and principles currently in state of change. Stress of case study method of investigation into educational law. Prerequisite: 9 credit hours in Education.

Learning Outcomes: 1. Acquired proficiency in the Indiana Standards for School Leaders - Building Level content and skills. The Indiana Department of Education believes these content standards define those skills and abilities that school leaders must possess to produce greater levels of success for all students. The learning outcomes in this course are based on the Indiana standards focused on the student acquiring proficiency in human resource management; equity and access to educational programs, curricula and available supports; behavior management systems; school safety and emergency preparedness; student safety and welfare; and the rights and responsibilities of students, families, and school staff. Credits: 3.00

EDST 61000 - Supervision Of Instruction And Instructional Personnel

Credit Hours: 3.00. (EDFA 61000) A comprehensive approach

to supervision and instruction that develops the knowledge, interpersonal, and leadership skills, which are then applied in a school setting for the purpose of instructional improvement. Models of supervision, leadership and evaluation will be examined to gain knowledge in order to apply effective strategies for diverse situations. The study of transformational change in today's schools will guide leadership knowledge to the task of direct assistance, collegiality, collaboration, culture of trust, professional development, dialectic inquiry, curriculum development and action research. Prerequisite: EDST 51200 .

Learning Outcomes: 1. Recognize the temper of diverse situations within their instructional leadership role and appropriately apply strategies that will address the situations. 2. Use the understanding and experience of instructional supervision concepts explored throughout this course and apply supervisory principles to the daily functions and responsibilities of an education administrator. 3. Demonstrate the ability to correctly apply various leadership concepts to various fact-based situations and formulate a plan of action to address each situation. 4. Accurately interpret the characteristics of a healthy organization (campus, district, etc.). 5. Evaluate the results of teacher and administrator interviews regarding system and recommend a teacher appraisal system that may improve the equality of observations and appraisals. Credits: 3.00

EDST 69400 - Intern In Educational Administration: Building Administrator

Credit Hours: 1.00 to 3.00. (EDFA 69400) Field experience in educational administration under university supervision in selected situations related to school building administration. Amount of credit to be determined by nature and extent of assignment. Permission of instructor required.

Learning Outcomes: * Credits: 1.00 to 3.00

Course Set Three (7 credits)

EDST 51400 - Economics Of Education

Credit Hours: 3.00. A general course in financing education, including current economic theories, sources of revenues, and trends in fiscal structure and operations in education.

Learning Outcomes: 1. Develop and understand the goals of public education, why states invest in education, and the legal basis for financing public education. 2. Develop and understand the sources of revenues for public education and the approaches used to raise and distribute funds for school district operations. 3. Develop and understand the concepts of equity and adequacy and how these ideas are reflected in current state education policy and educational leadership practices. 4. Develop and understand budgeting strategies and procedures used by educational leaders to influence student achievement outcomes and realize other school-based goals. Credits: 3.00

EDST 51600 - School-Community Relations

Credit Hours: 3.00. (EDFA 51600) This course will stress concepts and principles relevant to school-community interaction. It will focus on the new roles of the public in education and will deal with problems encountered by educators in communicating with the public.

Learning Outcomes: 1. Design their commitment to build stronger family and community relationships with schools. 2. Understand important analytical, policy-relevant, and practice-oriented perspectives on family and community involvement in education 3. Develop skills and strategies for fostering mutually beneficial family and community connections with schools. Credits: 3.00

EDST 69400 - Intern In Educational Administration: Building Administrator

Credit Hours: 1.00 to 3.00. (EDFA 69400) Field experience in educational administration under university supervision in selected situations related to school building administration. Amount of credit to be determined by nature and extent of assignment. Permission of instructor required.

Learning Outcomes: * Credits: 1.00 to 3.00

Course Set One (7 credits)

EDST 60200 - Seminar: The School Principalship

Credit Hours: 3.00. Individual exploration in depth of selected aspects of the school principalship and critical analysis of related issues. Prerequisite: EDST 51200 .

Learning Outcomes: 1. Acquired proficiency in the Indiana Standards for School Leaders - Building Level content and skills. The Indiana Department of Education believes these content standards define those skills and abilities that school leaders must possess to produce greater levels of success for all students. The learning outcomes in this course are based on the Indiana standards focused on the students acquiring proficiency in: Leadership, Supervision, Vision and Mission, Change, Staff Recruitment & Selection, Staff Evaluation, Staff/Administrative Relations, Curriculum Leadership and Management, Student Discipline, Pupil Personnel Services, Professional Development, Ethics, Decision Making, Planning, Time Management and Teaching and Learning. Credits: 3.00

EDST 60700 - Administration Of Educational Systems

Credit Hours: 3.00. An examination of administrative function, process, structure, and practice. Special emphasis given to theory development in administration. Exploration of system analysis applications to educational administration. Prerequisite: EDST 51200 .

Learning Outcomes: 1. Acquired proficiency in the Indiana Standards for School Leaders - Building Level content and skills. The Indiana Department of Education believes these content standards define those skills and abilities that school leaders must possess to produce greater levels of success for all students. The learning outcomes in this course are based on the Indiana Standards focused on students acquiring proficiency in organizational and resource management, including using data to identify needs and priorities within the organization; identifying and addressing organizational barriers to student achievement; using technological tools to manage information and support effective management of the organization; and using practices for the safe, efficient and effective operation of school's physical plant, equipment and auxiliary services. Credits: 3.00

EDST 69400 - Intern In Educational Administration: Building Administrator

Credit Hours: 1.00 to 3.00. (EDFA 69400) Field experience in educational administration under university supervision in selected situations related to school building administration. Amount of credit to be determined by nature and extent of assignment. Permission of instructor required.

Learning Outcomes: * Credits: 1.00 to 3.00

Selectives (6 credits)

EDPS 54000 - Gifted, Creative And Talented Children

Credit Hours: 3.00. This course is an introduction to the intellectual, social, and emotional characteristics of gifted youth; philosophies of gifted education; and programmatic and classroom approaches for supporting gifted students generally and within different domains (e.g., intellectual, academic, creative, artistic, leadership).

Learning Outcomes: 1. Understand who gifted, creative, and talented children are and how their talent development needs can be met in the school setting. 2. Recognize the diversity that exists within the gifted, creative, and talented population. 3. Understand the history, philosophical traditions, and paradigms of practice in gifted education. 4. Develop awareness of specific strategies for supporting gifted, creative, and talented students within the school context. 5. Develop awareness of key professional resources in the field of gifted education and talent development. 6. Develop a personal identity as a practitioner of gifted education. Credits: 3.00

EDPS 54500 - Social And Affective Development Of Gifted Students

Credit Hours: 3.00. This course focuses on the social and emotional development of gifted and talented students. An overview of the characteristics and needs of gifted

subpopulations, diversity issues, and family/parenting concerns along with an introduction to current educational approaches and counseling interventions are provided. The course is designed to complement EDPS 54000.

Learning Outcomes: 1. Analyze, synthesize, and evaluate current research literature on the social and affective development of gifted students. 2. Discuss characteristics and needs of subpopulations of gifted and talented learners and the implications for academic instruction and/or counseling interventions. 3. Increase knowledge of issues related to the social and affective development of gifted students through class discussion, interaction with gifted students, and completion of CORE assignments. Credits: 3.00

EDPS 66300 - Organization And Administration Of Special Education

Credit Hours: 3.00. (EDST 66300) A comprehensive course in the organization and administration of special education including the organizational arrangements, identification, placement and service delivery, tests and assessments, program evaluation, personnel, and school/community relations.

Learning Outcomes: 1. Examine, discuss, and gain an understanding of the role of the special education director. 2. Apply the federal and state rules and regulations for special education in school settings. 3. Understand the role of litigation in the field of special education. 4. Understand special education funding options, identify budget preparation strategies and fund management. 5. Demonstrate ways to ensure parent involvement. 6. Discuss current trends and issues in educating children with disabilities, including ethnic and cultural diversity, discipline, suspension and expulsion. Credits: 3.00

EDCI 58500 - Multicultural Education

Credit Hours: 3.00. The course aims to develop understanding of multicultural education as an on-going reform process that addresses social justice issues through an examination of race, class, gender, ethnicity, language, sexual orientation, etc.

Learning Outcomes: 1. Develop awareness of multicultural issues in education and other fields. 2. Increase knowledge of multicultural education and applications of multicultural theories to education and other disciplines. 3. Develop skills in meeting the needs of diverse populations. Credits: 3.00

EDPS 55500 - Differentiating Curriculum & Instruction

Credit Hours: 3.00. This course provides a solid foundation and set of principles for differentiating curriculum and instruction in any classroom at any grade level. Students will explore a variety of evidence-based strategies, tools, and curriculum models that effectively meet the diverse needs of all learners. Through readings, online class meetings and discussions, case studies, differentiated instruction examples, direct application, and reflection, students will deepen their understanding and need to differentiate. With an overarching goal of increasing achievement and developing student talents, this course includes the following major components: creating positive learning environments that support a) high-quality curriculum; b) diagnostic, formative, and summative assessments to inform instructional decision-making; and c) flexible grouping; addressing student differences in readiness, interest, and learning profile (including learning preference, intelligence preference, gender, culture, language preference, locale, and opportunities to learn) and appreciating how these differences influence the ways in which students learn and are motivated; understanding that the process of differentiation involves modifying content, process, product, learning environment, and/or affect; incorporating higher-order thinking skills, creative problem solving, project-based learning, authentic/respectful tasks, collaborative learning, and other evidence-based strategies to promote student achievement and talent development; understanding how differentiation of curriculum and instruction fits within specific educational interventions and models, such as scaffolding, flexible grouping, Response to Intervention (RTI), and Multi-Tiered System of Support (MTSS).

Learning Outcomes: 1. Deconstruct the concept of differentiation as a response to the readiness levels; interests; learning preferences and strengths; and academic, social, emotional needs of learners by modifying curriculum, instruction, learning environment, and/or affect. 2. Assess students' readiness, interests, and learning profiles to create differentiated lessons that utilize instructional strategies and technologies that motivate and engage students in learning, including those from special

populations. 3. Develop, implement, and evaluate various differentiated instructional plans designed to maximize learning and demonstrate proficiency in analyzing and evaluating differentiated lessons taught by other teachers. 4. Evaluate and reflect upon your course experience and your plan to implement differentiation knowledge and skills gained in this course. Credits: 3.00

Required Courses (24 credits)

EDPS 53300 - Introduction To Educational Research I: Methodology

Credit Hours: 3.00. This course presents a sequence of journal articles and exercises that help introduce the foundational concepts of the course, including: research design, reliability and validity, various methodologies commonly used in educational research, and basic quantitative and qualitative data analyses. In addition, contrasting research conclusions are shown in the articles to help students learn why careful analysis of articles and their theoretical framing is critical to evaluating their conclusions.

Learning Outcomes: 1. Find research literature. 2. Read and critique educational research. 3. Deepen knowledge of at least one research area in education. 4. Design, conduct, analyze, and write a research project. Credits: 3.00

Course Set One (7 credits)

EDST 60200 - Seminar: The School Principalship

Credit Hours: 3.00. Individual exploration in depth of selected aspects of the school principalship and critical analysis of related issues. Prerequisite: EDST 51200 .

Learning Outcomes: 1. Acquired proficiency in the Indiana Standards for School Leaders - Building Level content and skills. The Indiana Department of Education believes these content standards define those skills and abilities that school leaders must possess to produce greater levels of success for all students. The learning outcomes in this course are based on the Indiana standards focused on the students acquiring proficiency in: Leadership, Supervision, Vision and Mission, Change, Staff Recruitment & Selection, Staff Evaluation, Staff/Administrative Relations, Curriculum Leadership and Management, Student Discipline, Pupil Personnel Services, Professional Development, Ethics, Decision Making, Planning, Time Management and Teaching and Learning. Credits: 3.00

EDST 60700 - Administration Of Educational Systems

Credit Hours: 3.00. An examination of administrative function, process, structure, and practice. Special emphasis given to theory development in administration. Exploration of system analysis applications to educational administration. Prerequisite: EDST 51200 .

Learning Outcomes: 1. Acquired proficiency in the Indiana Standards for School Leaders - Building Level content and skills. The Indiana Department of Education believes these content standards define those skills and abilities that school leaders must possess to produce greater levels of success for all students. The learning outcomes in this course are based on the Indiana Standards focused on students acquiring proficiency in organizational and resource management, including using data to identify needs and priorities within the organization; identifying and addressing organizational barriers to student achievement; using technological tools to manage information and support effective management of the organization; and using practices for the safe, efficient and effective operation of school's physical plant, equipment and auxiliary services. Credits: 3.00

EDST 69400 - Intern In Educational Administration: Building Administrator

Credit Hours: 1.00 to 3.00. (EDFA 69400) Field experience in educational administration under university supervision in selected situations related to school building administration. Amount of credit to be determined by nature and extent of assignment. Permission of instructor required.

Learning Outcomes: * Credits: 1.00 to 3.00

Course Set Two (7 credits)

EDST 60900 - Legal Aspects Of American Education

Credit Hours: 3.00. (EDFA 60900) Legal foundations of education as established by constitutional provisions, court decisions, opinions of attorney generals, administrative rulings, and executive directives. Emphasis on legal theory and principles currently in state of change. Stress of case study method of investigation into educational law. Prerequisite: 9 credit hours in Education.

Learning Outcomes: 1. Acquired proficiency in the Indiana Standards for School Leaders - Building Level content and skills. The Indiana Department of Education believes these content standards define those skills and abilities that school leaders must possess to produce greater levels of success for all students. The learning outcomes in this course are based on the Indiana standards focused on the student acquiring proficiency in human resource management; equity and access to educational programs, curricula and available supports; behavior management systems; school safety and emergency preparedness; student safety and welfare; and the rights and responsibilities of students, families, and school staff. Credits: 3.00

EDST 61000 - Supervision Of Instruction And Instructional Personnel

Credit Hours: 3.00. (EDFA 61000) A comprehensive approach to supervision and instruction that develops the knowledge, interpersonal, and leadership skills, which are then applied in a school setting for the purpose of instructional improvement. Models of supervision, leadership and evaluation will be examined to gain knowledge in order to apply effective strategies for diverse situations. The study of transformational change in today's schools will guide leadership knowledge to the task of direct assistance, collegiality, collaboration, culture of trust, professional development, dialectic inquiry, curriculum development and action research. Prerequisite: EDST 51200 .

Learning Outcomes: 1. Recognize the temper of diverse situations within their instructional leadership role and appropriately apply strategies that will address the situations. 2. Use the understanding and experience of instructional supervision concepts explored throughout this course and apply supervisory principles to the daily functions and responsibilities of an education administrator. 3. Demonstrate the ability to correctly apply various leadership concepts to various fact-based situations and formulate a plan of action to address each situation. 4. Accurately interpret the characteristics of a healthy organization (campus, district, etc.). 5. Evaluate the results of teacher and administrator interviews regarding system and recommend a teacher appraisal system that may improve the equality of observations and appraisals. Credits: 3.00

EDST 69400 - Intern In Educational Administration: Building Administrator

Credit Hours: 1.00 to 3.00. (EDFA 69400) Field experience in educational administration under university supervision in selected situations related to school building administration. Amount of credit to be determined by nature and extent of assignment. Permission of instructor required.

Learning Outcomes: * Credits: 1.00 to 3.00

Course Set Three (7 credits)

EDST 51400 - Economics Of Education

Credit Hours: 3.00. A general course in financing education, including current economic theories, sources of revenues, and trends in fiscal structure and operations in education.

Learning Outcomes: 1. Develop and understand the goals of public education, why states invest in education, and the legal basis for financing public education. 2. Develop and understand the sources of revenues for public education and the approaches used to raise and distribute funds for school district operations. 3. Develop and understand the concepts of equity and adequacy and how these ideas are reflected in current state education policy and educational

leadership practices. 4. Develop and understand budgeting strategies and procedures used by educational leaders to influence student achievement outcomes and realize other school-based goals. Credits: 3.00

EDST 51600 - School-Community Relations

Credit Hours: 3.00. (EDFA 51600) This course will stress concepts and principles relevant to school-community interaction. It will focus on the new roles of the public in education and will deal with problems encountered by educators in communicating with the public.

Learning Outcomes: 1. Design their commitment to build stronger family and community relationships with schools. 2. Understand important analytical, policy-relevant, and practice-oriented perspectives on family and community involvement in education 3. Develop skills and strategies for fostering mutually beneficial family and community connections with schools. Credits: 3.00

EDST 69400 - Intern In Educational Administration: Building Administrator

Credit Hours: 1.00 to 3.00. (EDFA 69400) Field experience in educational administration under university supervision in selected situations related to school building administration. Amount of credit to be determined by nature and extent of assignment. Permission of instructor required.

Learning Outcomes: * Credits: 1.00 to 3.00

Course Set One (7 credits)

EDST 60200 - Seminar: The School Principalship

Credit Hours: 3.00. Individual exploration in depth of selected aspects of the school principalship and critical analysis of related issues. Prerequisite: EDST 51200 .

Learning Outcomes: 1. Acquired proficiency in the Indiana Standards for School Leaders - Building Level content and skills. The Indiana Department of Education believes these content standards define those skills and abilities that school leaders must possess to produce greater levels of success for all students. The learning outcomes in this course are based on the Indiana standards focused on the students acquiring proficiency in: Leadership, Supervision, Vision and Mission, Change, Staff Recruitment & Selection, Staff Evaluation, Staff/Administrative Relations, Curriculum Leadership and Management, Student Discipline, Pupil Personnel Services, Professional Development, Ethics, Decision Making, Planning, Time Management and Teaching and Learning. Credits: 3.00

EDST 60700 - Administration Of Educational Systems

Credit Hours: 3.00. An examination of administrative function, process, structure, and practice. Special emphasis given to theory development in administration. Exploration of system analysis applications to educational administration. Prerequisite: EDST 51200 .

Learning Outcomes: 1. Acquired proficiency in the Indiana Standards for School Leaders - Building Level content and skills. The Indiana Department of Education believes these content standards define those skills and abilities that school leaders must possess to produce greater levels of success for all students. The learning outcomes in this course are based on the Indiana Standards focused on students acquiring proficiency in organizational and resource management, including using data to identify needs and priorities within the organization; identifying and addressing organizational barriers to student achievement; using technological tools to manage information and support effective management of the organization; and using practices for the safe, efficient and effective operation of school's physical plant, equipment and auxiliary services. Credits: 3.00

EDST 69400 - Intern In Educational Administration: Building Administrator

Credit Hours: 1.00 to 3.00. (EDFA 69400) Field experience in educational administration under university supervision in selected situations related to school building administration.

Amount of credit to be determined by nature and extent of assignment. Permission of instructor required.

Learning Outcomes: * Credits: 1.00 to 3.00

Concentrations

About the Program

Educational Studies: Educational Psychology and Research Methodology Concentration, MSED or MS

About the Program

Program Requirements - Thesis

Required Courses (16 credits)

Foundation Course (3 credits)

EDPS 53300 - Introduction To Educational Research I: Methodology

Credit Hours: 3.00. This course presents a sequence of journal articles and exercises that help introduce the foundational concepts of the course, including: research design, reliability and validity, various methodologies commonly used in educational research, and basic quantitative and qualitative data analyses. In addition, contrasting research conclusions are shown in the articles to help students learn why careful analysis of articles and their theoretical framing is critical to evaluating their conclusions.

Learning Outcomes: 1. Find research literature. 2. Read and critique educational research. 3. Deepen knowledge of at least one research area in education. 4. Design, conduct, analyze, and write a research project. Credits: 3.00

Primary Area Courses (6 credits)

EDPS 53000 - Cognition And Learning In Context

Credit Hours: 3.00. Theories of learning and development, research on instruction and learning, and principles of measurement applied to educational problems.

Learning Outcomes: 1. Understand the central components of Behaviorism, differentiate between classical and operant conditioning, and apply the theories to teaching and learning. 2. Understand the central tenets of constructivism, identify a range of constructivist theories or perspectives, and distinguish constructivism from behaviorism. 3. Understand the central components of theories of learning and development developed by Bandura, Piaget, and Vygotsky, and apply them to teaching and learning. 4. Understand the roles of memory, expertise, transfer, conceptual change, meta-cognition, and self-regulated learning for student learning, and their implications for teaching. 5. Identify the central characteristics of instructional scaffolding, and cooperative and collaborative learning, how they are associated with learning, and how they may be instantiated. 6. Understand central tenets of sociocultural (or sociohistorical) and situated theories of learning and development and apply them to teaching and learning. 7. Understand the central characteristics of inquiry (or project-based learning) and their affordances and limitations with respect to teaching and learning. 8. Understand how policies (educational and otherwise), political priorities, beliefs, and national and international factors affect affordances for teaching and learning. Credits: 3.00

EDPS 53100 - Introduction To Measurement And Instrument Design

Credit Hours: 3.00. An application-oriented introduction to constructing educational and psychological tests and surveys. Class sessions include guided practice with the process of instrument development, from trait and test task domain definition, item writing and revision, and item analysis, to score

interpretation and validation.

Learning Outcomes: 1. Explain fundamental concepts and terminology in educational measurement. 2. Evaluate existing measurement instruments and score uses. 3. Contribute to development of instruments for measuring educational outcomes. 4. Interpret descriptive statistics for test and test item scores. Credits: 3.00

Seminar Courses (4 credits)

EDPS 63100 - Applied Educational Research Design Seminar

Credit Hours: 1.00 to 3.00. This seminar seeks to promote professionalism, research and scholarly productivity and collegial support among graduate students in gifted, creative (GCT), and talented studies, associated graduate students, visiting scholars, and interested others. A secondary purpose involves assisting GCT students, COE students, and associates with successful study and career preparation by focusing on research, grants, thesis preparation, graduate writing, proposal development, professional development, and degree completion. Finally, seminar offers students the opportunity to discuss, learn and "mess" around with current issues in the field and of personal interest. Seminar creates time and incentive for students to become more productive with their scholarship efforts, and offers students credit for work completed and formal support for the professional development and scholarship processes. In this course students should expect to attend, contribute, and participate. A variety of formats will be used, including, but not limited to: discussion, simulations, group work, lecture, guest speakers, and peer feedback. Prerequisite: EDPS 63000 and one graduate course in Statistics.

Learning Outcomes: 1. Engage with IRB process. 2. Write for publication. 3. Critically review and revise writing. 4. Engage in research. 5. Develop a professional vita. 6. Write conference proposals. 7. Create professional presentations. 8. Review relevant literature. Credits: 1.00 to 3.00

EDPS 63200 - Seminar In Research Procedures In Education

Credit Hours: 1.00 to 3.00. Experimental, field study, scientific survey, and prediction study methods in education. Internal and external validity, identification and development of research problems, criteria development, common methodological errors, strategies of analysis, and sources of acceptable educational research literature will be reviewed. Critical analyses of the research methodology of educational research reports in the student's field. Prerequisite: EDPS 63000 or 53300 and course work in Statistics.

Learning Outcomes: 1. Develop specific advanced methodological skills and knowledge that are applicable to education research and practice. Credits: 1.00 to 3.00

EDPS 63300 - Seminar In Educational Psychology

Credit Hours: 1.00 to 3.00. Recent investigations and research in educational psychology. One topic is dealt with in each enrollment. The topics provide an in-depth study of those areas of psychological investigation in educational settings and problems. These areas include: (1) instructional technology and design; (2) individual differences and educational growth; (3) school learning: theory and research; (4) classroom behavior and social processes; (5) educational assessment; and (6) other relevant topics. Prerequisite: EDPS 53000 .

Credits: 1.00 to 3.00

Statistics Course (3 credits)

PSY 60000 - Statistical Inference

Credit Hours: 3.00. Emphasis is given to principles underlying both parametric and nonparametric inference.

Credits: 3.00

STAT 50100 - Experimental Statistics I

Credit Hours: 3.00. Concepts and methods of applied statistics. Exploratory analysis of data. Sample design and experimental design. Normal distributions. Sampling distributions. Confidence intervals and tests of hypotheses for one and two samples. Inference for contingency tables, regression and correlation, and one-way analysis of variance. Use of the SAS statistical software. Intended primarily for students who have not had calculus. Not open to students in mathematical sciences or engineering. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: College Algebra.

Learning Outcomes: 1. Produce and identify basic statistical analyses. 2. Discuss statistical terminology (speak statistics). 3. Use SAS to run basic statistical analyses and interpret corresponding SAS output. Credits: 3.00

EDPS 55600 - Introduction To Quantitative Data Analysis Methods In Education I

Credit Hours: 3.00. This online course is designed to provide an overview of introductory quantitative data analysis methods in education. The course is specially designed to enhance students' quantitative reasoning and skills through discussions of issues in educational data and authentic data analysis experiences of a variety of education data. The topics to be covered in this course include data collection and description, sampling distributions, methods of quantitative data analysis often used in education research. Permission of instructor required.

Learning Outcomes: 1. Think critically about quantitative data analysis used in popular magazines, newspapers, and journal articles. 2. Apply the knowledge gained in the course to analysis his/her own data with simple quantitative methods. 3. Understand common issues in analysis and interpretation of educational/social science data. 4. Design a research study, use a statistical software package to analyze the data generated from the research study, and appropriately interpret the results and report the conclusions of the study. Credits: 3.00

Primary Area Electives (9 credits)

Thesis Research (12 credits)

EDPS 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required.

Credits: 1.00 to 18.00

Program Requirements - Non-thesis

Required Courses (16 credits)

Research Problems Course (3 credits)

EDPS 59000 - Individual Research Problems

Credit Hours: 1.00 to 6.00. Opportunities for students to study particular problems under the guidance of a member of the This plan of individualized instruction may be used in any field of education or vocational education. Does not include thesis work. Permission of instructor required.

Credits: 1.00 to 6.00

Primary Area Electives (9 credits)

Related Area Electives (6 credits)

Educational Studies: Gifted Education Concentration, MSED or MS

EDPS 53300 - Introduction To Educational Research I: Methodology

Credit Hours: 3.00. This course presents a sequence of journal articles and exercises that help introduce the foundational concepts of the course, including: research design, reliability and validity, various methodologies commonly used in educational research, and basic quantitative and qualitative data analyses. In addition, contrasting research conclusions are shown in the articles to help students learn why careful analysis of articles and their theoretical framing is critical to evaluating their conclusions.

Learning Outcomes: 1. Find research literature. 2. Read and critique educational research. 3. Deepen knowledge of at least one research area in education. 4. Design, conduct, analyze, and write a research project. Credits: 3.00

Core Courses (6 credits)

EDPS 50500 - Foundations Of Career Development And Assessment

Credit Hours: 3.00. Treats career development theories which emphasize aspects of the self in decision making, occupational classification systems, and educational and vocational information with applications to individual and group counseling.

Learning Outcomes: 1. Develop a comprehensive understanding of core and emerging theories and areas of research in career development. 2. Demonstrate the ability to conceptualize career counseling cases from various theoretical and multicultural perspectives. 3. Demonstrate the ability to integrate theory and research and utilize this information in such a way that it informs applications of career counseling and assessment. 4. Demonstrate understanding of the role cultural, individual difference (e.g., biological, personality), and developmental factors play in shaping career development processes. Credits: 3.00

EDPS 53000 - Cognition And Learning In Context

Credit Hours: 3.00. Theories of learning and development, research on instruction and learning, and principles of measurement applied to educational problems.

Learning Outcomes: 1. Understand the central components of Behaviorism, differentiate between classical and operant conditioning, and apply the theories to teaching and learning. 2. Understand the central tenets of constructivism, identify a range of constructivist theories or perspectives, and distinguish constructivism from behaviorism. 3. Understand the central components of theories of learning and development developed by Bandura, Piaget, and Vygotsky, and apply them to teaching and learning. 4. Understand the roles of memory, expertise, transfer, conceptual change, meta-cognition, and self-regulated learning for student learning, and their implications for teaching. 5. Identify the central characteristics of instructional scaffolding, and cooperative and collaborative learning, how they are associated with learning, and how they may be instantiated. 6. Understand central tenets of sociocultural (or sociohistorical) and situated theories of learning and development and apply them to teaching and learning. 7. Understand the central characteristics of inquiry (or project-based learning) and their affordances and limitations with respect to teaching and learning. 8. Understand how policies (educational and otherwise), political priorities, beliefs, and national and international factors affect affordances for teaching and learning. Credits: 3.00

EDPS 53100 - Introduction To Measurement And Instrument Design

Credit Hours: 3.00. An application-oriented introduction to constructing educational and psychological tests and surveys. Class sessions include guided practice with the process of instrument development, from trait and test task domain definition, item writing and revision, and item analysis, to score interpretation and validation.

Learning Outcomes: 1. Explain fundamental concepts and terminology in educational measurement. 2. Evaluate existing measurement instruments and score uses. 3. Contribute to development of instruments for measuring educational outcomes. 4. Interpret descriptive statistics for test and test item scores. Credits: 3.00

EDPS 53600 - Achievement Motivation And Performance

Credit Hours: 3.00. Study of current theory and research on the nature and development of achievement motivation. Motivation for intellectual and academic performance will be emphasized. Applications of theory in educational settings will be considered.

Credits: 3.00

Seminar Courses (4 credits)

EDPS 63100 - Applied Educational Research Design Seminar

Credit Hours: 1.00 to 3.00. This seminar seeks to promote professionalism, research and scholarly productivity and collegial support among graduate students in gifted, creative (GCT), and talented studies, associated graduate students, visiting scholars, and interested others. A secondary purpose involves assisting GCT students, COE students, and associates with successful study and career preparation by focusing on research, grants, thesis preparation, graduate writing, proposal development, professional development, and degree completion. Finally, seminar offers students the opportunity to discuss, learn and "mess" around with current issues in the field and of personal interest. Seminar creates time and incentive for students to become more productive with their scholarship efforts, and offers students credit for work completed and formal support for the professional development and scholarship processes. In this course students should expect to attend, contribute, and participate. A variety of formats will be used, including, but not limited to: discussion, simulations, group work, lecture, guest speakers, and peer feedback. Prerequisite: EDPS 63000 and one graduate course in Statistics.

Learning Outcomes: 1. Engage with IRB process. 2. Write for publication. 3. Critically review and revise writing. 4. Engage in research. 5. Develop a professional vita. 6. Write conference proposals. 7. Create professional presentations. 8. Review relevant literature. Credits: 1.00 to 3.00

EDPS 63200 - Seminar In Research Procedures In Education

Credit Hours: 1.00 to 3.00. Experimental, field study, scientific survey, and prediction study methods in education. Internal and external validity, identification and development of research problems, criteria development, common methodological errors, strategies of analysis, and sources of acceptable educational research literature will be reviewed. Critical analyses of the research methodology of educational research reports in the student's field. Prerequisite: EDPS 63000 or 53300 and course work in Statistics.

Learning Outcomes: 1. Develop specific advanced methodological skills and knowledge that are applicable to education research and practice. Credits: 1.00 to 3.00

EDPS 63300 - Seminar In Educational Psychology

Credit Hours: 1.00 to 3.00. Recent investigations and research in educational psychology. One topic is dealt with in each enrollment. The topics provide an in-depth study of those areas of psychological investigation in educational settings and problems. These areas include: (1) instructional technology and design; (2) individual differences and educational growth; (3) school learning: theory and research; (4) classroom behavior and social processes; (5) educational assessment; and (6) other relevant topics. Prerequisite: EDPS 53000 .

Credits: 1.00 to 3.00

Statistics Course (3 credits)

PSY 60000 - Statistical Inference

Credit Hours: 3.00. Emphasis is given to principles underlying both parametric and nonparametric inference.

Credits: 3.00

STAT 50100 - Experimental Statistics I

Credit Hours: 3.00. Concepts and methods of applied statistics. Exploratory analysis of data. Sample design and experimental design. Normal distributions. Sampling distributions. Confidence intervals and tests of hypotheses for one and two samples. Inference for contingency tables, regression and correlation, and one-way analysis of variance. Use of the SAS statistical software. Intended primarily for students who have not had calculus. Not open to students in mathematical sciences or engineering. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: College Algebra.

Learning Outcomes: 1. Produce and identify basic statistical analyses. 2. Discuss statistical terminology (speak statistics). 3. Use SAS to run basic statistical analyses and interpret corresponding SAS output. Credits: 3.00

Primary Area Courses (9 credits)

EDPS 54000 - Gifted, Creative And Talented Children

Credit Hours: 3.00. This course is an introduction to the intellectual, social, and emotional characteristics of gifted youth; philosophies of gifted education; and programmatic and classroom approaches for supporting gifted students generally and within different domains (e.g., intellectual, academic, creative, artistic, leadership).

Learning Outcomes: 1. Understand who gifted, creative, and talented children are and how their talent development needs can be met in the

school setting. 2. Recognize the diversity that exists within the gifted, creative, and talented population. 3. Understand the history, philosophical traditions, and paradigms of practice in gifted education. 4. Develop awareness of specific strategies for supporting gifted, creative, and talented students within the school context. 5. Develop awareness of key professional resources in the field of gifted education and talent development. 6. Develop a personal identity as a practitioner of gifted education. Credits: 3.00

EDPS 54200 - Curriculum And Program Development In Gifted Education

Credit Hours: 3.00. This course is an introduction to the curriculum development and program design for meeting the needs of gifted, creative, and talented students. Students will be exposed to established program and curriculum models, as well as the nuts and bolts of developing curricular plans, materials, and specialized programs that support the advanced learning needs of gifted students.

Learning Outcomes: 1. Students will think strategically about gifted program design, including such design components as mission statements, program goals, building a continuum of services, and designing student selection procedures. 2. Students will become familiar with major program and curriculum models in gifted education. 3. Students will practice designing and revising lessons to incorporate instructional strategies well suited for high-ability students. 4. Students will become critical evaluators of educational materials and practices to assess their suitability for use with high-ability students. Credits: 3.00

EDPS 54500 - Social And Affective Development Of Gifted Students

Credit Hours: 3.00. This course focuses on the social and emotional development of gifted and talented students. An overview of the characteristics and needs of gifted subpopulations, diversity issues, and family/parenting concerns along with an introduction to current educational approaches and counseling interventions are provided. The course is designed to complement EDPS 54000.

Learning Outcomes: 1. Analyze, synthesize, and evaluate current research literature on the social and affective development of gifted students. 2. Discuss characteristics and needs of subpopulations of gifted and talented learners and the implications for academic instruction and/or counseling interventions. 3. Increase knowledge of issues related to the social and affective development of gifted students through class discussion, interaction with gifted students, and completion of CORE assignments. Credits: 3.00

Related Area Electives (6 credits)

Thesis Research (6 credits)

Program Requirements - Non-Thesis

Required Courses (22 credits)

Research Problems Course (3 credits)

EDPS 59000 - Individual Research Problems

Credit Hours: 1.00 to 6.00. Opportunities for students to study particular problems under the guidance of a member of the This plan of individualized instruction may be used in any field of education or vocational education. Does not include thesis work. Permission of instructor required.

Credits: 1.00 to 6.00

Related Area Electives (6 credits)

Educational Studies: Higher Education Systems, Policy, and Leadership Concentration, MSED

About the Program

Program Requirements

Required Courses (xx credits)

Core Courses (xx credits)

EDPS 53300 - Introduction To Educational Research I: Methodology

Credit Hours: 3.00. This course presents a sequence of journal articles and exercises that help introduce the foundational concepts of the course, including: research design, reliability and validity, various methodologies commonly used in educational research, and basic quantitative and qualitative data analyses. In addition, contrasting research conclusions are shown in the articles to help students learn why careful analysis of articles and their theoretical framing is critical to evaluating their conclusions.

Learning Outcomes: 1. Find research literature. 2. Read and critique educational research. 3. Deepen knowledge of at least one research

area in education. 4. Design, conduct, analyze, and write a research project. Credits: 3.00

EDST 61300 - Clinic For Educational Leaders

Credit Hours: 1.00 to 6.00. (EDFA 61300) Clinic for educational leaders.

Credits: 1.00 to 6.00

EDST 69500 - Internship In Education

Credit Hours: 1.00 to 10.00. (EDFA 69500) Amount of credit to be determined by nature and extent of the assignment. A special course in selected areas of education, designed to provide practical field experience under professional supervision in selected situations related to the candidate's area of specialization.

Credits: 1.00 to 10.00

EDST 52000 - Educational Leadership, Governance, And Policy

Credit Hours: 3.00. The aim of this course is to explore and examine the complexities of contemporary PK-22 education leadership, administration, and governance. This course will cover the foundational administrative knowledge and skills necessary for transformational leadership at the modern primary, secondary, and post-secondary educational settings. The scope of this course seeks to cultivate an understanding of the functionality of educational systems as organizations within the context of a technologically, socially, and culturally changing world.

Learning Outcomes: 1. Analyze a variety of literature on PK-22 educational leadership, integrating relevant literature from the fields and disciplines of higher education, leadership, business, political science, and sociology. 2. Apply skillfully foundational PK-22 leadership knowledge and skills necessary for middle management and senior-level educational leadership in the context of a rapidly changing, culturally diversifying, technologically dynamic global education field. 3. Understand sustainable transformational education leadership by repeatedly engaging in activities and assignments that: Require a comprehensive analysis and understanding of how the following interface: institutional finance and budgeting, strategic planning and assessment, organizational structure and culture, existing and emerging education policy, and the current social and political climate; Require an understanding and analysis of the common day-to-day and long-term challenges that contemporary PK-22 education administrators face in strategic decision-making; Require an evaluation of structural and cultural practices and norms in PK-22 education administration for the sake of comparative analysis. Credits: 3.00

EDST 52100 - Foundations In PK-XXII Educational Systems

Credit Hours: 3.00. This survey course broadly explores the complex foundations of U.S. educational systems from pre-kindergarten (PK) through the doctoral level of education (PK-22). Through the lenses of culture, history, politics, and society, this course seeks to examine factors that impact the policies and practices of PK-22 educational systems. From theoretical knowledge to philosophical orientations, the course interrogates the ways schools transform society and ways society transforms schools. The course incorporates a variety of engaged learning activities including discussion prompts, reflective journaling of course readings, and literature review and research writing. As such, this course challenges students to: 1. Describe and analyze the cultural, historical, political, and social foundations of PK-22 education systems; 2. Examine the interrelationships of culture, politics, and social structures related to educational systems; 3. Analyze and evaluate current issues in PK-22 education systems; 4. Construct connections between and among course topics, specifically drawing from educational models and philosophies.

Learning Outcomes: 1. Describe and analyze the cultural, historical, political, and social foundations of PK-22 education systems. 2. Examine the interrelationships of culture, politics, and social structures related to educational systems. 3. Analyze and evaluate current issues in PK-22 education systems. 4. Construct connections between and among course topics, specifically drawing from educational models and philosophies. Credits: 3.00

EDST 52200 - Culture And Social Issues In PK-XXII Education

Credit Hours: 3.00. The aim of this course is to engage

students in the critical examination of cultural and social issues impacting PK-22 education at the local, state, and federal levels. This course will review the evolving functional role of PK-22 education in a diversifying global society. By way of critical intercultural and intracultural examination and reflection, this course seeks to cultivate a deeper understanding of the ways that education influences and is influenced by issues related to cultural and social change and conflict.

Learning Outcomes: 1. Analyze a variety of literature on cultural and social issues, integrating relevant literature from the fields and disciplines of education, anthropology, sociology, and political science. 2. Examine and evaluate the past and present activity /role of PK-22 entities during periods of social and cultural changes and conflict. 3. Reflect critically on intercultural and intracultural biases, perspectives, and positions, and the way that they might influence day-to-day interactions in educational environments. 4. Apply acquired knowledge and understanding of the corresponding relationship between culture/social issues and PK-22 education, to create comprehensive proposals and recommendations for PK-22 entities to engage with and address issues on diversity. Credits: 3.00

EDST 64000 - Higher Education Law

Credit Hours: 3.00. This course explores the legal framework within which institutions of higher education operate. Course materials, activities, and assignments will give students a deep understanding of how state and federal legislative bodies and courts operate. Students will read statutory materials and case law on legal issues related to higher education, including: free speech, religion, academic freedom, searches and seizures, due process rights, equal protection issues, individuals with disabilities, contracts and employment, torts and university liability. Permission of instructor required.

Learning Outcomes: 1. Think critically and reflectively. 2. Synthesize case law, and statutory and administrative law materials to create and share a robust understanding of how the varied sources of law inform all interactions at institutions of higher education. 3. Create new knowledge by synthesizing, applying, and communicating how the law can and should be applied in higher education institutions. 4. Learn and apply legal research skills that will empower them to contribute to legal scholarship. 5. Become more fluent in communicating complex legal concepts to stakeholders at different levels (students, peers, administrators, etc.). Credits: 3.00

EDST 64200 - Cultural Engagement In Higher Education Communities

Credit Hours: 3.00. The influence of culture is of particular import with issues facing the world today and Higher Education institutions (HEIs) are not immune to this reality. HEIs often serve as an institutional base for communities and have a vested interest in meaningful engagement with the communities that surround their campuses. This course is designed to enable learners to confidently communicate, build relationships, and work effectively in culturally diverse communities. Through exploration of a variety of intercultural theories, students will become aware of and be able to navigate the cultural influences in local, state, regional, national, and international higher education communities. As part of the course, students will engage in their communities through experiential, real-world, case study, and project management methods. Permission of instructor required.

Learning Outcomes: 1. Deepen their thinking and practice of community engagement and the positionality of the institution within its community. 2. Demonstrate that as a complex organization, Higher education functions as both a personal and a societal (public and private) benefit. 3. Demonstrate consistent critical attention and critical thinking to their own and others positionality including cultural identities, social and organizational power and privilege, and intercultural competence. 4. Formulate skills to better recognize, prevent, and resolve cross-cultural conflicts. 5. Construct effective cross-cultural relationships and work in an intercultural group setting. 6. Evaluate and summarize intercultural theories as applied to their individual/institutional contexts. 7. Describe a context for examining the organization of knowledge and institutions of higher education

in relation to community-based problem solving. 8. Examine complex social and organizational issues from different perspectives - specifically the ability to conduct research and analysis using a variety of community engagement and cultural frameworks. 9. Formulate and articulate rational arguments through discussions, peer review, and reflective and research writing. 10. Apply theory to practice in a final community engagement research project. Credits: 3.00

EDST 64300 - Higher Education Economics And Finance

Credit Hours: 3.00. This course provides students with an overview of financial issues related to higher education. Students will discuss and evaluate topics such as the public versus private financial benefits of higher education, the financial relationship between institutions of higher education and both state and federal governments, and issues related to labor economics. Permission of instructor required.

Learning Outcomes: 1. Think critically and reflectively. 2. Synthesize, create, and communicate knowledge. 3. Engage in professional development. 4. Participate actively in the profession. Credits: 3.00

Internship Course (xx credits)

EDST 69500 - Internship In Education

Credit Hours: 1.00 to 10.00. (EDFA 69500) Amount of credit to be determined by nature and extent of the assignment. A special course in selected areas of education, designed to provide practical field experience under professional supervision in selected situations related to the candidate's area of specialization.

Credits: 1.00 to 10.00

Apply acquired knowledge and understanding of the corresponding relationship between culture/social issues and PK-22 education, to create comprehensive proposals and recommendations for PK-22 entities to engage with and address issues on diversity. Credits: 3.00

EDST 64000 - Higher Education Law

Credit Hours: 3.00. This course explores the legal framework within which institutions of higher education operate. Course materials, activities, and assignments will give students a deep understanding of how state and federal legislative bodies and courts operate. Students will read statutory materials and case law on legal issues related to higher education, including: free speech, religion, academic freedom, searches and seizures, due process rights, equal protection issues, individuals with disabilities, contracts and employment, torts and university liability. Permission of instructor required.

Learning Outcomes: 1. Think critically and reflectively. 2. Synthesize case law, and statutory and administrative law materials to create and share a robust understanding of how the varied sources of law inform all interactions at institutions of higher education. 3. Create new knowledge by synthesizing, applying, and communicating how the law can and should be applied in higher education institutions. 4. Learn and apply legal research skills that will empower them to contribute to legal scholarship. 5. Become more fluent in communicating complex legal concepts to stakeholders at different levels (students, peers, administrators, etc.). Credits: 3.00

EDST 64200 - Cultural Engagement In Higher Education Communities

Credit Hours: 3.00. The influence of culture is of particular import with issues facing the world today and Higher Education institutions (HEIs) are not immune to this reality. HEIs often serve as an institutional base for communities and have a vested interest in meaningful engagement with the communities that surround their campuses. This course is designed to enable learners to confidently communicate, build relationships, and work effectively in culturally diverse communities. Through exploration of a variety of intercultural theories, students will become aware of and be able to navigate the cultural influences in local, state, regional, national, and international higher education communities. As part of the course, students will engage in their communities through experiential, real-world, case study, and project management methods. Permission of instructor required.

Learning Outcomes: 1. Deepen their thinking and practice of community engagement and the positionality of the institution within its community. 2. Demonstrate that as a complex organization, Higher education functions as both a personal and a societal (public and private) benefit. 3. Demonstrate consistent critical attention and critical thinking to their own and others positionality including cultural identities, social and organizational power and privilege, and intercultural competence. 4. Formulate skills to better recognize, prevent, and resolve cross-cultural conflicts. 5. Construct effective cross-cultural relationships and work in an intercultural group setting. 6. Evaluate and summarize intercultural theories as applied to their individual/institutional contexts. 7. Describe a context for examining the organization of knowledge and institutions of higher education in relation to community-based problem solving. 8. Examine complex social and organizational issues from different perspectives - specifically the ability to conduct research and analysis using a variety of community engagement and cultural frameworks. 9. Formulate and articulate rational arguments through discussions, peer review, and reflective and research writing. 10. Apply theory to practice in a final community engagement research project. Credits: 3.00

EDST 64300 - Higher Education Economics And Finance

Credit Hours: 3.00. This course provides students with an overview of financial issues related to higher education. Students will discuss and evaluate topics such as the public versus private financial benefits of higher education, the financial relationship between institutions of higher education and both state and federal governments, and issues related to labor economics. Permission of instructor required.

Learning Outcomes: 1. Think critically and reflectively. 2. Synthesize, create, and communicate knowledge. 3. Engage in professional development. 4. Participate actively in the profession. Credits: 3.00

Educational Studies: Special Education Concentration, MSED or MS

About the Program

Program Requirements

Required Courses (xx credits)

Core Courses (28 credits)

EDPS 51500 - Foundations Of Applied Behavioral Analysis In School Settings

Credit Hours: 3.00. Application of learning theory, measurement procedures, verification of functional relationships, and developing knowledge of current significant research in applied behavior analysis.

Learning Outcomes: 1. Introduced to specific methods and teaching strategies for working with children with emotional and behavioral disabilities. 2. Prepared to systematically monitor student performance. 3. Prepare teachers to devise and implement usable functional behavior analysis and behavior management plans for students with emotional and behavioral disabilities. Credits: 3.00

EDPS 53300 - Introduction To Educational Research I: Methodology

Credit Hours: 3.00. This course presents a sequence of journal articles and exercises that help introduce the foundational concepts of the course, including: research design, reliability and validity, various methodologies commonly used in educational research, and basic quantitative and qualitative data analyses. In addition, contrasting research conclusions are shown in the articles to help students learn why careful analysis of articles and their theoretical framing is critical to evaluating their conclusions.

Learning Outcomes: 1. Find research literature. 2. Read and critique educational research. 3. Deepen knowledge of at least one research area in education. 4. Design, conduct, analyze, and write a research project. Credits: 3.00

EDPS 56300 - Data-Based Decision Making For Learners With Exceptionalities

Credit Hours: 3.00. Advanced procedures for educational assessment of exceptional individuals: norm-referenced and curriculum-based measurement, error analyses, and observational ratings. Adaptations and selections of tests for sensory impairments, behavioral styles, different intelligence levels and ages.

Learning Outcomes: 1. Apply terminology, theory, and the implications of measurement theory to select, administer, and score and interpret formal, informal, and/or curriculum-based assessment results for key stakeholders to make data-based decisions. 2. Apply principles of UDL to make decisions regarding selecting, adapting, and modifying assessments to accommodate student(s) with exceptionalities, including students who are nonverbal or English Learners. 3. Apply knowledge of the referral and classification procedures and interpret, report, and communicate results to stakeholders via paper and/or digitally. 4. Evaluate eligibility (including students from culturally and/or linguistically diverse backgrounds and/or referred for interventions through the Response to Instruction (RtI) process), program (strategies for prioritizing areas of the general education curriculum and sequencing, implementing, and evaluating individualized learning objectives), and placement decisions (continuum of services: general education classroom, advantages and disadvantages of various placement options and programs) for students with exceptionalities. 5. Apply strategies for engaging in reflection and self-assessment activities to address one's own strengths and weaknesses, to become aware of one's own cultural biases and differences and dispositions toward students with intense exceptional needs and their families, to improve instruction, and to determine personal goals for professional

growth. Credits: 3.00

EDPS 56500 - Math Curricula For Learners With Exceptionalities

Credit Hours: 3.00. This course will explore research-supported general and specialized math curricula to prepare candidates to design and/or adapt math lessons and instructional materials to meet the math needs of students with exceptionalities.

Learning Outcomes: 1. Apply principles of UDL when selecting, adapting, and modifying math assessments to accommodate student(s) with exceptionalities, including students who are nonverbal, have intense intervention needs, or are English Learners. 2. Evaluate research-supported math instructional strategies and materials appropriate to the strength, needs, and characteristics of students with exceptionalities. 3. Apply strategies to work effectively with general education teachers and support staff to provide services that incorporate differentiated instruction, transition assessments, and assistive technology that facilitate students' math learning and the students' learning environment. 4. Create math lesson plans, based on national, state and/or local math curricula standards, and the scope of sequence of grade-level/chronologically-aged appropriate general education math curriculum that incorporate UDL, research-supported math instructional strategies and materials, and provide meaning-filled math learning opportunities that facilitate student's ability to make connections (e.g., learning mathematics in the context of cooking and art). 5. Create math lesson plans that incorporate UDL and apply research-supported strategies to provide specially designed mathematics instruction, including strategies for problems and meaning-filled math learning opportunities that facilitate students' ability to make connections (e.g., learning mathematics in the context of cooking and art). 6. Evaluate math instruction, monitor progress, and make instructional changes to support students' math learning. Credits: 3.00

EDPS 56800 - Social, Legal, And Ethical Issues Across The Lifespan

Credit Hours: 3.00. Survey of difference and similarities of children with exceptionality, including their nature and characteristics related to their developmental and educational needs. Analysis and practical application of social, legal, and ethical issues in the field of special education.

Learning Outcomes: 1. Explain the historical perspectives and foundations of general and special education policy, current issues, and research (REPA 1.1, 1.2; CEC Int. 1.1; CEC Adv. 3.3, 4.2, 6.1). 2. Apply ethical guidelines, state and federal laws and policies, and utilize the rights, roles, and responsibilities of stakeholders and organizations concerning the education of students with exceptionalities (REPA 1.3, 1.4, 1.5; CEC Int. 1.1, 2.2; CEC Adv 3.3, 4.2, 5.1, 6.1, 6.2, 6.3). 3. Evaluate the influence of cultural, linguistic, and socioeconomic factors on the disproportionate identification of individuals from diverse groups. (REPA 2.8.; CEC Int. 1.2, 2.2; CEC Adv. 2.3, 3.2, 4.2, 5.2). 4. Examine the roles and responsibilities of team members (RtI, multidisciplinary, Case Conference Committee (CCC), families, student) to facilitate in developing, implementing, monitoring, and amending individualized programs for students with exceptionalities (IEPs, transition plans, health-care plans, and behavioral and academic intervention plans) setting goals, and monitoring progress toward goal each grading period. (REPA 4.3, 4.4, 4.5; CEC Int. 2.1, 2.2, 2.3, 7.1; CEC Adv. 4.2, 5.3). 5. Evaluate eligibility (including students from culturally and/or linguistically diverse backgrounds and/or referred for interventions through the Response to Instruction (RtI) process), program (strategies for prioritizing areas of the general education curriculum and sequencing, implementing, and evaluating individualized learning objectives),

and placement decisions (continuum of services: general education classroom, advantages and disadvantages of various placement options and programs) for students with mild and/or intense exceptional needs. (REPA 4.1, 4.2, 4.7; CEC Int. 1.1, 1.2, 2.1, 2.3, 3.1, 3.2; CEC Adv 4.2, 5.1, 5.2). 6. Engage in professional development activities and professional organizations relevant to teaching students with exceptional needs, and knowledge of professional resources, organizations, and publications for enhancing one's professional skills and for engaging in lifelong professional development (REPA 10.4/10.5; CEC Int 1.2; CEC Adv. 5.4, 5.5, 6.4, 6.5). 7. Apply strategies for engaging in reflection and self-assessment activities to address one's own strengths and weaknesses, to become aware of one's own cultural biases and differences and dispositions toward students with intense exceptional needs and their families, to improve instruction, and to determine personal goals for professional growth (REPA 10.6/10.7; CEC Int 2.2, 2.3, 4.2, 5.1; CEC Adv. 6.3, 7.1). Credits: 3.00

EDPS 57701 - Development Of Learners With Mild Intervention Needs

Credit Hours: 3.00. This course will explore the 4 areas of child development and the milestones associated with Cognitive, Social/Emotional, Language and Communication, and Movement and Physical development. This foundation in typical development will allow candidates to better understand atypical development in relation to characteristics and etiologies of mild disabilities. Candidates will investigate the multiple impacts systems have on individuals with mild disabilities and their families.

Learning Outcomes: 1. Describe typical and atypical human development, characteristics and etiologies in order to address the educational needs of individuals with mild disabilities. 2. Apply knowledge of the effects of medical conditions, physical and health needs, and common medications (e.g., stimulant, antidepressant, antiepileptic) on students with mild exceptional needs. 3. Analyze the impact of disability on the multiple aspects (education, career, vocation, social relationships, recreation, and adult life) of the life of an individual with mile intervention needs, including the knowledge of the family's role in supporting learning development. 4. Explain the influence of cultural, linguistic, and socioeconomic factors on the disproportionate identification of individuals with mild intervention needs from diverse groups. 5. Apply strategies for engaging in reflection and self-assessment activities to address one's own strengths and weaknesses, to become aware of one's own cultural biases and differences and dispositions toward students with mild exceptional needs and their families to improve instruction, and to determine personal goals for professional growth. Credits: 3.00

EDPS 59000 - Individual Research Problems

Credit Hours: 1.00 to 6.00. Opportunities for students to study particular problems under the guidance of a member of the This plan of individualized instruction may be used in any field of education or vocational education. Does not include thesis work. Permission of instructor required.

Credits: 1.00 to 6.00

EDPS 52400 - Effective Instruction For Students With Significant Reading Difficulties

Credit Hours: 3.00. This course will explore significant reading difficulties, such as dyslexia, and essential components of effective reading instruction. This course will investigate scientifically-based reading research (SBRR), evidence-based and developmentally appropriate reading instruction and interventions to support students with exceptionalities.

Learning Outcomes: 1. Identify the foundations of language acquisition and literacy development, including cognitive, linguistic, cultural, social, and motivational factors that affect language acquisition and literacy development; and major components of reading development, including phonemic awareness,

phonics, fluency, vocabulary, and text comprehension. 2. Explore the history, origins, and underlying causes of significant reading difficulties, including dyslexia. 3. Synthesize principles of scientifically based reading research (SBRR) and evidence-based reading instruction and intervention, such as applying data-based decision making, setting individual student learning goals, and using instruction grounded in SBRR. 4. Explain key concepts of phonemic awareness: the critical role of phonemic awareness in learning to read an alphabetic language; the distinction between phonological awareness (i.e., the awareness that oral language is composed of smaller units, such as spoken words and syllables) and phonemic awareness (i.e., a specific type of phonological awareness involving the ability to distinguish the separate phonemes in spoken words); and knowledge of the continuum of phonological- and phonemic-awareness skills development. 5. Summarize key concepts of phonics in developing accurate decoding and automaticity in word recognition; the importance of sequencing phonics instruction according to the increasing complexity of linguistic units; the reciprocity between decoding and encoding; and the continuum of phonics skills. 6. Create SBRR-based, evidence-based, and developmentally appropriate assessment, instruction, intervention, or extension lesson plan, and ongoing progress monitoring in phonemic awareness, phonics, fluency, vocabulary and academic language, comprehension and analysis of informational, persuasive, and literary texts, including response to literature. Credits: 3.00

EDPS 52700 - Literacy Curricula For Learners With Exceptionalities

Credit Hours: 3.00. This course will explore research-supported general and specialized literacy curricula to prepare candidates to design and/or adapt instructional lessons and materials to meet the needs of students with exceptionalities.

Learning Outcomes: 1. Apply principles of UDL when selecting, adapting, and modifying assessments to accommodate student(s) with exceptionalities, including students who are nonverbal or English Learners. 2. Evaluate research-supported instructional strategies and materials appropriate to the strengths, needs, and characteristics of students with exceptionalities within the areas of literacy development, reading fluency, concepts of vocabulary and academic language, and comprehension and analysis of informational, persuasive, and literary text. 3. Apply strategies to work effectively with general education teachers and support staff to provide services that incorporate differentiated instruction, transition assessments, and assistive technology that facilitate student learning and the students' learning environment. 4. Create lesson plans, based on national, state, and/or local curricula standards and the scope and sequence of grade-level/chronologically-aged appropriate general education content-area curriculum that incorporate UDL, research-supported instructional strategies and materials, and provide meaning-filled learning opportunities. 5. Design lesson plans that incorporate UDL and apply research-supported strategies to provide specially designed reading and writing instruction, including strategies for providing explicit and systematic instruction and strategies for using technology to support various aspects of the reading and writing process and include instructional and assistive strategies to teach students to monitor errors in reading comprehension and writing. 6. Evaluate instruction, monitor progress, and make instructional changes to support student learning. Credits: 3.00

EDPS 55800 - Transition Education And Services

Credit Hours: 3.00. This course will explore a variety of resources, strategies, and techniques for promoting successful life transitions for students with mild and intense intervention needs before and throughout the school years and into postsecondary and adult settings.

Learning Outcomes: 1. Apply ethical guidelines, state and federal transition laws and policies (REPA 9.6, 9.7; CEC Int 1.1, 2.3: CEC Adv 2.2, 2.3, 3.3, 4.1, 5.1, 5.2, 6.1) 2. Evaluate state, school, and private resources (e.g. Individual Family Service Plans, Medicaid Waivers, Vocational Rehabilitation, Special Needs Trusts, Issues of Guardianship, Bureau of Developmental Disability Services) that promote successful life transitions (REPA 9.6, 9.7; CEC Int 2.1, 2.2, 2.3, 3.2, 5.2, 5.3, 5.6, 6.1, 6.2; CEC Adv 2.3, 3.2, 3.3, 3.4, 4.2, 5.1, 5.2). 3. Examine the rights, roles, and responsibilities of stakeholders and organizational resources concerning the transition process of students with exceptionalities (REPA 1.3, 1.4, 1.5, 9.6, 9.7; CEC Int. 1.1, 2.2, 2.3; CEC Adv 2.2, 2.3, 3.3, 4.2, 5.1, 6.1, 6.2, 6.3). 4. Create a transition-related lesson/activity to support positive, life-long transition outcomes (REPA 3.9, 9.2, 9.4, 9.5; CEC Int 2.1, 2.2, 2.3, 3.2, 5.2, 5.3, 5.6, 6.1, 6.2; CEC Adv 2.3, 3.2, 3.3, 3.4, 4.2, 5.1, 5.2). 5. Apply strategies to collaborate effectively with general education teachers, support staff, families and community/organizational resources to identify services that incorporate differentiated instruction, transition assessments, and assistive technology that facilitate student learning and promote positive transition outcomes. (REPA 4.6, 4.8, 9.3, 9.4, 9.5; CEC Int 1.1, 1.2, 2.3, 3.2, 4.2, 4.3, 5.2, 7.1, 7.2, 7.3; CEC Adv 1.1, 2.3, 3.2, 3.3, 4.2, 5.1, 5.2, 5.3, 6.2, 6.3, 7.1, 7.2, 7.3). 6. Apply strategies to support students with exceptionalities to develop and strengthen self-determination skills (REPA 7.8; CEC Int 1.1, 1.2, 2.1, 2.2, 2.3, 3.2, 5.2, 5.6, 6.1, 6.2; CEC Adv 1.1, 2.3, 3.2, 3.3, 3.4, 4.2, 5.1, 5.2, 6.2, 6.3). Credits: 3.00

Concentrations

Electrical and Computer Engineering, MSECE

About the Program

Program Requirements - Thesis

Required Courses (9 credits)

Core Courses (6 credits)

ECE 55900 - MOS VLSI Design

Credit Hours: 3.00. An introduction to most aspects of large-scale MOS integrated circuit design including: device fabrication and modeling; inverter characteristics; designing CMOS combinational and sequential circuits; designing arithmetic building blocks and memory structures; interconnect and timing issues; testing and verification; and system design considerations. Term projects involve the complete design of a functional logic block or system using CAD tools.

Credits: 3.00

ECE 60000 - Random Variables And Signals

Credit Hours: 3.00. Engineering applications of probability theory. Problems on events, independence, random variables, distribution and density functions, expectations, and characteristic functions. Dependence, correlation, and regression; multivariate Gaussian distribution. Stochastic processes, stationarity, ergodicity, correlation functions, spectral densities, random inputs to linear systems; Gaussian processes. Prerequisite: Master's student standing or higher.

Learning Outcomes: 1. Problems on events, independence, random variables, distribution and density functions, expectations, and characteristic functions. 2. Dependence,

correlation, and regression; multi-variate Gaussian distribution. 3. Stochastic processes, stationarity, ergodicity, correlation functions, spectral densities, random inputs to linear systems; Gaussian processes. Credits: 3.00

ECE 60200 - Lumped System Theory

Credit Hours: 3.00. An investigation of the basic theory and techniques of modern system theory, emphasizing linear state model formulations of continuous and discrete time systems in the time domain and frequency domain. Coverage includes notions of linearity, time invariance, discrete and continuous time state models, canonical forms, associated transfer functions and impulse response models, the state transition matrix, the Jordan form, controllability, observability, and stability. Prerequisite: Master's student standing or higher and concurrent prerequisite: MA 51100.

Credits: 3.00

ECE 60400 - Electromagnetic Field Theory

Credit Hours: 3.00. Review of general concepts (Maxwell's equations, materials interaction, boundary conditions, energy flow); statics (Laplace's equation, Poisson's equation); distributed parameter systems (classification of solutions, transmission lines, and wave-guides); radiation and antennas (arrays, reciprocity, Huygen's principle); a selected special topic (e.g., magnetostatics, waves in anisotropic media and optical fibers). Offered in alternate years. Prerequisite: Master's student standing or higher.

Credits: 3.00

ECE 60600 - Solid State Devices

Credit Hours: 3.00. A relatively-broad, moderate-depth coverage of semiconductor devices and related topics. The first portion of the course presents and examines semiconductor fundamentals required in the operational analysis of solid state devices. A detailed examination of the PN junction diode and PN junction devices follows. The final portion of the course treats heterojunction surface devices including the Schottky diode, the MOS capacitor and the MOSFET. Offered in alternate years. Prerequisite: Master's student standing or higher.

Credits: 3.00

ECE 60800 - Computational Models And Methods

Credit Hours: 3.00. Computation models and techniques for the analysis of algorithm complexity. The design and complexity analysis of recursive and nonrecursive algorithms for searching, sorting, set operations, graph algorithms, matrix multiplication, polynomial evaluation and FFT calculations. NP-complete problems. Prerequisite: Master's student standing or higher.

Learning Outcomes: 1. Learn computation models and techniques for the analysis of algorithm complexity. 2. Learn the design and complexity analysis of recursive and non-recursive algorithms for searching, sorting, set operations, graph algorithms, matrix multiplication, polynomial evaluation and FFT calculations. 3. Learn the NP-complete problems. Credits: 3.00

ECE 61000 - Energy Conversion

Credit Hours: 3.00. Basic principles of static and electromechanical energy conversion. Control of static power converters. Reference frame theory applied to the analysis of rotating devices. Analysis and dynamic characteristics of induction and synchronous machines. State variable analysis of electromechanical devices and converter supplied electromechanical drive systems. Prerequisite: Master's student standing or higher.

Credits: 3.00

Math Course (3 credits)

Seminar Course (0 credits)

ECE 69400 - Electrical And Computer Engineering Seminar

Credit Hours: 0.00. Seminar presentations by representatives from industry, members of the faculty of the School of Electrical and Computer Engineering, and other staff and faculty of Purdue University. The presentations introduce the student to a wide variety of current topics relevant to the technical and career aspects of electrical and computer engineering. Technical topics span the entire spectrum of electrical and computer engineering. Career topics include the importance of interpersonal communications, opportunities beyond graduate school, interviewing techniques, and descriptions of non-typical jobs. Required of electrical and computer engineering graduate students at Purdue during one of their first two semesters in residence.

Credits: 0.00

Electives (9-15 credits)

Thesis Research (6-12 credits)

ECE 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required.

Credits: 1.00 to 18.00

Program Requirements - Non-thesis Innovation Track

Required Courses (9-10 credits)

Core Course (3 credits)

ECE 55900 - MOS VLSI Design

Credit Hours: 3.00. An introduction to most aspects of large-scale MOS integrated circuit design including: device fabrication and modeling; inverter characteristics; designing CMOS combinational and sequential circuits; designing arithmetic building blocks and memory structures; interconnect and timing issues; testing and verification; and system design considerations. Term projects involve the complete design of a functional logic block or system using CAD tools.

Credits: 3.00

ECE 60000 - Random Variables And Signals

Credit Hours: 3.00. Engineering applications of probability theory. Problems on events, independence, random variables, distribution and density functions, expectations, and characteristic functions. Dependence, correlation, and regression; multivariate Gaussian distribution. Stochastic processes, stationarity, ergodicity, correlation functions, spectral densities, random inputs to linear systems; Gaussian processes. Prerequisite: Master's student standing or higher.

Learning Outcomes: 1. Problems on events, independence, random variables, distribution and density functions, expectations, and characteristic functions. 2. Dependence, correlation, and regression; multi-variate Gaussian distribution. 3. Stochastic processes, stationarity, ergodicity, correlation functions, spectral densities, random inputs to linear systems; Gaussian processes. Credits: 3.00

Credit Hours: 3.00. Computation models and techniques for the analysis of algorithm complexity. The design and complexity analysis of recursive and nonrecursive algorithms for searching, sorting, set operations, graph algorithms, matrix multiplication, polynomial evaluation and FFT calculations. NP-complete problems. Prerequisite: Master's student standing or higher.

Learning Outcomes: 1. Learn computation models and techniques for the analysis of algorithm complexity. 2. Learn the design and complexity analysis of recursive and non-recursive algorithms for searching, sorting, set operations, graph algorithms, matrix

multiplication, polynomial evaluation and FFT calculations. 3. Learn the NP-complete problems. Credits: 3.00

ECE 61000 - Energy Conversion

Credit Hours: 3.00. Basic principles of static and electromechanical energy conversion. Control of static power converters. Reference frame theory applied to the analysis of rotating devices. Analysis and dynamic characteristics of induction and synchronous machines. State variable analysis of electromechanical devices and converter supplied electromechanical drive systems. Prerequisite: Master's student standing or higher.

Credits: 3.00

Project Track Courses (3-4 credits)

STAT 51400 - Design Of Experiments

Credit Hours: 3.00. Fundamentals, completely randomized design; randomized complete blocks; latin square; multi-classification; factorial; nested factorial; incomplete block and fractional replications for 2n, 3n, 2m x 3n; confounding; lattice designs; general mixed factorials; split plot; analysis of variance in regression models; optimum design. Use of existing statistical programs.

Learning Outcomes: 1. Understand design principles and use these principles to plan and implement an experiment in such a way that a statistical analysis results in valid and objective conclusions. 2. Know how to choose an appropriate design given the available resources, factors of interest, and information on nuisance factors. 3. Perform the proper statistical analysis and draw valid conclusions from any designed experiment. Credits: 3.00

ECE 69500 - Advanced Topics In Electrical And Computer Engineering

Credit Hours: 1.00 to 3.00. Formal classroom or individualized instruction on advanced topics of current interest. Permission of instructor required.

Credits: 1.00 to 3.00

IE 54500 - Engineering Economic Analysis

Credit Hours: 3.00. Analysis of engineering costs and capital investments. Applications of classical optimization, mathematical programming, and the theory of production to the analysis of investment proposals. Evaluation and selection of individual projects and formulation of capital investment programs.

Credits: 3.00

IE 54600 - Economic Decisions In Engineering

Credit Hours: 3.00. Topics in decision-making and rationality including decision analysis, decision-making under uncertainty, and various descriptive and prescriptive models from operations research, economics, psychology, and business. Applications are drawn from engineering decision-making, public policy, and personal decision-making. Attention also is paid to designing aids to improve decision-making.

Credits: 3.00

IE 59000 - Topics In Industrial Engineering

Credit Hours: 1.00 to 6.00. Selected topics in industrial engineering for seniors and graduate students. Permission of instructor required.

Credits: 1.00 to 6.00

SYS 50000 - Perspectives On Systems

Credit Hours: 3.00. This course provides an introduction to, and references for, each of four distinct approaches to SE concepts and tools. Individual assignments and team projects will be based on readings from these multiple approaches and selected case studies. Participants will be encouraged to bring their own prior expertise and examples to the discussions and projects. While the course will discuss quantitative topics (including cybernetics, feedback control systems, and statistical process control), the course itself will emphasize a more interdisciplinary conceptual integration rather than stand-alone analysis of these topics.

Learning Outcomes: 1. Design a system, component, or process to meet desired needs within realistic constraints such as economic, environmental, social, political, ethical, health and safety, manufacturability, and sustainability. 2. Function on multidisciplinary teams. 3. Identify, formulate, and solve engineering problems. 4. Understand professional and ethical responsibility. 5. Communicate effectively. 6. Acquire the broad education necessary to understand the impact of engineering solutions in a global, economic, environmental, and societal context. 7.

Recognize the need for, and an ability to engage in life-long learning. 8. Acquire knowledge of contemporary issues. 9. Prepare graduates to design, develop, implement, and improve integrated systems that include people, materials, information, equipment and energy. Credits: 3.00

ENGR 50200 - Engineering Leadership

Credit Hours: 3.00. Engineering leadership is the ability to inspire and guide engineering and technology-focused teams and organizations to achieve strategic outcomes. The successful engineering leader creates value at the intersection of technical systems and human systems. This course introduces students to evidence-based, practice-proven frameworks and tools related to (1) leadership presence, (2) cognitive diversity and psychological safety in teams, and (3) designing and transforming organizations and ecosystems.

Learning Outcomes: 1. Describe characteristics of effective leaders in engineering and technology-focused teams and organizations. 2. Apply tools and frameworks for effective leadership of engineering and technology-focused teams and organizations. 3. Analyze the potential strengths and potential of various leadership approaches and behaviors in engineering and technologically focused teams and organizations. Credits: 3.00

Math Course (3 credits)

Electives (14-15 credits)

Innovation Project Courses (6 credits)

ECE 69500 - Advanced Topics In Electrical And Computer Engineering

Credit Hours: 1.00 to 3.00. Formal classroom or individualized instruction on advanced topics of current interest. Permission of instructor required.

Credits: 1.00 to 3.00

Program Requirements - Non-thesis Implementation Track

Required Courses (16 credits)

Core Courses (7 credits)

ECE 55900 - MOS VLSI Design

Credit Hours: 3.00. An introduction to most aspects of large-scale MOS integrated circuit design including: device fabrication and modeling; inverter characteristics; designing CMOS combinational and sequential circuits; designing arithmetic building blocks and memory structures; interconnect and timing issues; testing and verification; and system design considerations. Term projects involve the complete design of a functional logic block or system using CAD tools.

Credits: 3.00

ECE 60000 - Random Variables And Signals

Credit Hours: 3.00. Engineering applications of probability theory. Problems on events, independence, random variables, distribution and density functions, expectations, and characteristic functions. Dependence, correlation, and regression; multivariate Gaussian distribution. Stochastic processes, stationarity, ergodicity, correlation functions, spectral densities, random inputs to linear systems; Gaussian processes. Prerequisite: Master's student standing or higher.

Learning Outcomes: 1. Problems on events, independence, random variables, distribution and density functions, expectations, and characteristic functions. 2. Dependence, correlation, and regression; multi-variate Gaussian distribution. 3. Stochastic processes, stationarity, ergodicity, correlation functions, spectral densities, random inputs to linear systems; Gaussian processes. Credits: 3.00

ECE 60200 - Lumped System Theory

Credit Hours: 3.00. An investigation of the basic theory and techniques of modern system theory, emphasizing linear state model formulations of continuous and discrete time systems in the time domain and frequency domain. Coverage includes notions of linearity, time invariance, discrete and continuous time state models, canonical forms, associated transfer

functions and impulse response models, the state transition matrix, the Jordan form, controllability, observability, and stability. Prerequisite: Master's student standing or higher and concurrent prerequisite: MA 51100.

Credits: 3.00

ECE 60400 - Electromagnetic Field Theory

Credit Hours: 3.00. Review of general concepts (Maxwell's equations, materials interaction, boundary conditions, energy flow); statics (Laplace's equation, Poisson's equation); distributed parameter systems (classification of solutions, transmission lines, and wave-guides); radiation and antennas (arrays, reciprocity, Huygen's principle); a selected special topic (e.g., magnetostatics, waves in anisotropic media and optical fibers). Offered in alternate years. Prerequisite: Master's student standing or higher.

Credits: 3.00

ECE 60600 - Solid State Devices

Credit Hours: 3.00. A relatively-broad, moderate-depth coverage of semiconductor devices and related topics. The first portion of the course presents and examines semiconductor fundamentals required in the operational analysis of solid state devices. A detailed examination of the PN junction diode and PN junction devices follows. The final portion of the course treats heterojunction surface devices including the Schottky diode, the MOS capacitor and the MOSFET. Offered in alternate years. Prerequisite: Master's student standing or higher.

Credits: 3.00

ECE 60800 - Computational Models And Methods

Credit Hours: 3.00. Computation models and techniques for the analysis of algorithm complexity. The design and complexity analysis of recursive and nonrecursive algorithms for searching, sorting, set operations, graph algorithms, matrix multiplication, polynomial evaluation and FFT calculations. NP-complete problems. Prerequisite: Master's student standing or higher.

Learning Outcomes: 1. Learn computation models and techniques for the analysis of algorithm complexity. 2. Learn the design and complexity analysis of recursive and non-recursive algorithms for searching, sorting, set operations, graph algorithms, matrix multiplication, polynomial evaluation and FFT calculations. 3. Learn the NP-complete problems. Credits: 3.00

ECE 61000 - Energy Conversion

Credit Hours: 3.00. Basic principles of static and electromechanical energy conversion. Control of static power converters. Reference frame theory applied to the analysis of rotating devices. Analysis and dynamic characteristics of induction and synchronous machines. State variable analysis of electromechanical devices and converter supplied electromechanical drive systems. Prerequisite: Master's student standing or higher.

Credits: 3.00

ECE 69500 - Advanced Topics In Electrical And Computer Engineering

Credit Hours: 1.00 to 3.00. Formal classroom or individualized instruction on advanced topics of current interest. Permission of instructor required.

Credits: 1.00 to 3.00

Professional Development & Implementation Courses (9 credits)

STAT 51400 - Design Of Experiments

Credit Hours: 3.00. Fundamentals, completely randomized design; randomized complete blocks; latin square; multi-classification; factorial; nested factorial; incomplete block and fractional replications for 2n, 3n, 2m x 3n; confounding; lattice designs; general mixed factorials; split plot; analysis of variance in regression models; optimum design. Use of existing statistical programs.

Learning Outcomes: 1. Understand design principles and use these principles to plan and implement an experiment in such a way that a statistical analysis results in valid and objective conclusions. 2. Know how to choose an appropriate design given the available resources, factors of interest, and information on nuisance factors. 3. Perform the proper statistical analysis and draw valid conclusions from any designed experiment. Credits: 3.00

ECE 52600 - Fundamentals Of MEMS And Micro-Integrated Systems

Credit Hours: 3.00. (BME 58100) Key topics in micro-electro-mechanical systems (MEMS) and biological micro-integrated systems; properties of materials for MEMS; microelectronic process modules for design and fabrication. Students will prepare a project report on the design of a biomedical MEMS-based micro-integrated system. Offered in alternate years. Permission of department required.

Credits: 3.00

ECE 53800 - Digital Signal Processing I

Credit Hours: 3.00. Theory and algorithms for processing of deterministic and stochastic signals. Topics include discrete signals, systems, and transforms, linear filtering, fast Fourier transform, nonlinear filtering, spectrum estimation, linear prediction, adaptive filtering, and array signal processing.

Learning Outcomes: 1. Understand the autocorrelation and covariance methods of estimating the correlation matrix. 2. Know the Discrete Time Fourier Transform (DTFT) and its relationship to the Discrete Fourier Transform (DFT). 3. Comprehend of parametric methods of spectrum estimation, including autoregressive modeling, minimum variance, linear prediction, and eigendecomposition-based methods. 4. Understand nonparametric methods of spectrum estimation, including the periodogram and the correlogram. 5. Understand of linear filters, including the Wiener filter, as applied stochastic to signals. 6. Introduce to adaptive filters, including the method of steepest descent and the least-mean-square (LMS) algorithms. Credits: 3.00

ECE 54400 - Digital Communications

Credit Hours: 3.00. Introduction to digital communication systems and spread spectrum communications. Topics include analog message digitization, signal space representation of digital signals, binary and M-ary signaling methods, detection of binary and M-ary signals, comparison of digital communication systems in terms of signal energy and signal bandwidth requirements. The principal types of spread spectrum systems are analyzed and compared. Application of spread spectrum to multiple access systems and to secure communication systems is discussed.

Credits: 3.00

ECE 54700 - Introduction To Computer Communication Networks

Credit Hours: 3.00. A qualitative and quantitative study of the issues in design, analysis, and operation of computer communication and telecommunication networks as they evolve toward the integrated networks of the future, employing both packet and circuit switching technology. The course covers packet and circuit switching, the OSI standards architecture and protocols, elementary queuing theory for performance evaluation, random access techniques, local area networks, reliability and error recovery, and integrated networks.

Learning Outcomes: 1. Demonstrate an understanding of the fundamental principles underlying computer communication networks. [1,3,4;a,e] 2. Demonstrate an ability to obtain mathematical models of networking systems. [1,2,4;a,e] 3. Demonstrate an ability to perform queueing analysis of simpler queueing networks, convergence analysis of routing protocols, and stability analysis of random access mechanisms. [1,2,4;a,e,k] 4. Demonstrate an ability to solve simple network design and optimization problems to meet specifications in though put and delay. [1,4;a,c,e,k] 5. Demonstrate an ability to use simulation tools for network analysis and design. [1,3,4;a,c,e,k] Credits: 3.00

ECE 55900 - MOS VLSI Design

Credit Hours: 3.00. An introduction to most aspects of large-scale MOS integrated circuit design including: device fabrication and modeling; inverter characteristics; designing CMOS combinational and sequential circuits; designing arithmetic building blocks and memory structures; interconnect and timing issues; testing and verification; and system design considerations. Term projects involve the complete design of a functional logic block or system using CAD tools.

Credits: 3.00

ECE 56500 - Computer Architecture

Credit Hours: 3.00. An introduction to the problems involved in designing and analyzing current machine architectures. Major topics include performance and cost analysis, pipeline processing, vector machines and numerical applications, hierarchical memory design, and multiprocessor architectures. A quantitative approach allowing a computer system designer to determine the extent to which a design meets design goals is emphasized.

Credits: 3.00

ECE 56800 - Embedded Systems

Credit Hours: 3.00. This course provides an introduction to the design of embedded and ubiquitous computing systems including their hardware and software architectures, design methodologies and tools, and communication protocols. The

lectures are organized into three parts namely, (a) basic design principles including specification and modeling, hardware components and platforms, software organization, embedded and real-time operating systems, interfacing with external environments using sensors and actuators, and communication in distributed embedded systems, (b) advanced topics such as energy management, safety and reliability, and security, and (c) case-studies of real-world systems from a variety of embedded application domains such as biomedical devices, smart cards and RFID, networked sensors, personal computing devices, home appliances and electronics, mobile robotics, etc. In addition to hands-on programming assignments using off-the-shelf embedded system development kits, the course will feature a comprehensive project where students will design, implement, and evaluate a prototype embedded system.

Credits: 3.00

ECE 56900 - Introduction To Robotic Systems

Credit Hours: 3.00. The topics to be covered include: basic components of robotic systems; selection of coordinate frames; homogeneous transformations; solutions to kinematic equations; velocity and force/torque relations; manipulator dynamics in Lagrange's formulation; digital simulation of manipulator motion; motion planning; obstacle avoidance; controller design using the computed torque method; and classical controllers for manipulators. Basic knowledge of vector-matrix manipulations required.

Credits: 3.00

ECE 57000 - Artificial Intelligence

Credit Hours: 3.00. Introduction to the basic concepts and various approaches of artificial intelligence. The first part of the course deals with heuristic search and shows how problems involving search can be solved more efficiently by the use of heuristics and how, in some cases, it is possible to discover heuristics automatically. The next part of the course presents ways to represent knowledge about the world and how to reason logically with that knowledge. The third part of the course introduces the student to advanced topics of AI drawn from machine learning, natural language understanding, computer vision, and reasoning under uncertainty. The emphasis of this part is to illustrate that representation and search are fundamental issues in all aspects of artificial intelligence.

Credits: 3.00

ECE 57300 - Compilers And Translator Writing Systems

Credit Hours: 3.00. This course presents the concepts needed to efficiently design and implement translators. Basic compiler/translation theory and technology are briefly reviewed, after which the course focuses on software tools for the automatic construction of translators, as well as more complex concepts involving the construction of compiler symbol tables, etc. Using C on ECN UNIX, each student will construct a simple lexical-recognizer generator, parser generator, and code-generator generator. Basic understanding of compilers and proficiency in C language required.

Credits: 3.00

ECE 59500 - Selected Topics In Electrical Engineering

Credit Hours: 1.00 to 3.00. Formal classroom or individualized instruction on topics of current interest. Permission of instructor required.

Credits: 1.00 to 3.00

ECE 60400 - Electromagnetic Field Theory

Credit Hours: 3.00. Review of general concepts (Maxwell's equations, materials interaction, boundary conditions, energy flow); statics (Laplace's equation, Poisson's equation); distributed parameter systems (classification of solutions, transmission lines, and wave-guides); radiation and antennas (arrays, reciprocity, Huygen's principle); a selected special topic (e.g., magnetostatics, waves in anisotropic media and optical fibers). Offered in alternate years. Prerequisite: Master's student standing or higher.

Credits: 3.00

ECE 60600 - Solid State Devices

Credit Hours: 3.00. A relatively-broad, moderate-depth coverage of semiconductor devices and related topics. The first portion of the course presents and examines semiconductor fundamentals required in the operational analysis of solid state devices. A detailed examination of the PN junction diode and PN junction devices follows. The final portion of the course treats heterojunction surface devices including the Schottky diode, the MOS capacitor and the MOSFET. Offered in alternate years. Prerequisite: Master's student standing or higher.

Credits: 3.00

ECE 62400 - Multimedia Systems

Credit Hours: 3.00. Provides a general coverage of three major areas that include multimedia data management (logical and physical modeling), broadband network architectures and protocols for distributed multimedia communication, and user interface environments. Various models and specification methodologies in these areas are introduced. The discussion is augmented with various case studies. Prerequisite: ECE 54700 , ECE 56200 .

Credits: 3.00

ECE 62900 - Introduction To Neural Networks

Credit Hours: 3.00. Information processing with neural networks, biological and engineering implications, learning algorithms, current neural network models and architectures, implementational topics, applications in areas such as signal/image processing, pattern recognition, optimization, simulation, system identification, nonlinear prediction, communications, and control. Concurrent prerequisite: ECE 60000 .

Credits: 3.00

ECE 63400 - Digital Video Systems

Credit Hours: 3.00. Digital video systems. Characteristics of basic analog video systems, including bandwidth constraints, color encoding, and composite signal formation. Digital video concepts with emphasis on processing of time-varying images. Topics include: filtering, enhancement, restoration, and motion estimation and prediction. Digital video compression techniques, including intraframe coding approaches, with particular emphasis on JPEG. MPEG1 and MPEG2 video compression standards. Low bit rate approaches, including H.261, H.263, and MPEG4. Applications include: video servers, transmission systems, high definition television, multimedia systems, and videoconferencing systems. Offered in alternate years. Concurrent prerequisite: ECE 60000 .

Credits: 3.00

ECE 63700 - Digital Image Processing I

Credit Hours: 3.00. Introduction to digital image processing techniques for enhancement, compression, restoration, reconstruction, and analysis. Lecture and experiments covering a wide range of topics. 2-D signals and systems, image analysis, and image segmentation. Achromatic vision, color image processing, color imaging systems, image sharpening, interpolation, decimation, linear and nonlinear filtering, printing and display of images. Image compression, image restoration, and tomography. Offered every third semester.

Credits: 3.00

ECE 63900 - Error Control Coding

Credit Hours: 3.00. The theory and practice of error control coding is examined. The study includes the arithmetic of Galois fields as well as linear block, cyclic, and convolutional codes. Some applications of codes in digital communication systems and in computer systems are presented. Offered every third semester. Concurrent prerequisite: ECE 60000 .

Credits: 3.00

ECE 64100 - Model Based Image And Signal Processing

Credit Hours: 3.00. An advanced treatment of the methods in model-based signal and image processing including stochastic modeling of multidimensional signals, Bayesian estimation, inverse methods, doubly stochastic models, regularized inversion, the EM algorithm, Bayesian networks, Markov chains, optimization, convexity, majorization techniques, and stochastic simulation. The underlying theory is presented in the context of applications including image restoration, tomographic reconstruction, clustering, classification, and segmentation. Prerequisite: ECE 60000, 63700.

Learning Outcomes: 1. Understand how to model an imaging system. 2. Understand widely used methods for solving inverse problems in imaging applications. 3. Implement an image reconstruction algorithm for applications such as deconvolution and denoising. 4. Understand how probability can be used to model imaging systems and images. 5. Understand basic approaches to optimization of quadratic and non-quadratic functions. 6. Understand MAP and ML estimation methods. Credits: 3.00

ECE 66100 - Computer Vision

Credit Hours: 3.00. This course deals with how an autonomous or a semi-autonomous system can be endowed with visual perception. The issues discussed include: sampling from a topological standpoint; grouping processes; data structures, especially hierarchical types such as pyramids, quadtrees, octrees, etc.; graphic theoretic methods for structural description and consistent labeling; issues in 3-D vision such as object representation by Gaussian spheres, generalized cylinders, etc. Prerequisite: ECE 57000 .

Credits: 3.00

ECE 69500 - Advanced Topics In Electrical And Computer Engineering

Credit Hours: 1.00 to 3.00. Formal classroom or individualized instruction on advanced topics of current interest. Permission of instructor required.

Credits: 1.00 to 3.00

IE 54500 - Engineering Economic Analysis

Credit Hours: 3.00. Analysis of engineering costs and capital investments. Applications of classical optimization, mathematical programming, and the theory of production to the analysis of investment proposals. Evaluation and selection of individual projects and formulation of capital investment programs.

Credits: 3.00

IE 54600 - Economic Decisions In Engineering

Credit Hours: 3.00. Topics in decision-making and rationality including decision analysis, decision-making under uncertainty, and various descriptive and prescriptive models from operations research, economics, psychology, and business. Applications are drawn from engineering decision-making, public policy, and personal decision-making. Attention also is paid to designing aids to improve decision-making.

Credits: 3.00

IE 59000 - Topics In Industrial Engineering

Credit Hours: 1.00 to 6.00. Selected topics in industrial engineering for seniors and graduate students. Permission of instructor required.

Credits: 1.00 to 6.00

ECE 50863 - Computer Network Systems

Credit Hours: 3.00. The goal of this course is to provide students with a proper grounding in the basic concepts and seminal work in computer network protocols and systems, and to introduce students to research in the field. The course will cover classical concepts such as network architecture, switching, routing, congestion control, and quality-of-service, and discuss recent developments in these areas. The course will also cover new developments in networking such as network measurements, network management, overlay networking and peer-to-peer systems, network security, and new network architectures. The course will emphasize a system-oriented and empirical view of internet architecture. Graduate standing or consent of instructor.

Learning Outcomes: 1. Understand the architectural principles underlying internet design. 2. Understand LAN interconnects, routing algorithms, and congestion control algorithms. 3. Identify, formulate, and solve problems encountered in the design of networks. 4. Implement networking systems and rigorously evaluate them using systematic empirical methods. Credits: 3.00

ECE 51018 - Hybrid Electric Vehicles

Credit Hours: 3.00. Introduction to architectures and technologies associated with electric and hybrid electric vehicles including their constituent components. Specific topics include electric and hybrid electric drive trains, energy storage (batteries/ultracapacitors, fuel cells), electromechanical energy conversion (induction and permanent magnet motors and generators), power electronics, vehicle-level modeling and control, and optimization. Prerequisite by Topic: Energy conversion and power electronics.

Learning Outcomes: 1. Understand the principal architectures of electric and hybrid electric vehicles. 2. Analyze performance characteristics and understand limitations of each architecture. 3. Understand the principal components of an HEV including the energy storage, conversion, transmission, and control subsystems. 4. Integrate disparate subsystem models to form end-to-end vehicle model. Credits: 3.00

ECE 60872 - Reliable And Secure Computer Systems

Credit Hours: 3.00. The course provides an introduction to the hardware and software methodologies for specifying, modeling and designing fault-tolerant systems supported by case studies of real systems. The material presents a broad spectrum of hardware and software error detection and recovery techniques that can be used to build reliable networked systems. The lectures discuss how the hardware and software techniques interplay, what techniques can be provided in COTS hardware, what can be embedded into operating system and network communication layers, and what can be provided via a distributed software layer and in the application itself. Prerequisite by Topic: Any one high level programming language experience; A basic background in probability.

Learning Outcomes: 1. Formulate design principles for dependable systems. 2. Analyze mathematically a system for its dependability properties. 3. Understand and apply hardware dependability techniques. 4. Understand and apply software dependability techniques. 5. Understand and apply networking dependability techniques. 6. Design, develop, and present an innovative project on dependable systems. Credits: 3.00

ECE 61016 - Power Electronic Converters And Systems

Credit Hours: 3.00. The objective of this course is to educate students in the operation, detailed modeling, average-value modeling, and control design of power electronics converters and systems of converters. Prerequisite by Topic: Basic knowledge of ordinary differential equations, solution of ODEs using numerical methods, state-space system representation, basic feedback control design with frequency domain methods,

reference frame theory, some knowledge of rotating electric machinery. Permission of instructor required. Prerequisites: ECE 61010. Concurrent prerequisites: ECE 61000 and ECE 38200. Concurrent prerequisites by topic: synchronous machines (wound rotor and permanent magnet), reference frame theory, three-phase inverters, basic frequency domain control techniques, state-space representation of systems.

Learning Outcomes: 1. Understand switched circuits. 2. Understand average-value analysis techniques. 3. Understand feedforward/feedback control of power electronic converters. 4. Understand waveform level and average-value simulation techniques for switched systems. 5. Understand several ac-dc, dc-ac, and dc-dc power conversion topologies. 6. Understand inverter modulation techniques. 7. Understand ethical homework and project practices, and implication of failure to adhere to these. 8. Understand how to effectively present project results. Credits: 3.00

SYS 50000 - Perspectives On Systems

Credit Hours: 3.00. This course provides an introduction to, and references for, each of four distinct approaches to SE concepts and tools. Individual assignments and team projects will be based on readings from these multiple approaches and selected case studies. Participants will be encouraged to bring their own prior expertise and examples to the discussions and projects. While the course will discuss quantitative topics (including cybernetics, feedback control systems, and statistical process control), the course itself will emphasize a more interdisciplinary conceptual integration rather than stand-alone analysis of these topics.

Learning Outcomes: 1. Design a system, component, or process to meet desired needs within realistic constraints such as economic, environmental, social, political, ethical, health and safety, manufacturability, and sustainability. 2. Function on multidisciplinary teams. 3. Identify, formulate, and solve engineering problems. 4. Understand professional and ethical responsibility. 5. Communicate effectively. 6. Acquire the broad education necessary to understand the impact of engineering solutions in a global, economic, environmental, and societal context. 7. Recognize the need for, and an ability to engage in life-long learning. 8. Acquire knowledge of contemporary issues. 9. Prepare graduates to design, develop, implement, and improve integrated systems that include people, materials, information, equipment and energy. Credits: 3.00

ECE 50024 - Machine Learning

Credit Hours: 3.00. An introductory course to machine learning, with a focus on supervised learning using linear models. The course will have four parts: (1) mathematical background on linear algebra, probability, and optimization. (2) classification methods including Bayesian decision, linear regression, logistic, regression,
and support vector machine. (3) robustness of classifier and adversarial examples. (4) learning theory on the feasibility of learning, VC dimension, complexity analysis, bias-variance analysis. Suitable for senior undergraduates and graduates with a background in probability, linear algebra, and programming.

Learning Outcomes: 1. Apply basic linear algebra, probability, and optimization tools to solve machine learning problems. 2. Understand the principles of supervised learning methodologies, and can comment on their advantages and limitations. 3. Explain the trade-os in model complexity, sample complexity, bias, variance, and generalization error in the learning theory. 4. Implement, debug, and execute basic machine learning algorithms on computers. Credits: 3.00

ECE 60827 - Programmable Accelerator Architectures

Credit Hours: 3.00. Programmable hardware accelerators seek to fulfill the promise of continued performance and energy-efficiency gains in the era of a slowing Moore's law, larger problem sizes and an increased focused on energy-efficiency. These factors have caused hardware acceleration to become ubiquitous in today's computing world and critically important in computing's future. This class will introduce students to the architectures of programmable accelerators. We will delve deeply into the architectures of modern massively parallel accelerators like GPUs, culminating in a course project. General topics in hardware acceleration will be discussed, including but not limited to GPGPU and massively parallel computing, approximate accelerators, reconfigurable hardware and programmable hardware for machine learning. Pre-requisite: ECE 43700 or equivalent and ECE 56500.

Learning Outcomes: 1. Learn knowledge and scholarship. 2. Learn communication. 3. Learn critical thinking. 4. Learn ethical and responsible research. 5. Have professionalism. Credits: 3.00

ECE 60146 - Deep Learning - Theory And Practice Of Deep Neural Networks

Credit Hours: 3.00. This course teaches the theory and practice of deep neural networks from basic principles through state-of-the-art methods. The class blends hands-on programming, using a variety of state-of-the-art programming frameworks, with theoretical treatment based on current literature. Implementation will emphasize the use of the Pytorch language and the use of dynamic computational graphs. Some previous experience with optimization techniques is important for success in the course.

Learning Outcomes: 1. Understand how to design a neural network architecture that is appropriate for a wide range of specific applications. 2. Create an efficient implementation of a wide range of standard neural network architectures in Pytorch. 3. Use neural networks to solve applications problems in classification, regression and data generation. 4. Understand how the fundamental theory of optimization can be used to efficiently train neural networks. 5. Understand the trade-offs between optimization techniques and how these techniques can be selected to achieve the best neural network training. 6. Understand and use current theory of neural network performance. 7. Understand the limitation of existing neural network theory and the likely directions of future research. Credits: 3.00

ECE 51216 - Digital Systems Design Automation

Credit Hours: 3.00. This course will provide an introduction to the tools used to design and analyze circuits at the logic level of abstraction (where circuits are composed of gates and flip-flops). Most digital chips used in computing and electronic systems (including microprocessors, graphics processors, chips used in network routers, cell phones, digital audio/video appliances, automotive electronics) are entirely or largely designed using EDA tools. This course will focus on the foundations of logic-level EDA tools, including the design of exact and heuristic algorithms that form the basis for VLSI Computer-Aided Design. Topics covered include an overview of the IC design flow and levels of abstraction, synthesis of two-level (AND-OR / PLA) circuits, multi-level logic synthesis and technology mapping, sequential circuit synthesis, Logic-level verification using Boolean Satisfiability and BDDs, Timing Analysis, Power analysis and Reduction, and design techniques for emerging nanoscale technologies.

Learning Outcomes: 1. Design minimal combinational logic circuits. 2. Design minimal finite-state machines. Credits: 3.00

ECE 60270 - Structure And Dynamics Of Large-Scale Networks

Credit Hours: 3.00. Large-scale networks are prevalent in both engineered systems (e.g., the Internet, the power grid, industrial control networks, large robotic swarms and sensor networks) and in natural systems (e.g., genetic networks, ecological networks, social and economic networks). While the specific details of such networks will depend on the application, the last few decades have seen the emergence of an underlying "science" of networks, comprised of a common language (graph theory) for representing large-scale networks, along with mathematical models and analytical techniques for studying structure and dynamics. This course will provide a detailed introduction to the field of network science. It will develop common mathematical representations of networks, metrics for identifying important features of networks, generative mechanisms for networks (including both random-graph and strategic network formation perspectives), and tools for studying dynamical processes on networks (such as information cascades, opinion dynamics and interconnected dynamical systems). This is an introductory course that establishes several of the fundamental tools and concepts in network science, and requires only an undergraduate background in probability and linear algebra.

Learning Outcomes: 1. Characterize networks based on degree distributions, clustering coefficients, diameter, etc. 2. Identify influential nodes via centrality metrics. 3. Analyze random and strategic (game-theoretic) models for large-scale networks. 4. Analyze dynamical processes and stability of interconnected dynamical systems on networks. Credits: 3.00

ECE 51032 - Computational Methods For Power System Analysis

Credit Hours: 3.00. System modeling of power networks. Description of modern electricity markets. Analysis of the economic dispatch problem using optimality conditions. Planning of distributed energy resources. Smart grid

applications. Machine learning applications to power systems (forecasting, demand-side management, and fault detection). Assigned projects will involve implementing some of the methods using realistic power system models.

Learning Outcomes: 1. Explain how electricity markets work and how various computational methods are used in power system operations and planning. 2. Understand formulation and solution techniques applied to normal operation of large power systems. 3. Implement existing optimization packages to solve power system problems. 4. Use machine learning methods to answer questions about power system operations. Credits: 3.00

ECE 60283 - Epidemic Processes Over Networks

Credit Hours: 1.00. This course presents a class of epidemic models from a network science, control theoretic, and data science perspective. Networked epidemiological ideas will be explored combined with probability theory and systems theoretic ideas to be able to capture spread behavior, learn the behavior from data, and design mitigation techniques. Namely, the course consists of three modules: 1) Networked Virus Models, 2) Limiting Behavior of Networked Virus Models, and 3) Parameter Identification & Mitigation Algorithms. Prerequisites: ECE 60281 and ECE 60282.

Learning Outcomes: 1. Differentiate between distinct networked compartmental models for epidemics (SI, SIS, SIR, etc.) in order to identify the best model for a given scenario. 2. Analyze the limiting behavior of networked models for epidemic processes by identifying the different possible equilibria of the models and specifying conditions for converging to different equilibria. 3. Estimate model parameters from data for the different networked epidemic models. 4. Employ the estimated model parameters to forecast the spread of an outbreak. 5. Choose the best networked model for a given scenario/dataset by employing their knowledge of the epidemic models and by comparing the fit from the estimated parameters and the forecast accuracy. 6. Develop and implement mitigation algorithms for the different models of epidemic processes. 7. Leverage the advantages and disadvantages of using networked models of epidemics processes versus group models in a given situation. Credits: 1.00

ECE 60432 - Nanophotonic Modeling

Credit Hours: 1.00. This course is an introduction to photonic materials and devices structured on the wavelength scale. Generally, these systems will be characterized as having critical dimensions at the nanometer scale. These can include nanophotonic, plasmonic, and metamaterials components and systems. Co-requisite: ECE 60400 or equivalent.

Learning Outcomes: 1. Write down photonic modes using Bloch's theorem. 2. Calculate standing wave modes at the band edge of a 1D periodic photonic crystal. 3. Calculate TE and TM modes at the band edge of a 2D square-periodic photonic crystal. 4. Draw the irreducible Brillouin zone for a 2D triangular lattice photonic crystal. 5. Calculate the band structure of a 2D triangular lattice photonic crystal for the lowest 8 bands using MIT Photonic Bands. 6. Identify the lowest-energy photonic bandgap in TE and TM polarizations associated with a 2D triangular lattice photonic crystal. 7. Use a ray-optics transfer matrix to calculate the reflection and transmission associated with multiple optical elements. 8. Use a wave-optics T-matrix to calculate transmission and reflection through several dielectric layers arranged in a 1D stack. 9. Use a wave-optics S-matrix to calculate transmission and reflection through several dielectric layers arranged in a 1D stack. 10. Use Singular Value Decomposition in CAMFR to calculate the eigenmodes associated with a photonic crystal waveguide structure consisting of a row of defects. 11. Calculate the quality factor of a resonant mode using the FDTD method. 12. Calculate the band structure of a 2D periodic structure using the FDTD method. 13. Calculate the relative enhancement in the local density of photonic states associated with a defect in a 2D photonic crystal using the FDTD method. 14. Calculate a transmission

spectrum using the Finite Element Method. 15. Calculate a transmission spectrum for a waveguide using the Beam Propagation Method. 16. Calculate the emission spectrum of a photonic emitter using the Finite Element Method. Credits: 1.00

ECE 50836 - Introduction To Data Mining

Credit Hours: 3.00. This course introduces fundamental techniques in data mining, i.e., the techniques that extract useful knowledge from a large amount of data. Topics include data preprocessing, exploratory data analysis, association rule mining, clustering, classification, anomaly detection, recommendation and graph analysis. Students are expected to gain the skills to formulate data mining problems, solve the problems using data mining techniques and interpret the output.

Learning Outcomes: 1. Describe and explain the process of data mining. 2. Formulate problems in real-world applications into data mining tasks and solve the problems using data mining techniques. 3. Implement software programs that conduct data mining and evaluate the output of data mining programs. 4. Present data mining solutions to people in scientific and other disciplines. Credits: 3.00

ECE 61025 - Finite Element Analysis Of Electric Machines

Credit Hours: 3.00. Application of advanced numerical methods for the characterization of the steady-state and dynamic characteristics of electromechanical energy conversion devices including solenoids, synchronous, induction, and permanent-magnet machines.

Learning Outcomes: 1. Apply basic concepts of vector calculus to quantify and correlate the physical variables of electromagnetic fields. 2. Interpret Maxwell's equations in the context of electric machinery. 3. Recognize how variational calculus can be used to reformulate the partial differential equations governing the magnetic field. 4. Solve linear and nonlinear quasi-magnetostatic problems of electromechanical energy conversion devices numerically using the finite element method. 5. Develop custom-made software for conducting finite element analysis of electric machinery. Credits: 3.00

ENGR 50200 - Engineering Leadership

Credit Hours: 3.00. Engineering leadership is the ability to inspire and guide engineering and technology-focused teams and organizations to achieve strategic outcomes. The successful engineering leader creates value at the intersection of technical systems and human systems. This course introduces students to evidence-based, practice-proven frameworks and tools related to (1) leadership presence, (2) cognitive diversity and psychological safety in teams, and (3) designing and transforming organizations and ecosystems.

Learning Outcomes: 1. Describe characteristics of effective leaders in engineering and technology-focused teams and organizations. 2. Apply tools and frameworks for effective leadership of engineering and technology-focused teams and organizations. 3. Analyze the potential strengths and potential of various leadership approaches and behaviors in engineering and technologically focused teams and organizations. Credits: 3.00

Seminar Course (0 credits)

ECE 69400 - Electrical And Computer Engineering Seminar

Credit Hours: 0.00. Seminar presentations by representatives from industry, members of the faculty of the School of Electrical and Computer Engineering, and other staff and faculty of Purdue University. The presentations introduce the student to a wide variety of current topics relevant to the technical and career aspects of electrical and computer engineering. Technical topics span the entire spectrum of electrical and computer engineering. Career topics include the importance of interpersonal communications, opportunities beyond graduate school, interviewing techniques, and descriptions of non-typical jobs. Required of electrical and computer engineering graduate students at Purdue during one of their first two semesters in residence.

Credits: 0.00

Electives (14 credits)

ECE 69600 - Advanced Electrical Engineering Projects

Credit Hours: 0.00 to 18.00. Individual research projects to be

approved by the supervising faculty member before registering for the course. An approved written report must be filed before credit is accepted. Permission of instructor required.

Credits: 0.00 to 18.00

ECE 69700 - Directed Reading In Electrical Engineering

Credit Hours: 1.00 to 3.00. Individualized reading course supervised by an appropriate faculty member and pertaining to a topic not intended for a subsequent project or thesis done by that student. Approval for each reading course must be obtained from the department prior to registration. Permission of instructor required.

Credits: 1.00 to 3.00

Concentrations

Electrical and Computer Engineering, MSECE (OL)

About the Program

Program Requirements

Required Courses (12 credits)

Core Courses (6 credits)

ECE 55900 - MOS VLSI Design

Credit Hours: 3.00. An introduction to most aspects of large-scale MOS integrated circuit design including: device fabrication and modeling; inverter characteristics; designing CMOS combinational and sequential circuits; designing arithmetic building blocks and memory structures; interconnect and timing issues; testing and verification; and system design considerations. Term projects involve the complete design of a functional logic block or system using CAD tools.

Credits: 3.00

ECE 60000 - Random Variables And Signals

Credit Hours: 3.00. Engineering applications of probability theory. Problems on events, independence, random variables, distribution and density functions, expectations, and characteristic functions. Dependence, correlation, and regression; multivariate Gaussian distribution. Stochastic processes, stationarity, ergodicity, correlation functions, spectral densities, random inputs to linear systems; Gaussian processes. Prerequisite: Master's student standing or higher.

Learning Outcomes: 1. Problems on events, independence, random variables, distribution and density functions, expectations, and characteristic functions. 2. Dependence, correlation, and regression; multi-variate Gaussian distribution. 3. Stochastic processes, stationarity, ergodicity, correlation functions, spectral densities, random inputs to linear systems; Gaussian processes. Credits: 3.00

ECE 60200 - Lumped System Theory

Credit Hours: 3.00. An investigation of the basic theory and techniques of modern system theory, emphasizing linear state model formulations of continuous and discrete time systems in the time domain and frequency domain. Coverage includes notions of linearity, time invariance, discrete and continuous time state models, canonical forms, associated transfer functions and impulse response models, the state transition matrix, the Jordan form, controllability, observability, and stability. Prerequisite: Master's student standing or higher and concurrent prerequisite: MA 51100.

Credits: 3.00

ECE 60400 - Electromagnetic Field Theory

Credit Hours: 3.00. Review of general concepts (Maxwell's equations, materials interaction, boundary conditions, energy flow); statics (Laplace's equation, Poisson's equation); distributed parameter systems (classification of solutions, transmission lines, and wave-guides); radiation and antennas (arrays, reciprocity, Huygen's principle); a selected special topic (e.g., magnetostatics, waves in anisotropic media and optical fibers). Offered in alternate years. Prerequisite: Master's student standing or higher.

Credits: 3.00

ECE 60600 - Solid State Devices

Credit Hours: 3.00. A relatively-broad, moderate-depth coverage of semiconductor devices and related topics. The first portion of the course presents and examines semiconductor fundamentals required in the operational analysis of solid state devices. A detailed examination of the PN junction diode and PN junction devices follows. The final portion of the course treats heterojunction surface devices including the Schottky diode, the MOS capacitor and the MOSFET. Offered in alternate years. Prerequisite: Master's student standing or higher.

Credits: 3.00

ECE 60800 - Computational Models And Methods

Credit Hours: 3.00. Computation models and techniques for the analysis of algorithm complexity. The design and complexity analysis of recursive and nonrecursive algorithms for searching, sorting, set operations, graph algorithms, matrix multiplication, polynomial evaluation and FFT calculations. NP-complete problems. Prerequisite: Master's student standing or higher.

Learning Outcomes: 1. Learn computation models and techniques for the analysis of algorithm complexity. 2. Learn the design and complexity analysis of recursive and non-recursive algorithms for searching, sorting, set operations, graph algorithms, matrix multiplication, polynomial evaluation and FFT calculations. 3. Learn the NP-complete problems. Credits: 3.00

ECE 61000 - Energy Conversion

Credit Hours: 3.00. Basic principles of static and electromechanical energy conversion. Control of static power converters. Reference frame theory applied to the analysis of rotating devices. Analysis and dynamic characteristics of induction and synchronous machines. State variable analysis of electromechanical devices and converter supplied electromechanical drive systems. Prerequisite: Master's student standing or higher.

Credits: 3.00

Math/Statistics Courses (6 credits)

MA 51100 - Linear Algebra With Applications

Credit Hours: 3.00. Real and complex vector spaces; linear transformations; Gram-Schmidt process and projections; least squares; QR and LU factorization; diagonalization, real and complex spectral theorem; Schur triangular form; Jordan canonical form; quadratic forms.

Credits: 3.00

MA 52700 - Advanced Mathematics For Engineers And Physicists I

Credit Hours: 3.00. MA 52700 is not a prerequisite for MA 52800; these courses can be taken independently. Topics in MA 52700 include linear algebra, systems of ordinary differential equations, Laplace transforms, Fourier series and transforms, and partial differential equations. MA 51100 is recommended.

Learning Outcomes: 1. Know the theory of systems of linear equations. 2. Know the theory of eigenvalues and eigenvectors and apply it to solve systems of ordinary differential equations and to analyze qualitative features. 3. Know theoretical properties of Laplace transforms and how to use them. 4. Know the basic theory of Fourier series and transforms, and how to apply these to solve partial differential equations. Credits: 3.00

MA 52800 - Advanced Mathematics For Engineers And Physicists II

Credit Hours: 3.00. MA 52700 is not a prerequisite for MA 52800; these courses can be taken independently. Topics in MA 52800 include divergence theorem, Stokes theorem, complex variables, contour integration, calculus of residues and applications, conformal mapping, and potential theory. MA 51000 is recommended.

Learning Outcomes: 1. Improve knowledge of vector calculus and multivariable integral calculus. 2. Know basic theory of functions of a complex variable, including complex integration. 3. Improve knowledge of Taylor series, and extend this to Laurent series. 4. Know applications of complex analysis, including conformal mapping and potential theory. Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand

statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

STAT 51200 - Applied Regression Analysis

Credit Hours: 3.00. Inference in simple and multiple linear regression, residual analysis, transformations, polynomial regression, model building with real data, nonlinear regression. One-way and two-way analysis of variance, multiple comparisons, fixed and random factors, analysis of covariance. Use of existing statistical computer programs. Prerequisite: Coursework in Statistical Methods with a calculus prerequisite.

Learning Outcomes: 1. Learn to build and analyze simple and multiple regression models, analysis of variance and covariance (ANOVA/ANCOVA) for regression, inference for regression, diagnostics and remedial measures for regression, transformations, residual analysis, model building, polynomial and interaction models. Credits: 3.00

STAT 51300 - Statistical Quality Control

Credit Hours: 3.00. A strong background in control charts including adaptations, acceptance sampling for attributes and variables data, standard acceptance plans, sequential analysis, statistics of combinations, moments and probability distributions, applications.

Learning Outcomes: 1. Acquire fluency in the language and techniques of modem quality control and its applications. 2. Conceptually understand the utility of statistics for quality control. 3. Apply control charts and experimental design techniques to solve real-life quality control problems. 4. Utilize appropriate Statistical software for statistical computation, visualization, control chart construction, and design of experiments. 5. Discuss what is learned in lecture and assignments through oral and written presentations. Credits: 3.00

STAT 51400 - Design Of Experiments

Credit Hours: 3.00. Fundamentals, completely randomized design; randomized complete blocks; latin square; multi-classification; factorial; nested factorial; incomplete block and fractional replications for 2n, 3n, 2m x 3n; confounding; lattice designs; general mixed factorials; split plot; analysis of variance in regression models; optimum design. Use of existing statistical programs.

Learning Outcomes: 1. Understand design principles and use these principles to plan and implement an experiment in such a way that a statistical analysis results in valid and objective conclusions. 2. Know how to choose an appropriate design given the available resources, factors of interest, and information on nuisance factors. 3. Perform the proper statistical analysis and draw valid conclusions from any designed experiment. Credits: 3.00

STAT 51600 - Basic Probability And Applications

Credit Hours: 3.00. A first course in probability, intended to serve as a background for statistics and other applications. Sample spaces and axioms of probability, discrete and continuous random variables, conditional probability and Bayes' theorem, joint and conditional probability distributions, expectations, moments and moment generating functions, law of large numbers, and central limit theorem. (The probability material in course one of the Society of Actuaries and the Casualty Actuarial Society is covered by this course.)

Learning Outcomes: 1. Identify which discrete and continuous distributions are applicable in a given setting. 2. Use conditional probabilities, Bayes theorem, and conditional distributions. 3. Utilize joint distributions in the context of several

random variables. 4. Apply the law of large numbers and the central limit theorem in asymptotic settings. 5. Derive moments and moment generating functions for discrete and continuous random variables. Credits: 3.00

STAT 51700 - Statistical Inference

Credit Hours: 3.00. A basic course in statistical theory covering standard statistical methods and their application. Estimation including unbiased, maximum likelihood and moment estimation; testing hypotheses for standard distributions and contingency tables; confidence intervals and regions; introduction to nonparametric tests and linear regression.

Learning Outcomes: 1. Understand the basic asymptotic theory including consistency and convergence in distribution. 2. Know how to perform some elementary statistical inference such as estimation, confidence interval and hypothesis testing. 3. Be familiar with the maximum likelihood method to make statistical inference. 4. Know how to judge the quality of different estimators. 5. Know how to perform optimal tests of hypotheses. Credits: 3.00

STAT 54000 - Computational Finance I

Credit Hours: 3.00. An introduction to the mathematical tools and techniques of modern finance theory, in the context of Black-Scholes option pricing. Brownian motion and its stochastic calculus, Ito's formula, and Feynman-Kac formula. Pricing and hedging of claims on Black-Scholes assets. Incomplete markets. Path-dependent options. Stochastic portfolio optimization.

Learning Outcomes: 1. Obtain necessary mathematical background necessary to study quantitative methods in finance. 2. Understand mathematical models of modern financial markets. Credits: 3.00

Concentrations

GPA Requirements

Engineering Education, MSENE, MSE, or MS

About the Program

Program Requirements

Required Courses (15 credits)

Core Courses (15 credits)

ENE 50200 - History And Philosophy Of Engineering Education

Credit Hours: 3.00. Examines the history and philosophy of engineering education by: (1) exploring the history of engineering education through archival research and historical documents (critical moments, tensions, issues); (2) investigating philosophies of education and the philosophies that have guided engineering as a profession; and (3) critiquing the evolution of engineering education, identifying alternative scenarios, and imagining a future role in engineering education. This course introduces students to the field of engineering education while broadening their views of the roles of interrelationships between teaching and research. Open to students in Engineering Education. Permission of instructor required.

Learning Outcomes: 1. Develop a culture of critical reflection, engagement, and collaborative learning. 2. Provide opportunities for students to identify and understand tools to inquire into the history and philosophy of engineering education and develop the skills for using these tools. 3. Provide opportunities for students to use these inquiry tools to form persuasive arguments about the nature of engineering education. Credits: 3.00

ENE 50300 - Engineering Education Inquiry

Credit Hours: 3.00. This course is conceived as a bridge between beginning graduate students' knowledge of technical research and modes of inquiry appropriate to the new field of

engineering education. It is designed as the entryway to required research method courses taken as part of the students' plan of study. By the end of this survey course, students will be able to critique research in terms of the quality of the authors' argument based on their chain of reasoning, and will recognize that the articulation of a research question, the significance of the question, the choice of methods in regards to the research goals, and the transparency of the explanation of the methodology are all the parts of the chain of reasoning. Permission of instructor required.

Learning Outcomes: 1. Provides a pathway into the discipline that characterizes the diversity of approaches to engineering education research and research topics. 2. Create opportunities to discuss the need for rigorous engineering education research. 3. Develop critical understanding of relationships between research problem, method, and design. 4. Foster community development and collaborative efforts among students and engineering education researchers. 5. Help students identify conceptual hurdles and individual pathways into research activities. 6. Support students' identity development as an engineering education researcher. Credits: 3.00

ENE 50600 - Content, Assessment And Pedagogy: An Integrated Engineering Design Approach

Credit Hours: 3.00. The course is explicitly identified in the ENE-PhD requirements as a "foundation course" required for all students. This course is intended to be taken early in a graduate student's curriculum and therefore is designed to be a bridge between the student's previous experience with engineering (education, work, and teaching) and new engineering education research-based approaches. It is intended as an entryway to help students apply an engineering design approach to the design of instruction. To meet this aim, the course involves an iterative project-based approach in a context (design site) that is chosen by the student for its relevance, interest and potential application.

Learning Outcomes: 1. Develop and articulate an engineering design approach for content, assessment, and pedagogy (CAP). 2. Critically describe the research-based features of each of the elements - content, assessment and pedagogy. 3. Apply the principles and theories to the design of a course, module, lesson plan, or other instructional setting. 4. Use reflection and dialogue as a tool of self-discovery for shaping and refining personal philosophies for the design of instruction. 5. Participate in a ""community of practice"" culture through formation of our own community and participation in the broader community of engineering education. Credits: 3.00

ENE 50400 - Leadership, Policy, And Change In Science, Technology, Engineering, And Mathematics (STEM) Education

Credit Hours: 3.00. This course provides a foundation for examining historical and current perspectives of STEM education programs and policy at the secondary and postsecondary levels. Focusing on the relationships among education policy, leadership theories, and models of systemic change, this course will enable students to situate and envision their potential role in shaping engineering education within the context of the larger education landscape. Students will synthesize course readings, examine education policy, and reflect on leadership theories and change, as well as explore how they can influence leadership, policy, and /or organizational change in STEM education through a semester project.

Learning Outcomes: 1. Evaluate leadership theories and the leadership process. 2. Identify and evaluate factors that contribute to effective leadership within organizations. 3. Analyze education policy at local, state, and national levels with a focus on STEM education. 4. Evaluate models of systemic change and diffusion of innovative processes. 5. Understand key aspects, strategies, and applications of systemic change in education. 6. Generate strategies to implement change within STEM education environments. Credits: 3.00

ENE 50500 - Theories Of Development And Engineering Thinking

Credit Hours: 3.00. This course examines theories of human development, learning and epistemology in the context of Engineering Education. A broad survey of readings guides an in-depth study of fundamental theories of development and knowledge generation as it relates to pedagogy and research. A rich body of theoretical literature will be studied in order to explore its relation to engineering education. Work in the course aims to construct answers to the following three questions: (1) How do theories of human learning, development, and epistemology help us think about engineering? (2) How do they

relate to engineering education? (3) How do they inform research method and practice in engineering education? No restrictions. It is helpful, however, for students to have engaged in prior reading-and writing- intensive courses that required them to synthesize large amounts of information. For this reason, it is recommended that students are enrolled currently in a graduate program at Purdue University. Permission of department required.

Learning Outcomes: 1. Summarize and critique theories of learning and development. 2. Propose connections between theories of learning and development and engineering thinking. 3. Apply theories of learning and development to the construction of engineering learning environments. 4. Generate engineering education research questions that are aligned with respective theories of learning and development. 5. Remember the main points of historically important theories of learning and development. 6. Consider how different theories of learning and development might be used as frameworks for your individual research projects (e.g. your dissertation research). Credits: 3.00

ENE 50101 - Foundations Of Engineering Education

Credit Hours: 3.00. In this course, new doctoral students in engineering education explore their roles within the field of engineering education, create a learning plan that maps to program requirements, and develop habits of mind to support their ongoing professional development. Students learn to write clearly and coherently in an academic context. Students examine research trends and faculty interests so they can make informed choices about advising and program opportunities. Permission of instructor required.

Learning Outcomes: 1. Critically reflect upon personal learning goals, and articulate a learning plan that will eventually result in a professional portfolio. 2. Develop skills in academic writing. 3. Understand the research interests of local faculty members. 4. Identify resources that will facilitate the student's transition into the engineering education community. Credits: 3.00

Seminar Course (0 credits)

ENE 69000 - Seminar In Engineering Education

Credit Hours: 0.00. Seminar course covering a broad range of current discovery, learning, and engagement topics in Engineering Education. Seminar presentations by representatives from academia, industry, other external institutions, and members of the Purdue University community. This is a required course for the graduate program in the Department of Engineering Education.

Learning Outcomes: 1. Develop an understanding of the field of Engineering Education in its widest possible applications. 2. Develop an appreciation of the various interdisciplinary research efforts being pursued Engineering Education has the potential to provide leadership. Credits: 0.00

Selectives (6 credits)

ENE 59500 - Special Topics In Engineering Education

Credit Hours: 0.00 to 6.00. Primarily designed for specialized topic areas for which there is no specific course, workshop, or individual study plan, but having enough student interest to justify the formalized teaching of a course. Permission of instructor required.

Learning Outcomes: 1. Objectives and outcomes vary due to nature of course. Credits: 0.00 to 6.00

ENE 68500 - Educational Methods In Engineering

Credit Hours: 3.00. (CHE 68500) Students will learn how to teach in an engineering environment where both classroom and laboratory instruction is intertwined. Classroom techniques, such as lectures, cooperative groups, mastery and PSI, TV and video, and guided design will be studied, in addition to class preparation issues, such as ABET accreditation and design content. Students will study motivation, learning theories and cycles, and personality types. Includes teaching practice and group projects. Student must be admitted into a Ph.D. program in Engineering or other technical discipline (Finished with MS or MS-bypass). Not open to students who have taken PSY 69500/EDPS 63400. Permission of Instructor required.

Learning Outcomes: 1. Summarize and critique theories of learning and development. 2. Propose connections between theories of learning and development and engineering

thinking. 3. Apply theories of learning and development to the construction of engineering learning environments. 4. Generate engineering education research questions that are aligned with respective theories of learning and development. 5. Remember the main points of historically important theories of learning and development. 6. Consider how different theories of learning and development might be used as frameworks for your individual research projects (e.g. your dissertation research). Credits: 3.00

ENE 69500 - Advanced Topics In Engineering Education

Credit Hours: 0.00 to 6.00. Primarily designed for specialized topic areas for which there is no specific course, workshop, or individual study plan, but having enough student interest to justify the formalized teaching of a course. Permission of instructor required.

Credits: 0.00 to 6.00

ENE 68700 - Mentored Teaching In Engineering

Credit Hours: 1.00 or 3.00. Mentored experience in the teaching of engineering, with structured opportunities for individual reflection. All students create a scholarly teaching portfolio. Students who register for three credits conduct a scholarship of teaching and learning project. Prerequisites: Significant concurrent responsibility for teaching an engineering course. Registration in or completion of ENE 50600 (Content, Assessment And Pedagogy) or ENE 68500 (Educational Methods In Engineering); or instructor permission required.

Learning Outcomes: 1. Think critically about the relationships between your teaching experiences and the readings in this course and the prerequisite courses. 2. Use reflection, mentoring, and student feedback to learn from teaching experiences. 3. Explain the reasons for choices of teaching methods. 4. Analyze evidence of student learning. 5. Identify and address ethical issues in teaching situations. 6. Plan and carry out a scholarly investigation of teaching and learning through the SoTL project. Credits: 1.00 or 3.00

ENE 50400 - Leadership, Policy, And Change In Science, Technology, Engineering, And Mathematics (STEM) Education

Credit Hours: 3.00. This course provides a foundation for examining historical and current perspectives of STEM education programs and policy at the secondary and postsecondary levels. Focusing on the relationships among education policy, leadership theories, and models of systemic change, this course will enable students to situate and envision their potential role in shaping engineering education within the context of the larger education landscape. Students will synthesize course readings, examine education policy, and reflect on leadership theories and change, as well as explore how they can influence leadership, policy, and /or organizational change in STEM education through a semester project.

Learning Outcomes: 1. Evaluate leadership theories and the leadership process. 2. Identify and evaluate factors that contribute to effective leadership within organizations. 3. Analyze education policy at local, state, and national levels with a focus on STEM education. 4. Evaluate models of systemic change and diffusion of innovative processes. 5. Understand key aspects, strategies, and applications of systemic change in education. 6. Generate strategies to implement change within STEM education environments. Credits: 3.00

Required Courses (18 credits)

Engineering Courses (9 credits)

Systems Engineering Courses (9 credits)

Management Selectives (9 credits)

MGMT 67000 - Business Analytics

Credit Hours: 2.00 to 4.00. Introduction to quantitative decision procedures under uncertainty. Applications of descriptive statistics, probability models, simulation models, interval estimates, and hypothesis testing to management problems. Managerial-oriented cases are used in instruction. Prerequisite: Master's student standing and Management majors only.

Credits: 2.00 to 4.00

MGMT 66000 - Introduction To Operations Management

Credit Hours: 2.00 to 4.00 (West Lafayette) 3.00 (Calumet, North Central). As goods and services are produced and distributed, they move through a set of inter-related operations or processes in order to match supply with demand. The design of these operations for strategic advantage, investment in improving their efficiency and effectiveness, and controlling these operations to meet performance objectives is the domain of Operations Management. The primary objective of the course is to provide an overview of this important functional area of business. Prerequisite: MGMT 67000 .

Credits: 2.00 to 4.00

MGMT 65000 - Strategic Management I

Credit Hours: 2.00 to 4.00. Concepts and methods that integrate previous training in functional areas of management. The perspective is that of the general manager charged with directing the total enterprise. Emphasis is given to formulation and implementation of strategy. Prerequisite: MGMT 61000 , MGMT 62000 , Master's student standing and Management majors only.

Credits: 2.00 to 4.00

MGMT 62000 - Marketing Management

Credit Hours: 2.00 to 4.00 (West Lafayette and Calumet) 3.00 (North Central). An integrated analysis of major marketing decisions, including product pricing, advertising, distribution, and sales force policies. Prerequisite: Master's student standing and Management majors only.

Credits: 2.00 to 4.00

MGMT 60000 - Accounting For Managers

Credit Hours: 2.00 to 3.00 (West Lafayette) 3.00 (Calumet, North Central). The two-course accounting sequence employs a user's perspective on the firm's database. First, the standard accounting model is developed into a working tool, as no prior study of accounting is assumed. Then illustrative business cases are discussed to show how external reports conform to financial contracts and public regulation. Public reports primarily directed to investors and creditors are analyzed to reconstruct the economic events and managerial decisions underlying generally accepted accounting standards. Prerequisite: Masters student standing and Management majors only.

Core Courses (13 credits)

TECH 64600 - Analysis Of Research In Industry And Technology

Credit Hours: 3.00. Analysis of research and evaluation of research reports. Emphasis on understanding the application of fundamental statistical methods in design and interpretation of research findings in industrial, technical, and human resource development environments. Prerequisite: Master's student standing.

Credits: 3.00

MET 50300 - Applied Optimization

Credit Hours: 3.00. This course will introduce technology graduate students and senior undergraduates to the basic concepts of optimization methods with particular emphasis on applications in product and process design. Unconstrained nonlinear problems will be presented and solved using steepest descent and conjugate directions. Constrained problems will be solved using exterior penalty functions. Permission of department required.

Learning Outcomes: 1. Recognize optimization problems and cast them in standard form. 2. Identify objective functions and constraints. 3. Use commercial software to solve formal optimization problems. 4. Correctly identify global and local optimum solutions. 5. Use basic calculus concepts to calculate design sensitivities. 6. Understand the geometric concept of design space and be able to plot design space for a constrained problem with two design variables. Credits: 3.00

MET 52700 - Technology From A Global Perspective

Credit Hours: 3.00. Introduction to the challenges faced by the practicing technologist when working and interacting with international technical personnel, both here and abroad, including history, standards, education, and practice of technology outside the United States. Permission of department required.

Learning Outcomes: 1. Awareness and comprehension of cross-cultural factors necessary for international professional practice in technology. 2. Effective research strategies that access what is known about technology development, usage and impact from a global perspective. 3. Knowledge and skill in researching and reporting cultural factors affecting business practices in a variety of independent nation states. 4. Knowledge of procedures, regulations and practices regarding international business. 5. Research skills to identify the natural and technology resources of countries. 6. An ability to contrast the impact of technology infrastructure and use of technology in developed countries to what occurs in underdeveloped countries. 7. Knowledge of the concept and application of ""Appropriate Technology"". 8. Knowledge of the historical development of technology in various modern nations. 9. Informed judgments regarding the influences of cultural and political environments of countries and their technological development. 10. Awareness of the major changes related to current and/or emerging technology in the leading industrial nations of the world. 11. Understanding of the methodologies employed for the effective introduction of technologies into new country or cultural settings. 12. Knowledge of selected International Technology Standards and organizations. Credits: 3.00

ENGT 50100 - Graduate Research Seminar

Credit Hours: 0.00 or 1.00. This course is intended to orient new graduate students to the Engineering Technology (ET) program and faculty. This includes PhD students and students pursuing a Master's degree through a thesis or directed project option. This does not include students pursuing a Master's degree with coursework only. Research activities within ET and throughout Purdue University are discussed. Student resources and opportunities are reviewed to give the students the tools they need to be successful. In addition, this course provides a way to develop a natural cohort of graduate students. This course is a graduate seminar course focused on the ET program. Graduate status or upper-division undergraduate. Permission of department required.

Learning Outcomes: 1. Summarize research interests of ET graduate faculty. 2. Interpret Purdue University research activities and resources and apply this knowledge to their particular research plan. 3. Generate MS or PhD preliminary documents based on ET specific requirements. 4. Implement effective use of library resources and ability to write scholarly information in accepted format styles. Credits: 0.00 or 1.00

ENGT 58100 - Workshop In Engineering Technology

Credit Hours: 1.00 to 21.00. This course number is used to pilot and develop new graduate level courses. Each 58100 course number is followed by either a unique alphabetic suffix (e.g., ABC) or numeric suffix (e.g., 123) and is given a unique title and course description. These courses can be included in a graduate plan of study with the usual condition that they must be approved by the student's graduate committee. Accordingly, it is important to discuss these courses with your faculty advisor and committee prior to registration. Permission of instructor required.

Learning Outcomes: 1. Vary by course offering. Credits: 1.00 to 21.00

Statistics Course (3 credits)

STAT 50100 - Experimental Statistics I

Credit Hours: 3.00. Concepts and methods of applied statistics. Exploratory analysis of data. Sample design and experimental design. Normal distributions. Sampling distributions. Confidence intervals and tests of hypotheses for one and two samples. Inference for contingency tables, regression and correlation, and one-way analysis of variance. Use of the SAS statistical software. Intended primarily for students who have not had calculus. Not open to students in mathematical sciences or engineering. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: College Algebra.

Learning Outcomes: 1. Produce and identify basic statistical analyses. 2. Discuss statistical terminology (speak statistics). 3. Use SAS to run basic statistical analyses and interpret corresponding SAS output. Credits: 3.00

STAT 50200 - Experimental Statistics II

Credit Hours: 3.00. Multiple regression including the general linear test, model selection, and regression diagnostics. Analysis of variance for factorial designs, including multiple comparisons. Analysis of covariance. Repeated measures designs. Extensive use of the SAS statistical software. Intended primarily for students who have not had calculus.

Learning Outcomes: 1. Produce and identify advanced statistical analyses. 2. Learn and understand advanced statistical terminology and concepts. 3. Use SAS to run advanced statistical analyses and interpret corresponding SAS output. Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables.

Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

STAT 51200 - Applied Regression Analysis

Credit Hours: 3.00. Inference in simple and multiple linear regression, residual analysis, transformations, polynomial regression, model building with real data, nonlinear regression. One-way and two-way analysis of variance, multiple comparisons, fixed and random factors, analysis of covariance. Use of existing statistical computer programs. Prerequisite: Coursework in Statistical Methods with a calculus prerequisite.

Learning Outcomes: 1. Learn to build and analyze simple and multiple regression models, analysis of variance and covariance (ANOVA/ANCOVA) for regression, inference for regression, diagnostics and remedial measures for regression, transformations, residual analysis, model building, polynomial and interaction models. Credits: 3.00

STAT 51300 - Statistical Quality Control

Credit Hours: 3.00. A strong background in control charts including adaptations, acceptance sampling for attributes and variables data, standard acceptance plans, sequential analysis, statistics of combinations, moments and probability distributions, applications.

Learning Outcomes: 1. Acquire fluency in the language and techniques of modem quality control and its applications. 2. Conceptually understand the utility of statistics for quality control. 3. Apply control charts and experimental design techniques to solve real-life quality control problems. 4. Utilize appropriate Statistical software for statistical computation, visualization, control chart construction, and design of experiments. 5. Discuss what is learned in lecture and assignments through oral and written presentations. Credits: 3.00

STAT 51400 - Design Of Experiments

Credit Hours: 3.00. Fundamentals, completely randomized design; randomized complete blocks; latin square; multi-classification; factorial; nested factorial; incomplete block and fractional replications for 2n, 3n, 2m x 3n; confounding; lattice designs; general mixed factorials; split plot; analysis of variance in regression models; optimum design. Use of existing statistical programs.

Learning Outcomes: 1. Understand design principles and use these principles to plan and implement an experiment in such a way that a statistical analysis results in valid and objective conclusions. 2. Know how to choose an appropriate design given the available resources, factors of interest, and information on nuisance factors. 3. Perform the proper statistical analysis and draw valid conclusions from any designed experiment. Credits: 3.00

Electives (5 credits)

Thesis Research (9 credits)

Program Requirements - Non-Thesis

Required Courses (9 credits)

Core Courses (6 credits)

MET 50300 - Applied Optimization

Credit Hours: 3.00. This course will introduce technology graduate students and senior undergraduates to the basic

concepts of optimization methods with particular emphasis on applications in product and process design. Unconstrained nonlinear problems will be presented and solved using steepest descent and conjugate directions. Constrained problems will be solved using exterior penalty functions. Permission of department required.

Learning Outcomes: 1. Recognize optimization problems and cast them in standard form. 2. Identify objective functions and constraints. 3. Use commercial software to solve formal optimization problems. 4. Correctly identify global and local optimum solutions. 5. Use basic calculus concepts to calculate design sensitivities. 6. Understand the geometric concept of design space and be able to plot design space for a constrained problem with two design variables. Credits: 3.00

MET 52700 - Technology From A Global Perspective

Credit Hours: 3.00. Introduction to the challenges faced by the practicing technologist when working and interacting with international technical personnel, both here and abroad, including history, standards, education, and practice of technology outside the United States. Permission of department required.

Learning Outcomes: 1. Awareness and comprehension of cross-cultural factors necessary for international professional practice in technology. 2. Effective research strategies that access what is known about technology development, usage and impact from a global perspective. 3. Knowledge and skill in researching and reporting cultural factors affecting business practices in a variety of independent nation states. 4. Knowledge of procedures, regulations and practices regarding international business. 5. Research skills to identify the natural and technology resources of countries. 6. An ability to contrast the impact of technology infrastructure and use of technology in developed countries to what occurs in underdeveloped countries. 7. Knowledge of the concept and application of ""Appropriate Technology"". 8. Knowledge of the historical development of technology in various modern nations. 9. Informed judgments regarding the influences of cultural and political environments of countries and their technological development. 10. Awareness of the major changes related to current and/or emerging technology in the leading industrial nations of the world. 11. Understanding of the methodologies employed for the effective introduction of technologies into new country or cultural settings. 12. Knowledge of selected International Technology Standards and organizations. Credits: 3.00

ENGT 56100 - Metrology Concepts And Applications

Credit Hours: 3.00. Metrology is a fundamental concept required for obtaining scientific data and understanding instrumentation. This course introduces the concepts of metrology associated with measurement systems: sensors, signal conditioning, data acquisition and analysis, as well as the error propagation. System and environmental noise are investigated along with methods to mitigate influences of noise. Standards and calibration of instrumentation are also studied. Concepts of metrology for the seven basic units of measurements are described from the macro to nano-scale.

Learning Outcomes: 1. Classify instrumentation necessary to make measurements of interest. 2. Summarize standards and calibration associated with measurements. 3. Implement various methods of reducing system and environmental noise. 4. Calculate errors budgets and adjust instrumentation to meet error budgets. 5. Identify ethical and international aspects of measurement science. Credits: 3.00

ENGT 50700 - Fundamentals Of Collaborative Leadership And Agile Strategy For Engineering Technology

Credit Hours: 3.00. This course will provide students with a foundation in collaborative leadership and agile strategy. The course brings together theories and insights from a variety of disciplines including engineering, management, psychology, and social science. Increasingly manufacturing management is being called upon to apply their technical skills in collaborative environments that cut across organizational units and inter-organizational boundaries. Understanding how to design and

guide collaborations and apply agile approaches for meeting strategic objectives is an important skill set and knowledge base in the 21st-century economy, defined more by open networks than the ridged hierarchies of the past.

Learning Outcomes: 1. Describe characteristics of highly effective leaders in engineering and technology-focused teams and organizations. 2. Apply tools and frameworks for highly effective leadership of engineering and technology-focused teams and organizations. 3. Analyze the potential strengths and potential of various leadership approaches and behaviors in engineering and technologically focused teams and organizations. Credits: 3.00

Statistics Course (3 credits)

STAT 50100 - Experimental Statistics I

Credit Hours: 3.00. Concepts and methods of applied statistics. Exploratory analysis of data. Sample design and experimental design. Normal distributions. Sampling distributions. Confidence intervals and tests of hypotheses for one and two samples. Inference for contingency tables, regression and correlation, and one-way analysis of variance. Use of the SAS statistical software. Intended primarily for students who have not had calculus. Not open to students in mathematical sciences or engineering. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: College Algebra.

Learning Outcomes: 1. Produce and identify basic statistical analyses. 2. Discuss statistical terminology (speak statistics). 3. Use SAS to run basic statistical analyses and interpret corresponding SAS output. Credits: 3.00

STAT 50200 - Experimental Statistics II

Credit Hours: 3.00. Multiple regression including the general linear test, model selection, and regression diagnostics. Analysis of variance for factorial designs, including multiple comparisons. Analysis of covariance. Repeated measures designs. Extensive use of the SAS statistical software. Intended primarily for students who have not had calculus.

Learning Outcomes: 1. Produce and identify advanced statistical analyses. 2. Learn and understand advanced statistical terminology and concepts. 3. Use SAS to run advanced statistical analyses and interpret corresponding SAS output. Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

STAT 51200 - Applied Regression Analysis

Credit Hours: 3.00. Inference in simple and multiple linear regression, residual analysis, transformations, polynomial

regression, model building with real data, nonlinear regression. One-way and two-way analysis of variance, multiple comparisons, fixed and random factors, analysis of covariance. Use of existing statistical computer programs. Prerequisite: Coursework in Statistical Methods with a calculus prerequisite.

Learning Outcomes: 1. Learn to build and analyze simple and multiple regression models, analysis of variance and covariance (ANOVA/ANCOVA) for regression, inference for regression, diagnostics and remedial measures for regression, transformations, residual analysis, model building, polynomial and interaction models. Credits: 3.00

STAT 51300 - Statistical Quality Control

Credit Hours: 3.00. A strong background in control charts including adaptations, acceptance sampling for attributes and variables data, standard acceptance plans, sequential analysis, statistics of combinations, moments and probability distributions, applications.

Learning Outcomes: 1. Acquire fluency in the language and techniques of modem quality control and its applications. 2. Conceptually understand the utility of statistics for quality control. 3. Apply control charts and experimental design techniques to solve real-life quality control problems. 4. Utilize appropriate Statistical software for statistical computation, visualization, control chart construction, and design of experiments. 5. Discuss what is learned in lecture and assignments through oral and written presentations. Credits: 3.00

STAT 51400 - Design Of Experiments

Credit Hours: 3.00. Fundamentals, completely randomized design; randomized complete blocks; latin square; multi-classification; factorial; nested factorial; incomplete block and fractional replications for 2n, 3n, 2m x 3n; confounding; lattice designs; general mixed factorials; split plot; analysis of variance in regression models; optimum design. Use of existing statistical programs.

Learning Outcomes: 1. Understand design principles and use these principles to plan and implement an experiment in such a way that a statistical analysis results in valid and objective conclusions. 2. Know how to choose an appropriate design given the available resources, factors of interest, and information on nuisance factors. 3. Perform the proper statistical analysis and draw valid conclusions from any designed experiment. Credits: 3.00

MET 52700 - Technology From A Global Perspective

Credit Hours: 3.00. Introduction to the challenges faced by the practicing technologist when working and interacting with international technical personnel, both here and abroad, including history, standards, education, and practice of technology outside the United States. Permission of department required.

Learning Outcomes: 1. Awareness and comprehension of cross-cultural factors necessary for international professional practice in technology. 2. Effective research strategies that access what is known about technology development, usage and impact from a global perspective. 3. Knowledge and skill in researching and reporting cultural factors affecting business practices in a variety of independent nation states. 4. Knowledge of procedures, regulations and practices regarding international business. 5. Research skills to identify the natural and technology resources of

countries. 6. An ability to contrast the impact of technology infrastructure and use of technology in developed countries to what occurs in underdeveloped countries. 7. Knowledge of the concept and application of ""Appropriate Technology"". 8. Knowledge of the historical development of technology in various modern nations. 9. Informed judgments regarding the influences of cultural and political environments of countries and their technological development. 10. Awareness of the major changes related to current and/or emerging technology in the leading industrial nations of the world. 11. Understanding of the methodologies employed for the effective introduction of technologies into new country or cultural settings. 12. Knowledge of selected International Technology Standards and organizations. Credits: 3.00

MET 53000 - Facilities Engineering Technology

Credit Hours: 3.00. A study of the application of the engineering sciences and technology to the solution of problems associated with mechanical and electrical systems in buildings. Emphasizes commercial and industrial facilities. Identifying energy conservation measures for both mechanical and electrical systems and evaluating their economic impact are an important focus of the course.

Learning Outcomes: 1. Explain building energy trends and related policy. 2. Explain the organizations and personnel supporting the built environment. 3. Use building automation systems to monitor and control building operation. 4. Quantify energy use in building systems. 5. Use accepted professional practice for technical computations and writing. 6. Calculate the economic impact of energy and resource conservation measures for buildings. 7. Compute the impact of solar energy use for a building. 8. Apply strategies for maintaining Indoor Air Quality in buildings. 9. Evaluate the performance of mechanical or electrical systems in buildings. Credits: 3.00

ENGT 50700 - Fundamentals Of Collaborative Leadership And Agile Strategy For Engineering Technology

Credit Hours: 3.00. This course will provide students with a foundation in collaborative leadership and agile strategy. The course brings together theories and insights from a variety of disciplines including engineering, management, psychology, and social science. Increasingly manufacturing management is being called upon to apply their technical skills in collaborative environments that cut across organizational units and inter-organizational boundaries. Understanding how to design and guide collaborations and apply agile approaches for meeting strategic objectives is an important skill set and knowledge base in the 21st-century economy, defined more by open networks than the ridged hierarchies of the past.

Learning Outcomes: 1. Describe characteristics of highly effective leaders in engineering and technology-focused teams and organizations. 2. Apply tools and frameworks for highly effective leadership of engineering and technology-focused teams and organizations. 3. Analyze the potential strengths and potential of various leadership approaches and behaviors in engineering and technologically focused teams and organizations. Credits: 3.00

ENGT 58300 - Applied Engineering Statistics For Industry

Credit Hours: 3.00. The purpose of this course is to teach the practitioner how to use and make better-informed decisions as a manager for making optimum process, business, or personnel decisions. Emphasis will be placed on Verification, Validation in R&D, Manufacturing, QA/QC, basic probability, Summarizing Data, Basic Tools (flowcharts, fishbone diagrams, Pareto charts), Process Capability - Cp/Cpk. Upper and lower control limits/charts, Use of Control Charts for Continual Improvement, Six Sigma, Design of Experiments, Taguchi Methodology and Data Analytics will also be covered.

Learning Outcomes: 1. Demonstrate the importance of the Central Limit Theorem and its application. 2. Evaluate the capability of a process using the process capability index (CPI). 3. Analyze variation reduction in relation to process capability and design of experiments. 4. Articulate how single-piece flow, standard work, and continuous improvement processes enable variation reduction. 5. Determine the expected number of defects from a given

process. 6. Explain the statistical meaning of Six Sigma. 7. Differentiate between Type I and Type II errors. 8. Calculate the sample size based on specified Type I and Type II Error. 9. Calculate a confidence interval. 10. Define direct run rate I first time through and its calculation. 11. Develop a hypothesis test. 12. Calculate regression and correlation of data and distinguish between correlation and causation. 13. Select and evaluate the test statistic for different kinds of hypothesis tests and make statistical inference decisions. 14. Construct and evaluate an ANOVA table and make statistical inference decisions. 15. Differentiate among different types of experimental designs and design an experiment. 16. Demonstrate the Taguchi quality loss function and how to make quality loss calculations. 17. Classify the procedural errors that can occur in experimental design, such as confirmation bias. 18. Explain data mining and Big Data and their role in the future of experimental design. Credits: 3.00

ENGT 55000 - Manufacturing System Design For Sustainability

Credit Hours: 3.00. This course prepares manufacturing and information technology leaders to design and analyze manufacturing processes to achieve manufacturing system objectives that meet internal and external customers quality, cost and delivery requirements within a safe environment. The course project covers major aspects of manufacturing system design and Industry 4.0 in the context of meeting customer needs. Technology leaders and entrepreneurs learn how to work with others to develop the design of manufacturing systems that are sustainable (business, ecological, social, technological) for the long term. When to use lean and six-sigma techniques in the context of the manufacturing enterprise system design to meet customer needs will be assessed from a system design perspective, through analytical and computer simulation techniques, and through the use of physical modeling tools.

Learning Outcomes: 1. Relate why and how the design of manufacturing processes/equipment that support manufacturing system requirements enables lower cost, high quality, on-time delivery, volume and mix flexibility, sustainability, and continuous improvement. 2. Determine why our tone affects the ability to make systems improvements; realize that the origin of at least 90 percent of all issues is due to the system design and implementation and not the people. 3. Apply a structured approach and language to identify, describe, and relate system design thinking to implementation structure and work - i.e. Lean is an outcome of effective system design. 4. Align performance measures to reinforce manufacturing system design requirements with the knowledge that total cost results from the system design. 5. Design a manufacturing system and the included manufacturing processes to establish product flow, part families and takt time -- time per unit (average pace of customer demand). 6. Create a controllable, robust system design, i.e., a manufacturing system that meets customer quality and delivery expectations in spite of disruptions. 7. Reduce the 5 Delays that increase manufacturing lead time by using manufacturing system design. 8. Apply methods to evaluate and develop Manufacturing Systems, including the Manufacturing System Design Decomposition (MSDD), Capability Maturity Model Integration (CMMI), Six Sigma (DMAIC) Process. 9. Describe why Tone, Plan Do Check Act (PDCA), Standard Work, Takt Time and a Robust / Controllable System Design are necessary for continuous improvement and sustainability. 10. Develop an organizational structure to sustain and improve the manufacturing system. Credits: 3.00

ENGT 54000 - Change Management For Enterprise Sustainability

Credit Hours: 3.00. Change management is at the core of an engineering organization's processes and data, and it affects every member of the enterprise. Change management provides a method for identifying, analyzing, preparing, implementing, validating, and documenting engineering changes throughout a product's lifecycle, to ensure everyone in the organization is

working from the same product record and changes are communicated in real-time. In this course, the core elements, data structures, stakeholders, and workflows of change management and their role as enablers of the digital thread and the digital enterprise are discussed. The application of the industry standard CM2 methodology is emphasized as a strategy to provide control, maintain data integrity, and improve visibility and traceability of changes.

Learning Outcomes: 1. Summarize the challenges that engineering and manufacturing organizations face when managing quality, options, and variants throughout a product lifecycle. 2. Construct and justify a product hierarchy and its associated datasets. 3. Estimate the magnitude of corrective action for a given change and compare it to the application of conformance measurements. 4. Assess the impact of an engineering change. 5. Evaluate and interpret the CM2 model, an industry-standard closed-loop change management process. 6. Differentiate and prepare the main change objects for authorizing and managing work. 7. Summarize the challenges and complexities of lifecycle sustainment and assess how they differ from those in product development. 8. Prepare a detailed change implementation plan. Credits: 3.00

ENGT 60500 - Engineering Technology Research Writing Strategies

Credit Hours: 2.00 to 3.00. The stated Master of Science in Engineering Technology graduate course teaches research literature mining and analysis found in Purdue licensed databases. Focuses on detail, a measurable topic, literature review, reporting, citation, data visualization using APA. Requires research paper writing aligned with ARWE specifications for in-depth research preparation and reporting. Students will research a topic relevant to a workplace problem in their industry. For example, a new technology, a process (Giga Casting for example), a material, supply chain, digitization, industry 4/5.0, sustainability, workforce diversity, aging workforce, ethics in the workplace, offshoring vs. onshoring, direct part marking, inventory/project management, cybersecurity risks, facility management, energy management, patents/intellectual property or environmental compliance. Keep in mind, Before You Start, that whichever topic you choose, the problem must be measurable. Measurable either from a quantitative or qualitative statistic perspective. Your topic will have to be tied to a global grand engineering challenge we face as a society and/or industry.

Learning Outcomes: 1. Evaluate the data you collected by completing the Workplace Information Literacy Strategies (WILS) activity to determine your research topic. 2. Analyze research topic/focus gained from the WILS, correlate a measurable research problem statement, and relate it to one of the 14 global, grand engineering challenges. 3. Create an Introduction to the problem statement. 4. Synthesize collected data by writing a review of the literature which supports the research problem topic. 5. Evaluate different research measures for the problem, choosing one to assess the problem. 6. Analyze the research measure(s) by using ChatGPT to help determine optimum research measure to write up. 7. Create a research methodology by writing a detailed script on how you intend to measure the research problem. 8. Submit expected deliverables in a timely manner after evaluating your final analysis report, synthesizing the introduction, research problem statement, review of literature, and research measure. 9. Present a compelling oration of your research topic and significance as to why the topic should be pursued or funded. The creation of a three-minute video debriefing is not an exercise in "watering down" research but forcing you to consolidate your ideas and concisely explain your research discoveries for senior leadership approval and funding. 10. Complete written assignments using APA format and NO passive wording or adverbs. Adhere to the MET 527 Academic Research Writing Expectations (ARWE) handout document. Failure to not read and follow the ARWE document will prove to be an unsuccessful assignment/course experience. 11. Perform individually AND not fall into the

plagiarism trap. Credits: 2.00 to 3.00

MFET 55800 - Smart Manufacturing & Global Supply Chain

Credit Hours: 3.00. Progressive manufacturing uses innovative technology to improve products or processes through the Internet of Things. Smart manufacturing is not limited to emerging technologies; rather, it is composed of efficient, productive, highly integrated, tightly controlled processes across a spectrum of globally competitive U.S. manufacturers and suppliers, including the facilities themselves. The course will examine the selection, characteristics, and optimization of materials, processes, big data, cloud analysis of design data, control and adaptive theories, and personnel in a production environment. Examining global manufacturing issues through a variety of business examples, you will study the framework that explains the characteristics and challenges surrounding global supply chain management and investigate the impact on suppliers, manufacturers, and customers.

Learning Outcomes: 1. Evaluate and design automation and control strategies in manufacturing operations. 2. Assess data collection, analysis, and sharing attributes of manufacturing systems and subsystems. 3. Plan and apply strategies for managing data from multiple sources. 4. Analyze and appraise variables significant for global supply chain management. Credits: 3.00

ENGT 51000 - Internet Of Things And Cybersecurity For Engineering And Technology

Credit Hours: 3.00. The internet has brought about the ability to embed computing into everyday devices to allow them to send and receive information. These devices, known as the Internet of Things (IoT), will require management at all levels to understand the inherent security risks due to the interconnection via the internet. Illegally accessing (hacking) IoT is increasingly becoming the most pervasive form of industrial espionage in use today. Understanding the threats aimed at IoT and how to protect IoT will be the key to keeping sensitive corporate information and secrets secure and private, and will require everyone's participation, not just the IT department. For this course students will learn the basics of research of and into cybersecurity, and the techniques used to commit industrial related crimes; how to detect these potentially catastrophic crimes; and the means to protect one of the company's most important assets...its systems and data.

Learning Outcomes: 1. Analyze security regulations relevant to their industry. 2. Apply a cybersecurity framework based upon industry regulations. 3. Analyze privacy issues with Internet of Things. 4. Analyze the difference between threats, vulnerabilities and risks as it relates to Internet of Things. 5. Apply techniques to mitigate risk to Internet of Things. 6. Evaluate the inherent benefits of using IoT, potential risks to IoT, and how to use a cybersecurity framework to help mitigate risk to IoT. Credits: 3.00

Concentrations

Program Learning Outcomes

English, MA

About the Program

Program Requirements - Thesis and Non-thesis

Required Courses (15 credits)

ENGL 50100 - Introduction To English Studies

Credit Hours: 3.00. Introduction to graduate studies in English with special emphasis on research and reference tools, methods of bibliography, and the writing of scholarly papers. Prerequisite: Fulfillment of the basic composition requirement and 6 credit hours in English.

Credits: 3.00

Breadth Areas (12 credits)

Medieval and Early Modern Courses (3 credits)

Transatlantic and Early Atlantic Courses (3 credits)

20th and 21st Century Literary Courses (3 credits)

Theory and Cultural Courses (3 credits)

Medieval and Early Modern Courses (3 credits)

Seminar (3 credits)

ENGL 60600 - Seminar In Poetry Writing

Credit Hours: 3.00. An advanced course in the writing of poetry. Workshop criticism. Study of the work of established writers. Prerequisite: admission to the MA program in creative writing.

Learning Outcomes: 1. Enhance active reading skills through the close examination and critique of the poetry, notebooks, and letters of established poets. 2. Enhance feedback skills through thoughtful, frank, tactful, and intelligent critiques of your classmates' poems. 3. Enhance writing skills through intensive writing of original poetry and through structure exercises. Credits: 3.00

ENGL 60900 - Seminar In Fiction Writing

Credit Hours: 3.00. An advanced course in the writing of fiction. Workshop critiques. Prerequisite: Admission to the creative writing program.

Learning Outcomes: 1. Enhance reading skills through close examination of other writers, including classmates and professional writers. 2. Enhance vocabulary for the creative writing discourse community. 3. Enhance feedback skills through thoughtful, frank, tactful, and intelligent discussion of your classmates stories and novel chapters. 4. Expand reading and writing aesthetics, and understanding of what literature is and can be, that will guide your reading and writing in the future. 5. Produce fiction benefitting a third-year thesis. Credits: 3.00

ENGL 62500 - Seminar On Empirical Research In Writing

Credit Hours: 3.00. An analysis and evaluation of empirical research concerned with composing processes, critical literacy, disciplinary writing, various writing cultures, and composition pedagogy. Students will study empirical research designs and develop a project in one of the above areas. Prerequisite: ENGL 59100 .

Credits: 3.00

ENGL 62700 - Seminar In Linguistics

Credit Hours: 3.00. Investigation of a topic in advanced linguistics research.

Credits: 3.00

ENGL 62900 - Seminar In English As A Second Language

Credit Hours: 3.00. In-depth study of variable subjects relating to the nature of English as a second/foreign/international language and its learning and teaching. Prerequisite: ENGL 51600 .

Credits: 3.00

ENGL 63000 - Seminar In Second Language Writing

Credit Hours: 3.00. An overview and examination of major issues in the theory, research, and practice of writing in English as a second language. Prerequisite: ENGL 51600 or ENGL 59100 .

Credits: 3.00

ENGL 66800 - Seminar In Interpretation And Cultural Theory

Credit Hours: 3.00. Examination of selected developments in social, cultural, and hermeneutical theories from the eighteenth century to the present.

Credits: 3.00

ENGL 67400 - Seminar In Language Testing

Credit Hours: 3.00. An introduction to the techniques, practices, and history of language testing. Introduces the basic tenets of measurement and the issues and controversies related to the measurement of language ability.

Credits: 3.00

ENGL 68000 - Seminar In Rhetoric And Composition

Credit Hours: 3.00. A variable content course dealing with topics such as cultural studies and composition, medieval rhetoric, renaissance rhetoric, literacy, historiographies of rhetoric, qualitative studies, and professional writing theory. Prerequisite: ENGL 59100 .

Credits: 3.00

ENGL 69600 - Seminar In Literature

Credit Hours: 3.00. Advanced study of special subjects.

Learning Outcomes: 1. Think critically about course content. 2. Read and write reflectively and critically about the course content. 3. Engage in course discussions, either online or face to face, which will encourage critical thought and personal engagement. Credits: 3.00

Breadth Areas (12 credits)

Medieval and Early Modern Courses (3 credits)

Transatlantic and Early Atlantic Courses (3 credits)

20th and 21st Century Literary Courses (3 credits)

Theory and Cultural Courses (3 credits)

Medieval and Early Modern Courses (3 credits)

Electives (12-15 credits)

Thesis Research (0-3 credits)

ENGL 69800 - Research MA Or MFA Thesis

Credit Hours: 1.00 to 18.00. Research MA Or MFA Thesis. Permission of instructor required.

Credits: 1.00 to 18.00

LTC Exam Requirements

Required Courses (15 credits)

ENGL 50100 - Introduction To English Studies

Credit Hours: 3.00. Introduction to graduate studies in English with special emphasis on research and reference tools, methods of bibliography, and the writing of scholarly papers. Prerequisite: Fulfillment of the basic composition requirement and 6 credit hours in English.

Credits: 3.00

Breadth Areas (12 credits)

Medieval and Early Modern Courses (3 credits)

Transatlantic and Early Atlantic Courses (3 credits)

20th and 21st Century Literary Courses (3 credits)

Theory and Cultural Courses (3 credits)

Medieval and Early Modern Courses (3 credits)

Seminar (3 credits)

ENGL 60600 - Seminar In Poetry Writing

Credit Hours: 3.00. An advanced course in the writing of poetry. Workshop criticism. Study of the work of established writers. Prerequisite: admission to the MA program in creative writing.

Learning Outcomes: 1. Enhance active reading skills through the close examination and critique of the poetry, notebooks, and letters of established poets. 2. Enhance feedback skills through thoughtful, frank, tactful, and intelligent critiques of your classmates' poems. 3. Enhance writing skills through intensive writing of original poetry and through structure exercises. Credits: 3.00

ENGL 60900 - Seminar In Fiction Writing

Credit Hours: 3.00. An advanced course in the writing of fiction. Workshop critiques. Prerequisite: Admission to the creative writing program.

Learning Outcomes: 1. Enhance reading skills through close examination of other writers, including classmates and professional writers. 2. Enhance vocabulary for the creative writing discourse community. 3. Enhance feedback

skills through thoughtful, frank, tactful, and intelligent discussion of your classmates stories and novel chapters. 4. Expand reading and writing aesthetics, and understanding of what literature is and can be, that will guide your reading and writing in the future. 5. Produce fiction benefitting a third-year thesis. Credits: 3.00

ENGL 62500 - Seminar On Empirical Research In Writing

Credit Hours: 3.00. An analysis and evaluation of empirical research concerned with composing processes, critical literacy, disciplinary writing, various writing cultures, and composition pedagogy. Students will study empirical research designs and develop a project in one of the above areas. Prerequisite: ENGL 59100 .

Credits: 3.00

ENGL 62700 - Seminar In Linguistics

Credit Hours: 3.00. Investigation of a topic in advanced linguistics research.

Credits: 3.00

ENGL 62900 - Seminar In English As A Second Language

Credit Hours: 3.00. In-depth study of variable subjects relating to the nature of English as a second/foreign/international language and its learning and teaching. Prerequisite: ENGL 51600 .

Credits: 3.00

ENGL 63000 - Seminar In Second Language Writing

Credit Hours: 3.00. An overview and examination of major issues in the theory, research, and practice of writing in English as a second language. Prerequisite: ENGL 51600 or ENGL 59100 .

Credits: 3.00

ENGL 66800 - Seminar In Interpretation And Cultural Theory

Credit Hours: 3.00. Examination of selected developments in social, cultural, and hermeneutical theories from the eighteenth century to the present.

Credits: 3.00

ENGL 67400 - Seminar In Language Testing

Credit Hours: 3.00. An introduction to the techniques, practices, and history of language testing. Introduces the basic tenets of measurement and the issues and controversies related to the measurement of language ability.

Credits: 3.00

ENGL 68000 - Seminar In Rhetoric And Composition

Credit Hours: 3.00. A variable content course dealing with topics such as cultural studies and composition, medieval rhetoric, renaissance rhetoric, literacy, historiographies of rhetoric, qualitative studies, and professional writing theory. Prerequisite: ENGL 59100 .

Credits: 3.00

ENGL 69600 - Seminar In Literature

Credit Hours: 3.00. Advanced study of special subjects.

Learning Outcomes: 1. Think critically about course content. 2. Read and write reflectively and critically about the course content. 3. Engage in course discussions, either online or face to face, which will encourage critical thought and personal engagement. Credits: 3.00

About the Program

Program Requirements - Thesis & Non-Thesis

Required Courses (3-5 credits)

ENTM 60000 - Graduate Student Orientation

Credit Hours: 1.00. Introduction and orientation to the requirements and culture of the Department of Entomology, the College of Agriculture, and Purdue University. Intended for graduate students in their first year.

Learning Outcomes: 1. Know the administrative regulations and procedures of Entomology and the Graduate School. 2. Know the history of Entomology. 3. Know the land grant mission and the role of Entomology. 4. Know the University hierarchy. 5. Know the roles, rules and expectations of the apprentice and mentors. 6. Begin creation of a career plan. 7. Develop strategies for effective networking. 8. Learn how to communicate within the discipline through oral and poster presentations. 9. Participate in independent activities. Credits: 1.00

GRAD 61200 - Responsible Conduct Of Research

Credit Hours: 1.00. Overview of values, professional standards, and regulations that define responsible conduct in research. Students learn the values and standards of responsible research through readings and lecture/discussion and practice application of these values and standards to research situations through class discussion of case studies from life sciences research. Students must be registered for M.S. or Ph.D. thesis research in their home department.

Credits: 1.00

GRAD 59000 - Special Topics

Credit Hours: 1.00 to 3.00. Hours and credits to be arranged. For the use of interdisciplinary programs and in other situations when appropriate departmental courses are not available or general Graduate School identification is desirable. To be used only with the consent of the dean of the Graduate School.

Credits: 1.00 to 3.00

GRAD 55000 - Fellowship And Grant Application Writing

Credit Hours: 2.00. Fellowship Application Writing is open to any graduate student who is interested in applying for fellowships and other grant opportunities. Graduate students will be taught how to write personal statements, research statements, and extended research plans that they can submit for fellowship applications. Organization of research background, methods, and significance will be emphasized. Writing mechanics and addressing grant agency requirements and procedures will also be covered. Additionally, fellowship and grant opportunities will be discussed along with professional communication skills.

Learning Outcomes: 1. Analyze the different types of fellowship opportunities currently available to them as well as form broad knowledge of postdoc and faculty grants. 2. Practice and evaluate proofreading skills to gain experience in editing fellowship application writings and be able to apply advanced proofreading skills to future writing projects. 3. Compose persuasive documents using a grant proposal writing style with appropriate formatting and organization and analyze their writing with grant agency criteria. 4. Synthesize and refine competitive personal statements, research plans, and statements of previous research to use for various fellowship

applications. Credits: 2.00

ENTM 60900 - Science Writing

Credit Hours: 1.00. This course is designed for graduate students (MS or PhD) at any stage in their professional career who are seeking formal training in manuscript and grant writing for a scientific audience. Students will be required to attend class and prepare for in-class group discussions and writing activities by reading assigned sections of the text or associated papers. Students will also be required to prepare a written assignment (manuscript or grant) over the course of the semester, which they will use to practice and hone newly acquired skills, as well as participating in peer evaluation of one another's writing. Permission of department required.

Learning Outcomes: 1. Utilize resources and approaches (e.g. online tools, peer-writing groups, time management skills) to develop regular writing habits. 2. Perform critiques of scientific manuscripts and research proposals. 3. Provide constructive criticism to fellow students on writing assignments. 4. Learn steps and basic principles (e.g. language, narrative structure, revision Revised: 08/11/21 process) used to write clear and concise scientific papers for a variety of audiences. 5. Apply principles of science writing to develop a complete draft of a specific section(s) of the MS/PhD research proposal, critical literature review, manuscript or other academic work (with instructor permission). Credits: 1.00

Core Selectives (12-13 credits)

ENTM 52500 - Medical And Veterinary Entomology

Credit Hours: 3.00. Introduction to the biology and control of arthropods of medical and veterinary importance, and coverage of the natural history and abatement of selected arthropod-related diseases, including arboviral encephalitis, filariasis, leishmaniasis, Lyme disease, malaria, plague, spotted fever, trypanosomiasis, and myasis. Offered in odd-numbered years.

Credits: 3.00

ENTM 61100 - Toxicology Of Insecticides

Credit Hours: 3.00. The chemistry, mode of action, and metabolism of insecticides and related compounds in both insect and vertebrate systems. Evaluation of toxic action, principles of selective toxicity, insecticide resistance, and environmental effects are also discussed. A minimal knowledge of entomology is required. Knowledge of biochemistry and neurobiology is useful. Offered in even-numbered years.

Credits: 3.00

ENTM 69200 - Special Topics

Credit Hours: 1.00 to 4.00. Advanced topics in specialties of department members such as, but not limited to: biochemistry and physiology; biological control; insect pest management; veterinary entomology; nematode systematics; pathology; systematics. The field in which work is offered will appear on the student's record. Doctoral student standing. Permission of instructor required.

Credits: 1.00 to 4.00

STAT 50300 - Statistical Methods For Biology

Credit Hours: 3.00. Introductory statistical methods, with emphasis on applications in biology. Topics include descriptive statistics, binomial and normal distributions, confidence interval estimation, hypothesis testing, analysis of variance, introduction to nonparametric testing, linear regression and correlation, goodness-of-fit tests, and contingency tables. Open only to majors related to the life sciences. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100.

Learning Outcomes: 1. Students will be able to identify and choose appropriate ways to graphically and numerically summarize data. 2. Students will be able to use basic statistical methods to perform statistical inference and draw appropriate conclusions. 3. Students will understand the mathematical foundations of statistical inference for random samples so that they can study and utilize additional statistical methods. Credits: 3.00

BIOL 58210 - Ecological Statistics

Credit Hours: 3.00. This course covers topics that are useful for successfully designing and analyzing statistically observational and experimental studies in ecology, animal behavior, evolutionary biology, forestry, wildlife sciences, fisheries, etc. Some topics are: differences between hypotheses and predictions, design of an ecological study, general linear models, assumptions, different types of designs (factorial, nested, repeated measures, blocks, split-plots, etc.), fitting models to data, etc. The course will focus on the conceptual

understanding of these topics (e.g., interpreting the results of statistical tests) and practice with statistical programs and real datasets.

Learning Outcomes: 1. Pose scientific questions, hypotheses, and predictions. 2. Plan and design ecological research projects. 3. Determine sample size requirements. 4. Use and interpret descriptive statistics. 5. Use general linear models and interpret their results. 6. Check for the assumptions of general linear models. 7. Manage data. 8. Understand the potential and limitations of statistics in ecological research. Credits: 3.00

ENTM 50800 - Integrative Insect Taxonomy

Credit Hours: 4.00. A multisource approach to understanding insect taxonomy, morphology, and evolution. We will compare traditional classification schemes with new hypotheses of insect evolutionary relationships based on an array of data sources. Students learn the importance of natural history collections and how to prepare insect specimens for permanent storage. We will explore insect diversity through hands-on laboratory exercises and field research.

Learning Outcomes: 1. Identify insects to family by to sight. 2. Implement field techniques for collecting insect specimens. 3. Demonstrate proper insect collection preparation and curation. 4. Understand the principles of insect morphology, classification, and nomenclature. 5. Understand phylogenetic hypotheses and their implementation in insect taxonomy. 6. Integrate skills through a final class project on insect evolution. Credits: 4.00

ENTM 64200 - Analysis Of Ecological Data

Credit Hours: 3.00. Intermediate course in analysis options for biological and ecological data. Topics include: univariate, multivariate, parametric and non-parametric analysis and their basis; advanced graphical techniques; basic mapping with and without geographical information systems; simulation modeling; associated coding for open source platforms. A previous graduate-level course in statistics is required. Working knowledge of ANOVA, t-tests, linear regression, and assumptions and distributions of test statistics for these is assumed.

Learning Outcomes: 1. Know data and analysis requirements when planning experiments and observational studies. 2. Apply several univariate and multivariate statistical analyses. 3. Model or simulate simple biological or ecological systems. 4. Use several different graphing techniques including mapping, three-dimensional plots, and animations. 5. Write code to accomplish 1-4 within open-source software. 6. Develop critical thinking skills. 7. Foster creativity by finding alternative solutions to analytical challenges. 8. Develop both the written and the technical side of communication skills. Credits: 3.00

ENTM 61000 - Current Trends In Insect Pest Management

Credit Hours: 3.00. Concepts of pest management and dynamics of pest populations, with emphasis on population regulation in theory and practice. The principles of applied ecology that pertain to insects and agricultural crops and systems. Identification, biology, behavior, and relationships of pests of forage, fiber, and vegetable crops. A knowledge of introductory entomology is recommended. Offered in even-numbered years.

Learning Outcomes: 1. Identify key insects in economically important IPM systems. 2. Design a pest management plan that includes preventive practices, sampling and economic thresholds. 3. Identify gaps in management techniques and propose new research directions. 4. Discuss key IPM concepts. Credits: 3.00

Thesis Research (6 credits)

ENTM 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required.

Credits: 1.00 to 18.00

Non-Thesis Project

Electives (6-15 credits)

Required Courses (3-5 credits)

ENTM 60000 - Graduate Student Orientation

Credit Hours: 1.00. Introduction and orientation to the requirements and culture of the Department of Entomology, the College of Agriculture, and Purdue University. Intended for graduate students in their first year.

Learning Outcomes: 1. Know the administrative regulations and procedures of Entomology and the Graduate School. 2. Know the history of Entomology. 3. Know the land grant mission and the role of Entomology. 4. Know the University hierarchy. 5. Know the roles, rules and expectations of the apprentice and mentors. 6. Begin creation of a career plan. 7. Develop strategies for effective networking. 8. Learn how to communicate within the discipline through oral and poster presentations. 9. Participate in independent activities. Credits: 1.00

GRAD 61200 - Responsible Conduct Of Research

Credit Hours: 1.00. Overview of values, professional standards, and regulations that define responsible conduct in research. Students learn the values and standards of responsible research through readings and lecture/discussion and practice application of these values and standards to research situations through class discussion of case studies from life sciences research. Students must be registered for M.S. or Ph.D. thesis research in their home department.

Credits: 1.00

About the Program

Environmental and Ecological Engineering, MSEEE

About the Program

Program Requirements - Thesis & Non-thesis

Required Courses (18-30 credits)

Core Courses (9 credits)

EEE 69500 - Experimental Courses

Credit Hours: 0.00 to 6.00. Topics vary. Arrange hours and credit. Permission of instructor required.

Credits: 0.00 to 6.00

Electives (9-21 credits)

Seminar (0 credits)

EEE 69000 - Environmental And Ecological Engineering Graduate Seminar

Credit Hours: 0.00. Combination of invited speakers (outside and inside Purdue) including graduate students. Topics will range across environmental and ecological engineering with an emphasis on current topics.

Learning Outcomes: 1. Increased understanding of academic and research topics in Environmental and Ecological Engineering (EEE). 2. Improve ability of EEE graduate students to think critically about research and presentation skills of others. 3. Increased ability to critique his or her own work. Credits: 0.00

Thesis Research (12 credits)

EEE 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required.

Learning Outcomes: 1. Learning objectives vary per student. Credits: 1.00 to 18.00

Concentrations

GPA Requirements

Finance, MS

About the Program

Program Requirements

Required Courses (14 credits)

MGMT 64300 - Financial Risk Management

Credit Hours: 2.00 to 4.00. Provides a foundation for understanding ways in which financial institutions and industrial firms can optimally manage financial risks. Concentrates on various "functional" risk measurement problems related to interest rate risk, default risk, exchange rates, and commodity prices. Prerequisite: MGMT 61000 .

Credits: 2.00 to 4.00

MGMT 64200 - Portfolio Management

Credit Hours: 2.00 to 4.00. Methods of analysis of common stocks and bonds for individual and institutional portfolios. Review of the empirical evidence of security market efficiency, and implications of that evidence for various methods of security

analysis. Team projects to analyze the economy, the particular industry or sector, and selected firms within the industry or sector, and to make specific buy-hold-sell recommendations for the stocks and bonds of those firms. Prerequisite:MGMT 61000 .

Credits: 2.00 to 4.00

MGMT 61400 - Investments

Credit Hours: 2.00 to 4.00. Examination of the process of asset valuation. Emphasis on portfolio analysis, security selection, risk-return relationships, and performance evaluation. Additional topics considered include security analysis, option pricing and analysis, futures contracts, and security market operations.

Learning Outcomes: 1. Develop a sound foundation for the main concepts in investment management and portfolio theory. 2. Understand how stock, bond, and option prices are determined. 3. Learn the analytical tools and financial theory necessary to understand how financial assets are used for investment decisions. 4. Take a critical look at the process of investing and relate the topics covered to current real-world problems relevant to practitioners. 5. Prepare students for more advanced courses in investments, portfolio management, and corporate finance. Credits: 2.00 to 4.00

MGMT 61100 - Advanced Corporate Finance

Credit Hours: 2.00 to 4.00 (West Lafayette, Calumet) 3.00 (North Central). Long-term capital structure planning, capital budgeting, treatment of uncertainty in investment decisions, security underwriting, dividend policies, and mergers. Prerequisite: MGMT 61000.

Learning Outcomes: 1. Outline and describe Corporate Financial Policies and understand their potential impact of firm value. 2. Value real options in capital budgeting projects using the Black Scholes, the risk-neutral probability and the duplicating portfolio models. 3. Understand the use of and characteristics of various alternatives to corporate finance including leasing, convertible bonds, and structured finance. Credits: 2.00 to 4.00

MGMT 61000 - Financial Management

Credit Hours: 0.00 to 4.00. Analysis of short-term working capital needs. Cash budgeting procedures, pro forma statements, major types of short-term loan arrangements, and short-term asset management. Prerequisite: MGMT 60000, Master's student standing or higher and Management and Computational Finance majors only.

Learning Outcomes: 1. Explain how the Statement of Cash Flows can be used to diagnose operating performance and describe the calculation and use of financial ratios. 2. Define financial ratio analysis and explain how ratios reflect financial performance. 3. Examine how a company's financial plan is shaped by a company's operating strategy. 4. Recognize how seasonal patterns of activity affect a company's financial plan. 5. Discuss long-term financial planning. 6. Compare compounding interest rates, discounting cash flows, and bond valuation. 7. Recognize techniques used in project analyses and capital budgeting, as well as incremental cost and revenue in capital project analysis. 8. Apply capital structure theory in practice. Credits: 0.00 to 4.00

MGMT 60200 - Valuation And Financial Statement Analysis

Credit Hours: 2.00. Establishes how to use accounting information to make business and investment decisions. Internally, the information is used to assess performance of units, to evaluate performance of upper-level management, to monitor the firm's investment and financing decisions, and for comparison purposes with the firm's rivals. Externally, accounting information is used by financial analysts, investors and (potential) acquirers to assess the value of the firm, by creditors to assess its credit-worthiness, and by regulators. Prerequisite: MGMT 60000 , MGMT 60100 .

Learning Outcomes: 1. Demonstrate ability to understand financial statements and related information. 2. Practice communicating decisions and ideas through written and oral communication. Credits: 2.00

MGMT 60000 - Accounting For Managers

Credit Hours: 2.00 to 3.00 (West Lafayette) 3.00 (Calumet,

North Central). The two-course accounting sequence employs a user's perspective on the firm's database. First, the standard accounting model is developed into a working tool, as no prior study of accounting is assumed. Then illustrative business cases are discussed to show how external reports conform to financial contracts and public regulation. Public reports primarily directed to investors and creditors are analyzed to reconstruct the economic events and managerial decisions underlying generally accepted accounting standards. Prerequisite: Masters student standing and Management majors only.

Credits: 2.00 to 3.00

MGMT 59100 - Launching Global Leaders

Credit Hours: 0.00 to 2.00. Capitalizing on the unique personal and professional backgrounds of each student in our program, the Launching Global Leaders course provides a comprehensive and customizable leadership development curriculum. In this year long course, students will engage in a 360 assessment of strategically identified professional competencies critical to success in the contemporary workforce. Using these target areas as a guide, students will then customize their leadership development experience by selectively engaging in a variety of program offerings, including: interactive industry simulations, personal and team performance enhancement tools, professional coaching, interactive learning sessions with industry leaders, and workshops in developing intercultural competency, personal branding and career management.

Learning Outcomes: 1. Comprehensively assess their individual leadership strengths and areas of development along the Launching Global Leaders competency model. 2. Gain exposure to a variety of leadership styles and strategies from successful industry leaders. 3. Gain an awareness of contemporary issues facing leaders of global organizations, and strategies for future. 4. Gain exposure to tools and concepts currently utilized in industry that inspire continuous self-improvement. Credits: 0.00 to 2.00

Specialty Tracks (22 credits)

General Finance

Core Courses (12 credits)

MGMT 64400 - Venture Capital And Investment Banking

Credit Hours: 2.00 to 4.00. Examines the process of corporate value creation through financial policy choices. The sequence of topics roughly parallels the life cycle of a typical corporation. Begins by studying the financing of entrepreneurial companies. Then studies the investment banking and capital acquisition process employed for public securities issues. Also examines capital acquisition and reorganization decisions, such as the use of hybrid securities like convertible debt and PIPEs, project financing bankruptcy reorganizations, and equity structurings. Prerequisite: MGMT 61000 .

Credits: 2.00 to 4.00

MGMT 51100 - Fixed Income Securities

Credit Hours: 2.00. Introduction to fixed income securities. Discusses a variety of contracts-starting with pure discount bonds, coupon bonds, and callable bonds. Continues with options on bonds, caps, floors, and interest rate swaps. Introduces the theory of the term structure and present models for pricing fixed income securities. Topics include: spot and forward markets for debt instruments, simple models for interest rate risk management, duration, convexity, organized exchange-traded interest rate contracts, interest rate swaps, pricing relationships and the theory of the term structure, and single factor models for pricing interest rate claims.

Learning Outcomes: 1. Identify how to value and hedge commonly traded fixed income securities. 2. Demonstrate understanding of underlying economic determinants and behavior of fixed income securities. 3. Outline and structure such securities. Credits: 2.00

MGMT 41150 - Futures And Options

Credit Hours: 3.00. The course covers basic features and pricing of derivative securities such as forwards, futures, and options.

Learning Outcomes: 1. Understand the basic features and pricing of commonly used derivative products. 2. Develop necessary analytical tools needed to make good managerial decisions using derivatives. Credits: 3.00

MGMT 41220 - FinTech

Credit Hours: 3.00. Dramatic development in technology is fundamentally transforming all aspects of financial intermediation including lending, payment services, investments

and trading. The goal of the course is to introduce these new developments to students with the emphasis on underlying economic mechanisms. We will start with talking about fiat money but quickly delve into cryptocurrencies and their applications. We will talk about tokens, smart contracts, automated market making and how applications of these concepts are transforming financial services and financial inclusion. We will cover these topics by analyzing real companies and contrast them with traditional players in the financial system.

Learning Outcomes: 1. Understand fundamentals of blockchain and cryptocurrencies. 2. Understand tokenization, smart contracts, and automated market makers. 3. Evaluate implications of decentralized finance on banking, fund raising, financial markets and financial inclusion. 4. Develop skills to analyze various business models in the Fintech space. 5. Create a case study on a real Fintech company. Credits: 3.00

MGMT 69000 - Advanced Problems In Management

Credit Hours: 1.00 to 4.00. Advanced investigation in a specific management field at the graduate level.

Credits: 1.00 to 4.00

Selectives (10 credits)

MGMT 61500 - International Financial Management

Credit Hours: 2.00 to 4.00 (West Lafayette) 3.00 (Calumet). Integrative course dealing with the management of firms doing business internationally. Emphasis on decision making. Will draw upon, and adapt, managerial decision models developed for domestic operations, as well as cover appropriate international institutional material. Particular focus on finance and strategic management. Prerequisites: ECON 51500.

Learning Outcomes: 1. Evaluate how changes in the exchange rates affect a firm's cash flows and value. 2. Evaluate how international capital budgeting decisions are affected by the complications due to currency considerations. 3. Evaluate how international capital budgeting decisions are affected by the complications due to tax considerations. 4. Evaluate how international capital budgeting decisions are affected by the complications due to country risk considerations. Credits: 2.00 to 4.00

MGMT 59000 - Directed Readings In Management

Credit Hours: 1.00 to 4.00 (West Lafayette, North Central) 2.00 to 4.00 (Calumet). Supervised reading and reports in various subjects. Open only to a limited number of seniors and graduate students. Permission of instructor required.

Credits: 1.00 to 4.00

MGMT 51300 - Student Managed Investment Fund

Credit Hours: 0.00 to 3.00. This course provides undergraduate and graduate students with hands-on portfolio management experience by investing a $300,000 (as of 2017) portfolio in the stock market. This student-managed fund is a large time commitment, and this course is a way to give students class credit for their experiential learning through SMIF.

Learning Outcomes: 1. Gain knowledge about investing through experiential learning by managing real money. 2. Learn how to analyze stocks and create buy or sell recommendations through team meetings and presentations. 3. Gain teamwork experience and in-depth knowledge by working with industry-specific teams for stock research. Credits: 0.00 to 3.00

MGMT 64000 - Financial Modeling

Credit Hours: 2.00 or 3.00. This course provides an introduction to financial modeling using computer applications. The first part of the course covers how to use Microsoft Excel to analyze historical and pro forma financial statements, stock return data, linear regression analysis, Monte Carlo simulations, Pivot Tables and also covers many advanced functions within Excel. The second part of the course provides an introduction to using SAS to analyze financial data and more advanced regression techniques. Prerequisites: MGMT 61000 (Note: Students who have not taken MGMT 61000 may enroll with instructor permission).

Learning Outcomes: 1. Gain experience using Excel to solve complex problems and build financial models. 2. Learn how to use Excel and other software to build, test and run regression analysis with financial data. 3. Provide an introduction to using SAS for analyzing financial data. 4. Learn how to implement Monte Carlo simulations using Excel for financial

applications. Credits: 2.00 or 3.00

MGMT 64700 - Financial Engineering

Credit Hours: 2.00 or 3.00. The objective of this course is to provide students with the necessary skills to value and hedge a wide variety of derivatives contracts used in financial markets. The main tool of analysis of the course is stochastic calculus set in continuous-time. Some basic knowledge of stochastic processes would be helpful, but not essential: we will cover what we need in class. The course covers valuation of securities using modern martingale methods as well as the necessary parameter estimation and numerical methods such as Monte Carlo simulations. Applications will include derivatives such as options on stocks, bonds and currencies, as well as valuation of defaultable securities, and modeling the term structure of interest rates and risk management with Value-at-Risk. Prerequisites: MGMT 61400, or similar coursework with instructor permission.

Learning Outcomes: 1. Value and hedge commonly traded financial derivatives. 2. Understand the underlying economic determination and behavior of financial derivatives. 3. Design and structure such financial derivatives. Credits: 2.00 or 3.00

Corporate Finance

Core Courses (7 credits)

MGMT 51100 - Fixed Income Securities

Credit Hours: 2.00. Introduction to fixed income securities. Discusses a variety of contracts-starting with pure discount bonds, coupon bonds, and callable bonds. Continues with options on bonds, caps, floors, and interest rate swaps. Introduces the theory of the term structure and present models for pricing fixed income securities. Topics include: spot and forward markets for debt instruments, simple models for interest rate risk management, duration, convexity, organized exchange-traded interest rate contracts, interest rate swaps, pricing relationships and the theory of the term structure, and single factor models for pricing interest rate claims.

Learning Outcomes: 1. Identify how to value and hedge commonly traded fixed income securities. 2. Demonstrate understanding of underlying economic determinants and behavior of fixed income securities. 3. Outline and structure such securities. Credits: 2.00

MGMT 41220 - FinTech

Credit Hours: 3.00. Dramatic development in technology is fundamentally transforming all aspects of financial intermediation including lending, payment services, investments and trading. The goal of the course is to introduce these new developments to students with the emphasis on underlying economic mechanisms. We will start with talking about fiat money but quickly delve into cryptocurrencies and their applications. We will talk about tokens, smart contracts, automated market making and how applications of these concepts are transforming financial services and financial inclusion. We will cover these topics by analyzing real companies and contrast them with traditional players in the financial system.

Learning Outcomes: 1. Understand fundamentals of blockchain and cryptocurrencies. 2. Understand tokenization, smart contracts, and automated market makers. 3. Evaluate implications of decentralized finance on banking, fund raising, financial markets and financial inclusion. 4. Develop skills to analyze various business models in the Fintech space. 5. Create a case study on a real Fintech company. Credits: 3.00

MGMT 69000 - Advanced Problems In Management

Credit Hours: 1.00 to 4.00. Advanced investigation in a specific management field at the graduate level.

Credits: 1.00 to 4.00

Selectives (15 credits)

MGMT 61500 - International Financial Management

Credit Hours: 2.00 to 4.00 (West Lafayette) 3.00 (Calumet). Integrative course dealing with the management of firms doing business internationally. Emphasis on decision making. Will draw upon, and adapt, managerial decision models developed for domestic operations, as well as cover appropriate international institutional material. Particular focus on finance and strategic management. Prerequisites: ECON 51500.

Learning Outcomes: 1. Evaluate how changes in the exchange rates affect a firm's cash flows and value. 2. Evaluate how international capital budgeting decisions are affected by the complications due to currency considerations. 3.

Evaluate how international capital budgeting decisions are affected by the complications due to tax considerations. 4. Evaluate how international capital budgeting decisions are affected by the complications due to country risk considerations. Credits: 2.00 to 4.00

MGMT 59000 - Directed Readings In Management

Credit Hours: 1.00 to 4.00 (West Lafayette, North Central) 2.00 to 4.00 (Calumet). Supervised reading and reports in various subjects. Open only to a limited number of seniors and graduate students. Permission of instructor required.

Credits: 1.00 to 4.00

MGMT 41150 - Futures And Options

Credit Hours: 3.00. The course covers basic features and pricing of derivative securities such as forwards, futures, and options.

Learning Outcomes: 1. Understand the basic features and pricing of commonly used derivative products. 2. Develop necessary analytical tools needed to make good managerial decisions using derivatives. Credits: 3.00

MGMT 51300 - Student Managed Investment Fund

Credit Hours: 0.00 to 3.00. This course provides undergraduate and graduate students with hands-on portfolio management experience by investing a $300,000 (as of 2017) portfolio in the stock market. This student-managed fund is a large time commitment, and this course is a way to give students class credit for their experiential learning through SMIF.

Learning Outcomes: 1. Gain knowledge about investing through experiential learning by managing real money. 2. Learn how to analyze stocks and create buy or sell recommendations through team meetings and presentations. 3. Gain teamwork experience and in-depth knowledge by working with industry-specific teams for stock research. Credits: 0.00 to 3.00

MGMT 64000 - Financial Modeling

Credit Hours: 2.00 or 3.00. This course provides an introduction to financial modeling using computer applications. The first part of the course covers how to use Microsoft Excel to analyze historical and pro forma financial statements, stock return data, linear regression analysis, Monte Carlo simulations, Pivot Tables and also covers many advanced functions within Excel. The second part of the course provides an introduction to using SAS to analyze financial data and more advanced regression techniques. Prerequisites: MGMT 61000 (Note: Students who have not taken MGMT 61000 may enroll with instructor permission).

Learning Outcomes: 1. Gain experience using Excel to solve complex problems and build financial models. 2. Learn how to use Excel and other software to build, test and run regression analysis with financial data. 3. Provide an introduction to using SAS for analyzing financial data. 4. Learn how to implement Monte Carlo simulations using Excel for financial applications. Credits: 2.00 or 3.00

MGMT 64700 - Financial Engineering

Credit Hours: 2.00 or 3.00. The objective of this course is to provide students with the necessary skills to value and hedge a wide variety of derivatives contracts used in financial markets. The main tool of analysis of the course is stochastic calculus set in continuous-time. Some basic knowledge of stochastic processes would be helpful, but not essential: we will cover what we need in class. The course covers valuation of securities using modern martingale methods as well as the necessary parameter estimation and numerical methods such as Monte Carlo simulations. Applications will include derivatives such as options on stocks, bonds and currencies, as well as valuation of defaultable securities, and modeling the term structure of interest rates and risk management with Value-at-Risk. Prerequisites: MGMT 61400, or similar coursework with instructor permission.

Learning Outcomes: 1. Value and hedge commonly traded financial derivatives. 2. Understand the underlying economic determination and behavior of financial derivatives. 3. Design and structure such financial derivatives. Credits: 2.00 or 3.00

MGMT 57100 - Data Mining

Credit Hours: 2.00. Introduces the concepts, techniques, tools, and applications of data mining. The material is approached from the perspective of a business analyst, with an emphasis on supporting tactical and strategic decisions. Includes a variety of techniques to identify nuggets of information or decision-making knowledge in bodies of data, and extracting these in such a way that they can be put to use in the area, such as decision

support, prediction, forecasting, and estimation.

Credits: 2.00

Financial Analytics

Core Courses (6 credits)

MGMT 51100 - Fixed Income Securities

Credit Hours: 2.00. Introduction to fixed income securities. Discusses a variety of contracts-starting with pure discount bonds, coupon bonds, and callable bonds. Continues with options on bonds, caps, floors, and interest rate swaps. Introduces the theory of the term structure and present models for pricing fixed income securities. Topics include: spot and forward markets for debt instruments, simple models for interest rate risk management, duration, convexity, organized exchange-traded interest rate contracts, interest rate swaps, pricing relationships and the theory of the term structure, and single factor models for pricing interest rate claims.

Learning Outcomes: 1. Identify how to value and hedge commonly traded fixed income securities. 2. Demonstrate understanding of underlying economic determinants and behavior of fixed income securities. 3. Outline and structure such securities. Credits: 2.00

MGMT 64700 - Financial Engineering

Credit Hours: 2.00 or 3.00. The objective of this course is to provide students with the necessary skills to value and hedge a wide variety of derivatives contracts used in financial markets. The main tool of analysis of the course is stochastic calculus set in continuous-time. Some basic knowledge of stochastic processes would be helpful, but not essential: we will cover what we need in class. The course covers valuation of securities using modern martingale methods as well as the necessary parameter estimation and numerical methods such as Monte Carlo simulations. Applications will include derivatives such as options on stocks, bonds and currencies, as well as valuation of defaultable securities, and modeling the term structure of interest rates and risk management with Value-at-Risk. Prerequisites: MGMT 61400, or similar coursework with instructor permission.

Learning Outcomes: 1. Value and hedge commonly traded financial derivatives. 2. Understand the underlying economic determination and behavior of financial derivatives. 3. Design and structure such financial derivatives. Credits: 2.00 or 3.00

MGMT 69000 - Advanced Problems In Management

Credit Hours: 1.00 to 4.00. Advanced investigation in a specific management field at the graduate level.

Credits: 1.00 to 4.00

Selectives (16 credits)

MGMT 64400 - Venture Capital And Investment Banking

Credit Hours: 2.00 to 4.00. Examines the process of corporate value creation through financial policy choices. The sequence of topics roughly parallels the life cycle of a typical corporation. Begins by studying the financing of entrepreneurial companies. Then studies the investment banking and capital acquisition process employed for public securities issues. Also examines capital acquisition and reorganization decisions, such as the use of hybrid securities like convertible debt and PIPEs, project financing bankruptcy reorganizations, and equity structurings. Prerequisite: MGMT 61000 .

Credits: 2.00 to 4.00

MGMT 61500 - International Financial Management

Credit Hours: 2.00 to 4.00 (West Lafayette) 3.00 (Calumet). Integrative course dealing with the management of firms doing business internationally. Emphasis on decision making. Will draw upon, and adapt, managerial decision models developed for domestic operations, as well as cover appropriate international institutional material. Particular focus on finance and strategic management. Prerequisites: ECON 51500.

Learning Outcomes: 1. Evaluate how changes in the exchange rates affect a firm's cash flows and value. 2. Evaluate how international capital budgeting decisions are affected by the complications due to currency considerations. 3. Evaluate how international capital budgeting decisions are affected by the complications due to tax considerations. 4. Evaluate how international capital budgeting decisions are affected by the complications due to country risk considerations. Credits: 2.00 to 4.00

MGMT 59000 - Directed Readings In Management

Credit Hours: 1.00 to 4.00 (West Lafayette, North Central) 2.00 to 4.00 (Calumet). Supervised reading and reports in various subjects. Open only to a limited number of seniors and graduate

students. Permission of instructor required.

Credits: 1.00 to 4.00

MGMT 58200 - Management Of Organizational Data

Credit Hours: 2.00. Provides the basic concepts and skills needed to analyze and organize business data, as well as to utilize the organized data to answer a variety of business queries. After successful completion, students will have an understanding of why database management is important and what it entails, how to analyze the data requirements of a business scenario and represent these requirements by means of entity-relationship (ER) diagrams, translate an ER diagram into normalized relations for a relational database management system, write simple and relatively complex data retrieval commands in the SQL language for an Oracle database, use Microsoft Access as a front end to a server database in Oracle, be familiar with several selected topics of current interest in the data management arena.

Credits: 2.00

MGMT 41150 - Futures And Options

Credit Hours: 3.00. The course covers basic features and pricing of derivative securities such as forwards, futures, and options.

Learning Outcomes: 1. Understand the basic features and pricing of commonly used derivative products. 2. Develop necessary analytical tools needed to make good managerial decisions using derivatives. Credits: 3.00

MGMT 51300 - Student Managed Investment Fund

Credit Hours: 0.00 to 3.00. This course provides undergraduate and graduate students with hands-on portfolio management experience by investing a $300,000 (as of 2017) portfolio in the stock market. This student-managed fund is a large time commitment, and this course is a way to give students class credit for their experiential learning through SMIF.

Learning Outcomes: 1. Gain knowledge about investing through experiential learning by managing real money. 2. Learn how to analyze stocks and create buy or sell recommendations through team meetings and presentations. 3. Gain teamwork experience and in-depth knowledge by working with industry-specific teams for stock research. Credits: 0.00 to 3.00

MGMT 64000 - Financial Modeling

Credit Hours: 2.00 or 3.00. This course provides an introduction to financial modeling using computer applications. The first part of the course covers how to use Microsoft Excel to analyze historical and pro forma financial statements, stock return data, linear regression analysis, Monte Carlo simulations, Pivot Tables and also covers many advanced functions within Excel. The second part of the course provides an introduction to using SAS to analyze financial data and more advanced regression techniques. Prerequisites: MGMT 61000 (Note: Students who have not taken MGMT 61000 may enroll with instructor permission).

Learning Outcomes: 1. Gain experience using Excel to solve complex problems and build financial models. 2. Learn how to use Excel and other software to build, test and run regression analysis with financial data. 3. Provide an introduction to using SAS for analyzing financial data. 4. Learn how to implement Monte Carlo simulations using Excel for financial applications. Credits: 2.00 or 3.00

MGMT 41220 - FinTech

Credit Hours: 3.00. Dramatic development in technology is fundamentally transforming all aspects of financial intermediation including lending, payment services, investments and trading. The goal of the course is to introduce these new developments to students with the emphasis on underlying economic mechanisms. We will start with talking about fiat money but quickly delve into cryptocurrencies and their applications. We will talk about tokens, smart contracts, automated market making and how applications of these concepts are transforming financial services and financial inclusion. We will cover these topics by analyzing real companies and contrast them with traditional players in the financial system.

Learning Outcomes: 1. Understand fundamentals of blockchain and cryptocurrencies. 2. Understand tokenization, smart contracts, and automated market makers. 3. Evaluate implications of decentralized finance on banking, fund raising, financial markets and financial inclusion. 4. Develop skills to analyze various business models in the Fintech space. 5. Create a case study on a real Fintech company. Credits: 3.00

MGMT 58700 - Using R For Analytics

Credit Hours: 2.00. R has been one of the leading open-source programming languages used by analytics professionals today. You will develop the ability to interpret and modify R code to perform data analysis using the popular RStudio integrated development environment (IDE). During the first four weeks programming syntax, data structures, logic, functions, data loading, data reshaping, and shiny tool creation will be discussed to establish the necessary foundation to turn your data into insights using R. In every class we will discuss and apply a new R library or set of functions. During the last three weeks of the course you will perform descriptive, predictive, and prescriptive analytics with R. Assignments are both conceptual and hands-on exercises. The culmination of this course entails a final team project where you design, develop, and present a working Shiny application prototype that integrates descriptive, predictive, and prescriptive analytics to support a business problem. Permission of department required.

Learning Outcomes: 1. Ability to interpret and modify R code to perform data analysis. 2. Perform descriptive, predictive, and prescriptive analytics with R. 3. Design, develop, and present a working R-Shiny app that integrates descriptive, predictive, and prescriptive analytics to provide end-user decision support. Credits: 2.00

Wealth and Asset Management

Core Courses (11 credits)

MGMT 64400 - Venture Capital And Investment Banking

Credit Hours: 2.00 to 4.00. Examines the process of corporate value creation through financial policy choices. The sequence of topics roughly parallels the life cycle of a typical corporation. Begins by studying the financing of entrepreneurial companies. Then studies the investment banking and capital acquisition process employed for public securities issues. Also examines capital acquisition and reorganization decisions, such as the use of hybrid securities like convertible debt and PIPEs, project financing bankruptcy reorganizations, and equity structurings. Prerequisite: MGMT 61000 .

Credits: 2.00 to 4.00

MGMT 59000 - Directed Readings In Management

Credit Hours: 1.00 to 4.00 (West Lafayette, North Central) 2.00 to 4.00 (Calumet). Supervised reading and reports in various subjects. Open only to a limited number of seniors and graduate students. Permission of instructor required.

Credits: 1.00 to 4.00

MGMT 51100 - Fixed Income Securities

Credit Hours: 2.00. Introduction to fixed income securities. Discusses a variety of contracts-starting with pure discount bonds, coupon bonds, and callable bonds. Continues with options on bonds, caps, floors, and interest rate swaps. Introduces the theory of the term structure and present models for pricing fixed income securities. Topics include: spot and forward markets for debt instruments, simple models for interest rate risk management, duration, convexity, organized exchange-traded interest rate contracts, interest rate swaps, pricing relationships and the theory of the term structure, and single factor models for pricing interest rate claims.

Learning Outcomes: 1. Identify how to value and hedge commonly traded fixed income securities. 2. Demonstrate understanding of underlying economic determinants and behavior of fixed income securities. 3. Outline and structure such securities. Credits: 2.00

MGMT 41100 - Investment Management

Credit Hours: 3.00. Examination of investment alternatives relevant to the individual and/or family-unit investor. Operations of the markets in which securities are traded. Theory and application of security valuation, portfolio construction, capital markets, and performance evaluation. Particular attention given to fixed income securities, common stocks, options, investment companies, and other popular investment alternatives.

Learning Outcomes: 1. Learn about the investment alternatives relevant to the individual and/or family-unit investor by studying operations of the markets in which securities are traded, examining theory and application of security valuation, portfolio construction, capital markets, and performance evaluations. 2. Learn more in-depth information regarding fixed income securities, common stocks, options, investments companies, and other popular investment alternatives. Credits: 3.00

MGMT 64700 - Financial Engineering

Credit Hours: 2.00 or 3.00. The objective of this course is to provide students with the necessary skills to value and hedge a

wide variety of derivatives contracts used in financial markets. The main tool of analysis of the course is stochastic calculus set in continuous-time. Some basic knowledge of stochastic processes would be helpful, but not essential: we will cover what we need in class. The course covers valuation of securities using modern martingale methods as well as the necessary parameter estimation and numerical methods such as Monte Carlo simulations. Applications will include derivatives such as options on stocks, bonds and currencies, as well as valuation of defaultable securities, and modeling the term structure of interest rates and risk management with Value-at-Risk. Prerequisites: MGMT 61400, or similar coursework with instructor permission.

Learning Outcomes: 1. Value and hedge commonly traded financial derivatives. 2. Understand the underlying economic determination and behavior of financial derivatives. 3. Design and structure such financial derivatives. Credits: 2.00 or 3.00

Selectives (11 credits)

MGMT 61500 - International Financial Management

Credit Hours: 2.00 to 4.00 (West Lafayette) 3.00 (Calumet). Integrative course dealing with the management of firms doing business internationally. Emphasis on decision making. Will draw upon, and adapt, managerial decision models developed for domestic operations, as well as cover appropriate international institutional material. Particular focus on finance and strategic management. Prerequisites: ECON 51500.

Learning Outcomes: 1. Evaluate how changes in the exchange rates affect a firm's cash flows and value. 2. Evaluate how international capital budgeting decisions are affected by the complications due to currency considerations. 3. Evaluate how international capital budgeting decisions are affected by the complications due to tax considerations. 4. Evaluate how international capital budgeting decisions are affected by the complications due to country risk considerations. Credits: 2.00 to 4.00

MGMT 59000 - Directed Readings In Management

Credit Hours: 1.00 to 4.00 (West Lafayette, North Central) 2.00 to 4.00 (Calumet). Supervised reading and reports in various subjects. Open only to a limited number of seniors and graduate students. Permission of instructor required.

Credits: 1.00 to 4.00

MGMT 51300 - Student Managed Investment Fund

Credit Hours: 0.00 to 3.00. This course provides undergraduate and graduate students with hands-on portfolio management experience by investing a $300,000 (as of 2017) portfolio in the stock market. This student-managed fund is a large time commitment, and this course is a way to give students class credit for their experiential learning through SMIF.

Learning Outcomes: 1. Gain knowledge about investing through experiential learning by managing real money. 2. Learn how to analyze stocks and create buy or sell recommendations through team meetings and presentations. 3. Gain teamwork experience and in-depth knowledge by working with industry-specific teams for stock research. Credits: 0.00 to 3.00

MGMT 64000 - Financial Modeling

Credit Hours: 2.00 or 3.00. This course provides an introduction to financial modeling using computer applications. The first part of the course covers how to use Microsoft Excel to analyze historical and pro forma financial statements, stock return data, linear regression analysis, Monte Carlo simulations, Pivot Tables and also covers many advanced functions within Excel. The second part of the course provides an introduction to using SAS to analyze financial data and more advanced regression techniques. Prerequisites: MGMT 61000 (Note: Students who have not taken MGMT 61000 may enroll with instructor permission).

Learning Outcomes: 1. Gain experience using Excel to solve complex problems and build financial models. 2. Learn how to use Excel and other software to build, test and run regression analysis with financial data. 3. Provide an introduction to using SAS for analyzing financial data. 4. Learn how to implement Monte Carlo simulations using Excel for financial applications. Credits: 2.00 or 3.00

MGMT 41220 - FinTech

Credit Hours: 3.00. Dramatic development in technology is fundamentally transforming all aspects of financial intermediation including lending, payment services, investments and trading. The goal of the course is to introduce these new developments to students with the emphasis on underlying economic mechanisms. We will start with talking about fiat

money but quickly delve into cryptocurrencies and their applications. We will talk about tokens, smart contracts, automated market making and how applications of these concepts are transforming financial services and financial inclusion. We will cover these topics by analyzing real companies and contrast them with traditional players in the financial system.

Learning Outcomes: 1. Understand fundamentals of blockchain and cryptocurrencies. 2. Understand tokenization, smart contracts, and automated market makers. 3. Evaluate implications of decentralized finance on banking, fund raising, financial markets and financial inclusion. 4. Develop skills to analyze various business models in the Fintech space. 5. Create a case study on a real Fintech company. Credits: 3.00

MGMT 57100 - Data Mining

Credit Hours: 2.00. Introduces the concepts, techniques, tools, and applications of data mining. The material is approached from the perspective of a business analyst, with an emphasis on supporting tactical and strategic decisions. Includes a variety of techniques to identify nuggets of information or decision-making knowledge in bodies of data, and extracting these in such a way that they can be put to use in the area, such as decision support, prediction, forecasting, and estimation.

Credits: 2.00

MGMT 69000 - Advanced Problems In Management

Credit Hours: 1.00 to 4.00. Advanced investigation in a specific management field at the graduate level.

Credits: 1.00 to 4.00

Food Science, MS

About the Program

Program Requirements - Thesis

Required Courses (5 credits)

FS 55501 - Case Study

Credit Hours: 1.00. A brief overview of problem-solving and teamwork concepts will be presented in class. A problem will be given by an industrial sponsor, and work groups (teams) will be assigned to solve the problem and present the findings.

Learning Outcomes: 1. Work to solve a defined technical problem in food technology. 2. Gain an experience for solving a problem by effective literature search and preliminary experimentation. 3. Analyze data and evaluate the outcome for solving a problem. 4. Coordinate personal contributions within the team. 5. Organize and communicate thoughts/data in a well-organized manner. 6. Present both written and oral reports outlining the approach, procedure, outcome, and recommendation to solve the stated problem. Credits: 1.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central

Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

STAT 51200 - Applied Regression Analysis

Credit Hours: 3.00. Inference in simple and multiple linear regression, residual analysis, transformations, polynomial regression, model building with real data, nonlinear regression. One-way and two-way analysis of variance, multiple comparisons, fixed and random factors, analysis of covariance. Use of existing statistical computer programs. Prerequisite: Coursework in Statistical Methods with a calculus prerequisite.

Learning Outcomes: 1. Learn to build and analyze simple and multiple regression models, analysis of variance and covariance (ANOVA/ANCOVA) for regression, inference for regression, diagnostics and remedial measures for regression, transformations, residual analysis, model building, polynomial and interaction models. Credits: 3.00

GRAD 61200 - Responsible Conduct Of Research

Credit Hours: 1.00. Overview of values, professional standards, and regulations that define responsible conduct in research. Students learn the values and standards of responsible research through readings and lecture/discussion and practice application of these values and standards to research situations through class discussion of case studies from life sciences research. Students must be registered for M.S. or Ph.D. thesis research in their home department.

Credits: 1.00

Basic Food Science Courses (5 credits)

FS 55001 - Food Chemistry

Credit Hours: 1.00. Principles and concepts of the effects of heat, light, oxygen, and water activity on chemical reactions and physical events involved in processing, storage, and preparation of food products and their relationships to nutritional quality, organoleptic quality, stability, and safety. Class meets for 5 weeks.

Learning Outcomes: Students are expected to have a working knowledge of the following topics: 1. Structures and functions of major food components, including water, proteins, carbohydrates, and lipids; Major chemical reactions or structural changes occurring with macronutrients (water, proteins, carbohydrates, lipids) in foods and impacts on shelf-life. 2. Major components and reactions occurring in major food groups, including fruits, vegetables, grains, legumes, red meats, poultry, eggs, fish, and shellfish. 3. Examples of the effects of processing on food constituents and end product quality; Basic principles of dispersed systems: colloids, gels, emulsions, foams; Problem solving using basic food chemistry knowledge. Credits: 1.00

FS 55101 - Food Analysis

Credit Hours: 1.00. Principles and applications of chemical, physical, and sensory techniques to analyze foods. Class meets for 5 weeks.

Learning Outcomes: 1. Identify government regulations that dictate industrial standard practices of food analysis. 2. Describe the principles of the official and rapid methods of analysis of the following food components: moisture, ash, fat, protein. 3. For any given food product, select and justify the use of 1) an official, and 2) a rapid method of analysis for the following food components: moisture, ash, fat, protein. 4. Describe the principles of the methods of analysis for the following food components/properties: individual sugars, starch, total dietary fiber, vitamins, individual minerals, oxygen demand, texture, color, sensory evaluation, lipid oxidation, lipid saturation, titratable acidity, extraneous matter, protein nutritional and functional properties. 5. Relate the various analyses discussed in class to quality assurance of specific food products. 6. Explain the principles and applications of the

following techniques in food analysis: chromatography, electrophoresis, spectroscopy (including mass spectroscopy and MALDI), enzymatic assays, immuno-based assays. Credits: 1.00

FS 55201 - Nutritional Sciences

Credit Hours: 1.00. Study of perspectives on established nutrition knowledge, concepts, and principles pertinent to the field of food science. Contemporary information about diet as it relates to health and safety issues. Controversies regarding nutrients and functional foods. Class meets 5 weeks.

Learning Outcomes: Students will learn about the scientific principle relevant to: 1. Newly released dietary guideline for Americans 2010, & components in diets and foods. 2. Digestion, absorption and metabolism of macro-nutrients. 3. Digestion, absorption and metabolism of vitamins and minerals frequently used in food processing. 4. Influence of food components on energy balance and body weight management. Credits: 1.00

FS 55301 - Food Microbiology

Credit Hours: 1.00. Principles and applications of the microbiology of foods. Focuses on many of the important conditions that may lead to foodborne illness and food spoilage. Structured in three main sections related to foodborne hazards: 1) identification, 2) control and prevention, and 3) detection. Class meets weeks 1-5.

Learning Outcomes: 1. Identify the major components of food that affect microbial growth. 2. Explain major foodborne pathogens and under what conditions they thrive. 3. Use microbiological information and molecular techniques to solve practical problems of the food industry. Credits: 1.00

FS 55402 - Food Processing

Credit Hours: 1.00. The Food Processing course will present an overview of the basic food engineering concepts and unit operations involved in the manufacture of various food products. Students will be able to understand the food processing literature and to effectively communicate with food technologists and engineers. Topics to be covered include: physical properties of foods, unit operations commonly found in the food industry, and processing equipment. Permission of department required.

Learning Outcomes: 1. Understand the rationale and principle of operation behind common food processing operations. 2. Identify and explain the unit operations involved in the manufacture of specific food products. 3. Explain how processing parameters will affect quality and safety of processed products. 4. Communicate effectively with food technologists and engineers. 5. Work effectively with team members with various backgrounds. Credits: 1.00

Seminar Course (1 credit)

FS 68400 - Food Science Seminar

Credit Hours: 1.00. Current topics in food science.

Credits: 1.00

Research Areas (4-13 credits)

General Program

FS 53000 - Food Ingredient Technology

Credit Hours: 1.00. Identifies functions of ingredients listed on ingredient labels of food products and discusses alternative ingredient choices for food products.

Credits: 1.00

FS 59000 - Special Problems

Credit Hours: 1.00 to 5.00. Specialized study in research laboratories, libraries, or computer laboratories for problems related to food science that are not taught in regular courses. Permission of instructor required.

Credits: 1.00 to 5.00

FS 59100 - Special Topics

Credit Hours: 1.00 to 3.00. Specialized topics not covered in other courses will be offered as one-credit minicourses. Topics, requirements, and credits will be determined yearly. Permission of instructor required.

Credits: 1.00 to 3.00

FS 62000 - Scientific Writing In Food Science

Credit Hours: 2.00. This course covers the essential elements of publishing original research at professional meetings (oral presentations and papers) and in peer-reviewed journals (original research manuscripts). Topics include: ethics in writing, effective reading of the literature, organizing research data, choosing a journal, writing the manuscript (results, materials and methods, introduction, discussion, title, abstract, references), publication process, revising and reviewing, poster presentation, and short oral presentations. Each student will write a paper, prepare a 12-minute oral presentation, and prepare a poster, based on data from his/her graduate research project. Permission of instructor required.

Credits: 2.00

FS 69000 - Special Topics In Food Science

Credit Hours: 1.00 to 3.00. Individual study of specialized materials. Permission of instructor required.

Credits: 1.00 to 3.00

FS 53100 - Science Of Experimental Cuisine

Credit Hours: 3.00. This course brings together culinary arts and the application of food chemistry and ingredient technology principles. Emphasis will be placed on food construction and deconstruction, using common food preparation and molecular gastronomy techniques.

Learning Outcomes: 1. Develop and use the vocabulary of a professional chef. 2. Understand and intelligently discuss how cooking works. 3. Demonstrate practical proficiency in food preparation skills. 4. Understand and experience food from farm to fork. 5. Compare and contrast home, culinary/food service, and large food industry food production practices. 6. Use common food preparation and molecular gastronomy techniques to manipulate the structure of food ingredients and finished food products. 7. Describe the fundamental structure-function relationships of food ingredients and how each of the applied techniques alters the ingredient structure and/or function. 8. Explore and control common food-related reactions/interactions including: emulsification, Maillard browning, caramelization, gelatinization, gelation, denaturation. 9. Exemplify the scientific process and inquiry driven research by designing, implementing, and analyzing experiments related to food construction and deconstruction. 10. Design and create food textures and products by manipulating fundamental structure-function relationships of food ingredients, and explain the science of how the foods were constructed. Credits: 3.00

Thesis Research (6 credits)

FS 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required.

Credits: 1.00 to 18.00

Required Courses (5 credits)

FS 55501 - Case Study

Credit Hours: 1.00. A brief overview of problem-solving and teamwork concepts will be presented in class. A problem will be given by an industrial sponsor, and work groups (teams) will be assigned to solve the problem and present the findings.

Learning Outcomes: 1. Work to solve a defined technical problem in food technology. 2. Gain an experience for solving a problem by effective literature search and preliminary experimentation. 3. Analyze data and evaluate the outcome for solving a problem. 4. Coordinate personal contributions within the team. 5. Organize and communicate thoughts/data in a well-organized manner. 6. Present both written and oral reports outlining the approach, procedure, outcome, and recommendation to solve the stated problem.

Credits: 1.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing

hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

STAT 51200 - Applied Regression Analysis

Credit Hours: 3.00. Inference in simple and multiple linear regression, residual analysis, transformations, polynomial regression, model building with real data, nonlinear regression. One-way and two-way analysis of variance, multiple comparisons, fixed and random factors, analysis of covariance. Use of existing statistical computer programs. Prerequisite: Coursework in Statistical Methods with a calculus prerequisite.

Learning Outcomes: 1. Learn to build and analyze simple and multiple regression models, analysis of variance and covariance (ANOVA/ANCOVA) for regression, inference for regression, diagnostics and remedial measures for regression, transformations, residual analysis, model building, polynomial and interaction models. Credits: 3.00

GRAD 61200 - Responsible Conduct Of Research

Credit Hours: 1.00. Overview of values, professional standards, and regulations that define responsible conduct in research. Students learn the values and standards of responsible research through readings and lecture/discussion and practice application of these values and standards to research situations through class discussion of case studies from life sciences research. Students must be registered for M.S. or Ph.D. thesis research in their home department.

Credits: 1.00

Program Requirements - Non-Thesis

Required Courses (4 credits)

FS 55501 - Case Study

Credit Hours: 1.00. A brief overview of problem-solving and teamwork concepts will be presented in class. A problem will be given by an industrial sponsor, and work groups (teams) will be assigned to solve the problem and present the findings.

Learning Outcomes: 1. Work to solve a defined technical problem in food technology. 2. Gain an experience for solving a problem by effective literature search and preliminary experimentation. 3. Concentrations

GPA Requirements

Additional Information

About the Program

Forestry and Natural Resources, MSF or MS

About the Program

Program Requirements - Thesis and Non-thesis

Required Courses (24-30 credits)

Core Courses (5 credits)

FNR 59800 - Topical Problems In Forestry And Natural Resources

Credit Hours: 1.00 to 3.00. Subjects and problems of interest to the student. Permission of instructor required.

Learning Outcomes: 1. Demonstrate ability to think critically regarding topic studied. Use effective strategies to communicate knowledge regarding topic studied. Credits: 1.00 to 3.00

GRAD 61200 - Responsible Conduct Of Research

Credit Hours: 1.00. Overview of values, professional standards, and regulations that define responsible conduct in research. Students learn the values and standards of responsible research through readings and lecture/discussion and practice

application of these values and standards to research situations through class discussion of case studies from life sciences research. Students must be registered for M.S. or Ph.D. thesis research in their home department.

Credits: 1.00

FNR 50600 - Theory And Application Of Natural Resource Extension Programming

Credit Hours: 1.00. This course will provide an opportunity for students to develop and implement extension activities based on their research interests. The course will focus on important natural resources issues, identify common target audiences, provide examples of extension programming, discuss outputs developed from various extension programs, and outline metrics used to evaluate program impact.

Learning Outcomes: 1. Be familiar with the breadth of natural resource extension programs. 2. Create a logic model based on student research and extension interests. 3. Develop a plan that outlines student extension goals. 4. Communicate technical information to non-scientific audiences. Credits: 1.00

FNR 59000 - Introduction To Teaching In Natural Resources

Credit Hours: 1.00. This applied course introduces topics related to teaching science courses to facilitate and support the success of teaching assistants in Forestry and Natural Resources. Students will read and review assigned readings and then participate in a discussion at a weekly class meeting. Students also will have an opportunity to practice and apply concepts through development and presentation of a lesson plan. Permission of instructor required.

Learning Outcomes: 1. Learn evaluated and applied methods to effectively engage and support diverse student populations in formal and informal classrooms. 2. Develop skills to communicate effectively while teaching natural resource topics. 3. Connect ethical teaching practices to teaching actions. 4. Develop a personal teaching philosophy and an associated formal statement. 5. Create materials for a 50 min lecture period lesson plan on a topic of their choice that incorporates concepts from the semester. Credits: 1.00

Research Areas (19-25 credits)

Core Courses (5 credits)

FNR 59800 - Topical Problems In Forestry And Natural Resources

Credit Hours: 1.00 to 3.00. Subjects and problems of interest to the student. Permission of instructor required.

Thesis Research (6 credits)

FNR 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required.

Learning Outcomes: 1. Integrate and synthesize relevant literature, theories, methods from their field of study into a cohesive thesis or manuscript framework that showcases their understanding of existing research and identifying gaps that would benefit from future studies or research. 2. Construct and articulate clear, coherent research objectives, hypotheses, and/or predictions and develop methods that will address these. 3. Conduct research and collect data on thesis topic. Credits: 1.00 to 18.00

Non-Thesis Project

Additional Requirements

FNR 50600 - Theory And Application Of Natural Resource Extension Programming

Credit Hours: 1.00. This course will provide an opportunity for students to develop and implement extension activities based on their research interests. Concentrations

Program Learning Outcomes

GPA Requirements

About the Program

Global Supply Chain Management, MS

About the Program

Program Requirements

Required Courses (12 credits)

MGMT 66400 - Supply Chain Management

Credit Hours: 2.00 to 4.00. Continues the examination of the linkage between a firm's product-market strategy and the role of the operations (i.e., production) function initiated in MGMT 660. Topics include material requirements planning, production activity control, and just-in-time systems. Prerequisite: MGMT 66000.

Learning Outcomes: 1. Learn tools and methodologies to model and analyze supply chain processes. 2. Learn how to manage

uncertainty and risk, both within the firm and across the supply chain. 3. Learn how to effectively coordinate supply chains using contracts. 4. Understand how companies have used the principles from this course to significantly enhance their competitiveness and to innovate business models. Credits: 2.00 to 4.00

MGMT 66000 - Introduction To Operations Management

Credit Hours: 2.00 to 4.00 (West Lafayette) 3.00 (Calumet, North Central). As goods and services are produced and distributed, they move through a set of inter-related operations or processes in order to match supply with demand. The design of these operations for strategic advantage, investment in improving their efficiency and effectiveness, and controlling these operations to meet performance objectives is the domain of Operations Management. The primary objective of the course is to provide an overview of this important functional area of business. Prerequisite: MGMT 67000 .

Credits: 2.00 to 4.00

MGMT 56600 - Global Supply Chain Management

Credit Hours: 2.00. This course will integrate issues from marketing (channels of distribution), logistics, and operations management to develop a broad understanding of a supply chain in a global context. Students will learn how different factors, including exchange rate risk, custom duty and trading policies, geographic distribution of resources and demand, availability and reliability of local supplier, and characteristics of consumer, affect the design and execution of global supply chain strategies. Prerequisites: Students are expected to have taken a basic course on operations (such as the masters core class MGMT 66000: Introduction to Operations Management) and a basic course on supply chain management (such as the masters elective MGMT 66400: Supply Chain Management). Exposure to a course on optimization is also preferred, but not required. The course requires logical and analytical thinking.

Learning Outcomes: 1. Train the students to understand the issues in managing a global supply chain and to manage them and optimize their performance. It requires critical thinking through the participation of games, case discussions, and presentation of case assignments. Credits: 2.00

MGMT 56500 - Strategic Sourcing And Procurement

Credit Hours: 2.00. This course will address the process of procurement including terminology, metric, and decision making. Additionally, we will investigate the best practices and processes for managing the relationships with suppliers and their performance. We will also explore the sourcing decision and the strategic ramifications of producing/ providing goods and services internally or purchasing them from external organizations. Prerequisites: Students are expected to have taken a basic course on operations (such as the masters core class MGMT 66000: Introduction to Operations Management) and a basic course on supply chain management (such as the masters elective MGMT 66400: Supply Chain Management).

Learning Outcomes: 1. Develop a good understanding of sourcing and procurement strategies and enhance the student's analytical skills to make optimal sourcing and procurement decisions. It requires critical thinking through the participation of games, case discussions and presentation of case assignments. Credits: 2.00

MGMT 56100 - Logistics

Credit Hours: 2.00 or 3.00. Examines the distribution and delivery functions in a manufacturing or service industry. Topics include inventory control in distribution, transportation planning, distribution requirements planning, analysis of waiting lines, distribution system design and facility location and layout analysis.

Credits: 2.00 or 3.00

MGMT 56800 - Supply Chain Analytics

Credit Hours: 2.00. There is an exponential growth in the adoption of big data technologies in every walk of life. Organizations are collecting, storing, and analyzing massive amounts of data. This data is commonly referred to as big data because of its large volume, the velocity with which it is collected and transmitted, the variety of forms it takes, and veracity of its origin and content. In order to capitalize on the opportunities presented by big data, businesses are putting in place technologies, people, and processes. Just collecting, transmitting and storing big data creates little value for an organization. For many organizations, the term big data currently represents only a data infrastructure such as the Apache Hadoop family of products. The key to delivering real value from big data is the use of analytics. Data must be analyzed and the results used by decision makers and organizational processes in order to generate value. The main objective of this course is to learn how to collect, process, store, and analyze big data. Assignments could easily be completed in Python or SQL. We assume no familiarity with Linux and will introduce you to all essential Linux commands. Students need

access to a computer with a 64 bit operating system and at least 4 GB of RAM. Note: 8 GB or more of RAM is strongly recommended.

Learning Outcomes: 1. Learn a systematic set of current popular analytical methodologies, including (1) data management and exploration (database management, data visualization, etc.), (2) data analysis (statistical methods, time series analysis, etc.), (3) modeling (math models, advanced spreadsheet engineering, etc.), and (4) decision analysis (optimization, simulation, numerical analysis, etc.). 2. Use these methodologies in a large-scale supply chain simulation game and to analyze cases involving multiple supply chain functions, such as forecasting, procurement, inventory, transportation, pricing, contract, revenue management, and reverse supply chain. Credits: 2.00

General Business Selectives (0-18 credits)

MGMT 65000 - Strategic Management I

Credit Hours: 2.00 to 4.00. Concepts and methods that integrate previous training in functional areas of management. The perspective is that of the general manager charged with directing the total enterprise. Emphasis is given to formulation and implementation of strategy. Prerequisite: MGMT 61000 , MGMT 62000 , Master's student standing and Management majors only.

Credits: 2.00 to 4.00

MGMT 64200 - Portfolio Management

Credit Hours: 2.00 to 4.00. Methods of analysis of common stocks and bonds for individual and institutional portfolios. Review of the empirical evidence of security market efficiency, and implications of that evidence for various methods of security analysis. Team projects to analyze the economy, the particular industry or sector, and selected firms within the industry or sector, and to make specific buy-hold-sell recommendations for the stocks and bonds of those firms. Prerequisite:MGMT 61000 .

Credits: 2.00 to 4.00

MGMT 63800 - Pricing Strategies And Algorithms

Credit Hours: 2.00. The course enables participants to formulate a systematic framework for approaching the problem of pricing a product, and more generally, a product line. The concepts and analytical methods necessary to develop such a framework are explored and incorporate marketing, competitive, and legal aspects. The course will use a combination of lectures, case discussions and exercises. Prerequisite: MGMT 62000.

Learning Outcomes: 1. Adopt a systematic framework to approach the problem of pricing a product or service. 2. Understand various approaches to estimate value of a product or service to users. 3. Understand the tradeoff between price and sales volume and its relation to price elasticity. 4. Understand segmented pricing and psychological aspects of pricing. 5. Understand the implications of pricing in a competitive environment and the importance of price policy. 6. Appreciate pricing issues when selling through an intermediary. 7. Be introduced to legal aspects of pricing. Credits: 2.00

MGMT 62000 - Marketing Management

Credit Hours: 2.00 to 4.00 (West Lafayette and Calumet) 3.00 (North Central). An integrated analysis of major marketing decisions, including product pricing, advertising, distribution, and sales force policies. Prerequisite: Master's student standing and Management majors only.

Credits: 2.00 to 4.00

MGMT 61400 - Investments

Credit Hours: 2.00 to 4.00. Examination of the process of asset valuation. Emphasis on portfolio analysis, security selection, risk-return relationships, and performance evaluation. Additional topics considered include security analysis, option pricing and analysis, futures contracts, and security market operations.

Learning Outcomes: 1. Develop a sound foundation for the main concepts in investment management and portfolio theory. 2. Understand how stock, bond, and option prices are determined. 3. Learn the analytical tools and financial theory necessary to understand how financial assets are used for investment decisions. 4. Take a critical look at the process of investing and relate the topics covered to

current real-world problems relevant to practitioners. 5. Prepare students for more advanced courses in investments, portfolio management, and corporate finance. Credits: 2.00 to 4.00

MGMT 61000 - Financial Management

Credit Hours: 0.00 to 4.00. Analysis of short-term working capital needs. Cash budgeting procedures, pro forma statements, major types of short-term loan arrangements, and short-term asset management. Prerequisite: MGMT 60000, Master's student standing or higher and Management and Computational Finance majors only.

Learning Outcomes: 1. Explain how the Statement of Cash Flows can be used to diagnose operating performance and describe the calculation and use of financial ratios. 2. Define financial ratio analysis and explain how ratios reflect financial performance. 3. Examine how a company's financial plan is shaped by a company's operating strategy. 4. Recognize how seasonal patterns of activity affect a company's financial plan. 5. Discuss long-term financial planning. 6. Compare compounding interest rates, discounting cash flows, and bond valuation. 7. Recognize techniques used in project analyses and capital budgeting, as well as incremental cost and revenue in capital project analysis. 8. Apply capital structure theory in practice. Credits: 0.00 to 4.00

MGMT 60000 - Accounting For Managers

Credit Hours: 2.00 to 3.00 (West Lafayette) 3.00 (Calumet, North Central). The two-course accounting sequence employs a user's perspective on the firm's database. First, the standard accounting model is developed into a working tool, as no prior study of accounting is assumed. Then illustrative business cases are discussed to show how external reports conform to financial contracts and public regulation. Public reports primarily directed to investors and creditors are analyzed to reconstruct the economic events and managerial decisions underlying generally accepted accounting standards. Prerequisite: Masters student standing and Management majors only.

Credits: 2.00 to 3.00

MGMT 59000 - Directed Readings In Management

Credit Hours: 1.00 to 4.00 (West Lafayette, North Central) 2.00 to 4.00 (Calumet). Supervised reading and reports in various subjects. Open only to a limited number of seniors and graduate students. Permission of instructor required.

Credits: 1.00 to 4.00

MGMT 65430 - Negotiations In Organizations

Credit Hours: 1.00 to 3.00. Decision making examines organizational context, stages, creativity, biases, and group processes. Negotiations examine strategies for preparing and conducting negotiations. The principal focus is on individual and interpersonal aspects of each. Permission of department required.

Learning Outcomes: 1. Understand the basic components of business negotiations through reading and completing assignments based on the textbook chapters. 2. Learn the basic components of a negotiated contract by completing a business transaction in written form. 3. Attain pragmatic negotiations skills using the I-Message method for daily activities encompassing negotiation tactics and the Verbal Skills method for more sophisticated negotiations for a major business transaction. 4. Explore cultural differences in negotiations by completing a study of practice in two countries other than the U.S. and sharing results with other students to expand their cultural knowledge base. 5. Explore and practice alternative dispute resolution techniques including mediation and arbitration. 6. Demonstrate the negotiations skills they are attaining by participating in class role-plays and by completing a final major negotiation in class. Credits: 1.00 to 3.00

MGMT 64000 - Financial Modeling

Credit Hours: 2.00 or 3.00. This course provides an introduction to financial modeling using computer applications. The first part of the course covers how to use Microsoft Excel to analyze historical and pro forma financial statements, stock return data, linear regression analysis, Monte Carlo simulations, Pivot Tables and also covers many advanced functions within Excel.

The second part of the course provides an introduction to using SAS to analyze financial data and more advanced regression techniques. Prerequisites: MGMT 61000 (Note: Students who have not taken MGMT 61000 may enroll with instructor permission).

Learning Outcomes: 1. Gain experience using Excel to solve complex problems and build financial models. 2. Learn how to use Excel and other software to build, test and run regression analysis with financial data. 3. Provide an introduction to using SAS for analyzing financial data. 4. Learn how to implement Monte Carlo simulations using Excel for financial applications. Credits: 2.00 or 3.00

MGMT 58100 - Big Data Technologies

Credit Hours: 2.00. There is an exponential growth in the adoption of big data technologies in every walk of life. Organizations are collecting, storing, and analyzing massive amounts of data. This data is commonly referred to as big data because of its large volume, the velocity with which it is collected and transmitted, the variety of forms it takes, and veracity of its origin and content. In order to capitalize on the opportunities presented by big data, businesses are putting in place technologies, people, and processes. Just collecting, transmitting and storing big data creates little value for an organization. For many organizations, the term big data currently represents only a data infrastructure such as the Apache Hadoop family of products. The key to delivering real value from big data is the use of analytics. Data must be analyzed and the results used by decision makers and organizational processes in order to generate value. The main objective of this course is to learn how to collect, process, store, and analyze big data. Assignments could easily be completed in Python or SQL. We assume no familiarity with Linux and will introduce you to all essential Linux commands. Students need access to a computer with a 64 bit operating system and at least 4 GB of RAM. Note: 8 GB or more of RAM is strongly recommended.

Learning Outcomes: 1. Learn visualization techniques using Tableau to query large datasets and gain insights from it. 2. Learn to deploy big data technologies such as Cloudera Hadoop on Virtual Box. 3. Learn to collect data using open APIs to access streaming data from sites like Twitter, Quandl, Buzzfeed, etc. 4. Learn to architect a big data platform for analysis. Credits: 2.00

MGMT 59800 - Analyzing Unstructured Data

Credit Hours: 2.00. This course prepares master students with the advanced and frontier technique for analyzing unstructured data that is built on the prerequisite of basic data analysis on structured data (e.g., data mining using python). Upon completion, students are expected to be competent and skilled in collecting, processing, and analyzing online unstructured data using the state-of-art artificial intelligence modeling (e.g., neural networks and deep learning methods) and the mainstream open-sourced toolboxes (e.g., NLTK, scikit-learn, keras, and TensorFlow); students should at least be proficient to design and lead industry-level practical projects conceptually when working with data scientist. We take text and image as examples for illustration and cover applications of: Text mining and feature extraction (e.g., sentiment, topic, readability, etc.); Image classification (e.g., recognition, etc.); Advanced applications (e.g., translations, chatbot, image expression, etc.) The course is formatted as a combination of seminars and hands-on coding practices in class. Students are expected to code (and debug) in the class. The main method topics covered include: Crawling unstructured data using scrapy. Representation and embedding of text and image. Unsupervised learning for unstructured data (e.g., LDA topic modeling, clustering, etc.) Supervised learning for unstructured data (e.g., classic ML models, A/D/C/RNN, LSTM, etc.). Permission of instructor required.

Learning Outcomes: 1. Be competent and skilled in collecting, processing, and analyzing online unstructured data using the state-of-art artificial intelligence modeling (e.g., neural networks and deep learning methods) and the mainstream open-sourced toolboxes (e.g., NLTK, scikit-learn, keras, and TensorFlow). 2. Design and lead industry-level practical projects in joint with data scientist. Credits: 2.00

MGMT 57100 - Data Mining

Credit Hours: 2.00. Introduces the concepts, techniques, tools, and applications of data mining. The material is approached from the perspective of a business analyst, with an emphasis on supporting tactical and strategic decisions. Includes a variety of techniques to identify nuggets of information or decision-making knowledge in bodies of data, and extracting these in such a way that they can be put to use in the area, such as decision support, prediction, forecasting, and estimation.

Credits: 2.00

GSCM Selectives (0-18 credits)

MGMT 67200 - Advanced Business Analytics

Credit Hours: 2.00. Quantitative decision procedures under uncertainty applied to business problems. Basic concepts in econometrics and multivariate analysis are studied. Several managerial-oriented case studies are used to illustrate estimation, testing, and regression procedures. Master's student standing and Management majors only.

Learning Outcomes: 1. Review of Multiple Linear Regression. 2. Analysis of Variance (ANOVA): A Regression Approach. 3. Qualitative Independent Variables. 4. Qualitative or Discrete Dependent Variables. 5. Univariate Time Series Models for the Mean. 6. Univariate Time Series Models for Volatility. Credits: 2.00

MGMT 65700 - Manufacturing Strategy And Process Innovation

Credit Hours: 2.00. In recent years many firms have rediscovered manufacturing and operations as a potential source of strategic advantage. In general, these firms have sought to develop capabilities in operations which provide a sustainable advantage in the marketplace. In addition, successful firms have developed processes for understanding the cross-functional implications of product and process choices. In this course, we will seek to understand the circumstances under which particular operating capabilities are most beneficial and how such capabilities can be developed so that operations can be exploited for competitive advantage. Concurrent Prerequisite: MGMT 61000, 65000, 66000.

Learning Outcomes: 1. Identify a fit between Competitive Priorities and Operational Choices by showing how such a fit is accomplished in case analysis and write-ups and understanding pressures to change competitive priorities or operational choices. 2. Establish how capabilities emerge over time and enable a trajectory of competitive advantage by showing how capabilities create options to change tradeoffs in competitive priorities in case analysis and write-ups and identifying financial implications of pursuing one competitive priority vs another. 3. Use financial analysis and discussion of capabilities to argue for investment choices in case analysis. 4. Understand benefits of different approaches to supplier alliances. Consider tradeoffs in governance cost, production cost, long term efficiency and responsiveness in arms length, vertically integrated, and third way supplier partnerships in case analysis. Credits: 2.00

MGMT 58200 - Management Of Organizational Data

Credit Hours: 2.00. Provides the basic concepts and skills needed to analyze and organize business data, as well as to utilize the organized data to answer a variety of business queries. After successful completion, students will have an understanding of why database management is important and what it entails, how to analyze the data requirements of a business scenario and represent these requirements by means of entity-relationship (ER) diagrams, translate an ER diagram into normalized relations for a relational database management system, write simple and relatively complex data retrieval commands in the SQL language for an Oracle database, use Microsoft Access as a front end to a server database in Oracle, be familiar with several selected topics of current interest in the data management arena.

Credits: 2.00

MGMT 56400 - Management Of Service Operations

Credit Hours: 2.00. Special characteristics of services require an interdisciplinary approach to analyzing operations. This course draws upon concepts from accounting, management science, and marketing. Differences and similarities between the service and manufacturing organizations are analyzed. Case studies of service organizations are used extensively. Prerequisite: MGMT 66000 (if Graduate student status) or else MGMT 36100 (if Undergraduate student status).

Credits: 2.00

MGMT 58600 - Python Programming

Credit Hours: 2.00 or 3.00. Because data grows exponentially and becomes complex, we need computational methods to collect, store, and analyze them in order to be successful in science, engineering, business, and other professions. Python Programming, is an introductory programming class that meets this need. You will learn how to write computer programs in Python language to solve real-world problems. This class is designed for students that want to learn to computer programming for data science. This course guides students through the basic Python programming language, from initial concepts to final data analysis using python and external packages.

Learning Outcomes: 1. Understand the basic

programming concepts. 2. Understand the basic syntax and semantics of the Python language. 3. Understand the primitive data types build into Python. 4. Understand principles of data storage and manipulation. 5. Understand and use computer programming for basic interactive web applications. 6. Able to design, write and debug simple program to handle real-world data. Credits: 2.00 or 3.00

MGMT 56900 - Ethical And Sustainable Supply Chain Management

Credit Hours: 2.00 or 3.00. This course provides students with knowledge and skills for building and analyzing ethical and sustainable practices in supply chains, taking a holistic view of the interaction between businesses, the environment, and society.

Learning Outcomes: 1. Run life-cycle analysis (LCA) and interpret findings. 2. Analyze product and process performance through life-cycle thinking. 3. Understand the Tragedy of the Commons in the business context and identify the underlying reasons. 4. Assess pros and cons of various solutions to the Tragedy of the Commons problem in business context. 5. Identify and explain various product stewardship practices and their pros and cons. 6. Identify innovative business models, such as Servicizing, based on sustainable use of products and services. 7. Compare and contrast traditional supply chain with closed-loop supply chain. 8. Compare and contrast different types of contracts and practices for incentivizing compliance with ethical and sustainable conduct throughout the supply chain. 9. Identify and analyze opportunities and constraints in building ethical and sustainable supply chains. 10. Compare and contrast alternative ways of complying with environmental and social regulations such as carbon trading. Credits: 2.00 or 3.00

MGMT 56200 - Project Management

Credit Hours: 2.00. Emphasizes the use of PC-based project management software and its applications, particularly in manufacturing organizations and especially new product development projects. Extensive use is made of several case studies to illustrate the planning and monitoring of a project. Class is held in a computer lab.

Learning Outcomes: 1. Understand the importance and challenges of managing projects of various types and sizes. 2. Learn and apply tools for project selection, team formation, and requirements gathering. 3. Create detailed budgets and schedules. 4. Acquire analytical capabilities for monitoring projects and investigating variances in scope, budget, and schedules. 5. Improve their ability to concisely communicate project information to senior management. Credits: 2.00

MGMT 56000 - Manufacturing Planning And Control

Credit Hours: 2.00 or 3.00. An advanced course in manufacturing planning and control systems, emphasizing the integration of demand forecasting, inventory control, production scheduling, and production control. Topics are linked through case studies and an elaborate manufacturing computer simulation game.

Learning Outcomes: 1. Master the major concepts, techniques and models of process design and analysis, and the ability to apply them to contexts beyond manufacturing. 2. Master the major tools for conformance quality control and performance quality improvement. 3. Understand the trend in manufacturing management and the advanced skills needed. 4. Acquire the analytical capabilities to uncover problems and improvement opportunities in manufacturing management. Credits: 2.00 or 3.00

Global Supply Chain Management, MS (OL)

About the Program

Program Requirements

Required Courses (17 credits)

MGMT 66000 - Introduction To Operations Management

Credit Hours: 2.00 to 4.00 (West Lafayette) 3.00 (Calumet, North Central). As goods and services are produced and distributed, they move through a set of inter-related operations or processes in order to match supply with demand. The design of these operations for strategic advantage, investment in improving their efficiency and effectiveness, and controlling these operations to meet performance objectives is the domain of Operations Management. The primary objective of the course is to provide an overview of this important functional area of business. Prerequisite: MGMT 67000 .

Credits: 2.00 to 4.00

MGMT 56600 - Global Supply Chain Management

Credit Hours: 2.00. This course will integrate issues from marketing (channels of distribution), logistics, and operations management to develop a broad understanding of a supply chain in a global context. Students will learn how different factors, including exchange rate risk, custom duty and trading policies, geographic distribution of resources and demand, availability and reliability of local supplier, and characteristics of consumer, affect the design and execution of global supply chain strategies. Prerequisites: Students are expected to have taken a basic course on operations (such as the masters core class MGMT 66000: Introduction to Operations Management) and a basic course on supply chain management (such as the masters elective MGMT 66400: Supply Chain Management). Exposure to a course on optimization is also preferred, but not required. The course requires logical and analytical thinking.

Learning Outcomes: 1. Train the students to understand the issues in managing a global supply chain and to manage them and optimize their performance. It requires critical thinking through the participation of games, case discussions, and presentation of case assignments. Credits: 2.00

MGMT 56500 - Strategic Sourcing And Procurement

Credit Hours: 2.00. This course will address the process of procurement including terminology, metric, and decision making. Additionally, we will investigate the best practices and processes for managing the relationships with suppliers and their performance. We will also explore the sourcing decision and the strategic ramifications of producing/ providing goods and services internally or purchasing them from external organizations. Prerequisites: Students are expected to have taken a basic course on operations (such as the masters core class MGMT 66000: Introduction to Operations Management) and a basic course on supply chain management (such as the masters elective MGMT 66400: Supply Chain Management).

Learning Outcomes: 1. Develop a good understanding of sourcing and procurement strategies and enhance the student's analytical skills to make optimal sourcing and procurement decisions. It requires critical thinking through the participation of games, case discussions and presentation of case assignments. Credits: 2.00

MGMT 56800 - Supply Chain Analytics

Credit Hours: 2.00. There is an exponential growth in the adoption of big data technologies in every walk of life. Organizations are collecting, storing, and analyzing massive amounts of data. This data is commonly referred to as big data because of its large volume, the velocity with which it is collected and transmitted, the variety of forms it takes, and veracity of its origin and content. In order to capitalize on the opportunities presented by big data, businesses are putting in place technologies, people, and processes. Just collecting, transmitting and storing big data creates little value for an organization. For many organizations, the term big data currently represents only a data infrastructure such as the Apache Hadoop family of products. The key to delivering real value from big data is the use of analytics. Data must be analyzed and the results used by decision makers and organizational processes in order to generate value. The main objective of this course is to learn how to collect, process, store, and analyze big data. Assignments could easily be completed in Python or SQL. We assume no familiarity with Linux and will introduce you to all essential Linux commands. Students need access to a computer with a 64 bit operating system and at least 4 GB of RAM. Note: 8 GB or more of RAM is strongly recommended.

Learning Outcomes: 1. Learn a systematic set of current popular analytical methodologies, including (1) data management and exploration (database management, data visualization, etc.), (2) data analysis (statistical methods, time series analysis, etc.), (3) modeling (math models, advanced spreadsheet engineering, etc.), and (4) decision analysis (optimization,

simulation, numerical analysis, etc.). 2. Use these methodologies in a large-scale supply chain simulation game and to analyze cases involving multiple supply chain functions, such as forecasting, procurement, inventory, transportation, pricing, contract, revenue management, and reverse supply chain. Credits: 2.00

MGMT 56900 - Ethical And Sustainable Supply Chain Management

Credit Hours: 2.00 or 3.00. This course provides students with knowledge and skills for building and analyzing ethical and sustainable practices in supply chains, taking a holistic view of the interaction between businesses, the environment, and society.

Learning Outcomes: 1. Run life-cycle analysis (LCA) and interpret findings. 2. Analyze product and process performance through life-cycle thinking. 3. Understand the Tragedy of the Commons in the business context and identify the underlying reasons. 4. Assess pros and cons of various solutions to the Tragedy of the Commons problem in business context. 5. Identify and explain various product stewardship practices and their pros and cons. 6. Identify innovative business models, such as Servicizing, based on sustainable use of products and services. 7. Compare and contrast traditional supply chain with closed-loop supply chain. 8. Compare and contrast different types of contracts and practices for incentivizing compliance with ethical and sustainable conduct throughout the supply chain. 9. Identify and analyze opportunities and constraints in building ethical and sustainable supply chains. 10. Compare and contrast alternative ways of complying with environmental and social regulations such as carbon trading. Credits: 2.00 or 3.00

MGMT 56200 - Project Management

Credit Hours: 2.00. Emphasizes the use of PC-based project management software and its applications, particularly in manufacturing organizations and especially new product development projects. Extensive use is made of several case studies to illustrate the planning and monitoring of a project. Class is held in a computer lab.

Learning Outcomes: 1. Understand the importance and challenges of managing projects of various types and sizes. 2. Learn and apply tools for project selection, team formation, and requirements gathering. 3. Create detailed budgets and schedules. 4. Acquire analytical capabilities for monitoring projects and investigating variances in scope, budget, and schedules. 5. Improve their ability to concisely communicate project information to senior management. Credits: 2.00

Electives (13 credits)

MGMT 67200 - Advanced Business Analytics

Credit Hours: 2.00. Quantitative decision procedures under uncertainty applied to business problems. Basic concepts in econometrics and multivariate analysis are studied. Several managerial-oriented case studies are used to illustrate estimation, testing, and regression procedures. Master's student standing and Management majors only.

Learning Outcomes: 1. Review of Multiple Linear Regression. 2. Analysis of Variance (ANOVA): A Regression Approach. 3. Qualitative Independent Variables. 4. Qualitative or Discrete Dependent Variables. 5. Univariate Time Series Models for the Mean. 6. Univariate Time Series Models for Volatility. Credits: 2.00

MGMT 65000 - Strategic Management I

Credit Hours: 2.00 to 4.00. Concepts and methods that integrate previous training in functional areas of management. The perspective is that of the general manager charged with directing the total enterprise. Emphasis is given to formulation and implementation of strategy. Prerequisite: MGMT 61000 , MGMT 62000 , Master's student standing and Management majors only.

Credits: 2.00 to 4.00

MGMT 65430 - Negotiations In Organizations

Credit Hours: 1.00 to 3.00. Decision making examines organizational context, stages, creativity, biases, and group processes. Negotiations examine strategies for preparing and conducting negotiations. The principal focus is on individual and interpersonal aspects of each. Permission of department required.

Learning Outcomes: 1. Understand the basic components of business negotiations through reading and completing assignments based on the textbook chapters. 2. Learn the basic components of a negotiated contract by completing a business transaction in written form. 3. Attain pragmatic negotiations skills using the I-Message method for daily activities encompassing negotiation tactics and the Verbal Skills method for more sophisticated negotiations for a major business transaction. 4. Explore cultural differences in negotiations by completing a study of practice in two countries other than the U.S. and sharing results with other students to expand their cultural knowledge base. 5. Explore and practice alternative dispute resolution techniques including mediation and arbitration. 6. Demonstrate the negotiations skills they are attaining by participating in class role-plays and by completing a final major negotiation in class. Credits: 1.00 to 3.00

MGMT 65420 - Leadership

Credit Hours: 1.00 to 3.00. Examines organizational leadership responsibilities, forms of leadership, the acquisition, use, and consequences of power, critical leader skills, and how corporate environments shape leadership. Emphasis on self-discovery and development of managerial leadership knowledge and skills.

Learning Outcomes: 1. Increase conceptual understanding of key leadership principles and strategies utilized within formal organizations. 2. Have deepening knowledge regarding important interpersonal relationship skills and abilities. 3. Help students discover important insights into oneself as a leader (including strengths and weaknesses/opportunities for personal growth). Credits: 1.00 to 3.00

MGMT 58600 - Python Programming

Credit Hours: 2.00 or 3.00. Because data grows exponentially and becomes complex, we need computational methods to collect, store, and analyze them in order to be successful in science, engineering, business, and other professions. Python Programming, is an introductory programming class that meets this need. You will learn how to write computer programs in Python language to solve real-world problems. This class is designed for students that want to learn to computer programming for data science. This course guides students through the basic Python programming language, from initial concepts to final data analysis using python and external packages.

Learning Outcomes: 1. Understand the basic programming concepts. 2. Understand the basic syntax and semantics of the Python language. 3. Understand the primitive data types build into Python. 4. Understand principles of data storage and manipulation. 5. Understand and use computer programming for basic interactive web applications. 6. Able to design, write and debug simple program to handle real-world data. Credits: 2.00 or 3.00

MGMT 57100 - Data Mining

Credit Hours: 2.00. Introduces the concepts, techniques, tools, and applications of data mining. The material is approached from the perspective of a business analyst, with an emphasis on supporting tactical and strategic decisions. Includes a variety of techniques to identify nuggets of information or decision-making knowledge in bodies of data, and extracting these in such a way that they can be put to use in the area, such as decision support, prediction, forecasting, and estimation.

About the Program

Program Requirements - Thesis & Non-thesis

Required Courses (21 credits)

Core Courses (19 credits)

HSCI 31200 - Radiation Science Fundamentals

Credit Hours: 3.00. This course introduces principles and concepts related to nuclear energetics, radioactive decay, the interactions of ionizing radiation with matter, and the human health effects of exposure to ionizing radiation. Fundamental concepts related to atomic and sub-atomic physical processes as well as relevant aspects of modern physics are briefly reviewed. Students gain practical experience and enhance their understanding of radiation protection by participating in a radiological emergency response exercise (RERE).

Learning Outcomes: 1. Have a sense of scale for the atomic and sub-atomic world with regard to size and energies involved. 2. Recognize the major types of radioactive decay, calculate the rates of particle emission, and apply the theory of radioactive decay to decay chains, medical imaging applications and radio dating. 3. Describe and apply the mechanisms of interactions of radiation with matter. 4. Explain and apply mechanisms of radiation detection and quantification. 5. Know and quantify the biological effects of exposure to radiation using dosimetry principles. 6. Be proficient at manipulating the physical quantities and systems of units used in the radiological

sciences and at applying critical thinking and problem-solving skills. Credits: 3.00

HSCI 51400 - Radiation Instrumentation Laboratory

Credit Hours: 2.00. Laboratory techniques required for the application of radiation and radionuclides.

Credits: 2.00

HSCI 52600 - Principles Of Health Physics And Dosimetry

Credit Hours: 3.00. Principles of health physics, radiation dosimetry, and radiation shielding. Topics covered include natural and man-made radiation environments, operational radiation quantities and units, radiation protection philosophy, risk and dose limits, dose-response models, mortality estimates and risk calculations.

Credits: 3.00

HSCI 53400 - Applied Health Physics

Credit Hours: 3.00. Lecture and case studies related to the application of radiation dosimetry and shielding principles to the practice of health physics, including environmental and in-plant monitoring, emergency response, decommissioning and decontamination, operational criteria for meeting ALARA exposure limits, and the transport, disposal and treatment of radioactive waste. Epidemiological studies related to radiological accidents and nuclear power are also examined.

Credits: 3.00

HSCI 54000 - Radiation Biology

Credit Hours: 3.00. Effects of ionizing radiation on living systems at the molecular, cellular and tissue levels. Biological basis for radiation therapy treatment planning and radiation protection.

Learning Outcomes: 1. Understand the interaction of radiation with cells. 2. Understand the biological, chemical, and physical factors that modulate the interaction of radiation with cells. 3. Understand the mechanisms of cell killing by radiation. 4. Understand the repair of radiation damage. 5. Understand the genetic effects of radiation. 6. Understand the carcinogenic effects of radiation. 7. Understand the effects of radiation on different tissues. 8. Understand the effects of acute whole body irradiation. 9. Understand the use of radiation in cancer therapy. 10. Understand the effects of radiation on development. 11. Understand the biology of radiation carcinogenesis. 12. Understand the risk of cancer in populations exposed to low doses of radiation. Credits: 3.00

HSCI 57400 - Medical Health Physics

Credit Hours: 2.00. This course introduces the legislation and international and national recommendations relevant to the practice of radiation protection in medicine. Principles for the design of radiation use monitoring programs and shielding for radiation facilities is covered. Radiation risk avoidance and management for staff, patients and their families, and members of the public are discussed.

Learning Outcomes: 1. Introduce the student to the application of health physics in medicine and the role of the health physicist and medical physicist in this environment. Real-life experiences will be provided by lecturers to connect the professional and technical aspects of medical health physics to the clinical environment. 2. Identify issues and problems that would not normally be taught in the pure academic setting. Credits: 2.00

HSCI 51500 - Introduction To Nuclear And Radiological Source Security

Credit Hours: 3.00. This course focuses on the basic elements of nuclear and radiological source security. It examines methods for planning and evaluating nuclear security activities at the State and facility level, establishing nuclear security culture in different types of nuclear and radiological installations, and examines nuclear cyber and information security measures. Issues and approaches for nuclear security concerns, both state-level (e.g., nonproliferation and deterrence) and asymmetric concerns (e.g., nuclear smuggling and nuclear terrorism) will be addressed. The integration of safety and security and the use of alternative technologies will also be covered. Group exercises and simulations in applied nuclear security scenarios will complement lectures given by a number of national and international experts. This course is designed for both "technical" (engineering and science) and "non-technical" (policy) students and the interaction between students of different backgrounds is encouraged.

Learning Outcomes: 1. To introduce students to the basic concept of nuclear security. 2. To introduce students to the basics of nuclear security planning at the facility and state level. 3. Introduce students to proliferation efforts,

framing them within the historical and security-related context. 4. Create a foundational understanding of relevant security, safeguards and nonproliferation treaties and agreements. 5. Leverage existing technical knowledge in coming to policy conclusions. 6. Develop both a regime and state specific knowledge base. 7. Illustrate understanding through technical and policy oriented exercises. 8. Expand relevant technical knowledge base as well as introduce students to new instrumentation and concepts. Credits: 3.00

Professional Course (1 credit)

GRAD 61200 - Responsible Conduct Of Research

Credit Hours: 1.00. Overview of values, professional standards, and regulations that define responsible conduct in research. Students learn the values and standards of responsible research through readings and lecture/discussion and practice application of these values and standards to research situations through class discussion of case studies from life sciences research. Students must be registered for M.S. or Ph.D. thesis research in their home department.

Credits: 1.00

HSCI 61300 - Professionalism And Professional Development In Health Sciences

Credit Hours: 1.00. Professionalism is a skill set necessary for graduate student success and future career development. Professionalism consists of multiple attributes allowing for the development of effective and productive careers while also contributing to positive workplace environments. Specifically, these skill sets benefit all disciplines and career paths. This course will provide students with an overview of career development, soft skills, responsible conduct of research, and diversity, equity, and inclusion. This 1-credit course is specifically designed to supplement initial RCR training students receive in GRAD61200. The course is designed to support additional RCR training to meet expectations for best practices by NIH and other funding agencies. It will focus on professionalism and professional development for new students in their MS and Ph.D. programs across the Health Sciences. It will be delivered as a 50-min. combined lecture and class discussion once a week. All Ph.D. and thesis-based MS students in the School of Health Sciences are expected to take this course, typically in the Spring of their second or third year. Permission from department required. Prerequisite: GRAD 61200.

Learning Outcomes: 1. Describe the fundamentals of professionalism and professional conduct as both a trainee and within one's own career. 2. Demonstrate responsible conduct of research and diversity, equity, and inclusion through participation in course discussions. 3. Actively participate in the development of multiple soft skills including networking, negotiation, interview, leadership, conflict resolution, networking, and social media management. 4. Critically think and analyze complex professional situations often occurring in scientific careers. Credits: 1.00

Seminar Course (1 credit)

HSCI 69600 - Seminar In Health Science

Credit Hours: 0.00 or 1.00. Selected topics in health sciences presented by staff, students, and invited speakers.

Credits: 0.00 or 1.00

Statistics Selective (3 credits)

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables.

Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

STAT 51200 - Applied Regression Analysis

Credit Hours: 3.00. Inference in simple and multiple linear regression, residual analysis, transformations, polynomial regression, model building with real data, nonlinear regression. One-way and two-way analysis of variance, multiple comparisons, fixed and random factors, analysis of covariance. Use of existing statistical computer programs. Prerequisite: Coursework in Statistical Methods with a calculus prerequisite.

Learning Outcomes: 1. Learn to build and analyze simple and multiple regression models, analysis of variance and covariance (ANOVA/ANCOVA) for regression, inference for regression, diagnostics and remedial measures for regression, transformations, residual analysis, model building, polynomial and interaction models. Credits: 3.00

HSCI 52500 - Introduction To Statistical And Computational Approaches For Health Sciences

Credit Hours: 3.00. Statistical methods are important for data analysis and understanding the trends in the dataset.
This course will provide an introduction to the analysis of biological data in a statistical framework using standard computational methods. The course will have a lecture and hands-on component to introduce students to topics and then utilize them to solve typical problems in Health Sciences. In addition to learning the statistical concepts, the students will also be introduced to computational approaches for data analysis. The combination of statistical and computational concepts along with the hands-on experience will help students in their research projects. The topics covered include data representation, sample statistics, probability, common discrete and continuous distribution, confidence interval estimation, experimental design, analysis of variance, statistical methods for hypothesis testing, linear and logistic regression, correlation, power analysis, graph theory, network analysis, omics-based analysis, and data visualization. The course is ideal for Health Sciences students who perform data analysis and are interested in implementing these approaches in their research. Permission of department required.

Learning Outcomes: 1. Describe the fundamentals of statistics and computational concepts useful for research. 2. Think critically and analyze methods of data collection, statistical tools for data analysis, and presentation of results. 3. Evaluate systematically statistical procedures and summaries. 4. Learn methods for computational analysis and data visualization. 5. Participate actively in developing projects to apply statistical and computational approaches. Credits: 3.00

Thesis Research (6 credits)

HSCI 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required.

Credits: 1.00 to 18.00

Project Course (3 credits)

HSCI 59000 - Special Topics

Credit Hours: 1.00 to 8.00. Special topics, projects, or readings in selected areas of health sciences at a level appropriate for seniors and graduate students. Permission of instructor required.

Credits: 1.00 to 8.00

HSCI 69000 - Special Topics

Credit Hours: 1.00 to 8.00. Special topics, projects, or readings in selected areas of health sciences at a level appropriate for graduate students. Permission of instructor required.

Credits: 1.00 to 8.00

Electives (3-6 credits)

HSCI 31300 - Principles Of Radiation Detection And Measurement

Credit Hours: 2.00. Course presents an introduction to the principles of radiation detection and measurement, including statistical models, counting statistics, error analysis, detection limits, ionization chambers, proportional counters, GM counters, scintillation counters, gamma-ray spectroscopy, solid-state detectors, TLDs, track-etch and bubble detectors.

Learning Outcomes: 1. Understand the fundamentals of 3 types of ionization radiation. 2. Understand radiation safety. 3. Understand how to choose the radiation detection devices that fit for a specific purpose. 4. Understand what their capabilities and limitations are. 5. Understand how to interpret and use the output from radiation detectors. 6. Understand medical applications of radiation or radioactive materials. 7. Understand basic principles to detect the radioactive materials injected into human or animal subjects. 8. Understand different nuclear imaging procedures. 9. Understand fundamentals of molecular imaging. 10. Understand the receptor-based radiotracers for imaging and radiotherapy. Credits: 2.00

HSCI 54600 - Advanced Industrial Hygiene Control Technology

Credit Hours: 4.00. Study of the various techniques needed to control hazards in the workplace. Engineering controls are placed in effort to reduce or remove the hazard at the source by isolating the worker from the hazard. Major emphasis is placed on developing a working understanding of industrial ventilation, including basic principles of fluid flow, hood and duct design, and system balancing. Effects and control of the physical hazards of noise, vibration, and heat stress are addressed. A field trip to a major industry summarizes the course material.

Learning Outcomes: 1. Use scientific and engineering principles to anticipate and recognize potential health hazards in the workplace. 2. Interpret the scientific literature and health data and apply these to the anticipating, recognition, evaluation and control of occupational hazards in the workplace. 3. Describe/understand different approaches for controlling exposures in the occupational environment and give hypothetical and real situations in terms of the best control methods and relative pros & cons. 4. Understand the physical and physiological aspects of heat stress and heat strain and apply this knowledge to prevent heat injury in the workplace. 5. Understand potential sources of indoor air quality problems, physical symptoms which may be experienced by individuals exposed to various contaminants, and methods of improving the indoor environment. 6. Identify biological contaminants and methods of controlling exposure. 7. Understand the physical and physiological aspects of noise-induced hearing loss and apply this knowledge to assess exposure and prevent hearing loss in the workplace. 8. Perform calculations of noise levels, noise doses and the effectiveness of noise control options. 9. Select and size the components of a local exhaust ventilation system: hoods, ductwork, air cleaners, fans, and balance/test such systems, culminating in the ability to design a small ventilation system. Credits: 4.00

HSCI 54700 - Fundamentals Of Epidemiology

Credit Hours: 3.00. This course is an introduction to epidemiology, which is the study of the patterns, causes, and impact of disease in populations. Epidemiology is increasingly important for public health and clinical medicine research and policy. This course will discuss the basic principles and methods of epidemiology, including measurements of disease occurrence and association, study designs, and determination of causality. Contemporary examples will be used to illustrate the application of these concepts, with an emphasis on environmental causes of disease.

Learning Outcomes: 1. Describe major models of disease causation and prevention. 2. Calculate the extent of disease in populations. 3. Identify and utilize appropriate epidemiologic study designs. 4. Estimate the association between exposure and disease. 5. Differentiate

between association and causation. 6. Explain and employ the use of epidemiologic tools in public health and clinical practice. 7. Review and critique basic epidemiology studies. Credits: 3.00

HSCI 55100 - Physical Agents In Environmental Health

Credit Hours: 3.00. Physical characterization and biological interactions of non-ionizing radiation with emphasis on the adverse effects of human exposure. Topics include source characterization, environmental exposure assessment, measurement instrumentation, toxicological and epidemiological findings, control strategies.

Credits: 3.00

HSCI 55200 - Introduction To Aerosol Science

Credit Hours: 3.00. The principles of aerosol behavior and sampling, with particular emphasis on applications in the health sciences. Topics include aerosol aerodynamics, aerosol filtration, pulmonary deposition of aerosols, methods of environmental sampling, and generation of laboratory aerosols.

Credits: 3.00

HSCI 56000 - Toxicology

Credit Hours: 3.00. (MCMP 56000) Introduction to general principles of toxicology, target organ toxicity, and safety evaluation. Covers toxicity of metals, solvents, pesticides, gases, dusts, and food additives.

Credits: 3.00

HSCI 69000 - Special Topics

Credit Hours: 1.00 to 8.00. Special topics, projects, or readings in selected areas of health sciences at a level appropriate for graduate students. Permission of instructor required.

Credits: 1.00 to 8.00

NUCL 50100 - Nuclear Engineering Principles

Credit Hours: 3.00. A first course for graduate students desiring a nuclear engineering sequence and an elective for students in science or engineering. The course is structured in four parts: (1) Nuclear structure and radiation, biological effects and medical applications of radiation. (2) Basics of neutron and reactor physics, neutron diffusion and reactor criticality. (3) Nuclear materials and waste. (4) Reactor systems and safety.

Credits: 3.00

HSCI 52000 - Risk Assessment In Environmental Health

Credit Hours: 3.00. Risk assessment as used in environmental health is the scientific process used to determine the extent of human exposure to an environmental hazard, and the type and quantify of health effects that are likely to result from these exposures. Information derived from risk assessments are used as the basis for setting regulatory guidelines, determinations of whether a given situation is "safe" or "hazardous" throughout government and industry. This course will cover the process and steps needed to performing a risk assessment, how risk communication can be used to discuss results of a risk assessment, and the use of risk management as a tool to translate results of a risk assessment into policy.

Learning Outcomes: 1. Define risk assessment and describe the general processes and methods used for risk assessment. 2. Discuss and analyze how issues such as variability and uncertainty impact risk assessments. 3. Define risk communication and describe what features improve (or worsen) its effectiveness. 4. Describe the process of hazard management including its strengths and weaknesses in terms of ensuring protection of human health. 5. Perform a risk assessment on an environmental hazard and communicate the results of this assessment. Credits: 3.00

HSCI 54400 - Advanced Topics In Exposure Assessment

Credit Hours: 2.00. The course will prepare students to use techniques of exposure assessment as it relates to environmental and occupational epidemiological studies as well as regulatory compliance at workplace and in community settings, risk science, and susceptibility factors. It will include exposure assessment study design, the strengths and weaknesses of various exposure assessment techniques, and how to link exposure assessment with occupational and environmental health. Core concepts to be covered include exposure variability and its implications for reconstructing historical exposures, the choice of exposure metric, surrogate measures and measurement errors, exposure modeling, and biomarkers of exposure. The course emphasizes critical and analytical discussions of seminal exposure assessment literature. Students are required to critically evaluate exposure assessment strategies in selected epidemiological studies from the peer-reviewed literature. Students participate in the class through presentations, class discussions, and a semester project.

Learning Outcomes: 1. Explain the nature of

exposure problems in reconstructing historical exposures in occupational and non-occupational settings. 2. Recognize the implications of sparse and missing data and the choice of the exposure-response relationship. 3. Design a testable hypothesis and execute research activity to investigate exposure to environmental contaminants at workplace or in a community, and interpret data obtained from such studies. 4. Be aware of the modeling tools for quantifying exposures. 5. Evaluate critically exposure assessment strategies in occupational and environmental epidemiological studies and risk assessments. Credits: 2.00

HSCI 54800 - Advanced Industrial Hygiene Instrumentation Techniques

Credit Hours: 3.00. This course covers sophisticated field and laboratory instrumentation and techniques, sampling methodology for organic vapors, dust, fibers, noise, and heat; calibration and validation techniques; emphasis on critical analysis of data.

Learning Outcomes: 1. Use scientific and engineering principles to anticipate and recognize potential health hazards in the workplace. 2. Interpret the scientific literature and health data and apply these to the anticipating, recognition, evaluation and control of occupational hazards in the workplace. 3. Describe/understand different approaches for controlling exposures in the occupational environment and give hypothetical and real situations in terms of the best control methods and relative pros and cons. 4. Understand the physical and physiological aspects of heat stress and heat strain and apply this knowledge to prevent heat injury in the workplace. 5. Understand the potential sources of indoor air quality problems, physical symptoms which may be experiences by individuals exposed to various contaminants, and methods of improving the indoor environment. 6. Identify biological contaminants and methods of controlling exposure. 7. Understand the physical and physiological aspects of noise-induced hearing loss and apply this knowledge to assess exposure and prevent hearing loss in the workplace. 8. Perform calculations of noise levels, noise doses and the effectiveness of noise control options. 9. Select and size the components of a local exhaust ventilation system: hoods, ductwork, air cleaners, fans and balance/test such systems, culminating in the ability to design a small ventilation system. Credits: 3.00

NRES 38010 - Hazardous Waste Handling

Credit Hours: 3.00. This course trains individuals to stop the release or potential releases of hazardous substances. They have a more aggressive role than first responders at the operations level by approaching the point of the release to plug, patch, or otherwise stop it or manage offensive operations. This course satisfies the OSHA standards for completion of the 40-hour Hazardous Waste Operator/Emergency Response Technician certification, 29CFR1910.120. Topics covered include implementing an employer's emergency response plan; classification and identification of unknown materials using field survey instruments; functioning within the Incident Command System; specialized chemical protective equipment; hazard and risk assessment techniques; advanced product control operations; decontamination procedures; proper termination procedures; and basic chemical and toxicological terminology.

Learning Outcomes: 1. Analyze a response scene to stop the release or potential releases of hazardous substances. 2. Connect knowledge and awareness to meet OSHA requirements. (29 CFR 1910.120) for working on projects that involve the handling of hazardous materials. 3. Receive their 40-hour HAZWOPER Certification after successfully completing all requirements. Credits: 3.00

HSCI 62500 - Grant Writing For Health Sciences

Credit Hours: 1.00. The ability to clearly communicate research concepts, ideas, and hypotheses is an essential skill for all researchers. Specifically, concise expression of complex research rationale, experimental design, and innovation through the grant application process benefits all disciplines and career paths. This course will provide students with an overview of the entire grant writing process through expert lectures, active

discussion, writing activities, and peer-review processes.

Learning Outcomes: 1. Describe the federal funding systems and grant submission process. 2. Demonstrate scientific writing and critique skills as applied to grant proposals. 3. Develop a National Institute of Health R21 grant proposal. 4. Actively participate in the grant proposal review process by critiquing other's work. Credits: 1.00

Required Courses (6 credits)

HIST 57600 - Problems In Latin American History

Credit Hours: 3.00. A detailed examination of specific topics in Latin American history. Topics offered vary between colonial and national periods.

Credits: 3.00

HIST 59000 - Directed Reading In History

Credit Hours: 1.00 to 3.00. A reading course directed by the instructor in whose field of specialization the content of the reading falls. Approval of each reading project must be secured from the department. Permission of instructor required.

Credits: 1.00 to 3.00

HIST 60100 - Reading Seminar In European History

Credit Hours: 1.00 to 3.00. Bibliography and historiography of selected fields of topics in European history; may vary in subject matter from semester to semester. Prerequisite: Master's student standing.

Credits: 1.00 to 3.00

HIST 61000 - History: Theory And Methods

Credit Hours: 3.00. This is the first part of an introductory two-course sequence for new graduate students intended to acquaint them with some important issues regarding the modern professional practice of history. This semester concentrates on historiography, theoretical questions, and methodological debates that today's working historians inevitably encounter. Students read about the practice of historical scholarship and read several important example texts representing different approaches to the discipline over the past 200 years. Students write several short book reviews, position papers, and a mock grant proposal during this semester. The course is required of incoming graduate students in history. It usually will be followed by HIST 61100 , Research Practicum.

Learning Outcomes: 1. Become familiar with current trends in historical writing and argumentation. 2. Master a certain amount of knowledge about the evolution of the historical profession (historiography) but more importantly the recognition of problems inherent in asking and answering historical questions using documentary evidence and other sources available to scholars. 3. Able to formulate a research question and situate it within a context of existing historical scholarship, arguing for its significance to the community of scholars to

whom it is addressed. 4. Develop critical thinking and communication skills. 5. Learn ethical research conduct and the appropriate use of historical investigation will be explored in the course of the seminar. Credits: 3.00

HIST 61100 - History: Research Practicum

Credit Hours: 3.00. The second half of a two-semester sequence for new graduate students intended to acquaint them with important issues regarding the modern practice of historical scholarship. This course is a research seminar in which students shape and execute their own research projects resulting in original article-length historical essays. In addition, matters relating to ethical conduct of research and problems of historical writing and argumentation are discussed. Prerequisites: HIST 61000 or 59800. Permission of instructor required.

Learning Outcomes: 1. Learn the process of shaping and executing a historical research project. 2. Learn the production of an original article-length historical essay. 3. Articulate their research question, propose strategies for finding appropriate evidence and sources, and discuss ways of constructing arguments to most effectively communicate the answers they find to their questions. Credits: 3.00

HIST 64100 - Reading Seminar In Global History

Credit Hours: 3.00. Individual and group study of topics in global history. Topics reflect the research, teaching, or historiographic specialties of the faculty offering the course. Subtitles indicate the focus of the research seminar. Prerequisite: Master's student standing.

Credits: 3.00

HIST 65100 - Reading Seminar In American History

Credit Hours: 1.00 to 3.00. Bibliography and historiography of selected fields or topics in American history; may vary in subject matter from semester to semester. Prerequisite: Master's student standing.

Credits: 1.00 to 3.00

HIST 67000 - Seminar In Latin American History

Credit Hours: 3.00. Research or reading seminar in Latin American History on a selected topic in colonial or national period of Latin American History. Topics vary. It may be repeated once with change of topic. Students must have been admitted into M.A. or Ph.D. history programs or any other graduate program at Purdue. Also, adequate knowledge of languages pertinent to research topic is expected. No prior knowledge of Latin American History is required.

Learning Outcomes: 1. Become familiarized with the historical process in Latin America from 1492 to the present. 2. Understand the complexities of doing research in the area (e.g., the type of documentation, archives, and scholarly community that exist in Latin America). 3. Develop critical thinking and research abilities. Credits: 3.00

Major Research Area (15 credits)

HIST 51200 - England Under The Stuarts

Credit Hours: 3.00. This intensive study of seventeenth-century England focuses on the political, religious, and economic tensions under the early Stuarts; the Civil War; Cromwell's Protectorate; and The Glorious Revolution. Topics discussed include parliament, puritanism, radicalism, the Restoration, and the Whig Oligarchy.

Credits: 3.00

HIST 57600 - Problems In Latin American History

Credit Hours: 3.00. A detailed examination of specific topics in Latin American history. Topics offered vary between colonial and national periods.

Credits: 3.00

HIST 57700 - Contemporary Latin America

Credit Hours: 3.00. A topical and regional approach to recent political, social, and economic movements in Latin America.

Credits: 3.00

HIST 59000 - Directed Reading In History

Credit Hours: 1.00 to 3.00. A reading course directed by the instructor in whose field of specialization the content of the reading falls. Approval of each reading project must be secured from the department. Permission of instructor required.

Credits: 1.00 to 3.00

HIST 59500 - The Holocaust And Genocide

Credit Hours: 3.00. (POL 59500) History and analysis of the Nazi attempt to destroy the European Jews, with comparisons to other instances of genocide.

Credits: 3.00

HIST 60100 - Reading Seminar In European History

Credit Hours: 1.00 to 3.00. Bibliography and historiography of selected fields of topics in European history; may vary in subject matter from semester to semester. Prerequisite: Master's student standing.

Credits: 1.00 to 3.00

HIST 60200 - Seminar In European History

Credit Hours: 3.00. Individual and group study of topics in European history from the medieval period to the modern era. Topics reflect the research, teaching, or historiographical specialties of the faculty offering the course. Subtitles indicate the focus of the research seminar. Prerequisite: Master's student standing.

Credits: 3.00

HIST 64100 - Reading Seminar In Global History

Credit Hours: 3.00. Individual and group study of topics in global history. Topics reflect the research, teaching, or historiographic specialties of the faculty offering the course. Subtitles indicate the focus of the research seminar. Prerequisite: Master's student standing.

Credits: 3.00

HIST 64200 - Seminar In Global History

Credit Hours: 3.00. Individual and group study of topics in global history. Topics reflect the research, teaching, or historiographic specialties of the faculty offering the course. Subtitles indicate the focus of the research seminar. Prerequisite: Master's student standing.

Credits: 3.00

HIST 65000 - Teaching The History Survey Course

Credit Hours: 3.00. This course provides an introduction to the literature on teaching history at the college level, especially the literature on pedagogy, theory, and conceptualization needed for the undergraduate survey course. Students will become familiar with the professional literature, develop their own syllabus for the survey course, and produce an extensive historiographical essay supporting and justifying the contents of the syllabus. Class discussions will expose students to a number of teaching strategies, concepts, and exercises. Prerequisite: Master's student standing. Permission of instructor required.

Learning Outcomes: 1. Have effective communication through written and oral modes. 2. Have critical and creative thinking skills in acquiring a broad base of knowledge and applying it to complex issues. 3. Have competence in a major area of study. 4. Have appreciation for and understanding of an expanded world perspective by engaging respectfully with a diverse range of individuals, communities and viewpoints. Credits: 3.00

HIST 65100 - Reading Seminar In American History

Credit Hours: 1.00 to 3.00. Bibliography and historiography of selected fields or topics in American history; may vary in subject matter from semester to semester. Prerequisite: Master's student standing.

Credits: 1.00 to 3.00

HIST 65200 - Seminar In American History

Credit Hours: 3.00. Individual and group study of topics in American history from the colonial period to the present. Topics reflect the research, teaching, or historiographical specialties of the faculty offering the course. Subtitles indicate the focus of the research seminar. Prerequisite: Master's student standing.

Credits: 3.00

HIST 67000 - Seminar In Latin American History

Credit Hours: 3.00. Research or reading seminar in Latin American History on a selected topic in colonial or national period of Latin American History. Topics vary. It may be repeated once with change of topic. Students must have been admitted into M.A. or Ph.D. history programs or any other graduate program at Purdue. Also, adequate knowledge of languages pertinent to research topic is expected. No prior knowledge of Latin American History is required.

Learning Outcomes: 1. Become familiarized with the historical process in Latin America from 1492 to the present. 2. HIST 65000 - Teaching The History Survey Course

Credit Hours: 3.00. This course provides an introduction to the literature on teaching history at the college level, especially the literature on pedagogy, theory, and conceptualization needed for the undergraduate survey course. Students will become familiar with the professional literature, develop their own syllabus for the survey course, and produce an extensive historiographical essay supporting and justifying the contents of the syllabus. Class discussions will expose students to a number of teaching strategies, concepts, and exercises. Prerequisite: Master's student standing. Permission of instructor required.

Learning Outcomes: 1. Have effective communication through written and oral modes. 2. Have critical and creative thinking skills in acquiring a broad base of knowledge and applying it to complex issues. 3. Have competence in a major area of study. 4. Have appreciation for and understanding of an expanded world perspective by engaging respectfully with a diverse range of individuals, communities and viewpoints. Credits: 3.00

HIST 65100 - Reading Seminar In American History

Credit Hours: 1.00 to 3.00. Bibliography and historiography of selected fields or topics in American history; may vary in subject matter from semester to semester. Prerequisite: Master's student standing.

Credits: 1.00 to 3.00

HIST 65200 - Seminar In American History

Credit Hours: 3.00. Individual and group study of topics in American history from the colonial period to the present. Topics reflect the research, teaching, or historiographical specialties of the faculty offering the course. Subtitles indicate the focus of the

research seminar. Prerequisite: Master's student standing.

Credits: 3.00

HIST 67000 - Seminar In Latin American History

Credit Hours: 3.00. Research or reading seminar in Latin American History on a selected topic in colonial or national period of Latin American History. Topics vary. It may be repeated once with change of topic. Students must have been admitted into M.A. or Ph.D. history programs or any other graduate program at Purdue. Also, adequate knowledge of languages pertinent to research topic is expected. No prior knowledge of Latin American History is required.

Learning Outcomes: 1. Become familiarized with the historical process in Latin America from 1492 to the present. 2. Understand the complexities of doing research in the area (e.g., the type of documentation, archives, and scholarly community that exist in Latin America). 3. Develop critical thinking and research abilities. Credits: 3.00

Required Courses (6 credits)

HIST 61000 - History: Theory And Methods

Credit Hours: 3.00. This is the first part of an introductory two-course sequence for new graduate students intended to acquaint them with some important issues regarding the modern professional practice of history. This semester concentrates on historiography, theoretical questions, and methodological debates that today's working historians inevitably encounter. Students read about the practice of historical scholarship and read several important example texts representing different approaches to the discipline over the past 200 years. Students write several short book reviews, position papers, and a mock grant proposal during this semester. The course is required of incoming graduate students in history. It usually will be followed by HIST 61100 , Research Practicum.

Learning Outcomes: 1. Become familiar with current trends in historical writing and argumentation. 2. Master a certain amount of knowledge about the evolution of the historical profession (historiography) but more importantly the recognition of problems inherent in asking and answering historical questions using documentary evidence and other sources available to scholars. 3. Able to formulate a research question and situate it within a context of existing historical scholarship, arguing for its significance to the community of scholars to whom it is addressed. 4. Develop critical thinking and communication skills. 5. Learn ethical research conduct and the appropriate use of historical investigation will be explored in the course of the seminar. Credits: 3.00

HIST 61100 - History: Research Practicum

Credit Hours: 3.00. The second half of a two-semester sequence for new graduate students intended to acquaint them with important issues regarding the modern practice of historical scholarship. This course is a research seminar in which students shape and execute their own research projects resulting in original article-length historical essays. In addition, matters relating to ethical conduct of research and problems of historical writing and argumentation are discussed. Prerequisites: HIST 61000 or 59800. Permission of instructor required.

Learning Outcomes: 1. Learn the process of shaping and executing a historical research project. 2. Learn the production of an original article-length historical essay. 3. Articulate their research question, propose strategies for finding appropriate evidence and sources, and discuss ways of constructing arguments to most effectively communicate the answers they find to their questions. Credits: 3.00

About the Program

Program Requirements - Thesis and Non-thesis

Required Courses (3 credits)

HORT 60100 - Planning And Presenting Plant Science Research

Credit Hours: 1.00. The purpose of this course is to acquaint students with the culture of scientific research and the processes of scientific discovery and review. This course will: (1) acquaint students with techniques used in presenting short scientific talks, as e.g., at national meetings, (2) expose students to procedures used in preparing scientific papers, proposals, etc., (3) introduce students to the outcomes expected to be achieved by graduate education and the processes by which students are mentored and evaluated, (4) help students begin formulating their research project proposal, (5) acquaint students with guidelines for biosafety and responsible conduct of research and provide a forum for discussion of ethical issues confronting researchers, particularly those inherent in participating in extramurally-funded research, (6) acquaint students with intellectual property issues involved in scientific research, (7) acquaint students with core research facilities across campus, and (8) expose students to discussions regarding the importance of diversity and an atmosphere of mutual respect to research excellence. This course is taken for a letter grade and carries one hour of credit.

Credits: 1.00

HORT 60200 - Horticulture Research Seminar

Credit Hours: 1.00. Weekly attendance at the Horticulture and Landscape Architecture Departmental seminars to help graduate students develop an appreciation for attending seminars and learning appropriate and effective presentation skills. HORT 602 compliments HORT 60100 and HORT 60300 by extending the presentation and project development approaches learned, so that students are better ready to prepare and defend their project proposals in HORT 60300. Prerequisite: BCHM 56100.

Credits: 1.00

GRAD 61200 - Responsible Conduct Of Research

Credit Hours: 1.00. Overview of values, professional standards, and regulations that define responsible conduct in research. Students learn the values and standards of responsible research through readings and lecture/discussion and practice application of these values and standards to research situations through class discussion of case studies from life sciences research. Students must be registered for M.S. or Ph.D. thesis research in their home department.

Credits: 1.00

Analytical Tools Course (3 credits)

COM 58500 - Qualitative Methods In Communication Research

Credit Hours: 3.00. An introduction to qualitative research methods in communication studies. Provides students with an overview of several techniques for, and issues in, gathering, analyzing, writing-up, and using qualitative data. Department permission required.

Learning Outcomes: 1. Examine the philosophical assumptions, theoretical traditions and epistemology of qualitative methods in the field of communication. 2. Understand various approaches to qualitative inquiry, particularly entailing narrative research, phenomenological research, grounded theory research, ethnographic research, and case study research. 3. Critique written qualitative research in communication journals and identify ways to improve them. 4. Develop skills and techniques to design a qualitative research project, which includes the process of getting IRB approval, collecting and analyzing qualitative data, and writing up qualitative findings. Credits: 3.00

AGEC 65000 - Application Of Quantitative Analysis: Econometrics I

Credit Hours: 3.00. Brief presentation of probability concepts, mathematical expectation, probability density and distribution functions as background for studying principles of economic model construction. Emphasis is on econometric single equation models, principles of estimation, the general linear model, tests of hypothesis, confidence interval estimation, and special topics such as errors in the variables, multicollinearity, dummy variables, hetero-scedasticity, autocorrelation and prediction problems. Prerequisite: STAT 51100 ; ECON 51100 or ECON 60700 , matrix algebra.

Credits: 3.00

AGEC 65100 - Application Of Quantitative Analysis: Econometrics II

Credit Hours: 3.00. Emphasis is on using advanced econometric techniques. The course covers use of computer

software and interpretation and reporting of econometric results. The first part of the course includes general econometric concepts, such as least squares and maximum likelihood estimation, desirable statistical properties, assumptions of the classical linear regression model, Monte Carlo methods, nested and non-nested hypothesis tests. Later, more specialized topics are covered, including multiple equation models, simultaneous equation models, limited dependent variable models, and other topics that are deemed relevant. Prerequisite: AGEC 65000.

Credits: 3.00

ASM 54000 - Geographic Information System Application

Credit Hours: 3.00. Fundamentals of GIS analysis applied to environmental, agricultural, and engineering-related problems. Topics include data sources, spatial analysis; projections; creating data and metadata, and conceptualizing and solving spatial problems using GIS.

Learning Outcomes: 1. Apply fundamental geographic information system concepts for organizing, symbolizing, and visualizing spatial and temporal data. 2. Demonstrate proficiency with spatial data manipulation methods for creating and editing geodatabases, geocoding, and performing geoprocessing operations on spatial data. 3. Apply spatial analysis tools to process vector and raster data for decision-making. 4. Create models to automate GIS workflow and build custom geoprocessing tools. 5. Construct user-friendly dashboards/web apps/StoryMaps for sharing developed solutions. 6. Research publicly available GIS data and use it for the final project or demonstrate Python programming skills to analyze publicly available data. Credits: 3.00

AGRY 54500 - Remote Sensing Of Land Resources

Credit Hours: 3.00. Application of remote sensing and spatial databases for observing and managing land resources within the Earth System; analysis and interpretation of remotely sensed data in combination with field observations and other data sources; conceptualization and design of a global earth resources information system.

Learning Outcomes: 1. Evaluate, analyze, and apply the fundamentals of remote sensing related to sensor technologies, Multispectral/hyperspectral imaging, active and passive radar, LIDAR, GPS, preprocessing of remote sensing image data, Radiometric and geometric correction, data enhancement for visual interpretation, extraction of information from data, spatial and spectral feature extraction for analysis, Unsupervised and supervised classification, terrain modeling and sources of remote sensing data/information.

Credits: 3.00

ECON 67400 - Microeconometrics

Credit Hours: 1.00 to 3.00. This advanced course covers the econometrics and statistical methods needed to study data on individual agents in general qualitative response models and models of limited dependent variables. Special emphasis is placed on applying the alternate estimation and inference techniques to actual or simulated datasets. Topics include: univariate binary models, multinomial and multivariate qualitative response models, choice based sampling, distribution-free estimation methods, and Tobit models. Prerequisite: ECON 67200 .

Credits: 1.00 to 3.00

ECON 67200 - Econometrics II

Credit Hours: 1.00 to 3.00. Topics include generalized method of moments, estimation and inference with weak instruments, panel data models and bootstrap methods. Prerequisite: ECON 67100.

Learning Outcomes: 1. Identify important econometric issues of interest in practical scenarios. 2. Demonstrate the application of state of the art methods to relevant economic questions. 3. Outline a broad picture of the subject by logically connecting the various topics. 4. Criticize the use of inadequate methods through discussion of published work.

Credits: 1.00 to 3.00

ECON 67100 - Econometrics I

Credit Hours: 1.00 to 3.00. An introduction to the modern techniques of econometrics and their applications. Topics include: the classical linear regression model (specification, estimation, inference, and prediction), specification analysis, functional form, heteroscedasticity, and autocorrelation. Prerequisite: ECON 67000.

Learning Outcomes: 1. Investigate the

properties of econometric estimators under a variety of conditions. 2. Explain econometric techniques for estimating causal effects. 3. Explain the principles and purpose of Monte Carlo simulation methods. 4. Conduct basic empirical analyses of cross sectional data. Credits: 1.00 to 3.00

ECON 56200 - Econometrics I

Credit Hours: 3.00. This masters-level course in econometrics covers the tools that will enable students to conduct empirical analysis using economics data. The course examines the statistical techniques used in testing economic theories, estimating casual effects, and making predictions. Emphasis is placed on estimating a single equation (e.g., a demand function) and the problems associated with such estimation. As part of the course, students will estimate equations using STATA, a statistical software package. Permission of department required.

Learning Outcomes: 1. Students will have the tools to perform simple econometric analysis of Economic problems. Credits: 3.00

ENTM 69200 - Special Topics

Credit Hours: 1.00 to 4.00. Advanced topics in specialties of department members such as, but not limited to: biochemistry and physiology; biological control; insect pest management; veterinary entomology; nematode systematics; pathology; systematics. The field in which work is offered will appear on the student's record. Doctoral student standing. Permission of instructor required.

Credits: 1.00 to 4.00

FNR 58000 - Research Methods For Natural Resource Social Science

Credit Hours: 3.00. This class covers basic elements of research design for social scientists, with an emphasis on issues pertinent to natural resource management. Topics to be covered include the role of theories and paradigms in designing sound research, writing research questions and hypotheses, and the importance of validity and reliability in research design. Qualitative, quantitative, and mixed methods designs are presented and discussed.

Learning Outcomes: 1. Understand fundamental concepts such as theories and paradigms that are essential precursors to designing sound research. 2. Able to articulate clear research questions and testable hypotheses. 3. Differentiate between different research designs and know which are appropriate under which circumstances. 4 Understand overarching issues such as validity and reliability. 5. Know under which circumstances qualitative, quantitative or mixed methods are appropriate. 6. Demonstrate knowledge of a variety of commonly-used research methods. 7. Articulate basic steps involved in analyzing qualitative and quantitative data. 8. Demonstrate the ability to write a research proposal. Credits: 3.00

FNR 64700 - Quantitative Methods For Ecologists

Credit Hours: 3.00. Examines the assumptions and utility of statistical and other data analytic techniques that are encountered commonly or increasingly being used in ecological research. Emphasis is placed on the potential applications of these quantitative methods in an ecological context. Topics include traditional multivariate methods (cluster analysis, principal components, factor analysis, discriminant analysis, multidimensional scaling, correspondence analysis), generalized linear models (logistic Poisson, and ordinal regression and derivatives), randomization methods, information-theoretic model selection and inference, and hierarchical models. An introduction to Bayesian analysis is provided for generalized linear (and mixed) models, with applications to (meta) population and (meta) community ecology. Prerequisite: BIOL 58210 or ENTM 64200 or STAT 51200 , or consent of instructor. Knowledge of linear algebra and experience with R is desirable but not essential.

Learning Outcomes: 1. Determine the appropriate statistical tool to use when confronted with most questions and data types. 2. Be familiar with the assumptions underlying these methods. 3. Have some familiarity with software required to apply the methods. 4. Offer a basic interpretation of results provided. Credits: 3.00

STAT 50300 - Statistical Methods For Biology

Credit Hours: 3.00. Introductory statistical methods, with emphasis on applications in biology. Topics include descriptive statistics, binomial and normal distributions, confidence interval estimation, hypothesis testing, analysis of variance, introduction to nonparametric testing, linear regression and correlation, goodness-of-fit tests, and contingency tables. Open only to majors related to the life sciences. For statistics majors and

minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100.

Learning Outcomes: 1. Students will be able to identify and choose appropriate ways to graphically and numerically summarize data. 2. Students will be able to use basic statistical methods to perform statistical inference and draw appropriate conclusions. 3. Students will understand the mathematical foundations of statistical inference for random samples so that they can study and utilize additional statistical methods. Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

STAT 51200 - Applied Regression Analysis

Credit Hours: 3.00. Inference in simple and multiple linear regression, residual analysis, transformations, polynomial regression, model building with real data, nonlinear regression. One-way and two-way analysis of variance, multiple comparisons, fixed and random factors, analysis of covariance. Use of existing statistical computer programs. Prerequisite: Coursework in Statistical Methods with a calculus prerequisite.

Learning Outcomes: 1. Learn to build and analyze simple and multiple regression models, analysis of variance and covariance (ANOVA/ANCOVA) for regression, inference for regression, diagnostics and remedial measures for regression, transformations, residual analysis, model building, polynomial and interaction models. Credits: 3.00

STAT 51600 - Basic Probability And Applications

Credit Hours: 3.00. A first course in probability, intended to serve as a background for statistics and other applications. Sample spaces and axioms of probability, discrete and continuous random variables, conditional probability and Bayes' theorem, joint and conditional probability distributions, expectations, moments and moment generating functions, law of large numbers, and central limit theorem. (The probability material in course one of the Society of Actuaries and the Casualty Actuarial Society is covered by this course.)

Learning Outcomes: 1. Identify which discrete and continuous distributions are applicable in a given setting. 2. Use conditional probabilities, Bayes theorem, and conditional distributions. 3. Utilize joint distributions in the context of several random variables. 4. Apply the law of large numbers and the central limit theorem in asymptotic settings. 5. Derive moments and moment generating functions for discrete and continuous random variables. Credits: 3.00

ASEC 59000 - Special Problems

Credit Hours: 1.00 to 6.00. A study of special problems in agricultural communications, agricultural education, or youth development not covered in regular coursework. To be arranged with the instructor or departmental representative prior to registering. Permission of instructor required.

Credits: 1.00 to 6.00

BIOL 58210 - Ecological Statistics

Credit Hours: 3.00. This course covers topics that are useful for successfully designing and analyzing statistically observational and experimental studies in ecology, animal behavior, evolutionary biology, forestry, wildlife sciences, fisheries, etc. Some topics are: differences between hypotheses and predictions, design of an ecological study, general linear models, assumptions, different types of designs (factorial, nested, repeated measures, blocks, split-plots, etc.), fitting models to data, etc. The course will focus on the conceptual understanding of these topics (e.g., interpreting the results of statistical tests) and practice with statistical programs and real datasets.

Learning Outcomes: 1. Pose scientific questions, hypotheses, and predictions. 2. Plan and design ecological research projects. 3. Determine sample size requirements. 4. Use and interpret descriptive statistics. 5. Use general linear models and interpret their results. 6. Check for the assumptions of general linear models. 7. Manage data. 8. Understand the potential and limitations of statistics in ecological research. Credits: 3.00

HORT 53000 - Introduction To Computing For Biologists

Credit Hours: 3.00. This course will teach the basic skills and knowledge required to operate in UNIX environment and program in Python. The course is designed to teach graduate, and advanced undergraduate students in plant and animal sciences the skill set required to analyze and interpret their own datasets. The lectures and associated lab section will provide students hands-on experience in working within a high-performance computing environment to analyze genome-scale datasets.

Learning Outcomes: 1. Define their biological data analysis as a computational problem. 2. Identify portions of the analysis that will benefit from parallelization. 3. Write one or more scripts that use the computational power provided by compute clusters to analyze large biological data sets in a speedy manner. Credits: 3.00

HORT 53100 - Applied Plant Genomics

Credit Hours: 2.00. This course aims to provide students an introduction to the theory and practice of functional genomics in plants. The course is centered around the many forms in which DNA sequencing technologies are applied to understand plant genomes, their variation and their function. The course will cover concepts in plant genome sequencing, transcriptome profiling and functional enrichment analyses in sets of genes. This is a full semester course that meets twice a week for: 1. A lecture that covers the rationale and theory of the topic and 2. A hands-on lab section that provides experiential learning with the computational tools and packages used in plant genomics and transcriptomics.

Learning Outcomes: 1. Describe and compare the chemistry, data yield, and cost of first generation, next generation and third generation sequencing technologies, and their applications in plant genome sequencing. 2. Obtain and understand the information on genome sequences and gene annotations for a sequenced plant genome. 3. Design and perform a transcriptome analysis pipeline. 4. Describe the statistical basis of gene enrichment analysis. 5. Apply standard gene group analysis tools to perform GO term analysis, motif analysis, pathway analysis, gene list overlapping and gene regulatory network analysis to interpret a gene list resulting from a functional genomics project. Credits: 2.00

Primary Area Courses (18-24 credits)

AGRY 51000 - Turfgrass Science

Credit Hours: 3.00. An advanced course in turfgrass management which focuses on the management requirements of intensively cultured turfgrass areas, with a specific emphasis on golf course and athletic fields. Interrelationships among soil, plant and atmospheric environments, management practices and turfgrass quality will be stressed.

Credits: 3.00

AGRY 51200 - Integrated Turfgrass Systems

Credit Hours: 3.00. Integration of agronomic principles for professionally managing golf courses, athletic complexes, lawn care companies, and sod production facilities in an efficient and

environmentally friendly manner. Emphasizes independent thinking and team cooperation for understanding the social, ethical, and economical aspects underlying the daily agronomic management decisions, including construction, establishment, cultural practices, fertilization, and pest management. Course meets for weeks 1-10.

Credits: 3.00

HORT 51300 - Nutrition Of Horticulture Crops

Credit Hours: 1.00. An integrated course about plant nutrition focused on horticultural crops. The unique features of nutrient availability in a soil-less horticultural media will be highlighted. An emphasis will be placed on understanding the physiological basis of plant responses to nutrient application. Weeks 1-5.

Credits: 1.00

HORT 55100 - Plant Responses To The Environment

Credit Hours: 3.00. Future agricultural production and the environment will encounter multifaceted challenges from global climate change, heat and drought incidence and severity, and limited land and resources. An understanding of how plant responds to these changes is essential to develop new technologies and systems approaches to mitigate the negative impacts and enhance agricultural crop productivity. This is an advanced plant biology course covering the present state of understanding of phenological, physiological, and molecular and genetic mechanisms and processes by which plants acclimate to transient and chronic environmental extremes.

Learning Outcomes: 1. Demonstrate an enhanced understanding of scientific principles. 2. Exhibit critical thinking. 3. Have a better understanding of the expectations of a professional scientist. 4. Increase the ability to evaluate and communicate scientific concepts. 5. Better understand scientific collaborative processes. 6. Understand some of the social and cultural interactions that come to play in scientific research. 7. Understand some of the ethical issues involved in the conduct of scientific research. 8. Understand the necessity for continuous learning that characterizes the scientific research process. Credits: 3.00

HORT 64000 - Metabolic Plant Physiology

Credit Hours: 3.00. (BCHM 64000, BTNY 64000) Topics include photosynthesis, respiration, carbohydrate and lipid metabolism, and nitrogen, sulfur, and secondary metabolism. This course is the third in a series of core courses in the Purdue Plant Biology Program graduate curriculum. Prerequisite: BCHM 56100, BTNY 55300 or HORT 55300, Prerequisite: BIOL 55100 or HORT 55100.

Learning Outcomes: 1. Knowledge in basic principles of plant metabolism. 2. Skill in presenting complex ideas. 3. Critical and creative thinking skills in evaluating the primary literature. Credits: 3.00

HORT 53000 - Introduction To Computing For Biologists

Credit Hours: 3.00. This course will teach the basic skills and knowledge required to operate in UNIX environment and program in Python. The course is designed to teach graduate, and advanced undergraduate students in plant and animal sciences the skill set required to analyze and interpret their own datasets. The lectures and associated lab section will provide students hands-on experience in working within a high-performance computing environment to analyze genome-scale datasets.

Learning Outcomes: 1. Define their biological data analysis as a computational problem. 2. Identify portions of the analysis that will benefit from parallelization. 3. Write one or more scripts that use the computational power provided by compute clusters to analyze large biological data sets in a speedy manner. Credits: 3.00

HORT 53100 - Applied Plant Genomics

Credit Hours: 2.00. This course aims to provide students an introduction to the theory and practice of functional genomics in plants. The course is centered around the many forms in which DNA sequencing technologies are applied to understand plant genomes, their variation and their function. The course will cover concepts in plant genome sequencing, transcriptome profiling and functional enrichment analyses in sets of genes. This is a full semester course that meets twice a week for: 1. A lecture that covers the rationale and theory of the topic and 2. A hands-on lab section that provides experiential learning with the computational tools and packages used in plant genomics and transcriptomics.

Learning Outcomes: 1. Describe and compare the chemistry, data yield, and cost of first generation, next generation and third generation sequencing technologies, and their applications in plant genome sequencing. 2. Obtain and understand the information on genome

sequences and gene annotations for a sequenced plant genome. 3. Design and perform a transcriptome analysis pipeline. 4. Describe the statistical basis of gene enrichment analysis. 5. Apply standard gene group analysis tools to perform GO term analysis, motif analysis, pathway analysis, gene list overlapping and gene regulatory network analysis to interpret a gene list resulting from a functional genomics project. Credits: 2.00

LA 50100 - Research Methods For Design Applications

Credit Hours: 1.00. The growing need for understanding the role of individuals, communities, and society in shaping the natural environment has led to a greater emphasis on landscape architectural research and the need to provide training in the research methods to support these efforts. It is an exciting time to enter this arena as landscape architects are collaborating with natural and social scientist to achieve better conservation outcomes, promote sustainable behaviors, and increase awareness and understanding of the complex environmental challenges facing our society. Non-Landscape Architecture students may gain enrollment with permission of instructor.

Learning Outcomes: 1. Understand the need for social science research in landscape architecture practice and how this informs design theory development. 2. Model conceptually the relationship between social and ecological variables and understand the types of research methods available to explore these relationships. 3. Learn how to access demographic information about communities and user groups. 4. Develop a basic understanding of analysis tools and techniques, such as the use of GIS applications, Microsoft Excel, and SPSS (Statistical Package for Social Science) to conduct analysis of quantitative data. 5. Understand the common phases of developing theory-driven research and systems design evaluation. Credits: 1.00

Thesis Research (6 credits)

HORT 69500 - Horticulture Seminar

Credit Hours: 0.00. Topics of current interest to staff and students.

Credits: 0.00

HORT 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required.

Credits: 1.00 to 18.00

Non-thesis Requirement

Required Courses (3 credits)

HORT 60100 - Planning And Presenting Plant Science Research

Credit Hours: 1.00. The purpose of this course is to acquaint students with the culture of scientific research and the processes of scientific discovery and review. This course will: (1) acquaint students with techniques used in presenting short scientific talks, as e.g., at national meetings, (2) expose students to procedures used in preparing scientific papers, proposals, etc., (3) introduce students to the outcomes expected to be achieved by graduate education and the processes by which students are mentored and evaluated, (4) help students begin formulating their research project proposal, (5) acquaint students with guidelines for biosafety and responsible conduct of research and provide a forum for discussion of ethical issues confronting researchers, particularly those inherent in participating in extramurally-funded research, (6) acquaint students with intellectual property issues involved in scientific research, (7) acquaint students with core research facilities across campus, and (8) expose students to discussions regarding the importance of diversity and an atmosphere of mutual respect to research excellence. This course is taken for a letter grade and carries one hour of credit.

Credits: 1.00

HORT 60200 - Horticulture Research Seminar

Credit Hours: 1.00. Weekly attendance at the Horticulture and Landscape Architecture Departmental seminars to help graduate students develop an appreciation for attending seminars and learning appropriate and effective presentation skills. HORT 602 compliments HORT 60100 and HORT 60300 by extending the presentation and project development approaches learned, so that students are better ready to prepare and defend their project proposals in HORT 60300.

Prerequisite: BCHM 56100.

Credits: 1.00

GRAD 61200 - Responsible Conduct Of Research

Credit Hours: 1.00. Overview of values, professional standards, and regulations that define responsible conduct in research. Students learn the values and standards of responsible research through readings and lecture/discussion and practice application of these values and standards to research situations through class discussion of case studies from life sciences research. Students must be registered for M.S. or Ph.D. thesis research in their home department.

Required Courses (27 credits)

Core Courses (21 credits)

HTM 51400 - Business Analytics For Service Industries

Credit Hours: 3.00. In today's highly dynamic business environment, decision-makers often encounter problems that are complex and data intensive. This course focuses on a variety of techniques from the field of business statistics and exposes students to statistical and decision analytics to solve data-driven decision-making problems. The course adopts a practical spreadsheet-based approach to facilitate decision-making and explores the practical applications of these techniques across various functional fields, with a specific focus on service industries.

Learning Outcomes: 1. Identify and evaluate managerial problems requiring data-based decision-making. 2. Apply quantitative methods to model and analyze real-world situations. 3. Employ analytic software tools to solve problems from various functional fields. 4. Communicate solutions and managerial implications across different stakeholders.

Credits: 3.00

HTM 50800 - Cultivating A Service Excellence Mindset

Credit Hours: 3.00. Understanding the fundamental principles of service management is essential to successfully manage service organizations in a complex market environment. This course utilizes major theoretical frameworks, such as Service-Dominant Logic, to address key issues in managing service organizations, including creating service culture, motivating a service-minded workforce, co-creating service value, and achieving service excellence. Students develop managerial skills through a thorough understanding of service strategies, systems, and processes to optimize service value.

Learning Outcomes: 1. Demonstrate an understanding of the strategic implications for managing the service experience. 2. Explain the critical role of managing the employee-customer interface in the service delivery process. 3. Evaluate various service management strategies to enhance service excellence. 4. Construct key service management systems and processes to solve issues in complex service environments. Credits: 3.00

HTM 50600 - Leading People In Service Industries

Credit Hours: 3.00. Leadership requires an understanding of human behavior, organizational culture, and strategy. In this class, students are exposed to leadership theory through the extant literature. Facilitated by readings and class discussion, students develop critical and analytical understanding of how theory informs and connects to practice. The course topics include human resources functions, organizational and human behavior, human values and motivations, team dynamics, decision-making, and change management. This course takes an interdisciplinary approach, with student learning drawn from different fields.

Learning Outcomes: 1. Understand the role of leadership in successful organizations. 2.

Explain how human resource practices contribute to organizational effectiveness. 3. Analyze theories and practices in human resources, organizational behaviors, and leadership. 4. Connect leadership theories to organizational practices. 5. Synthesize different theoretical perspectives within/across service industries. Credits: 3.00

HTM 50700 - Integrated Marketing Communications For Service Industries

Credit Hours: 3.00. This course addresses the unique challenges and opportunities in marketing the intangible, inseparable, variable, and perishable service products. Balancing theoretical research and practical applications, this course provides a systematic review of key components and processes for an effective integrated marketing communication for service industries. Students will learn how to leverage both long-standing and emerging marketing communication approaches (e.g., strategic marketing and promotion, branding, public relations, digital marketing, social media, influencer marketing and artificial intelligence application) to create customer awareness, manage customer expectations, build customer relationships, and ensure customer satisfaction and loyalty.

Learning Outcomes: 1. Evaluate the role of marketing communications in achieving success for service organizations. 2. Identify critical metrics to understand customer expectations and manage customer perceptions. 3. Apply customer-centric approach to leverage various marketing communication methods and tools to meet customer needs, wants and demands. 4. Develop, promote, and manage service promises through both external and internal marketing. Credits: 3.00

HTM 50900 - Service Experience Design

Credit Hours: 3.00. The success of service organizations requires well-planned design of the service environment and customer experience journey to enhance operational efficiency and excellence, drive customer satisfaction and loyalty, and differentiate from competitors. Addressing the importance of developing and providing optimal customer experience in service industries, this course aims to inspire a design-thinking approach to create contemporary customer experiences in various service settings. By gaining insights from the service design theories, students will gain knowledge to effectively manage the physical environment, service interactions, and service delivery processes to enhance the overall service experience quality. Learning by practice, students will apply the learned design tools to envisage, blueprint, and devise innovative service experience solutions.

Learning Outcomes: 1. Articulate the role of service experience design for the strategic success of service organizations in the marketplace. 2. Conduct critical quantitative and qualitative analyses of customer service experience. 3. Design service experiences for customers by utilizing various experience design tools. 4. Communicate the service design process to service industry professionals and relevant stakeholders. Credits: 3.00

HTM 51300 - Strategy In Service Industries

Credit Hours: 3.00. Strategic management plays a pivotal role in helping industry leaders gain a competitive advantage and accomplish business goals in an ever-changing marketplace. This course centers on the exploration of various theories, frameworks, and models to understand contemporary issues and challenges in service industries. Through the application of strategic management principles and strategy-oriented tasks, students comprehend essential topics in strategic management, including environmental and competitor analysis, strategic planning, strategy formulation, strategy execution, and strategic evaluation and control.

Learning Outcomes: 1. Articulate the theoretical principles and tactical practices in strategy management. 2. Analyze external and internal factors to effectively manage service organizations. 3. Evaluate the strategic planning process for service organizations. 4. Apply strategic theories, frameworks, and models to management practices in service organizations. Credits: 3.00

HTM 51000 - Strategic Revenue Management In Service Industries

Credit Hours: 3.00. Revenue management is a vital strategic tool enabling decision-makers to coordinate various functions leading to company-wide profit maximization. This course empowers students with analytical tools to generate optimal revenue solutions in a competitive marketplace. In the course, students learn economics of pricing and market competition, models and algorithms for capacity allocation, overbooking, and forecasting through a variety of real-world contexts.

Learning Outcomes: 1. Solve for optimal prices given capacity constraints and market segmentation. 2. Calculate optimal protection and overbooking levels. 3. Forecast demand based on time series models and advanced booking models. 4. Formulate strategies to manage consumer responses to revenue management practices across various service industries. 5. Address challenges in revenue management implementation in service industries. Credits: 3.00

HTM 50400 - Consumer Behavior

Credit Hours: 3.00. Understanding how and why consumers make decisions about purchasing goods, services, and experiences allows companies to tailor their business strategies, product development, and customer service efforts to meet the specific needs and preferences of their target customer base. This course addresses the growing demand for professionals to better understand psychological, social and situational influences of consume behavior. This course provides students not only with an understanding of consumer behavior concepts and theories, but also with the tools and methodologies that can be directly applied to real-world scenarios to navigate dynamic markets, effectively engage customers, and drive business success in today's competitive marketplace.

Learning Outcomes: 1. Explain how consumer behavior contributes to customer acquisition, satisfaction, and retention for relevant businesses and organizations. 2. Evaluate psychological, social, and situational influences on consumer behavior. 3. Interpret and predict consumer behavior in diverse industry contexts. 4. Synthesize current trends in consumer behavior to identify opportunities for creating customer satisfaction, engagement, and enriched experiences. 5. Formulate effective strategies to build and maintain consumer loyalty. Credits: 3.00

Statistics Courses (6 credits)

SOC 58000 - Methods Of Social Research I

Credit Hours: 3.00. An intermediate-level examination of research designs, measurement, and sampling with emphasis on issues of problem formulation and the logic and application of methodological procedures.

Credits: 3.00

SOC 58100 - Methods of Social Research II

Credit Hours: 3.00. Emphasis on statistical inference applied to sociological problems; topics include the binomial distribution and the logic of inference, one and two sample tests, confidence intervals, and chi-square. Introduction to bivariate correlation and regression, analysis of variance.

Credits: 3.00

STAT 50100 - Experimental Statistics I

Credit Hours: 3.00. Concepts and methods of applied statistics. Exploratory analysis of data. Sample design and experimental design. Normal distributions. Sampling distributions. Confidence intervals and tests of hypotheses for one and two samples. Inference for contingency tables, regression and correlation, and one-way analysis of variance. Use of the SAS statistical software. Intended primarily for students who have not had calculus. Not open to students in mathematical sciences or engineering. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: College Algebra.

Learning Outcomes: 1. Produce and identify basic statistical analyses. 2. Discuss statistical terminology (speak statistics). 3. Use SAS to run basic statistical analyses and interpret corresponding SAS output. Credits: 3.00

STAT 50200 - Experimental Statistics II

Credit Hours: 3.00. Multiple regression including the general linear test, model selection, and regression diagnostics. Analysis of variance for factorial designs, including multiple comparisons. Analysis of covariance. Repeated measures designs. Extensive use of the SAS statistical software. Intended primarily for students who have not had calculus.

Learning Outcomes: 1. Produce and identify advanced statistical analyses. 2. Learn and understand advanced statistical terminology and concepts. 3. Use SAS to run advanced statistical analyses and interpret corresponding SAS output. Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

STAT 51200 - Applied Regression Analysis

Credit Hours: 3.00. Inference in simple and multiple linear regression, residual analysis, transformations, polynomial regression, model building with real data, nonlinear regression. One-way and two-way analysis of variance, multiple comparisons, fixed and random factors, analysis of covariance. Use of existing statistical computer programs. Prerequisite: Coursework in Statistical Methods with a calculus prerequisite.

Learning Outcomes: 1. Learn to build and analyze simple and multiple regression models, analysis of variance and covariance (ANOVA/ANCOVA) for regression, inference for regression, diagnostics and remedial measures for regression, transformations, residual analysis, model building, polynomial and interaction models. Credits: 3.00

Thesis Research (6 credits)

HTM 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required.

Learning Outcomes: 1. Vary by topic due to the nature of the course. Credits: 1.00 to 18.00

Additional Requirements (0-1 credit)

HTM 59001 - Graduate Professional Industry Internship

Credit Hours: 1.00. The Graduate Professional Industry Internship allows graduate students to gain valuable experience through paid employment with a company in the hospitality and tourism industry or a related industry. In addition, each student will research an issue and provide a potential solution to a problem faced by the employer. This course is not repeatable without special permission from the HTM Graduate Policy Committee and is only open to HTM graduate students who have completed a minimum of two semesters and 16 hours of graduate coursework in HTM. Credit is not allowed for both HTM 59001 and HTM 59002. Permission from Graduate Professional Industry Internship Coordinator is required to enroll in this course. Permission of instructor required.

Learning Outcomes: 1. Understand how to effectively manage a service industry business. 2. Develop critical thinking, creativity, and problem solving skills. Credits: 1.00

Program Requirements - Non-Thesis

Required Courses (21 credits)

Core Courses (21 credits)

HTM 51400 - Business Analytics For Service Industries

Credit Hours: 3.00. In today's highly dynamic business environment, decision-makers often encounter problems that are complex and data intensive. This course focuses on a variety of techniques from the field of business statistics and exposes students to statistical and decision analytics to solve data-driven decision-making problems. The course adopts a practical spreadsheet-based approach to facilitate decision-making and explores the practical applications of these techniques across various functional fields, with a specific focus on service industries.

Learning Outcomes: 1. Identify and evaluate managerial problems requiring data-based decision-making. 2. Apply quantitative methods to model and analyze real-world situations. 3. Employ analytic software tools to solve problems from various functional fields. 4. Communicate solutions and managerial implications across different stakeholders. Credits: 3.00

HTM 50800 - Cultivating A Service Excellence Mindset

Credit Hours: 3.00. Understanding the fundamental principles of service management is essential to successfully manage service organizations in a complex market environment. This course utilizes major theoretical frameworks, such as Service-Dominant Logic, to address key issues in managing service organizations, including creating service culture, motivating a service-minded workforce, co-creating service value, and achieving service excellence. Students develop managerial skills through a thorough understanding of service strategies, systems, and processes to optimize service value.

Learning Outcomes: 1. Demonstrate an understanding of the strategic implications for managing the service experience. 2. Explain the critical role of managing the employee-customer interface in the service delivery process. 3. Evaluate various service management strategies to enhance service excellence. 4. Construct key service management systems and processes to solve issues in complex service environments. Credits: 3.00

HTM 50600 - Leading People In Service Industries

Credit Hours: 3.00. Leadership requires an understanding of human behavior, organizational culture, and strategy. In this class, students are exposed to leadership theory through the extant literature. Facilitated by readings and class discussion, students develop critical and analytical understanding of how theory informs and connects to practice. The course topics include human resources functions, organizational and human behavior, human values and motivations, team dynamics, decision-making, and change management. This course takes an interdisciplinary approach, with student learning drawn from different fields.

Learning Outcomes: 1. Understand the role of leadership in successful organizations. 2. Explain how human resource practices contribute to organizational effectiveness. 3. Analyze theories and practices in human resources, organizational behaviors, and leadership. 4. Connect leadership theories to organizational practices. 5. Synthesize different theoretical perspectives within/across service industries. Credits: 3.00

HTM 50700 - Integrated Marketing Communications For Service Industries

Credit Hours: 3.00. This course addresses the unique challenges and opportunities in marketing the intangible, inseparable, variable, and perishable service products. Balancing theoretical research and practical applications, this course provides a systematic review of key components and processes for an effective integrated marketing communication for service industries. Students will learn how to leverage both long-standing and emerging marketing communication approaches (e.g., strategic marketing and promotion, branding, public relations, digital marketing, social media, influencer marketing and artificial intelligence application) to create customer awareness, manage customer expectations, build customer relationships, and ensure customer satisfaction and loyalty.

Learning Outcomes: 1. Evaluate the role of marketing communications in achieving success for service organizations. 2. Identify critical metrics to understand customer expectations and manage customer perceptions. 3. Apply customer-centric approach to leverage various marketing communication methods and tools to meet customer needs, wants and demands. 4. Develop, promote, and manage service promises through both external and internal marketing. Credits: 3.00

HTM 50900 - Service Experience Design

Credit Hours: 3.00. The success of service organizations requires well-planned design of the service environment and customer experience journey to enhance operational efficiency and excellence, drive customer satisfaction and loyalty, and differentiate from competitors. Addressing the importance of developing and providing optimal customer experience in service industries, this course aims to inspire a design-thinking approach to create contemporary customer experiences in various service settings. By gaining insights from the service design theories, students will gain knowledge to effectively manage the physical environment, service interactions, and service delivery processes to enhance the overall service experience quality. Learning by practice, students will apply the learned design tools to envisage, blueprint, and devise innovative service experience solutions.

Learning Outcomes: 1. Articulate the role of service experience design for the strategic success of service organizations in the marketplace. 2. Conduct critical quantitative and qualitative analyses of customer service experience. 3. Design service experiences for customers by utilizing various experience design tools. 4. Communicate the service design process to service industry professionals and relevant stakeholders. Credits: 3.00

HTM 51300 - Strategy In Service Industries

Credit Hours: 3.00. Strategic management plays a pivotal role in helping industry leaders gain a competitive advantage and accomplish business goals in an ever-changing marketplace. This course centers on the exploration of various theories, frameworks, and models to understand contemporary issues and challenges in service industries. Through the application of strategic management principles and strategy-oriented tasks, students comprehend essential topics in strategic management, including environmental and competitor analysis, strategic planning, strategy formulation, strategy execution, and strategic evaluation and control.

Learning Outcomes: 1. Articulate the theoretical principles and tactical practices in strategy management. 2. Analyze external and internal factors to effectively manage service organizations. 3. Evaluate the strategic planning process for service organizations. 4. Apply strategic theories, frameworks, and models to management practices in service organizations. Credits: 3.00

HTM 51000 - Strategic Revenue Management In Service Industries

Credit Hours: 3.00. Revenue management is a vital strategic tool enabling decision-makers to coordinate various functions leading to company-wide profit maximization. This course empowers students with analytical tools to generate optimal revenue solutions in a competitive marketplace. In the course, students learn economics of pricing and market competition, models and algorithms for capacity allocation, overbooking, and forecasting through a variety of real-world contexts.

Learning Outcomes: 1. Solve for optimal prices given capacity constraints and market segmentation. 2. Calculate optimal protection and overbooking levels. 3. Forecast demand based on time series models and advanced booking models. 4. Formulate strategies to manage consumer responses to revenue management practices across various service industries. 5. Address challenges in revenue management implementation in service industries. Credits: 3.00

HTM 50400 - Consumer Behavior

Credit Hours: 3.00. Understanding how and why consumers make decisions about purchasing goods, services, and experiences allows companies to tailor their business strategies, product development, and customer service efforts to meet the specific needs and preferences of their target customer base. This course addresses the growing demand for professionals to better understand psychological, social and situational influences of consume behavior. This course provides students not only with an understanding of consumer behavior concepts and theories, but also with the tools and methodologies that can be directly applied to real-world scenarios to navigate dynamic markets, effectively engage customers, and drive business success in today's competitive marketplace.

Learning Outcomes: 1. Explain how consumer behavior contributes to customer acquisition, satisfaction, and retention for relevant businesses and organizations. 2. Evaluate psychological, social, and situational influences on consumer behavior. 3. Interpret and predict consumer behavior in diverse industry contexts. 4. Synthesize current trends in consumer behavior to identify opportunities for creating

customer satisfaction, engagement, and enriched experiences. 5. Formulate effective strategies to build and maintain consumer loyalty. Credits: 3.00

Electives (9 credits)

HTM 55300 - Cultivating A Service Excellence Mindset For Healthcare Professionals

Credit Hours: 3.00. Notwithstanding the importance for healthcare services to prioritize clinical outcomes for patients, there is a growing need to think about the patient experience beyond science-driven, evidence-based practices. The healthcare sector is being transformed by consumerism and transparency that demands a more holistic approach to managing the patient experience. In order to promote patient engagement and to enhance their experience, an intentional strategic intent, as reflected in a service excellence mindset, is required. This course seeks to establish the foundation of this mindset for healthcare professionals that are driven to make a difference in their patients' lives. The aim of the course is for students to develop a greater appreciation for the complexity of providing excellent service in the healthcare industry. The course will stimulate students to think differently and more deeply about the patient experience through a service management lens. In doing so they will develop the necessary skills to make effective decisions in the constantly changing patient experience landscape. Permission of department required.

Learning Outcomes: 1. Demonstrate an understanding of the strategic implications for managing the patient experience (patient expectations, drivers of satisfaction, service quality measurement, creating a service culture). 2. Examine the critical role of managing the employee-patient interface in delivering patient-centric services. 3. Recognize and evaluate various service management practices to enhance the patient experience. 4. Recommend key service management systems and practices to improve or solve problems in the complex healthcare environment. Credits: 3.00

HTM 55400 - Designing The Patient Experience For Contemporary Healthcare Systems

Credit Hours: 3.00. In the rapidly evolving healthcare industry, optimizing the patient experience remains a fundamental focus of practice. Addressing the practical challenge and complexity of providing excellent healthcare services, this class aims to inspire a design-thinking approach to reimagine and reinvent the patient experience in the contemporary healthcare systems. Learning by practice, students will apply the design tools to envisage, blueprint, and devise a patient experience solution. Gaining insights on experience-centric innovations in the healthcare domain, students will develop capabilities to better manage the service interactions, facility, and processes to enhance the quality of the patient experience and ease the stress of a hospital stay. Permission of department required.

Learning Outcomes: 1. Demonstrate an understanding of the role of experience design for healthcare organizations' strategic success in the contemporary market environment. 2. Conduct critical quantitative and qualitative analysis of the healthcare service experience. 3. Apply various experience design tools to innovatively design healthcare service experiences for the relevant stakeholders (e.g., patients, service providers). 4. Communicate effectively the design product in both written and verbal manners to healthcare professionals. Credits: 3.00

HTM 55500 - Investing In Healthcare Human Capital

Credit Hours: 3.00. The modern work environment is increasingly focused on working with people in teams - working with people and for people. In seeking to motivate and lead people, it is imperative to acknowledge individuals have different backgrounds, perspectives, and viewpoints. In successfully balancing the challenges of working with people in the labor intensive, diverse and high-stakes nature of the healthcare industry, this class seeks to provide knowledge on organizational behavior concepts (e.g., employee performance, satisfaction, engagement, and motivation; group behavior, teamwork; emotional labor, stress, work-life balance) and the skills to practice this knowledge as a healthcare professional. This course will provide students with the foundational building blocks to adapt to the changing landscape of the work environment, applying theories and exercising critical thinking skills to realize a transformative healthcare workforce experience. Permission of the department required.

Learning Outcomes: 1. Demonstrate an understanding of knowledge, skills, and abilities (KSA's) needed by successful leaders in the healthcare industry. 2. Apply organizational

behavior theories and the role of managers in the context of the healthcare work environment. 3. Evaluate the role of leadership and management of personnel - individuals, groups, and teams - within the healthcare industry. 4. Recommend various leadership and management practices to improve and provide solutions for issues in today's healthcare workforce. Credits: 3.00

HTM 50400 - Consumer Behavior

Credit Hours: 3.00. Understanding how and why consumers make decisions about purchasing goods, services, and experiences allows companies to tailor their business strategies, product development, and customer service efforts to meet the specific needs and preferences of their target customer base. This course addresses the growing demand for professionals to better understand psychological, social and situational influences of consume behavior. This course provides students not only with an understanding of consumer behavior concepts and theories, but also with the tools and methodologies that can be directly applied to real-world scenarios to navigate dynamic markets, effectively engage customers, and drive business success in today's competitive marketplace.

Learning Outcomes: 1. Explain how consumer behavior contributes to customer acquisition, satisfaction, and retention for relevant businesses and organizations. 2. Evaluate psychological, social, and situational influences on consumer behavior. 3. Interpret and predict consumer behavior in diverse industry contexts. 4. Synthesize current trends in consumer behavior to identify opportunities for creating customer satisfaction, engagement, and enriched experiences. 5. Formulate effective strategies to build and maintain consumer loyalty. Credits: 3.00

HTM 50500 - Hotel Asset Management & Investment

Credit Hours: 3.00. Asset management is an indispensable discipline in the hospitality industry, aimed at maximizing the value of hotel properties in alignment with the owners' and investors' strategic objectives. A competent manager in the industry needs to possess basic understanding of asset management principles and practices for operational and strategic decisions. This course exposes students to the multifaceted world of representing ownership interests in managing hotel investments, and helps students to establish a robust corporate finance foundation to become a competent manager in the industry. Through this course, students develop a nuanced understanding of the intricate interplay among operational issues, real estate management, and financial decisions, and effectively apply the learned knowledge to hotel real estate investment and operation strategies.

Learning Outcomes: 1. Describe the role of an asset manager in the dynamic relationships among various hotel investment stakeholders. 2. Analyze the impacts of operational decisions, such as revenue management, leases, management contract, and franchise agreement, on asset valuation. 3. Explain the effects of development and management of physical assets on hotel operations and valuation. 4. Compare and apply various hotel valuation approaches. 5. Evaluate the effects of capital structure decisions on hotel investment returns. Credits: 3.00

Additional Requirements

HTM 59001 - Graduate Professional Industry Internship

Credit Hours: 1.00. The Graduate Professional Industry Internship allows graduate students to gain valuable experience through paid employment with a company in the hospitality and tourism industry or a related industry. In addition, each student will research an issue and provide a potential solution to a problem faced by the employer. This course is not repeatable without special permission from the HTM Graduate Policy Committee and is only open to HTM graduate students who have completed a minimum of two semesters and 16 hours of graduate coursework in HTM. Credit is not allowed for both HTM 59001 and HTM 59002. Permission from Graduate Professional Industry Internship Coordinator is required to enroll in this course. Permission of instructor required.

Learning Outcomes: 1. Understand how to effectively manage a service industry business. 2. Develop critical thinking, creativity, and problem solving skills. Credits: 1.00

Required Courses (21 credits)

HTM 51400 - Business Analytics For Service Industries

Credit Hours: 3.00. In today's highly dynamic business environment, decision-makers often encounter problems that are complex and data intensive. This course focuses on a variety of techniques from the field of business statistics and exposes students to statistical and decision analytics to solve data-driven decision-making problems. The course adopts a practical spreadsheet-based approach to facilitate decision-making and explores the practical applications of these techniques across various functional fields, with a specific focus on service industries.

Learning Outcomes: 1. Identify and evaluate managerial problems requiring data-based decision-making. 2. Apply quantitative methods to model and analyze real-world situations. 3. Employ analytic software tools to solve problems from various functional fields. 4. Communicate solutions and managerial implications across different stakeholders. Credits: 3.00

HTM 50800 - Cultivating A Service Excellence Mindset

Credit Hours: 3.00. Understanding the fundamental principles of service management is essential to successfully manage service organizations in a complex market environment. This course utilizes major theoretical frameworks, such as Service-Dominant Logic, to address key issues in managing service organizations, including creating service culture, motivating a service-minded workforce, co-creating service value, and achieving service excellence. Students develop managerial skills through a thorough understanding of service strategies, systems, and processes to optimize service value.

Learning Outcomes: 1. Demonstrate an understanding of the strategic implications for managing the service experience. 2. Explain the critical role of managing the employee-customer interface in the service delivery process. 3. Evaluate various service management strategies to enhance service excellence. 4. Construct key service management systems and processes to solve issues in complex service environments. Credits: 3.00

HTM 50600 - Leading People In Service Industries

Credit Hours: 3.00. Leadership requires an understanding of human behavior, organizational culture, and strategy. In this class, students are exposed to leadership theory through the extant literature. Facilitated by readings and class discussion, students develop critical and analytical understanding of how theory informs and connects to practice. The course topics include human resources functions, organizational and human behavior, human values and motivations, team dynamics, decision-making, and change management. This course takes an interdisciplinary approach, with student learning drawn from different fields.

Learning Outcomes: 1. Understand the role of leadership in successful organizations. 2. Explain how human resource practices contribute to organizational effectiveness. 3. Analyze theories and practices in human resources, organizational behaviors, and leadership. 4. Connect leadership theories to organizational practices. 5. Synthesize different theoretical perspectives within/across service industries. Credits: 3.00

HTM 50700 - Integrated Marketing Communications For Service Industries

Credit Hours: 3.00. This course addresses the unique challenges and opportunities in marketing the intangible, inseparable, variable, and perishable service products. Balancing theoretical research and practical applications, this course provides a systematic review of key components and processes for an effective integrated marketing communication for service industries. Students will learn how to leverage both long-standing and emerging marketing communication approaches (e.g., strategic marketing and promotion, branding, public relations, digital marketing, social media, influencer marketing and artificial intelligence application) to create customer awareness, manage customer expectations, build customer relationships, and ensure customer satisfaction and loyalty.

Learning Outcomes: 1. Evaluate the role of marketing communications in achieving success

for service organizations. 2. Identify critical metrics to understand customer expectations and manage customer perceptions. 3. Apply customer-centric approach to leverage various marketing communication methods and tools to meet customer needs, wants and demands. 4. Develop, promote, and manage service promises through both external and internal marketing. Credits: 3.00

HTM 50900 - Service Experience Design

Credit Hours: 3.00. The success of service organizations requires well-planned design of the service environment and customer experience journey to enhance operational efficiency and excellence, drive customer satisfaction and loyalty, and differentiate from competitors. Addressing the importance of developing and providing optimal customer experience in service industries, this course aims to inspire a design-thinking approach to create contemporary customer experiences in various service settings. By gaining insights from the service design theories, students will gain knowledge to effectively manage the physical environment, service interactions, and service delivery processes to enhance the overall service experience quality. Learning by practice, students will apply the learned design tools to envisage, blueprint, and devise innovative service experience solutions.

Learning Outcomes: 1. Articulate the role of service experience design for the strategic success of service organizations in the marketplace. 2. Conduct critical quantitative and qualitative analyses of customer service experience. 3. Design service experiences for customers by utilizing various experience design tools. 4. Communicate the service design process to service industry professionals and relevant stakeholders. Credits: 3.00

HTM 51300 - Strategy In Service Industries

Credit Hours: 3.00. Strategic management plays a pivotal role in helping industry leaders gain a competitive advantage and accomplish business goals in an ever-changing marketplace. This course centers on the exploration of various theories, frameworks, and models to understand contemporary issues and challenges in service industries. Through the application of strategic management principles and strategy-oriented tasks, students comprehend essential topics in strategic management, including environmental and competitor analysis, strategic planning, strategy formulation, strategy execution, and strategic evaluation and control.

Learning Outcomes: 1. Articulate the theoretical principles and tactical practices in strategy management. 2. Analyze external and internal factors to effectively manage service organizations. 3. Evaluate the strategic planning process for service organizations. 4. Apply strategic theories, frameworks, and models to management practices in service organizations. Credits: 3.00

HTM 51000 - Strategic Revenue Management In Service Industries

Credit Hours: 3.00. Revenue management is a vital strategic tool enabling decision-makers to coordinate various functions leading to company-wide profit maximization. This course empowers students with analytical tools to generate optimal revenue solutions in a competitive marketplace. In the course, students learn economics of pricing and market competition, models and algorithms for capacity allocation, overbooking, and forecasting through a variety of real-world contexts.

Learning Outcomes: 1. Solve for optimal prices given capacity constraints and market segmentation. 2. Calculate optimal protection and overbooking levels. 3. Forecast demand based on time series models and advanced booking models. 4. Formulate strategies to manage consumer responses to revenue management practices across various service industries. 5. Address challenges in revenue management implementation in service industries. Credits: 3.00

Electives (9 credits)

HTM 50400 - Consumer Behavior

Credit Hours: 3.00. Understanding how and why consumers make decisions about purchasing goods, services, and experiences allows companies to tailor their business strategies, product development, and customer service efforts to meet the specific needs and preferences of their target customer base. This course addresses the growing demand for professionals to better understand psychological, social and situational influences of consume behavior. This course provides students not only with an understanding of consumer behavior concepts

and theories, but also with the tools and methodologies that can be directly applied to real-world scenarios to navigate dynamic markets, effectively engage customers, and drive business success in today's competitive marketplace.

Learning Outcomes: 1. Explain how consumer behavior contributes to customer acquisition, satisfaction, and retention for relevant businesses and organizations. 2. Evaluate psychological, social, and situational influences on consumer behavior. 3. Interpret and predict consumer behavior in diverse industry contexts. 4. Synthesize current trends in consumer behavior to identify opportunities for creating customer satisfaction, engagement, and enriched experiences. 5. Formulate effective strategies to build and maintain consumer loyalty. Credits: 3.00

HTM 50500 - Hotel Asset Management & Investment

Credit Hours: 3.00. Asset management is an indispensable discipline in the hospitality industry, aimed at maximizing the value of hotel properties in alignment with the owners' and investors' strategic objectives. A competent manager in the industry needs to possess basic understanding of asset management principles and practices for operational and strategic decisions. This course exposes students to the multifaceted world of representing ownership interests in managing hotel investments, and helps students to establish a robust corporate finance foundation to become a competent manager in the industry. Through this course, students develop a nuanced understanding of the intricate interplay among operational issues, real estate management, and financial decisions, and effectively apply the learned knowledge to hotel real estate investment and operation strategies.

Learning Outcomes: 1. Describe the role of an asset manager in the dynamic relationships among various hotel investment stakeholders. 2. Analyze the impacts of operational decisions, such as revenue management, leases, management contract, and franchise agreement, on asset valuation. 3. Explain the effects of development and management of physical assets on hotel operations and valuation. 4. Compare and apply various hotel valuation approaches. 5. Evaluate the effects of capital structure decisions on hotel investment returns. Credits: 3.00

Required Courses (26 credits)

Core Courses (9 credits)

HDFS 60200 - Advanced Family Science

Credit Hours: 3.00. Integrative and comprehensive assessment of both classic and recent contributions in the field of family science. Other topics include major theory and research, historical, current, and future critical issues in family science.

Learning Outcomes: 1. Describe and critique classic and emerging theoretical and conceptual frameworks in family science, with attention to refinements over time. 2. Demonstrate critical thinking skills through exploring and discussing diverse theoretical viewpoints and recent research in family science. 3. Apply theoretical and conceptual frameworks when developing empirical research in family science. Credits: 3.00

HDFS 60400 - Developmental And Family Approaches To Diversity And Oppression

Credit Hours: 3.00. In this course, we will utilize an intersectional lens throughout the course to critically examine the development of individuals oppressed due to their minority status in the United States. We will review current research and literature across disciplines to: 1) understand the origin, meaning, and purpose of race and racism; 2) learn about the history of oppression and resilience of minoritized groups; 3) analyze systems of discrimination; 4) introduce theoretical frameworks for studying the unique, intersectional experiences

of minoritized populations and examples of their application to empirical research, and 5) discuss how research can be used to advance social justice. Permission of department required.

Learning Outcomes: 1. Define concepts such as discrimination, race, racism, gender (beyond binary definitions), cissexism, heterosexism, neurodiversity, and ableism as they pertain to diverse populations in the U.S. 2. Present their own intersectionality and demonstrate how personal intersections can inform bias and actions. 3. Discuss the diversity that exists in the US and identify systemic factors that interact with this diversity (including but not limited to socioeconomic factors). 4. Explain the major concerns regarding minoritized groups' experiences and the factors that promote positive outcomes for marginalized individuals and families. 5. Evaluate critically the theoretical foundation of empirical studies conducted with diverse individuals/families and apply diversity-focused theory to student research content areas of interest. Credits: 3.00

HDFS 60600 - Advanced Human Development

Credit Hours: 3.00. This course provides an overview of human development and serves as a graduate-level introduction to HDFS. Relevant theories and models will provide the structure for consideration of the nature, processes, and mechanisms of developmental change. Particular attention will be paid to diversity in developmental influences and trajectories, including atypical development. Students will gain specific knowledge and professional skills through the pursuit of individual research interests, culminating in a written grant proposal and class presentation of the proposal.

Learning Outcomes: 1. Ability to articulate and apply knowledge of theories and empirical research central to the field of human development. 2. Demonstration of understanding of diverse paths through the human life course and important determinants of those paths, including racism, ageism, ableism, sexism, and other forms of social stratification. 3. Ability to think critically about developmental theories and research, notably the ability to integrate developmental theory with research interests. 4. Ability to communicate conceptual and substantive ideas clearly and cogently. Credits: 3.00

Colloquium (4 credits)

HDFS 69700 - Graduate Student Colloquium

Credit Hours: 1.00. Research presentations by faculty members, graduate students, and invited speakers. Includes attention to: (1) the responsible conduct of research, (2) professional/scholarly and teaching development, and (3) diversity, equity, and inclusion.

Learning Outcomes: 1. Expose students to a wide swath of HDFS-related research across the life course. 2. Provide a rotation of professional development trainings (e. g., vita, job talk, and conference presentation development). 3. Foster teaching development through presentations, workshops, or trainings. 4. Generate internal and external networking opportunities for graduate students. 5. Address issues of diversity, equity, and inclusion (DEI) in HDFS by (a) providing a platform for increased representation in presenters, (b) critically considering how research in HDFS serves diverse (i. e., underrepresented/underserved/historically marginalized) populations, and (c) increasing our competencies related to DEI as part of professional development. Credits: 1.00

Quantitative/Research Methods Courses (13 credits)

HDFS 61300 - Quantitative Methods I: Inferential Statistics And ANOVA

Credit Hours: 3.00. This course provides a basic understanding of foundational concepts and tools used in statistical analysis and inference in the behavioral sciences, including data preparation, sample description, hypothesis testing, univariate and bivariate statistics, and ANOVA. Emphasis is placed on the conceptual and interpretive understanding of statistical

methods. Prerequisite: Undergraduate coursework in Statistics.

Learning Outcomes: 1. Understand the basics of probability, sampling, and inferential theory underlying statistical methods. 2. Understand univariate and bivariate statistics and ANOVA modeling methods. 3. Formulate testable hypotheses. 4. Apply proper statistical tests to evaluate hypotheses. 5. Analyze data using univariate and bivariate statistics, ANOVA, and statistical software. 6. Properly interpret the statistical estimates and tests covered in the course. 7. Use statistical methods to test your research questions using empirical data. 8. Produce written communication of analytic methods and interpretation of results. Credits: 3.00

HDFS 61500 - Research Methods In Child And Family Study

Credit Hours: 4.00. Basic research methods employed in the study of children and families are examined, including quantitative and qualitative designs, data collection, analysis, and interpretation. In the laboratory component, students are afforded supervised practice in the application of various methods using selected statistical analysis programs. Prerequisite: Graduate course in Statistics. Permission of instructor required.

Credits: 4.00

HDFS 61700 - Quantitative Methods II: Regression

Credit Hours: 4.00. This course has two primary goals: 1) provide students with foundational knowledge related to linear regression statistical analyses, and 2) provide students with the opportunity to practice writing, interpreting, and presenting regression analyses for the purposes of dissemination. Prerequisite: HDFS 61300 or PUBH 60100 or STAT 50100 or PSY 64600. Permission of instructor required.

Learning Outcomes: 1. Understand the foundations of linear regression statistical analyses, including multiple regression. 2. Understand mediation and moderation hypotheses and associated testing in linear regression. 3. Derive research questions and hypotheses testable in linear regression. 4. Analyze data using linear regression modeling and statistical software. 5. Properly interpret the statistical estimates and tests covered in the course. 6. Apply regression modeling to your research questions using empirical data. 7. Produce written communication of analytic methods and interpretation of results. Credits: 4.00

PSY 68100 - Seminar In Research Methodologies Of Industrial/Organizational Psychology

Credit Hours: 3.00. Intensive analysis of application of various research and statistical methods to the study of human behavior in organizational settings.

Learning Outcomes: 1. Develop an understanding of quantitative research methods employed in psychology, including their strengths and limitations in addressing validity concerns. 2. Apply quantitative research methods to your own research. 3. Have critical thinking skills and good professional judgment regarding research, theory, and methods. 4. Have written and oral skills. 5. Understand and able to apply professional and ethical values of psychology. Credits: 3.00

STAT 51100 - Statistical Methods

Credit Hours: 3.00. Descriptive statistics; elementary probability; sampling distributions; inference, testing hypotheses, and estimation; normal, binomial, Poisson, hypergeometric distributions; one-way analysis of variance; contingency tables; regression. For statistics majors and minors, credit should be allowed in no more than one of STAT 30100, STAT 30301, STAT 35000, STAT 35500, STAT 50100, and in no more than one of STAT 50300 and STAT 51100. Prerequisite: Two semesters of college calculus.

Learning Outcomes: 1. Understand the difference between population parameters and sample statistics. 2. Understand practical data displays: meaning and interpretation of common data displays in the media. 3. Appreciate various interpretations of probability and where they enter into statistical studies. 4. Understand statistical distributions: difference between discrete and continuous random variables. Computing the mean and variance using

various important probability distributions such as the Binomial, Hypergeometric, Poisson, Normal, Exponential, Gamma. Computing probabilities using these distributions. 5. Understand statistical distributions of two or more random variables: Sample statistics and their distributions. Understanding the Central Limit Theorem. 6. Understand statistical inference: to understand what this means and what are some practical and important applications. Examples include Confidence Intervals, Tests of Hypotheses for one, two or more populations. Linear Regression with emphasis on the difference between causation and relationships. Credits: 3.00

PSY 68800 - Research Methods In Social Psychology

Credit Hours: 3.00. This course provides a broad and rigorous, graduate-level overview of contemporary research methodology in social psychology and personality. The course follows a discussion seminar format. Permission of department required.

Learning Outcomes: 1. Understand the specific rationale for using different methodological techniques to answer different kinds of questions. 2. Learn to plan, implement, and analyze social psychology research, including traditional laboratory and other experimental procedures and designs. Credits: 3.00

Core Courses (9 credits)

HDFS 60200 - Advanced Family Science

Credit Hours: 3.00. Integrative and comprehensive assessment of both classic and recent contributions in the field of family science. Other topics include major theory and research, historical, current, and future critical issues in family science.

Learning Outcomes: 1. Describe and critique classic and emerging theoretical and conceptual frameworks in family science, with attention to refinements over time. 2. Demonstrate critical thinking skills through exploring and discussing diverse theoretical viewpoints and recent research in family science. 3. Apply theoretical and conceptual frameworks when developing empirical research in family science. Credits: 3.00

HDFS 60400 - Developmental And Family Approaches To Diversity And Oppression

Credit Hours: 3.00. In this course, we will utilize an intersectional lens throughout the course to critically examine the development of individuals oppressed due to their minority status in the United States. We will review current research and literature across disciplines to: 1) understand the origin, meaning, and purpose of race and racism; 2) learn about the history of oppression and resilience of minoritized groups; 3) analyze systems of discrimination; 4) introduce theoretical frameworks for studying the unique, intersectional experiences of minoritized populations and examples of their application to empirical research, and 5) discuss how research can be used to advance social justice. Permission of department required.

Learning Outcomes: 1. Define concepts such as discrimination, race, racism, gender (beyond binary definitions), cissexism, heterosexism, neurodiversity, and ableism as they pertain to diverse populations in the U.S. 2. Present their own intersectionality and demonstrate how personal intersections can inform bias and actions. 3. Discuss the diversity that exists in the US and identify systemic factors that interact with this diversity (including but not limited to socioeconomic factors). 4. Explain the major concerns regarding minoritized groups' experiences and the factors that promote positive outcomes for marginalized individuals and families. 5. Evaluate critically the theoretical foundation of empirical studies conducted with diverse individuals/families and apply diversity-focused theory to student research content areas of interest. Credits: 3.00

HDFS 60600 - Advanced Human Development

Credit Hours: 3.00. This course provides an overview of human development and serves as a graduate-level introduction to HDFS. Relevant theories and models will provide the structure for consideration of the nature, processes, and mechanisms of developmental change. Particular attention will be paid to diversity in developmental influences and trajectories, including

atypical development. Students will gain specific knowledge and professional skills through the pursuit of individual research interests, culminating in a written grant proposal and class presentation of the proposal.

Learning Outcomes: 1. Ability to articulate and apply knowledge of theories and empirical research central to the field of human development. 2. Demonstration of understanding of diverse paths through the human life course and important determinants of those paths, including racism, ageism, ableism, sexism, and other forms of social stratification. 3. Ability to think critically about developmental theories and research, notably the ability to integrate developmental theory with research interests. 4. Ability to communicate conceptual and substantive ideas clearly and cogently. Credits: 3.00

Thesis Research (5 credits)

HDFS 69000 - Directed Research In HDFS

Credit Hours: 1.00 to 4.00. Directed research and supervised research on a topic in student's area of specialization. Permission of instructor required.

Credits: 1.00 to 4.00

HDFS 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required.

Credits: 1.00 to 18.00

Required Courses (26 credits)

Concentrations

GPA Requirements

Additional Information

About the Program

Human Resource Management, MS

About the Program

Program Requirements

Required Courses (18 credits)

OBHR 68100 - Managing Behavior In Organizations

Credit Hours: 2.00 to 4.00. Individual and group behavior are the central components of the study of behavior in organizations. Focus is on the managerial application of knowledge to issues such as motivation, group processes, leadership, organizational design structure, and others. The course employs cases, exercises, discussions, and lectures. Prerequisite: Master's student standing and Management majors only.

Credits: 2.00 to 4.00

MGMT 65430 - Negotiations In Organizations

Credit Hours: 1.00 to 3.00. Decision making examines organizational context, stages, creativity, biases, and group processes. Negotiations examine strategies for preparing and conducting negotiations. The principal focus is on individual and interpersonal aspects of each. Permission of department required.

Learning Outcomes: 1. Understand the basic components of business negotiations through reading and completing assignments based on the textbook chapters. 2. Learn the basic components of a negotiated contract by completing a business transaction in written form. 3. Attain pragmatic negotiations skills using the I-Message method for daily activities encompassing negotiation tactics and the Verbal Skills method for more sophisticated negotiations for a major business transaction. 4. Explore cultural differences in negotiations by completing a study of practice in two countries other than the U.S. and sharing results with other students to expand their cultural knowledge base. 5. Explore and practice alternative dispute resolution techniques including mediation and arbitration. 6. Demonstrate the negotiations skills they are attaining by participating in class role-plays and by completing a final major negotiation in class.

Credits: 1.00 to 3.00

MGMT 65420 - Leadership

Credit Hours: 1.00 to 3.00. Examines organizational leadership responsibilities, forms of leadership, the acquisition, use, and consequences of power, critical leader skills, and how corporate environments shape leadership. Emphasis on self-discovery and development of managerial leadership knowledge and skills.

Learning Outcomes: 1. Increase conceptual understanding of key leadership principles and strategies utilized within formal organizations. 2. Have deepening knowledge regarding important interpersonal relationship skills and abilities. 3. Help students discover important insights into oneself as a leader (including strengths and weaknesses/opportunities for personal growth).

Credits: 1.00 to 3.00

MGMT 59100 - Launching Global Leaders

Credit Hours: 0.00 to 2.00. Capitalizing on the unique personal and professional backgrounds of each student in our program, the Launching Global Leaders course provides a comprehensive and customizable leadership development curriculum. In this year long course, students will engage in a 360 assessment of strategically identified professional competencies critical to success in the contemporary workforce. Using these target areas as a guide, students will then customize their leadership development experience by selectively engaging in a variety of program offerings, including: interactive industry simulations, personal and team performance enhancement tools, professional coaching, interactive learning

sessions with industry leaders, and workshops in developing intercultural competency, personal branding and career management.

Learning Outcomes: 1. Comprehensively assess their individual leadership strengths and areas of development along the Launching Global Leaders competency model. 2. Gain exposure to a variety of leadership styles and strategies from successful industry leaders. 3. Gain an awareness of contemporary issues facing leaders of global organizations, and strategies for future. 4. Gain exposure to tools and concepts currently utilized in industry that inspire continuous self-improvement. Credits: 0.00 to 2.00

MGMT 65460 - Talent Acquisition

Credit Hours: 2.00 to 3.00. This course focuses on the effective management of the flow of talent into and through organizations. It covers workforce planning, recruiting and selection, career transitions, and other workforce movement. It is designed to teach students the skills to recruit and select the best talent to help drive organizational strategy. Students will also learn how to design a process and framework for final individual or group selection. Lastly, they will learn several strategies to successfully orient and onboard new employees.

Learning Outcomes: 1. Design a talent acquisition program in order for an organization's talent to be its competitive advantage. 2. Design a workforce implementation plan and a process to identify issues and continuous refinement of the plan. 3. Create a Recruiting plan that is focused on both external and internal candidates. 4. Design a process for final candidate evaluation. 5. Develop strategies to orient and onboard newly acquired talent. Credits: 2.00 to 3.00

MGMT 65330 - HR Strategy

Credit Hours: 2.00 to 3.00. Survey of theory and techniques used in human resource management within organizations. Emphasis is placed on HRM, Strategic HRM, Managing Human Resources Globally, and Strategically Managing Human Resource Functions.

Learning Outcomes: 1. Understand the history of human resource management and how it has evolved to the strategic level. 2. Understand what strategic Human Resource Management means and entails. 3. Understand and complete a Human Resource Management Strategic plan. 4. Make yourself an invaluable resource to upper level management and the CEO by demonstrating the extreme importance and value of Strategic Human Resource management. Credits: 2.00 to 3.00

MGMT 65470 - Talent Management

Credit Hours: 2.00 to 3.00. This course focuses on the employer-employee relationship and how managers work with employees to improve their performance. Attention is given to Talent, Talent Management, and Performance Management in work settings, with an emphasis, however, on contemporary approaches to managing the employer-employee relationship and the systems for managing talent. Various definitions of Employee Engagement will be explored, along with how it is, measured, and why it is so important to your organization. Finally, various methods to engage employees in the organization will be studied.

Learning Outcomes: 1. Define talent and talent management. 2. Determine talent management strategies to support an organization's objectives and goals. 3. Evaluate talent management models to address organizational needs. 4. Develop and integrate a talent management system into organizations. 5. Define critical elements of a successful performance management system. 6. Identify methods to promote and maintain an engaged workforce. Credits: 2.00 to 3.00

MGMT 65390 - HR Analytics

Credit Hours: 2.00 to 3.00. This course provides an introduction to the field of HR analytics. HR Analytics is an advanced set of data analysis methodologies, tools and metrics for comprehensive workforce performance measurement and improvement. The objective of HR analytics is to drive evidence-based decisions and action in the workplace. In addition to your instructor, you may hear from expert practitioners and corporate leaders who have "been there and done that" leveraging a myriad of HR analytics along the way. We will also review (and hopefully expand) your understanding of handling data including conceptualizing models, identifying key metrics, collecting data,

analyzing data, and presenting data in ways that tell a powerful story. Throughout our course, I will infuse consulting concepts, methodologies, and lessons learned that combined with your analytic skills will help you to effectively serve as an HR Business Partner (internal HR consultant).

Learning Outcomes: 1. Understand how organizations use HR analytics to address business problems, support business decision making and drive business outcomes. 2. Become familiar with methods and processes to design, define and execute workforce research projects in a consulting capacity leveraging consulting models and methodologies and enhancing project management capabilities. 3. Learn how to approach and apply HR analytics methodology. 4. Understand current HR analytics practices, tools and emerging trends. Credits: 2.00 to 3.00

MGMT 65440 - Change Management

Credit Hours: 2.00. The purpose of this course is to provide you with essential tools and concepts you need to help create and sustain needed change in your personal and/or professional life, in your work teams and in organizations. This course is taught in an executive style format, intended for working future managers with emphasis on knowledge application and experiential learning.
