Courses

Information for Course Subject Codes by Department can be found here.

Aeronautical and Astronautical Engineering

AAE 20000 - Undergraduate Sophomore Seminar

Credit Hours: 0.00. The courses are intended to provide a forum for guest speakers, organizational and informational meetings with undergraduates, and to provide a venue for discussion of professional development. **Credits:** 0.00

AAE 20300 - Aeromechanics I

Credit Hours: 3.00. Fundamental concepts and principles of bodies in motion, with applications to aeronautical and astronautical problems. Subjects covered include rectilinear motion, curvilinear motion, rotation, and plane motion. The static equilibrium and quasistatic equilibrium situations are treated as a part of motion in which the acceleration is zero. Problems involving impact, separation, work, and energy are considered. **Credits:** 3.00

AAE 20400 - Aeromechanics II

Credit Hours: 3.00. Loads on aircraft. Strain, stress, and equations of equilibrium. Description of aircraft structures and materials. Torsion of shafts. Fuselage and wing structures. Symmetrical bending and stiffness analysis of solid and stringer-panel box beams. Structural failures. **Credits:** 3.00

AAE 20401 - Aeromechanics II Laboratory

Credit Hours: 1.00. Introduction to strain gauges, dial gauges, and photoelasticity. Tensile test. Torsion of solid and hollow propeller shafts. Stress concentration around skin cut-outs. Bending of symmetrical box wing beams. Combined axial and flexural test of aircraft stringers. Buckling of slender stringers. **Credits:** 1.00

AAE 25100 - Introduction To Aerospace Design

Credit Hours: 3.00. The role of design in aerospace engineering. Introduction to aerodynamics, performance, propulsion, structures, stability and control, and weights. Layout and general arrangement of aerospace vehicles. Design concept generation and selection. Computational methods for design. Trade studies and graphical optimization. Conceptual design exercise involving aircraft, spacecraft, or both. Technical presentations and communication for aerospace engineering.**Credits:** 3.00

AAE 29199 - Cooperative Experience I

Credit Hours: 0.00. Professional experience in aeronautics and astronautics. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

AAE 29299 - Cooperative Experience II

Credit Hours: 0.00. Professional experience in aeronautics and astronautics. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

AAE 30000 - Undergraduate Junior Seminar

Credit Hours: 0.00. The courses are intended to provide a forum for guest speakers, organizational and informational meetings with undergraduates, and to provide a venue for discussion of professional development. **Credits:** 0.00

AAE 30100 - Signal Analysis For Aerospace Engineering

Credit Hours: 3.00. Signal processing and spectral analysis for aerospace engineering. Fourier and fast Fourier transforms. Vibration analysis; estimation of natural frequencies, wing vibrations. Introduction to linear circuits, operational amplifiers and filtering. Noise suppression. **Credits:** 3.00

AAE 33300 - Fluid Mechanics

Credit Hours: 3.00. Kinematics of fluids and conservation equations for mass, momentum, and energy. Viscous and inviscid incompressible flow. Lift and drag in subsonic flow. Introduction to compressibility and boundary layers. Potential flow. **Credits:** 3.00

AAE 33301 - Fluid Mechanics Laboratory

Credit Hours: 1.00. A laboratory course designed to illustrate various aerodynamic phenomena. Experiments in incompressible viscous flow; flow measurement and visualization; laminar and turbulent boundary layers; wakes. **Credits:** 1.00

AAE 33400 - Aerodynamics

Credit Hours: 3.00. Incompressible airfoil and lifting line theory. Steady and unsteady, one-dimensional, linear and nonlinear flows. Normal shock waves. Steady, supersonic, two-dimensional linear and nonlinear flows. Oblique shock waves. Perturbation theory for wings and bodies. Design applications. **Credits:** 3.00

AAE 33401 - Aerodynamics Laboratory

Credit Hours: 1.00. A laboratory course designed to illustrate various aerodynamic phenomena. Airfoil pressure distribution. Finite wing lift, drag, and moment. Supersonic flow around bodies. Shock waves. **Credits:** 1.00

AAE 33800 - Thermal Sciences

Credit Hours: 3.00. A fundamental course covering a range of topics selected from the disciplines of engineering thermodynamics, fluid mechanics, heat transfer and combustion, with an emphasis on their application to propulsion. This is an entry level course to prepare students for advanced analysis of propulsion and energy systems. Upon completion of this course, students are expected to be able to apply fundamental principles to perform thermodynamic analysis for thermophysical problems involving fluid flow, heat transfer and combustion. **Credits:** 3.00

AAE 33900 - Aerospace Propulsion

Credit Hours: 3.00. Survey of air-breathing and rocket propulsion systems for AAE students not in the propulsion option. Thermodynamic cycles, analysis of air-breathing systems and components. Rocket Equation, rocket cycles, liquid and solid propellants, chemical equilibrium. **Credits:** 3.00

AAE 34000 - Dynamics And Vibrations

Credit Hours: 3.00. Kinematics and kinetics of particles and rigid bodies. Topics include a particle in orbit, systems of particles, vibrations, Euler's equations of motion, Eulerian angles, and aerospace vehicle dynamics. **Credits:** 3.00

AAE 35103 - Aerospace Systems Design

Credit Hours: 3.00. Aerospace system lifecycle and design process. Stakeholder needs elicitation and requirements generation. Quality function deployment and hierarchical objective trees. Concept generation and creativity techniques. Introduction to safety, risk, cost and value analysis. Critical evaluation of the applicability of systems engineering techniques in specific contexts. Application of these techniques to a team semester design project. **Credits:** 3.00

AAE 35200 - Structural Analysis I

Credit Hours: 3.00. Properties of wing and fuselage sections. Beam-column moments. Torsion of thin-walled and skin-stringer multiple-cell sections. Nonsymmetrical bending of skin-stringer wing sections. Flexural shear in open and closed thin-walled and skin-stringer sections. Loads and stresses in the rib system. Cutouts and shear lag. Modified beam theory for wing and fuselage design. Deflection by energy method. Introduction to composite structures. **Credits:** 3.00

AAE 35201 - Structural Analysis I Laboratory

Credit Hours: 1.00. Location of shear center. Torsion of thin-walled open and closed sections. Torsion of multiple-cell, thin-walled section. Nonsymmetrical bending of skin-stringer cross section. Shear lag effect. Bending of composite beam. **Credits:** 1.00

AAE 36100 - Introduction To Random Variables In Engineering

Credit Hours: 3.00. Events, sample space, probability, conditional probability, independence, random variables. Probability mass functions, density functions, and cumulative distribution functions. Derived probability density functions. Bernoulli, Poisson, and normal processes. Applications to engineering problems. Some fundamental limit theorems. **Credits:** 3.00

AAE 36400 - Control System Analysis

Credit Hours: 3.00. Modeling and analysis of dynamical systems with aerospace applications. Laplace transforms, transfer functions, block diagrams. Transient and steady-state response of dynamical systems. Root Locus, Bode, Nyquist methods for control systems analysis. Introduction to controller design. **Credits:** 3.00

AAE 36401 - Control Systems Laboratory

Credit Hours: 1.00. Enhance student awareness of control systems by providing hands-on experience using dynamic systems representative of air and space vehicles. Design of a control system from start to finish by mapping requirements into control solutions through the process of modeling, identification, and controller design (PID and Lead-Lag). **Credits:** 1.00

AAE 38199 - Professional Practice Co-Op I

Credit Hours: 0.00. To obtain professional practice with qualified employers within industry, government, or small business. Professional Practice students only. Permission of department required. **Credits:** 0.00

AAE 38299 - Professional Practice Co-Op II

Credit Hours: 0.00. To obtain professional practice with qualified employers within industry, government, or small business. Professional Practice students only. Permission of department required. **Credits:** 0.00

AAE 38399 - Professional Practice Co-Op III

Credit Hours: 0.00. To obtain professional practice with qualified employers within industry, government, or small business. Professional Practice students only. Permission of department required. **Credits:** 0.00

AAE 39399 - Cooperative Experience III

Credit Hours: 0.00. Professional experience in aeronautics and astronautics. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.**Credits:** 0.00

AAE 39499 - Extensive Cooperative Experience IV

Credit Hours: 0.00. Professional experience in aeronautics and astronautics. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

AAE 39599 - Extensive Cooperative Experience V

Credit Hours: 0.00. Professional experience in aeronautics and astronautics. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

AAE 39699 - Professional Practice Internship

Credit Hours: 0.00. Professional experience in aeronautics and astronautics. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Permission of department required. **Credits:** 0.00

AAE 40000 - Undergraduate Senior Seminar

Credit Hours: 1.00. A lecture-demonstration series emphasizing evaluation of career options, identification and development of professional skills. Example of career-related topics include choosing a job, and post graduate education in engineering or other disciplines. Examples of professional skills topics covered include interviewing, writing, and ethics. Assessment of student achievement of AAE program learning outcomes. **Credits:** 1.00

AAE 41200 - Introduction To Computational Fluid Dynamics

Credit Hours: 3.00. Introductory course in the formulation and application of finite difference methods for solving fluid flow problems. Classification of partial differential equations and formulation of well-posed problems. Discrete approximation of partial differential equations: stability, consistency, and convergence. Finite-volume formulations. Survey of methods for solving hyperbolic, elliptic, and parabolic problems. Formulation of discrete boundary conditions. Application of methods to one- and two-dimensional flow problems. **Credits:** 3.00

AAE 41600 - Viscous Flows

Credit Hours: 3.00. Navier-Stokes equations, boundary layer theory, frictional drag and heating, separation and transition. Turbulent flows. Computational methods for laminar and turbulent flows. **Credits:** 3.00

AAE 41800 - Zero-Gravity Flight Experiment

Credit Hours: 3.00. Team-based design-build-test engineering experience to maximize the benefits of student participation in the NASA Reduced Gravity Student Flight Opportunity Program (or similar). Gravity, orbits, and weightlessness. Low-gravity capillary fluid physics, scaling laws, and components. Experiment design for multiple short zero gravity test times. Technical proposal writing, design for manufacturability, experiment fabrication, planning, testing, and execution. **Credits:** 3.00

AAE 42100 - Flight Dynamics And Control

Credit Hours: 3.00. Flight vehicle rigid-body equations of motion; linearization via small perturbation techniques. Trim analysis, static and dynamic stability, aerodynamic stability derivatives and control effectiveness. Vehicle transfer functions, stability augmentation, aircraft handling qualities. Introduction to flexible vehicle effects. **Credits:** 3.00

AAE 43800 - Air-Breathing Propulsion

Credit Hours: 3.00. Basic operating principles and analysis of performance characteristics of propulsion systems for air-breathing aerospace vehicles. Ramjet, turbojet, turbofan and turboprop cycle analysis. Propeller analysis and design. Analysis of flow through inlets, combustors, nozzles, compressors, and turbines. Component matching. Not open to students with credit in ME 43800. **Credits:** 3.00

AAE 43900 - Rocket Propulsion

Credit Hours: 3.00. Flight mechanics and the propulsion system requirements for terrestrial and interplanetary flight. Converging-diverging nozzle analysis and design. Thermochemistry of propellants and performance calculations. Solid rocket motor interior ballistics and design. Thrust chamber and turbo machinery analysis and design. Liquid rocket engine cycle analysis and design. Elements of nuclear and electric propulsion systems. **Credits:** 3.00

AAE 44000 - Spacecraft Attitude Dynamics

Credit Hours: 3.00. Description of orientation, angular velocity, and angular acceleration in terms of direction cosines, Euler parameters, and angles. Forces and moments acting on space vehicles. Attitude stability of various types of satellites in circular and elliptic orbits. Spin stabilization and gravity gradient torques. Gyroscopic devices and energy dissipation. Introduction to attitude control. **Credits:** 3.00

AAE 45000 - Spacecraft Design

Credit Hours: 3.00. Senior students perform a team-based spacecraft design, requiring application of the education and skills developed in the aerospace curriculum. Components include analysis methods for preliminary design, development of an initial vehicle concept, and development of a complete numerical model of the mission, culminating in oral and written reports by the teams. **Credits:** 3.00

AAE 45100 - Aircraft Design

Credit Hours: 3.00. Senior students perform a team-based aircraft design, requiring application of the education and skills developed in the aerospace curriculum. Aircraft mission requirements include engine cycle selection and airframe/engine integration, performance, stability and control, structures, human factors, avionics, sensors, and manufacturing processes. The teams present oral and written reports on their designs. **Credits:** 3.00

AAE 45300 - Matrix Methods In Aerospace Structures

Credit Hours: 3.00. Matrix algebra and its programming. Energy principles and finite element formulation method. Coordinate transformation and assemblage. Stiffness, mass, and incremental stiffness matrices for aircraft elements - bar, beam, and shear panel. Analysis and design of wing box and fuselage structures using simple computer programs (static and dynamic). **Credits:** 3.00

AAE 45400 - Design Of Aerospace Structures

Credit Hours: 3.00. Design/failure criteria for aerospace structures, materials selection, introduction to manufacturing methods, structural assemblies, component details, concurrent engineering, and interdisciplinary design teams. **Credits:** 3.00

AAE 49000 - Special Problems In Aeronautical Engineering

Credit Hours: 0.00 to 18.00. Hours and credit to be arranged. Permission of instructor required. **Credits:** 0.00 to 18.00

AAE 49700 - Independent Study In Aerospace Engineering

Credit Hours: 0.00 to 6.00. Projects or special topics of contemporary importance or of special interest outside the scope of the standard undergraduate curriculum. Interested students seek a faculty advisor in their area of special interest and together prepare a brief description of the work to be undertaken. Permission of instructor required. **Credits:** 0.00 to 6.00

AAE 50700 - Principles Of Dynamics

Credit Hours: 3.00. Kinematics, fundamental laws of mechanics, constraints, and generalized coordinates. Lagrange's equations, virtual work. Application to particle dynamics, rigid body motion, and spacecraft dynamics. Knowledge of differential equations required. **Credits:** 3.00

AAE 50800 - Optimization In Aerospace Engineering

Credit Hours: 3.00. Formulation of optimization problems encountered in aerospace engineering. Minima of functions and functionals, necessary conditions, calculus of variations, control formulation, two-point boundary-value problems. Applications to typical problems in aerospace engineering, such as optimal launch, minimum time to climb, maximum range, and optimal space trajectories. **Credits:** 3.00

AAE 51100 - Introduction To Fluid Mechanics

Credit Hours: 3.00. The basic conservation equations are derived for a compressible viscous fluid, and then are specialized for applications in potential flow, viscous flow, and gas dynamics. **Credits:** 3.00

AAE 51200 - Computational Aerodynamics

Credit Hours: 3.00. Finite difference methods for solving fluid flow problems. Review of classification of partial differential equations, well-posed problems, and discrete approximation of partial differential equations. Matrix and von Neumann stability analysis. Consistency and convergence. Grid generation: elliptic, hyperbolic, and transfinite mesh generation methods. Methods for solving the unsteady Euler equations: finite-volume formulations, flux-split and flux-difference formulations, shock-capturing, formulation of boundary conditions, artificial viscosity models, and multi-grid acceleration.**Credits:** 3.00

AAE 51400 - Intermediate Aerodynamics

Credit Hours: 3.00. Thin airfoil theory and panel methods. Three-dimensional elementary solutions, lifting-line and lifting-surface models. Slender wing and slender body theory. Normal/oblique shock waves. One- and multi-dimensional flows and conical flows. Method of characteristics. Introduction to transonic flow, hypersonic flow, and airfoil design. **Credits:** 3.00

AAE 51500 - Rotorcraft Aerodynamics

Credit Hours: 3.00. Introduction to Vertical Take-Off and Landing (VTOL) concepts and configurations. Rotor kinematics. Momentum and blade element theory. Rotor wakes and noise. Airfoil design for rotorcraft. Introduction to Computational Fluid Dynamics (CFD) techniques, rotorcraft performance, and design. **Credits:** 3.00

AAE 51800 - Low-Gravity Fluid Dynamics

Credit Hours: 3.00. Theory and design for control of liquid propellants in weightlessness. Gravity and orbits review. Satellite and space-probe acceleration environments. Capillary-dominated fluid dynamics: contact angle, surface tension, curvatures, and solution methods. Industry practice and current topics. **Credits:** 3.00

AAE 51900 - Hypersonic Aerothermodynamics

Credit Hours: 3.00. Aerodynamics of satellites and planetary re-entry. Continuum hypersonic flow. Inviscid and viscous effects, boundary layers, and heat transfer. Shock and boundary-layer interactions. Equilibrium flow of high-temperature reacting gases. Nonequilibrium effects. Kinetic theory and rarefied flows. Direct simulation Monte Carlo techniques. **Credits:** 3.00

AAE 52000 - Experimental Aerodynamics

Credit Hours: 3.00. Theory and application of experimental techniques and instrumentation for aerodynamics and fluid mechanics. Computer data acquisition, wind tunnels, force balances, flow visualization, pressure probes, hot wire anemometry, laser Doppler velocimetry and turbulence measurements. **Credits:** 3.00

AAE 52100 - Plasma Laboratory

Credit Hours: 3.00. The laboratory course will include lab prep lectures, practical classes and mini-projects. Lab prep lectures will briefly cover topics of the basic plasma physics and diagnostics relevant to the subsequent practical classes. In addition, details of the corresponding lab procedure, instructions and lab report assignment will be discussed. Practical classes will involve students in practical creation and operation of various plasma sources and plasma diagnostics. Specifically, students will operate DC high voltage breakdown facility, electrostatic accelerator (ion thruster), cross-field accelerator (Hall thruster), Atmospheric-Pressure Plasma Jet facility, and will conduct measurements of plasma parameters using Langmuir probes, microwave interferometer and optical spectrometer. **Credits:** 3.00

AAE 52300 - Introduction To Remote Sensing

Credit Hours: 3.00. Fundamentals of satellite and airborne remote sensing. Basic physical principles of electromagnetic wave propagation will be introduced. From this foundation, the phenomenology's enabling properties of the atmosphere; ocean and land surface to be measured at a distance will be developed. These principles will be applied to the design of instruments and satellite missions for Earth observation. Microwave instruments will be emphasized, although there will also be discussion of optical systems. Most of the material would also be applicable to remote sensing of other planets. Intended for students in Engineering or the Sciences. **Credits:** 3.00

AAE 53200 - Orbit Mechanics

Credit Hours: 3.00. Orbit determination of near-earth satellites and various perturbations; libration and attitude control; orbit transfer and interception; lunar theory and interplanetary orbits; ascending mechanics and re-entry. **Credits:** 3.00

AAE 53300 - Space Traffic Engineering Management

Credit Hours: 3.00. The course teaches the basic techniques and concepts relevant to Space Traffic Management (STM) and Space Situational Awareness (SSA) from a rigorous engineering perspective. The class starts with learning how measurements are collected and processed and then moves on to the non-linear orbital motion and astrodynamics in the near-Earth realm. The focus is on orbit determination and orbit improvement of satellites and space debris to detect new objects and maintain custody of them. Lastly, the class focuses on determining the probability of collision of two resident space objects. At the end of the course, the students are equipped with a fundamental Matlab toolset to investigate their own STM or SSA problems.**Credits:** 3.00

AAE 53400 - Spacecraft Electric Propulsion

Credit Hours: 3.00. Spacecraft electric propulsion systems are intended to provide thrust for propelling spacecrafts in interplanetary missions, orbital maneuvers, and attitude control. The course will start with reviewing material on the mechanics and thermodynamics of propulsion, and identifying the niche occupied by the electric propulsion systems. The course will cover elements of plasma physics and electromagnetic theory essential for studying the electric propulsion systems. The core of the course will focus on studying various electric propulsion concepts which utilize electric power produced on-board to generate thrust. Mechanisms of the utilization of the electric power to accelerate gas or plasma and produce thrust will be considered, including electrothermal, electrostatic, electromagnetic, and gasdynamic acceleration mechanisms. **Credits:** 3.00

AAE 53500 - Propulsion Design, Build, Test

Credit Hours: 3.00. Intensive one-semester treatment of the aerospace propulsion component development process. Derivation of design requirements from mission objective to detailed components; the design process. Standard methods for thermostructural, life, performance, and combustion stability design analysis; combustor design. Experimental procedures; fabrication; test. Special topics according to student interest. **Credits:** 3.00

AAE 53700 - Hypersonic Propulsion

Credit Hours: 3.00. Analysis of advanced high speed air breathing propulsion concepts for hypersonic flight. Missions and trajectories. Engine/airframe integration. Aerothermodynamic analysis of ramjets, scramjets, and oblique detonation wave engines. On- and off-design of compression inlets and minimum length nozzles. Cryogenic fuels and skin cooling. Ram accelerator ballistic launch concepts. **Credits:** 3.00

AAE 53800 - Air Breathing Propulsion

Credit Hours: 3.00. (ME 53800) Analysis of operating characteristics of turbojet, turbofan, turboshaft, afterburning, and ramjet propulsion systems. Analysis and design of inlet, diffuser, combustor, compressor, turbine, nozzle. Component matching and off-design performance. Inlet distortion, nozzle-afterbody, and installation losses. Mission analysis. **Credits:** 3.00

AAE 53900 - Advanced Rocket Propulsion

Credit Hours: 3.00. Generalized internal compressible and incompressible flows. Thermochemistry and heat transfer in rocket applications. Advanced topics in solid rocket motor performance and internal ballistics. Liquid rocket engine cycle analysis and turbopump design. Combustion of liquid and solid propellants. Hybrid rockets and thermal-nuclear engines. **Credits:** 3.00

AAE 54500 - Dynamic Behavior of Materials

Credit Hours: 3.00. Materials' responses to high-rate loading are different from their quasi-static behavior. Applications of materials in structures subjected to impact loading from events such as bird strike require the understanding of dynamic material behavior. Such high-rate materials behavior is not available in standard materials handbooks or design manuals. This course introduces stress wave propagation in solids, which is the foundation to characterization and understanding of high-rate response of materials. Then, the theoretical background and working principles of high-rate experimental methods are presented to characterize the material response under high-rate loading conditions. Finally, rate-dependent material models are introduced to describe the dynamic material behavior and deformation mechanisms. **Credits:** 3.00

AAE 54600 - Aerospace Structural Dynamics And Stability

Credit Hours: 3.00. Dynamics of continuous systems: rod, beam, frame, and plate structures. General structural principles: virtual work, Hamilton's principle, Lagrange's equation, and Ritz method for discrete approximations. Modal analysis: eigenanalysis, mode shapes, mode superposition, and complex modes. Nonlinear vibrations: phase plane, Poincare, bifurcation plots, and chaos. Stability of the motion: classification of problems, follower loads, aerodynamic loads, divergence, flutter, pulsating compression, and gyroscopic systems. **Credits:** 3.00

AAE 54800 - Mechanical Behavior Of Aerospace Materials

Credit Hours: 3.00. This course serves as an overview for materials behavior for students without a materials background, including seniors and entry-level graduate students. Materials are at the foundation for all of engineering, as evident by the latest products that we design, to the airplanes that we fly, to the latest smartphones. In fact, breakthroughs with material research are often accompanied by rapid advancements in technology. Thus, it is paramount for all engineers to have an understanding of the structure and behavior of materials. In this class, we focus on the structure of materials, the microstructure connection to mechanical properties, and, ultimately, failure mechanisms. Materials play an important role in both design and manufacturing, which will be addressed in the context of components and extreme environments. Of specific interest will be defects within materials, defect formation/evolution, and their role in strengthening mechanisms. Material anisotropy, micromechanisms, and elasto-plastic properties at the atomic, single-crystal/constituent, and polycrystal-material levels and their use in explaining the deformation and failure characteristics in metals, polymers, and ceramics; failure mechanisms and toughening in composites; structure and behavior of aerospace materials: metal alloys, ceramic-matrix composites, and fiber-reinforced polymer composites. Particular topics will also include: elastic deformation, dislocation mechanics, plastic deformation and strengthening mechanisms, creep, and failure mechanisms; design criteria; special topics. We will attempt to have minimal overlap with AAE 55400, Fatigue of Structures and Materials. Therefore we will not cover fracture, fatigue, or stress concentrators. **Credits:** 3.00

AAE 55000 - Multidisciplinary Design Optimization

Credit Hours: 3.00. Basics of numerical optimization: problem formulation, conditions of optimality, search direction, and step length. Calculus-based techniques for univariate and multivariate optimization. Constrained and unconstrained optimization methods. Global optimization methods. Multi-objective optimization: Pareto optimality and approaches. Recent multidisciplinary design optimization techniques: approximations, response surface methodology, and collaborative optimization. Applications of various methods and techniques to representative engineering problems, culminating in a final project. Ability to solve mathematical problems with MATLAB and IMSL and similar software helpful. **Credits:** 3.00

AAE 55100 - Design Theory And Methods For Aerospace Systems

Credit Hours: 3.00. Introduction to design theory, aerospace design process, design specification and requirements, concept generation and selection, design decomposition, improving designs, process design, and concurrent engineering. Design for assembly/manufacture. Projects allow for application and critical analysis of design methods. **Credits:** 3.00

AAE 55200 - Nondestructive Evaluation Of Structures And Materials

Credit Hours: 3.00. Overview of methods employed for nondestructive evaluation of structures and materials taught in the context of damage tolerant structural analysis. Major inspection topics include: radiography, ultrasonics, eddy current, penetrant, magnetic, and visual/optical techniques. Other new emerging inspection techniques also are discussed. Offered in alternate years. **Credits:** 3.00

AAE 55300 - Elasticity In Aerospace Engineering

Credit Hours: 3.00. A basic course in the theory of elasticity with emphasis on understanding the fundamental principles and solution techniques used in the stress analysis of structures. Cartesian tensors. Governing equations for linear elasticity. Rigorous derivation of beam and plate equations from the three-dimensional elasticity equations. Torsion. Thermoelasticity. The stress functions and complex functions approaches to two-dimensional problems. Energy methods and approximate solutions. Three-dimensional problems. Knowledge of differential equations assumed. **Credits:** 3.00

AAE 55400 - Fatigue Of Structures And Materials

Credit Hours: 3.00. Development and application of methods for predicting the fatigue life of structural components. Characterization and response of materials to cyclic loading. Fatigue resistant design of aerospace structures. Both fatigue crack initiation and crack propagation concepts are discussed. **Credits:** 3.00

AAE 55500 - Mechanics Of Composite Materials

Credit Hours: 3.00. Current and potential applications of composite materials. Review of elasticity of anisotropic solids. Methods for determining mechanical properties of heterogeneous materials. Static and dynamic analyses of laminated composites. Fracture and fatigue of laminates. Reliability, testing, and design of composites. **Credits:** 3.00

AAE 55600 - Aeroelasticity

Credit Hours: 3.00. The study of the effect of aerodynamic forces of flexible aircraft. Static aeroelastic problems; control effectiveness; lift effectiveness; divergence. Dynamic aeroelasticity; classical flutter; an introduction to stability augmentation with controls. A review of standard and modern numerical solution techniques; the k-method, the British or p-k method. **Credits:** 3.00

AAE 55800 - Finite Element Methods In Aerospace Structures

Credit Hours: 3.00. Introduction to the use of advanced finite element methods in the calculation of deformation, strain, and stress in aerospace structures. Topics include: 1-D, 2-D, 3-D, and axisymmetric elements, isoperimetric element formulation, convergence, treatment of boundary conditions and constraints. Special topics include stability, dynamic analysis, and nonlinear material behavior. Emphasis is on the theoretical knowledge of the finite element method. Applied experience is gained by solution of aerospace structural analysis problems through use of professional software. **Credits:** 3.00

AAE 56000 - System-Of-Systems Modeling And Analysis

Credit Hours: 3.00. Introduction to features of system-of-systems problems; problem definition tools; role of complexity; network topology analysis and agent-based simulation models; architecture analysis; metrics for multi-stakeholder problems; semester team projects allow students to exercise and critique such methods for analyzing system-of-systems problems. Some background in probability and statistics (e.g. random variables, probability density and distributions, sampling methods) is expected. **Credits:** 3.00

AAE 56100 - Introduction To Convex Optimization

Credit Hours: 3.00. (IE 56100) Introduction to convex analysis, convex optimization problems, algorithms of convex optimization and measures of their complexity, and application of convex optimization in aerospace engineering. Recognition of convex optimization problems that arise in scientific and engineering applications. Introduction to software tools to solve convex optimization problems. **Credits:** 3.00

AAE 56400 - Systems Analysis And Synthesis

Credit Hours: 3.00. State space methods of analysis and design of continuous and discrete-time linear systems. Coordinate transformations, Jordan canonical forms, digital control, controllability and observability of continuous and discrete systems. Liapunov stability analysis. The linear regulator problem of optimal control via Hamilton Jacobi theory. Pole assignment, stabilizability, detectability. State estimation for deterministic models. Minimal order observers. MA 51100 recommended concurrently. **Credits:** 3.00

AAE 56500 - Guidance And Control Of Aerospace Vehicles

Credit Hours: 3.00. Optimal control theory and application to trajectory optimization; flight control synthesis and guidance law development; handling qualities; stability augmentation; auto-pilots. Launch vehicle and ballistic missile attitude control. AAE 56400 recommended. **Credits:** 3.00

AAE 56700 - Introduction To Applied Stochastic Processes

Credit Hours: 3.00. An introductory course in the concept of a discrete and continuous stochastic process based upon physical phenomena that originally gave rise to the specific stochastic models that are studies. Spectral analysis, response of time invariant systems to noise inputs. Estimation theory, Kalman and Winer filtering. **Credits:** 3.00

AAE 56800 - Applied Optimal Control And Estimation

Credit Hours: 3.00. This course introduces students to analysis and synthesis methods of optimal controllers and estimators for (stochastic) dynamical systems. The topics in this course include a review of probability and stochastic processes, classical estimation techniques, Pontryagin's maximum principle, dynamic programming. Linear Quadratic Regulator problems (LQR), Kalman filter, duality of LQR with Kalman filter, Linear Quadratic Gaussian (LQG), and a range of engineering applications. **Credits:** 3.00

AAE 57100 - Complex System Safety

Credit Hours: 3.00. The objective of this course is to provide students with the ability to assess the safety risk posed by engineering systems, taking into consideration hardware, software, human, and organizational factors, and using risk assessment tools that are used in practice in industry.**Credits:** 3.00

AAE 57500 - Introduction To Satellite Navigation And Positioning

Credit Hours: 3.00. Introduction to radio-navigation techniques, using the Global Navigation Satellite System (GNSS); GNSS signal structures; satellite search and acquisition; satellite tracking; coordinate systems and time; observations; atmospheric effects; and position-velocity-time (PVT) solutions. **Credits:** 3.00

AAE 58500 - Air Transportation Systems

Credit Hours: 3.00. This course provides an overview of civil air transportation system design and operations, ranging from the economics of airlines to air traffic control. The course is divided into two general theme areas: Airline Economics and

Scheduling; and Airline Fight Operations and Air Traffic Control. This course will prepare students for positions in the civil aviation industry and for graduate research in civil aviation topics. Permission of instructor required. **Credits:** 3.00

AAE 59000 - Projects In Aeronautical Engineering

Credit Hours: 1.00 to 6.00. Topics vary - projects in Aeronautical Engineering. Permission of instructor required. **Credits:** 1.00 to 6.00

AAE 59500 - Aerospace Seminar

Credit Hours: 0.00. An interdisciplinary seminar that provides a forum for invited speakers and staff to discuss new developments in practice and current research in aerospace engineering. **Credits:** 0.00

AAE 59700 - Independent Study In Aerospace Engineering

Credit Hours: 0.00 to 6.00. Projects or special topics of contemporary importance or of special interest that are outside the scope of the standard graduate curriculum can be studied under the Special Topics in Aerospace Engineering course. Interested students should seek a faculty advisor by meeting with individual faculty members who work in their area of special interest and prepare a brief description of the work to be undertaken in cooperation with their advisor. Permission of instructor required. **Credits:** 0.00 to 6.00

AAE 60700 - Variational Principles Of Mechanics

Credit Hours: 3.00. Basic concepts of analytical mechanics, calculus of variations, Hamilton's equations, Hamilton-Jacobi theory, canonical transformations. Offered in alternate years. Prerequisite: AAE 50700. **Credits:** 3.00

AAE 61300 - Viscous Flow Theory

Credit Hours: 3.00. Compressible, laminar boundary layer theory; Buseman and Crocco integrals; skin friction and heat transfer. Introduction to turbulent boundary layers and transition phenomena. Advanced boundary layer theory; the method of inner and outer expansions. Boundary layers with chemical reaction; applications to hypersonic flow and combustion. Prerequisite: AAE 51100. **Credits:** 3.00

AAE 61500 - Aeroacoustics

Credit Hours: 3.00. (ME 61500) Quantitative measures of sound (decibel) scales, spectra, energetics of acoustic motions, and measurement techniques. The wave theory of sound (basic equations and properties, sound propagation in homogeneous and inhomogeneous media, one-, two-, and three-dimensional sound fields, and distributed sources). Effects of source movement. Aerodynamic noise generation-acoustic analogy (Lighthill's equation and Ffowcs Williams-Hawkins equation). Introduction to Computational Aeroacoustics (CAA). Noise from turbulent shear flows (jet noise, cavity noise, and noise from flow over objects). Noise from turbomachinery, propellers, and rotors. Prerequisite: AAE 51100 or ME 50900 or ME 51300. **Credits:** 3.00

AAE 62400 - Laminar-Turbulent Transition

Credit Hours: 3.00. Instability mechanisms, such as Kelvin-Helmholtz, Tollmien-Schlichting, Gortler, and crossflow. Secondary instabilities. Nonlinear and nonparallel effects; the Parabolized Stability Equations; receptivity; transition prediction. Effects of compressibility, heating, roughness, turbulence, noise, curvature, etc. Turbulent spots and the extent of transitional flow. Prerequisite: AAE 51100. **Credits:** 3.00

AAE 62600 - Turbulence And Turbulence Modeling

Credit Hours: 3.00. Physical description of turbulence. Reynolds averaged equations. Scaling of basic turbulent flows. Homogeneous turbulence, spectra and two-point correlations. Hierarchy of turbulence models, including zero-, one-, and two-equation models, Reynolds stress models, large eddy simulations, and direct numerical simulations. Additional topics, such as compressibility effects on turbulence and probability density function methods, as time allows. Prerequisite: AAE 51100. **Credits:** 3.00

AAE 63200 - Advanced Orbital Dynamics

Credit Hours: 3.00. Discussion of more advanced concepts in astrodynamics. Includes fundamental theories from celestial mechanics, as well as trajectory determination and perturbation analysis with application to the motion of Earth-orbiting and interplanetary spacecraft. Assumes experience with the two-body problem. Offered in alternate years. Prerequisite: AAE 50700, AAE 53200. **Credits:** 3.00

AAE 64200 - Graduate Professional Practice

Credit Hours: 0.00. Practice in industry and comprehensive written reports of this practice. Approval by the student's adviser or major professor and by the Graduate professional practice administrator. Prerequisite: Approval by the student's adviser or major professor and by the Graduate professional practice administrator. Permission of instructor required. **Credits:** 0.00

AAE 64600 - Elastic Wave Propagation

Credit Hours: 3.00. Elastic wave propagation in rods, beams, and plates. Wave motion in semi-infinite bodies; Rayleigh, Lamb and Love waves. Pochhammer-Chree theory for rods. General properties of dispersive waves and approximation techniques. Impact. Wave front and ray methods. Introduction to wave propagation in anelastic and nonhomogenous media, and to large amplitude and shock waves. Prerequisite: AAE 55300 or ME 56300. **Credits:** 3.00

AAE 64800 - Modeling Damage And Strengthening Mechanisms In Materials

Credit Hours: 3.00. The usage of materials is the backbone of engineering practice. Yet, advances in materials have stagnated due to overly conservative approaches, trial-and-error testing, and long qualification times. Material modeling offers tremendous opportunities to address these issues. This class offers advanced modeling strategies at the intersection of mechanics and materials science for both polycrystalline and composite materials. The course topics are defined as follows: First, advanced micromechanics analysis of modern engineering materials with emphasis on relating elastic microstructural phenomena to the mechanics of material behavior, via the Eshelby inclusion problem and its application to fiber reinforced composites. Second, classical plasticity is summarized via phenomenological and mathematical formulation of the constitutive laws, including yielding, yield surface; von Mises, Tresca yield criteria; Drucker's stability postulate; strain or work hardening, normality rule, perfect plasticity, and stress-strain law. Third, crystal plasticity is discussed, specifically physical and mathematical foundation for plasticity in crystalline materials, with a detailed description of the Bishop and Hill implementation of the Taylor model for deformation of polycrystals. Lastly, concepts of dislocations leading to strengthening mechanisms in metals are discussed: (i) by studying the anisotropy of material and elastoplastic properties at crystal level, microstructural basis for deformation in metals, polymers, and ceramics and (ii) failure mechanisms and toughening in metals, with primary emphasis on work/strain hardening, solid solution hardening, precipitate hardening, and grain boundaries. The course will be comprised of three projects, where the student chooses the topic of the third and final project. Prerequisite: AAE 55300 or equivalent. **Credits:** 3.00

AAE 65400 - Fracture Mechanics

Credit Hours: 3.00. Methods of stress analysis in elastic media containing cracks. Fracture criteria. The strain energy release rate and J-integral. Crack tip plasticity. Interface cracks. Cracks in anisotropic solids. Bending of cracked plates. Dynamic crack propagation. Prerequisite: AAE 55300. **Credits:** 3.00

AAE 66600 - Nonlinear Dynamics, Systems, And Control

Credit Hours: 3.00. Fundamental concepts and tools that are useful in the analysis of nonlinear systems and in the design of controllers and estimators for such systems. Results are illustrated by, and applied to, aerospace/mechanical systems. Prerequisite: AAE 56400. **Credits:** 3.00

AAE 66800 - Hybrid Systems: Theory And Analysis

Credit Hours: 3.00. Hybrid systems are dynamical systems with both continuous and discrete dynamics and they are finding increasing applications in a variety of engineering fields, even in scientific fields such as biological systems. This course will present the recent advances in modeling, analysis, control, and verification of hybrid systems. Topics covered in this course include the following aspects of hybrid systems: continuous-time and discrete-event models; reachability analysis; safety specifications and model checking; optimal control and estimation of hybrid systems; stability analysis and verification tools; stochastic hybrid systems; numerical simulations; and a range of engineering applications. Prerequisites: AAE 56400. **Credits:** 3.00

AAE 67500 - Advanced Signals And Systems For Satellite Navigation

Credit Hours: 3.00. Fundamental theory of ranging signal design. Generation of pseudorandom noise. Methods for detecting, tracking, and estimating delay using ranging signals. Probability of detection, probability of false alarm, and tracking threshold derived from a stochastic signal model. Models for multiple access, quantization, clock and multipath errors. Examples drawn from present-day Global Navigation Satellite Systems (GNSS). Prerequisites: ECE 60000, AAE 56700, or equivalent (Random Variables and Stochastic Processes). **Credits:** 3.00

AAE 69000 - Advanced Aeronautical Engineering Projects

Credit Hours: 1.00 to 6.00. Topics vary. Permission of instructor required. **Credits:** 1.00 to 6.00

AAE 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required. **Credits:** 1.00 to 18.00

AAE 69900 - Research PhD Thesis

Credit Hours: 1.00 to 18.00. Research PhD Thesis. Permission of instructor required. **Credits:** 1.00 to 18.00

AT 24802 - Commercial Flight II Under Federal Aviation Regulations Part 141

Credit Hours: 2.00. This course is designed to finish preparation for the FAA Commercial Pilot Certificate practical exam. Permission of department required.**Credits:** 2.00

Aerospace Studies

AFT 11000 - Heritage And Values I

Credit Hours: 1.00. A survey course designed to introduce students to the United States Air and Space Forces and provides an overview of the basic characteristics, missions, and organization of the Air and Space Forces. **Credits:** 1.00

AFT 11100 - Air Force ROTC Leadership Laboratory I

Credit Hours: 1.00. Introduction to military training. Introduction to drill and ceremonies, study and experience in Air Force standards, customs and courtesies. **Credits:** 1.00

AFT 12000 - Heritage And Values II

Credit Hours: 1.00. A survey course designed to introduce students to the United States Air and Space Forces and provides an overview of the basic characteristics, missions, and organization of the Air and Space Forces.**Credits:** 1.00

AFT 12100 - Air Force ROTC Leadership Laboratory II

Credit Hours: 1.00. Reinforces Air Force military training, drill and ceremonies, study and experience in Air Force standards, customs and courtesies. **Credits:** 1.00

AFT 20220 - Air Force ROTC Leadership Laboratory

Credit Hours: 1.00. Leadership Laboratory (LLAB) is a dynamic and integrated grouping of leadership developmental activities designed to meet the needs and expectations of prospective Department of the Air Force second lieutenants and to complement the AFROTC academic program. It is a student planned, organized, and executed practicum conducted under the supervision of the Detachment Commander and Operations Flight Commander.**Credits:** 1.00

AFT 23000 - Team And Leadership Fundamentals I

Credit Hours: 1.00. Provides a fundamental understanding of both leadership and team building. The lessons and course flow are designed to prepare students for field training and leadership positions in the detachment.**Credits:** 1.00

AFT 23100 - Air Force ROTC Leadership Laboratory III

Credit Hours: 1.00. Cadets experiment with and develop leadership/management skills. Study of Air Force customs and courtesies, drill and ceremonies, and giving military commands; instructing, correcting, and evaluating the preceding skills, and study the Air Force officer environment. **Credits:** 1.00

AFT 24000 - Team And Leadership Fundamentals II

Credit Hours: 1.00. Provides a fundamental understanding of both leadership and team building. The lessons and course flow are designed to prepare students for field training and leadership positions in the detachment.**Credits:** 1.00

AFT 24100 - Air Force ROTC Leadership Laboratory IV

Credit Hours: 1.00. Cadets continue with emphasis on field training preparation, developing leadership/management skills. Study of Air Force customs and courtesies, drill and ceremonies, and giving military commands; instructing, correcting, and evaluating the preceding skills, and study the Air Force officer environment. **Credits:** 1.00

AFT 35100 - Leading People And Effective Communication I

Credit Hours: 3.00. Leading People and Effective Communication utilizes student's field training experience to take a more in-depth look at leadership. Special emphasis is placed on enhancing communication skills, and why that is important as a leader. Students have an opportunity to try out these leadership and management techniques in a supervised environment as juniors and seniors.**Credits:** 3.00

AFT 35200 - Air Force ROTC Leadership Laboratory V

Credit Hours: 1.00. Intermediate level leadership experience for military training cadets. Cadets lead the planning, coordinating, and directing of military activities for the cadet corps; provide formal training and guidance to increase the understanding, motivation, and performance of other cadets. **Credits:** 1.00

AFT 36100 - Leading People And Effective Communication II

Credit Hours: 3.00. Leading People and Effective Communication uses the student's field training experience to take a more in-depth look at leadership. Special emphasis is placed on enhancing communication skills, and why that is important as a leader. Students have an opportunity to try out these leadership and management techniques in a supervised environment as juniors and seniors.**Credits:** 3.00

AFT 36200 - Air Force ROTC Leadership Laboratory VI

Credit Hours: 1.00. Advanced leadership experience for field training preparation cadets. Cadets lead the planning, coordinating, and directing of military activities for the cadet corps; provide formal training and guidance to increase the understanding, motivation, and performance of other cadets. **Credits:** 1.00

AFT 40220 - Air Force ROTC Leadership Laboratory

Credit Hours: 1.00. Leadership Laboratory (LLAB) is a dynamic and integrated grouping of leadership developmental activities designed to meet the needs and expectations of prospective Department of the Air Force second lieutenants and to complement the AFROTC academic program. It is a student planned, organized, and executed practicum conducted under the supervision of the Detachment Commander and Operations Flight Commander.**Credits:** 1.00

AFT 47100 - National Security/Commissioning Preparation I

Credit Hours: 3.00. National Security/Commissioning Preparation is designed for college seniors and gives them the foundation to understand their role as military officers and how they are directly tied to our National Security Strategy. It is an overview of the complex social and political issues facing the military profession and requires a measure of sophistication commensurate with the senior college level.**Credits:** 3.00

AFT 47200 - Air Force ROTC Leadership Laboratory VII

Credit Hours: 1.00. Advanced leadership experience for introductory military training cadets. Cadets lead the planning, coordinating, and directing of military activities for the cadet corps; provide formal training and guidance to increase the understanding, motivation, and performance of other cadets. Prepare for active duty. **Credits:** 1.00

AFT 48100 - National Security/Commissioning Preparation II

Credit Hours: 3.00. National Security/Commissioning Preparation is designed for college seniors and gives them the foundation to understand their role as military officers and how they are directly tied to our National Security Strategy. It is an overview of the complex social and political issues facing the military profession and requires a measure of sophistication commensurate with the senior college level.**Credits:** 3.00

AFT 48200 - Air Force ROTC Leadership Laboratory VIII

Credit Hours: 1.00. Advanced leadership experience for field training preparation cadets. Cadets lead the planning, coordinating, and directing of military activities for the cadet corps; provide formal training and guidance to increase the understanding, motivation, and performance of other cadets. Prepare for active duty. **Credits:** 1.00

African American Studies

AAS 27100 - Introduction To African American Studies

Credit Hours: 3.00. Introduction to the philosophical and methodological principles underlying Afro-American studies. Dimensions of the black experience, including history, education, politics, psychology, economics, religion, social organization, and art, will be covered, and the requisite academic tools and sources will be examined. **Credits:** 3.00

AAS 27700 - African American Popular Culture

Credit Hours: 3.00. This course focuses on the production of popular culture through African-based and non African-based traditions among African Americans in the United States. Pop culture forms covered include film, theatre, visual arts, literature, dance, sports, music and religious traditions. **Credits:** 3.00

AAS 35900 - Black Women Writers

Credit Hours: 3.00. (ENGL 35900) This course introduces students to the rich and varied literary texts produced by black women writers. Literary analysis, along with a consideration of historical, cultural, gender, and racial contexts will be emphasized. **Credits:** 3.00

AAS 37000 - Black Women Rising

Credit Hours: 3.00. This course examines the rise of black women and their impact on economic, social, and cultural issues. **Credits:** 3.00

AAS 37100 - The African American Experience

Credit Hours: 3.00. Focus on specific topics of the personal experiences of blacks, in Africa and the diaspora, including black identity, black culture, and the relationships between blacks and society. **Credits:** 3.00

AAS 37300 - Issues In African American Studies

Credit Hours: 3.00. Focuses on a specific topic that relates to selected issues in the life, history, and culture of peoples of African ancestry. **Credits:** 3.00

AAS 37500 - The Black Family

Credit Hours: 3.00. This course considers and examines the black family as a social institution, focusing on both recent research as well as more descriptive accounts of issues concerning the black family. **Credits:** 3.00

AAS 37600 - The Black Male

Credit Hours: 3.00. This course examines critically the factors contributing to the deteriorating status of African American males and the positive ways of coping with that experience. Includes an overview of research perspectives defining current knowledge on the subject. **Credits:** 3.00

AAS 39200 - Caribbean History And Culture

Credit Hours: 3.00. This course introduces students to the rich and varied literary texts produced by black women writers. Literary analysis, along with a consideration of historical, cultural, gender, and racial contexts will be emphasized. **Credits:** 3.00

AAS 47300 - Blacks In Hollywood Film

Credit Hours: 3.00. A history of the representation of blacks in mainstream film throughout the twentieth century. **Credits:** 3.00

AAS 47400 - Research Methods In African American Studies

Credit Hours: 3.00. This course covers research techniques used by researchers to observe and to interpret scholarly investigation on race, class and gender from an African-American perspective. **Credits:** 3.00

AAS 49000 - Directed Readings In African American Studies

Credit Hours: 3.00. This course allows students to create an independent course of study with an instructor on a topic relevant to the African, African American, or African Diasporic experience. **Credits:** 3.00

AAS 49100 - Special Topics In African American Studies

Credit Hours: 1.00 to 4.00. Special Topics in African American Studies addresses special topics or projects under the direction of the instructor in the field of African American or African Diasporic Studies. The course may vary from 1-4 credit hours. It may be taught as a lecture or as a lecture with a lab. **Credits:** 1.00 to 4.00

AAS 57400 - Research Methods In African American Studies

Credit Hours: 3.00. This course covers techniques used by researchers and to interpret scholarly investigation on race, class and gender from an African American perspective. **Credits:** 3.00

AAS 57500 - Theories Of African American Studies

Credit Hours: 3.00. This course addresses the development of an African American intellectual tradition. The course will span disciplines and swathes of time in order to understand how scholars not only created new ideas but developed theories that shaped and changed academic inquiry. **Credits:** 3.00

AAS 59000 - Directed Readings In African American Studies

Credit Hours: 1.00 to 4.00. This directed readings course allows students to work with African American Studies faculty on work that cannot be achieved through one of the regular course offerings. This is a variable topics course that can be satisfied through individual course work with an instructor. A student wishing to earn such credit is required to obtain permission of the instructor in order to enroll for the course. This does not include work for thesis or dissertation projects. Permission of instructor required. **Credits:** 1.00 to 4.00

Agricultural and Biological Engineering

ABE 20100 - Material And Energy Balances In Biological Engineering

Credit Hours: 4.00. Thermodynamic principles associated with biological systems and processing of biological materials. Emphasis on the first law of thermodynamics. Fundamentals of steady-state mass and energy balances for reacting and non-reacting processes including multiple unit operations emphasizing living systems and bioprocessing. Applications of the first law conservation of energy to biological systems, energy conversion systems, and the environmental impacts of energy production. Development of engineering problem solving skills via Mathcad and MATLAB software. Laboratory emphasizes combining technical engineering skills with professional skill development through computer and laboratory exercises including two extensive projects that result in a biological product design.**Credits:** 4.00

ABE 20200 - Thermodynamics In Biological Engineering

Credit Hours: 3.00. Thermodynamic principles and their applications to biochemical and biological systems with emphasis on the second law of thermodynamics and use of molecular interpretations of energies and entropies. Concept of entropy balances and process efficiency. Free energy and chemical equilibrium. Equilibrium between phases, colligative properties, binding of ligands and formation of biological membranes. Molecular motion and transport properties and their application in biochemical analytical methods. Development of physical chemical problem solving skills using Mathcad and MATLAB software.**Credits:** 3.00

ABE 20500 - Computations For Engineering Systems

Credit Hours: 3.00. Development of engineering problem solving and design skills. Use of Excel, MATLAB, and Mathcad for problem solving, data analysis, numerical modeling, and statistics. Introduction to elementary statics, dynamics, materials, thermodynamics, fluid mechanics, and energy topics. **Credits:** 3.00

ABE 21000 - Thermodynamics Principles Of Engineering And Biological Systems

Credit Hours: 3.00. Application of thermodynamic principles to the design and operation of biological and engineering systems. The focus is on mass and energy balances for non-reacting processes and on the second law of thermodynamics. These principles are applied to biological and agricultural engineering systems. Specific topics include refrigeration systems, power cycles, energy conversion systems, and environmental impacts of energy production. **Credits:** 3.00

ABE 22600 - Biotechnology Laboratory I

Credit Hours: 2.00. Focuses on nucleic acid manipulation. Modules include, making a eukaryotic library, identifying clones, sub-cloning into a bacterial expression vector and verification of the clone's identity by restriction analysis and DNA sequencing. Basic laboratory techniques (solution making, buffer preparation, good safety techniques), sterile technique and compliance procedures. **Credits:** 2.00

ABE 28100 - Professional Internship

Credit Hours: 0.00. Supervised professional experience in agricultural and biological engineering. Program conducted under the direction of an engineering faculty member and with the cooperation of an employer. Student submits a summary report. Permission of department required. **Credits:** 0.00

ABE 29000 - Sophomore Seminar

Credit Hours: 1.00. Current agricultural and biological engineering issues will be discussed by students, staff, and guest speakers. Career planning, employment opportunities, professionalism, ethics, and improvement of communication skills will be emphasized. **Credits:** 1.00

ABE 29199 - Cooperative Experience I

Credit Hours: 0.00. Professional experience in agricultural and biological engineering. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

ABE 29299 - Cooperative Experience II

Credit Hours: 0.00. Professional experience in agricultural and biological engineering. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

ABE 30100 - Modeling And Computational Tools In Biological Engineering

Credit Hours: 3.00. Introduction to principles of analysis, setup, and modeling of biological systems using fundamental principles of engineering. Development of mathematical and numerical models to solve steady state and transient processes involving material and energy balances and utilizing thermodynamic, transport, and kinetic reaction principles, and economics in biological engineering systems.**Credits:** 3.00

ABE 30200 - Biochemical Laboratory Techniques For Biological Engineers

Credit Hours: 1.00. Experiments that introduce methods for analysis and recovery of biological molecules and that utilize the mathematical concepts to manipulate collected data. Introduction to engineering experimental design.**Credits:** 1.00

ABE 30300 - Physical Chemistry In Biological Engineering

Credit Hours: 3.00. Physical chemical principles associated with transport of mass, momentum and energy in bioprocesses. Principles for measuring physical chemical properties, a description of predictive equations for their evaluation and the role of these principles in the design and optimization of bioprocesses.**Credits:** 3.00

ABE 30400 - Biological Engineering Laboratory

Credit Hours: 3.00. Laboratory course focused on bioprocessing topics such as fluid flow, mixing, rheology, hydrolysis, and fermentation of biomaterials. Students will participate in design of experiments, system set up, data collection, statistical data analysis, and presentation of results.**Credits:** 3.00

ABE 30500 - Physical Properties Of Biological Materials

Credit Hours: 3.00. Physical properties of agricultural crops and food products and their relationship to harvesting, storage, and processing. Physical properties covered include: density, shape, moisture content, water potential, water activity, friction and flow or particulate solids, terminal velocity, thermal properties, interaction with electromagnetic radiation, and viscoelastic behavior of solids. **Credits:** 3.00

ABE 30700 - Momentum Transfer In Biological Engineering

Credit Hours: 3.00. Fluid statics, Newton's law of viscosity, shell momentum balances, equations of continuity and motion, one dimensional flow problems, flow through porous media, velocity distributions with more than one independent variable, two dimensional flow through a channel, stream function, velocity potential, dimensional analysis, boundary layer, turbulent flow, Reynolds stress, form and skin friction, application of macroscopic momentum and mechanical energy balances to engineering problems.**Credits:** 3.00

ABE 30800 - Heat And Mass Transfer In Biological Engineering

Credit Hours: 3.00. Principles of transport of energy and mass. Mechanisms of heat transfer, heat conduction, heat convection and heat radiation. Development of applications using macroscopic and microscopic balances of energy. Application of thermal energy balances and Fourier's Law to describe steady state and transient conduction applications including heat generation. Effect of the geometry on these processes. Basic principles of design of heat transfer equipment and its operation. Application of species mass balances and Fick's Law to steady state and transient diffusion problems. Effect of geometry on these processes. Analogies between transport of momentum, heat and mass applications to the solution of practical problems in the Food Process and Biological Engineering fields.**Credits:** 3.00

ABE 31400 - Design Of Electronic Systems

Credit Hours: 3.00. Fundamental aspects of circuits, microprocessors, transducers, sensors, instrumentation, and data acquisition are presented, with particular emphasis on electronic systems used in agricultural, biological, and food applications. Laboratory exercises used to apply the course material to constructing and testing circuits, microprocessor controlled systems, and the data collection and monitoring of systems. **Credits:** 3.00

ABE 32000 - Solid Modeling, Simulation, And Analysis

Credit Hours: 3.00. Introduction to parametric, feature-based solid modeling; dimensioned 2D and 3D engineering drawings; tolerancing; mechanical dynamic simulation; kinematic models, analysis and simulation of simple linkages and complex systems; mechanism design and evaluation; visualization and animation of results; interfacing of computer aided engineering software. Projects involving industrial parts and assemblies will be discussed and assigned. **Credits:** 3.00

ABE 32500 - Soil And Water Resource Engineering

Credit Hours: 4.00. Interrelationships of the plant-water-air-soil system; hydrologic processes; protection of surface and ground water quality; GIS targeting of soil and water protection measures; and design of subsurface and overland drainage systems, irrigation systems, and soil erosion control practices. **Credits:** 4.00

ABE 32700 - Biotechnology Laboratory II

Credit Hours: 2.00. The course is a Course Undergraduate Research Experience (CURE), more specifically, a part of the Howard Hughes Medical Institute's (HHMI) (http://www.hhmi.org/grants/sea/) Science Education Alliance and is an authentic research experience. Students engage in hands-on discovery as scientists with the ultimate objective of contributing new mycobacteriophage genomes to the scientific literature and public databases (www.phagesdb.org and the Purdue institution page can be found here: https://phagesdb.org/institutions/PURD/).**Credits:** 2.00

ABE 33000 - Design Of Machine Components

Credit Hours: 3.00. Introduction to design; stress analysis; deformation and stiffness considerations; static and fatigue strength design; design of components of the food processing, farm and off-highway machines, and mechanical systems. **Credits:** 3.00

ABE 33600 - All Terrain Vehicle Design

Credit Hours: 3.00. A structured approach to the design process, including innovation, analysis, evaluation, documentation, and presentation. Design areas typically focus on machinery and vehicles related to agricultural applications. During the first two weeks, the students will define their design problem, statement of work, approach, and timeline. Their final report will summarize the design process and the steps used to solve the proposed problem. All students will give a brief presentation of their design during the last weekly lab meeting. **Credits:** 3.00

ABE 37000 - Reaction Kinetics In Biological Engineering

Credit Hours: 3.00. This course will introduce students to the tenets of kinetics/rates of chemical/biochemical reactions. Reaction rate models will be developed and used to design basic ideal reactors and non-ideal flow reactors. Models for homogeneous, heterogeneous, and catalytic reactions will be developed and used to develop reactor designs. A variety of computational numerical modeling skills will be used in the solution of these models, including numerical interpolation, and numerical solution of set of differential equations. MatLAB software programming tools will be used by students for computational analysis. **Credits:** 3.00

ABE 38199 - Professional Practice Coop I

Credit Hours: 0.00. Professional practice with qualified employers within industry, government, or small business. Permission of department required. Professional Practice students only. **Credits:** 0.00

ABE 38299 - Professional Practice Co-Op II

Credit Hours: 0.00. Professional practice with qualified employers within industry, government, or small business. Professional Practice students only. Permission of department required. **Credits:** 0.00

ABE 38399 - Professional Practice Co-Op III

Credit Hours: 0.00. Professional practice with qualified employers within industry, government, or small business. Professional Practice students only. Permission of department required. **Credits:** 0.00

ABE 39399 - Cooperative Experience III

Credit Hours: 0.00. Professional experience in agricultural and biological engineering. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

ABE 39499 - Extensive Cooperative Experience IV

Credit Hours: 0.00. Professional experience in agricultural and biological engineering. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

ABE 39599 - Extensive Cooperative Experience V

Credit Hours: 0.00. Professional experience in agricultural and biological engineering. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

ABE 39699 - Professional Practice Internship

Credit Hours: 0.00. Professional practice with qualified employers within industry, government, or small business. Permission of department required. **Credits:** 0.00

ABE 40600 - Ag/Biol Engineering Ambassador Leadership Seminar

Credit Hours: 1.00. Students engage in a weekly seminar/lab that includes topics such as leadership, professional skills, teamwork, engaging audiences and Purdue culture. Students utilize these skills while representing the Department of Agricultural

and Biological Engineering to current and prospective students, alumni, donors, legislators, and other supporters of Purdue' Agricultural and Biological Engineering department. Students must be selected as an ABE Ambassador. Permission of department required.**Credits:** 1.00

ABE 42500 - Water Quality Engineering

Credit Hours: 3.00. This course provides in-depth perspectives on water quality in source and environmental water systems (lakes, rivers, groundwaters, and coastal waters) including sources and causes of water quality impairments and design of workable and cost-effective management solutions. The course integrates hydrology, chemistry, biology, and ecology as foundations of water quality management and incorporates operation mechanisms of management practices in designing solutions for pollution control. Students will have opportunities to engage with lectures, water quality measurements and data analysis, computer modeling, case studies, design, and discussion sessions. **Credits:** 3.00

ABE 42600 - Ecological Restoration Engineering

Credit Hours: 3.00. This course focuses on ecologically-based design principles to restore degraded ecosystems, specifically wetlands, stream/floodplains, and prairies. Students will identify and synthesize design elements, natural and anthropogenic stresses, and management considerations to develop resilient restoration designs. Laboratory experience provides open-ended projects, data collection, and field trips to reinforce the design process. **Credits:** 3.00

ABE 43500 - Hydraulic Control Systems For Mobile Equipment

Credit Hours: 3.00. Design of basic fluid power components and systems. Includes power steering, hydrostatic and hydromechanical transmission, electrohydraulic servo valves, servomechanism, and manually controlled systems. **Credits:** 3.00

ABE 44000 - Cell And Molecular Modeling In Biological Engineering

Credit Hours: 3.00. This course examines the design principles underlying the organizations and dynamics of biological networks with an emphasis on genetic/molecular circuits. Topics include the structure and tuning of network motifs and relationship to performance parameters such as robustness to internal noise, temporal response, noise filtering, bi-stability, pattern generation and temporal programs. Examples are presented from the study of natural systems and the design of new synthetic systems.**Credits:** 3.00

ABE 44400 - Design And Advanced Manufacturing Processes For Internal Combustion Engines

Credit Hours: 3.00. This course introduces the manufacture and assembly of machined piece parts into a functional assembly. The creation of a prototype internal combustion engine will be utilized as the base project for the course, and students will design and create the parts and final assemblies. Students will be given a background on the process flow of modern manufacturing by general metal machining processes, manual machine tool operation, digital machine tool programming, numerical machine tool operation, the measurement of critical machining output variables, and the assembly of piece parts into subassemblies and final products. Course participants will work as a team to develop their production parts, final presentation, and final report.**Credits:** 3.00

ABE 45000 - Computational Modeling And Data Analysis In Agricultural Engineering

Credit Hours: 3.00. The course is divided into three sections. Students will (1) learn about first and second-order dynamic systems, block diagrams, modeling of mechanical and electrical systems, and control theory while using Matlab and Simulink for modeling; (2) Learn about numerical methods for modeling of continuum mechanics and transport phenomena including finite element method and finite difference method. Applications in heat transfer, fluid flow, and solid mechanics will be studied in the

computer lab; (3) Learn about data analysis topics including statistical models, probability theory, regression analysis, classification techniques, and machine learning. **Credits:** 3.00

ABE 45300 - Leadership In Biotechnology

Credit Hours: 1.00 to 3.00. This course provides students who have completed the research experience in ABE biotechnology laboratory courses an opportunity to continue their professional development by serving as peer leaders in the classroom. The ABE biotechnology laboratory courses are part of the Howard Hughes Medical Institute's (HHMI) Science Education Alliance and provide an authentic laboratory research experience with the students engaged in hands-on discovery as a scientist with the ultimate objective of contributing new viral genomes to the scientific literature and public databases. As part of the model for implementing the course-based undergraduate research experience in the biotechnology laboratory courses, senior-level students that successfully completed those courses serve as peer leaders in the classroom. Peer leaders attend the course section along with the currently enrolled students and build competencies in leadership by guiding their team on their research project throughout the semester. Permission of instructor required. **Credits:** 1.00 to 3.00

ABE 45700 - Unit Operations In Biological Engineering

Credit Hours: 3.00. Application of momentum and heat transfer to biological and food process engineering. Viscosity, non-Newtonian fluids, experimental methods of rheological characterization of food and biological systems; viscoelasticity; design equations for pipe flow, pumps, mixing, emulsification, extrusion, sheeting, heat exchanges, aseptic processing, sterilization, freezing, and evaporation.**Credits:** 3.00

ABE 46000 - Sensors And Process Control

Credit Hours: 3.00. Fundamental aspects of transducers, biosensors, instrumentation, and computer control are presented, with particular emphasis on sensors and controls used in agricultural, biological, and food applications. Laboratory and pilot plant scale computer controlled equipment is used to examine response of process variables, sensor calibration, control system modeling, and controller selection and tuning. Prerequisite: differential equations and a course in either heat transfer or fluid mechanics.**Credits:** 3.00

ABE 48400 - Project Planning And Management

Credit Hours: 1.00. Review of topics relevant to project planning and execution in industry, including technical communication, budgeting, team management, intellectual property rights, contracts and timelines. Students will select a Capstone project and assemble a project proposal within a team environment. **Credits:** 1.00

ABE 48500 - Agricultural Engineering Project Management And Design

Credit Hours: 4.00. Team based projects are completed during the semester and documented with a written report and oral presentations. Projects encompass a broad range of topics within agricultural engineering such as the design of environmental systems, machinery, precision agriculture and robotics, and student design competitions. **Credits:** 4.00

ABE 48600 - Agricultural Engineering Design

Credit Hours: 3.00. Students implement, test, refine, present, and deliver the capstone project solution proposed in ABE 48400. Team based projects are completed during the semester and documented with a written report, poster presentation, and oral presentations. Projects encompass a broad range of topics within agricultural engineering such as the design of environmental systems, machinery, precision agriculture and robotics, and student design competitions. **Credits:** 3.00

ABE 49000 - Professional Practice In Agricultural And Biological Engineering

Credit Hours: 1.00. Career areas in agricultural engineering; job opportunities and graduate study; professional attitudes and ethics; contracts and specifications; patents. **Credits:** 1.00

ABE 49500 - Select Topics In Agricultural And Biological Engineering

Credit Hours: 1.00 to 3.00. Credit and hours to be arranged. Special topics and projects of contemporary importance or of special interest that are outside the scope of the standard agricultural and biological engineering curriculum. The specific topic that is offered will be indicated on the student's record. A written report and oral presentation of final results are required. Permission of instructor required. **Credits:** 1.00 to 3.00

ABE 49800 - Undergraduate Research In Agricultural And Biological Engineering

Credit Hours: 1.00 to 3.00. Credit and hours to be arranged. Individual research projects for students with the approval of their advisors. Requires prior approval of, and arrangement with, a faculty research advisor. A written report and public oral presentation of final results are required. Permission of instructor required. **Credits:** 1.00 to 3.00

ABE 49900 - Thesis Research

Credit Hours: 1.00 to 6.00. Credit and hours to be arranged. Individualized research on agricultural and biological engineering problems. Arrange with program coordinator before registering. A written report and public oral presentation of final results are required. Permission of instructor required. **Credits:** 1.00 to 6.00

ABE 50100 - Welding Engineering

Credit Hours: 3.00. Design of weldments and modeling of heat transfer and residual stresses of the welding processes. Finite element theory of nonlinear properties for the many processes including laser, submerged arc, manual, Gas Tungsten Arc Welding (GTAW), plasma, and electron beam. Metallurgy topics include continuous cooling transformation curves in optimizing engineered joint strength, including cutting and welding. Offered in alternate years.**Credits:** 3.00

ABE 50300 - Surface Properties And Powder Performance Of Microparticulate Systems

Credit Hours: 3.00. Material Surface Science is the study of properties that occurs at the interface of two phases. Surface phenomena needs to be addressed to understand and manipulate the behavior of particulate materials. Probing particulate surface properties at the nano- and micro-level helps to relate these to the macroscale powder performance. The main focus of this course is on the application of surface analytical techniques for assessing the physical and chemical factors that dictate particulate interactions in various food, pharmaceutical, biological, mineral, environmental (soil and water) and aerosol systems. This course will provide the student both a broad overview of the state-of-the-art analytical tools available to assess particulate surfaces and a fundamental insight into the characteristic behavior of system of particles. This course is unique because the student will learn and articulate how surface, physical, chemical and bulk properties are relevant in the performance of microparticulate systems of his/her interest.**Credits:** 3.00

ABE 50501 - Particle, Powder, and Compact Characterization

Credit Hours: 2.00. The goal of this course is to familiarize students with the properties and methods used to characterize the physical and mechanical behavior of particles, granules, and compacts with the intention of using these properties for process and performance design.**Credits:** 2.00

ABE 50502 - Particles, Powders, And Compact Characterization Laboratory

Credit Hours: 1.00. The goal of this laboratory course is to train students on state-of-the-art laboratory equipment used to measure the mechanical properties of particles, granules, powders, and compacts.**Credits:** 1.00

ABE 51100 - Drug Development

Credit Hours: 3.00. A review of drug discovery and drug development, with emphasis on the regulatory aspects of these activities. Animal preclinical research and human clinical research are discussed in detail. In addition, the process for the assembly of an IND and NDA is discussed along with the Phases (I,II,III) of human clinical trials. The CMC (chemistry manufacturing and control) aspects of drug development are presented along with ICH documents and manufacturing process analytical technologies. The course concludes with a brief review of international regulatory issues and patents. **Credits:** 3.00

ABE 51200 - Good Regulatory Practices

Credit Hours: 3.00. Includes a review of the FDA and ICH regulations on good manufacturing, good laboratory, good clinical practices. The meaning of these regulations, the globalization of practices and the roles and responsibilities of various professionals implementing these regulations will be addressed. Special emphasis will be detailed coverage of the process for the assembly and submission of an IND or NDA, and the function of the regulatory affairs department in a pharmaceutical company. **Credits:** 3.00

ABE 51300 - Quality Management, Audits, Inspections

Credit Hours: 3.00. This course provides advanced topics in quality management and business improvement methods that apply to the pharmaceutical industry. Emphasis will be placed on specific issues of industry, audits, and inspections, as well as the successful selection and presentation of business and quality improvement projects to produce compliance and competitive advantage. **Credits:** 3.00

ABE 51400 - Documents And Dialogues Of Drug Development And Registration

Credit Hours: 3.00. This capstone advanced course will integrate previous learning relating to laws and regulations, quality principles and practices, and the preparation and submission of documents for preclinical research clinical trials and new drug approvals. Special topic lectures will be given. Considerable time will be devoted to preparing regulatory documents and conducting "mock" dialogues and negotiations with "pretend" agency officials. **Credits:** 3.00

ABE 51500 - Molecular Basis Of Manufacturing

Credit Hours: 3.00. This advanced course addresses important Chemistry Manufacturing and Control (CMC) issues related to manufacturing and quality by design. The course provides important information on strategies for quality by design, manufacturing strategies for early development, the best approaches to analyzing data, and strategies for reporting the information to the FDA. This course will also focus on product design and processing. Using product and process design helps achieve quality by design (QbD), strong development reports, excellent regulatory submissions and allows continuous improvement. The course includes laboratory exercises, laboratory tours, and/or workshops outlining how to interpret the data. **Credits:** 3.00

ABE 52200 - Ecohydrology

Credit Hours: 3.00. Ecohydrology links hydrological and ecological processes at various spatiotemporal scales and is considered to be one of the most exciting frontiers of the future. Hydrological processes in individual ecosystems and the role of water in linking the myriad components of the landscape will be explored in this three-credit course. Interactions between hydrological and biological processes and factors that regulate and shape these interactions will be covered. The ecohydrology principles covered will include integration of water and biota at the catchment scale, nutrient transport and cycling, modeling ecohydrological processes, and quantification of ecosystem services. Recommended: a prior course in hydrology. **Credits:** 3.00

ABE 52700 - Computer Models In Environmental And Natural Resources Engineering

Credit Hours: 3.00. Offers students in environmental and natural resources engineering programs an understanding of the hydrological processes and related design skills. Principles of soil erosion by water; drainage of agricultural lands; surface runoff; flood and reservoir routing; hydrodynamic and water quality in pipe network; nonpoint source pollution; and transport phenomenon are studied. Current computer models utilized in industry for decision support are applied using case studies to further enhance the understanding of the hydrological processes. Limitations and advantages of the models are discussed. Offered in alternate years. **Credits:** 3.00

ABE 52900 - Nonpoint Source Pollution Engineering

Credit Hours: 3.00. Engineering principles involved in assessment and management of nonpoint source (NPS) pollution. Effect of NPS pollution on ecosystem integrity. Use of GIS/mathematical models to quantify extent of pollution. Design/implementation of best management practices to reduce nonpoint source pollution and improve water quality. Discussion of total maximum daily load (TMDL) principles and processes. **Credits:** 3.00

ABE 53000 - Plant Phenotyping Technologies

Credit Hours: 3.00. Introducing concepts, models, algorithms, and tools in plant phenotyping development and application projects. Class topics include high-throughput phenotyping in greenhouse, field phenotyping platforms, Ag remote sensing, plant sensors (hyperspectral, 3D thermal, florescent, X-ray, etc.), plant image processing technologies, statistical modeling, big data, database requirement, artificial intelligence algorithms, and hybridizations of the above techniques applied in plant phenotyping. Permission of instructor required. **Credits:** 3.00

ABE 53100 - Instrumentation And Data Acquisition

Credit Hours: 3.00. This course educates students in the use, selection, and design of instrumentation and data acquisition for agricultural, food, environmental, and biological systems. Emphasis is on measurement of position (GPS), force, pressure, power, torque, flow, and temperature along with environmental sensors. Labs focus on building and using measurement systems and programming PC computers for data acquisition and analysis. Prior knowledge of electrical circuitry is desirable. **Credits:** 3.00

ABE 53500 - Design And Modeling Of Fluid Power Systems

Credit Hours: 3.00. Introduction to fluid power technology. Design of hydraulic systems for mobile and industrial application for functionality, cost and energy efficiency. Modeling strategies for fluid power systems. Demo labs and class projects are given to reinforce the design and modeling learning projects. **Credits:** 3.00

ABE 54000 - Principles Of Systems & Synthetic Biology

Credit Hours: 3.00. Synthetic biology harnesses the power and adaptability of biology to engineer living systems that address grand societal challenges. This course introduces students to fundamental concepts and techniques in this interdisciplinary discipline, and studies state-of-the-art techniques from the primary literature. The course follows the standard Design-Build-Test-Learn (DBTL) cycle of contemporary practice and includes topics such as biological circuit design, advanced DNA assembly techniques, genome editing technologies, next generation sequencing, and directed evolution. **Credits:** 3.00

ABE 54500 - Design Of Off-Highway Vehicles

Credit Hours: 3.00. Problems associated with the design of off-highway vehicles, with special emphasis on farm and industrial tractors and self-propelled machines; engines; power trains; traction; vehicle control systems; human factors; testing and evaluation of performance. **Credits:** 3.00

ABE 54700 - Models And Microbiomes

Credit Hours: 3.00. Determine the use of computational, physical, and biological models for studying and engineering microbiomes. Study peer-reviewed literature and synthesize findings in the form of oral and written deliverables. Background in microbiology either from coursework or research and interest in microbiomes recommended. **Credits:** 3.00

ABE 55700 - Biological Engineering Design I

Credit Hours: 3.00. Course includes analysis and design of operations, such as dehydration, fermentation, and separation processes. Development of experimental designs, integration of pilot plant results into the design, operation and scale-up process systems. Emphasis on how the properties of biological materials influence the quality of the processed product.**Credits:** 3.00

ABE 55800 - Biological Engineering Design II

Credit Hours: 3.00. This course will focus on the design, synthesis, creation, evaluation, and optimization of processes to convert basic biological materials into a finished product. Concepts of materials and energy balances, thermodynamics, kinetics, transport phenomena of biological systems will be used to design processes to minimize energy and environmental impacts, and evaluate economic factors while maintaining product quality. Course will include group projects, oral and written reports.**Credits:** 3.00

ABE 56000 - Biosensors: Fundamentals And Applications

Credit Hours: 3.00. (BME 52100) An introduction to the field of biosensors and an in-depth and quantitative view of device design and performance analysis. An overview of the current state of the art to enable continuation into advanced biosensor work and design. Topics emphasize biomedical, bioprocessing, environmental, food safety, and biosecurity applications. **Credits:** 3.00

ABE 58000 - Advanced Processes In Biological Engineering

Credit Hours: 3.00. Physical and chemical structure of biomass. Reaction kinetics of hydrolysis of hemicellulose and cellulose to fermentable sugars. Fundamentals of ethanol production by fermentation. Separation of fermentation products into pure components.**Credits:** 3.00

ABE 58500 - Soil Microbiology

Credit Hours: 3.00. The soil microbial population and its role in the soil ecosystem; microbial transformations of inorganic and organic compounds; decomposition of residues; and dynamics of soil organic matter. **Credits:** 3.00

ABE 59000 - Special Problems

Credit Hours: 1.00 to 6.00. Assignment by consent of the instructor in the selected field of study. Laboratory, field, and library studies and reports on special problems related to agricultural and biological engineering not covered in regular coursework. Permission of instructor required. **Credits:** 1.00 to 6.00

ABE 59100 - Special Topics

Credit Hours: 0.00 to 4.00. Primarily designed for students (two or more) desiring credit from subject areas for which no specific course, workshop, or individual study plan is offered. Area of study will deal with topics that have enough student interest to justify the formalized teaching of a specialized topic. The course may be repeated by a student as long as the topic being taught is not repeated. Permission of instructor required. **Credits:** 0.00 to 4.00

ABE 62600 - Technology Entrepreneurship And Research Translation

Credit Hours: 3.00. (TLI 62600) The course is designed to introduce graduate students and faculty mentors to the intellectual, financial, and management processes associated with translating research into tangible products through university initiated, early-stage commercialization (start-up) activities. Lectures will present case studies of technologies and pathways to commercialization. Guest speakers will illustrate the start-up process through real-world experience, and will also address approaches for managing entrepreneurial activities, intellectual property and conflicts of interest in a university environment. Permission of Instructor required.**Credits:** 3.00

ABE 62700 - Colloidal Phenomena In Bioprocessing

Credit Hours: 3.00. The structure, stability, and rheology of biological dispersions, emulsions, and foams are explained in terms of the principles of electrostatics, hydrodynamics, thermodynamics, and statistical mechanics. Additional topics include colloidal phenomena in downstream bioprocessing, as well as colloidal aspects of some food systems. Prerequisite: Thermodynamics and physical chemistry. **Credits:** 3.00

ABE 65100 - Environmental Informatics

Credit Hours: 3.00. This course will educate students in the use, manipulation and analysis of environmental data by introducing them to scripting languages (e.g. c-shell, python), data types (e.g. ASCII, binary, NetCDF), databases (e.g. XML, DBF) and data visualization software (e.g. GMT, ArcMap) as well as techniques for checking data quality, working with missing data, and handling large diverse sources of time series and spatial data. Students will manipulate, check and insert data from a variety of sources, use that data as input to distributed hydrologic model, analyze model output and learn methods for properly documenting their data use (creation of metadata) and long-term archival storage of those data. Skills learned should be applicable to most computer operating systems, but the majority of work for this class will be done within the Unix/Linux environment. Students taking this course should have experience with one or more programming languages, including but not limited to C, Fortran, Perl, Python, java, Basic, or two writing scripts or macros within programs such as MATLAB, S-Plus, R, SAS. **Credits:** 3.00

ABE 68000 - Bioseparations And Bioprocess Engineering: Principles, Practice And Economics

Credit Hours: 3.00. Engineering fundamentals of separations and purification of biological molecules. Case studies and examples illustrate principles and practice of centrifugation, precipitation, crystallization, filtration, membrane separations, chromatography, and affinity separation of recombinant proteins and other biomolecules. Process scale-up and economics of biotechnology products and processes are mentioned in the context of their impact on purification development. Prerequisites: ABE 58000. **Credits:** 3.00

ABE 69100 - Special Topics

Credit Hours: 1.00 to 4.00. Primarily designed for advanced specialized topic areas in agricultural and biological engineering for which there is no specific course, workshop, or individual study plan, but having enough student interest to justify the formalized teaching of a course. Permission of instructor required. **Credits:** 1.00 to 4.00

ABE 69400 - Graduate Research Training

Credit Hours: 0.00. Strategies for success in graduate study are taught. Students will learn how to write a graduate research proposal, effectively plan for degree milestones, and learn about benefits of participating in professional societies. Students will also complete required training for graduate student researchers, including responsible conduct of research, laboratory safety, and an equal access/equal opportunity briefing. **Credits:** 0.00

ABE 69600 - Graduate Seminar

Credit Hours: 1.00. Best practices for effectively presenting scientific research are taught and practiced. Students will also present a twenty-minute seminar of original research results, as well as provide and receive constructive criticism on presentation form and content for improved future presentations. **Credits:** 1.00

ABE 69700 - Doctoral Professional Development

Credit Hours: 1.00. Discussion of research problems, methods, procedure, and reports. Discussion and practice to improve written and oral communication. Professional development activities. **Credits:** 1.00

ABE 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required. **Credits:** 1.00 to 18.00

ABE 69900 - Research PhD Thesis

Credit Hours: 1.00 to 18.00. Research PhD Thesis. Permission of instructor required. **Credits:** 1.00 to 18.00

Agricultural Economics

AGEC 20201 - Introduction To Data Analytics For Agricultural Business

Credit Hours: 3.00. Overview of data analytics in agricultural business. Students are exposed to an overview of software tools with a primary focus on Excel, introduction to relational databases, and data visualization. Focus is in using financial, accounting, and economic data to make management decisions. Laptop required. **Credits:** 3.00

AGEC 20300 - Introductory Microeconomics For Food And Agribusiness

Credit Hours: 3.00. This course introduces the application of microeconomics as used by farms and agribusiness firms. The behavior of individual firms is evaluated as price and output are determined in various market structures (pure competition, pure monopoly, monopolistic competition, and oligopoly). Other topics include pricing and employment of resources, market failure and the social control of industry (government, economics policy, and regulation), cost and production theory. **Credits:** 3.00

AGEC 20400 - Introduction To Resource Economics And Environmental Policy

Credit Hours: 3.00. The course provides an overview of microeconomic theory and its application to issues related to evaluating resource economic issues and environmental policy. Topics discussed include efficiency, sustainability, valuation, externalities, governmental policies, and benefit cost analysis. **Credits:** 3.00

AGEC 21700 - Economics

Credit Hours: 3.00. National economic problems such as unemployment, recessions, inflation, taxation, bank interest rates, the growth of government, monetary systems, and a rising national debt are discussed along with the principles, policies, and institutions for solving these macroeconomic problems. **Credits:** 3.00

AGEC 22000 - Economics Of Agricultural Markets

Credit Hours: 3.00. This class provides an overview of U.S. and international agricultural markets, and develops a framework for analyzing those markets. Concepts include determination of agricultural prices, spatial dimensions of agricultural markets, and trade; temporal dimensions of agricultural markets, and futures and options markets; and public policy in agricultural markets. **Credits:** 3.00

AGEC 25000 - Economic Geography Of World Food And Resources

Credit Hours: 3.00. A study of the important issues and economic decisions about worldwide resource use for food and fiber production as influenced by geography, climate, history, social institutions, national self-interest, and the environment. **Credits:** 3.00

AGEC 26000 - Mentoring Leadership

Credit Hours: 1.00. This course is designed to teach upperclassmen how to mentor freshman to thrive and survive as entering freshmen in Agricultural Economics. The main focus is on the transition to college life, as well as practical information on time management, taking and rewriting classroom notes, preparing for examinations and quizzes, dealing with stress and interpersonal relationships, and health. Additional topics include opportunities for student involvement in campus life and organizations, career paths for the various programs of study in Agricultural Economics, and how to successfully work in groups. Mentors are restricted to AGBS, AGEC, AGFN, AGMG, FARM, FIMM, QAEC, and SLMK students. Permission of department required. **Credits:** 1.00

AGEC 27500 - Honors Course - Lower Division

Credit Hours: 1.00 to 4.00. Utilized to offer a new honors course for a maximum of three years. Variable title, credit, and instructional type. Course may be repeated for credit if content and titles are different. Offered primarily to first and second-year students. Courses offered must be approved by departmental or program faculty and College of Agriculture Honors Committee. Enrollment in an honors program. Permission of department required. **Credits:** 1.00 to 4.00

AGEC 28900 - Foundational Internship

Credit Hours: 1.00. Foundational internship that is preplanned and conducted under the direction of a faculty or staff member working in cooperation with an employer representative. A learning plan must be developed and approved by the student, faculty or staff coordinator, and employer representative prior to beginning the internship. A comprehensive report describing the management strategies used by the company or organization when he/she spent their internship is required. Permission of department required. **Credits:** 1.00

AGEC 29199 - Cooperative Experience I

Credit Hours: 0.00. Professional experience in agricultural economics. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

AGEC 29299 - Cooperative Experience II

Credit Hours: 0.00. Professional experience in agricultural economics. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

AGEC 29600 - Selected Topics In Agricultural Economics

Credit Hours: 1.00 to 3.00. Special topics in agricultural economics aimed at sophomore-level students. May be repeated for credit under a different topic title. **Credits:** 1.00 to 3.00

AGEC 29800 - Careers In Agribusiness

Credit Hours: 1.00. This course is designed to give an overview of the career possibilities available to students with a degree from the Department of Agricultural Economics at Purdue University. The goal of the course is to help students think about their future, engender excitement about the diversity of career prospects that will be available to them, and help provide real-world context for the material that will be learned in other Agribusiness and Agricultural Economics courses. Students will learn from individuals working all along the farm and food value chain from agricultural input supply to farming to transportation and storage to food processing to food retailing, in firms ranging from start-ups to multinational corporations. Additionally, students will learn from individuals working in affiliated careers from government, law, education and non-governmental organizations, etc. as well as from some who are no longer working in food and agriculture. **Credits:** 1.00

AGEC 30300 - Intermediate Applied Microeconomics

Credit Hours: 3.00. This course develops advanced microeconomic models of consumer and producer choice. All theory will be derived from mathematical first principles and will rely heavily on applications of calculus, with motivating examples and case studies drawn from topics in agricultural and resource economics. The course will also cover basic numerical simulation methods in tandem with the theory; the aim is for students to be able to simulate and quantify economic phenomena using real-world examples related to the theory.**Credits:** 3.00

AGEC 30500 - Agricultural Prices

Credit Hours: 3.00. Analysis of prices and the movement of farm product prices; relations of farm product prices to farm input and other prices; conceptual and statistical analysis of agricultural supply and demand relationships; application of price analysis, price forecasting, agricultural outlook, agricultural policy; adjustment of farming to new price conditions. **Credits:** 3.00

AGEC 31000 - Farm Organization

Credit Hours: 3.00. Economic factors controlling success in farming; types of farming; business records and analysis; adjustment in organization to meet changing economic conditions; organization and management of successful farms. **Credits:** 3.00

AGEC 32100 - Principles Of Commodity Marketing

Credit Hours: 3.00. An in-depth background on the origin, operation, and application of futures and options in risk management for agriculture. Covers grain, livestock, and yield futures and options. Applications of futures and options to price and yield risk management is provided. Comparison of expected results from various risk management alternatives and decision-making processes to use in selecting a risk management strategy. **Credits:** 3.00

AGEC 32700 - Principles Of Food And Agribusiness Marketing

Credit Hours: 3.00. This course is a study of the major components of marketing decisions made by food and agribusiness firms. The course examines the marketing process, market research, marketing opportunities, and marketing strategies. Students will work on developing skills for evaluating and making marketing decisions.**Credits:** 3.00

AGEC 33000 - Management Methods For Agricultural Business

Credit Hours: 3.00. Management of nonfarm, agriculturally related businesses. Topics include tools for management decision making, legal forms of business organization, basics of accounting, and important financial management techniques. Case studies and computer simulation game. **Credits:** 3.00

AGEC 33100 - Principles Of Industrial Selling

Credit Hours: 3.00. The principles of selling and their application to the industrial businesses. Topics include attitudes and value systems, basic behavioral patterns, the purchase decision process, relationship of sales to marketing, selling strategies, preparing for sales calls, making sales presentations, handling objections, and closing sales. Emphasis is placed on application of principles to real-world situations and on building selling skills through class projects. Requires class trips. Students will pay individual lodging or meal expenses when necessary. **Credits:** 3.00

AGEC 33300 - Food Distribution - A Retailing Perspective

Credit Hours: 3.00. Distribution factors that affect the food industry. Particular attention to the food wholesaling and retailing sectors. Presentation of economic tools to evaluate performance in the food industry. Discussion of the relative importance of each of the major departments in the modern supermarket. Discussion of current and future industry prototypes.**Credits:** 3.00

AGEC 34000 - International Economic Development

Credit Hours: 3.00. This course is designed to introduce students to issues and problems related to international economic development. Topics covered include a description of the current situation in developing countries and the history of growth and development. The course is grounded in the body of theory associated with economic development, but concentrates on the many practical problems such as poverty, population growth, urbanization, education and the environment. The three areas with the greatest attention are agricultural development, international trade, and policy analysis for developing countries.**Credits:** 3.00

AGEC 35200 - Quantitative Techniques For Firm Decision Making

Credit Hours: 3.00. Introduction to mathematical programming and computing as an aid to agricultural decision making by firms, linear programming, game theory and strategy, simulation, the waiting-line problem, the equipment replacement decision, and multiproduct scheduling methods.**Credits:** 3.00

AGEC 37500 - The Process Of Economic Research

Credit Hours: 1.00. This course is a study of the process of conducting economic research. The course examines the research problem and objectives, literature review, conceptual framework, methods and procedures, and reporting research. Students will identify a research topic and project advisor. For Honors program students only in Agricultural Economics. Permission of instructor required. **Credits:** 1.00

AGEC 39001 - Professional Internship Programs In Agricultural Economics

Credit Hours: 0.00. Supervised professional experiences in agricultural economics. Programs must be preplanned and conducted under the direction of the departmental coordinator with the cooperation of an employer. Students must submit a summary report. Permission of instructor required. **Credits:** 0.00

AGEC 39399 - Cooperative Experience III

Credit Hours: 0.00. Professional experience in agricultural economics. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

AGEC 39499 - Extensive Cooperative Experience IV

Credit Hours: 0.00. Professional experience in agricultural economics. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

AGEC 39599 - Extensive Cooperative Experience V

Credit Hours: 0.00. Professional experience in agricultural economics. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

AGEC 40000 - Agricultural Economics Study Abroad

Credit Hours: 0.00 to 8.00. Utilized to record credits earned through participation in Purdue study abroad programs with cooperating foreign universities. **Credits:** 0.00 to 8.00

AGEC 40600 - Natural Resource And Environmental Economics

Credit Hours: 3.00. (FNR 40600) Introduction to economic models of renewable and nonrenewable natural resources and the use of these models in the analysis of current resource use and environmental issues. **Credits:** 3.00

AGEC 41000 - Agricultural Policy

Credit Hours: 3.00. Economic analysis of U.S. food and agricultural policy; current and past farm legislation; international trade; agricultural policies in selected countries; domestic and foreign food assistance; structural change; agricultural research policy; macroeconomic linkages with the agricultural sector; and emerging environmental policy issues, land and water use.**Credits:** 3.00

AGEC 41100 - Farm Management

Credit Hours: 4.00. Principles of farm organization and management, farmer interviews, and the application of computerized farm decision-making methods. **Credits:** 4.00

AGEC 41200 - Farm Business Management Workshop

Credit Hours: 1.00 to 3.00. Making decisions regarding the organization and operation of farm businesses with which students will be associated after graduation. Areas of decision-making include enterprise selection, farm growth, organizing large-scale farms, communication, labor management, machinery management, operating agreements, legal organization, and tax strategies. **Credits:** 1.00 to 3.00

AGEC 42100 - Advanced Commodity Marketing

Credit Hours: 3.00. Application of commodity marketing principles to grain, livestock, and other commodity sectors. Applications include hedging, speculation, risk management, and fundamental and technical price analysis. Examination and testing of pricing strategies and the development of commodity marketing plans. **Credits:** 3.00

AGEC 42400 - Financial Management Of Agricultural Business

Credit Hours: 3.00. A study of the major types of financial decisions made by agriculturally related firms, including investment in inventory, receivables and cash, property, plant, and equipment; sources and types of short-term, intermediate, and long-term capital; legal patterns of the business organization, emphasis on implementation involving agribusiness case problems. **Credits:** 3.00

AGEC 42500 - Estate Planning And Property Transfer

Credit Hours: 3.00. The ownership and transfer of farm business property. Includes tax and other implications of life estates, trust arrangements, sale of property, and charitable contributions. **Credits:** 3.00

AGEC 42700 - Advanced Agribusiness Marketing

Credit Hours: 3.00. Application of marketing principles to market planning, research, and analysis. Development of strategic marketing plans for agribusiness.**Credits:** 3.00

AGEC 42900 - Agri-Marketing Analytics

Credit Hours: 3.00. This course focuses on the use of modern, data-drive analytics marketing techniques. Focuses on the analysis of marketing data and metrics to help make business decisions. A hands-on course that requires extensive use of the computer. Laptops required.**Credits:** 3.00

AGEC 43000 - Agricultural And Food Business Strategy

Credit Hours: 3.00. An advanced course in business planning and strategy for potential agribusiness and food firm managers. Focuses on development of viable business strategy in the context of the firm's market and its internal condition. Makes extensive use of case studies that document management dilemmas of agribusiness firms, ranging from those providing inputs to agricultural producers to firms involved in the retail distribution of food.**Credits:** 3.00

AGEC 43100 - Advanced Industrial Sales And Marketing

Credit Hours: 4.00. Advanced presentation techniques, sales management and analysis, improving communication skills, study of industrial marketing strategies, interaction with industry executives, and strategies for career development. Requires class trips. Students will pay individual lodging or meal expenses when necessary. Permission of instructor required. **Credits:** 4.00

AGEC 45000 - International Agricultural Trade

Credit Hours: 3.00. Study of U.S. agricultural trade with emphasis on international trade theory, exchange rates and their determination, relationships between domestic agricultural policies and trade policies, and analysis of institutional arrangements for world trade in agricultural products.**Credits:** 3.00

AGEC 45100 - Applied Econometrics

Credit Hours: 3.00. Application of strategies to economic problems. Simple and multiple regression, dummy variables, logit analysis, time series, and forecasting.**Credits:** 3.00

AGEC 45500 - Agricultural Law

Credit Hours: 3.00. Selected general legal topics (courts, contracts, torts, property and commercial law) with emphasis on farming problems (e.g., landowner-tenant, grain contracts, fences, and animal liability) and cases. **Credits:** 3.00

AGEC 45600 - Federal Income Tax Law

Credit Hours: 3.00. Introduction to the federal income tax laws applicable to individuals and small business with emphasis on the farming business. The course includes management implications and the policy basis for the tax law system. Techniques and practice for the preparation of selected forms will be included. There will be limited exposure to taxation of partnerships, corporations, estates, and to federal gift and estate tax law. **Credits:** 3.00

AGEC 47500 - Honors Course - Upper Division

Credit Hours: 1.00 to 4.00. Utilized to offer a new honors course for a maximum of three years. Variable title, credit, and instructional type. Course may be repeated for credit if content and titles are different. Offered primarily to third and fourth-year students. Courses offered must be approved by departmental or program faculty and College of Agriculture Honors Committee. Enrollment in an honors program. Permission of department required. **Credits:** 1.00 to 4.00

AGEC 48900 - Professional Internship

Credit Hours: 2.00. Professional internship that is preplanned and conducted under the direction of a faculty or staff member working in cooperation with an employer representative. A learning plan must be developed and approved by the student, faculty or staff coordinator, and employer representative prior to beginning the internship. A summary report describing their economic or business analysis for the company or organization where he/she spent their internship is required. Permission of department required. **Credits:** 2.00

AGEC 49600 - Selected Topics In Agribusiness Management

Credit Hours: 1.00. Intended for individuals in the food industry marketing and management, sales and marketing, agribusiness management, agricultural finance, and farm management options. Also open to students in other agricultural economics options as well as to students outside the department. Focuses on current topics in the management of food and agribusiness firms. Provides advanced treatment of these topics for upper-division students. This is a set of one-hour seminars that will address current topics in food and agribusiness management. The topics of focus will be those that either are not treated in other courses, or are not treated in depth needed by a student pursuing a management career in the food and agribusiness industries. Topics will be reviewed annually as to relevance and will be changed as needed. Five week session. **Credits:** 1.00

AGEC 49800 - Special Problems

Credit Hours: 1.00 to 3.00. Open primarily to qualified seniors who want to study special problems in agricultural economics not covered in regular work. Permission of instructor required. **Credits:** 1.00 to 3.00

AGEC 49900 - Thesis

Credit Hours: 1.00 to 6.00. Thesis. Permission of instructor required. **Credits:** 1.00 to 6.00

AGEC 50600 - Agricultural Marketing And Price Analysis

Credit Hours: 3.00. Marketing margins and derived demand; elasticity. Modeling supply and demand relationships; single and multiple equation systems; forecasting. Industrial organization economics applied to the food processing, wholesaling, and retailing industries; subsector analysis, vertical coordination; marketing and competition policies. **Credits:** 3.00

AGEC 51600 - Mathematical Tools For Agricultural And Applied Economics

Credit Hours: 3.00. This course provides first year graduate students and advanced undergraduate students with the specific set of applied mathematical tools needed to support graduate coursework in microeconomics, macroeconomics, economic programming, and econometrics. The course reviews skills and concepts from a number of fields of mathematics including matrix algebra, calculus, optimization theory, and mathematical statistics. The course emphasizes specific applications to economic theory and applied problems in agricultural economics and related areas. Students should be comfortable with introductory-level calculus before entering the course. Permission of instructor required. **Credits:** 3.00

AGEC 52400 - Agricultural Finance

Credit Hours: 3.00. Designed to provide students the concepts and tools to apply financial management principles to farm businesses. Topics include financing alternatives, preparation and interpretation of financial statements, and capital investment analysis using discounted cash flows. **Credits:** 3.00

AGEC 52500 - Environmental Policy Analysis

Credit Hours: 3.00. Designed to assist in understanding how environmental information and knowledge are produced, disseminated, and utilized in a variety of institutional contexts. Readings are selected to promote discussion and interaction concerning alternative mechanisms for protecting environmental resources. Prerequisite: introductory microeconomics course suggested. **Credits:** 3.00

AGEC 52600 - International Food And Agribusiness Marketing Strategy

Credit Hours: 3.00. Students will develop their analytical, decision-making, and communication skills related to marketing management of food systems in the world economy. They will analyze a foreign market's potential and market entry strategies; compare consumer differences and similarities across markets; define issues related to marketing mix standardization or adaptation; and evaluate effects of economic, social, and legal environments on marketing strategy. **Credits:** 3.00

AGEC 52800 - Global Change And The Challenge Of Sustainably Feeding A Growing Planet

Credit Hours: 3.00. This course investigates the major drivers of global agricultural and environmental change associated with the global farm and food system. This includes demography, income growth, biofuels, climate change, environmental and ecosystem services, livestock consumption, food waste and land use change. Weekly modules include a guest lecture, student led discussion of readings and discussion of lab assignments undertaken using the SIMPLE model of global agriculture, environment and food security. The class culminates with a course project which is presented to the class and written up in a term paper. **Credits:** 3.00

AGEC 53000 - Strategic Agribusiness Management

Credit Hours: 3.00. Addresses issues in the strategic management of agricultural and food businesses. Emphasis is on developing a framework for formulating strategy, making strategic choices in a variety of business environments, and implementing strategy. Extensive use of management case studies and a major term project with an agribusiness firm focus on developing managerial problem-solving skills. **Credits:** 3.00

AGEC 53200 - World Food Problems

Credit Hours: 3.00. This course focuses on the multi-disciplinary challenges that exist in meeting the food and nutrition needs of a growing world population. The course aims to instill an appreciation of the importance of economics, food production and technology, trade, culture, communication, political processes and institutions, demography and related factors in determining adequate food availability and health globally. Permission of instructor required. **Credits:** 3.00

AGEC 55200 - Introduction To Mathematical Programming

Credit Hours: 3.00. Introduction to constrained and optimization problems and their solution using mathematical programming techniques. Theory and implementation of linear, quadratic, and integer programming methods are examined. Applications to farm management, diet and feed rations, spatial market equilibrium, agricultural sector analysis, and other problems from agricultural economics. Use of computer software packages for practical problems. **Credits:** 3.00

AGEC 57100 - Global Issues In International Agribusiness

Credit Hours: 1.00. This is the first course in a required three-course sequence designed for students in the "Professional Masters in International Agribusiness" concentration in the Department of Agricultural Economics. The course objective is to expose students to a wide range of global issues directly and indirectly related to the production, processing, and marketing of agricultural products (food, fuel, fiber). Topics vary and may include food security, malnutrition, food safety, biofuels, the environment, trade and agricultural policy, emerging agricultural technologies, and climate change. Prerequisites: Enrollment in Professional Masters in International Agribusiness or permission of instructor required. **Credits:** 1.00

AGEC 57200 - International Agribusiness Market Opportunities

Credit Hours: 2.00. This is the second course in a required three-course sequence designed for students in the "Professional Masters in International Agribusiness" concentration in the Department of Agricultural Economics. The course objective is to assist students in identifying and exploring market opportunities in international agribusiness, including those related to the production, processing, and marketing of agricultural products including food, fuel, and fiber. The course combines lectures with discussion and project-based learning and group activities. **Credits:** 2.00

AGEC 57300 - International Business Analysis

Credit Hours: 3.00. This is the third course in a required three-course sequence designed for students in the Professional Masters in International Agribusiness concentration in the Department of Agricultural Economics. The course objective is to assist students in conducting a professional business analysis focusing on either a market opportunity, financial management, or other management issue in international agribusiness. The course is project-based and includes group activities and written and oral presentations. **Credits:** 3.00

AGEC 59500 - Internship

Credit Hours: 0.00 to 3.00. This course allows students to work in firms, government agencies or non-profit organizations undertaking projects with the supervision of faculty mentors and onsite supervisors. Permission of department required. **Credits:** 0.00 to 3.00

AGEC 59600 - Seminars In Current Issues In Agricultural Economics

Credit Hours: 1.00 to 3.00. Study of selected current developments in agricultural economics. Topics will be announced in advance. Permission of instructor required. **Credits:** 1.00 to 3.00

AGEC 60000 - Agricultural Finance

Credit Hours: 3.00. Advanced capital budgeting topics including: tax policy, inflation, optimal replacement, bid models, and inclusion of financing flows; application of expected utility theory and mathematical programming to optimal capital structure decisions of proprietors; farmland investment, pricing, and dynamics; pricing contingent claims. Prerequisite: AGEC 52400; AGEC 55200 suggested. **Credits:** 3.00

AGEC 60200 - Preparation And Procedures For Policy Analysis

Credit Hours: 3.00. Research methods, scientific methodology, problem identification, and the nature of policy problems including economic policy readings, case studies, and practice project proposals. **Credits:** 3.00

AGEC 60400 - Fundamentals Of Applied Welfare Economics

Credit Hours: 1.00. Basic concepts and principles of applied welfare economics including Pareto conditions for welfare maximization; public goods, externalities, and property rights; consumer and producer surplus; theory of the second best; and neoclassical and contemporary theories of income distribution. Concurrent Prerequisite: ECON 51100. **Credits:** 1.00

AGEC 60500 - Agricultural Markets And Price Analysis

Credit Hours: 3.00. Agricultural markets are multi-faceted, having been studied using a wide range of analytical tools. This graduate-level course emphasizes charactering demand and supply of agricultural markets and understanding forces that determine commodity and food prices. It also aims to cover a set of economic studies of prices and assist students in applying theoretical frameworks and time-series econometrics to empirical analysis of agricultural prices. In addition to studying prices in perfectly competitive markets, the first half of the course highlights several classic models of consumer demand and agricultural supply, prices under imperfect competition, price spreads (marketing margins), and the economics of information. The second half of the course focuses on empirical price analysis. Popular time-series econometric tools are introduced to study price relationships over space and time, price discovery mechanisms, and functions of futures markets. **Credits:** 3.00

AGEC 60800 - Benefit-Cost Analysis

Credit Hours: 2.00. Principles and practice for analysis of the benefits and costs of public investments. Topics include measures of project worth, choice of the discount rate, analysis of projects with multiple objectives and purposes, identifying and quantifying benefits and costs, applications of consumer and producer surplus in project analysis, treatment of risk and uncertainty, and shadow pricing techniques for project evaluation in developing counties. Concurrent Prerequisite: AGEC 60400; a graduate course in microeconomic theory. **Credits:** 2.00

AGEC 60900 - Applied Welfare Analysis

Credit Hours: 3.00. This course develops the theory and methods used to assess the benefits and costs of economic policies and projects. Topics include benefit-cost analysis, economic impact analysis, nonmarket valuation, and analysis of risk and uncertainty. Prerequisites: A graduate course in microeconomic theory; a graduate course in regression analysis. **Credits:** 3.00

AGEC 61200 - Agricultural Production Economics I

Credit Hours: 3.00. Economic theory and empirical research methods for management of natural resource based production systems. Topics include: analysis of response in crops and livestock production, resource allocation, economics of site specific management, commodity supply and input demand. Concurrent Prerequisite: ECON 51100. **Credits:** 3.00

AGEC 61300 - Introduction To Economics Of Risk

Credit Hours: 3.00. A background in expected utility theory and applications. EUH axioms, risk aversion, utility elicitation, expected utility and moments, stochastic dominance, mean-variance, risk free asset, diversification, single index model, increasing risk, production under risk, programming models and applications. Prerequisite: AGEC 55200, ECON 51100, STAT 51100. **Credits:** 3.00

AGEC 61400 - Advanced Agricultural Production Economics

Credit Hours: 3.00. Course covers advanced techniques for economic analysis of agricultural production economics. Students are required to produce a course project demonstrating competency at the applied research frontier of the field and participate in presentation, discussion, and peer review of course members' work. Prerequisites: AGEC 61200 and ECON 60700 or Consent of Instructor. **Credits:** 3.00

AGEC 61600 - Resource Economics And Policy

Credit Hours: 3.00. Natural resource development and allocation in both static and dynamic contexts. Analysis of scarcity and growth issues, equity considerations, derivation of optimal pricing and depletion rules. Application of advanced production concepts to national resource problems. Prerequisite: AGEC 60400, ECON 51100. **Credits:** 3.00

AGEC 61700 - Applied Welfare And Environmental Economics

Credit Hours: 3.00. Theory of welfare economics relevant to understanding foundations of benefit-cost analysis and concepts for policy design in areas such as environment, resources, and trade. Applied projects to be selected and analyzed by students. Prerequisite: AGEC 60400 and ECON 60700 , or Consent of Instructor. **Credits:** 3.00

AGEC 61800 - Applied General Equilibrium Analysis

Credit Hours: 3.00. Theory and empirical techniques behind numerical general equilibrium analysis. The course is divided into two parts: 1) development of the basic analytical framework and model properties, and 2) in-depth study of selected applications in international trade, price analysis, and resource and environmental economics. Homework assignments involve a mix of qualitative analysis and microcomputer-based computational exercises. Prerequisite: AGEC 60400; Prerequisite: ECON 51100 or ECON 60700. **Credits:** 3.00

AGEC 61900 - Applied Microeconomic Theory

Credit Hours: 3.00. Provides students with the capability to apply microeconomic theory and econometrics to analyses of economic issues and problems. Students will work through applied producer/consumer problems to gain experience in the uses of econometric estimation. Topics include: primal-dual approaches, direct and indirect functions, flexible functional forms, static optimization, separability and aggregation, risk and expectations, dynamics and demographics. Examples are drawn from both consumer and producer applications. Prerequisite: AGEC 65100, ECON 60700. **Credits:** 3.00

AGEC 62000 - Computational Analysis Of Markets And Policy

Credit Hours: 3.00. Exposes students to a variety of topics in applied economics relating to markets and policy. Students build, calibrate, and revise simple economic models, with the basic structure of more complex models being provided. Through a series of problem sets focusing on analytical skills and computation, students bridge theory and application in economics. **Credits:** 3.00

AGEC 62200 - Food System Organization And Policy

Credit Hours: 3.00. Development of framework to study food system organization and policy; survey of measurement and empirical testing problems in industrial-organization research on food-system market structure and performance; review of competition policies and evaluation of policy alternatives. Prerequisite: Graduate courses in microeconomic theory and marketing. **Credits:** 3.00

AGEC 62500 - Macroeconomic Issues In Agriculture

Credit Hours: 3.00. Studies the nature and importance of linkages between agriculture and the macro economy, and examines theories and methods used to establish or quantify these linkages in agricultural models. Extensions of macroeconomic

accounting and theory into an open economy are explored by examining attempts by agricultural economists to estimate macroeconomic linkages and build them into commodity models, and considering consequences of implicit and explicit macroeconomic assumptions in much of our work. The changing role of agriculture in an economy under structural transformation will be key to understanding these linkages and how they evolve, as shown in several new developments seeking to explain both recent events and policy history in macro-theoretical frameworks consistent with observed empirical regularities. **Credits:** 3.00

AGEC 63000 - Urban And Regional Economics

Credit Hours: 3.00. The literature discussed in this urban and regional economics course covers theoretical texts, conceptual as well as statistical, and empirical applications in order to introduce the student to the economist's view on spatial variation in economic outcomes. This ranges from coverage of the theory of industrial location choice, through theoretical and empirical analysis of the spatial distribution of economic activities (agglomeration theory, industrial clusters, central place theory), to theoretical and empirical explanations for the spatial structure of cities, the working of regional labor markets and migration. The course covers various empirical tools utilized in spatial data analysis (spatial econometrics) and modeling of regional economies and their interrelations (interregional input-output analysis). Prerequisites: AGEC 20300 or ECON 34000 or ECON 51100. **Credits:** 3.00

AGEC 63100 - The Theory And Practice Of Spatial Econometrics

Credit Hours: 3.00. This course deals with the analysis of spatial data and centers on both exploratory tools developed in spatial statistics and GIScience, as well as on econometric models that have been the main focus in spatial econometrics. During the course, the theoretical basis for the analysis of spatial data and spatial models will be covered. This theoretical angle will be combined with ample opportunities to acquire hands-on experience in the analysis of spatial data. To the effect, up-to-date software, such as GeoDa, R, Stata, and MATLAB will be used. A good working knowledge of basic statistics and regression techniques is needed. Prior experience with GIS is helpful but not required. Prerequisites: AGEC 45100 or AGEC 65000 or ECON 67100 or STAT 41700 or STAT 51200 or STAT 51700. **Credits:** 3.00

AGEC 63300 - Advanced Topics In Space, Health, And Population Economics

Credit Hours: 1.00. This course is designed to introduce students to advanced research in space, health, and population economics. It is designed to introduce both topical content and state-of-the-art research tools to students through a combination of guest speakers, faculty presentations, and discussions. The seminar also serves as a forum for students to present their own work and receive critical commentary from faculty and peers. The course is organized as a graduate seminar and gives students a chance to actively explore their own research ideas. **Credits:** 1.00

AGEC 64000 - Agricultural Policy

Credit Hours: 3.00. Policy analysis for agriculture in the world economy. Emphasis on application of economic theory to analyze commodity programs, international trade, environmental concerns, and investment in human capital and agricultural research. Prerequisite: AGEC 41000, AGEC 60400. **Credits:** 3.00

AGEC 64300 - Theory Of Economic Development

Credit Hours: 3.00. The economic theories behind the predominant approaches to economic development are reviewed. Both the sources of growth and problems in the development process are stressed. Emphasis is on the analysis and evolution of the models supporting the different approaches and the empirical analysis leading to changes in the paradigms. The role of agriculture in the economic development process is one of the topics. Other important issues are technological change, income distribution, structural adjustment, and the debt problem. Prerequisite: ECON 51100, ECON 51200. **Credits:** 3.00

AGEC 64400 - International Agricultural Trade

Credit Hours: 3.00. International trade theory relevant to understanding world agricultural trade and the problems of agriculture in an open economy. Models for analyzing the effects of trade policy and market conditions on the agricultural sector. Welfare analysis of restrictions on trade. Prerequisite: ECON 51100, ECON 51200 **Credits:** 3.00

AGEC 65000 - Application Of Quantitative Analysis: Econometrics I

Credit Hours: 3.00. Brief presentation of probability concepts, mathematical expectation, probability density and distribution functions as background for studying principles of economic model construction. Emphasis is on econometric single equation models, principles of estimation, the general linear model, tests of hypothesis, confidence interval estimation, and special topics such as errors in the variables, multicollinearity, dummy variables, hetero-scedasticity, autocorrelation and prediction problems. Prerequisite: STAT 51100; ECON 51100 or ECON 60700, matrix algebra. **Credits:** 3.00

AGEC 65100 - Application Of Quantitative Analysis: Econometrics II

Credit Hours: 3.00. Emphasis is on using advanced econometric techniques. The course covers use of computer software and interpretation and reporting of econometric results. The first part of the course includes general econometric concepts, such as least squares and maximum likelihood estimation, desirable statistical properties, assumptions of the classical linear regression model, Monte Carlo methods, nested and non-nested hypothesis tests. Later, more specialized topics are covered, including multiple equation models, simultaneous equation models, limited dependent variable models, and other topics that are deemed relevant. Prerequisite: AGEC 65000. **Credits:** 3.00

AGEC 65200 - Application Of Quantitative Analysis: Mathematical Programming

Credit Hours: 3.00. Recent literature on the theory and application of mathematical programming and agricultural modeling. Model building and analysis techniques with focus on matching solution methods to problems. Prerequisite: AGEC 55200, ECON 61200; a course in matrix algebra. **Credits:** 3.00

AGEC 65400 - Economic Dynamics

Credit Hours: 2.00. Focuses on the application of the tools of dynamic optimization to problems in economics. Covers continuous-time and discrete-time dynamic optimization techniques, including the calculus of variations, optimal control theory, and dynamic programming. Applications are drawn from a range of problems in microeconomics and macroeconomics, including current topics in agricultural economics, natural resource economics, and investment theory. Course meets weeks 1 - 10. Prerequisite: AGEC 65200, ECON 60700. **Credits:** 2.00

AGEC 65500 - Applied Economic Time Series Analysis

Credit Hours: 3.00. This course is designed to improve students' abilities to estimate and interpret time series models. The course begins with univariate models and progresses to multivariate analysis. Alternative methods for identifying, estimating, and forecasting with time series models will be discussed. In addition, analysis of non-stationary time series and co-integration modeling will be covered in this course. Prerequisite: AGEC 65100 or consent of instructor. Mastery of applied statistics, calculus, and microeconomic theory at the Masters level or higher is desirable. **Credits:** 3.00

AGEC 68100 - Economics For Food And Agribusiness Managers

Credit Hours: 3.00. Addresses the institutional setting, business climate, and structure of the food and agricultural markets. Encompasses both the domestic and international dimensions of the food chain, including consumer demand, global sourcing, and worldwide production potential. Focuses on managerial economics, as applied to such topics as food system market structure, the nature and dimensions of domestic and global competition, the components of cost and revenue, and the food system value chain. Permission of department required.**Credits:** 3.00

AGEC 68200 - The Macroeconomics And Trade Environment Of The Food System

Credit Hours: 3.00. Exposes students to the nature of linkages among agriculture, international markets, and the macro-economy, which are key to the fortunes of U.S. farmers and agribusiness. Exam theories and methods that allow students to establish or quantify these linkages and evaluate the consequences of alternative policies, demonstrating the usefulness of economic analysis as a tool. Also explores current policy issues facing the food and agribusiness industries, which might include farm legislation; environmental regulations; and food safety and nutrition labeling rules, among other policy topics. Permission of department required.**Credits:** 3.00

AGEC 68400 - Applied Quantitative Methods For Decision Making

Credit Hours: 3.00. Explores the application of contemporary concepts and quantitative techniques for decision making in the face of uncertainty. Focus is on application of statistical tools to decisions facing the food and agricultural business manager. Permission of department required.**Credits:** 3.00

AGEC 68500 - Advanced Quantitative Methods For Decision Making Under Uncertainty

Credit Hours: 3.00. Explores key areas of risk management of the food and agricultural firm, including price, production, strategic, regulatory, technology, market/competitor, political, financial, and exchange rate risk. Contemporary tools, such as score carding, decision trees, and real options are introduced for quantifying and managing uncertain decisions. Permission of department required.**Credits:** 3.00

AGEC 68600 - Strategic Food And Agribusiness Management

Credit Hours: 3.00. This course explores integration of the functional areas of business at the corporate level. Heavy emphasis is on analysis of the business environment, setting strategic direction, assessing core competencies, choosing a market position and developing competitive advantage, and organizational implementation and control in the context of the food and agricultural markets. The course makes heavy use of case studies of firms in the food and agricultural marketplace. Permission of department required.**Credits:** 3.00

AGEC 68700 - Problem Solving And Project Management For Decision Makers

Credit Hours: 3.00. Develops a structured approach to problem solving, including problem definition, development of alternatives, identifying consequences, assessing trade-offs, and making informed choices. Research methods and project management concepts will be addressed. A major business analysis project will be framed during the course, to be completed as part of the capstone course in business analysis. Permission of department required.**Credits:** 3.00

AGEC 68800 - Business Analysis Capstone Course

Credit Hours: 3.00. Capstone experience where students will work on individual projects focused on a comprehensive detailed analysis of an issue facing their employer or an issue of general interest to the student. It is expected that this project will draw on tools and concepts developed throughout the MS program and be delivered to an appropriate audience of decision-makers upon completion. Permission of department required.**Credits:** 3.00

AGEC 69000 - Seminars In Agricultural Economics

Credit Hours: 0.00 to 18.00. Intensive study of selected current developments in agricultural economics. Topics will be announced in advance. Permission of instructor required. **Credits:** 0.00 to 18.00

AGEC 69100 - Topical Research In Agricultural Economics

Credit Hours: 1.00 to 6.00. Topics of interest to the student. Designed to give training in research. Credit dependent upon amount of work done. Permission of instructor required. **Credits:** 1.00 to 6.00

AGEC 69200 - Workshop In Applied Economics

Credit Hours: 1.00. A workshop on how to communicate research results in a seminar setting. Students present at least once during the course and will be present for other students' presentations. Students may present their own research, or a paper from a recent journal also is acceptable. The course is open to master's students, and one credit of this course is required of doctoral students. **Credits:** 1.00

AGEC 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required. **Credits:** 1.00 to 18.00

AGEC 69900 - Research PhD Thesis

Credit Hours: 1.00 to 18.00. Research PhD Thesis. Permission of instructor required. **Credits:** 1.00 to 18.00

Agricultural Sciences Education & Communication

ASEC 10100 - Agriculture, Science And Social Issues

Credit Hours: 1.00. This course introduces Purdue Agriculture students to social issues that influence the future of science innovation and the agriculture industry. It will particularly focus on areas of apparent disconnect with regard to agriculture, scientific evidence and the general public. In order to learn how to communicate with others on controversial issues, concepts of engagement will be discussed as ways to better understand audiences and find areas of common interest. Featuring guest speakers on current social issues, students will learn how issues impact the agriculture industry and science innovation and consider how to engage stakeholders regarding these concerns. **Credits:** 1.00

ASEC 15200 - Agricultural Communication Seminar

Credit Hours: 3.00. This course provides an introduction to agricultural communication as a professional field, including its current status and role within the larger U.S. mass media system. The course will also provide an overview of career options and professional skills and competencies required of agricultural communicators. **Credits:** 3.00

ASEC 21200 - Greenhouse And Landscape Fundamentals For Educators

Credit Hours: 3.00. (HORT 21200) This course will prepare future educators in using a greenhouse and landscape as teaching tools. The key focus will be preparing students to apply greenhouse and landscape management fundamentals in order to teach these concepts in the classroom. Laboratories will explore how to identify and produce both woody and herbaceous plants while safely maintaining and operating greenhouse technologies. Students will also explore how to implement landscape design technologies and identify tools, equipment, and landscape plants. Permission of instructor required.**Credits:** 3.00

ASEC 24000 - Seminar In Agricultural Education

Credit Hours: 1.00. Development of an understanding of the origin, scope, and objectives of agricultural education; role of the agricultural science and business teacher as a professional educator; basic responsibilities of a teacher of agricultural science and business; and significance of legislation affecting agricultural education. **Credits:** 1.00

ASEC 28000 - Digital Storytelling

Credit Hours: 3.00. Students will plan, shoot, and edit videos; collaborate in teams; plan and generate social media; and write feature pieces for digital platforms. Students will gain meaningful digital storytelling experiences that will enhance their understanding of various platforms and build their professional portfolios. **Credits:** 3.00

ASEC 28500 - Introduction To Publication Design

Credit Hours: 3.00. Introduction to pre-press production of professional-quality publications. Emphasis on computer applications for publication layout, design and production. Topics include composition, readability, typography, graphic resolution, and color management systems.**Credits:** 3.00

ASEC 29000 - Special Problems In Agricultural Science And Education Communication

Credit Hours: 1.00 to 6.00. Open primarily to freshmen and sophomores who desire to study special problems in agricultural communication, agricultural education, life science education, extension education, leadership education or youth development not covered in regular coursework. To be arranged with instructor or departmental representative prior to registering. Permission of instructor required. **Credits:** 1.00 to 6.00

ASEC 30100 - Building Intercultural Partnerships

Credit Hours: 3.00. This course uses a combination of readings, videos, experiential activities, presentations, and face-to-face & virtual excursions/engagement with "other/different" international cultural groups to deepen students' ownership of their own learning and to identify and understand both similarities and differences in values and social norms across countries and cultures. Students will enhance their intercultural communication skills, their emotional resilience, and their ability to engage effectively and equitably in conversations and partnerships with people from other countries and cultures.**Credits:** 3.00

ASEC 31800 - Coordination Of Supervised Agricultural Experience Programs

Credit Hours: 2.00. Record keeping and supervisory skills needed to advise and coordinate supervised agricultural experience programs for secondary agricultural science and business students. Integration of supervised agricultural experiences with programming in youth organizations and classroom instruction for secondary agricultural science and business classrooms. **Credits:** 2.00

ASEC 31900 - Planning Agricultural Science And Business Programs

Credit Hours: 2.00. Development of course content plans that coordinate and utilize agricultural science and business, community resources, FFA, and supervised agricultural experience programs. **Credits:** 2.00

ASEC 33100 - The Role Of Horses In Human History, Culture And Society

Credit Hours: 3.00. A multi-disciplinary course that introduces students to the history of the human-horse relationship in a global context. Because the history of horse and human interaction is so broad and so important to the development of civilization, the course will include a broad view of horses in the context of agriculture, transportation, sport, culture and art. Permission of instructor required. **Credits:** 3.00

ASEC 34000 - Laboratory Practices In Agricultural Education

Credit Hours: 2.00. This course is designed to introduce pre-service agricultural education teachers to laboratory integration into the agricultural education curriculum at the middle school and secondary school level. Emphasis is placed on laboratory safety,

skill acquisition, developing knowledge of laboratory components in Agriscience, laboratory utilization, facilitating student learning in the laboratory setting, appropriate teaching methods and techniques, curriculum applications, and classroom resources. Travel to on and off-campus sites will be required. **Credits:** 2.00

ASEC 34100 - Curriculum Development In Agricultural Education

Credit Hours: 2.00. This course is designed to expose students to appropriate teaching techniques, curricula and resources within agricultural education. Procedures for designing, implementing, and evaluating curriculum will be examined. Emphasis will be placed on new and emerging areas in agriculture, food, and natural resources. **Credits:** 2.00

ASEC 35500 - Controversial Science And Media In The Public Sphere

Credit Hours: 3.00. This course will utilize case studies of controversial science news to explore the multiple factors that converge to influence how science and technology become controversial issues across a variety of social/ political domains. In addition to foundational understanding of communication theory, students will develop two primary skills: 1) a structure for the critical analysis of science news, 2) the skills to meaningfully communicate across stakeholders. The science content (GMOs, climate change, pesticide use, etc.) will provide the background information for analysis of the main focus of the course, which is in learning the communication process for effectively communicating science to non-science audiences. Case studies and applied critical media theory will be utilized to explore such controversies as climate change, genetically modified foods, and other emergent science controversies. **Credits:** 3.00

ASEC 38000 - Feature Writing And Production

Credit Hours: 3.00. Students gain hands-on studio experiences in all phases of features writing, storytelling, and production. Students will analyze audiences, generate story ideas, research, interview, write, edit, shoot photos, plan social media, design pages, and can shoot short-form video. **Credits:** 3.00

ASEC 38500 - Communication Strategies For Controversial Issues In ANR

Credit Hours: 3.00. This course trains students to communicate about controversial science and emerging technology in contested environments. Additionally, the course covers public engagement principles for science topics and how to communicate risks in the context of agriculture, and natural resources science and technology.**Credits:** 3.00

ASEC 40000 - Agricultural Education Study Abroad

Credit Hours: 0.00 to 8.00. Utilized to record credits earned through participation in Purdue study abroad programs with cooperating foreign universities. **Credits:** 0.00 to 8.00

ASEC 43100 - Planning For International Engagement Methods

Credit Hours: 1.00. A team-based laboratory course for students who seek experience working with international partners to plan and conduct quality service-learning projects. Using established partner relationships, students will work with international partners to address hands-on, real-world, identified challenges to learn the principles of extension methodology and sustainable community development by integrating their discipline knowledge and technical skills from previous courses. Students will also learn the intercultural communication, market analysis, project design and planning, entrepreneurial business planning for micro-credit loans and business ventures, and cultural factors affecting community food security while they work in bi-national teams to determine how best to apply their classroom knowledge and experience to respond to partners' needs and local resource constraints.**Credits:** 1.00

ASEC 43110 - International Engagement Methods

Credit Hours: 1.00 to 3.00. Using established partner relationships, students will travel to and live in Cap Haitien for 8-10 days and work with Haitian partners and students to learn the principles of extension methodology, sustainable community development, and how to most effectively work with local leaders. Students will also learn the intercultural communication, entrepreneurial business planning, and cultural factors affecting community food security status while they work bi-national teams to determine how best to apply their classroom knowledge and experience.**Credits:** 1.00 to 3.00

ASEC 43120 - Evaluating International Engagement Methods

Credit Hours: 1.00. Designed for students who have just returned from the Engagement Methods for Int'l Food Security course or have previous experience working with our partners. In order to 1) fully comprehend the impact of the experience and 2) foster true long-term relationships with and service to our partners, it is required to work on our projects when we return. Matt McGregor, Former Exec. Dir. of Timmy Global Health, told us that "it's not really about the trip". It is essential that we accomplish: 1) Closure of trip experiences with partners and contacts - thank you's and complete follow-up; 2) Reflection of Purdue student experiences and personal goals/follow-up actions; 3) Promotion of food insecurity realities and opportunities for support; and 4) Planning, recommendations, and promotion of future service learning courses.**Credits:** 1.00

ASEC 44000 - Methods Of Teaching Agricultural Education

Credit Hours: 3.00. Principles and procedures for teaching agricultural science and business in public schools. Must be admitted to teacher education program. **Credits:** 3.00

ASEC 44100 - Field Experience In Agricultural Education Programs

Credit Hours: 1.00 to 3.00. Field experience in agricultural science and business programs to include observation and participation in the teaching process and program development activities. **Credits:** 1.00 to 3.00

ASEC 44200 - Curriculum Implementation In Agricultural Education

Credit Hours: 2.00. Students develop skills necessary to implement standards-based curriculum in Agricultural Education through hands-on application. Course is designed for students who have an understanding of curriculum development and teaching methodology. **Credits:** 2.00

ASEC 48000 - Agricultural Communication Capstone Seminar

Credit Hours: 3.00. Prepares graduating students for entry to the workplace, assesses and enhances their communication knowledge and skills, and provides project experiences that will demonstrate their ability to communicate scientific and technical information through a variety of media. Projects will include student presentations and magazine style articles on issues of concern to agricultural and general audiences; and a final project that requires students to conceive and create a web site that uses converging media to communicate effectively a topical issue. **Credits:** 3.00

ASEC 48500 - Environmental Communication

Credit Hours: 3.00. This is an interactive learning course in science and environmental communication with a strong emphasis on development of practical writing and communication skills for students who will become professionals in environment or natural resources. The public primarily obtains environmental information through the media, as such, scientists need to develop the understanding and skills necessary to engage with a range of audiences through the design of effective communication products. This course provides a unique balance of communication theory and skills training in which students develop the confidence to meaningfully communicate environmental issues. **Credits:** 3.00

ASEC 49000 - Special Problems

Credit Hours: 1.00 to 6.00. Open to undergraduates who desire to study special problems in agricultural communications, agricultural education, or youth development not covered in regular coursework. To be arranged with the instructor or departmental representative prior to registering. Permission of instructor required. **Credits:** 1.00 to 6.00

ASEC 49100 - Special Topics In Agricultural Science And Education Communication

Credit Hours: 1.00 to 3.00. Designed for specialized topic areas for which there is no specific course, but have enough student interest to justify formalized teaching of an undergraduate-level course. The course may be repeated by a student as long as the topic being taught is not repeated. The specific topic that is offered will be indicated on the student's record. To be arranged with the instructor or departmental representative prior to registering. Permission of instructor required. **Credits:** 1.00 to 3.00

ASEC 49700 - Thesis Research

Credit Hours: 1.00 to 6.00. For Honors students only doing specialized youth development and agricultural education research. Arrange with academic advisor and honors research coordinator before registering. **Credits:** 1.00 to 6.00

ASEC 49900 - Special Problems In Agricultural Communication

Credit Hours: 1.00 to 3.00. Application of principles of mass communication in the production of agriculturally related news, feature, and magazine articles, radio and television reports, photographs, and publications in the Department of Agricultural Communication Service. Permission of instructor required. **Credits:** 1.00 to 3.00

ASEC 52000 - Foundations Of Agricultural Education, Extension, And Communication

Credit Hours: 3.00. Critical analysis of the historical and philosophical assumptions, current strategic intents and relevant policies underpinning the discipline of agricultural education - inclusive of Extension education and agricultural communication - and project the impact existing economic, social and political issues may have in this field in the next 15 to 25 years. Instructor permission required. **Credits:** 3.00

ASEC 53100 - Global Learning For Agriculture, Food And Natural Resources

Credit Hours: 3.00. This is a graduate-level course in which students research, design, and evaluate communication and education methods and theoretical frameworks to apply appropriate cultural, community engagement, targeted outcomes of a population defined by the student. The central experience is an international/intercultural professional development experience immersed in rural and urban communities and cultures. Students will learn and develop global perspectives and effective engagement strategies to address agronomic, cultural, and community engagement realities affecting agriculture, life sciences and natural resources. **Credits:** 3.00

ASEC 54000 - Program Development In Agricultural And Extension Education

Credit Hours: 3.00. Application of principles of agricultural and extension education. Emphasis on program development, supervised experience programs, and effective organization of an agricultural and extension education program. **Credits:** 3.00

ASEC 54100 - Program Development In School-Based Agricultural Education

Credit Hours: 3.00. This graduate course in agricultural education concentrates on program planning and delivery of secondary programs in agriculture. Special emphasis is placed on utilizing school and community resources to develop programmatic offerings, recruit and retain students, organize FFA activities, direct supervised agricultural experience programs, and manage the agricultural education program. Various topics to be discussed will be determined based upon current trends in the field of

agricultural education as well as the needs and interests of the students enrolled. Foundational procedures involved in conducting a secondary agricultural education program will be addressed. Permission of instructor required. **Credits:** 3.00

ASEC 54500 - Teaching STEM Through Agriculture, Food And Natural Resources

Credit Hours: 3.00. The course focuses on the background and history of STEM movement and agricultural education, contemporary models, strategies, and justification for incorporation of science, technology, engineering and mathematics (STEM) concepts and practices into K-12 formal and non-formal agricultural education programs. Consider and develop the best practices for STEM teaching and learning and enhancement of STEM content in agriculture, food and natural resources (AFNR) context. The goal of the course is to help students develop knowledge about STEM integration and equip them with teaching knowledge and skills for designing K-12 lesson plans by using integrated STEM through AFNR. Students will learn strategies that promote engagement in integrated STEM through AFNR activities. At the end of the course, students should be able to design and implement research-based integrated STEM through AFNR lesson plans and assessment plans. **Credits:** 3.00

ASEC 54600 - Communication And Issues Engagement For Agricultural Professionals

Credit Hours: 3.00. In this eight-week online course, students will be exposed to science communication and issues engagement principles. The course is designed primarily for those with little or no formal communication training. Topics include evidence-based best practices for communicating science; news media and social media influences on controversial science; how to monitor controversial issues; and major theoretical perspectives and strategies for engaging the public on food and agricultural science. **Credits:** 3.00

ASEC 54800 - Communicating Science To The Public

Credit Hours: 1.00. This course will help graduate students in science disciplines learn to communicate science to non-expert audiences. Through readings, assignments and guided discussions, students will learn relevant communication theories and recommended strategies for engaging with the public on science and technology topics. **Credits:** 1.00

ASEC 55000 - Program Evaluation In Formal And Non-formal Settings

Credit Hours: 3.00. The purpose of this course it to provide a basic understanding of program evaluation processes, concepts, and theories and to develop expertise needed to design and conduct systematic evaluation of formal and non-formal programs. **Credits:** 3.00

ASEC 55100 - International Engagement And Development Strategies

Credit Hours: 3.00. Sem. S and SS, cr. 3; an overview of cross-disciplinary, cultural, theoretical frameworks, communication tools, and assessment methods applied to international agricultural development and engagement. Lectures, panel discussions, and case studies on appropriate methods of development and engagement, international project planning, intercultural effectiveness, principles of sustainable agricultural, food, community development, and program/project monitoring and evaluation will be the basis of assignments and team work. This eight-week course will provide the theoretical and social frameworks and principles needed to successfully work in multi-agency partnerships on international development projects. **Credits:** 3.00

ASEC 56500 - Principles Of Adult Education

Credit Hours: 3.00. (EDCI 56500) Principles of adult education applied to helping adults learn, evaluating their performance, and determining their needs. Examines history, philosophy, and research of adult education. Explores techniques required in design and delivery of instruction for adults. **Credits:** 3.00

ASEC 58200 - Introduction To The Application Of Inferential Statistics

Credit Hours: 3.00. The goal of this course is to introduce students to the use and application of statistics with a particular focus on descriptive and inferential analysis procedures. This course will also introduce students to the use of statistical software, namely the Statistical Package for the Social Science (SPSS). Permission of instructor required. **Credits:** 3.00

ASEC 58500 - Science Communication

Credit Hours: 3.00. This course utilizes foundational research and commentary from scholars to track the evolution of media and our ability as scientists to understand and effectively communicate these issues to a non-science audience. Science and technology are evolving faster than societies ability to understand, assimilate, and make policies to address these increasingly complex issues. As a result, controversies arise over issues such as climate change, forest management, genetically modified foods, energy choices, genetic engineering, nanotechnology, water management, and agricultural practices, etc. This course covers the range of issues in the field of science communication including: the nature of science, how to translate evidence for a lay audience, media practices, reporting and qualifying uncertainty, human psychology and belief systems, information processing, and the most current research for messaging science. We will work together to examine the foundational scholarly literature in this area and how it is/ or is not reflected in construction of popular media. You will use this knowledge to construct both compelling oral science narratives, and a science story for popular consumption. **Credits:** 3.00

ASEC 59000 - Special Problems

Credit Hours: 1.00 to 6.00. A study of special problems in agricultural communications, agricultural education, or youth development not covered in regular coursework. To be arranged with the instructor or departmental representative prior to registering. Permission of instructor required. **Credits:** 1.00 to 6.00

ASEC 59100 - Special Topics

Credit Hours: 1.00 to 4.00. Specialized topics not covered in other courses. Topics, requirements, and credits to be determined yearly. To be arranged with the instructor or departmental representative prior to registering. Permission of instructor required. **Credits:** 1.00 to 4.00

ASEC 59500 - Internship In Agricultural Sciences Education And Communication

Credit Hours: 1.00 to 10.00. A special course designed to provide practical field experience under professional supervision in selected situation related to the student's area of specialization. Amount of credit to be determined by the nature and extent of the assignment. To be arranged with the instructor of departmental representative prior to registering. Permission of instructor required.**Credits:** 1.00 to 10.00

ASEC 62000 - Adolescent And Youth Development In Context

Credit Hours: 3.00. This graduate-level course examines the major developmental issues of adolescents and youth with attention to their familial, cultural, and socio-economic backgrounds. Topics include health and well-being; biological, socio-emotional, and cognitive development; sexual and racial/ethnic identity; risks and resilience; peer and family relationships; civic engagement and activism; positive youth development; and the transition to adulthood. Course readings focus primarily on adolescents and youth in the United States, although international contexts are also incorporated across the class. **Credits:** 3.00

ASEC 63000 - Theories Of Learning And Development

Credit Hours: 3.00. The goal of this course is to introduce students to a variety of theoretical perspectives of learning and development and how they may be used in both formal, informal and non-formal educational settings. This goal will be achieved

through students' analysis of key concepts, assumptions, propositions and principles of four theoretical areas: (1) Foundational Learning Theory, (2) Student Development Theory, (3) Career & Workforce Development Theory and (4) Youth Development & Experiential Learning Theory. This course will also build on students' prior exposure to behaviorist, cognitive, and constructivist approaches of learning and development. In sum, many of the theories discussed in this course will provide students with a greater understanding of human thought and behavior that will help them become more effective educators, researchers and practitioners. Permission of instructor required.**Credits:** 3.00

ASEC 64000 - Courses Of Study In Agricultural Education Programs

Credit Hours: 2.00 to 4.00. Principles and procedures of curriculum construction applied to development and organization for courses of study in agricultural science and business. **Credits:** 2.00 to 4.00

ASEC 64200 - Seminar In Agricultural And Extension Education

Credit Hours: 1.00 to 4.00. Identification and analysis of contemporary programs used in agricultural and extension education. Prerequisite: 12 credit hours in Education. **Credits:** 1.00 to 4.00

ASEC 64400 - ASEC Graduate Seminar

Credit Hours: 1.00. Students are familiarized with planning and presenting ASEC research through written and oral presentations based on the student's proposed thesis topic. Weekly attendance and participation at seminars help graduate students use appropriate and effective presentation skills, understand expectations regarding responsible conduct of research, and learn about current topics in ASEC related research areas. **Credits:** 1.00

ASEC 68100 - Research Design For Social Scientists

Credit Hours: 3.00. The goal of the course is to examine social science theories and research designs in the contexts of agricultural and natural resources education, communication and engagement. Students will develop understanding of the chain of reasoning and create a research design to study a problem of interest. Students will apply the concepts they learned in a research methods course by critiquing research manuscripts and creating a rationale for a research proposal. After taking the course, students should have gained understanding of how research designs are thoughtfully and argumentatively justified to study a researchable problem in informal, non-formal, and formal educational contexts and other social science contexts. Pre-or-Corequisite: FNR 58000 or EDPS 53300 (or instructor's permission for graduate-level social science research methods course). **Credits:** 3.00

ASEC 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required. **Credits:** 1.00 to 18.00

ASEC 69900 - Research PhD Thesis

Credit Hours: 1.00 to 18.00. Research PhD Thesis. Permission of instructor required. **Credits:** 1.00 to 18.00

Agricultural Systems Management

ASM 10400 - Introduction To Agricultural Systems

Credit Hours: 3.00. Basic principles of selection and operation of agricultural production equipment, including farm tractors and machines and crop-processing equipment. Planning considerations for crop storage and animal production systems and devices for water conservation and erosion control. **Credits:** 3.00

ASM 10500 - Computing Technology With Applications

Credit Hours: 3.00. Computers will be used to solve problems (logistics, economic, agri-science) related to agricultural technology and businesses. Spreadsheets for problem solving and data analysis is the focus, with advanced features employed to improve functionality and capability of decision aids. Use of office software for written communication and visual aids will also be covered. Some applications of cloud platforms and specialty applications for communication and computations in team/group environments will be used. Interoperability and compatibility of files and platforms will be part of the experience. **Credits:** 3.00

ASM 20100 - Construction And Maintenance

Credit Hours: 3.00. Fundamental principles in the selection and use of tools for the construction and maintenance of agricultural and related facilities, equipment, and machines. Areas covered include small engines, concrete and masonry, wood, plumbing, electricity, and metal. **Credits:** 3.00

ASM 21100 - Technical Graphic Communications

Credit Hours: 3.00. Introduction to graphic communication methods using traditional techniques and emphasizing modern computer-based techniques. Topics covered include: free-hand sketching, lettering, and dimensioning; selection of data presentation methods; and plan interpretation and cost calculations. A majority of assignments will include use of commercially available computer-aided drawing packages. **Credits:** 3.00

ASM 21600 - Introduction To Surveying

Credit Hours: 1.00. Introduction to plane surveying, including instruction and practice in the use of surveying instruments. Basic overview of distance/angle measurement, leveling, direction, traversing, and mapping. Each weekly topic includes practical application and field exercises as applied to landscape architecture and forestry. **Credits:** 1.00

ASM 22100 - Career Opportunities Seminar

Credit Hours: 1.00. An introductory course to acquaint students with career and employment opportunities in the field of agricultural systems management. Guest speakers are invited to share their experiences and philosophies with the students. Special emphasis is given to improving communication skills. **Credits:** 1.00

ASM 22200 - Crop Production Equipment

Credit Hours: 3.00. Principles of machine performance, capacity, machinery components, and operation. Study of tractors, trucks, utility vehicles, and combines. Equipment topics include chemical application, tillage tools, planters and seeders, hay and forage harvesters, electronic monitors and controllers. Computer-based analysis of equipment sizing and systems selection. **Credits:** 3.00

ASM 23600 - Environmental Systems Management

Credit Hours: 3.00. Analysis of environmental systems with special emphasis on non-urban and agribusiness needs. Technological and sociological solutions to environmental problems. Computer-based tools are used to analyze global environmental issues, chemical use and management, waste disposal and management, water and air quality, soil and water conservation, sustainable agriculture, regulatory and policy issues. **Credits:** 3.00

ASM 24500 - Materials Handling And Processing

Credit Hours: 3.00. Principles of materials handling and processing. Physical properties and characteristics of food, fiber, and feed materials as related to harvesting, handling, processing, and storage. Processing of agricultural materials including drying, preservation, size reduction (e.g. grinding, crushing, shredding), mixing and blending, refrigeration, extrusion, and pelleting. Conveying and transport systems with consideration of their effects on damage and quality. The course elements are tied together by a treatment of scheduling and coordination of biologically based systems, which involve production, handling, quality control, and processing. **Credits:** 3.00

ASM 29100 - Special Topics

Credit Hours: 1.00 to 4.00. Designed for specialized topic areas for which there is no specific course, but have enough student interest to justify formalized teaching of an undergraduate-level course. The course may be repeated by a student as long as the topic being taught is not repeated. The special topic that is offered will be indicated on the student's record. Permission of instructor is required. **Credits:** 1.00 to 4.00

ASM 29199 - Cooperative Experience I

Credit Hours: 0.00. Professional experience in agricultural systems management. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

ASM 29299 - Cooperative Experience II

Credit Hours: 0.00. Professional experience in agricultural systems management. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

ASM 33300 - Facilities Planning And Management

Credit Hours: 3.00. Principles of facility (system) planning and management involving buildings, equipment, and materials handling and flow. Student teams select a case firm (problem) with instructor approval. Principles learned week by week are applied to the development of an overall plan for the complex, over the course of the semester. Case examples can include firms handling supplies, seeds, grains, feeds, chemicals, wastes, and farm produce, as well as farming operations producing grain, forage, and/or livestock products. Students will learn to use AutoCAD to develop drawings, without prior computer drafting experience. **Credits:** 3.00

ASM 34500 - Power Units And Power Trains

Credit Hours: 3.00. An introduction to power generation and transfer in mechanical and fluid power systems. Internal combustion engines, fuels, and cycles are introduced. Clutches, mechanical transmissions, automatic transmissions, hydrostatic transmissions, and final drives are discussed. Principles of hydraulics, fluids, cylinders, pumps, motors, valves, hoses, filters, reservoirs, and accumulators are studied. **Credits:** 3.00

ASM 35000 - Safety In Agriculture

Credit Hours: 1.00. An overview of the agricultural safety movement in the United States with consideration given to the specific human environmental and technological factors influencing farm-related accidents. Special emphasis is given to reduction of unnecessary risks in agricultural production. Course meets during weeks 1-8. **Credits:** 1.00

ASM 39399 - Cooperative Experience III

Credit Hours: 0.00. Professional experience in agricultural systems management. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

ASM 39499 - Extensive Cooperative Experience IV

Credit Hours: 0.00. Professional experience in agricultural systems management. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

ASM 39599 - Extensive Cooperative Experience V

Credit Hours: 0.00. Professional experience in agricultural systems management. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

ASM 40000 - Agricultural Systems Management Study Abroad

Credit Hours: 0.00 to 8.00. Utilized to record credits earned through participation in Purdue study abroad programs with cooperating foreign universities. **Credits:** 0.00 to 8.00

ASM 42000 - Electric Power And Controls

Credit Hours: 3.00. Fundamentals and application of electric power for agricultural facilities; safe wiring principles; operation and performance characteristics of electric motors; applications of control systems that include monitors, sensors, relays, and programmable logic controllers. **Credits:** 3.00

ASM 42100 - Senior Seminar

Credit Hours: 1.00. Professional attitudes and ethics, resume preparation and interview procedures, business correspondence, meetings, and career planning. **Credits:** 1.00

ASM 42200 - Advanced Machine Technology For Agricultural Crop Production

Credit Hours: 3.00. The course examines technologies and techniques associated with modern farming practices often referred to in general as precision agriculture. It is structured to center around expert presentations from industry, academia, and farming practice, with a focus on technologies and appropriate application of such technologies in crop production systems in the Eastern Corn Belt. Consent of instructor required. **Credits:** 3.00

ASM 44100 - Methods Of Teaching Agricultural Mechanics

Credit Hours: 1.00. Emphasis on facilities, shop layout, organization, course planning, and demonstrations. Course meets during weeks 1-6. For students seeking certification as teachers of agriculture. **Credits:** 1.00

ASM 44400 - Design And Advanced Manufacturing Processes For Internal Combustion Engines

Credit Hours: 3.00. This course introduces the manufacture and assembly of machined piece parts into a functional assembly. The creation of a prototype internal combustion engine will be utilized as the base project for the course, and students will create and test the parts and final assembly. Students will be given a background on the process flow of modern manufacturing by general metal machining processes, manual machine tool operation, digital machine tool programming, numerical machine tool operation, the measurement of critical machining output variables, and the assembly of piece parts into subassemblies and final products. Course participants will work as a team to develop their production parts, final presentation, and final report.**Credits:** 3.00

ASM 49000 - Special Problems

Credit Hours: 1.00 to 6.00. Assignment by consent of instructor in the field of selected study. Laboratory, field, and library studies and reports on special problems related to agricultural systems management not covered in regular coursework. A written report and oral presentation of final results is required. Permission of instructor required. **Credits:** 1.00 to 6.00

ASM 49100 - Special Topics

Credit Hours: 1.00 to 4.00. Designed for specialized topic areas for which there is no specific course, but have enough student interest to justify formalized teaching of an undergraduate-level course. The course may be repeated by a student as long as the topic being taught is not repeated. The specific topic that is offered will be indicated on the student's record. Permission of instructor required. **Credits:** 1.00 to 4.00

ASM 49400 - Project Planning And Management

Credit Hours: 1.00. Review of topics relevant to project planning and execution in industry, including technical communication, budgeting, team management, intellectual property rights, contracts and timelines. Students will select a Capstone project and assemble a project proposal within a team environment. **Credits:** 1.00

ASM 49500 - Agricultural Systems Management Capstone Project

Credit Hours: 3.00. Students implement, test, refine, present, and deliver the capstone project solution proposed in ASM 49400. Team based projects are completed during the semester and documented with a written report, poster presentation, and oral presentations. Projects encompass a broad range of topics within agricultural systems management. **Credits:** 3.00

ASM 49600 - Project Planning And Capstone Project

Credit Hours: 1.00 to 4.00. Topics relevant to project planning and execution in industry, including technical communication, budgeting, team management, intellectual property, and timelines. Students will develop a project proposal to address contemporary issues in agricultural systems management and complete that plan related to contemporary issues in agricultural systems management. Permission of instructor required. **Credits:** 1.00 to 4.00

ASM 49800 - Directed Experience In Teaching Mechanized Agriculture

Credit Hours: 1.00 to 3.00. This course is designed primarily for students majoring in agricultural education, extension education, agricultural systems management, and agricultural engineering. Permission of instructor required. **Credits:** 1.00 to 3.00

ASM 49900 - Thesis Research

Credit Hours: 1.00 to 6.00. Thesis Research. Admission to honors program. Permission of instructor required. **Credits:** 1.00 to 6.00

ASM 51000 - Agrosecurity-Emergency Management For Agricultural Production Operations

Credit Hours: 3.00. Prepares individuals for management and loss control positions in agricultural production, agribusiness operations, and emergency management agencies. Addresses prevention, preparation, mitigation, response, and recovery from disasters such as fires, explosions, entrapments, tornadoes, floods, winter storms, earthquakes, vandalism, chemical releases, and bio-terrorism. Students complete a community service learning activity, in which they assist a farm or agribusiness manager in developing formal emergency preparedness plans. **Credits:** 3.00

ASM 51100 - Foundations In Homeland Security Studies

Credit Hours: 3.00. An interdisciplinary course addressing prevention, mitigation, preparation, response, and recovery from catastrophic events that threaten private and public sector resources and infrastructures. Course contents will include: characteristics of security; personal/corporate perspectives; identification of assets; assessing cost/benefits of protecting assets; risk assessment and risk management; crisis decision making; emergency management resources and response infrastructures; best practices in emergency management and risk and crisis communication; business continuity; and the importance of a collaborative response. Case studies include the 9-11 attacks and Hurricane Katrina. External experts will present and career opportunities will be discussed.**Credits:** 3.00

ASM 51200 - Managing Resources and Applications for Homeland Security

Credit Hours: 3.00. An interdisciplinary course providing examples and practice in applying and managing the resources, including technologies, used in the private and public sectors for homeland security programs. Course contents will include: terrorism; corporate security; biosecurity; health care preparedness; personal/community preparedness; risk transfer; and information security and privacy. Additional content includes discussion of local, state, and federal preparedness programs issues in the public/private sectors that are designed to ensure survival during a continuum of emergency events, and continued practice in using collaborative application of team building skills. Permission of instructor required.**Credits:** 3.00

ASM 53000 - Power And Machinery Management

Credit Hours: 3.00. Management and selection of farm machines and power units with emphasis on cost analysis and evaluation of new machines and practices. **Credits:** 3.00

ASM 53200 - Introduction To Agricultural Informatics

Credit Hours: 3.00. This course will overview current and emerging digital technologies with applications in agriculture, environment, and food systems. Students are expected to have a minimal computing and/or programming background, and those with no programming background should contact the instructor for guidance. Through a modular hands-on course design, students will incrementally learn user-centered technology design skills, computational thinking skills to evaluate, design, conceptualize, and implement informatics solutions to data-driven challenges. Students will gain programming skills in current data science and web development technology stacks (Python, HTML, CSS, SQL, Django), and design an informatics solution to problem in their own area of interest. This course supports professional development for students in pursuit of careers in digital product design or data-driven research.**Credits:** 3.00

ASM 54000 - Geographic Information System Application

Credit Hours: 3.00. Fundamentals of GIS analysis applied to environmental, agricultural, and engineering-related problems. Topics include data sources, spatial analysis; projections; creating data and metadata, and conceptualizing and solving spatial problems using GIS. **Credits:** 3.00

ASM 55000 - Grain Drying And Storage

Credit Hours: 3.00. Crop drying and storage principles including equilibrium moisture, psychrometrics, and drying rates. Modern drying and conditioning techniques including dryeration, in-bin counterflow drying, and combination drying. Estimating fixed and variable drying costs, aeration of stored grain, and maintenance of grain quality. Offered in even-numbered years. **Credits:** 3.00

ASM 59000 - Special Problems

Credit Hours: 1.00 to 6.00. Assignment by consent of the instructor in the field of selected study. Laboratory, field, and library studies and reports on special problems related to agricultural systems management not covered in regular coursework. Permission of instructor required. **Credits:** 1.00 to 6.00

ASM 59100 - Special Topics

Credit Hours: 1.00 to 4.00. Primarily designed for specialized topic areas in agricultural systems management for which there is no specific course, workshop, or individual study plan, but having enough student interest to justify the formalized teaching of a course. Permission of instructor required. **Credits:** 1.00 to 4.00

ASM 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required. **Credits:** 1.00 to 18.00

ASM 69900 - ASM Research PhD Thesis

Credit Hours: 1.00 to 18.00. Research PhD Thesis. Permission of Instructor required. **Credits:** 1.00 to 18.00

Agriculture

AGR 10100 - Introduction To The College Of Agriculture And Purdue University

Credit Hours: 0.50. Students are introduced to the College of Agriculture and Purdue University. Specific areas discussed include the diversity of career opportunities within agriculture, the relationships between different areas of agriculture, ethics, the impact of undergraduate coursework, including the core curriculum, on scholarship and career preparation, and the challenges facing the food, agricultural, and natural resource system. The use of guest lecturers provides a networking opportunity for students. Enrollment in this course is restricted to beginning freshmen students. Course meets weeks 1-8. **Credits:** 0.50

AGR 10700 - Pathway To Purdue

Credit Hours: 1.00. This course is a required one credit introductory course for students participating in the Pathway to Purdue program. Students will learn about the Pathway to Purdue programs, study skills and techniques, transfer policies and requirements, as well as hear from a variety of guest speakers who will discuss relevant topics. Permission of department required. **Credits:** 1.00

AGR 10800 - Agriculture Technology And Innovation

Credit Hours: 1.00. The course will cover a broad range of innovations and technologies involved in the agricultural industry. The broad topics covered in this class will discuss development of latest technologies assisting in increase in yield, production

and efficiency of agricultural systems. This may include, but is not limited to topics regarding environmental protection, plant production, livestock systems, and agricultural machinery. **Credits:** 1.00

AGR 11100 - Introduction To Agricultural And Biological Engineering Academic Programs

Credit Hours: 0.50. An introduction to the academic programs offered in the Department of Agricultural and Biological Engineering which include Agricultural Systems Management, Agricultural and Natural Resources Engineering, and Biological and Food Process Engineering. Topics include, but are not limited to undergraduate plans of study, courses, experiential programs, internships, student organizations, career opportunities, academic policies, scholarships, and student services. Course meets during weeks 1-8. **Credits:** 0.50

AGR 11200 - Introduction To Agricultural Economics Academic Programs

Credit Hours: 0.50. An introduction to the academic programs offered in the Department of Agricultural Economics. Topics include, but are not limited to undergraduate plans of study, courses, experiential programs, internships, student organizations, career opportunities, academic policies, scholarships, and student services. Course meets during weeks 1-8. **Credits:** 0.50

AGR 11300 - Introduction To Agronomy Academic Programs

Credit Hours: 0.50. An introduction to the academic programs offered in the Department of Agronomy, which includes Applied Meteorology, Agronomic Business and Marketing, Environmental Soil Science, International Agronomy, Plant Genetics and Plant Breeding, Soil and Crop Management, Soil and Crop Science, Turf Science, and associate degrees. Topics include, but are not limited to undergraduate plans of study, courses, experiential programs, internships, student organizations, career opportunities, academic policies, scholarships, and student services. Course meets during weeks 1-8. **Credits:** 0.50

AGR 11400 - Introduction To Animal Sciences Academic Programs

Credit Hours: 0.50. An introduction to the academic programs offered in the Department of Animal Sciences. Topics include, but are not limited to undergraduate plans of study, courses, experiential programs, internships, student organizations, career opportunities, academic policies, scholarships, and student services. Course meets during weeks 1-8. **Credits:** 0.50

AGR 11500 - Introduction To Biochemistry Academic Programs

Credit Hours: 0.50. An introduction to the academic programs offered in the Department of Biochemistry. Topics include, but are not limited to undergraduate plans of study, courses, experiential programs, internships, student organizations, career opportunities, academic policies, scholarships, and student services. Course meets during weeks 1-8. **Credits:** 0.50

AGR 11700 - Introduction To Entomology Academic Programs

Credit Hours: 0.50. An introduction to the academic programs offered in the Department of Entomology. Topics include, but are not limited to undergraduate plans of study, courses, experiential programs, internships, student organizations, career opportunities, academic policies, scholarships, and student services. Course meets during weeks 1-8. **Credits:** 0.50

AGR 11800 - Introduction To Food Science Academic Programs

Credit Hours: 0.50. An introduction to the academic programs offered in the Department of Food Science. Topics include, but are not limited to undergraduate plans of study, courses, experiential programs, internships, student organizations, career opportunities, academic policies, scholarships, and student services. Course meets during weeks 1-8.**Credits:** 0.50

AGR 11900 - Introduction To Forestry And Natural Resources Academic Programs

Credit Hours: 0.50. An introduction to the academic programs offered in the Department of Forestry and Natural Resources. Topics include, but are not limited to undergraduate plans of study, courses, experiential programs, internships, student organizations, career opportunities, academic policies, scholarships, and student services. Course meets during weeks 1-8. **Credits:** 0.50

AGR 12000 - Introduction To Horticulture And Landscape Architecture Academic Programs

Credit Hours: 0.50. An introduction to the academic programs offered in the Department of Horticulture and Landscape Architecture. Topics include, but are not limited to undergraduate plans of study, courses, experiential programs, internships, student organizations, career opportunities, academic policies, scholarships, and student services. Course meets during weeks 1-8. **Credits:** 0.50

AGR 12100 - Introduction To Agricultural Sciences Education And Communication Academic Programs

Credit Hours: 0.50. An introduction to the academic programs offered in the Department of Agricultural Sciences Education and Communication which includes Agricultural Communication and Agricultural Education. Topics include, but are not limited to undergraduate plans of study, courses, experiential programs, internships, student organizations, career opportunities, academic policies, scholarships, and student services. Course meets during weeks 1-8. **Credits:** 0.50

AGR 12200 - Introduction To Natural Resources And Environmental Science Academic Programs

Credit Hours: 0.50. An introduction to the academic programs offered in Pre-Environmental Studies and Natural Resources and Environmental Science. Topics include, but are not limited to undergraduate plans of study, courses, experiential programs, internships, student organizations, career opportunities, academic policies, scholarships, and student services. Course meets during weeks 1-8. **Credits:** 0.50

AGR 12400 - Introduction To College Of Agriculture Pre-Veterinary Medicine Academic Programs

Credit Hours: 0.50. An introduction to the academic programs offered in Pre-Veterinary Medicine. Topics include, but are not limited to undergraduate plans of study, courses, experiential programs, internships, student organizations, career opportunities, academic policies, scholarships, and student services. Course meets during weeks 1-8. **Credits:** 0.50

AGR 12500 - Introduction To Plant Science

Credit Hours: 1.00. An introduction to the academic programs offered in plant science. Topics include, but are not limited to, undergraduate plans of study, courses, and experiential programs including undergraduate research opportunities, internships, student organizations, career opportunities, academic policies, scholarships, and student services. **Credits:** 1.00

AGR 15000 - Woman In Agriculture I

Credit Hours: 1.00. Intended to expose first-year students to resources and the development of a network of students across campus. The course will support their transition to Purdue through a sense of community and increased engagement, and provide students access to faculty across the College of Agriculture in a small group setting. Activities include seminars to expose

students to college and university resources, hands-on learning activity for team building, study halls, and group meals.**Credits:** 1.00

AGR 15100 - Women In Agriculture II

Credit Hours: 1.00. Intended to expose first-year students to academic, industry, government and professionals across the field of agriculture. The course will support networking and internship preparation through increased engagement with professionals across the field of agriculture, site visits and seminars. Activities include student seminars and presentation, field trips, case-studies and mock scenarios for problem solving and team building. Section one will focus on career exposure, development and communication skills.**Credits:** 1.00

AGR 20100 - Communicating Across Culture

Credit Hours: 3.00. This course will provide students with an opportunity to understand their place in a multicultural, multiethnic, multinational country, the United States. It is designed to provide an academic overview of the field of multicultural education as it evolved to this day. The course will offer an introductory overview of the many differences that exist within all human beings. Because the diversity among individuals is endless, we cannot study all differences, but will study a sampling such as race, ethnicity, gender identity, age, social class, disability, learning styles, and religion/spiritual orientation. Issues of poverty, language, and social justice may also be examined in relationship to the above major areas of emphasis. **Credits:** 3.00

AGR 20500 - Dean's Scholars Seminar

Credit Hours: 1.00. Students are introduced to the breadth and mission of the College of Agriculture. Specific areas discussed include the diversity of career opportunities within agriculture, the relationships between different areas of agriculture, ethics, the opportunities within undergraduate research, and the challenges facing the food, agricultural, and natural resource system. Students will be exposed to a series of guest lecturers to gain an overview of the various fields within the college and undergraduate research or scholarly work opportunities.**Credits:** 1.00

AGR 29000 - Special Topics In Agriculture

Credit Hours: 0.00 to 3.00. Presentation of subject matter not available in other courses offered by the college. The specific topic that is offered will be indicated on the student's academic record. **Credits:** 0.00 to 3.00

AGR 29199 - Cooperative Experience I

Credit Hours: 0.00. Professional experience in agriculture, food, or natural resources. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

AGR 29299 - Cooperative Experience II

Credit Hours: 0.00. Professional experience in agriculture, food, or natural resources. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

AGR 29400 - Directed Readings In Agriculture, Environment, And Society

Credit Hours: 0.00 to 3.00. Presentation of subject matter not available in other courses offered by the college. Directed reading and discussion of books and other documents of significant importance and current interest in agriculture, food systems,

renewable natural resources, and the environment. The specific topic that is covered will be indicated on the student's academic record. Permission of instructor required. **Credits:** 0.00 to 3.00

AGR 33300 - Data Science For Agriculture

Credit Hours: 3.00. Students will apply data processes including identifying data needs, acquiring data, assessing data quality, data wrangling, filtering, and visualization. In each of several topic areas (forestry, animal science, agronomy, food science, entomology, engineering, economics), data-driven insights and improved decision making will be the culmination of applied data skills. Students will understand data ethics and practice data management skills including the merging of disparate but related data sets. **Credits:** 3.00

AGR 39399 - Cooperative Experience III

Credit Hours: 0.00. Professional experience in agriculture, food, or natural resources. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

AGR 39499 - Extensive Cooperative Experience IV

Credit Hours: 0.00. Professional experience in agriculture, food, or natural resources. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

AGR 39500 - International Internship

Credit Hours: 3.00. Supervised international internship in agricultural, food, or natural resource disciplines. The international internship must be approved as part of a Purdue University study abroad program and conducted under the supervision of a College of Agriculture faculty member. Students must submit a summary report and fulfill all requirements established by faculty supervisor. Consent of the College of Agriculture International Programs in Agriculture and Office of Academic Programs staff required. **Credits:** 3.00

AGR 39599 - Extensive Cooperative Experience V

Credit Hours: 0.00. Professional experience in agriculture, food, or natural resources. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

AGR 40000 - Agriculture Study Abroad

Credit Hours: 0.00 to 8.00. Utilized to record credits earned through participation in Purdue study abroad programs with cooperating foreign universities. **Credits:** 0.00 to 8.00

AGR 49000 - Special Problems

Credit Hours: 0.00 to 3.00. Topics and credit hours to be arranged. **Credits:** 0.00 to 3.00

AGR 49300 - Special Topics In International Agriculture

Credit Hours: 0.00 to 3.00. A course that provides students interested in international agriculture opportunity for in-depth study and analysis of major issues associated with the relationship of U.S. agriculture to world agriculture and agricultural development abroad. Current and significant topics will be selected. Permission of instructor required. **Credits:** 0.00 to 3.00

AGR 49400 - Advanced Readings In Agriculture, Environment, And Society

Credit Hours: 0.00 to 3.00. Presentation of subject matter not available in other courses offered by the college. Directed reading and discussion of books and other documents of significant importance and current interest in agriculture, food systems, renewable resources and the environment. The specific topic that is offered will be indicated on the student's academic record. Permission of instructor required. **Credits:** 0.00 to 3.00

AGR 49500 - International Professional Experience In Agriculture, Food, Or Natural Resources

Credit Hours: 0.00. Supervised international professional experiences in agricultural, food, or natural resource disciplines. The professional experience period must be preplanned and conducted under the supervision of a College of Agriculture faculty member. Students must submit a summary report. Consent of the College of Agriculture international professional experience program coordinator required. Permission of instructor required. **Credits:** 0.00

AGR 49600 - Multicultural Professional Experience

Credit Hours: 0.00. The multicultural professional experience must be pre-planned and conducted under the supervision of a College of Agriculture faculty member. The experience must be a minimum of four weeks in length. Students must submit a summary report. **Credits:** 0.00

AGR 59500 - Current Topics In Agriculture, Natural Resources, And Related Sciences

Credit Hours: 1.00 to 3.00. Critical examination of developments in specialized and emerging areas of agriculture not taught in other courses. Some topics include lecture, lab, directed reading or independent study. Students must have graduate standing or obtain permission of instructor. **Credits:** 1.00 to 3.00

Agronomy

AGRY 10500 - Crop Production

Credit Hours: 3.00. Fundamental principles of crop production and distribution. Emphasis is placed on applying technological advances in agronomy to active crop-production situations, including basic soils, agricultural meteorology, and crop physiology and breeding. **Credits:** 3.00

AGRY 12000 - Water And Food Security

Credit Hours: 3.00. General science introduction to global and regional water resources issues, especially with respect to food security. It will address the role of water in agriculture throughout the world and agriculture's impact on water resources. Students will focus first on developing the scientific underpinnings of water supply and crop water use. With this background, they will explore key issues relating to water scarcity and balancing agricultural and urban demands for water, water quality and soil salinization, water footprints of food and the use of virtual water embedded in food to offset national water deficits, regulation and roles science and policy in solving water problems. **Credits:** 3.00

AGRY 12300 - Genetics And Society

Credit Hours: 3.00. Introduction to the broad impacts that genetics and genomics have on society, from medicine, genetic testing and DNA evidence to agriculture, genetically modified crops and synthetic life. Background information is provided on a weekly topic followed by extensive in-class discussion. **Credits:** 3.00

AGRY 12500 - Environmental Science And Conservation

Credit Hours: 3.00. (EAPS 12500, FNR 12500, NRES 12500) Introduction to environmental science and conservation includes topics in ecological principles, conservation and natural resource management, human impacts on the environment, toxic waste disposal, climate change, energy, air and water pollution, environmental geology and geologic hazards. **Credits:** 3.00

AGRY 15500 - Introduction To Soil Morphology

Credit Hours: 2.00. This course features an introductory field experience in evaluating soil morphology. Students will develop skills determining horizon nomenclature, texture, soil color, structure, consistence and drainage. Basic concepts regarding the impact of soil morphology on use of soils for various purposes will be presented. Collegiate soil judging is a portion of the subject matter discussed. **Credits:** 2.00

AGRY 21000 - Fundamentals Of Turfgrass Culture

Credit Hours: 3.00. (HORT 21000) An introductory course in turfgrass management emphasizing turfgrass growth and development, species characteristics, their adaptation and basic cultural requirements for ornamental and functional turfgrass areas. The requirements and cultural inputs needed for proper establishment and maintenance of a high quality, low maintenance lawn will be discussed. **Credits:** 3.00

AGRY 21100 - Fundamentals Of Turfgrass Culture Laboratory

Credit Hours: 1.00. (HORT 21100) Companion lab to AGRY 21000. Laboratory exercises will focus on turfgrass and seed anatomy, morphology, identification as well as the hands-on basic principles of turfgrass culture. Designed for the student who intends to pursue a career in turfgrass management and plans to enroll in AGRY 510. Enrollment preference will be given to Turfgrass Science Majors. **Credits:** 1.00

AGRY 25100 - Introduction To Soils

Credit Hours: 1.00. Characteristics of soils and associated landscapes; soil genesis and classification; relation of soils to land use; soil management relative to erosion, tillage, drainage, moisture supply, and aeration. Credit cannot be given in both AGRY 25100 and AGRY 25500/NRES 25500 or AGRY 27000. Course meets during weeks 1-6. **Credits:** 1.00

AGRY 25500 - Soil Science

Credit Hours: 3.00. (NRES 25500) Differences in soils; soils genesis; physical, chemical, and biological properties of soils; relation of soils to problems of land use and pollution; soil management relative to tillage, erosion, drainage, moisture supply, temperature, aeration, fertility, and plant nutrition. Introduction to fertilizer chemistry and use. Not available to students who have taken AGRY 27000. **Credits:** 3.00

AGRY 27000 - Forest Soils

Credit Hours: 3.00. Development, distribution, and classification of soil profile; soil characteristics related to forest practices; nature and cause of soil differences; fertility and plant nutrition. Not available to students who have taken AGRY 25500 or NRES 25500. **Credits:** 3.00

AGRY 27500 - Honors Course - Lower Division

Credit Hours: 1.00 to 4.00. Utilized to offer a new honors course for a maximum of three years. Variable title, credit, and instructional type. Course may be repeated for credit if content and titles are different. Offered primarily to first- and second-year students. Courses offered must be approved by departmental or program faculty and College of Agriculture Honors Committee. Permission of instructor required. **Credits:** 1.00 to 4.00

AGRY 28500 - World Crop Adaptation And Distribution

Credit Hours: 3.00. Examination of how environmental factors, including climate and soils, impact the global distribution of major food crops. Identification of the types of naturally occurring plant communities and comparison of these communities with those of environmentally and economically sound field cropping systems. Exploration of how man's intervention has maintained or modified the productivity of food crops in agricultural communities and how his intervention has affected the environment. **Credits:** 3.00

AGRY 29199 - Cooperative Experience I

Credit Hours: 0.00. Professional experience in agronomy. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

AGRY 29299 - Cooperative Experience II

Credit Hours: 0.00. Professional experience in agronomy. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

AGRY 32000 - Genetics

Credit Hours: 3.00. The transmission of heritable traits; probability; genotypic-environmental interactions; chromosomal aberrations; polyploidy; gene mutations; genes in populations; the structure and function of nucleic acids; biochemical genetics; molecular genetics; coding.**Credits:** 3.00

AGRY 32100 - Genetics Laboratory

Credit Hours: 1.00. This course is a hands-on laboratory course that uses plants and microorganisms to demonstrate basic concepts of classical, molecular, and modern genetics. This course is designed to provide students with fundamental knowledge and skills for conducting genetics and molecular biology laboratory experiments. Students will gain experience with methods including but not limited to gel electrophoresis, DNA extraction, PCR, cloning, restriction digest analysis, phenotypic analysis, DNA sequencing, bioinformatics, SNP genotyping, qualitative gene expression analysis, and quantitative gene expression analysis. Students will learn how to plan and validate their laboratory experiments. The goal of this course is to prepare students to confidently perform and interpret experimental results in future laboratory courses or careers. **Credits:** 1.00

AGRY 33500 - Weather And Climate

Credit Hours: 3.00. An introductory course in meteorology and climatology with applications to daily life. The study of the fundamental physical principles behind weather and climate and how they apply to the homeowner and the world citizen. Emphasis is on how to interpret weather conditions and forecasts, what controls the wide range of climates in the world, and what the future may hold. **Credits:** 3.00

AGRY 33700 - Environmental Hydrology

Credit Hours: 3.00. This course is designed to provide undergraduate students with both the basics of how water moves through the environment and current theories as to how hydrologic response is modified by environmental change at a variety of temporal and spatial scales. **Credits:** 3.00

AGRY 33800 - Environmental Field Skills

Credit Hours: 1.00. This practical, field-based laboratory course is designed to provide hands-on experience with environmental monitoring field techniques, including stream discharge measurements, slug tests, aquatic sampling, surveying and wetland delineations utilizing local sites and watersheds as the classroom. **Credits:** 1.00

AGRY 34900 - Soil Ecology

Credit Hours: 3.00. An introductory course that will cover the basic concepts of soil ecology. Biological diversity and the interactions between and within biotic and abiotic components of the soil ecosystem, nutrient cycling, and genetic engineering are introduced. **Credits:** 3.00

AGRY 35000 - Global Awareness

Credit Hours: 1.00 to 3.00. A seminar-type course about world geography, cultures, and agriculture. Speakers are selected from the many Purdue graduate students and visiting scholars from around the world. Extra credit may be earned through independent study of a global issue. **Credits:** 1.00 to 3.00

AGRY 35500 - Soil Morphology And Geography

Credit Hours: 2.00. This course features field experience in advanced techniques in soil morphology including the study of the relationship of soils to landscaped, common parent materials of Midwest and classification of soils in the Soil Taxonomy. Course material emphasizes the development of detailed descriptions of soil properties and how these properties directly impact the interpretations and recommendations for land use options. Use and management of soils based on landscape position and morphology will be covered including on-site waste disposal, homes with basements as well as road and street construction. Collegiate soil judging is a portion of the subject matter discussed. Requires class trips. Students will pay individual lodging or meal expenses when necessary. **Credits:** 2.00

AGRY 36500 - Soil Fertility

Credit Hours: 3.00. Principles of soil chemistry and physics influencing plant nutrition; emphasis on diagnosis and solution of problems on soil reaction and nutrient status; fertilizer chemistry and use; reaction of pesticides and growth regulators with soils. **Credits:** 3.00

AGRY 37500 - Crop Production Systems

Credit Hours: 3.00. Factors affecting management decisions in crop production systems. Development of small grain and row cropping systems. Interaction of factors affecting efficient production systems, including seed selection, tillage, planting management, pest management, and harvesting and storage considerations. **Credits:** 3.00

AGRY 38500 - Environmental Soil Chemistry

Credit Hours: 4.00. (NRES 38500) Designed as an upper level introductory course covering environmental soil chemistry concepts in framework most applicable to inorganic and organic chemical contamination of soil and water resources and intended for students in environmental science fields that may not have a strong chemistry and/or math background. (el.5). **Credits:** 4.00

AGRY 39399 - Cooperative Experience III

Credit Hours: 0.00. Professional experience in agronomy. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

AGRY 39499 - Extensive Cooperative Experience IV

Credit Hours: 0.00. Professional experience in agronomy. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

AGRY 39599 - Extensive Cooperative Experience V

Credit Hours: 0.00. Professional experience in agronomy. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

AGRY 39800 - Agronomy Seminar

Credit Hours: 1.00. Weekly discussions of agronomic topics and other subjects relative to agronomic interest. Students are expected to participate in the discussions.**Credits:** 1.00

AGRY 39900 - Individual Study

Credit Hours: 1.00 to 3.00. Supervised individual study or research over topics not covered in other courses. Arrange with agronomy faculty before registering. Permission of instructor required. **Credits:** 1.00 to 3.00

AGRY 40000 - Agronomy Study Abroad

Credit Hours: 0.00 to 8.00. Utilized to record credits earned through participation in Purdue study abroad programs with cooperating foreign universities. **Credits:** 0.00 to 8.00

AGRY 42000 - Computing For The Natural Sciences

Credit Hours: 3.00. Basic programming, problem solving, data visualization and communication in the context of agriculture and natural science research using R. Topics include iteration, functions, vectors, strings, algorithms, graphics and reproducible reports in R. This course is appropriate for undergraduates with a curiosity in computing fundamentals and interest in working with research data, especially those potentially applying to graduate school. Also appropriate for graduate students, researchers or other professionals who desire an introduction to programming with R. NO programming experience is necessary. This is not a statistics course; having had introductory statistics and some background coursework in agricultural or other natural sciences is expected.**Credits:** 3.00

AGRY 43100 - Atmospheric Thermodynamics

Credit Hours: 3.00. (EAPS 42100) Structure and composition of the atmosphere. Thermodynamics of dry and moist air, including adiabatic and pseudoadiabatic processes, hydrostatic stability, and air mass determination. **Credits:** 3.00

AGRY 43200 - Atmospheric Dynamics I

Credit Hours: 3.00. (EAPS 42200) A study of the general system of equations governing mass and momentum changes in the atmosphere; special horizontal wind representations; thermal wind relationships; circulation, vorticity, divergence, and vertical motion. **Credits:** 3.00

AGRY 43300 - Atmospheric Dynamics II

Credit Hours: 3.00. (EAPS 42300) An extension of AGRY 43200 with the emphasis on perturbation theory and hydrodynamic stability, air mass and frontal theory, barotropic and baroclinic models, wave cyclone theory, and numerical weather prediction. **Credits:** 3.00

AGRY 44100 - Synoptic Laboratory I

Credit Hours: 1.00. (EAPS 43100) Analysis of vertical distributions of temperature and moisture with applications to adiabatic and pseudoadiabatic processes, hydrostatic stability, and air mass determination. **Credits:** 1.00

AGRY 44200 - Synoptic Laboratory II

Credit Hours: 1.00. (EAPS 43200) Analysis of horizontal distributions of pressure, temperature, wind, vorticity, and vertical motions. Applications to synoptic scale wave propagation. **Credits:** 1.00

AGRY 44300 - Synoptic Laboratory III

Credit Hours: 1.00. (EAPS 43300) Diagnosis of midtropospheric wave propagation and growth. Analysis of surface pressure fields and fronts and their relationships to upper air features. Extensive use is made of teletype and facsimile weather information. **Credits:** 1.00

AGRY 44400 - Weather Analysis And Forecasting

Credit Hours: 3.00. (EAPS 43400) In-depth study of contemporary weather analysis and forecasting techniques and problems. Extensive use is made of teletype and facsimile data and numerical weather prediction guidance provided by the National Meteorological Center. **Credits:** 3.00

AGRY 45000 - Soil Conservation and Water Management

Credit Hours: 3.00. (NRES 45000) Principles of soil conservation with emphasis on control of soil erosion by wind and water; impact of soil management decisions on environment; soil-water-plant relations, includes agronomic aspects of water management for both irrigation and drainage. **Credits:** 3.00

AGRY 46500 - Soil Physical Properties

Credit Hours: 3.00. Physical properties and processes in soils; water flow, soil structure, chemical movement; principles and methods of physical analysis of soils; the influence of soil physical processes on environmental quality and plant growth. **Credits:** 3.00

AGRY 47500 - Honors Course - Upper Division

Credit Hours: 1.00 to 4.00. Utilized to offer a new honors course for a maximum of three years. Variable title, credit, and instructional type. Course may be repeated for credit if content and titles are different. Offered primarily to third- and fourth-year students. Courses offered must be approved by departmental or program faculty and College of Agriculture Honors Committee. Permission of instructor required. **Credits:** 1.00 to 4.00

AGRY 48000 - Plant Genetics

Credit Hours: 3.00. Principles and recent advances in plant genetics including: genetic segregation, linkage, DNA markers and applications, chromosomes and genomes, variation in chromosome number and structure, mutation, recombination and DNA repair, quantitatively inherited traits, introduction to principles of population genetics, gene expression, gene organization, regulation of gene activity, gene function, identifying important genes, cloning genes, reverse genetics, plant transformation, applications of genetic engineering, genome sequencing, using sequence data. **Credits:** 3.00

AGRY 48500 - Precision Crop Management

Credit Hours: 3.00. An experiential lecture, discussion and field laboratory course for graduating seniors majoring in Agronomy. Analysis of multi-layer digital georeferenced crop data is used to inform the development and evaluation of zone-specific agronomic input prescriptions. Variables include factors affecting soil productivity, soil fertility and N management (including emerging sensor and crop modeling technologies). Prescriptions for variable crop genetics and seeding rates are also discussed. Sound agronomic use of emerging technologies such as real time soil moisture, organic matter, temperature and moisture sensing to affect variable seeding depth, rate and precision are included. May be used in combination with AGRY 49800 to meet the Agronomy undergraduate capstone requirement; will also meet the GIS/GPS requirement in Agronomy plans of study. **Credits:** 3.00

AGRY 49700 - Agronomy Internship Or Research Reporting

Credit Hours: 1.00. Reflection and reporting on participation in government, industrial, or other internship program or research assistantship. This course is intended to provide an opportunity for students to reflect on their internship experience, interact with students with similar experience, and report on the experience, as part of preparation for a career in the environmental sciences. Permission of department required.**Credits:** 1.00

AGRY 49800 - Agronomy Senior Seminar

Credit Hours: 1.00. Weekly discussions and presentations on assigned topics in Agronomy, interpersonal interactions, professional ethics, and leadership skills. Student teams will evaluate case studies and present their analysis orally and in writing. **Credits:** 1.00

AGRY 49900 - Thesis Research

Credit Hours: 1.00 to 6.00. For students doing individualized research on agronomic problems; report required. Arrange with academic advisor and honors research advisor before registering. Admission to honors program. Permission of instructor required. **Credits:** 1.00 to 6.00

AGRY 50500 - Forage Management

Credit Hours: 3.00. The study of the role of economically important crop species in the soil-plant-animal complex. Physiology, utilization, and management of forage species will be emphasized. **Credits:** 3.00

AGRY 51000 - Turfgrass Science

Credit Hours: 3.00. An advanced course in turfgrass management which focuses on the management requirements of intensively cultured turfgrass areas, with a specific emphasis on golf course and athletic fields. Interrelationships among soil, plant and atmospheric environments, management practices and turfgrass quality will be stressed. **Credits:** 3.00

AGRY 51100 - Population Genetics

Credit Hours: 3.00. (ANSC 51100) Basic concepts of population genetics. Characterization of populations using gene frequencies, gametic and zygotic disequilibrium; forces changing gene frequencies (mutation, migration, selection, and random genetic drift) and genotypic frequencies (mating systems: inbreeding, crossbreeding, and phenotypic assortative) and related hypothesis testing; gene trees and the coalescent process; and molecular phylogenies. **Credits:** 3.00

AGRY 51200 - Integrated Turfgrass Systems

Credit Hours: 3.00. Integration of agronomic principles for professionally managing golf courses, athletic complexes, lawn care companies, and sod production facilities in an efficient and environmentally friendly manner. Emphasizes independent thinking and team cooperation for understanding the social, ethical, and economical aspects underlying the daily agronomic management decisions, including construction, establishment, cultural practices, fertilization, and pest management. Course meets for weeks 1-10. **Credits:** 3.00

AGRY 51400 - Environmental Stress Management For Turfgrass

Credit Hours: 1.00. Designed for students who desire an understanding of how environmental stresses influence turfgrass growth and how they can be managed with cultural practices. The course covers current research findings in stress management and integrates turfgrass environmental physiology with turfgrass management. **Credits:** 1.00

AGRY 51500 - Plant Mineral Nutrition

Credit Hours: 3.00. Fundamental principles and concepts of the mineral nutrition of higher plants; processes and mechanisms controlling nutrient bioavailability and acquisition; physiological, genetic, and ecological aspects of plant nutrition including rhizosphere dynamics and interaction with disease. **Credits:** 3.00

AGRY 51800 - Plant Physiology And Biotechnology Research Techniques

Credit Hours: 3.00. This course has two components. The physiology section covers some of the popular experiments, such as the measurement of water potential, photosynthesis, stomata density, carbohydrate content, enzyme activity, mineral deficiency, drought stress physiology, plant pigment analysis, etc. The biotechnology section guides students through the entire procedure of genetic engineering, culminating in a project that will serve as an example on how to use molecular tools to answer fundamental physiological questions. **Credits:** 3.00

AGRY 52000 - Principles And Methods Of Plant Breeding

Credit Hours: 3.00. Introduction to methods and techniques of breeding field crops, with emphasis on the application of genetic principles; analysis of and present approach to the solution of specific breeding problems in selected field crops. **Credits:** 3.00

AGRY 52500 - Crop Physiology And Ecology

Credit Hours: 3.00. Study of the physiological basis for growth, yield, and adaptation of crop plants. Topics emphasized include: carbohydrate assimilation and partitioning, nitrogen metabolism, crop growth and development, water relations, stress tolerance,

and crop improvement using physiological genetics. Basic background in college level plant biology is recommended. **Credits:** 3.00

AGRY 53000 - Advanced Plant Genetics

Credit Hours: 3.00. Advanced treatment of principles and recent advances in plant genetics including: mutagenesis; cell, molecular and direct approaches to genetic analysis and genetic interactions; haploidy; chromosomal organization and aberrations; transposable elements; mutations, para mutation and epigenetics in higher plants; extra nuclear inheritance; cytogenetic and molecular affinities between crop plants and their wild relatives; genetic manipulations; gene discovery; genetic approaches to understanding agriculturally useful plant traits. ESTs and global gene expression analysis, proteomics, metabolic profiling, comparative genomics and genome evolution. Offered in odd-numbered years. **Credits:** 3.00

AGRY 53500 - Boundary Layer Meteorology

Credit Hours: 3.00. (EAPS 52500) This course has required class trips. Students will pay individual lodging or meal expenses where necessary. A study of the physical nature of the lowest layers of the atmosphere. The energy balance concept and the turbulent transfer of heat, momentum, and water vapor are discussed in detail. Some specific microclimates are studied in this context. **Credits:** 3.00

AGRY 53600 - Environmental Biophysics

Credit Hours: 3.00. An analysis of the energy fluxes to and from terrestrial plants, insects, mammals, and humans as they exist in their macro and microclimates. Agricultural meteorology methods (both research and operational) will be presented. Labs will be both in-laboratory and in-field with reports required. A special project will be required of all students and will be presented in class and written as if for publication. **Credits:** 3.00

AGRY 54000 - Soil Chemistry

Credit Hours: 3.00. Emphasis on processes controlling the gaseous, solution, and solid phases in soils including precipitation, acid-base, oxidation-reduction, complexation, absorption, and ion exchange. **Credits:** 3.00

AGRY 54400 - Environmental Organic Chemistry

Credit Hours: 3.00. The fundamental properties and processes responsible for the fate of organic chemicals in the environment, with emphasis on soil and water chemistry. Areas to be addressed will include both conceptual and theoretical aspects of processes relevant to environmental fate of contaminants; measurement, estimation, correlation, and application of the parameters most commonly used to assess various chemodynamic properties in soil-water systems. **Credits:** 3.00

AGRY 54500 - Remote Sensing Of Land Resources

Credit Hours: 3.00. Application of remote sensing and spatial databases for observing and managing land resources within the Earth System; analysis and interpretation of remotely sensed data in combination with field observations and other data sources; conceptualization and design of a global earth resources information system. **Credits:** 3.00

AGRY 55000 - Field Crops Breeding Techniques

Credit Hours: 2.00. Field nursery experience, including crossing procedures, plant evaluation, selection for pest resistance and for agronomic characters, and field data evaluation. **Credits:** 2.00

AGRY 55500 - Soil And Plant Analysis

Credit Hours: 3.00. Principles and methods of chemical analysis of plants and soils. Topics include soil carbon analysis, exchangeable cations, soil acidity, salinity, pesticide analysis, and elemental analysis of plant tissue and forage analysis. Quantitative gravimetric and volumetric techniques are reviewed followed by use of instrumental methods of analysis including atomic absorption, UV/Visible spectrometry, HPLC, and gas chromatography. Laboratory safety, quality assurance/quality control, and data reporting are emphasized. Students having at least one year of chemistry including a quantitative analysis laboratory will be suitably prepared. **Credits:** 3.00

AGRY 56000 - Soil Physics

Credit Hours: 3.00. Fundamentals of soil physics; transport of chemicals, heat, and gases; field spatial variability; principles and methods of physical analysis of soils; the influence of soil physical processes on environmental quality and agricultural production. Students having an understanding of introductory soil science will be suitably prepared. **Credits:** 3.00

AGRY 56500 - Soils And Landscapes

Credit Hours: 3.00. Soils as natural components of landscapes, geomorphology and soil characteristics; processes of soil formation; principal soils of Indiana, their adaptations, limitations, productivity and use; global soil distributions; application of GPS and mobile GIS in the field. This course requires two all-day field trips. Students will pay individual meal expenses when necessary. **Credits:** 3.00

AGRY 58000 - Soil And Rhizosphere Microbiology

Credit Hours: 3.00. Soils are complex ecosystems that host a diverse array of organisms, which interact with and respond to their environment. This course explores the ecology, evolution, and functions of soil microbes, with a particular focus on their interactions with plants. Through this course, students will gain an understanding of the metabolic processes and life-history strategies of archaea, bacteria, fungi, and viruses in soil, root, and rhizosphere compartments. Students will also survey the microbiomes of diverse soil ecosystems, such as forests, agroecosystems, and grasslands, and learn principles of soil microbiology and biogeochemistry. In addition, students will acquire practical knowledge about the methods used for characterizing microbes in soil and plant systems. **Credits:** 3.00

AGRY 58200 - Environmental Fate Of Pesticides

Credit Hours: 3.00. Emphasis is given to developing a fundamental understanding of the processes controlling the fate of organic chemicals, such as pesticides, in the environment. Processes considered include: volatilization, degradation, leaching, and sorption. **Credits:** 3.00

AGRY 58500 - Soils And Land Use

Credit Hours: 3.00. Soils as a resource in development planning; soil properties affecting land use; use of soil survey, aerial photos, topographic maps, and other resource data in land-use allocation; nonengineering aspects of site selection for various land uses, water conservation, waste disposal, and erosion control. **Credits:** 3.00

AGRY 59600 - Professional Presentations

Credit Hours: 1.00. Develop confidence and skills in preparing and delivering professional presentations to both peer scientific and student audiences. (el. 7) **Credits:** 1.00

AGRY 59700 - Communicating With The Public

Credit Hours: 1.00. This course will prepare students being trained as agronomy professionals to enhance their communication skills so they can successfully interact with the public. (el. 7) Offered in alternate years. **Credits:** 1.00

AGRY 59800 - Special Problems

Credit Hours: 1.00 to 6.00. Research on agronomic problems conducted in laboratory, field, or library; report required; arrange with an agronomy staff member before registering. Permission of instructor required. **Credits:** 1.00 to 6.00

AGRY 60000 - Genomics

Credit Hours: 3.00. An introduction to the technologies and analytical methods used in studying genomes, their functions and systems biology. This course prepares graduate students for further study of these techniques in additional courses and in their research. Students with an understanding of introductory genetics and statistics will be suitably prepared for this course. Offered in even-numbered years. **Credits:** 3.00

AGRY 60100 - Introduction To Graduate Research

Credit Hours: 1.00. This course provides framework for graduate studies. It helps the new graduate student understand the roles and responsibilities in graduate education, providing guidance for scientific reading, writing, and research activities. Topics include understanding ethical issues in science, enhancing their ability to communicate with a broad range of people, and establishing initial perspectives on professional development. Permission of department required.**Credits:** 1.00

AGRY 60500 - Advanced Plant Breeding

Credit Hours: 3.00. Advanced study of genetic principles and their application to plant breeding systems, techniques, and objectives. Offered in alternate years. Prerequisite: AGRY 52000; a course in statistics covering simple analysis of variance. **Credits:** 3.00

AGRY 61100 - Quantitative Genetics

Credit Hours: 3.00. Continuation of AGRY 51100, ANSC 51100. Quantitative genetics in animals and plants. Genotypic and environmental variances; covariances between relatives; single- and multiple-trait selection and correlated responses; genotype-environment interaction. Inbreeding and crossbreeding: means, variances, heterosis, intra- and inter-population improvement. Prerequisite: STAT 51200; Prerequisite: AGRY 51100 OR ANSC 51100. **Credits:** 3.00

AGRY 62400 - Plant Ecophysiology

Credit Hours: 3.00. This course will explore the influence of the environment on growth and development, reproduction, adaptation, survival and evolution of plants. The fundamental study of physiological mechanisms underlying adaptive strategies and their ecological consequences will be included. Prerequisites: Undergraduate or graduate level of Plant Physiology (HORT 30100 or AGRY 52500 or HORT 55100 or FNR 43400 or equivalent). **Credits:** 3.00

AGRY 63500 - Micrometeorology

Credit Hours: 3.00. A rigorous study of the atmospheric boundary layer with special attention to turbulent diffusion processes in the lower atmosphere. Offered in alternate years. Prerequisite: AGRY 53500. **Credits:** 3.00

AGRY 64100 - Statistical Hydrology

Credit Hours: 3.00. This course is designed to serve as an advanced graduate course in the statistical analysis of hydrologic data, including time series analysis and modeling, frequency analysis and uncertainty. Prerequisites: AGRY 33700 or CE 54200 or ABE 32500 and STAT 51100 or STAT 50300. **Credits:** 3.00

AGRY 64900 - Molecular Microbial Ecology

Credit Hours: 3.00. Focuses on the application of various molecular genetic techniques for studying micro-organisms from and in the environment. The method, theoretical basis of each method, and interpretation of results are covered. The major areas discussed are the application of molecular genetic techniques to study: (1) total microbial communities; (2) diversity of micro-organisms in a community; and (3) biotechnological uses of micro-organisms. Prerequisite: AGRY 32000 or AGRY 58000 or BCHM 56200 or BIOL 24100 or BIOL 43800 or BIOL 54900. **Credits:** 3.00

AGRY 65000 - Clay Mineralogy

Credit Hours: 4.00. Principles of crystal chemistry, survey of clay mineral structures, and identification of clay minerals by X-ray diffraction, chemical methods, differential thermal analysis, infrared spectroscopy, and specific surface area measurements. Role of clay minerals in the natural environment. Offered in alternate years. **Credits:** 4.00

AGRY 69500 - Graduate Professional Practice

Credit Hours: 1.00 to 3.00. An internship experience with a for-profit, non-profit, or governmental entity to complement the student's academic coursework. Practical experience with an employer is required to successfully complete the course. The student must present a letter from the proposed employer describing to a reasonable extent the work to be undertaken, document the expectations, and find an Agronomy faculty advisor/instructor to oversee the experience. Course may be taken in successive semesters. Permission of instructor required.**Credits:** 1.00 to 3.00

AGRY 69600 - Agronomy Graduate Seminar

Credit Hours: 1.00. Weekly discussion of assigned topics in soil and crop science. **Credits:** 1.00

AGRY 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required. **Credits:** 1.00 to 18.00

AGRY 69900 - Research PhD Thesis

Credit Hours: 1.00 to 18.00. Research PhD Thesis. Permission of instructor required. **Credits:** 1.00 to 18.00

American Sign Language

ASL 10100 - American Sign Language I

Credit Hours: 3.00. A basic introduction to American Sign Language. This course introduces students to the tools for mastering the grammar at a basic expressive and receptive level. Introduction to cultural and historical aspects of ASL and the deaf community. **Credits:** 3.00

ASL 10200 - American Sign Language II

Credit Hours: 3.00. A continuation of ASL 10100. Further study of the language with more emphasis on receptive and expressive conversational skills. Includes readings of research studies relevant to lectures. **Credits:** 3.00

ASL 20100 - American Sign Language III

Credit Hours: 3.00. A more advanced study of American Sign Language. Further development of receptive and expressive skills using more advanced material. Continued emphasis on cultural and historical aspects in relation to the evolution of the language and language usage. **Credits:** 3.00

ASL 20200 - American Sign Language IV

Credit Hours: 3.00. A continuation of ASL 20100. Includes some introduction to linguistic structure, especially classifiers, temporal sequencing and aspect, and conversational regulators. **Credits:** 3.00

ASL 28000 - American Deaf Community: Language, Culture, And Society

Credit Hours: 3.00. The linguistic, cultural, and societal context of the deaf community in America. Both historical and contemporary aspects of deaf identity will be included, with an emphasis on the central role that ASL plays in the lives of deaf individuals. **Credits:** 3.00

ASL 30100 - American Sign Language V

Credit Hours: 3.00. This course is a continuation of ASL 20200 (5th in sequence of courses in ASL). Features of Level 5 are expanded student discourse, advanced ASL structure and vocabulary, roleshift variations, formal storytelling, text analysis and formal/informal presentations. **Credits:** 3.00

ASL 30200 - American Sign Language Advanced-Level VI

Credit Hours: 3.00. This course is a sequential course in the advanced study of American Sign Language (ASL) with emphasis on basic concepts of language based ASL. This is an application of language usage in ASL in which students will gain an advanced understanding and mastery of ASL grammar. Includes instruction in semantic and grammatical accuracy and appropriate discourse strategies in a variety of communication contexts. Students utilize advanced receptive and expressive skills. **Credits:** 3.00

ASL 36100 - The Structure Of American Sign Language I: Phonology And Morphology

Credit Hours: 3.00. Linguistic study of ASL, including the following: phonological features of individual signs (hand shape, orientation, location, movement) and how those features shift when placed in a stream of signs; morphological features of signs, including compounding and lexicalization of fingerspelled words; grammar, focusing on typical word orders found in ASL sentences; meaning of signs and how those meanings have shifted over time (as well as how those meanings shift for particular dialects); and typical pragmatic features of conversation in ASL. Knowledge of ASL is required. **Credits:** 3.00

ASL 36200 - The Structure Of American Sign Language II: Syntax, Semantics And Language Use

Credit Hours: 3.00. This course introduces students who already have prior knowledge of linguistics (e.g., phonetics, phonology, and morphology) to three areas of study in linguistics: Syntax, Semantics, and language use. Linguistic study of ASL, including the following: Syntax includes units on basic sentence types, lexical categories, word order, time and aspect, verbs, and the function of the spaces. Semantics includes the meanings of individual signs and sentences. Language in Use includes Black ASL, Variation and Historical Change. Bilingualism and language acquisition will be also covered. ASL Discourse has the ways that

signed conversations among deaf people differ from speaking conversation of hearing people, why these differences exist, and why they are culturally important. Knowledge of ASL is required.**Credits:** 3.00

ASL 36400 - Introduction To Structure Of American Sign Language

Credit Hours: 3.00. This course provides an introductory overview of the major linguistic structures of American Sign Language. Major topics are: phonology, morphology, syntax, language use, and linguistic applications. Some comparisons with English and other spoken and signed languages will be examined. Course will be conducted in ASL. **Credits:** 3.00

ASL 39000 - Undergraduate Research In American Sign Language

Credit Hours: 3.00. This course is designed to allow for the investigation of topics related to the linguistic structure of ASL, populations of ASL language learners, sub-populations of the Deaf Community at the undergraduate level. Permission of instructor required. **Credits:** 3.00

American Studies

AMST 10100 - America And The World

Credit Hours: 3.00. This course examines the evolution of American culture as the United States transitioned from a relatively isolated country at the end of the 19th century to an active shaper of a global community by the 21st century. We will examine ways in which American Culture shaped and was shaped by international relationships that transcend nation states. We will explore reactions to, and the results of, the spread of American culture both inside and outside the United States. By studying traditional cultural forms like art, music, design, literature, film, and technology the course will build a foundation from which to understand the configuration of American culture. Yet the course will also emphasize American culture expression, that in the forms of television, advertising, sport, cartoons, social media, video games, fashion, food, drugs, and automobiles, have transcended the geographical boundaries of the United States to engage in global interplays of material cultural exchange. **Credits:** 3.00

AMST 20100 - Interpreting America

Credit Hours: 3.00. Introduction to the interdisciplinary study of American culture, history, and society in its national and global contexts. **Credits:** 3.00

AMST 21000 - Sport In American Culture

Credit Hours: 3.00. This course engages critical questions regarding sport and its role in American culture. It examines the ways sport serves as a key site for the study of larger social issues and social problems, including how race, gender, social class and other social locations are simultaneously reproduced and challenged in and through sport. The course also explores the relationships between sport and other major social institutions, such as the economy, education, politics, and media. **Credits:** 3.00

AMST 22000 - Technology And Play

Credit Hours: 3.00. This course introduces students to games, as well as investigating innovations and controversies in the gaming industry. It will explore theories of play, how technological innovations and business practices in both digital and analog gaming (through board games, video games, tabletop games, and esports) mediate or structure the experience of play. It will also survey the rise of myriad gaming subcultures, including celebrity streamers and esports.**Credits:** 3.00

AMST 25000 - An Introduction To American Protest Movements: What Are They? What Can They Do? How Can We Make One?

Credit Hours: 3.00. In this course, we will study the reasons people in the United States have historically decided to create social movements, tactics and strategies they use to make and sustain those movements, obstacles to their success, and ways of judging their victories. The course will draw on scholarship on social movements from various fields, especially the field of American Studies. Because social movements are created by ordinary people, we will use a variety of sources they leave behind: speeches, testimonials, pamphlets, historical accounts, autobiographies, manifestos. We will also explore scholarship on social movements to try to understand how best to record and analyze the work social movements do. The course seeks to provide students an understanding of the role of protest movements in American history. Permission of instructor required. **Credits:** 3.00

AMST 30100 - Perspectives On America

Credit Hours: 3.00. Advanced interdisciplinary study of American culture, history, and society in their national and global contexts. **Credits:** 3.00

AMST 31000 - Invention, Innovation, And Design

Credit Hours: 3.00. This course focuses on the various ways that invention, innovation, and design shape the modern world. We will investigate the forms, uses, and meanings of a diverse set of objects, networks, and systems that influence the ways we live. We will explore these ideas through the concepts of consumption, waste, and "smart" to gain a deeper understanding of how material infrastructures influence human existence. This project-based course will use readings, discussions, and critical reflections to inform a series of hands-on projects to understand our roles as designers, creators, and users of science, technology, and material culture. Permission of instructor required. **Credits:** 3.00

AMST 32000 - Understanding The National Football League

Credit Hours: 3.00. This course counters the cultural myth that sports are "simply a form of entertainment" or "an escape from reality" and takes seriously the notion that sports matter as a social, cultural, and political force. Students will use academically informed inquiry and investigation to examine broader cultural dynamics through a critical examination of the National Football League. Course topics include how the NFL shapes social identities including race, gender, sexuality, and American identity, the connection between football and militarism, the relationship between the NFL and commercialism, the role the NFL plays in the triad of men's violence, among other topics. **Credits:** 3.00

AMST 32500 - Sports, Technology, And Innovation

Credit Hours: 3.00. This course examines how science, technology, engineering, and data analysis reshape sports. Traditionally, sports have been understood as competitions between humans. However, recent technoscientific developments have altered this arrangement and have changed the ways sports are played. We have reached a place where heated competitions not only take place on the fields of play, but also within scientific and engineering laboratories. The fundamental question this project-based course will address is: how will new and emerging scientific knowledge and technological innovations transform sports? We will explore topics ranging from football, baseball, basketball, and soccer, to e-sports, fantasy sports, and sports analytics. **Credits:** 3.00

AMST 33000 - American Car Culture

Credit Hours: 3.00. The automobile has become one of the most influential technologies of the 20th century, and continues to impact American life in the 21st. This course will examine the immense social, political, technological, and environmental impacts of the car on American culture; and take an interdisciplinary approach to the understanding the automobile industry, its production systems, its marketing strategies, and the way automobiles reflect the changing landscapes of consumer tastes and values over time. **Credits:** 3.00

AMST 49000 - Senior Capstone In American Studies

Credit Hours: 6.00. Interdisciplinary senior capstone project in American Studies. Permission of department required. **Credits:** 6.00

AMST 59000 - Directed Readings In American Studies

Credit Hours: 1.00 to 3.00. A reading course in aspects of American Studies directed by the instructor in whose particular field of specialization the content on the reading falls. Permission of Instructor required. **Credits:** 1.00 to 3.00

AMST 60100 - Introduction To American Studies

Credit Hours: 3.00. An exploration of the cultural and institutional history of American Studies designed to acquaint students with the interdisciplinary concepts of American Studies by focusing on major canonical texts associated with that history. Prerequisite: Master's student standing and American Studies majors only. **Credits:** 3.00

AMST 60200 - Contemporary Issues In American Studies

Credit Hours: 3.00. An investigation of analytical categories, particularly race, class and gender, the multiple methodologies, and theoretical premises that shape developments in the field of American Studies. Prerequisite: AMST 60100. **Credits:** 3.00

AMST 60300 - American Studies Interdisciplinary Project

Credit Hours: 3.00. Students will conduct independent research under faculty supervision towards completion of the Special Field examination for the Ph.D. degree. The project should be an extended, original research essay, based upon interdisciplinary research. The project should aim to produce original findings on a clearly defined topic or problem. In addition to the research and essay, students must produce a statement of methodology in which they explain their choice of sources and how their project contributes to the field of American Studies. To be taken in the final semester of coursework. Prerequisite: AMST 60100. **Credits:** 3.00

AMST 60400 - Transnational American Studies

Credit Hours: 3.00. What does the term transnational mean? How is the term defined, practiced, and studied in different fields? How does one take a transnational perspective, or examine the transnational variable? This course will draw from various fields (sociology, history, anthropology, ethnic studies, etc.) to explore contemporary scholarship on transnationalism in theory and in practice. Specifically, we will examine scholarship that either, 1) utilizes the transnational perspective in understanding history, the globe, and human behavior/interactions, or 2) utilizes transnational behaviors/ties as a variable to measurement adaptation. Materials in this course will examine - through the lens of race, ethnicity, class, gender, and sexuality - individual and comparative transnational case studies related to the Americas, Africa, Asia, and Europe. This is a graduate seminar, and your active participation in discussions is mandatory. You will be asked to lead four seminar discussions on selected topics from the required readings, write three memos, and submit an extended book review. Permission of instructor required. **Credits:** 3.00

AMST 60500 - Theory And American Culture

Credit Hours: 3.00. This course provides an overview of key foundational texts in social and cultural theory, with a focus on theories of import to scholars in American Studies and related fields. We will explore the various types of theory, examining its internal logic, implications, and critiques. Consider this a brief introduction, meant to give you a general feel for the range and sophistication of available theories in American Studies. Moreover, as the "Cultural Politics" website observes, "Recent theory has reminded us that origin stories are powerful determining forces, and thus these tales of the growth and development of the discipline should be read both for what they say and for what they may leave out, read both for their truths and their partialities."

Similarly, the course syllabus itself creates a particular narrative regarding the development of the discipline. As such, students are encouraged to consider the syllabus through this perspective. **Credits:** 3.00

AMST 60600 - American Studies Methods

Credit Hours: 3.00. This class is specifically designed to be a survey course on the various methods employed by American Studies scholars from different disciplines. The objective of this course is to approach methods from both an epistemological and empirical perspective. In particular, we will investigate the what, why, and how of conducting research in an interdisciplinary field. As such, the following questions will drive this course: What are American Studies methods? Why are certain methodologies utilized (i.e., for what purpose)? How does one conduct research in American Studies? What method(s) should you use in your own research inquiry? And finally, what are some potential drawbacks in using a certain methodology for your project? This is a graduate seminar, and your active participation in discussions is mandatory. You will be asked to submit weekly discussion questions, lead five seminar discussions on selected topics from the required readings, and complete six assignments. The final assignment will include the background and methodological components of a research proposal.**Credits:** 3.00

AMST 62000 - EPXIRED - Archival Theory And Practice

Credit Hours: 3.00. This class explores recent theories of the Archive, as well as theories of archiving, examines scholarly approaches to archival research, and introduces students to the practical aspects of accessioning, arranging, describing, and preserving archival collections. Archival work for the class will be conducted under the supervision of a faculty member and a partnering library. Prerequisite: AMST 60100, AMST 60200. **Credits:** 3.00

AMST 63000 - M A Research Seminar

Credit Hours: 6.00. A research seminar required of all M.A. students in their final semester. Students write substantial essays based upon original research in which they seek to crystallize, in practice, methods and concepts of American Studies. Prerequisite: AMST 60100. **Credits:** 6.00

AMST 65000 - Reading Seminar In American Studies

Credit Hours: 3.00. A reading seminar on a selected topic in American Studies, taught by two faculty members from different disciplines, usually one from the humanities and one from the social sciences. Prerequisite: AMST 60100. **Credits:** 3.00

AMST 69500 - American Studies Service Learning/Internship

Credit Hours: 3.00. This course is to be used by students to complete a service learning or internship project that provides professional development towards completion of the degree. The project must be conducted under the supervision of a faculty member and community partner. The faculty supervisor will be responsible for determining the academic content of the course and requirements of service. In addition to academic requirements for the course, a final written report on the project must be filed with the American Studies program. The final report must describe the relationship between work completed for the course and the student's plan of study. Prerequisite: AMST 60100, AMST60200. **Credits:** 3.00

AMST 69900 - Research PhD Thesis

Credit Hours: 1.00 to 18.00. Research PhD Thesis. Permission of instructor required. **Credits:** 1.00 to 18.00

Animal Sciences

ANSC 10200 - Introduction To Animal Agriculture

Credit Hours: 3.00. A study of animal agriculture emphasizing the efficient production of animal food products from poultry, dairy and meat animals. Credit cannot be obtained for both ANSC 10100 and 10200. Course may also be offered for dual credit with cooperating Indiana high schools upon documented approval by Department of Animal Sciences. This course is required for ANSC majors classified as Freshman and Sophomores. **Credits:** 3.00

ANSC 10600 - Biology Companion Animal

Credit Hours: 3.00. Introduction to the various aspects of companion animal biology. Topics include anatomy, physiology, health, immunity, nutrition, growth, digestion, metabolism, behavior, genetics, reproduction and lactation. **Credits:** 3.00

ANSC 12100 - Ethics Of Animal Use

Credit Hours: 2.00. The Ethics of Animal Use explores ethical issues relating to animal use in contemporary society. It integrates philosophical theories with scientific evidence relating to the use of animals in agriculture, biomedical research, companion animals, and issues relating to wildlife and the environment. **Credits:** 2.00

ANSC 18100 - Orientation To Animal Sciences

Credit Hours: 1.00. Introduction to the faculty, programs, opportunities, career preparation, and personal development requirements needed to succeed in a career in the animal industries. Course meets during weeks 1-8. Requires class trips. Students will pay individual lodging or meal expenses when necessary. **Credits:** 1.00

ANSC 22100 - Principles Of Animal Nutrition

Credit Hours: 3.00. Classification and function of nutrients, deficiency symptoms, digestive processes, characterization of feedstuffs, and formulation of diets for domestic animals.**Credits:** 3.00

ANSC 23000 - Physiology Of Domestic Animals

Credit Hours: 4.00. A lecture and laboratory course designed to present physiology of domestic farm animals. Function of tissues and organs, maintenance of internal steady-state conditions, and body responses to external environmental conditions will be presented. Physiological mechanisms involved in lactation, growth, and reproduction will be included. **Credits:** 4.00

ANSC 24000 - Principles Of Animal Production

Credit Hours: 3.00. A comprehensive overview of production systems including life cycles and animal requirements for non-ruminant and ruminant farm animals species. How animal production is affected by the environment, availability of resources, and market access will emphasized. Data requirements and interpretation for decision making will be highlighted. **Credits:** 3.00

ANSC 24500 - Applied Animal Management

Credit Hours: 2.00. Skills and practices related to handling and care of beef and dairy cattle, horses, poultry, sheep, and swine. **Credits:** 2.00

ANSC 25500 - Principles Of Animal Products

Credit Hours: 3.00. Survey of the animal product industries; meat, dairy, eggs, and wool. Meat as a food, conversion of muscle to meat, conversion of dairy to dairy products, food safety, food quality, inspection, and basic processing, in addition to basic wool production. **Credits:** 3.00

ANSC 28100 - Career Planning In Animal Sciences

Credit Hours: 1.00. A seminar course designed to inform students of the career opportunities in animal industries, develop their interviewing and other interpersonal skills, and begin to plan the course of study, work experiences, and marketing methods needed to obtain a successful internship and employment. **Credits:** 1.00

ANSC 29200 - Special Assignments

Credit Hours: 0.00. To be arranged with individual staff members prior to registration. Reading, discussions, written reports, seminar presentations, teaching, field or laboratory experiences provided for enrichment in special areas of animal science. Permission of department required. **Credits:** 0.00

ANSC 29300 - Special Assignments

Credit Hours: 1.00 to 3.00. Reading, discussions, written reports, seminar presentations, teaching, field or laboratory experiences provided for enrichment in special areas of animal science. Combination of ANSC 29300 and AGR 49300 cannot exceed six credits. Permission of instructor required. **Credits:** 1.00 to 3.00

ANSC 29400 - Exploring International Animal Agriculture

Credit Hours: 3.00. An experiential learning class. Interrelationship of animal agriculture with agronomic production, feed industries, culture, national infrastructure, political systems and international trade will be investigated through international travel. Critical thinking and communication skills will be enhanced by topic leadership, comparative analysis and seminar presentation. May be repeated for credit with variable title. **Credits:** 3.00

ANSC 29500 - Special Topics In Animal Sciences

Credit Hours: 0.00 to 3.00. Lecture presentation of specialized material not available in formal courses of the department. The specific topic that is offered will be indicated on the student's record. May be repeated for credit with variable title. Permission of instructor required. **Credits:** 0.00 to 3.00

ANSC 30100 - Animal Growth, Development, And Evaluation

Credit Hours: 2.00. Provides an overview of how nutrition, genetics, and environment affect beef cattle, swine, and sheep growth, development, and end-product quality and value. Students receive hands-on experience evaluating and determining the economic value of live animals and carcasses in various market grids.**Credits:** 2.00

ANSC 30300 - Animal Behavior

Credit Hours: 3.00. Discussion of animal behavior with emphasis on developing an understanding of the reasons domesticated animals react the way they do toward their kind and to humans. The laboratory will be used for observation of behavior patterns in animals. Solutions for unusual behavior include behavior modification techniques. **Credits:** 3.00

ANSC 31100 - Animal Breeding And Genetics

Credit Hours: 4.00. Genetic principles and their applications in improvement of production efficiency in livestock.**Credits:** 4.00

ANSC 32400 - Applied Animal Nutrition

Credit Hours: 3.00. Application of the principles of animal nutrition to the formulation and feeding of supplements and complete rations for animals; ration ingredients and substitution values; computer applications; legal aspects of feed formulation; and industry practices. Requires class trips. Students will pay individual lodging or meal expenses when necessary. **Credits:** 3.00

ANSC 32500 - Applied Ruminant Nutrition

Credit Hours: 2.00. Application of the principles of ruminant nutrition to the formulation and feeding of supplements and complete rations for animals; ration ingredients and substitution values; computer applications; legal aspects of feed formulation; and industry practices. **Credits:** 2.00

ANSC 32600 - Applied Non-ruminant Nutrition

Credit Hours: 2.00. Application of the principles of non-ruminant nutrition to the formulation and feeding of supplements and complete rations for animals; ration ingredients and substitution values; computer applications; legal aspects of feed formulation; and industry practices. **Credits:** 2.00

ANSC 33100 - The Role Of Horses In Human History, Culture, And Society

Credit Hours: 3.00. A multi-disciplinary course that introduces students to the history of the human-horse relationship in a global context. Because the history of horse and human interaction is so broad and so important to the development of civilization, the course will include a broad view of horses in the context of agriculture, transportation, sport, culture and art. **Credits:** 3.00

ANSC 33200 - Environmental Physiology Of Domestic Animals

Credit Hours: 2.00. Interactions of environmental factors with physiological processes in domestic animals. **Credits:** 2.00

ANSC 33300 - Physiology Of Reproduction

Credit Hours: 3.00. This course is designed to introduce students to the essential principles of mammalian reproduction and apply this knowledge in a hands-on laboratory setting. Upon completion of this course, students are expected to understand the processes of sexual determination, sexual differentiation, steroid hormone signaling, spermatogenesis, oogenesis, fertilization, gestation, parturition and lactation. **Credits:** 3.00

ANSC 34500 - Animal Health Management

Credit Hours: 3.00. The objectives of this course are to familiarize the student with disease processes and mechanisms. Management techniques in food, companion, and research animal species that minimize or prevent disease will be emphasized, as well as the consequences on animal production, reproduction, and human health. **Credits:** 3.00

ANSC 35100 - Meat Science

Credit Hours: 3.00. Study of muscle and meat, principles involved in the conversion of living animals to meat and by-products; efficient utilization of all types of meat as food. **Credits:** 3.00

ANSC 35101 - Meat Science Laboratory

Credit Hours: 1.00. Application of scientific principles to the meat industry, with emphasis on all aspects of processing including: harvest; carcass grading and evaluation; fabrication; cured, smoked, and comminuted meat products; quality control; product development; and retail and food service merchandising. **Credits:** 1.00

ANSC 36000 - Muscle Food Production And Safety

Credit Hours: 3.00. Study the science, art, and economics of processed meats. Investigate methods to add value to meat and meat products, including hands-on processing, new product development, and industry tours. Study of meat-borne pathogens and methods of control. Science and practical aspects of food safety in meat production. Seven principles of HACCP will be investigated and each student will receive HACCP Certification from the International HACCP Alliance.**Credits:** 3.00

ANSC 37000 - Livestock Evaluation

Credit Hours: 2.00. This course is designed to develop logical thinking and speaking skills, while developing the ability to critically evaluate livestock in their production environments. Prior experience in public speaking or judging is not required. The combination of ANSC 37000, ANSC 37100, ANSC 37200, ANSC 47000, ANSC 47100, and ANSC 47200 cannot exceed three credits toward ANSC electives. Requires class trips. Students will pay individual lodging or meal expenses when necessary. **Credits:** 2.00

ANSC 37100 - Dairy Evaluation

Credit Hours: 2.00. This course will enable the student to become familiar with breeds of dairy, parts of dairy cattle and their relationship to function. Opportunities will exist to associate with people from various breed organizations within the dairy industry. The combination of ANSC 37000, 37100, 37200, 47000, 47100, and 47200 cannot exceed three credits toward ANSC electives. Requires class trips. Students will pay individual lodging or meal expenses when necessary. **Credits:** 2.00

ANSC 38100 - Leadership For A Diverse Workplace

Credit Hours: 3.00. An interactive, small group discussion class covering effective interpersonal and group skills needed to enhance career satisfaction in a diverse workplace including building networks within industry, cross-cultural communication and gaining experiences in group problem-solving and decision-making. This course may be used as an additional written communication elective as required in all plans of study in Animal Sciences.**Credits:** 3.00

ANSC 39000 - Animal Sciences Internship

Credit Hours: 0.00. Internships with producers, businesses, or agencies arranged in cooperation with faculty coordinator. Permission of department required. **Credits:** 0.00

ANSC 39300 - Animal Industry Travel Course

Credit Hours: 1.00 or 2.00. A classroom and travel course designed to expose students to animal production operations, agribusinesses, industry leaders, and their philosophies as well as critical contemporary issues throughout various geographical areas of the United States. Travel is conducted during spring break or summer sessions and includes visits to animal production farms, universities, and agribusinesses. Additional fee required. Limited to two credits toward Animal Sciences electives. Offered in odd numbered years. Permission of instructor required. **Credits:** 1.00 or 2.00

ANSC 40000 - Animal Sciences Study Abroad

Credit Hours: 0.00 to 8.00. Utilized to record credits earned through participation in Purdue study abroad programs with cooperating foreign universities. **Credits:** 0.00 to 8.00

ANSC 40400 - Animal Welfare

Credit Hours: 3.00. A multi-disciplinary course that introduces students to the fields of animal welfare and the ethics of animal use. The course will emphasize farm animal welfare and production issues. Requires class trips. Students will pay individual lodging or meal expenses when necessary. **Credits:** 3.00

ANSC 41500 - Advanced Animal Physiology

Credit Hours: 3.00. This course is an advanced physiology course building on concepts and knowledge introduced in ANSC 23000 about whole body physiology. Additionally, this course will introduce interpretation of scientific literature to understand physiological processes. **Credits:** 3.00

ANSC 42500 - Ruminant Reproductive Farm Management

Credit Hours: 2.00. This course will teach how to apply the animal science disciplines such as nutrition, genetics, physiology, and animal behavior in a systems approach that will result in the desired level of reproductive performance. Animal handling skills associated with the reproductive management of beef cattle, dairy cattle, goats, and sheep will be discussed. Laboratories require use of both live animals and animal specimens.**Credits:** 2.00

ANSC 42600 - Non-ruminant Reproductive Farm Management

Credit Hours: 2.00. This course will teach how to apply the animal science disciplines such as nutrition, genetics, physiology, and animal behavior in a systems approach that will result in the desired level of reproductive performance. Animal handling skills associated with reproductive management of swine and horses will be discussed. Laboratories require use of both live animals and animal specimens. **Credits:** 2.00

ANSC 43500 - Reproductive Management Of Farm Animals

Credit Hours: 3.00. Management practices associated with improved reproductive efficiency. Procedures for diagnosis of reproductive failure and practical methods of controlling reproduction will be identified. **Credits:** 3.00

ANSC 44000 - Horse Management

Credit Hours: 3.00. Current breeding, feeding, housing, selection, disease control, and other management practices essential for sound economic planning of horse operations in today's horse industry. Laboratory farm visits provide students with real application examples and industry contacts. **Credits:** 3.00

ANSC 44100 - Beef Management

Credit Hours: 3.00. Breeding, feeding, and management practices essential for economical beef production, including performance testing. **Credits:** 3.00

ANSC 44200 - Sheep Management

Credit Hours: 3.00. Breeding, feeding, and management practices essential for economical sheep production and commercial lamb feeding, including performance testing. **Credits:** 3.00

ANSC 44300 - Swine Management

Credit Hours: 3.00. Breeding, feeding, and management practices essential for commercial swine production, including performance testing. **Credits:** 3.00

ANSC 44400 - Dairy Management

Credit Hours: 3.00. Current breeding, feeding, physiology, disease prevention, and management practices essential for economical milk production. Requires class trips. Students will pay individual lodging or meal expenses when necessary. **Credits:** 3.00

ANSC 44500 - Commercial Poultry Management

Credit Hours: 3.00. Current developments and practices in the commercial production of eggs, broilers, and turkeys; principles of breeding, physiology, nutrition, management, and disease prevention. Requires class trips. Students will pay individual lodging or meal expenses when necessary. **Credits:** 3.00

ANSC 44600 - Companion Animal Management

Credit Hours: 3.00. This course details understanding of the economic scope of the pet industry as well as the role of pets in American society. The students will acquire the information to be responsible pet owners by experiencing their knowledge of housing practices, nutritional care, health care, behavior and breeding of companion animals. **Credits:** 3.00

ANSC 47000 - Livestock Judging

Credit Hours: 1.00. This course is designed to teach livestock evaluation, relationship of production data to live animal evaluation characteristics, expand logical thinking and reasoning skills, and enhance oral communication skills. Requires class trips. Students will pay individual lodging or meal expenses when necessary. **Credits:** 1.00

ANSC 47100 - Dairy Judging

Credit Hours: 1.00. Opportunities will exist to allow the student to practice analysis and enhance decision-making processes in placing animals in collegiate dairy contests. Communication skills will be developed to properly present and defend those decisions with confidence. Requires class trips. Students will pay individual lodging or meal expenses when necessary. **Credits:** 1.00

ANSC 48100 - Contemporary Issues In Animal Sciences

Credit Hours: 1.00. Industry-led and student-led discussions and debate of current issues facing animal industries. Experiences from internships, research problems, study abroad, or job shadowing will be shared among the students. **Credits:** 1.00

ANSC 48500 - Dairy Farm Evaluation

Credit Hours: 2.00. This course will provide students with an opportunity to integrate and apply knowledge of dairy cattle management systems, nutrition, reproduction, genetics, milk quality, animal handling, physical farm facilities, manure handling and management, personnel and their financial implications. Students will develop critical analysis skills and apply troubleshooting principles in the identification and resolution of dairy farm management issues in a learning environment that is structured around farm evaluation field trips and case studies. **Credits:** 2.00

ANSC 49100 - Special Problems

Credit Hours: 1.00 to 3.00. Supervised individual laboratory or library assignments. Written reports required. Permission of instructor required. **Credits:** 1.00 to 3.00

ANSC 49200 - Special Assignments

Credit Hours: 0.00. To be arranged with individual staff members prior to registration. Reading, discussions, written reports, seminar presentations, teaching, field or laboratory experiences provided for enrichment in special areas of animal science. Permission of department required. **Credits:** 0.00

ANSC 49300 - Special Assignments

Credit Hours: 1.00 to 3.00. Reading, discussions, written reports, seminar presentations, teaching, field or laboratory experiences provided for enrichment in special areas of animal science. Combination of ANSC 29300 and 49300 cannot exceed six credits. Permission of instructor required. **Credits:** 1.00 to 3.00

ANSC 49400 - Animals And Food Security: International Services Learning

Credit Hours: 1.00 to 4.00. This course prepares students for a service learning international experience and includes the planning of the trip, the actual trip and a reflective learning post-trip class. The course is a partnership between Purdue Animal Sciences, a host university and their students, a local community organization, and an international community development, NGO. The core of the experience is the faculty-led international service learning course where students live and work in villages in a developing country. Students will learn extension methodologies and how to contribute to sustainable projects. Students will be expected to work in bi-national teams across agricultural and community disciplines to not only contribute to the communities served but to apply their classroom knowledge and experience to make a difference in the community. AGEC 43000 is a highly recommended prerequisite. Prerequisites: Multicultural Awareness course (COA list). Permission of instructor required. **Credits:** 1.00 to 4.00

ANSC 49500 - Special Topics In Animal Sciences

Credit Hours: 0.00 to 3.00. Lecture presentation of specialized material not available in the formal courses of the department. The specific topic that is offered will be indicated on the student's record. Permission of instructor required. **Credits:** 0.00 to 3.00

ANSC 49900 - Thesis Research

Credit Hours: 1.00 to 6.00. For students doing specialized animal sciences research; report required. Arrange with academic advisor and honors research coordinator before registering. Permission of instructor required. **Credits:** 1.00 to 6.00

ANSC 51100 - Population Genetics

Credit Hours: 3.00. (AGRY 51100) Basic concepts of population genetics. Characterization of populations using gene frequencies, gametic and zygotic disequilibrium; forces changing gene frequencies (mutation, migration, selection, and random genetic drift) and genotypic frequencies (mating systems: inbreeding, crossbreeding, and phenotypic assortative) and related hypothesis testing; gene trees and the coalescent process; and molecular phylogenies. **Credits:** 3.00

ANSC 51300 - Design Of Animal Breeding Programs

Credit Hours: 3.00. Integration of principles of animal breeding and genetics into animal improvement programs. Emphasis is placed on the interaction among genetics, nutrition, and physiology. **Credits:** 3.00

ANSC 51400 - Animal Biotechnology

Credit Hours: 3.00. Presentation and discussion of the history, developments, and applications of molecular genetic analysis of human and animal genomes, and use of gene transfer in research, animal agriculture, and human medicine. Ethical and

economical ramifications of biotechnology in society will be introduced through reading assignments and discussion. **Credits:** 3.00

ANSC 51600 - Molecular Microbiome Analysis

Credit Hours: 3.00. The overall goal of the course is to provide students with an advanced understanding of microbial ecology in the animal microbiome and how to analyze next-generation sequencing data of amplicon libraries. In order to complete this goal, students will participate in activities including classroom lecture, group discussion, critical reading of literature, written assignments and exams, and student projects. Permission of instructor required.**Credits:** 3.00

ANSC 52200 - Monogastric Nutrition

Credit Hours: 3.00. Digestion and absorption, nutrient utilization and interrelationships in poultry, swine, and other monogastric animals. **Credits:** 3.00

ANSC 52400 - Ruminant Nutrition And Physiology

Credit Hours: 3.00. Physiological, microbiological, and biochemical effects and their interrelationships on digestion and metabolism in the ruminant animal. **Credits:** 3.00

ANSC 53400 - Advanced Reproductive Physiology

Credit Hours: 3.00. A study of mechanisms that interact to control reproduction in farm animals. Current scientific literature and hypotheses are presented, and potential methods to enhance reproductive efficiency are examined. **Credits:** 3.00

ANSC 53500 - Avian Physiology

Credit Hours: 2.00. (BMS 82800) A study of the basic principles of physiology and functional anatomy of birds. Topics include the following systems: muscular, nervous, cardiovascular, respiratory, digestive, lymphoid, endocrine, and reproductive. **Credits:** 2.00

ANSC 53700 - Adipocyte Biology

Credit Hours: 3.00. This course will provide the student with a conceptual background in the development of adipose tissue and its biological function with emphasis on the endocrine and immunologic aspects of the adipocyte. Differences between species will be emphasized where possible. **Credits:** 3.00

ANSC 55200 - Advanced Meat Science

Credit Hours: 3.00. The overall goal of the course is to provide students with an advanced understanding of meat science and technology. In order to complete this goal, students will participate in activities including classroom lecture, group discussion, critical reading of literature, written assignments and exams, and/or student projects. **Credits:** 3.00

ANSC 55500 - Animal Growth And Development

Credit Hours: 3.00. A study of the molecular and cellular processes controlling embryonic development and growth of domesticated animals. Includes discussions of current research concerning molecular mechanisms of fertilization, egg activation, early development, and endocrine factors controlling cell growth, differentiation, and tissue formation. Experimental approaches utilized for developmental and growth biology research are discussed. **Credits:** 3.00

ANSC 59500 - Special Topics In Animal Sciences

Credit Hours: 0.00 to 3.00. Lecture presentation of specialized material not available in the formal courses of the department. The specific topic offered is indicated on the student's record. Permission of instructor required. **Credits:** 0.00 to 3.00

ANSC 62000 - Proteins And Amino Acids In Nutrition

Credit Hours: 3.00. Presentation of concepts concerning requirements for dietary amino acids, nutritional regulation of amino acid metabolism, and regulation of protein metabolism. Integrates biochemical and physiological functions of amino acids and features topics in nutritional regulation of whole-body protein turnover in mammalian and avian species. Offered in odd numbered years. Prerequisite: BCHM 56200. **Credits:** 3.00

ANSC 62500 - Nutritional Biochemistry And Physiology I

Credit Hours: 4.00. (FN 605) Integration of biochemical and physiological functions of nutrients in humans and animals emphasizing interactions in bone and gut. Prerequisite: ANSC 22100, 23000, BCHM 30700. **Credits:** 4.00

ANSC 62600 - Nutritional Biochemistry And Physiology II

Credit Hours: 2.00. (NUTR 60600) Integration of biochemical and physiological functions of nutrients in humans and animals emphasizing post-absorptive use of nutrients as sources of energy and for the synthesis of macromolecules. Offered weeks 1 - 8. Prerequisite: ANSC 62500. **Credits:** 2.00

ANSC 62700 - Nutritional Biochemistry And Physiology III

Credit Hours: 2.00. (NUTR 60700) Integration of biochemical and physiological functions of nutrients in humans and animals, emphasizing lipid metabolism and transport in the context of cardiovascular function. Offered weeks 9-16. Prerequisite: ANSC 62600. **Credits:** 2.00

ANSC 66000 - Intestinal Microbiology And Immunology

Credit Hours: 1.00. (FS 66000) Discussion and critique of recent journal articles related to intestinal microbiology/immunology. The specific areas covered under this forum are: (1) intestinal microbiology, (2) food microbiology as it relates to gastrointestinal diseases, (3) probiotics and prebiotics-related to intestinal health or pathogen control, and (4) mucosal immunity with major emphasis on intestinal immunology. **Credits:** 1.00

ANSC 68100 - Animal Sciences Graduate Seminar

Credit Hours: 1.00. Instruction and application of concepts for effective oral professional presentations in the field of Animal Sciences. The course will provide students with knowledge for effective oral communication of scientific information and an opportunity to put guidelines into practice. Permission of department required. **Credits:** 1.00

ANSC 69100 - Topical Research Problems

Credit Hours: 1.00 to 4.00. To be arranged with individual staff members prior to registration. Requires approval of the department head. Supervised individual research projects. Written reports required. Permission of instructor required. **Credits:** 1.00 to 4.00

ANSC 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required. **Credits:** 1.00 to 18.00

ANSC 69900 - Research PhD Thesis

Credit Hours: 1.00 to 18.00. Research PhD Thesis. Permission of instructor required. **Credits:** 1.00 to 18.00

Anthropology

ANTH 2050N - Introduction to Cultural Anthropology

Credit Hours: 3.00. A survey of cultural and social processes that influence human behavior, with comparative examples from different ethnic groups around the world, with the goal of better understanding the broad range of human behavioral potentials and those influences that shape the different expressions of these potentials. (Not open to students who have had A304.).**Credits:** 3.00

ANTH 10000 - Being Human: Introduction To Anthropology

Credit Hours: 3.00. Introduces anthropology's holistic approach to human nature and behavior. This course uses the tools of cultural, biological, archaeological, and linguistic anthropology to follow the human journey of uniformity and diversity through time and across space. **Credits:** 3.00

ANTH 20100 - Introduction To Archaeology And World Prehistory

Credit Hours: 3.00. Introduction to the ideas and practices of archaeology that are used in the contemporary study of human prehistory. Emphasis is placed on the social and technological changes that accompanied major turning points in the human past, including the earliest stone tools, the development of farming, through the advent of writing and monumental architecture among ancient states. **Credits:** 3.00

ANTH 20300 - Biological Bases Of Human Social Behavior

Credit Hours: 3.00. This course is an introduction to human social behavior from the perspective of biological anthropology, with special emphasis on human evolution and non-human primates. Topics include aggression, communication, learning, maturation, sexuality, and the evolution of social systems. **Credits:** 3.00

ANTH 20400 - Human Origins

Credit Hours: 3.00. Surveys our evolutionary journey, from fossil primates to modern humans, through a review of evolutionary theory and genetics, the fossil evidence for current theories in human evolution with insight from modern non-human primates, and the influence of environmental stressors on modern human biological variation. **Credits:** 3.00

ANTH 20500 - Human Cultural Diversity

Credit Hours: 3.00. Offers an engaging introduction to concepts, themes, methods, and ethical concerns that guide research and analysis in cultural anthropology. Students will learn how to identify and interpret the complexities of human culture - what makes cultures different, and in what ways are they more alike than we might assume? Topics include: race and racism; ethnicity and nationalism; gender; sexuality; kinship, family, and marriage; class and inequality; the global economy; politics and power; religion; and health and illness. **Credits:** 3.00

ANTH 21000 - Technology And Culture

Credit Hours: 3.00. This course explores the social dimensions of technology from the perspective of ancient, modern, and post-modern society. Topics include the origins of particular technologies; processes of technical development and dissemination; the politics of everyday artifacts; virtual identities; and technologies of the body. Suggested courses (not prerequisites): ANTH 10000, ANTH 20100 and/or ANTH 20500. **Credits:** 3.00

ANTH 21200 - Culture, Food And Health

Credit Hours: 3.00. This course is designed to provide an introduction to the field of Nutritional Anthropology in which we will examine issues related to diet, health and illness from holistic anthropological perspectives.**Credits:** 3.00

ANTH 21500 - Introduction To Forensic Anthropology

Credit Hours: 3.00. Introduction to forensic anthropology, the science that utilizes methods from skeletal biology and archaeology as tools in human identification in a medico-legal context. This course introduces students to methods used to recover and positively identify human remains, and to evaluate trauma and taphonomy in medico-legal situations. Topics include an overview of historical and current developments in the field. Students will develop a comprehensive understanding of the sequential order of applied work from the search for forensic scenes through the recovery of remains, and skeletal analysis in the laboratory. **Credits:** 3.00

ANTH 23000 - Gender Across Cultures

Credit Hours: 3.00. Explores gender and sexuality from a cross-cultural perspective. Draws on case studies to explore the complexities of women's and men's lives. Examines gender hierarchies, gender in a globalized world, and the cultural construction of sexuality and gender. **Credits:** 3.00

ANTH 23500 - The Great Apes

Credit Hours: 3.00. Students will learn the behavior and conservation of our closest relatives and how early ape studies changed our understanding of what it meant to be human. Topics include gender in science, ethics of research and cross-cultural understandings. **Credits:** 3.00

ANTH 24000 - Medicine, Science, And Culture

Credit Hours: 3.00. This course explores the intersections of medicine, science, and culture as powerful shapers of our lives and the world today. Anthropology broadly studies the human experience to help explain how our bodies, biology, and beliefs inform what "medicine," "health," "illness," and "healing" come to mean in diverse and cross-cultural contexts. The course will cover foundations in medical anthropology by exploring a range of topics and applications.**Credits:** 3.00

ANTH 25400 - Archaeological Hoaxes, Myths And Frauds

Credit Hours: 3.00. This course examines why the ancient past inspires so many theories about aliens, dark conspiracies, lost civilizations, and apocalyptic predictions. Topics include the popularity of pseudoscientific theories in American culture and the historical contexts in which common pseudoscientific ideas have emerged; why they persist in the face of archaeological evidence; and the role of pseudo-archaeology in the growing antagonism toward scientific expertise. Through an understanding of datasets and methods archaeologists use to evaluate claims about the past, the course goes beyond debunking ancient aliens and Atlantis to develop important critical thinking skills to evaluate evidence and recognize pseudo-scientific arguments in the media. **Credits:** 3.00

ANTH 25600 - Archaeology Of Beer

Credit Hours: 3.00. Alcoholic beverages are an important aspect of foodways, the cultural practices and values surrounding food and drink. This course provides an overview of the ancient origins of beer and other alcoholic beverages globally, and examines the cultural context and social role of these innovations through a combination of archaeology, material culture studies, historical texts, and ethnography. In addition to examining archaeological case studies of the production and consumption of beer and other alcoholic beverages, topics to be covered include: evolution of brewing and fermenting technology, biology and chemistry of brewing and fermentation, residue and materials analysis, origins of agriculture, emergence of social complexity, sexual division of labor, social identity (gender, class, ethnicity), and recent trends in production and consumption. **Credits:** 3.00

ANTH 28200 - Introduction To LGBTQ Studies

Credit Hours: 3.00. (WGSS 28200) This course offers students an introduction to the interdisciplinary study of lesbian, gay, bisexual, transgender and queer lives. It provides a basic grounding in theories of sexuality and LGBT histories, identities and movements in the U.S. and globally. **Credits:** 3.00

ANTH 30600 - Quantitative Methods For Anthropological Research

Credit Hours: 3.00. This course provides an introduction to the broad statistical methods used throughout the 4-fields of Anthropology. It covers elementary probability theory, basic concepts of statistical inference and study design. The course will motivate statistical methods through data analysis and visualization. It is designed for students who intend to focus in an anthropological discipline. It would also benefit a variety of students interested in 1) quantitative science literacy and planning for graduate work, 2) joining the workforce and becoming part of the educated citizenry. There are no prerequisites from the Statistics or Mathematics Departments. **Credits:** 3.00

ANTH 30700 - The Development Of Contemporary Anthropological Theory

Credit Hours: 3.00. Explores the history of anthropological theories pertaining to the understanding of commonality and variation in human biology, behavior, society, and cultures as they have developed over the approximately two centuries since anthropology was founded as a separate discipline. Considers those social, cultural, and historical factors that have influenced the history of anthropological ideas. Permission of instructor required. **Credits:** 3.00

ANTH 30800 - Critical Data Studies

Credit Hours: 3.00. Critical Data Studies (CDS), is an interdisciplinary field that addresses the ethical, legal, socio-cultural, epistemological and political aspects of data science, big data and digital infrastructure. This course focuses on current topics in critical data studies scholarship. Particular emphasis will be given to democratic and participatory approaches to algorithm design and responsible data management, curation and dissemination. Students will develop tools and methods to help scholars think critically and identify issues of concern to Local Communities. This is a research and writing intensive course.**Credits:** 3.00

ANTH 31000 - Mortuary Practices Across Cultures

Credit Hours: 3.00. Explores how death is treated or has been treated in diverse world cultures and time periods. Death is viewed as an expression of social behavior and as an expression of symbolic meaning. **Credits:** 3.00

ANTH 31100 - The Archaeology Of The Ancient Andes

Credit Hours: 3.00. Development of Andean culture from its earliest roots through the Spanish conquest of the Inca empire in the 16th century. Topics will include first settlement, the development of the first complex societies, and the emergence and collapse of the Inca Empire. **Credits:** 3.00

ANTH 31200 - The Archaeology Of Ancient Egypt And The Near East

Credit Hours: 3.00. Selected topics on the archaeology of ancient Near Eastern cultures in Mesopotamia, the circum-Mediterranean area, Egypt, and the Nile Valley, emphasizing an anthropological interpretation of the political, social, religious, and economic systems that contributed to their development. **Credits:** 3.00

ANTH 31300 - Archaeology Of North America

Credit Hours: 3.00. Archaeological overview of North America emphasizing Indigenous cultures prior to the arrival of Europeans, but including Contact and Post-Contact communities of the Historic Period. Topics will include the peopling of the Americas, culture and environment, social complexity, and Cultural Resource Management. **Credits:** 3.00

ANTH 32000 - Ancient States And Empires

Credit Hours: 3.00. Why did some small-scale societies develop into complex chiefdoms, states, and empires while others did not? How did ancient societies adapt in the face of social conflict and environmental challenges? What lessons can we learn from resilience or collapse of states in the ancient past? This course compares the political, social, ecological, contexts of the rise and fall of early complex societies, from densely populated hunter-gatherers in North America to the world's major ancient civilizations in Mesoamerica, the Andes, Nile Valley, Mesopotamia, Indus Valley, and China. We will also explore how societies responded to 'grand challenges' in antiquity such as climate variability, food insecurity, global-intercultural interaction, and what modern lessons we might derive from their successes and failures. **Credits:** 3.00

ANTH 32700 - Environment And Culture

Credit Hours: 3.00. This course provides a general overview to the field of environmental anthropology, and surveys key methods, and theories that anthropologists use to interpret human-environment interactions. Topics include culture ecology, agroecology, ethnobiology, political ecology, and environmental justice. **Credits:** 3.00

ANTH 33500 - Primate Behavior

Credit Hours: 3.00. This course is an introduction to the primate order and primate studies. The emphasis is on field studies. Ecological influences on social organization and behavior, learning, play, and communication will be considered as adaptations within an evolutionary framework.**Credits:** 3.00

ANTH 33600 - Human Variation

Credit Hours: 3.00. Biological differences between human individuals and groups, causes of variations, the role of genetics, concepts of race, and the interrelationship between the social and biological meanings of race will be considered. **Credits:** 3.00

ANTH 33700 - Human Diet: Origins And Evolution

Credit Hours: 3.00. This course will survey humans evolving relationship with food over the last few million years; from our Pilo-pleistocene origins (foraging) through the origins of agriculture to modern industrial food production. **Credits:** 3.00

ANTH 34000 - Global Perspectives On Health

Credit Hours: 3.00. This course examines health issues and risks faced by individuals around the world, but especially in resource poor geographical areas. We will explore in-depth the gendered, ethnic, cultural, and class dimensions that underlie the patterning of disease and illness worldwide. **Credits:** 3.00

ANTH 34100 - Culture And Personality

Credit Hours: 3.00. A cross-cultural survey stressing different basic personality types and the processes by which adult personality is acquired. Case studies of selected non-Western cultures will be used to provide comparative perspective. **Credits:** 3.00

ANTH 34600 - Pregnancy, Birth, And Babies

Credit Hours: 3.00. This course examines human universal patterns and cross-cultural variation in pregnancy, birth, and infant care practices, using evolutionary and biocultural perspectives. Students will connect course themes to current events and controversies, such as medical models of birth, public breastfeeding, and parent-infant co-sleeping.**Credits:** 3.00

ANTH 35800 - African Cultures

Credit Hours: 3.00. An introduction to the diversity of African cultures emphasizing detailed studies of selected cultural groups. Ethnographic writings about African cultures are assessed in relation to general information about the continent, its people and the colonial experience. **Credits:** 3.00

ANTH 36800 - Sociolinguistic Study Of African American English

Credit Hours: 3.00. A study of the history, structure, uses, and educational concerns of African American speech communities and the culture at large. **Credits:** 3.00

ANTH 37000 - Ethnicity And Culture

Credit Hours: 3.00. Course examines ethnicity and nation as constructs that vary across cultures, history and space, and surveys theories of cultures, ethnicity and nationalism. Issues examined include cultural identities, power, domination and resistance, and the role of identity politics in contemporary conflicts. **Credits:** 3.00

ANTH 37300 - Anthropology Of Religion

Credit Hours: 3.00. Anthropological theories of the origin, development, and functions of religion, ritual, and myth. Data drawn from western and non-western societies, with special emphasis on the relationship of religion to social structure, cultural patterns, and social change. **Credits:** 3.00

ANTH 37600 - Archaeology Of Death

Credit Hours: 3.00. Examination of mortuary behavior using archaeological, ethnographic, ethnohistorical, and biological data. Review of methods of studying variation in mortuary practices. **Credits:** 3.00

ANTH 37700 - Anthropology Of Hunter-Gatherer Societies

Credit Hours: 3.00. Selective global survey of societies whose mode of subsistence is/was based on the collection of wild food resources. Topics to be covered include: the development and current state of theory, ecology, social organization, land use, demography, subsistence rights, and worldview. **Credits:** 3.00

ANTH 37800 - Archaeology And Cultural Anthropology Of Mesoamerica (Mexico, Belize And Guatemala)

Credit Hours: 3.00. Overview of Mesoamerican peoples, cultures, and languages from the earliest periods to the rise of civilizations including Aztec, Maya, and Zapotec, and from the Spanish Conquest to the modern Indian communities of Mexico, Guatemala, and Belize. **Credits:** 3.00

ANTH 37900 - Native American Cultures

Credit Hours: 3.00. General survey of Native cultures of the Americas. Topics to be covered include prehistory, language, religion, aesthetics, culture contact and change, contemporary issues, and social, economic and political organization. **Credits:** 3.00

ANTH 38000 - Using Anthropology In The World

Credit Hours: 3.00. The use of anthropology in practical contexts. What anthropological practice is, how it originated, how it can be applied in non-academic and interdisciplinary contexts and careers. The main contemporary issues surrounding anthropological practice, including training, ethics, relevance, and rigor. For majors and non-majors. **Credits:** 3.00

ANTH 38400 - Designing For People: Anthropological Approaches

Credit Hours: 3.00. This course is about designing for people. You will use anthropological knowledge and skills to better understand human and technology interactions. With students from other fields, you will learn how to apply an anthropological perspective to human centered design and design with the needs of a specific user group in mind. **Credits:** 3.00

ANTH 38500 - Community Engagement In Anthropology

Credit Hours: 3.00. This course offers hands-on service learning experience with local community organizations involved with minority and immigrant populations. Part of the semester will include class meetings to explore issues and experiences of immigrant and ethnic groups in the U.S. **Credits:** 3.00

ANTH 38501 - Topics In Anthropology

Credit Hours: 3.00. An examination of selected topics in the field of anthropology. P: Sophomore or higher class standing required. **Credits:** 3.00

ANTH 39000 - Individual Research In Anthropology

Credit Hours: 1.00 to 3.00. Individual research or reading in an area of anthropology under the guidance of an anthropology faculty member. Permission of instructor required. **Credits:** 1.00 to 3.00

ANTH 39200 - Selected Topics In Anthropology

Credit Hours: 1.00 to 3.00. Various topics in anthropology that may change from semester to semester are presented by anthropology faculty members. **Credits:** 1.00 to 3.00

ANTH 39300 - Interdisciplinary Approaches To Environmental And Sustainability Studies

Credit Hours: 3.00. (ENGL 39300) This course is the lynchpin of the undergraduate Certificate in Environmental and Sustainability Studies. It will present a series of case studies, core concepts, and problem questions that integrate the following three academic approaches: 1) Human Dimensions and Environment/Sustainability, 2) Engineering and Environment/Sustainability, and 3) Environmental/Sustainability Sciences. **Credits:** 3.00

ANTH 40002 - Archaeological Methods And Techniques

Credit Hours: 3.00. Introduction to archaeological methods and techniques both in the field and laboratory. Fundamentals of field and laboratory equipment and technology, artifact recovery and processing, and report preparation. Introduction to preservation laws and regulations, and archaeological ethics and their application to archaeological practice. **Credits:** 3.00

ANTH 40400 - Comparative Social Organization

Credit Hours: 3.00. The course uses a broad cross-cultural comparative perspective to identify and analyze the major forms of human social organization. Emphasis is on kinship terminology, descent, marriage, residence units, economic exchange, political structure, and social inequality. **Credits:** 3.00

ANTH 40500 - Ethnographic Methods

Credit Hours: 3.00. This course introduces students to the basic methods of ethnographic research: the collection, analysis, and presentation of data derived from the systematic, direct observation of human behavior and interviewing of key informants. Students are required to complete a field project. **Credits:** 3.00

ANTH 41001 - Senior Capstone In Anthropology

Credit Hours: 3.00. Culminating experience required for all anthropology majors. Course synthesizes four-field anthropology coursework and training, and discusses academic/career options that benefit from anthropological training. Major element of the course will include synthesis paper and presentation, senior portfolio, and professional development. **Credits:** 3.00

ANTH 41400 - Introduction To Language And Culture

Credit Hours: 3.00. An exploration into the nature of human communication, particularly the structures, functions, and substance of human language. Focus is on the interpenetration of language, culture and cognition, on the evolution of language and speech, and on their uses in everyday life. **Credits:** 3.00

ANTH 41800 - Field Methods In Cultural Anthropology

Credit Hours: 1.00 to 9.00. Introduces basic field methods in Cultural Anthropology. Topics may include ethnographic or other interviewing techniques and methods of inquiry into any of the broad topics covered by Cultural Anthropology. Permission of department required. **Credits:** 1.00 to 9.00

ANTH 42500 - Archaeological Method And Theory

Credit Hours: 3.00. Introduction to the theory and methods of contemporary American archaeology. Basic field and laboratory methods are placed in the context of theoretical viewpoints and problems. Major theoretical issues in the field are explored, showing the integration of American archaeology with anthropology. **Credits:** 3.00

ANTH 42800 - Field Methods In Archaeology

Credit Hours: 1.00 to 9.00. Introduces basic field and laboratory methods in contemporary archaeology: methods of site survey, mapping, and excavation through the excavation of archaeological sites; the basics of archaeological data analysis and classification, and the computer-based analysis of archaeological data. Permission of instructor required.**Credits:** 1.00 to 9.00

ANTH 43600 - Human Evolution

Credit Hours: 3.00. This class examines the fossil evidence for human evolution and theories proposed to explain the development that led from the origin of primates to modern humans. This course will include lectures, exercises with fossil casts, presentation, and discussions. **Credits:** 3.00

ANTH 43800 - Field Methods In Biological Anthropology

Credit Hours: 1.00 to 9.00. Introduces basic laboratory methods in Biological Anthropology. Topics may include analysis of human or primate nutritional and biological markers or laboratory methods in the analysis of human skeletal populations. Permission of department required. **Credits:** 1.00 to 9.00

ANTH 46000 - Contemporary Issues In Agriculture

Credit Hours: 3.00. (AGRY 46000) Evaluates environmental, social, and humanistic implications of technological change in modern agriculture, using a problem-solving perspective. **Credits:** 3.00

ANTH 47000 - Psychological Anthropology

Credit Hours: 3.00. This course is an introduction to psychological anthropology, a field of study focusing on the complex relationship between individual experience, human psychology, and social and cultural variation. Using case studies drawn from a variety of cultures, we will discuss a range of topics, including cognition; motivation; emotion; learning and enculturation; self, identity, and personhood; and mental illness. **Credits:** 3.00

ANTH 48200 - Sexual Diversity In Global Perspectives

Credit Hours: 3.00. This course focuses on anthropological and interdisciplinary research in the study of sexuality with particular attention to lesbian, gay, bisexual and transgender identities. It explores historical, theoretical and ethnographic work on sexualities and genders in the US and globally. **Credits:** 3.00

ANTH 49700 - Senior Honors Seminar

Credit Hours: 3.00. A critical examination of some major works in anthropology and sociology, both classical and modern, and of some current theoretical and substantive issues in these disciplines. Open only to students in the departmental honors program. **Credits:** 3.00

ANTH 49800 - Senior Honors Paper

Credit Hours: 3.00. Requires a substantial paper on a topic approved by the instructor. The student is expected to work closely with the instructor on the paper's content and style. A presentation of the results of the work is made at the end of the semester. Open only to students in the departmental honors program. **Credits:** 3.00

ANTH 50400 - Archaeological Theory

Credit Hours: 3.00. Focuses on the development of archaeological theory, discussing several theoretical positions and genres of archaeological research. Students gain experience in working with theory in their own research and achieve literacy in archaeological theories. **Credits:** 3.00

ANTH 50500 - Culture And Society

Credit Hours: 3.00. Introduces contemporary sociocultural anthropology theory and practices, relating material to anthropology's history and its place in the social sciences. Covers problem formulation, study of cultural change, representation of human cultural diversity, and key case studies. **Credits:** 3.00

ANTH 50600 - The Development Of Modern Anthropology

Credit Hours: 3.00. The ways and kinds of thinking about the human species in pre-nineteenth-century Europe: nineteenth- and twentieth-century developments in Europe and North America; the central scientific paradigms; professional societies and journals; and national/international anthropologies will all be covered. **Credits:** 3.00

ANTH 50700 - History Of Theory In Anthropology

Credit Hours: 3.00. Connects the theoretical foundations of anthropology throughout the development of the discipline and related disciplines. Unpacks the when, how, and why of various theoretical positions, their shaping of research, and their concomitant logics of evidence.**Credits:** 3.00

ANTH 51400 - Anthropological Linguistics

Credit Hours: 3.00. Investigates the varieties of communication in human behavior, while exploring linguistics as a tool in social science research. Also considers origins of human language and speech, and relations of language with other aspects of culture, with societal phenomena and with individual cognition. **Credits:** 3.00

ANTH 51900 - Introduction To Semiotics

Credit Hours: 3.00. (COM 50700, ENGL 57000, LC 57000) The study of languages, literatures, and other systems of human communication. Includes a wide range of phenomena which can be brought together by means of a general theory of signs. The course deals with three fundamental areas: 1) verbal communication, 2) nonverbal communication (iconic systems, gestures, body language, etc.), and 3) communication through art forms. **Credits:** 3.00

ANTH 52300 - GIS For Humanities And Social Science Research

Credit Hours: 3.00. This course will introduce students the skills of spatial thinking, basic functions of Geography Information Systems (GIS), and spatial research methods that are most relevant to humanities and social science. The course will start with an introduction to basic GIS concepts and technology, then move onto GIS applications during the research process, including spatial research design, data acquisition, management, visualization, and spatial analytical techniques. Practical work will be introduced and completed using ESRI ArcGIS Pro software. **Credits:** 3.00

ANTH 53400 - Human Osteology

Credit Hours: 3.00. Anatomy of the human skeleton and dentition. Detailed study of skeletal elements and teeth, morphology, function, disease, and pathology. Identification of human remains with regard to age at death, gender, growth, and development in biocultural context. **Credits:** 3.00

ANTH 53500 - Foundations Of Biological Anthropology

Credit Hours: 3.00. Covers topics in biological anthropology, applying to both living and extinct humans and to non-human primates. Topics include: evolutionary theory; genetics; human variation and the race concept; intersections of biology and culture; fossils and paleoanthropology; ecology and speciation, primate behavior, and theories on the social behavior of early and contemporary humans. **Credits:** 3.00

ANTH 53600 - Primate Ecology

Credit Hours: 3.00. An examination of the complex interrelationships between populations of nonhuman primates and their habitats. Course topics focus on behavioral ecology and conservation including, predator-prey relationships, diet, and interspecific relations. **Credits:** 3.00

ANTH 56300 - Historical Linguistics

Credit Hours: 3.00. (ENGL 56300, LC 56300) A survey of mechanisms and motivations of linguistic change. Topics include: phonological, morphological, semantic and syntactic change, comparative and internal reconstruction, linguistic variation, language contact, and linguistic typology. **Credits:** 3.00

ANTH 56500 - Sociolinguistics

Credit Hours: 3.00. (SLHS 56500, COM 56500, ENGL 56500, LC 56500, LING 56500) An introduction to language in its social context, focusing on uses and users of language. Topics include social class, ethnic group, gender, language attitudes, and bilingualism. **Credits:** 3.00

ANTH 57500 - Economic Anthropology

Credit Hours: 3.00. Investigates economic aspects of nonindustrial societies, including forager, tribal, and peasant social formations. Emphasis on the economics of the domestic sphere and how households are linked to larger structures such as market systems and "world systems." **Credits:** 3.00

ANTH 58900 - Archaeology And Materials Science

Credit Hours: 3.00. This course provides instruction in the methods and theories used by archaeologists and materials scientists to study ancient and historic technology. The course focuses on the analysis and interpretation of archaeological artifacts and provides opportunities for hands-on learning. **Credits:** 3.00

ANTH 59000 - Individual Research Problems

Credit Hours: 1.00 to 3.00. Individual research or reading in an area of anthropology under an anthropology staff member. Does not include thesis work. Permission of instructor required.**Credits:** 1.00 to 3.00

ANTH 59200 - Selected Topics In Anthropology

Credit Hours: 1.00 to 3.00. Topics vary.**Credits:** 1.00 to 3.00

ANTH 60500 - Seminar In Ethnographic Analysis

Credit Hours: 3.00. Focuses on ethnographic research design, methodology, and ethics, discussing the appropriate selection of any method. Students gain experience with the varieties of ethnographic practice across anthropology and sibling sciences, the generation and analysis of data, and the writing up of ethnographic and of other qualitative research. **Credits:** 3.00

ANTH 60600 - Quantitative Research Design

Credit Hours: 3.00. Focuses on quantitative research design, methodology, and ethics, discussing the appropriate selection of any method. Students gain experience in generating and analyzing of quantitative and mixed-method data, and in the writing up and communication of quantitative research, altogether aiming for statistical literacy. **Credits:** 3.00

ANTH 60800 - Proseminar In Graduate Studies In Anthropology

Credit Hours: 2.00. This is an introduction to graduate study in Anthropology at Purdue. Students will be introduced to the research of Purdue Anthropology faculty and how their work fits into the contemporary landscapes of their fields. Students will gain familiarity with tools needed for graduate work in Anthropology at Purdue and be exposed to navigating the world of academic conferences and publishing. Students will have opportunities to engage in discussions on research ethics in our field. Students will engage with visiting speakers and their work as well as participate in learning how to organize academic events. During the semester, students will also be introduced to the resources available at Purdue to support their graduate studies and professional development including funding opportunities, procedures for preparing for research, career planning, supports for teaching, information about the structure of the Anthropology graduate program and supports for work-life balance. Students will receive credit for the course based on participation. Permission of instructor required.**Credits:** 2.00

ANTH 60900 - Seminar In Anthropology

Credit Hours: 2.00 or 3.00. Topics vary. Permission of instructor required. **Credits:** 2.00 or 3.00

ANTH 61100 - Special Topics In Archaeology

Credit Hours: 3.00. Critical examination of a selected aspect of contemporary archaeological research and theory. Topics will vary from year to year. **Credits:** 3.00

ANTH 62000 - Special Topics In Cultural Anthropology

Credit Hours: 3.00. Critical examination of a selected aspect of contemporary cultural anthropology research and theory. Topics will vary from year to year. **Credits:** 3.00

ANTH 62700 - Political Ecology

Credit Hours: 3.00. Political ecology centers on questions described as a research framework that pairs the strengths of political economic analysis with sociocultural and ecological approaches to environmental change. Students will explore the diverse ways of doing political ecology by drawing upon the fields of anthropology, political science, geography, and history as well as interdisciplinary environmental sciences. Students will critically examine the field through a historical exploration of its intellectual genealogy, an investigation of current research trends, and imagining possible future directions. Emphasis will be placed on both theory and methods while analyzing a variety of case studies. Permission of instructor required. **Credits:** 3.00

ANTH 63000 - Academic Professional Development

Credit Hours: 3.00. This seminar focuses on research design, grant writing, publishing, giving presentations, and the academic job market. As there are other seminars offered in the department that focus on the applied aspects of anthropology, this seminar focuses primarily on academic topics. The substance of the course will come from your own work in the form of proposals, teaching, and job market materials as well as your review of fellow classmates' work. **Credits:** 3.00

ANTH 64000 - Foundations And Frameworks: Applying Anthropology

Credit Hours: 3.00. This course focuses on using anthropology to address social issues. The course examines topics including: the history of anthropologists working in applied settings, the relationship between theory and practice, professional ethics, job

opportunities, and skills needed as anthropological practitioners. Students should have some background in anthropology if coming from another discipline e.g. prior coursework or relevant experience as determined by instructor. **Credits:** 3.00

ANTH 64100 - Discovery And Design: Making Projects Work

Credit Hours: 3.00. This course is about using anthropology to make projects work. Students will learn anthropological approaches and methods to discover salient aspects of a design problem and use this understanding to devise responses. Anthropological discovery, design and delivery processes are demonstrated. Students should have some background in anthropology if coming from another discipline e.g. prior coursework or relevant experience as determined by instructor. **Credits:** 3.00

ANTH 64200 - Public Engagement: Using Anthropological Knowledge

Credit Hours: 3.00. This course is about using and communicating anthropological knowledge. We will discuss what it means to work as an anthropologist and public intellectual. Effectively working with stakeholders, presenting information, offering solutions for addressing problems and implementing change are addressed. Students should have some background in anthropology if coming from another discipline e.g. prior coursework or relevant experience as determined by instructor. **Credits:** 3.00

ANTH 67300 - Seminar In The Anthropology Of Religion

Credit Hours: 3.00. Explores anthropological approaches to studying the place of religion in human experience. Considers different theories that anthropologists have developed for understanding religion - symbolic, materialist, evolutionary, psychological, and others - and how they fit with ethnographic data on religion in different cultures. **Credits:** 3.00

ANTH 69600 - Research MS

Credit Hours: 1.00 to 18.00. Research activities related to the MS degree. Possible activities might include, but are not limited to, data collection, individualized reading or project work, participation in group research meetings, proposal and project writing. Activities must be approved by the faculty supervisor. Permission of instructor required. **Credits:** 1.00 to 18.00

ANTH 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required. **Credits:** 1.00 to 18.00

ANTH 69900 - Research PhD Thesis

Credit Hours: 1.00 to 18.00. Research PhD Thesis. Permission of instructor required. **Credits:** 1.00 to 18.00

Arabic

ARAB 10100 - Standard Arabic Level I

Credit Hours: 3.00. Introduction to Modern Standard Arabic: the writing and sound systems, and systematic presentation of basic grammatical structures. Reading, writing, and vocabulary building are emphasized throughout. The course also includes an introduction to Arab culture. No previous knowledge of Arabic required. Permission of department required.**Credits:** 3.00

ARAB 10200 - Standard Arabic Level II

Credit Hours: 3.00. Further study of Modern Standard Arabic. Continued presentation of the basic structures of Arabic grammar and expansion of vocabulary. Reading and writing will be emphasized.**Credits:** 3.00

ARAB 11100 - Elementary Standard Arabic Conversation I

Credit Hours: 1.00. Development of oral skills for self-expression. Guided practice in conversation to enhance communicative competence. Group discussions in Standard Arabic on practical topics. **Credits:** 1.00

ARAB 11200 - Elementary Standard Arabic Conversation II

Credit Hours: 1.00. Development of oral skills for self-expression. Guided practice in conversation to enhance communicative competence. Small group discussions in Standard Arabic on practical topics. May be taken concurrently with ARAB 10200. **Credits:** 1.00

ARAB 12100 - Qur'anic Arabic Level I

Credit Hours: 3.00. Introduces students with knowledge of the Arabic alphabet and elementary Arabic word structure to the basic elements of Qur'anic Arabic and provides them with foundational knowledge of classical Arabic lexicon and grammar. Students will gain insights into the organizational structure of different words and short phrases as they explore the nature of Qur'anic Arabic, its diction, morphology and vocabulary that are crucial for understanding the text. In this course, students will also expand their vocabulary as they work through exercises focusing on identifying the importance of rendering sounds for correct reading, recitation and morphology of different words through sample excerpts from short chapters of the Qur'an. Students can take this course for language credit to meet course requirements in all fields that require a language. Permission of instructor required.
Credits: 3.00

ARAB 12200 - Qur'anic Arabic Level II

Credit Hours: 3.00. Continues students' development and mastery of Qur'anic Arabic and expands the foundational knowledge of classical Arabic lexicon and grammar gained in ARAB 121. Students will gain insights into the morphology and syntax of the Arabic of the Qur'an and explore Qur'anic Arabic, its diction, morphology and vocabulary that are crucial for understanding the meaning of the text. In this course, students will also expand their vocabulary as they work through exercises focusing on identifying the importance of rendering sounds for correct reading, recitation and morphology of different words through sample excerpts from short chapters of the Qur'an. Students can take this course for language credit to meet course requirements in all fields that require a language.
Credits: 3.00

ARAB 20100 - Standard Arabic Level III

Credit Hours: 3.00. This course is designed to allow students to use the grammar and vocabulary acquired in the first two semesters in dealing with specific social situations. Continued improvement of conversational, reading, and writing abilities and expansion of vocabulary. **Credits:** 3.00

ARAB 20200 - Standard Arabic Level IV

Credit Hours: 3.00. Increased mastery of the four language skills, with emphasis on reading and translation using materials from literary classical and modern Arabic. The course includes a study of some parts of the Koran. **Credits:** 3.00

ARAB 21100 - Elementary Standard Arabic Conversation II

Credit Hours: 1.00. Continuation of ARAB 11200. May be taken concurrently with ARAB 20100. **Credits:** 1.00

ARAB 21200 - Elementary Standard Arabic Conversation IV

Credit Hours: 1.00. Continuation of ARAB 21100. May be taken concurrently with ARAB 20200. **Credits:** 1.00

ARAB 22400 - Arabic Level IV: Business Arabic

Credit Hours: 3.00. Practical reading, writing, speaking, and listening comprehension skills directed toward use of Arabic for business purposes, including language needed for business negotiations, financial situations, travel, and memo writing. Aspects of cultural and social appropriateness needed in business situations in the Arab world. **Credits:** 3.00

ARAB 23000 - Arabic Literature In Translation

Credit Hours: 3.00. Survey of Arabic literature, from the classical to the postmodern period. Emphasis on connections between literary works and contemporary life. Conducted in English; no knowledge of Arabic required. **Credits:** 3.00

ARAB 23900 - Arab Women Writers

Credit Hours: 3.00. Survey of Arab women writers from North Africa, the Middle East, and Arab communities in the Western world. Emphasis on issues of sexuality, marriage, work, travel and immigration. Conducted in English; no knowledge of Arabic required. **Credits:** 3.00

ARAB 28000 - Arabic Culture

Credit Hours: 3.00. A historical and literary survey of defining characteristics of Arabic culture from pre-Islamic times to the modern period. **Credits:** 3.00

ARAB 28100 - Introduction To Islamic Civilization And Culture

Credit Hours: 3.00. This course is a survey of broad currents in the cultures, thought and civilization of the Muslim world. It emphasizes religious, intellectual and cultural trends, social and political structures and contemporary issues of Muslim societies within the current global cultural world. Taught in English. **Credits:** 3.00

ARAB 30100 - Standard Arabic Level V

Credit Hours: 3.00. Continued development of Arabic speaking, listening, reading, and writing abilities, using materials dealing primarily with the everyday life and civilization of Arabic-speaking countries, from various sources (newspapers, poetry, chapters from the Qu'ran). Conducted primarily in Arabic. **Credits:** 3.00

ARAB 30200 - Standard Arabic Level VI

Credit Hours: 3.00. Further work to develop speaking, listening, reading and composition skills in Standard Arabic, using materials dealing with ideas and events that have shaped the Arabic-speaking culture. Conducted primarily in Arabic. **Credits:** 3.00

ARAB 33000 - The Middle East On Film

Credit Hours: 3.00. This course offers an introduction to films produced in the Middle East and on Middle Eastern Cultures. In this class, we will view films from the Arab world, including North Africa, and the large Middle Eastern region. Parallel to film screening, students will read critical and analytical material that provide background as well as commentary and analysis of cultural and historical contexts on content of films and their making. The course will examine a series of topics such as identity politics, religious affiliation, gender, immigration, belonging, homeland and exile. We will also situate the films within the aesthetic traditions of production and reception and analyze how they provide critical perspectives and insights in central issues in the cultures of Middle Eastern cultures. The overarching goal of the class is to provide students with a solid understanding of the function of cinema and films in representation of the evolution and transformation of the cultures and societies of the region and the issues central to how communal and individual identities in the Middle Eastern region are shaped. The class will also equip the students with skills to analyze meaning making and the role of technical aspects such as cinematography, body language, script, setting and acting in the creation of characters. All films will be screened with English subtitles. **Credits:** 3.00

ARAB 33400 - North African Literature And Culture

Credit Hours: 3.00. A view of the culture and society of the Maghreb (Morocco, Algeria, Tunisia, and Libya). Emphasis on issues of race, politics, religion, and gender through literature and other forms of artistic expression, including film and music. Conducted in English; no knowledge of Arabic required. **Credits:** 3.00

ARAB 49000 - Special Topics In Arabic

Credit Hours: 1.00 to 4.00. Study of a selected topic in Arabic literature or culture. The topic will be announced in advance. Conducted in English; readings in English. Permission of instructor required. **Credits:** 1.00 to 4.00

ARAB 58700 - Modern Arab Thought

Credit Hours: 3.00. Prominent and critical issues in modern Arab thought. Identity, historical meaning, the Arab-Islamic cultural legacy, and tradition vs. modernity are engaged through Arab encounters with the West. Conducted in English; no knowledge of Arabic required. **Credits:** 3.00

Architectural Technology

ARCH 11700 - Construction Drafting And CAD

Credit Hours: 3.00. Introduction to drafting and CAD fundamentals, with emphasis on architectural and civil engineering topics. Development of basic drafting skills, using orthographic projections, auxiliary views, pictorial drawings, and drafting conventions. Students may not receive credit for both ART 116 and ART 117.**Credits:** 3.00

ARCH 12000 - Introduction To Construction Drafting With Building Information Modeling (BIM)

Credit Hours: 3.00. Introduction to drafting fundamentals using Building Information Modeling (BIM), an intelligent 3D model-based process that equips architecture, engineering, and construction professionals with the insight and tools to more efficiently plan, design, construct, and manage buildings and infrastructure. Autodesk Revit will be the software presented.

Credits: 3.00

ARCH 15500 - Residential Construction

Credit Hours: 3.00. Wood frame construction through a semester project requiring planning, preliminary, and working drawings. Outside lab assignments are required.**Credits:** 3.00

ARCH 21000 - History Of Architecture I

Credit Hours: 3.00. Survey of styles and influence of cultures which led to the development of architecture and engineering from the earliest times to the early 20th century.**Credits:** 3.00

ARCH 22200 - Commercial Construction

Credit Hours: 3.00. Preparation of preliminary and working drawings for an intermediate-size commercial or institutional building.**Credits:** 3.00

ARCH 22300 - 3D Architectural Modeling I

Credit Hours: 3.00. This course will study graphic solutions to visualizing interior spaces and environments by utilizing 3D modeling software. Students will learn the fundamentals and advanced toolset in the 3D modeling software Trimble SketchUp while working on a semester long visualization project.**Credits:** 3.00

ARCH 32300 - 3D Architectural Modeling II

Credit Hours: 3.00. This course has been designed to expand the students' knowledge, creativity, and technique when creating 3D digital models and renderings. This class should not be the students' introduction into Autodesk Revit Software, but a course developed to refine modeling and rendering skills. Topics include but are not limited to: understanding the use of architecture, materials, lighting, etc.**Credits:** 3.00

ARCH 32500 - Building Science & Energy

Credit Hours: 3.00. The study and practice of interior lighting with an emphasis on environmentally efficient lighting systems and energy economy. Through the design process and execution of luminaire layouts, students will examine the visual process, lamp and luminaire selection, calculation methods, lighting controls and evaluation of effective solutions.**Credits:** 3.00

INT 30200 - Three-Dimensional Design

Credit Hours: 3.00. This studio class examines the fundamentals of three-dimensional design, detailing and documentation, along with 3D thinking and visualization of design solutions sensitive to functional, ergonomic and aesthetic objectives.**Credits:** 3.00

Art and Design

AD 105EN - Beginning Painting I

Credit Hours: 2.00 or 3.00. Introduction to the techniques of painting. Aspects of pictorial composition; wide range of media. Painting from still life and live model. Will not count toward a Herron B.F.A. degree.**Credits:** 2.00 or 3.00

AD 109EN - Color & Interior Design

Credit Hours: 3.00. Aimed primarily at the person wishing to use color with an understanding of its effects in daily life. Survey of traditional meanings in various cultures. Concept of color as energy. Group and individual experiments included in an investigation of color, with regard to motivation and physical and emotional response factors.**Credits:** 3.00

AD 201EN - Photography I For Non, Art Majors

Credit Hours: 1.00 to 3.00. Introduction to the basics of black, and, white fine art photography for non, art majors only. Students provide their own fully manual 35mm camera. Will not count toward a Herron B.F.A. degree.**Credits:** 1.00 to 3.00

AD 1130N - Beginning Drawing I

Credit Hours: 2.00 or 3.00. Introduction to drawing, exploring a wide range of techniques. Study from nature and still, life objects and sketching from the model.**Credits:** 2.00 or 3.00

AD 10500 - Design I

Credit Hours: 3.00. Two-dimensional design fundamentals: concepts and processes. Studio problems are used to introduce concepts, vocabulary, and skills applicable to continued study in a variety of visual disciplines. Includes introduction to a variety of two-dimensional media and computer applications. **Credits:** 3.00

AD 10600 - Design II

Credit Hours: 3.00. Three-dimensional fundamentals: concepts and processes. Studio problems introduce design concepts, vocabulary, and construction skills applicable to continued study in a variety of visual disciplines. Includes introduction to a variety of 3-D media and 3-D computer graphics concepts. **Credits:** 3.00

AD 11300 - Basic Drawing

Credit Hours: 3.00. An introduction to drawing and sketching as a means of communication of ideas. CTL:IFA 1320 Drawing **Credits:** 3.00

AD 11400 - Drawing II

Credit Hours: 3.00. Continuation of AD 11300; emphasis is given to the exploration of a variety of media, the structuring of pictorial space, and figure drawing. **Credits:** 3.00

AD 11700 - Black And White Photography

Credit Hours: 3.00. An introductory course in silver-based photographic processes and creative image making. Emphasis is on the development of camera and darkroom techniques, and fostering critical thinking skills related to the traditions and aesthetics of black and white photographic practice. **Credits:** 3.00

AD 11900 - Color Photography

Credit Hours: 3.00. Introductory course in creative use of color photographic processes and studio practices. Emphasis is on the acquisition of digital cameras, studio, and digital printing skills which enable students to successfully perceive and structure images reflecting color's formal, symbolic, and emotional impact.**Credits:** 3.00

AD 12500 - Introduction To Interior Design

Credit Hours: 3.00. Introductory survey of interior spaces and their impact upon the physical, social, psychological, and aesthetic needs of people. Critical evaluation of concepts in the interior design profession and related fields will be emphasized. **Credits:** 3.00

AD 13000 - Interior Design Communication

Credit Hours: 3.00. Spatial studies, conceptual ideation, and methods of communicating in various two- and three-dimensional media. **Credits:** 3.00

AD 14600 - Design Drawing I

Credit Hours: 3.00. Problems in the skills and methods of professional design drawing. Emphasis on development of drawing as a conceptual tool and as part of the design process. Concentration on the media and techniques used in contemporary design drawing. **Credits:** 3.00

AD 19000 - Special Topics In Art And Design

Credit Hours: 1.00 to 3.00. Topics will vary. Permission of department required. **Credits:** 1.00 to 3.00

AD 20000 - Beginning Painting

Credit Hours: 3.00. This course is an introduction to painting, emphasizing fundamental painting techniques and materials in conjunction with varied subject matter. Traditional and nontraditional approaches and their art historical meanings will be examined and applied. **Credits:** 3.00

AD 20100 - Art For Elementary School Teachers

Credit Hours: 3.00. Art theory and experiences, curriculum theory, and materials preparatory for instruction of elementary school children. No undergraduate students may be enrolled in this course until they have been admitted to teacher education and a copy of this acceptance is on file. **Credits:** 3.00

AD 20200 - Introduction To Art Education

Credit Hours: 2.00. Lectures, readings, and discussions covering the history, theory, and professional literature of art education. **Credits:** 2.00

AD 20500 - Design III

Credit Hours: 3.00. Problems in two- and three-dimensional design, utilizing a variety of tools, materials, and processes. Study is made of the interaction between designer and society, involving concepts in art, psychology, technology, anthropology, and history. **Credits:** 3.00

AD 20600 - Studio In Visual Communication Design

Credit Hours: 3.00. Investigation of visual communication design theory, history, skills, and methodology, as well as preparation of art and mechanicals for graphic arts reproduction. **Credits:** 3.00

AD 21300 - Life Drawing I

Credit Hours: 3.00. Introduction to drawing the human figure with emphasis upon structure and gesture. **Credits:** 3.00

AD 21500 - Materials And Processes

Credit Hours: 3.00. An introductory course in the selection of materials and processes as relevant to design, with laboratory experiences in the safe and proper use of tools and equipment. Required of students wishing extensive access to A&D tools and equipment. **Credits:** 3.00

AD 22000 - Computers In Art

Credit Hours: 3.00. Introduction to computer graphics concepts and the electronic image as a fine art form. Emphasis is placed on personal expression, using the computer as a two-dimensional art tool. **Credits:** 3.00

AD 22600 - History Of Art To 1400

Credit Hours: 3.00. Review of painting, sculpture, and architecture from their beginnings to the end of the Middle Ages. CTL:IFA 1311 Art History I **Credits:** 3.00

AD 22700 - History Of Art Since 1400

Credit Hours: 3.00. Review of painting, sculpture, and architecture from 1400 to present. CTL:IFA 1312 Art History II **Credits:** 3.00

AD 22800 - Visual Communication Design Computing I

Credit Hours: 3.00. An introductory course in visual design computing programs used in the study and production of visual communication design.**Credits:** 3.00

AD 22900 - Visual Communication Design Computing II

Credit Hours: 3.00. An intermediate course in visual design computing programs used in the study and production of visual communication design.**Credits:** 3.00

AD 22901 - Visual Communication Design Sophomore Review

Credit Hours: 0.00. Sophomore Review is a qualifying assessment supervised by faculty members to monitor student learning and progress. Students who do not pass the review will be ineligible for Visual Communication Design upper-level studio courses. Permission from department required. **Credits:** 0.00

AD 23000 - Interior Design I

Credit Hours: 3.00. Study of behavior patterns, perceptions, needs, and usage of three-dimensional space through conceptual solutions to human environments. Interior design theory and application of design process through analysis, research, and synthesis will be explored. **Credits:** 3.00

AD 23300 - Electronic Media Studio

Credit Hours: 3.00. Introductory class to artistic practices on the computer. Students will work with digital still images, sounds, stop-frame animation and HTML-based websites and learn how to connect simple sensors to the computer to control digital images and sounds interactively. **Credits:** 3.00

AD 23400 - Art And Design Internship Preparation

Credit Hours: 1.00. Introduction and preparation for Art & Design Internship experience. Students will develop a resume, cover letter, and other resources in their search for a suitable internship placement. **Credits:** 1.00

AD 23500 - Materials And Processes II

Credit Hours: 3.00. Problems in three-dimensional design, incorporating materials, production processes, and applications of current technology, emphasizing aspects of society and technology. An introduction to complete industrial design problems, including problem definition, concepts, resource information, design development, final proposals, and presentation techniques. **Credits:** 3.00

AD 23600 - Lighting Fundamentals For Photography

Credit Hours: 3.00. Introductory course in understanding electronic strobe lighting. Begins with a review of basic lighting principles and a series of problem-solving assignments, which introduce control, and applications of electronic strobe lighting. Still life photography and portraiture are emphasized and covers on-location lighting. **Credits:** 3.00

AD 24000 - Interior Drafting And Drawing

Credit Hours: 3.00. Basic drafting and drawing techniques used in residential and small commercial buildings. Emphasis on interior projects, on multi-view drawing, isometrics, perspective, and architectural construction drawings, and rendering techniques. **Credits:** 3.00

AD 24200 - Ceramics I

Credit Hours: 3.00. An introduction to ceramic materials and processes used in creating wheelthrown and hand-formed pottery and sculpture. Emphasis on contemporary interpretations of traditional forms. Freshman and Sophomore students have priority. **Credits:** 3.00

AD 24600 - Design Drawing II

Credit Hours: 3.00. Continuation of the work done in A&D 245. Emphasis on development of skills and presentation quality design drawing. **Credits:** 3.00

AD 25000 - Interior Design II

Credit Hours: 3.00. Introduction to space planning methodology applied to small-scale residential and nonresidential environments. Human factors and user requirements, physical and psychological, will be emphasized. Interior materials, components, and special environmental concerns will be explored. **Credits:** 3.00

AD 25001 - Interior Design Sophomore Review

Credit Hours: 0.00. Sophomore Review is a qualifying assessment supervised by faculty members to monitor student learning and progress. Students who do not pass the review will be ineligible for Interior Design upper-level studio courses. Permission from department required. **Credits:** 0.00

AD 25100 - History Of Photography I

Credit Hours: 3.00. An introduction of the history of photography from the medium's inception until 1950. Emphasis is placed on understanding photographs from a variety of aesthetic, social, and cultural perspectives, including those of race, class, and gender. **Credits:** 3.00

AD 25500 - Art Appreciation

Credit Hours: 3.00. Understanding and appreciation of the problems overcome by mankind in the origins and growth of art. **Credits:** 3.00

AD 25600 - Presentation Techniques

Credit Hours: 3.00. Studio preparing students for project presentations. Classes will cover graphic techniques, including page layout, typography, portfolio formats, perspective drawings, photography, and verbal communication. **Credits:** 3.00

AD 25601 - Industrial Design Sophomore Review

Credit Hours: 0.00. This course is a qualifying assessment supervised by faculty members to monitor student learning and progress. Students who do not pass the review will be ineligible for Industrial Design upper-level studio courses. Permission from department required. **Credits:** 0.00

AD 26200 - Jewelry And Metalwork I

Credit Hours: 3.00. An introduction to the design and execution of hand-wrought jewelry and metalwork. **Credits:** 3.00

AD 26500 - Relief Printmaking

Credit Hours: 3.00. An introduction to the techniques of woodcut, linocut, collagraph, and related media. Emphasis on fine art conceptual issues, creativity, matting and framing art, and professional practices. **Credits:** 3.00

AD 26600 - Silkscreen Printmaking

Credit Hours: 3.00. An introduction to the techniques of silkscreen printmaking on paper, including the uses of handmade and light-sensitive stencils. Emphasis on fine art conceptual issues, creativity, matting, and framing art, and professional practices. **Credits:** 3.00

AD 26700 - Digital Imaging

Credit Hours: 3.00. An introductory course in the creative generation and digital enhancement of photo-related imagery. Emphasis is on the development of technical and critical thinking skills, as well as fostering an awareness of pertinent theoretical issues in digital age.**Credits:** 3.00

AD 27000 - Constructed Textiles

Credit Hours: 3.00. A beginning class in non-loom constructed textile techniques such as macram and card-weaving. Emphasis on three-dimensional design in fiber using historical textile structures as the basis for contemporary interpretations. **Credits:** 3.00

AD 27100 - Dyed Textiles

Credit Hours: 3.00. Beginning course in non-screen fabric dyeing techniques such as tie-dye and batik. Survey of historical surface design for contemporary interpretations in both two and three dimensions. **Credits:** 3.00

AD 27500 - Beginning Sculpture

Credit Hours: 3.00. An introductory course in sculpture, exploring basic concepts, techniques, and materials. Problems in class will emphasize individual student's aesthetic understanding of techniques and inventive use of materials. **Credits:** 3.00

AD 28000 - Human Behavior And Designed Environment

Credit Hours: 3.00. This foundation course examines issues pertaining to the environment's effects on human behavior and how humans' physiological, informational, and social needs impact the design of interior spaces. Specific topics explored include: personal and social use of space, proxemics, ergonomics, anthropometrics, cultural factors and universal design. **Credits:** 3.00

AD 28500 - Interior Components And Materials

Credit Hours: 3.00. Study of surface materials and subsystems and their application to architectural interior spaces. Emphasis on specification guidelines, including product performance, building codes, fire, safety, and health regulations. **Credits:** 3.00

AD 29000 - Special Topics In Art And Design

Credit Hours: 1.00 to 3.00. Topics will vary. Permission of department required. **Credits:** 1.00 to 3.00

AD 29199 - Cooperative Experience I

Credit Hours: 0.00. Professional experience in art and design. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

AD 29299 - Cooperative Experience II

Credit Hours: 0.00. Professional experience in art and design. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

AD 30000 - Life Drawing II

Credit Hours: 3.00. Emphasis is given to organizing the figure in pictorial space. **Credits:** 3.00

AD 30200 - Theory And Practice Of Elementary School Art

Credit Hours: 3.00. Theory and practice of art education for elementary school from early childhood through middle childhood. Restricted to art education majors. **Credits:** 3.00

AD 30300 - Art in Middle/Junior High Schools

Credit Hours: 3.00. Theory and practice of art education for early adolescent students in the middle/junior high school. **Credits:** 3.00

AD 30400 - Video Art

Credit Hours: 3.00. Introduction to digital video as a creative medium for artistic expression. Students will record, digitize, edit and distribute digital video content and author a digital portfolio of their work in the form of an interactive DVD. Permission of department required. **Credits:** 3.00

AD 30500 - Industrial Design I

Credit Hours: 3.00. Introduction to design principles in processes employing basic problem-solving techniques. Emphasis will be placed on man's interaction with form, thought processes, procedures, craftsmanship, and use of materials. Acceptance into professional industrial design concentration by successful performance in the mandatory portfolio review. Prerequisites: Passing mandatory portfolio review.**Credits:** 3.00

AD 30600 - Industrial Design II

Credit Hours: 3.00. An analysis of design through organic and aesthetic principles, natural solutions, and man-made systems. Skills and techniques for communication of creative design solutions. Rapid visualization, rendering, model making, and working models will be stressed. **Credits:** 3.00

AD 30701 - History Of Contemporary Photography

Credit Hours: 3.00. This course examines evolution of major themes in contemporary photography (Digital era to Present) from a variety of aesthetic, social, and cultural perspectives, fostering an awareness of pertinent theoretical issues. **Credits:** 3.00

AD 31100 - Ancient Greek Art

Credit Hours: 3.00. The great variety of Greek art, which helped lay the foundation of Western artistic tradition, is presented in several different media and over a period of several centuries. The social context and cultural context of Greek art, especially its humanistic values, is emphasized. Offered every two years. **Credits:** 3.00

AD 31200 - Ancient Roman Art

Credit Hours: 3.00. The history of Roman art in several different media is studied, from its origins to the end of the Empire, stressing the social and historical content of this art and its legacy to the modern world. Architecture, sculpture, painting and mosaics are emphasized along with small-scale arts such as jewelry, ceramics, and glass. Offered every two years. **Credits:** 3.00

AD 31400 - Experimental Drawing

Credit Hours: 3.00. Individual development of students' drawing abilities and skills at intermediate and advanced levels, emphasizing drawing as primary means of expression, experimentation with materials, and exposure to many different modes of creating in the area of drawing. **Credits:** 3.00

AD 31500 - Design Methodology

Credit Hours: 3.00. This course will cover the fundamental concepts of design methodology. Studies in various problem-solving and research methods as they apply to the designer and society.**Credits:** 3.00

AD 31600 - Seminar On Ideas In Industrial Design I: Design And Society

Credit Hours: 3.00. A study of design and the designer and the factors in society that affect his or her work. **Credits:** 3.00

AD 31800 - Fundamentals Of Interactive Multimedia Design

Credit Hours: 3.00. Fundamental issues of interactive multimedia design: Animation, interface design, and experience design from a visual communications perspective.**Credits:** 3.00

AD 31900 - Web Design For Visual Communication

Credit Hours: 3.00. Introduction to web-based design from a visual communication design application. **Credits:** 3.00

AD 32600 - Physical Computing

Credit Hours: 3.00. Introduction to electronics and computer vision for artists. Students learn to create expressive audiovisual systems that can respond to events in the physical world (movement, light/temperature change, sound, touch, etc.) through custom interfaces. **Credits:** 3.00

AD 33000 - Interior Design III

Credit Hours: 3.00. Study of advanced space-planning criteria and selection of furnishings, equipment, materials, and finishes. Design considerations for special populations (e.g., disabled, aged, low-income) will be explored. Must pass mandatory portfolio review. Prerequisites: Passing mandatory portfolio review.**Credits:** 3.00

AD 33100 - Digital Video Production And Aesthetics

Credit Hours: 3.00. This course is a basic studio introduction to video production and how video can be used as an artistic medium in conjunction with the students' photography. Topics include video/film formats, lighting, audio, editing, distribution, experimental, commercial and music video, production paperwork and extensive time spent on mastering the camera. Classes will consist of hands-on demonstrations, and critiques. **Credits:** 3.00

AD 33200 - Visual Communication Design I

Credit Hours: 3.00. A course designed to introduce the student to projects that will develop an understanding of basic problem-solving techniques in the areas of publication and promotional graphics. Acceptance into professional VCD sequence via mandatory portfolio review.**Credits:** 3.00

AD 33300 - Photo Silk Screen

Credit Hours: 3.00. Advanced study of the techniques of photo silkscreen and light-sensitive stencils. Emphasis on fine art conceptual issues, creativity, matting and framing art, and professional practices. **Credits:** 3.00

AD 33400 - New Media Culture

Credit Hours: 3.00. This lecture course provides a historical overview of the development of new media art. In their research, project papers, and practical assignments, students explore issues of media criticism, technology's impact on culture and society and visions of media utopias. **Credits:** 3.00

AD 33700 - Commercial And Professional Practice In Photography

Credit Hours: 3.00. This course introduces students the skills necessary to attain entry-level employment in the photographic field and familiarizes students with the vocabulary, procedures, and working realities specific to occupations in the field of photography in the areas of photo-journalism, magazine illustration, advertising/web design, and fine arts. Permission of department required. **Credits:** 3.00

AD 33800 - Advanced Interior Design Communication

Credit Hours: 3.00. Study of graphic design fundamentals and application of interior design visual presentation. To provide a foundation for developing proficiency in the use visual communication design in interior design presentation. Offered 3rd year in the Interior Design BFA program of study.**Credits:** 3.00

AD 33900 - Women Artists In The 20th Century

Credit Hours: 3.00. A critical overview of the lives, works, and experiences of women artists from the late 19th century to the present, examining the social and cultural challenges they faced, and reflecting on the changing roles women have played in art and society. **Credits:** 3.00

AD 34000 - Furniture Development

Credit Hours: 3.00. This course is an introduction to furniture design. The focus of this course is information relevant to furniture design including: basic ergonomics, structural techniques and materials and processes. Additional pertinent information regarding new and ongoing design trends will be explored. A mid-semester field trip to a major furniture manufacturer and/or design studio is offered. Students will design and build two of the following objects: a small freestanding shelving unit, small table, bench, table top object or stool. Students must pass mandatory portfolio review for this course. **Credits:** 3.00

AD 34200 - Ceramics II

Credit Hours: 3.00. A continuation of AD 24200; according to student needs in creating ceramic forms, a variety of in-depth experiences: experimental kiln building and firing techniques, methods of ceramic construction, surface treatment, and clay and glaze formulation. **Credits:** 3.00

AD 34300 - Northern Renaissance Art

Credit Hours: 3.00. The development of a mature North European art originating in the International Gothic tradition and culminating in the works of Albrecht Durer, Jerome Bosch, and Pieter Bruegel, the Elder. **Credits:** 3.00

AD 34400 - Latin American Art In The 20th Century

Credit Hours: 3.00. This course offers a critical yet comprehensive overview of modern and contemporary art from Latin America. It focuses on major artists, whose works and contributions are considered in both their specific socio-cultural context and in a larger art historical perspective. **Credits:** 3.00

AD 34600 - Italian Renaissance Art

Credit Hours: 3.00. A study of the painting, sculpture and architecture of Italy between 1300 and 1545 AD, including artists such as Leonardo da Vinci, Raphael and Michelangelo. The course will also relate these works of art to the culture, religion, politics, economics and social life of the period. **Credits:** 3.00

AD 34700 - Lighting For Interior Environments

Credit Hours: 3.00. The study of illuminating principles, design criteria, specifications and environmental systems applied to architectural interiors in public and private spaces. Permission of department required.**Credits:** 3.00

AD 34800 - History Of Islamic Art

Credit Hours: 3.00. Islamic art, one of the world's richest artistic traditions, is surveyed from its origins in the 7th century AD to the modern day. All types of artistic media, from large to small-scale, are included and seen against the background of the Islamic religion and history. Offered on a two-year rotation. **Credits:** 3.00

AD 35000 - Interior Design IV

Credit Hours: 3.00. Study of large-scale public and social spaces, emphasizing interior systems and components. Application of design for historic preservation, renovation, or adaptive reuse will be considered. **Credits:** 3.00

AD 35900 - Medieval European Art

Credit Hours: 3.00. A comprehensive study of the varied art forms in Western Europe from the decline of the Roman Empire until the beginnings of the Italian Renaissance: 500 A.D. to 1500 A.D. **Credits:** 3.00

AD 36101 - The Constructed Image

Credit Hours: 3.00. An intermediate level course focusing on the production of creative images constructed in the studio and in the field. Projects will address the planning and design of photographic images through the use of set design, styling, and post-production. Students will investigate both historical and contemporary trends in the art of the photographically-constructed image.**Credits:** 3.00

AD 36200 - Jewelry And Metalwork

Credit Hours: 3.00. Lost wax casting and mold making, mechanisms and stone setting for jewelry and metalwork. **Credits:** 3.00

AD 36300 - Documentary Photography

Credit Hours: 3.00. This course is an introduction to the great tradition of documentary photography. Students learn to see the world around them in a new way and produce a documentary project. The course requires reading and writing about photography, as well as making photography on a regular basis. The class emphasis is on thinking about why people photograph, what photographs do and do not mean to us, and on doing documentary work, on telling stories with photographs. **Credits:** 3.00

AD 36500 - Intermediate Painting

Credit Hours: 3.00. A studio course concentrating on the development of conceptual and technical skills of painting. This course is designed to help individual students gain a greater awareness of their personal creative goals and to foster means of expression. **Credits:** 3.00

AD 36600 - Visual Communication Design II

Credit Hours: 3.00. Field trips may be required. The study of corporate graphics and visual identity programs. **Credits:** 3.00

AD 36800 - Etching And Intaglio Printmaking

Credit Hours: 3.00. An introduction to the techniques of etching, engraving, aquatint, drypoint, collagraph, monoprint, and related processes. Emphasis on fine art conceptual issues, creativity, matting and framing art, and professional practices. **Credits:** 3.00

AD 36900 - Lithographic Printmaking

Credit Hours: 3.00. An introduction to the techniques of stone and plate lithography. Emphasis on fine art conceptual issues, creativity, matting and framing art, and professional practices. **Credits:** 3.00

AD 37000 - Woven Textiles

Credit Hours: 3.00. A beginning course in loom-woven textiles and pattern drafting. Emphasis on two- and three-dimensional design in fiber, using historical textile structures as the basis for contemporary interpretations.**Credits:** 3.00

AD 38000 - Baroque Art

Credit Hours: 3.00. A survey of European art and architecture during the 17th century, focused on Italy and the Netherlands, and emphasizing some of their leading painters. Works of art are seen in a broad social and cultural context, including the Counter-Reformation and the rise of capitalism. **Credits:** 3.00

AD 38100 - Alternative Photographic Processes

Credit Hours: 3.00. This course is designed to explore methods and concepts for creating photographs using alternative and historic processes. Through technical workshops and assigned projects students will become well-versed in medium and large format film cameras, as well as various 19th century processes.**Credits:** 3.00

AD 38200 - A Global History Of Modern Art

Credit Hours: 3.00. A study of artistic circulations and cultural exchanges between Europe, Asia, Africa, and the Middle East since the 18th century, designed to examine the history of modern art in a global and critical way. **Credits:** 3.00

AD 38300 - Modern Art

Credit Hours: 3.00. A comprehensive overview of Modern art from Impressionism to Surrealism, designed to help students understand the radical transformations art and society underwent in that period, and reflect upon the influence of new technologies, scientific discoveries, and world events on artistic creation. **Credits:** 3.00

AD 38400 - Contemporary Art

Credit Hours: 3.00. A comprehensive overview of the visual arts from the 1940's to the present, designed to help students understand the cultural, social, and historical dynamics that influence artistic creation, and reflect upon the artists' role in contemporary societies. **Credits:** 3.00

AD 38500 - History Of Interior Design

Credit Hours: 3.00. A survey of the historical changes in interior design and architecture from the 18th century to the present in their social, cultural, and political contexts. The course situates the history of interior design within broader debates about the social uses of space and the cultural significance of architecture and interiors. **Credits:** 3.00

AD 39100 - History Of Chinese Art

Credit Hours: 3.00. A historical survey of the visual arts and architecture of China from antiquity to the present. Emphasis will be placed on the relation of a broad range of art forms to their social and cultural contexts. **Credits:** 3.00

AD 39399 - Cooperative Experience III

Credit Hours: 0.00. Professional experience in art and design. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

AD 39499 - Extensive Cooperative Experience IV

Credit Hours: 0.00. Professional experience in art and design. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

AD 39500 - History Of Design

Credit Hours: 3.00. A survey of the historical development of design from the industrial revolution to the present that examines the influence of new technologies, materials, and style on design practice as well as the role of design in shaping the technologies and things of everyday life. Throughout the course, students will analyze design within the broader social, cultural, and political context of production, consumption, and use. **Credits:** 3.00

AD 39599 - Extensive Cooperative Experience V

Credit Hours: 0.00. Professional experience in art and design. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

AD 39600 - Art Museum Practices

Credit Hours: 3.00. This course examines art museums as cultural institutions with varied collections, serving an important social role. Museum administration and operation are discussed, as are exhibition preparation and museum architecture; a few field trips are required. Museum careers also are explored. **Credits:** 3.00

AD 39700 - Sustainability In The Built Environment

Credit Hours: 3.00. The study of philosophical concepts, principles, and theories of sustainability as they pertain to building methods, materials, systems, and occupants. To provide a foundation for evaluation of materials, processes, and applications of design components for environmentally responsible. Field trips will be required. **Credits:** 3.00

AD 40000 - Advanced Painting

Credit Hours: 3.00. A studio course concentrating on the development of an advanced body of work built upon the conceptual and technical skills of painting. This course is designed to help individual students gain a greater awareness of their personal creative goals and to foster means of expression. **Credits:** 3.00

AD 40200 - Art In Secondary School

Credit Hours: 3.00. Theory and practice of art education for adolescent and young adult students in the secondary school. Required prior to professional semester. **Credits:** 3.00

AD 40400 - Moldmaking And/Or Wheel-Throwing Production Techniques In Ceramics

Credit Hours: 3.00 to 6.00. This course will teach mold-making or wheel-throwing (depending on the individual student's interest) with a view to creating ceramic objects suitable for commercial mass-production. Both tableware and/or sculptural objects will be explored. For the wheel-throwing option the students must have at least one year of high school throwing or AD 24200 with a grade of at least "B" or permission of instructor. For the mold making and casting option only, students must be an Art and Design student or have permission of instructor. **Credits:** 3.00 to 6.00

AD 40500 - Industrial Design III

Credit Hours: 3.00. Design projects emphasizing sophisticated problem-solving methods. Design projects will stress diversity of industrial design and will trace the development of products from initial concept, research, and development through production. **Credits:** 3.00

AD 40600 - Industrial Design IV

Credit Hours: 3.00. Design of products in their relation to economic, physiological, psychological, and behavioral patterns of the consumer. Emphasis upon total thought processes to allow environmental considerations as well as technological realities. **Credits:** 3.00

AD 41500 - Professional Techniques

Credit Hours: 3.00. Research development for product design, with emphasis on socioeconomic concerns and documentation techniques. Portfolio refinement, including verbal, written, and other visual documentation and presentation skills in various media, such as drawing. Photography and computer-generated graphics will be stressed. **Credits:** 3.00

AD 41600 - Seminar On Ideas In Industrial Design II: Design And Creative Problem Solving Methods

Credit Hours: 3.00. A study of creative problem solving methods as used by the designer in his or her work. **Credits:** 3.00

AD 41700 - Variable Topics In Electronic And Time-Based Art

Credit Hours: 3.00. Examination of thematic or specialized topics reflecting the most recent developments and contemporary artistic practices in Electronic and Time-Based Art. Permission of department required. **Credits:** 3.00

AD 42100 - Advanced Studies In Photography And Related Media I

Credit Hours: 3.00. The first of two advanced level courses in photography/related media focusing on production of a formally and conceptually coherent body of work. Course emphasizes development of studio and critical thinking skills, and initiates investigation of the creative process. **Credits:** 3.00

AD 43000 - Interior Design V

Credit Hours: 3.00. Design of multi-use complex environments, emphasizing program and problem solving, facility planning, building systems, and materials technology. Application of alternative presentation technologies will be explored. **Credits:** 3.00

AD 43100 - Visual Communication Design III

Credit Hours: 3.00. The advanced study of communication concepts of poster and poster application in current media. **Credits:** 3.00

AD 43200 - Visual Communication Design IV

Credit Hours: 3.00. The study of product identity, packaging, and branding. **Credits:** 3.00

AD 43400 - Professional Practice For Visual Communication Designers

Credit Hours: 2.00. Specific professional practice topics for the visual communication designer. Topics include contracts, professional associations, ethics, portfolio and resume preparation, self-promotion and exhibition of creative work, the job market and the future of the profession. Field trips may be required. **Credits:** 2.00

AD 44000 - Interior Detailing And Construction

Credit Hours: 3.00. The process of designing, detailing, specifying, and constructing interior environments. Emphasis on teams, building systems, architectural drawing, and building codes. **Credits:** 3.00

AD 44200 - Ceramics III

Credit Hours: 3.00. A continuation of AD 34200; according to student needs in creating ceramic forms, a variety of in-depth experiences: experimental kiln building and firing techniques, methods of ceramic construction, surface treatment, and clay and glaze formulation. **Credits:** 3.00

AD 45400 - Modern Architecture

Credit Hours: 3.00. A study of nineteenth- and twentieth-century architecture. **Credits:** 3.00

AD 46200 - Metalsmithing

Credit Hours: 3.00. Metal forming and metalsmithing processes for small metal objects and jewelry. **Credits:** 3.00

AD 46500 - Professional Practice

Credit Hours: 3.00. The study of professional office and business procedures for the practice of interior design. Includes project administration, contracts, forms, and documents as used in the marketplace. **Credits:** 3.00

AD 46800 - Printmaking III

Credit Hours: 3.00. Study of the techniques of photo plate lithography and photo etching, with continued advanced studies in lithography and etching/intaglio. Emphasis on color printmaking, fine art conceptual issues, creativity, matting and framing art, and professional practices. **Credits:** 3.00

AD 47000 - Advanced Studies In Textiles

Credit Hours: 3.00. A textile seminar and studio course in advanced textile design, with the purpose of developing a personal direction and competence in textiles as fiber art. **Credits:** 3.00

AD 47800 - Internship In Art And Design

Credit Hours: 1.00 to 8.00. Intensive exposure to professional experience through supervised internship in art-and-design-related firms, departments, or studios. Consent to enroll, amount of credit, placement, and evaluation to be approved and coordinated by department. Permission of instructor required. **Credits:** 1.00 to 8.00

AD 49000 - Special Problems In Art And Design

Credit Hours: 1.00 to 6.00. Individual problems in art and design. Permission of instructor required. **Credits:** 1.00 to 6.00

AD 49100 - Special Topics In Art

Credit Hours: 1.00 to 4.00. Topics will vary. **Credits:** 1.00 to 4.00

AD 49900 - Studio Arts Professional Practice/Senior Exhibition

Credit Hours: 3.00. Study of professional practice in the contemporary art world: ethics, gallery, exhibition, studio practice, writing, visual documentation, and business of art. Seniors meet throughout spring semester to organize, install, and de-install Fine Arts Senior Exhibition. **Credits:** 3.00

AD 50200 - Curriculum Studies In Art Education

Credit Hours: 3.00. (EDCI 52000) Study of selected theories of curriculum conception as they apply to constructing arts education curricula in the schools. Permission of instructor required. **Credits:** 3.00

AD 50400 - Philosophical Studies In Art Education

Credit Hours: 3.00. (EDCI 52100) To introduce students to philosophy as a mode of disciplined inquiry in art education. Students will critically examine the literature of art education and identify problems requiring philosophical resolution. Permission of instructor required. **Credits:** 3.00

AD 51200 - Interaction Design Studies

Credit Hours: 3.00. This course examines concepts and methods for interaction design (IXD). It emphasizes a human-centered perspective and explores fundamental components involved in IXD research. Students will explore a wide range of literature and implement IXD theories in multi-disciplinary collaborative projects. **Credits:** 3.00

AD 52000 - Student Visual Design Service

Credit Hours: 3.00. The course will simulate the operation of a professional design studio affording the opportunity for hands-on experience in the development of a total graphic product from concept to finish and will include contact with clients, typesetters, and printers. Permission of instructor required. **Credits:** 3.00

AD 52200 - Interaction Design Evaluation

Credit Hours: 3.00. This course builds a foundation for interaction designers to conduct evaluation research. Students start from analyzing evaluation cases on interactive designs and systems to employing evaluation in design projects using quantitative, qualitative, or mixed methods of inquiry. **Credits:** 3.00

AD 53200 - Cognition In Design

Credit Hours: 3.00. This course focuses on understanding cognitive issues and theories in design. Students are exposed to different cognitive models and phases while they are designing interactive systems. They will develop the cognitive perspective, analyze user experience, and develop an interaction design. **Credits:** 3.00

AD 53500 - Furniture Design

Credit Hours: 3.00. Examination of furniture design trends and designers. Explore materials and manufacturing processes. Design and build a full-size seating unit. Shop skills required. Permission of instructor required. **Credits:** 3.00

AD 54200 - Information Visualization Design

Credit Hours: 3.00. This course starts from exploring visual perception and attention theories, studying modern visualization technologies and toolkits, and reviewing evolving visualization research. Students work on small exercises, and then accomplish complicated virtual and physical visualization projects for information representation and communication. **Credits:** 3.00

AD 55000 - Research Methods In Art And Design

Credit Hours: 3.00. An intensive course in research methods to assist students in developing a topic for directed study. Introduction to various research tools; exercises exploring issues of style, content, and organization; research methods and how they pertain to art and design. Permission of department required. **Credits:** 3.00

AD 55800 - Directed Project Research In Studio Arts

Credit Hours: 1.00 to 3.00. Initial M.F.A. project research and production in studio arts. Permission of instructor required. **Credits:** 1.00 to 3.00

AD 56800 - Directed Project Research In Design

Credit Hours: 1.00 to 3.00. Initial M.F.A. project research and production in design. Permission of instructor required. **Credits:** 1.00 to 3.00

AD 59000 - Special Art Problems

Credit Hours: 1.00 to 6.00. Individual problems in art history, appreciation, design, crafts, drawing, and painting. Credit dependent upon amount of work done. Permission of instructor required. **Credits:** 1.00 to 6.00

AD 59100 - Practicum For Art And Design Teaching Assistants

Credit Hours: 0.00. Seminar to train new Art and Design teaching assistants in the content, policies, and format of the courses they support in various roles, such as: primary instructor, primary studio technician, primary grader for the course, or primary student teacher supervisor. Topics include problem/project presentation, critique techniques, grading, and knowledge of materials and processes of the discipline. Subsequent semesters focus on improving and refining teaching and operational skills. Open only to Art and Design teaching assistants each semester they teach. Permission of instructor required. **Credits:** 0.00

AD 59200 - Graduate Seminar In Art Or Design History

Credit Hours: 3.00. This is a graduate seminar that focuses on a particular theme, period, or movement in the history of art or design. Permission from department required.**Credits:** 3.00

AD 60000 - Painting

Credit Hours: 3.00 to 6.00. Painting. Permission of department required. **Credits:** 3.00 to 6.00

AD 60300 - Theory In Art Seminar

Credit Hours: 3.00. Study of critical issues in modern and postmodern art and relevant methodologies: formalism, iconography, biography and autobiography. Marxism (cultural studies), semiotics, and psychoanalyses. Elements of contemporary professional art practice discussed, including writing of artists' and designers' statements, biographies, and resumes. Prerequisite: Admission to the M.F.A. program in Art and Design. Permission of department required. **Credits:** 3.00

AD 60500 - Problems In Industrial Design

Credit Hours: 3.00. Problems in product innovation, product design, product development, and environmental design. Emphasis is placed on the development of working prototypes. **Credits:** 3.00

AD 60600 - Problems In Visual Design

Credit Hours: 3.00. Problems relating to printing and digital technology, motion design, computer graphics, perception, and the development of visual communication prototypes. **Credits:** 3.00

AD 60700 - Graduate Seminar In Photography And Related Media

Credit Hours: 3.00 to 6.00. Study and discussion of the aesthetics, theory, and criticism of photography and related media. Applications include historical and contemporary research and/or the development and critical analysis of a body of work. Prerequisite: Admission to the M.F.A. program in Art and Design. Permission of department required. **Credits:** 3.00 to 6.00

AD 60800 - Advanced Typography

Credit Hours: 3.00. Explores the communicative and structural aspects of traditional and non-traditional typography, its current and past practitioners, and its evolving role in society. Independent research and group projects will supplement lectures, assigned readings, and field trips. Permission of department required. **Credits:** 3.00

AD 60900 - Information Design

Credit Hours: 3.00. This course aims to teach specific principles and methods pertaining to information design, an emerging discipline within visual communications design (graphic design) involving the selection, organization and presentation of information to a given audience, covering a wide and varied group of delivery mediums. Prerequisite: Admission to the M.F.A. program in Art and Design. Permission of department required. **Credits:** 3.00

AD 61000 - Advanced Poster Design

Credit Hours: 3.00. Specific principles and methods pertaining to poster design. Explores the historical and social implications of poster design. Practical and theoretical exercise will aid students in creative thinking and concept generation. Prerequisite: Admission to the M.F.A. program in Art and Design. Permission of department required. **Credits:** 3.00

AD 61100 - Advanced Web Design For Visual Communication Design

Credit Hours: 3.00. Explores experimental interface design issues and surveys emerging and advanced theories of interface design for the Web. Application of motion graphics design principles and design experimentation is part of the curriculum. Prerequisite: Admission to the M.F.A. program in Art and Design. Permission of department required. **Credits:** 3.00

AD 61200 - Color Aesthetic And Research

Credit Hours: 3.00. Explores color aesthetic based on the works of color masters (e.g., Albers, Itten, Chevreul, Birren, Munsell, and Ostwald) and contemporary color research issues applied to art and design. Color research methodology will be addressed. **Credits:** 3.00

AD 61300 - Drawing

Credit Hours: 3.00 to 6.00. Drawing. Permission of department required. **Credits:** 3.00 to 6.00

AD 61400 - Graduate Installation And Critique

Credit Hours: 3.00. A seminar for all graduate students in the studio arts incorporating the process of installation art to facilitate the exchange of ideas and professional criticism. **Credits:** 3.00

AD 61500 - Social Issues In Industrial Design

Credit Hours: 3.00. A study of mass-production materials and processes used by designers. Students will focus on the limitations and benefits of various manufacturing methods. Special attention will be given to injection molding, casting, and stamping. Prerequisite: Admission to the M.F.A. program in Art and Design. **Credits:** 3.00

AD 61600 - Electronic And Time-Based Art

Credit Hours: 3.00 to 6.00. This seminar explores contemporary artistic practices in Electronic and Time-Based Art, including emerging fields such as: generative and interactive art, audio-visual installation, and new media performance. The format of the course is a mixture of critique, workshops, research, presentations, and discussion. Permission of department required. **Credits:** 3.00 to 6.00

AD 61700 - Advanced Motion Design

Credit Hours: 3.00. This course explores Motion Design's multidisciplinary aspects, combining graphic design, animation, film, photography, videography, illustration, broadcast graphics, sound design, and visual effects. It prepares students to tackle common screen media challenges, emphasizing the development of sophisticated Motion Design projects. Offering an in-depth examination of Motion Design, this program highlights the range of techniques, processes, methods, and aesthetic options open to creators. It requires intensive effort, sharp observation, critical analysis, and commitment from graduate students, calling for a significant time commitment to achieve meaningful outcomes. The course highlights the essential role of a well-executed design process in creating work that is both innovative and engaging to the target audience while adhering to high professional standards.**Credits:** 3.00

AD 62500 - Applied Ornamental Design

Credit Hours: 3.00. Examination of past and present ornamental design applications and of the cultures that created them. Students will generate their own individual visual iconography to be transformed into designs for consumer products, architectural elements, or furniture. Prerequisite: Admission to the M.F.A. program in Art and Design. **Credits:** 3.00

AD 63500 - Advanced Materials And Processes

Credit Hours: 3.00. A study of mass-production materials and processes used by designers. Students will focus on the limitations and benefits of various manufacturing methods. Special attention will be given to injection molding, casting, and stamping. Prerequisite: Admission to the M.F.A. program in Art and Design. **Credits:** 3.00

AD 64000 - Special Topics In Interior Design

Credit Hours: 1.00 to 6.00. Special topics and theoretical approaches to individual projects within the built environment will be investigated, such as urban environments, existing and new structures, and interior environments. Topics could include either residential or non-residential projects. Prerequisite: Admission to the M.F.A. program in Art and Design. Permission of instructor required. **Credits:** 1.00 to 6.00

AD 65800 - MFA Project Research In Studio Arts

Credit Hours: 1.00 to 6.00. Intensive M.F.A. project production and thesis research in studio arts. Prerequisite: Three credit hours of AD 55800 with a minimum B- grade. Permission of instructor required. **Credits:** 1.00 to 6.00

AD 66100 - Jewelry And Metalsmithing

Credit Hours: 3.00 to 6.00. Jewelry and Metalsmithing. Permission of department required. **Credits:** 3.00 to 6.00

AD 66500 - Printmaking

Credit Hours: 3.00 to 6.00. Printmaking. Permission of department required. **Credits:** 3.00 to 6.00

AD 66800 - MFA Project Research In Design

Credit Hours: 1.00 to 6.00. Intensive M.F.A. project production and thesis research in design. Prerequisite: Three credit hours of AD 56800 with a minimum B- grade. Permission of instructor required. **Credits:** 1.00 to 12.00

AD 66900 - Materials And Processes For The Studio Artist

Credit Hours: 3.00 to 6.00. This course introduces graduate studio artists to various materials, methods and processes to supplement their current practical media of choice. Such methods include, but are not limited to, welding for the artist (MIG and arc), casting, cement, plaster, mold making, structural construction, using fabric for sculptural processes, sewing (machine and hand) printing on fabric. This is a survey course and exposes the student to the above allowing them to select one or multiple processes and materials to enhance and expand their practice. Permission of department required. **Credits:** 3.00 to 6.00

AD 67000 - Textile Art

Credit Hours: 3.00 to 6.00. Textile Art. Permission of department required. **Credits:** 3.00 to 6.00

AD 67500 - Sculpture

Credit Hours: 3.00 to 6.00. Sculpture. Permission of department required. **Credits:** 3.00 to 6.00

AD 67800 - Graduate Internship

Credit Hours: 1.00 to 6.00. Intensive exposure to professional experience through supervised internship in art or design firms, departments, or studios. The internship will consist of work to enhance the development of future professionals. The internship experience will help students integrate theory and practice and confirm career choices. Prerequisite: Admission to the M.F.A. program in Art and Design. Permission of instructor required. **Credits:** 1.00 to 6.00

AD 69000 - Advanced Problems In Art And Design

Credit Hours: 0.00 to 18.00. Credit and hours to be arranged. Permission of instructor required. **Credits:** 0.00 to 18.00

AD 69100 - Directed Readings In Art History

Credit Hours: 3.00. A survey of specialized publications for in-depth study in an area of special interest. Permission of instructor required. **Credits:** 3.00

AD 69300 - Historical Problems In Art Education

Credit Hours: 3.00. (EDCI 63000) Examination of methods used to investigate art education's history, past theory, and practices. Class work will include readings and discussion and will culminate in guided research and a short historical study. Permission of instructor required. Prerequisite: BA in art education. **Credits:** 3.00

AD 69600 - Aesthetic Development In Children

Credit Hours: 3.00. (EDCI 63100) Examination of historical and contemporary theory and research in children's aesthetic development (response and production) and analysis of the influences of such development on art education curricula and methodology. Permission of Instructor required. Prerequisite: BA in Art Education or an equivalent area. **Credits:** 3.00

AD 69700 - MFA Graduate Exhibition

Credit Hours: 3.00. Completion of M.F.A. thesis, oral defense, gallery installation of M.F.A. exhibition, public presentation, and documentation of exhibition. Prerequisite: Admission to the M.F.A. program in Art and Design. Concurrent Prerequisite: Must complete 12 credit hours of AD 65800 or AD 66800 during the same or prior session. Only open to M.F.A. graduate students in Art and Design. Permission of instructor required. **Credits:** 3.00

AD 69800 - Research MA Or MFA Thesis

Credit Hours: 1.00 to 18.00. Research MA Thesis. Permission of instructor required. **Credits:** 1.00 to 18.00

Asian American Studies

ASAM 24000 - Introduction To Asian American Studies

Credit Hours: 3.00. A general introduction to Asian American history and culture, with a focus on the diverse and multifaceted experiences of peoples of Asian descent in America and their contributions to U.S. culture and society. **Credits:** 3.00

ASAM 34000 - Contemporary Issues In Asian American Studies

Credit Hours: 3.00. Overviews various issues in contemporary Asian American Studies through theoretical and literary readings combined with examinations of popular media. Topics examine the multiple intersections of race, ethnicity, class, gender, and sexuality. **Credits:** 3.00

ASAM 34200 - Special Topics In Asian American Studies

Credit Hours: 3.00. This course will focus on specific issues and themes in Asian American Studies. **Credits:** 3.00

ASAM 49000 - Special Topics In Asian American Studies

Credit Hours: 3.00. Various topics in Asian American studies, changing from semester to semester as presented by different instructors.**Credits:** 3.00

Astronomy

AST A1000 - The Solar System

Credit Hours: 3.00 or 4.00. Celestial sphere, measurement of time, earth as a planet, moon, eclipses, planets and their satellites, comets, meteors, theories on origin of solar system.**Credits:** 3.00 or 4.00

ASTR 100AN - The Solar System

Credit Hours: 3.00 or 4.00. Celestial sphere, measurement of time, earth as a planet, moon, eclipses, planets and their satellites, comets, meteors, theories on origin of solar system.**Credits:** 3.00 or 4.00

ASTR 2640N - Stars And Galaxies

Credit Hours: 3.00 or 4.00. Principles of physics as applied to astronomy, sun as a star, physical properties of stars, stellar motions and distributions, double stars, variable stars, star clusters, nebulae, Milky Way System, other galaxies, expanding universe.**Credits:** 3.00 or 4.00

ASTR 12300 - Our Place In The Universe: From The Solar System To Distant Cosmos

Credit Hours: 3.00. This course is intended for students interested in learning about everything in the cosmos, from the Solar System, stars, our Galaxy, and other external galaxies now and in the distant past. Key physical principles in understanding these topics will be covered at the non-calculus level. The key space missions that enabled space explorations as well as their challenges and societal impact will be also discussed. **Credits:** 3.00

ASTR 26300 - Descriptive Astronomy: The Solar System

Credit Hours: 3.00. A descriptive course in astronomy intended for non-physics majors. Topics include properties of stars, stellar birth and death; the Hertzsprung-Russel diagram; binary systems; red giants and white dwarfs; supernova; neutron stars and black holes; galaxies; cosmology and the big bang; and dark matter. Includes required night-sky observing sessions. **Credits:** 3.00

ASTR 26400 - Descriptive Astronomy: Stars And Galaxies

Credit Hours: 3.00. A descriptive, nonmathematical course in astronomy intended for non-physics majors. Topics include: properties of stars; stellar birth and death; the Hertzsprung-Russel diagram; main sequence stars; binary systems; stellar clusters; red giants and white dwarfs, nova and supernova; neutron stars and black holes; galaxies and the cosmological red shift. Includes required observing sessions. Not available to students with credit in ASTR 36400. **Credits:** 3.00

ASTR 36300 - The Solar System

Credit Hours: 3.00. This course is intended for students in science or engineering. The components of the course consist of an overview of solar system objects and an overview of the physical processes that control the evolution of solar system objects since formation. The overview of solar system includes observations of the Sun, planets, asteroids and Kuiper-belt objects, comets, and interplanetary dust. Specific processes that are discussed include hydrostatic equilibrium, orbital dynamics, radioactive decay, and heat flow. The role of these processes in shaping planetary surfaces and atmosphere is explored. **Credits:** 3.00

ASTR 36400 - Stars And Galaxies

Credit Hours: 3.00. This course is intended for students in Science or Engineering. This is the second of a two-semester introductory sequence on astronomy and astrophysics, although it is designed to be a standalone course. It is intended mainly for Science and Engineering majors who are comfortable with calculus-based contents. The course provides an overview on the formation and evolution of stars, galaxies, and clusters of galaxies. Selected topics that are covered in more detail include stellar structure and atmosphere, properties of black holes, neutron stars, and white dwarfs, galactic dynamics, and dark matter in galaxies and clusters of galaxies. **Credits:** 3.00

ASTR 37000 - Cosmology

Credit Hours: 3.00. Intended for science and engineering majors. Basic physics and math knowledge will be assumed. The picture of how the Universe came to be and how it has evolved has recently come into sharp focus. This progress is the result of improved observational techniques that have resulted in high resolution images of very distant galaxies, a more accurate mapping of the Large Scale Structure of the Universe or the high resolution picture of the young universe provided by Cosmic Microwave Background observations. We will present a historical perspective of how ideas and data have shaped Cosmology through the centuries. In addition, we will review the theoretical models that are in agreement with the current observations. Our goal will be to provide the students with a broad overview of the current research in Cosmology with an eye toward stimulating the students curiosity about the many questions still awaiting answers in this field. **Credits:** 3.00

ASTR 56000 - Stellar Evolution

Credit Hours: 3.00. (PHYS 56000) Observational basis of astrophysics; formation of galaxies and stars; evolution of stars; white dwarfs, supernovae and neutron stars, pulsars, quasars, black holes; cosmic rays, their origin and acceleration; radio astronomy, radio galaxies; the H-21 cm line and the 3mK blackbody radiation; gravitational radiation; X-ray and g-ray astronomy; cosmology; space physics, magnetosphere, and solar wind. **Credits:** 3.00

ASTR 56100 - Galaxies And Large Scale Structure

Credit Hours: 3.00. (PHYS 56100) Covers basic observed properties and models of galactic structure, dynamics of stars, physics of interstellar medium, formation of galaxies, properties of clusters of galaxies, and dark matter. **Credits:** 3.00

ASTR 56200 - Introduction To High Energy Astrophysics

Credit Hours: 3.00. (PHYS 56200) An overview of important physical processes in a variety of astronomical settings and of the experimental techniques employed in the field of high energy astrophysics. Covered in more detail are individual systems that include black holes, neutron stars, white dwarfs, supernova remnants, active galactic nuclei, clusters of galaxies, gamma-ray bursts, and cosmic rays, with special emphasis on several research frontiers. **Credits:** 3.00

ASTR 56300 - Astroparticle Physics

Credit Hours: 3.00. (PHYS 56300) An overview of an emerging research frontier in modern physics that lies at the interface of particle physics and astrophysics. Emphasis is on topics that are particularly relevant to both fields, including cosmology, cosmic ray physics, very-high-energy gamma ray astrophysics, neutrino astrophysics, and gravitational wave physics. **Credits:** 3.00

ASTR 56700 - Observational Techniques In Astronomy

Credit Hours: 3.00. (PHYS 56700) Fundamental concepts in observational astronomy, including coordinate and time systems, telescopes and detectors, radiation and optics, and methods of statistical data analysis. **Credits:** 3.00

Aviation Technology

AT 10000 - Introduction To Aviation Technology

Credit Hours: 1.00. An introduction to the Department of Aviation Technology and its curricula as well as an overview of the aviation industry and associated careers. Aviation safety practices and human factors issues are discussed. An overview of aviation regulations and the regulatory process is included.**Credits:** 1.00

AT 10200 - Aviation Business

Credit Hours: 3.00. A discussion of the financial structure and operation of the aviation industry including aircraft and aerospace design parameters, as well as aviation financial and industrial processes. The course will cover material relevant to the overall structure of the aviation industry including history, current status of aerospace manufacturers, commercial airlines, and general aviation as well as governmental aviation agencies and international aviation. Commercialization of space and current issues in aviation will also be covered. **Credits:** 3.00

AT 10300 - Aerospace Vehicle Propulsion And Tracking Systems

Credit Hours: 3.00. This course is an introduction to propulsion systems used in aerospace vehicles. The student will learn terminology, component parts, and operational theory of propulsion systems. Course topics covered are reciprocating and turbine engine operation theory as well as rocket propulsion systems. including electrical, fuel, fire, ignition and lubrication. Operational and regulatory fuel requirements are discussed. Emerging technologies and environmental practices will be explored. **Credits:** 3.00

AT 10600 - Basic Aircraft Science

Credit Hours: 3.00. An introduction to federal regulatory systems and associated publications. Includes aircraft nomenclature, theory of flight, and fundamentals of the aviation industry. Introduces weight and balance procedures. Permission of department required. **Credits:** 3.00

AT 10901 - Introduction To Uncrewed Aircraft System Operations

Credit Hours: 3.00. This course will provide students the aeronautical knowledge required to operate a small UAS in the National Airspace. Students are introduced to various aspects of uncrewed aviation operations, which includes UAS system types and components, regulations and operational approvals, and indoctrination to the civil and commercial applications of UAS. Through the use of UAS simulation technology, students will develop basic small UAS flight skills and successfully complete various UAS operational scenarios. Upon successful completion of the course students will be prepared to obtain a Federal Aviation Administration (FAA) Remote Pilot Certificate with a Small UAS Rating. Permission of department is required. **Credits:** 3.00

AT 11200 - Introduction To Operational Aviation Safety

Credit Hours: 1.00. This course teaches students about industry safety standards and the School of Aviation and Transportation Technology's Safety Program. This course will emphasize applying various safety models to accident case studies and reported incidents.**Credits:** 1.00

AT 11501 - Experiential Honors Project IA

Credit Hours: 0.00 to 3.00. This is an interdisciplinary course open to all majors with a GPA of 3.0 or higher. The Center for Research and Education in Advanced Transportation Ecosystems-CREATE (approval is required to register). Each course provides students hands-on experience in addressing a specific real-world problem with a broad societal impact, some of these projects may be supported by an industry partner. CREATE will seek industry partners, help define the scope and deliverables associated with each project and invite students to participate. Permission of instructor required.**Credits:** 0.00 to 3.00

AT 11600 - Aircraft Science For Engineering Technology

Credit Hours: 3.00. Required for AET. This course is an introduction to theory of flight, aircraft nomenclature, aircraft configurations, high speed flight, and helicopter configurations and rotor dynamics. Covers lift/drag and concepts for flight at an engineering technology level beyond that of flight ground school. Federal regulatory systems for aircraft design and persons other than flight personnel and associated technical documents are covered. Introduces center of gravity theory, defines how to locate centers of gravity, and introduces weight and balance procedures for engineering technology, not covered by flight ground school. This course teaches topics in the curriculum required by 14 CFR Part 147 as outlined in the School of Aviation and Transportation Technology's Part 147 Operations Manual approved by the FAA, and provides specific knowledge and skills needed for FAA certification examinations.**Credits:** 3.00

AT 11601 - Experiential Honors Project IB

Credit Hours: 0.00 to 3.00. This is an interdisciplinary course open to all majors with a GPA of 3.0 or higher. Completion of AT 11501 with a grade of B or higher is required. The Center for Research and Education in Advanced Transportation Ecosystems-CREATE (approval is required to register). Each course provides students hands-on experience in addressing a specific real-world problem with a broad societal impact, some of these projects may be supported by an industry partner. CREATE will seek industry partners, help define the scope and deliverables associated with each project and invite students to participate. Permission of instructor required.**Credits:** 0.00 to 3.00

AT 11901 - Uncrewed Aerial Systems: Safety And Risk Management

Credit Hours: 3.00. This course discusses the fundamental concepts of Safety and Risk Management and their application to UAS operations. The course will provide insight into strategies for developing and implementing a formal safety management system (SMS) that effectively supports an organization's UAS operations. In addition, students will gain an understanding of ethical decision-making and its relationship to safety. Laboratory exercises provide students practical application of this knowledge to various UAS operational scenarios, which includes utilizing SMS principles in assessing risks and developing appropriate mitigations. Must possess a valid FAA Part 107 Remote Pilot Certificate. **Credits:** 3.00

AT 12700 - Publications Records And Regulations

Credit Hours: 3.00. Required for AET. This course provides students with the concepts, and information to understand the regulations and publications specific to aviation and aerospace vehicle repair and maintenance. The privileges and limitations of the 14 CFR Part 65 airmen certificates are covered, as well as the regulations governing repair facilities and repair stations. The specific forms and records, and the proper disposition of those records are covered. In addition, aircraft technical drawings and prints are examined and the student is to develop the ability to read and comprehend aircraft drawings, as well as make drawings/sketches for vehicle repair and/or alteration. Precision measuring equipment is covered as is the hardware specific to aviation and aerospace. Inspection procedures and conformity checks are covered. Engine run up operations for inspection purpose are covered. This course teaches topics in the curriculum required by 14 CFR Part 147 as outlined in the School of

Aviation and Transportation Technology's Part 147 Operations Manual approved by the FAA, and provides specific knowledge and skills needed for FAA certification examinations.**Credits:** 3.00

AT 14400 - Private Pilot Lectures

Credit Hours: 4.00. A study of the subject areas and information needed to operate as a private pilot in the aviation environment. The FAA private pilot written exam will be offered to those who qualify after taking the Lecture Course offering. **Credits:** 4.00

AT 14500 - Private Pilot Flight

Credit Hours: 2.00. In this course, the student will receive the necessary dual flight instruction and solo flight time to qualify for the FAA Private Pilot Certificate under Part 61 of the Federal Aviation Regulations.**Credits:** 2.00

AT 20200 - Aerospace Vehicle Systems Design, Analysis And Operations

Credit Hours: 3.00. Introduction to the design and engineering analysis of various systems found on modern aircraft and aerospace vehicles. Operational theory will also be presented for specific aircraft. Systems include electric power distribution, digital data, instrumentation, hydraulic, pneumatic, environmental, flight management, and autoflight. **Credits:** 3.00

AT 20300 - Aviation Operations Management

Credit Hours: 3.00. This course provides a forum for investigating contemporary issues facing the aviation and aerospace industries. Major topics include aviation operation, human resources, fiscal, and technology management. **Credits:** 3.00

AT 20501 - Statics For Aerostructures

Credit Hours: 3.00. This course provides an introduction to the static analysis of aerostructures. Force systems, resultants and equilibrium, moments, distributed loads, and centroids as they relate to aeronautical structures are studied. CAD software is introduced.**Credits:** 3.00

AT 20700 - Introduction To Aircraft Systems

Credit Hours: 3.00. Principles and design concepts of aircraft operating systems are covered. Emphasis is given to flight control, electrical, environmental, hydraulic, pneumatic, pressurization, oxygen, heating, cooling, fire protection, and ice and rain protection systems. Also included are theory of operation and design of aircraft instruments and associate systems.**Credits:** 3.00

AT 20802 - Aircraft Materials

Credit Hours: 3.00. In this course students study aluminum and composite materials used in aircraft. The course covers elements of design, fabrication, final assembly, and testing. Students also study the practical application of statics for airframe loads. **Credits:** 3.00

AT 20900 - Autonomous Aircraft Technology And Maintenance I

Credit Hours: 3.00. This course introduces fundamental concepts of autonomous aircraft technology and maintenance. Topics include history, airframe and powerplant selection, regulations governing uncrewed systems, airspace descriptions, safety, autonomous system programming and calibration, data package options, weather, system maintenance and repair, manual flight training, and aerodynamics and flight controls for autonomous aircraft. **Credits:** 3.00

AT 21000 - Ground Trainer I

Credit Hours: 1.00. Included in this course are maneuvers to develop basic attitude instrument flying skills, including tracking, holding, and approach procedures. Permission of department required.**Credits:** 1.00

AT 21100 - Ground Trainer II

Credit Hours: 1.00. This course is designed to develop a higher degree of coordination and judgement through additional experience in the flight training device. This course will continue to prepare the student for the FAA Commercial Pilot Certificate. Permission of department required.**Credits:** 1.00

AT 21200 - Operational Risk Assessment

Credit Hours: 1.00. This course gives students a comprehensive understanding of industry incident risk assessment and analyses. Students will learn about Safety Management Systems (SMS) feedback loop processes and techniques utilized to find root causes. Additionally, residual risks of real-world mishaps during flight operations will be examined.**Credits:** 1.00

AT 21500 - Experiential Honors Project IIA

Credit Hours: 0.00 to 3.00. This is an interdisciplinary course open to all majors with a GPA of 3.0 or higher. Students must have completed the AT 11601 course. The Center for Research and Education in Advanced Transportation Ecosystems-CREATE (approval is required to register). Each course provides students hands-on experience in addressing a specific real-world problem with a broad societal impact, some of these projects may be supported by an industry partner. CREATE will seek industry partners, help define the scope and deliverables associated with each project and invite students to participate. Permission of instructor required.**Credits:** 0.00 to 3.00

AT 21600 - Experiential Honors Project IIB

Credit Hours: 0.00 to 3.00. This is an interdisciplinary course open to all majors with a GPA of 3.0 or higher. Students must have completed AT 21500 with a grade of B or higher. The Center for Research and Education in Advanced Transportation Ecosystems (CREATE) approval is required to register. Each course provides students hands-on experience in addressing a specific real-world problem with a broad societal impact, some of these projects may be supported by an industry partner. CREATE will seek industry partners, help define the scope and deliverables associated with each project and invite students to participate. Permission of instructor required.**Credits:** 0.00 to 3.00

AT 21900 - Autonomous Aircraft Technology And Maintenance II

Credit Hours: 3.00. This course will further develop skills and understanding of autonomous aircraft technology and maintenance. Emphasis will be on design, selection, construction, flight test, evaluation, and repair, of stabilized uncrewed aircraft. Students will work hands-on with open-source flight controllers to perform autonomous missions. Additionally, students will design and deploy scenario-specific sensors using student-constructed rotorcraft. Students will be expected to demonstrate their sensor payload through lab and field demonstration and professional documentation. **Credits:** 3.00

AT 22300 - Human Factors For Flight Crews

Credit Hours: 3.00. This course explores the fundamental concepts of single pilot and multi-crew human factors issues. The first part of the course focuses on the physiological factors that affect single pilot aeronautical decision-making. The second part examines human error, threat and error management, and domains of crew resources management. The third segment utilizes team-building exercises, case study presentations, and a formal assignment to emphasis course learning outcomes.**Credits:** 3.00

AT 23300 - Ethics And Aviation

Credit Hours: 3.00. This discussion-oriented class is an introduction to the principles of ethical theory and the application of that theory to practical problems associated with the aviation industry. Actual aviation case studies are used to illustrate major concepts. **Credits:** 3.00

AT 24302 - Commercial Flight I Under Federal Aviation Regulations Part 141

Credit Hours: 2.00. This course is designed to develop a higher degree of coordination and judgment through additional experience in more advanced flight maneuvers and cross-country flying under Part 141 of the Federal Aviation Regulations. It will start to prepare the student for the FAA Commercial Pilot Certificate. Permission of department required.**Credits:** 2.00

AT 24800 - Commercial Flight II

Credit Hours: 2.00. The course is a continuation of the flight training received in AT 24300. Basic instrument flying techniques will be introduced to further enhance and refine the development of precision flying skills. Permission of department required. **Credits:** 2.00

AT 24900 - Instrument Flight Lectures

Credit Hours: 3.00. A study of the operation of flight instruments and radio navigation aids, federal aviation regulations pertinent to instrument flight, meteorology, instrument charts, instrument flight planning, and air traffic control procedures. Preparation for the FAA Instrument Rating written examination. **Credits:** 3.00

AT 25200 - Aviation Projects

Credit Hours: 3.00. This course will introduce the students to group projects in collaboration with industrial partners in aviation. A new project will be conducted each semester. Students will participate in the development of project goals, conducting field research, and developing a final course document and presentation. Travel outside of the normal assigned classroom time might be required. Permission of Department required. **Credits:** 3.00

AT 25300 - Instrument Flight

Credit Hours: 2.00. The course is designed to prepare the student for the FAA Commercial Pilot Certificate and Instrument Rating. Flight, ground pilot trainer, and ground instruction are included. Permission of department required. **Credits:** 2.00

AT 25302 - Instrument Flight Under Federal Aviation Regulations Part 141

Credit Hours: 2.00. This course is designed to prepare the student for the FAA Instrument Rating under Part 141 of the Federal Aviation Regulations. Permission of department required.**Credits:** 2.00

AT 25400 - Commercial Flight Lectures

Credit Hours: 3.00. The course is designed to review the principles of flight, aircraft systems, pertinent federal aviation regulations, and airman publications and service in order to prepare the student for the FAA Commercial Pilot written examination.**Credits:** 3.00

AT 26200 - Basic Aircraft Powerplant Technology

Credit Hours: 4.00. A study of the design, construction, and operating practices of aircraft reciprocating and small gas turbine engines. Laboratory exercises emphasize airworthiness evaluation, fault-isolation techniques, and standard service/maintenance practices. **Credits:** 4.00

AT 26502 - Aircraft Electrical Systems

Credit Hours: 3.00. An in-depth study of aircraft electrical components, both individually and as systems in the aircraft. DC electrical circuits, series and parallel circuits, magnetism, and electromagnetism are covered, as are DC power systems, schematics, and aircraft wiring practices. Aircraft charging systems, main power distribution, solid state electronics, batteries, and motors are also discussed. **Credits:** 3.00

AT 26700 - Fixed And Rotary Wing Assemblies

Credit Hours: 3.00. An overview of various fixed and rotary wing components and systems. Flight control systems, landing gear, fuel systems, wheels, brakes, and rotor systems are among the subjects studied.**Credits:** 3.00

AT 26900 - Air Traffic Control I

Credit Hours: 4.00. An introduction to the principles of air traffic control, including tower, approach control and enroute separation. Navigation theory as it relates to the ATC system will be explained, as well as the theory of operation of ATC radar and computer systems. **Credits:** 4.00

AT 27200 - Introduction To Composite Technology

Credit Hours: 3.00. An introduction to basic composite materials, processes, construction, testing, and repair. Students will work with a variety of wet and pre-impregnated fiber and matrix systems including glass, aramid fiber, and carbon-graphite.**Credits:** 3.00

AT 27800 - Nondestructive Testing For Aircraft

Credit Hours: 3.00. A study of nondestructive testing methods used to evaluate the structural integrity of airframes, engines, and components. Magnetic particle, liquid penetrant, electromagnetic, ultrasonic, and radiographic inspection are covered. **Credits:** 3.00

AT 28100 - Traffic Control II

Credit Hours: 4.00. An intensive review of air traffic control procedures and aviation regulations for students interested in seeking employment as air traffic controllers. **Credits:** 4.00

AT 28500 - ATC Procedures And Weather

Credit Hours: 3.00. An introduction to the technical procedures involved in the development and operation of the air traffic control system. Instrument procedures and design will be covered. Weather theory as pertaining to ATC will be discussed, along with observation and dissemination systems used by the FAA and NWS. **Credits:** 3.00

AT 28600 - National Airspace Systems Operations

Credit Hours: 3.00. An introduction to the technical procedures involved in operating unmanned Aerial Systems in the air traffic control system. Flight operations and procedures will be covered. Weather theory and flight regulations as they apply to UAS operations will also be discussed. **Credits:** 3.00

AT 29000 - Aviation Project

Credit Hours: 1.00 to 4.00. Independent study primarily for sophomore students who wish to pursue study and development work in special areas. Subject material must be arranged with the instructor before enrolling in the course. Permission of instructor required. **Credits:** 1.00 to 4.00

AT 29300 - Industrial Practice I

Credit Hours: 1.00. Industrial practice and experience in participating industry. Requires written report of the experience. Permission of department required. **Credits:** 1.00

AT 29400 - Industrial Practice II

Credit Hours: 1.00. Industrial practice and experience in participating industry. Requires written report of the experience. Permission of department required. **Credits:** 1.00

AT 30702 - Advanced Aircraft Systems

Credit Hours: 3.00. An in-depth study of aircraft components and operation with an emphasis on transport-category aircraft. Systems covered include fuel, environmental, fluid-power, flight control, fire protection, ice-control, warning, and auxiliary power. Practical projects utilize small ad transport-category aircraft. **Credits:** 3.00

AT 30802 - Aircraft Materials Processes

Credit Hours: 3.00. A study of the processes by which aircraft materials are converted into usable components. Laboratory activities include machining, welding, and analysis of material properties. **Credits:** 3.00

AT 30900 - Unmanned Autonomous Aerial Systems

Credit Hours: 3.00. This course includes the construction and flight test demonstration of fully autonomous aircraft. System performance will be monitored in real time. Post flight analysis, with system performance evaluation and optimization will be covered. **Credits:** 3.00

AT 30901 - Introduction To UAS Sensor Technology

Credit Hours: 3.00. This course introduces students to multiple forms of UAS sensors and core fundamentals of Remote Sensing and Geospatial Technology. Students will be introduced to basic data capture and processing techniques and to effectively apply different forms of UAS sensors to real-world applications.**Credits:** 3.00

AT 31100 - Aerospace Internship

Credit Hours: 3.00. This course consists of placing the student in an existing business or research unit within the department. Students will function as interns as they develop and manage business and/or operational processes within these units. This experience prepares students for the externship experience in the follow-on course. **Credits:** 3.00

AT 31400 - Operational Safety Mitigation

Credit Hours: 1.00. This course provides students with a hands-on learning experience within the Professional Flight Safety program. Students will use data and evidence from real-world safety reports to assess risks, develop control measures, and generate proposals that may be implemented into flight operations. Students will gain a clearer understanding of how flight operations and safety operations collaborate to mitigate hazards.**Credits:** 1.00

AT 31500 - Experiential Honors Project IIIA

Credit Hours: 0.00 to 3.00. This is an interdisciplinary course open to all majors with a GPA of 3.0 or higher. Students must have completed the AT 21600 course. The Center for Research and Education in Advanced Transportation Ecosystems-CREATE (approval is required to register). Each course provides students hands-on experience in addressing a specific real-world problem with a broad societal impact, some of these projects may be supported by an industry partner. CREATE will seek industry partners, help define the scope and deliverables associated with each project and invite students to participate. Permission of instructor required.**Credits:** 0.00 to 3.00

AT 31600 - Experiential Honors Project IIIB

Credit Hours: 0.00 to 3.00. This is an interdisciplinary course open to all majors with a GPA of 3.0 or higher. Students must have completed AT 31500 with a grade of B or higher. The Center for Research and Education in Advanced Transportation Ecosystems-CREATE (approval is required to register). Each course provides students hands-on experience in addressing a specific real-world problem with a broad societal impact, some of these projects may be supported by an industry partner. CREATE will seek industry partners, help define the scope and deliverables associated with each project and invite students to participate. Permission of instructor required.**Credits:** 0.00 to 3.00

AT 31900 - Uncrewed Aircraft Systems: Applications, Data, And Documentation

Credit Hours: 3.00. Focused on applying uncrewed aircraft technology to specific data gathering missions. Sensor types, mounting selection, and control will be demonstrated. Emphasis will be placed on sensor payloads, mission planning, and data acquisition. Post-flight data processing and analysis will be conducted using GIS and Remote Sensing software applications. All specifications and procedures will be documented in an industry-accepted format. **Credits:** 3.00

AT 32001 - Advanced Aviation Operations

Credit Hours: 3.00. This course covers modern principles for managing complex global aviation maintenance, ground and aerospace manufacturing operations. Particular emphasis is placed on "system-of-systems" and organizational resilience concepts in air vehicle lifecycle maintenance, aerospace manufacturing and airport surface/gate operations. Principles of Data Science, systems-thinking, process visualization, emerging technologies and modern workforce challenges and their impact on global sustainable airworthiness, safety, quality and performance reliability are covered in-depth. **Credits:** 3.00

AT 32501 - Advanced Aviation Meteorology

Credit Hours: 3.00. This course is designed for students who are preparing for careers as professional pilots or dispatchers and require an advanced knowledge of the impact of weather on aviation operations. **Credits:** 3.00

AT 32700 - Advanced Transport Flight Operations

Credit Hours: 3.00. This course addresses advanced aviation topics to include high speed aerodynamics, automated cockpit instrumentation, domestic/international flight operations, and global navigation.**Credits:** 3.00

AT 33502 - Avionics Systems

Credit Hours: 3.00. This course covers the theory of operation and applications of common electrical components used in various aircraft circuits. The theory and mathematical relationships of alternating current, reactance, impedance, and phase shift are examined. Operational theory, installation practices, and troubleshooting concepts of common aircraft communication and navigation systems are investigated. **Credits:** 3.00

AT 33800 - Airline Management

Credit Hours: 3.00. This course is a detailed study of airline management principles and processes. Topics include airline, economics, organization, forecasting, marketing, alliances, pricing, scheduling, finance, fleet planning, labor relations and air freight. Business ethics pertaining to airlines are introduced. **Credits:** 3.00

AT 34001 - Aerospace Business Statistics

Credit Hours: 3.00. This course provides an introduction to business statistics with a specific focus on managerial decision making in the aerospace industry. The course will focus on aircraft leasing and value determination. Topics include descriptive statistics, probability models, estimation, hypothesis testing, and regression analysis. Students use software to perform their own analyses. **Credits:** 3.00

AT 35100 - Flight Instructor Flight

Credit Hours: 2.00. Flight training in preparation for flight instructor certification. Instructional techniques are demonstrated and practiced by the student. Heavy emphasis is placed on student practice teaching of all maneuvers. FAA Commercial Pilot Certificate with Instrument Airplane Rating required. Permission of department required. **Credits:** 2.00

AT 35200 - Flight Instructor Lectures

Credit Hours: 4.00. The course teaches techniques of flight and ground instruction, analysis of maneuvers, aircraft performance, and federal aviation regulations applicable to flight instructors. Some practice teaching will be required. Preparation for the FAA written exam is included. **Credits:** 4.00

AT 35300 - Multi-Engine Flight

Credit Hours: 1.00. This course prepares the student for the FAA multi-engine rating. Dual flight instruction is conducted in a multi-engine aircraft. Individual ground instruction will be arranged.**Credits:** 1.00

AT 35400 - Turbine Flight Operations Lecture

Credit Hours: 2.00. A study of corporate aircraft systems and operations and an orientation to operational procedures.**Credits:** 2.00

AT 35900 - Airport Management

Credit Hours: 3.00. This course is a study of the history and development of contemporary airport facilities. Areas of study will include FAA airport design requirements, master plans, and airport operations. Field trips may be required. **Credits:** 3.00

AT 36201 - Aviation Operations

Credit Hours: 3.00. This course introduces students to the principles of managing a complex aviation operation. Students will be assigned active roles in monitoring and reporting on aircraft flight and maintenance practices. Every student will be assigned a role as part of a small group whose responsibility is to gather appropriate information, develop reports, and conduct practical research tasks as assigned. Weekly and monthly group meetings will be conducted similar to those found in the airline industry with students playing an active role in these meetings.**Credits:** 3.00

AT 36302 - Fundamentals Of Powerplant Systems

Credit Hours: 4.00. This course covers powerplant systems, including fuel metering devices, ignition systems, and propeller and propeller-related systems. Students learn to use the special tools required for these systems, and the processes for inspection, repair, and overhaul. Airworthiness evaluation and determination is stressed, as are testing and fault diagnosis procedures. The properties and operating characteristics of aircraft fuels are also covered. **Credits:** 4.00

AT 36500 - Instrument Flight Instructor Flight

Credit Hours: 1.00. Flight and ground training in preparation for the Instrument Flight Instructor Flight Test is given. Instructional techniques are demonstrated and practiced by the student. Analysis of maneuvers and common student errors also included. FAA Flight Instructor Airplane Pilot Certificate and Flight Instructor Instrument written exam passed. Permission of department required. **Credits:** 1.00

AT 36600 - Multi-Engine Flight Instructor Flight

Credit Hours: 1.00. Flight and ground training in preparation for the Flight Instructor Multi-engine Flight Test is given. Instructional techniques are demonstrated and practiced by the student. Analysis of maneuvers and common student errors also included. FAA Flight Instructor Airplane, Instrument Airplane, Commercial Pilot Certificate with Airplane Multi-engine Land Rating, 15 hours pilot in-command in multi-engine airplanes. Permission of department required. **Credits:** 1.00

AT 36900 - Air Traffic Control

Credit Hours: 3.00. An introduction to the principles of air traffic control, including tower and en route separation. Navigation theory as it relates to the ATC system will be explained, as will the theory of operation of ATC radar and computer systems. **Credits:** 3.00

AT 37002 - Advanced Aircraft Powerplants

Credit Hours: 3.00. This course covers the design, construction, operation, and overhaul practices of aircraft reciprocating and small gas-turbine engines. Airworthiness evaluation, fault-isolation techniques, and standard service and maintenance practices are emphasized. Dimensional and visual inspection and testing of engines following overhaul are stressed, as well. **Credits:** 3.00

AT 37200 - Aircraft Maintenance Practices

Credit Hours: 3.00. An in-depth study of practices and procedures used to ensure that an aircraft is maintained in an airworthy state. Aircraft publications and maintenance methodology are emphasized.**Credits:** 3.00

AT 37600 - Aircraft Gas Turbine Engine Technology I

Credit Hours: 4.00. Basic aircraft gas turbine engine theory, nomenclature, component design, turbine engine systems, operation, and fault isolation techniques are emphasized. Turbine engine maintenance, overhaul, operation, and inspection procedures are studied in detail.**Credits:** 4.00

AT 38100 - Aviation Security

Credit Hours: 3.00. This course introduces the challenges and complexity of aviation security faced by aviation professionals across the industry. It traces the evolution of current security approaches and explores technologies and processes targeting threat mitigation and improved operational efficiency. **Credits:** 3.00

AT 38201 - Advanced Flight Instructor Lecture

Credit Hours: 3.00. A discussion of instructional techniques for flight and ground instruction with a focus on instrument and multi-engine flight. This course includes analysis of maneuvers, aircraft performance, and federal aviation regulations applicable to flight instructors. Some practice teaching will be required. Preparation for the FAA practical tests for instrument instructor and multi-engine instructor are included.**Credits:** 3.00

AT 38300 - Instrument And Multiengine Instructor Flight

Credit Hours: 1.00. This course prepares the student for the FAA Flight Instructor Instrument and Multiengine Instructor ratings. All flight instruction is conducted in a multi-engine aircraft. **Credits:** 1.00

AT 38500 - Design Support Analysis

Credit Hours: 2.00. This course is designed to teach students interested in engineering design, design support, customer support, or aerospace manufacturing, the elements of product support and the analysis of design as related to the manufacturability, maintainability, and supportability of aerospace products. The students will be expected to complete a life cycle cost analysis and logistics plan for a design.**Credits:** 2.00

AT 38700 - Turbine Aircraft Simulation Lab

Credit Hours: 2.00. This course is a laboratory flight experience in a turbine aircraft flight simulator emphasizing normal and abnormal aircraft operations. Emphasis is on FAA-required flight procedures for pilot certification and safe operation of turbine powered aircraft. Permission of department required.**Credits:** 2.00

AT 38800 - Large Aircraft Systems

Credit Hours: 3.00. This course introduces transport aircraft limitations, systems, and systems operation. Topics include turbojet aircraft powerplants, flight instruments, electrical power, air-conditioning, pressurization, hydraulic, and flight control systems. Emphasis is aircraft and systems manufacturer's design and operational philosophies. **Credits:** 3.00

AT 39300 - Industrial Practice III

Credit Hours: 1.00. Industrial practice and experience in participating industry. Requires written report of the experience. **Credits:** 1.00

AT 39400 - Industrial Practice IV

Credit Hours: 1.00. Industrial practice and experience in participating industry. Requires written report of the experience. **Credits:** 1.00

AT 39500 - Turbine Aircraft Simulation Laboratory

Credit Hours: 1.00. This course is a laboratory flight experience in a turbine aircraft flight simulator, emphasizing normal and abnormal aircraft operations. Emphasis is on FAA-required flight procedures for pilot certification and safe operation of turbine-powered aircraft. Students seeking an FAA type rating must receive a grade of at least a B- in AT 35300. Permission of department required. **Credits:** 1.00

AT 39600 - Turbine Aircraft Flight Laboratory

Credit Hours: 1.00. This course is a laboratory flight experience in a turbine-powered aircraft, emphasizing normal and abnormal aircraft operations. Emphasis is on FAA-required flight procedures for certification and safe operation of turbine-powered aircraft. Permission of department required. **Credits:** 1.00

AT 40300 - Airman Certification Procedures

Credit Hours: 1.00. A survey of the procedures for obtaining federal certification as an Aircraft Maintenance Technician. **Credits:** 1.00

AT 40400 - Turbojet Copilot Operations

Credit Hours: 1.00. Provides students who are selected to participate in the turbojet copilot program with classroom, simulator, and flight instruction in turbojet systems and operation. Permission of instructor required. **Credits:** 1.00

AT 40500 - Turbojet Copilot Practicum I

Credit Hours: 1.00. This course provides students with copilot flight experience in a corporate-type turbojet aircraft. Student copilots gain experience in turbojet systems and operation, high-speed/high altitude ATC procedures, advanced navigation, and high-altitude meteorology. Permission of instructor required. **Credits:** 1.00

AT 40900 - Advanced Air Mobility: Management And Operations

Credit Hours: 3.00. UAS capstone course. Application of AAM technologies across multiple commercial-type operations, including certification, application, and management. A demonstration of the cumulative knowledge and skills learned in previous UAS courses. Requires current FAA Part 107 Remote Pilot Certificate. **Credits:** 3.00

AT 41101 - Aerospace Internship II

Credit Hours: 3.00. Students will be placed in an external industry-sponsored position that exists either within the department or at a location specified by the sponsor. Students will function as interns as they develop and manage business and/or operational processes within these units. **Credits:** 3.00

AT 41200 - Aviation Finance

Credit Hours: 3.00. The course will focus on the financial knowledge needed to operate and evaluate aviation businesses. Content will cover the impact of financial decisions on operational outcomes that add/decrease value to an aviation company's bottom line. Case studies will be utilized to demonstrate practical aspects of financial decisions as they relate to organizational performance and profitability. **Credits:** 3.00

AT 41501 - Experiential Honors Project IVA

Credit Hours: 0.00 to 3.00. This is an interdisciplinary course open to all majors with a GPA of 3.0 or higher. Students must have completed the AT 31600 course. The Center for Research and Education in Advanced Transportation Ecosystems-CREATE (approval is required to register). Each course provides students hands-on experience in addressing a specific real-world problem with a broad societal impact, some of these projects may be supported by an industry partner. CREATE will seek industry partners, help define the scope and deliverables associated with each project and invite students to participate. Permission of instructor required.**Credits:** 0.00 to 3.00

AT 41600 - Airline Indoctrination

Credit Hours: 2.00. This course provides the background knowledge required to serve as a crewmember operating a transport-category airplane. Topics include aircraft systems, airline operations, and FAR Part 121 regulations.**Credits:** 2.00

AT 41601 - Experiential Honors Project IVB

Credit Hours: 0.00 to 3.00. This is an interdisciplinary course open to all majors with a GPA of 3.0 or higher. Students must have completed AT 41501 with a grade of B or higher. The Center for Research and Education in Advanced Transportation Ecosystems-CREATE (approval is required to register). Each course provides students hands-on experience in addressing a specific real-world problem with a broad societal impact, some of these projects may be supported by an industry partner. CREATE will seek industry partners, help define the scope and deliverables associated with each project and invite students to participate. Permission of instructor required.**Credits:** 0.00 to 3.00

AT 41901 - Advanced Air Mobility Capstone

Credit Hours: 3.00. The conclusion and demonstration of the cumulative knowledge and skills learned within the UAS curriculum. Students will engage in a series of assignments that will guide them toward proposing and researching a capstone project that demonstrates knowledge gained in UAS and AAM topics. Students are expected to focus on the development of deliverable products that demonstrate their skills as effective UAS operators. **Credits:** 3.00

AT 42101 - Managerial Economics In Aviation

Credit Hours: 3.00. This course explores the process of making managerial decisions based on modern economic principles and concepts, and provides the student with a set of tools that can be used to make those decisions. Marginal analysis, forecasting, and cost analysis concepts are introduced, as are game-theoretic and probabilistic decision-making models. Bargaining strategies and linear programming tools are covered, as well.**Credits:** 3.00

AT 42201 - Aerospace Risk Management

Credit Hours: 3.00. This course focuses on students' understanding of the financial expertise needed to analyze trading and hedging programs for application in reducing aerospace risk exposure. The studies include research into the development and use of operational indices and their possible relation to hedging with commodity and security instruments. Emphasis will be placed on trading methods, use of futures, options, derivatives, and swaps as hedging financial instruments in providing improved risk management. **Credits:** 3.00

AT 43300 - Supervised Aviation Experience

Credit Hours: 1.00 to 3.00. Supervised aviation experience directed toward providing orientation, background, and insight into flight or ground operations. Permission of department required. **Credits:** 1.00 to 3.00

AT 43500 - Supervised Instructional Experience

Credit Hours: 1.00 to 4.00. This course provides students with experience as instructors in an aviation classroom or laboratory environment under the supervision of faculty. In addition to the supervisory skills gained, students will become knowledgeable in task planning and communication techniques. Permission of department required. **Credits:** 1.00 to 4.00

AT 43800 - Airline Operations

Credit Hours: 3.00. Students in this course study airline operations in depth. Topics include marketing, route analysis, aircraft selection, financial analysis, federal regulations, and scheduling. Currently industry problems are discussed as well. **Credits:** 3.00

AT 43900 - Aviation Command Leadership

Credit Hours: 2.00. Examination of pilot professional development and strategies for career planning and industry advancement. Emphasis is placed on leadership, command training, and mentorship for pilots throughout their career.**Credits:** 2.00

AT 44502 - Aircraft Electronics

Credit Hours: 3.00. A study of the computer-based electronic systems used to control both flight and engine parameters on modern aircraft. The course examines the various systems with an emphasis on how each component integrates into the electronic structure of the aircraft. **Credits:** 3.00

AT 45100 - Airport Operations

Credit Hours: 3.00. This course is an in-depth examination of airport operations for air carrier and general aviation airports, with a strong emphasis on practical problem solving of current operational issues facing local and area airports. **Credits:** 3.00

AT 45200 - Aviation Global Experience Seminar

Credit Hours: 1.00. This course prepares students for faculty-led study trips and similar international experiences for which direct course credit is not available. **Credits:** 1.00

AT 45300 - Aviation Global Experience

Credit Hours: 0.00 to 3.00. Supervised international study experience for AT students for which direct course credit not available. Specific objectives, requirements, and credit determined by the Aviation Technology department. **Credits:** 0.00 to 3.00

AT 45400 - Human Factors In Aviation

Credit Hours: 3.00. Students investigate the disciplines known as human factors and ergonomics and how they apply to various aviation career areas from a management perspective. Common industry models and error management strategies will be studied and evaluated. **Credits:** 3.00

AT 45900 - Airport Manager Certification

Credit Hours: 3.00. This course prepares students for the certified manager exam offered by the American Association of Airport Executives (AAAE). This certificate is the first step toward industry accreditation as an airport manager and director. **Credits:** 3.00

AT 47200 - Advanced Composite Technology

Credit Hours: 3.00. Students will perform a variety of fabrication, testing, and repair tasks using specialized composite fibers, matrices, and core materials.**Credits:** 3.00

AT 47500 - Aviation Law

Credit Hours: 3.00. A study of the fundamental legal and aviation law principles as they apply to the various participants in the aviation industry. Special emphasis is placed on contemporary aviation law issues such as pilot, flight instructor, and mechanic liability; product liability; and aviation insurance. **Credits:** 3.00

AT 47600 - Aircraft Gas Turbine Engine Technology II

Credit Hours: 3.00. This is a study of turbofan engines and systems. Engine installation, testing, and operational procedures are stressed. Emphasis is placed on performance evaluation, data calculations, and predictions of operational properties. Turbofan design theory, operational efficiencies, and fault isolation are discussed. **Credits:** 3.00

AT 47700 - Aircraft Maintenance Practicum

Credit Hours: 1.00. This course provides the knowledge, information and experience required for aviation professionals to interact safely in a general aviation environment.**Credits:** 1.00

AT 47900 - Control Tower Operator

Credit Hours: 3.00. This course includes a review of air traffic control procedures, federal aviation regulations, and aviation weather observation and reporting. It is designed to prepare students to pass the FAA Control Tower Operators Examination. **Credits:** 3.00

AT 48000 - Advanced Aviation Manufacturing (Lean Six Sigma Methodologies)

Credit Hours: 3.00. Course is a selective choice in the AET program. This is a study of advanced aviation manufacturing principles, lean six sigma methodologies and project management basics. Permission of instructor required. **Credits:** 3.00

AT 48100 - Aviation Safety Problems

Credit Hours: 3.00. This course provides the opportunity for students to study problems associated with aviation safety. Particular attention will be given to the formulation of specific recommendations for improvements in aviation safety. **Credits:** 3.00

AT 48700 - Transport Aircraft Simulation Laboratory

Credit Hours: 2.00. This is a laboratory course conducted in a turbine-type aircraft simulator. This course emphasizes normal instrument and aircraft procedures as well as aircraft systems and cockpit resource management. Permission of department required.**Credits:** 2.00

AT 49000 - Aviation Project

Credit Hours: 1.00 to 6.00. Independent study for junior and senior students who wish to pursue study and developmental work in special areas. Subject matter must be arranged with the instructor before enrolling in the course. Permission of instructor required. **Credits:** 1.00 to 6.00

AT 49200 - Aircraft Airworthiness Assurance

Credit Hours: 3.00. Students apply foundational airworthiness assurance principles from the aviation and aerospace industries, performing maintenance and inspection tasks on the school's large transport category laboratory aircraft. They research OEM data to develop and test air vehicle work instructions, incorporating modern maintenance and inspection practices like MSG-3, Reliability Centered Maintenance, and global Safety and Quality standards and Industry 4.0 data science frameworks relating to air vehicle maintenance. They also practice essential participative team and leadership competencies, taking on leadership roles with their laboratory peers as technical team members in a live airport ramp environment.**Credits:** 3.00

AT 49300 - Industrial Practice V

Credit Hours: 1.00. Industrial practice and experience in participating industry. Requires written report of the experience. **Credits:** 1.00

AT 49401 - Capstone Project Proposal

Credit Hours: 2.00. Students will study all aspects of a possible capstone project and will develop a proposal for conducting an applied research project.**Credits:** 2.00

AT 49501 - Applied Capstone Research Project

Credit Hours: 1.00. Students will complete the applied capstone project defined in AT 49401. **Credits:** 1.00

AT 49600 - Applied Research Proposal

Credit Hours: 2.00. Students perform a structured analysis of an industry-based problem or design challenge, producing a professionally written project proposal. Students engage all aspects of a product or process engineering design proposal including problem analysis, identifying design requirements, conceptualizing, and communicating a solution. Students incorporate rigorous research and industry methodologies like Quality Functional Deployment, Failure Mode and Effects Analysis, literature reviews, and project cost/ROI estimates to create and defend a written project proposal.**Credits:** 2.00

AT 49700 - Applied Research Project

Credit Hours: 3.00. Students transform their product/process design proposal created in the proposal design course into a requirements-driven, functional product. During design, they employ rigorous R&D criteria and metrics, global quality, safety, and other industry-based standards, tracking and reporting project development using Technology Readiness Level criteria. For deployment and test phases they incorporate human subject certification, protocols, and develop user-test measures using quantitative and qualitative analysis. The course deliverable is a final written report and functional project demonstration/presentation.**Credits:** 3.00

AT 49800 - Aviation Technology Capstone

Credit Hours: 3.00. The Aviation Technology Capstone course encourages teamwork in small groups on a substantial project. The intent of this course is to provide a capstone experience that integrates the material and previous experience of the student's curriculum. It also provides an opportunity for students to recognize and evaluate the interrelationship of their general education courses with the courses taken for their major. **Credits:** 3.00

AT 49900 - Aviation Technology

Credit Hours: 1.00 to 4.00. Hours, credit, and subject matter to be arranged by staff. Permission of department required. **Credits:** 1.00 to 4.00

AT 50500 - Research Methods In Aviation

Credit Hours: 3.00. This course explores the practical approach to research as it applies to identifying and exploring pragmatic problems in aviation industry settings. Industry based problems and issues often require a diversity of research skills, both quantitative and qualitative, in order to effectively address dynamic problems in complex and often high-risk work environments. This course offers an overview of mixed research methods which lends itself well to practical problem solving in industry. This course may also be offered in an online format. Permission of instructor required. **Credits:** 3.00

AT 50600 - MS Capstone Research Project

Credit Hours: 3.00. A formal investigation of a particular problem under the guidance of the advisory committee. Not applicable to a thesis option plan of study. Enrollment during at least two consecutive terms for a total of three credits is required. Permission of instructor required. **Credits:** 3.00

AT 50700 - Quantitative Research Methodologies In Transportation

Credit Hours: 3.00. This course provides an introduction to business statistics with a specific focus on data analyses and managerial decision making in the transportation industry. Topics include descriptive statistics, probability models, estimation, hypothesis testing, and regression analysis. Students use software to perform their own analyses. Permission of instructor required. **Credits:** 3.00

AT 50800 - Quality And Productivity In Industry And Technology

Credit Hours: 3.00. (IET 50800) Examines the contemporary issues of continuous improvement in quality and productivity in manufacturing and service industries. Includes a close examination of the evolving philosophies bearing on the scope, improvement, and costs of quality assurance programs in industry and technology. **Credits:** 3.00

AT 51900 - Aviation Geographic Information Science Applications

Credit Hours: 3.00. This course provides a core set of skills essential for understanding geospatial science and using Geographic Information Systems as a tool to conduct research with a spatial component. The student will learn how to acquire, process, analyze, and interpret geospatial data using real-world data sets in applied situations.**Credits:** 3.00

AT 52000 - Operational Assessment And Improvement

Credit Hours: 3.00. This course focuses on developing the skills to analyze, formulate, and apply techniques for work task improvement. Concepts to be studied include workflow enhancement, critical element streamlining, and value added analysis. Students will explore process map construction, process ownership, measurement system validation, standards creation, and decision factors. An industry project will be assigned and used to facilitate course objectives. Permission of instructor required. **Credits:** 3.00

AT 52100 - Resource Analysis And Optimization

Credit Hours: 3.00. This course provides the student with insight to develop and apply business models that adjust and adapt to the changing climate of daily operations in support of aviation customers and product movement. The course uses a combination of lecture and group discussion, as well as project activity to address resource analysis topics, such as queuing fundamentals, swarm theory, and forecasting models. Permission of instructor required.**Credits:** 3.00

AT 52400 - Managerial Economic Decision Making

Credit Hours: 3.00. This course explores managerial decision making, using economic and strategic impacts of new technology and transformation methodologies on the enterprise system. Management planning and decision making, process costing and allocation, operational control, management control, activity-based costing, and multi-attribute decision-making models are covered. Theory of constraints and lean implementations in aviation are studied to understand the short and long-term effects on financial measures. **Credits:** 3.00

AT 52500 - Process Improvement And Simulation

Credit Hours: 3.00. This course explores process modeling and simulation as applied to decision-making for process design and improvement. Emphasis is placed on understanding the application of process simulations to business problems including using fundamental statistical methods in the solution of an industry relevant problem. By planning and executing a computer-based simulation supporting an aviation or aerospace process design and improvement project, students improve analysis and project management skills. In addition to simulation, preparing visualizations of the process is also included for increased understanding of process interactions. **Credits:** 3.00

AT 52600 - Aviation Leadership

Credit Hours: 3.00. This course is intended for future aviation and aerospace managers. Using foundational readings, case studies, and critical analysis techniques, the contribution of past and contemporary aviation leaders will be reviewed. Permission of department required. **Credits:** 3.00

AT 52800 - Management And Design Of Training Systems

Credit Hours: 3.00. This course will examine the practical applications of managing the training process in industry and educational settings, including the development of instructional materials from an adult learner perspective. Curriculum design using various forms of media and delivery strategies will be emphasized. This course may also be delivered in an online format. Permission of department required. **Credits:** 3.00

AT 53000 - Multi-Cultural Issues In Team Operations

Credit Hours: 3.00. This course explores the nature and origins of professional, national, and organizational culture and their role in multi-disciplinary team activities. Power distance, individualism/collectivism, gender differences, and uncertainty avoidance are examined in terms of research by Hofstede. Management studies of several international air carriers will be utilized to highlight how cultural differences can affect perceptions. Permission of department required. **Credits:** 3.00

AT 53100 - International Civil Aviation Regulatory Systems

Credit Hours: 3.00. This course provides extensive multi-modal transportation security experience. Students will receive detailed information on air, maritime, rail, mass transit, trucking and oil pipeline security programs, as well as applicable threat mitigation processes. Completion of an undergraduate course in either aviation law or aviation security is recommended. This course may be applicable to undergraduates with appropriate experience and background in aviation or other transportation systems. There are no citizenship or security clearance requirements for this course. **Credits:** 3.00

AT 53200 - Contemporary Issues In Transportation Security

Credit Hours: 3.00. This course provides extensive multi-modal transportation security experience. Students will receive detailed information on air, maritime, rail, mass transit, trucking and oil pipeline security programs, as well as applicable threat mitigation processes. Completion of an undergraduate course in either aviation law or aviation security is recommended. This course may be

applicable to undergraduates with appropriate experience and background in aviation or other transportation systems. There are no citizenship or security clearance requirements for this course. **Credits:** 3.00

AT 53300 - Aviation Graduate Professional Practice Internship

Credit Hours: 1.00 to 3.00. This course involves a practical internship experience within the aviation industry that provides exposure to the roles and duties commensurate with the student's graduate program focus. Prerequisite: Completion of one term of graduate studies and the instructor will validate that the student has an offer letter from an approved company. Permission of assigned graduate chair is required. Permission of instructor required. **Credits:** 1.00 to 3.00

AT 54200 - Aviation Fuels And Exhaust Emissions

Credit Hours: 3.00. This course focuses on aviation fuels, including engine operation with fuel, combustion principles, chemistry, exhaust emissions, and fuel testing procedures. Additionally, the topics of greenhouse gases, global warming, oil reserves, fuel costs, and other factors driving the development of alternative aviation fuels will be covered. Current research in these areas will be discussed and testing procedures will be studied. Students will research new fuels in development, and will analyze the sustainability and potential for success promised by the new technologies in comparison with existing fuels. **Credits:** 3.00

AT 54300 - Contemporary Issues In Airport & Airline Finance

Credit Hours: 3.00. This course provides an overview of aviation financial management and is intended for current and future aviation and aerospace leaders and managers. Taking a global view, the course opens with the tremendous economic impact of the aviation sector that both drives and enables the interdependent global economy. The course material covers the unique business models and best practices in financial management for both the airport and airline industries and analyzes the relationship between the two (including the complications implicit in highly divergent planning horizons). The complexity of aircraft financing decisions is covered that lead up to building a fleet to serve the airlines' forecast growth. The course uses relevant readings and case studies as well as statistical data in time series to demonstrate the way financial management has evolved to improve performance in both the airport and airline industries. Permission of department required.**Credits:** 3.00

AT 54400 - Aircraft Lifecycle Management Innovations

Credit Hours: 3.00. This course explores sustainability as applied to aviation and aerospace industries and agencies, both in the private sector and public sector. Students improve analysis skills, and knowledge of the reasoning and application of sustainability. Emphasis is placed on understanding the global and national policies that lead to the regulations and practices in aviation and aerospace. Using a balanced scorecard and a triple bottom line approach, students will develop a project using aviation and aerospace publications to analyze an industry-relevant project using sustainability in the analysis. **Credits:** 3.00

AT 54600 - Aviation Financial Instruments And Operations

Credit Hours: 3.00. The course concentrates on increasing the understanding of financial expertise in analyzing trading and hedging programs for application in reducing aviation operational risk exposure. The studies include research into the development and use of operational indexes and their possible relation to hedging with commodity and security instruments. Emphasis will be placed on the understanding of current operational measurements and correlations to trading and hedging financial instruments in providing improved risk management in operational environments.**Credits:** 3.00

AT 54700 - Airline Revenue Management

Credit Hours: 3.00. This course aims to provide students with experience in airline revenue management applications. Primarily focusing on the commercial operation of airlines, this course covers various contemporary topics such as the segmentation,

inventory control, forecasting, budgeting and pricing. This course will use simulations to enhance the overall learning-teaching experience. **Credits:** 3.00

AT 54800 - Aircraft Asset Management

Credit Hours: 3.00. This course provides the student with a detailed exploration of aircraft asset management programs in both airlines and business aviation organizations. Students analyze and study the critical components of an asset management program, the financial methods in aircraft asset management, acquisition proposals, and development plans of aircraft acquisitions in this course. An airline industry-relevant project is used to improve student reasoning and application of industry standard aircraft asset management analysis procedures to include forecasting techniques, present value calculations, and benefit-cost analyses. This course serves as the foundational knowledge required for AT 54900. **Credits:** 3.00

AT 54900 - Aircraft Leasing

Credit Hours: 3.00. This course provides students with training and experience managing aircraft leases using financial and risk management methodologies specific to the airline and business aviation industries. Students conduct financial evaluations of leasing versus ownership programs of airlines, as well as analyze debt, equity and capital markets for aircraft financing. The course includes an examination of taxation issues related to aircraft leasing, maintenance reserves, and auditing of aircraft financial performance. The prerequisite for this course is AT 54800. **Credits:** 3.00

AT 55000 - Critical Systems Thinking

Credit Hours: 3.00. This course explores the application of critical systems thinking to complex problems. Using systems theory and case studies developed by technology visionaries, students will investigate alternative solutions to difficult industrial problems with global impact. Outcomes for this course include written assignments, oral presentations, and a final project that addresses a major industrial problem. **Credits:** 3.00

AT 55100 - Graduate Aviation Research Seminar

Credit Hours: 1.00. This course provides graduate students with an opportunity to present and develop ongoing research activity in a seminar setting. Individual student research designs, report/thesis structures, and project issues are developed in open forum. Permission of instructor required. **Credits:** 1.00

AT 57200 - Human Error And Safety

Credit Hours: 3.00. Explores the definition and nature of human error, error chains, and causal factors in error generation. Error taxonomies are reviewed in order to provide a classification scheme for grouping errors and assessing error criticality. Methods for assessing risk and predicting error generation potentials are learned, as well as strategies for controlling or eliminating errors. Case studies are utilized throughout the course to illustrate course concepts. Permission of instructor required. **Credits:** 3.00

AT 57300 - Managing The Risk Of Organizational Accidents

Credit Hours: 3.00. Examines strategies various industries use to assess the risk of organizational accidents and to develop safety management programs to prevent, capture, and recover from conditions that lead to disastrous outcomes. Strategies such as High Reliability Organizations, Operational Risk Management, Behavioral Based Safety, Tripod Delta, and Safety Cultures are explored as successful methods for improving organizational safety in high-risk environments and endeavors. Permission of instructor required. **Credits:** 3.00

AT 57400 - Exploratory Studies In Aviation Human Factors

Credit Hours: 3.00. Exploration of contemporary issues and research related to human factors theory and program strategies as they relate to the aviation industry. The course ventures beyond ergonomic issues into more diverse human factors considerations, while discussing an industry-wide and organizational perspective. The course utilizes a combination of lecture, group discussion, and independent study into issues relevant to student interests and career goals. Permission of instructor required. **Credits:** 3.00

AT 58100 - Workshop In Aviation Technology

Credit Hours: 0.00 to 8.00. Advanced study of technical and professional topics. Emphasis is on new developments relating to technical, operational, and training aspects of industry and technology education. **Credits:** 0.00 to 8.00

AT 59000 - Special Problems In Aviation Technology

Credit Hours: 1.00 to 12.00. Independent study of a special problem under the guidance of a member of the staff. Does not substitute for either M.S. thesis or M.S. project credit. Permission of instructor required. **Credits:** 1.00 to 12.00

AT 60700 - Aviation Applications Of Bayesian Inference

Credit Hours: 3.00. This course provides a critical foundation necessary for understanding Bayesian theory and employing that theory in the analysis of typical data generated in industry. The course will focus specifically on solutions of aviation-related problems through data analysis. Material includes overview and implementation of relevant statistical software applications. Practical skills in presenting advanced analyses to both professional and scientific audiences is a key component of the course. Prerequisites: AT 50700 OR IT 50700 OR STAT 30100 OR STAT 50100 OR STAT 51100. Permission of instructor required. **Credits:** 3.00

AT 64000 - Aviation And Aerospace Sustainability

Credit Hours: 3.00. This course explores sustainability as applied to aviation and aerospace industries and agencies, both in the private sector and public sector. Emphasis is placed on understanding aviation and aerospace sustainability academic literature and on connecting the global and national policies that lead to the regulations and practices. Aviation sustainability is comprised of multiple areas of impact such as economic, environmental, operational, and social. Students develop an understanding of existing sustainability assessment frameworks such as GRI that have general sustainability assessments along with specialized aviation industry frameworks. Using a multiple attribute analysis approach, students develop metrics and analyze the potential impact of sustainability initiatives in the aviation and aerospace industry. Prerequisites: STAT 30100 or STAT 31100 or STAT 50100 or STAT 51100 or IT 50700 or an instructor-approved statistical foundations course. Proficiency in statistical foundations is required to understand and evaluate environmental, economic and social sustainability data, information and methods presented in this course. **Credits:** 3.00

AT 65900 - Airport And Transportation Sustainability

Credit Hours: 3.00. AT 65900 Airport and Transportation Sustainability is a doctoral format course about the methods and practice of sustainability for airports and transportation. Sustainability in planning, design, construction and operation of airports and transportation facilities and infrastructure are addressed. Prerequisites: Successful completion of at least one statistics course covering descriptive and inferential statistics, an airport management course (e.g., AT 35900) and admission to doctoral program. Permission of instructor required. **Credits:** 3.00

AT 67500 - Aviation Safety Program Development

Credit Hours: 3.00. This course is designed to provide graduate students with essential information and practical activities necessary to develop and manage effective and comprehensive safety programs for a wide variety of aviation operations.

Students will conduct safety research, analyze data, and make presentations based on developed safety systems. Instructor permission required. **Credits:** 3.00

AT 68100 - Seminar In Aviation Technology

Credit Hours: 1.00 to 3.00. This variable title course will be used for temporary course offerings for doctoral-level students. Permission of Instructor required. **Credits:** 1.00 to 3.00

AT 69000 - Independent Study In Air Transportation

Credit Hours: 1.00 to 6.00. Intensive individual study of selected current developments and issues in air transportation. A faculty sponsor is required for this course. Prerequisite: Doctoral student standing. Permission of instructor required. **Credits:** 1.00 to 6.00

AT 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required. **Credits:** 1.00 to 18.00

AT 69900 - Research PhD Thesis

Credit Hours: 1.00 to 18.00. This course involves intensive research and writing activity associated with a doctoral dissertation. Prerequisite: Doctoral candidate status. Permission of instructor required. **Credits:** 1.00 to 18.00

Bands

BAND 11000 - Marching Band

Credit Hours: 2.00. Open through audition. Additional lab and activity fees involved. Mandatory participation required in Marching Band Workshop one week prior to start of fall classes which conflicts with Boilermaker Gold Rush. Workshop covers similar orientation to Gold Rush. Do enroll in BAND 11000 during summer registration prior to the workshop and audition process. **Credits:** 2.00

BAND 11100 - Symphony Orchestra

Credit Hours: 2.00. Open through audition. Additional lab and activity fees involved. **Credits:** 2.00

BAND 11200 - American Music Review

Credit Hours: 2.00. Singers and pianists only. American Music Review is a jazz big band plus 4-5 singers open through audition. Additional lab and activity fees involved. **Credits:** 2.00

BAND 11300 - Jazz Ensemble

Credit Hours: 2.00. Open through audition. Additional lab and activity fees involved. Permission of instructor required. **Credits:** 2.00

BAND 11400 - Basic Jazz

Credit Hours: 2.00. Open through audition. Additional lab and activity fees involved. **Credits:** 2.00

BAND 11500 - String Orchestra

Credit Hours: 2.00. The rehearsal, study, and performance of string orchestra music from the classical, romantic and contemporary areas of composition. **Credits:** 2.00

BAND 11600 - Symphonic Band

Credit Hours: 2.00. Open through audition. Additional lab and activity fees involved. **Credits:** 2.00

BAND 11700 - Concert Band

Credit Hours: 2.00. Open through audition. Additional lab and activity fees involved. **Credits:** 2.00

BAND 11800 - Collegiate Band

Credit Hours: 2.00. Open through audition. Additional lab and activity fees involved. **Credits:** 2.00

BAND 11900 - Varsity Band

Credit Hours: 2.00. Open through audition. Additional lab and activity fees involved. **Credits:** 2.00

BAND 12000 - Applied Music Studies

Credit Hours: 1.00. Private study on individual wind, string, and percussion instruments. Additional fees involved. Permission of instructor required. **Credits:** 1.00

BAND 12100 - Symphony Orchestra

Credit Hours: 2.00. Symphony Orchestra. **Credits:** 2.00

BAND 12200 - American Music Review

Credit Hours: 2.00. American Music Review. **Credits:** 2.00

BAND 33000 - Summer Concert Bands

Credit Hours: 2.00. Continuation of BAND 32000. **Credits:** 2.00

BAND 33100 - Summer Jazz Bands

Credit Hours: 2.00. Continuation of BAND 33000. **Credits:** 2.00

BAND 34000 - Renaissance Ensemble

Credit Hours: 2.00. A survey of renaissance and baroque ensemble literature to be played on appropriate instruments. Reproductions of renaissance and baroque wind, stringed, and brass instruments are available for use in the Department of Bands. **Credits:** 2.00

BAND 34100 - Renaissance Ensemble

Credit Hours: 2.00. A survey of renaissance and baroque ensemble literature to be played on appropriate instruments. Reproductions of renaissance and baroque wind, stringed, and brass instruments are available for use in the Department of Bands. **Credits:** 2.00

BAND 35000 - Wind Ensemble I

Credit Hours: 2.00. The University Wind Ensemble is an organization composed of 42 instrumentalists selected by audition from staff, graduate students, and symphony band members. Concentrating on the rehearsal and performance of contemporary wind music of a highly virtuoso and concertante nature, it offers its members extensive opportunities to rehearse and study works of considerable difficulty from the contemporary area of composition as well as some aspects of the baroque and classical fields. This organization meets once a week throughout the academic year. Permission of instructor required. **Credits:** 2.00

BAND 35100 - Instrument Ensemble Colloquium

Credit Hours: 2.00. Instrument Ensemble Colloquium. **Credits:** 2.00

BAND 36000 - Wind Ensemble II

Credit Hours: 2.00. The University Wind Ensemble is an organization composed of 42 instrumentalists selected by audition from staff, graduate students, and symphony band members. Concentrating on the rehearsal and performance of contemporary wind music of a highly virtuoso and concertante nature, it offers its members extensive opportunities to rehearse and study works of considerable difficulty from the contemporary area of composition as well as some aspects of the baroque and classical fields. This organization meets once a week throughout the academic year. **Credits:** 2.00

BAND 36100 - Instrument Ensemble Colloquium

Credit Hours: 2.00. Instrument Ensemble Colloquium. **Credits:** 2.00

BAND 43000 - Summer Concert Bands

Credit Hours: 2.00. Summer Concert Bands. **Credits:** 2.00

BAND 43100 - Summer Jazz Bands

Credit Hours: 2.00. Summer Jazz Bands. **Credits:** 2.00

BAND 44000 - Renaissance Ensemble

Credit Hours: 2.00. A survey of renaissance and baroque ensemble literature to be played on appropriate instruments. Reproductions of renaissance and baroque wind, stringed, and brass instruments are available for use in the Department of Bands. **Credits:** 2.00

BAND 44100 - Renaissance Ensemble

Credit Hours: 2.00. A survey of renaissance and baroque ensemble literature to be played on appropriate instruments. Reproductions of renaissance and baroque wind, stringed, and brass instruments are available for use in the Department of Bands. **Credits:** 2.00

BAND 47000 - Wind Ensemble III

Credit Hours: 2.00. The University Wind Ensemble is an organization composed of 42 instrumentalists selected by audition from staff, graduate students, and symphony band members. Concentrating on the rehearsal and performance of contemporary wind music of a highly virtuoso and concertante nature, it offers its members extensive opportunities to rehearse and study works of considerable difficulty from the contemporary area of composition as well as some aspects of the baroque and classical fields. This organization meets once a week throughout the academic year. **Credits:** 2.00

BAND 47100 - Ensemble Colloquium

Credit Hours: 2.00. Ensemble Colloquium. **Credits:** 2.00

BAND 48000 - Wind Ensemble IV

Credit Hours: 2.00. The University Wind Ensemble is an organization composed of 42 instrumentalists selected by audition from staff, graduate students, and symphony band members. Concentrating on the rehearsal and performance of contemporary wind music of a highly virtuoso and concertante nature, it offers its members extensive opportunities to rehearse and study works of considerable difficulty from the contemporary area of composition as well as some aspects of the baroque and classical fields. This organization meets once a week throughout the academic year. **Credits:** 2.00

BAND 48100 - Ensemble Colloquium

Credit Hours: 2.00. Ensemble Colloquium. **Credits:** 2.00

Basic Medical Sciences

BMS 11500 - Anatomy For Veterinary Technicians I - DL

Credit Hours: 2.00. This course is the first of two courses in the distance learning program that presents an introduction to the study of the major body systems and topographic relationships of the major domesticated species, with emphasis on the carnivore. **Credits:** 2.00

BMS 11600 - Anatomy For Veterinary Technicians II - DL

Credit Hours: 2.00. This course is the second of two courses in the distance learning program that presents an introduction to the study of the major body systems and topographic relationships of the major domesticated species, with emphasis on the carnivore. **Credits:** 2.00

BMS 13500 - Physiology For Veterinary Technicians I - DL

Credit Hours: 1.00. This course is the first of two courses in the distance learning program that presents an introduction to general physiology of the mammalian body systems and the general physiological process with emphasis on domestic animals. This course will address the functions of the different systems and homeostasis; the functions of the cell; the different compartments and solute transport; blood and defense; general functions of the nervous system, reflexes and special senses; the function of the nerve and muscle; cardiovascular system; and digestive system. **Credits:** 1.00

BMS 13600 - Physiology For Veterinary Technicians II - DL

Credit Hours: 1.00. This course is the second of two courses in the distance learning program that addresses the functions of the kidney and its role in regulation of extracellular volume and acid-base; respiration, mechanics of respiration and its control, transport of gases and hypoxia; physiology of the endocrine system, functions of the gonads, fertilization, pregnancy, parturition and lactation. **Credits:** 1.00

BMS 20100 - Applied Domestic Animal Anatomy With Clinical Correlations I

Credit Hours: 2.00. This course is the first of two in the Purdue College of Veterinary Medicine, Department of Basic Medical Sciences distance learning program covering the basic anatomy of common domestic animals. We will focus on the canine and comparative anatomy of the equine, ruminant, and human, especially where species differentiations exist. The information is organized according to body systems. Clinical correlations are used to emphasize the importance of the basic anatomy. Permission of instructor required. **Credits:** 2.00

BMS 20200 - Applied Domestic Animal Anatomy With Clinical Correlations II

Credit Hours: 2.00. This course is the second of two in the Purdue College of Veterinary Medicine, Department of Basic Medical Sciences distance learning program covering the basic anatomy of common domestic animals. We will focus on the canine and comparative anatomy of the equine, ruminant, and human, especially where species differentiations exist. The information is organized according to body systems. Clinical correlations are used to emphasize the importance of the basic anatomy. In this second course we cover thoracic, abdominal and head anatomy. Permission of instructor required. **Credits:** 2.00

BMS 23100 - Anatomy-VN

Credit Hours: 4.00. Gross and microscopic study of body systems and topographic relationships in major animal species. Laboratory consists of dissection as well as study of living animals.**Credits:** 4.00

BMS 23200 - Physiology-VN

Credit Hours: 2.00. Basic mammalian physiology, which covers general physiological processes with emphasis on domestic animals. Laboratory experiences and demonstrations form a major part of the laboratory instruction.**Credits:** 2.00

BMS 23300 - Introduction To Pharmacology-VN

Credit Hours: 0.50. This course introduces the concepts and terminology of pharmacology including basic terminology, pharmacokinetics, and pharmacodynamics.**Credits:** 0.50

BMS 23400 - Clinical Physiology: A Problem Solving Approach-Distance Learning

Credit Hours: 1.00. This course will provide the physiological basis for clinical functions and medical interventions of the animal. The course is designed to: 1. Complement and expand students' understanding of concepts taught in the general physiology course (BMS 23200, Physiology for Veterinary Technicians); 2. Emphasize how understanding basic physiological concepts can help in solving clinical cases; 3. Promote critical thinking, team work, communication skills and problem solving. **Credits:** 1.00

BMS 23500 - Pharmacology VT-DL

Credit Hours: 1.00. This course is the first of two courses in the distance learning program that presents an introduction to the principles of pharmacy and pharmacology for the veterinary technician. Emphasis will be placed upon key concepts of how drugs

work, terminology commonly used with therapeutic agents, important mechanisms and side effects of commonly used veterinary drugs, and dosage calculations. **Credits:** 1.00

BMS 23600 - Pharmacology II VT-DL

Credit Hours: 1.00. This course is the second of two courses in the distance learning program that presents an introduction to the principles of therapeutics and pharmacology for the veterinary technician. Emphasis will be placed upon key concepts of how drugs work, terminology commonly used with therapeutic agents, important mechanisms and side effects of commonly used veterinary drugs. **Credits:** 1.00

BMS 23700 - Applied Physiology With Clinical Correlations I

Credit Hours: 2.00. This course introduces students to the general physiology of mammalian body systems and physiological processes. This course will address the functions of the different systems and homeostasis; the functions of the cell and its different compartments; solute transport, blood and immunity; general functions of the nervous system, reflexes and special senses; the functions of the nerve and muscle, the cardiovascular system; and the digestive system. The course provides the basic physiological concepts of various organ systems and clinical correlations that emphasize how understanding of basic physiological concepts help students solve problems. The clinical correlations and the students-centered learning activities are deigned to promote critical thinking, team work, communication skills, and problem solving. The targeted undergraduate students are: Pre-vet students, animal science majors, wildlife majors, and students in biological sciences and biomedical engineering, and other students interested in use of animals as models for human diseases. Permission of instructor required.**Credits:** 2.00

BMS 23800 - Applied Physiology With Clinical Correlations II

Credit Hours: 2.00. This course introduces students to general physiology of mammalian body systems and general physiological processes, with emphasis on domestic animals. The course addresses the functions of the different systems, and the specific functions of the respiratory, renal, endocrine, and reproductive systems. Students will be introduced to ailments that result from malfunctions in each system. The course provides the basic physiological concepts of various organ systems and clinical correlations that emphasize how understanding basic physiological concepts can help in solving problems. The clinical correlations and the students-centered learning activities are deigned to promote critical thinking, team work, communication skills, and problem solving. The targeted undergraduate students are: Pre-vet, students, animal science majors, wildlife majors, and other interested students in biological sciences and biomedical engineering. Permission of instructor required. **Credits:** 2.00

BMS 33100 - Pharmacology-VN

Credit Hours: 1.50. This course introduces the concepts of drugs used in the different body systems. Mechanisms of action, side effects, and therapeutic applications are presented.**Credits:** 1.50

BMS 51700 - Problems In Basic Medical Sciences

Credit Hours: 0.50 to 8.00. Studies or investigations in the various disciplines of the basic medical sciences of man and domestic animals for advanced undergraduate and beginning graduate students. Permission of instructor required. **Credits:** 0.50 to 8.00

BMS 52400 - Introduction To Confocal Microscopy And Image Analysis

Credit Hours: 1.00. Introduction to the principles of confocal microscopy and rudiments of image analysis. Confocal microscopy can be used in biological and nonbiological systems and is, therefore, an interdisciplinary tool in the modern research laboratory. The three-dimensional reconstruction of images allows discovery of complex structures. Deals with fluorescence excitation and emission, optical design, basic image analysis principles, and application areas for which the technology has been targeted. The student will have a good understanding of the application and use of the technology by the end of the course. **Credits:** 1.00

BMS 52900 - Basic Bone Biology

Credit Hours: 3.00. This course is designed to present the fundamentals of bone biology. Approximately 45 hours of lecture will help the learner achieve the objectives outlined. Lectures will be given to present information and tie into information learners have acquired or will acquire in other courses (e.g. biomechanics, physiology, molecular biology, etc.) to assist them in combining all of their courses and research experiences together into one interdisciplinary learning experience. It is expected that students take additional time outside of scheduled class time to further learning. Materials for the learners will be posted on the course's website. These materials will include: Lecture notes and PowerPoints: Each lecturer will post his/her lecture notes and associated PowerPoint slides prior to the lecture. Additional information: As the course progresses, instructors may come across additional information that they may find useful for student learning of the material. These materials will be posted for students to utilize as they see fit. * *Materials found on other sites (e.g. social networking sites) will not be official course materials, so use at your own risk.* Permission of instructor required.**Credits:** 3.00

BMS 53400 - Systemic Mammalian Physiology

Credit Hours: 4.00. This course is a 4 credit hour course that provides fundamental concepts of mammalian physiology in nervous, muscular, blood and cardiovascular, respiratory, renal, digestive, endocrine, and reproductive systems. The major physiological functions of these systems will be explained at the organ as well as the cellular level. The structure and function relationships will be studied in detail. At the end of the course, the students are expected to have a solid understanding of basic functions of the human body. In addition, the student will be exposed to the current topics and key concepts of experimental research. This course offers an excellent opportunity for those students who are looking to either learn or refresh their physiological knowledge that can benefit a variety academic and professional career goals. **Credits:** 4.00

BMS 59800 - Introduction To Research In Basic Medical Sciences

Credit Hours: 1.00 to 3.00. Introduction to research in pharmacology and physiology under the direction of a member of the departmental graduate faculty. Permission of instructor required. **Credits:** 1.00 to 3.00

BMS 60200 - Special Topics In Basic Medical Sciences

Credit Hours: 0.50 to 8.00. Advanced studies of organismic, cellular, and molecular processes in the basic medical sciences of man and domestic animals. Permission of instructor required. **Credits:** 0.50 to 8.00

BMS 63100 - Flow Cytometry: Theory

Credit Hours: 2.00. A thorough excursion into the theory of flow cytometry. An understanding of what the technology is, how it operates, and where the applications exist. Covers optical systems, including filters, light excitation and emissions, fluorescent dyes and fluorescent molecules, electronics including detection systems, signal processing, data analysis, and computer applications. A discussion of lasers and other light sources, as well as quality control. Overview of the application areas in medical sciences, biological research, and other possible areas of use. **Credits:** 2.00

BMS 69200 - Seminar In Basic Medical Sciences

Credit Hours: 0.00 or 1.00. Oral presentation of assigned or selected topics pertaining to physiology and pharmacology. **Credits:** 0.00 or 1.00

BMS 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required. **Credits:** 1.00 to 18.00

BMS 69900 - Research PhD Thesis

Credit Hours: 1.00 to 18.00. Research PhD Thesis. Permission of instructor required. **Credits:** 1.00 to 18.00

BMS 80100 - Gross Anatomy Of The Dog And Cat

Credit Hours: 3.50. Study of the anatomy of the body systems and the topographic relationships of the dog and cat. **Credits:** 3.50

BMS 80200 - Comparative Anatomy

Credit hours: 4.00. A comparative study of the body systems and the topographic relationships of the major domestic species. This course is an extension of BMS 801 and will continue to build on anatomical knowledge so that it may be applied to multiple domestic species. **Credits:** 4.00

BMS 80300 - Applied Anatomy Of The Dog And Cat

Credit Hours: 1.00. Consists of seven 50-minute lectures and/or discussion periods and seven 150-minute laboratory sessions, plus a comprehensive final exam. This course builds on basic anatomical knowledge and explores, in depth, the anatomy relevant to medical and surgical conditions of the dog and cat. Laboratory will utilize anatomical models, cadavers as animal models, electronic resources, and limited use of live animals for clinical examinations. **Credits:** 1.00

BMS 80400 - Applied Anatomy Of The Horse

Credit Hours: 1.00. Consists of seven 50-minute lectures and/or discussion periods and seven 120-to-150-minute laboratory sessions, plus a comprehensive final exam. Course material is based upon clinical conditions of the horse that have an anatomical basis or emphasis. Laboratory sessions include topographical anatomy; joint and nerve injections and performance of other clinical procedures; use of multimedia learning aids; and dissection of the head, neck, viscera, and legs. **Credits:** 1.00

BMS 80500 - Applied Anatomy Of Production Animals

Credit Hours: 1.00. Consists of seven 50-minute lectures and/or discussion periods and seven 120-to-150-minute laboratory sessions, plus a comprehensive final exam. Course material is based upon clinical conditions of the production animals that have an anatomical basis or emphasis. Laboratory sessions include topographical anatomy; joint and nerve injections and performance of other clinical procedures; use of multimedia learning aids; and dissection of the head, neck, viscera, and legs. **Credits:** 1.00

BMS 80700 - Veterinary Cell And Tissue Biology Design I

Credit hours: 2.50. The first of a two-semester sequence of courses, emphasizing developmental and microstructural foundations of structural differentiation of cell, tissue, and organ systems. Emphasis is placed upon principles, fundamental concepts, and applicable details as well as comparative aspects of general importance for veterinary medicine and biomedical research. That you have some background in biochemistry and cell biology is assumed. **Credits:** 2.50

BMS 80800 - Veterinary Cell And Tissue Biology Design II

Credit hours: 2.00. All lectures will focus on mammalian microanatomy with species differences and aim to include also a brief comparative description for Avian microanatomy when applicable. Structural and molecular basis of cellular processes that are the foundation of fertilization, embryogenesis, histogenesis, and basic tissue specialization in domesticated animals. Structure and function of macromolecules and organelles that mediate signal transduction, differentiation, and integration within a whole animal. **Credits:** 2.00

BMS 81000 - Foundations In Basic Medical Sciences

Credit Hours: 1.50. The overall objective of this course is to provide the incoming first year DVM students the basic, foundational science principles upon which they will base study of the DVM curriculum. Emphasis is upon basic principles and fundamental concepts of: animal body organization and terminology; cellular and whole body metabolism; macromolecules, membranes, transport, biosynthetic processes, cellular communication/signal transduction, cell cycle and growth regulation, gene expression and embryonic development. **Credits:** 1.50

BMS 81100 - Physiology Of Domestic Animals I

Credit Hours: 3.00. General physiological process of mammals with special emphasis on domestic animals; normal interactions between large populations of cells, organs, organ systems and integrated functions of an entire animal; homeostatic mechanisms, physiology of body fluids and blood formed elements, muscle and cardiovascular systems. **Credits:** 3.00

BMS 81200 - Physiology Of Domestic Animals II

Credit Hours: 4.00. Continuation of Physiology of Domestic Animals I (BMS 81100). Survey of the principles, concepts and mechanisms of physiological processes with special emphasis on interactions between large populations of cells, tissues, organ systems and integrated functions of domestic animals of importance to veterinary medicine. The organ systems covered are respiratory, renal, digestive, endocrine, and reproductive. **Credits:** 4.00

BMS 81300 - Principles Of Pharmacology

Credit Hours: 1.50. Introduction to pharmacokinetics and pharmacodynamics, ethical dimensions of drug use in veterinary medicine, and drug categories that integrate well with other first-year subjects (e.g., drugs that alter endocrine/reproductive function). Emphasis is placed on general principles and prototypical drugs. **Credits:** 1.50

BMS 81400 - Basic And Applied Pharmacology I

Credit Hours: 3.00. BMS 81400 follows BMS 81300 and includes the study of drugs with actions related to the nervous system and the immune system at large, anticancer drugs, antiviral drugs, and drugs targeted to organ specific pathologies - e.g. cardiac, intestinal, pulmonary, and renal pathologies. **Credits:** 3.00

BMS 81401 - Pharmacology Principles And Applications

Credit Hours: 4.00. This is the first of two pharmacology courses in the DVM curriculum. The first part of this course encompasses an introduction to basic concepts necessary to understand and optimally administer and deliver therapeutic drugs, such as pharmacokinetics, pharmacodynamics, dose forms, dosing regimen and prescriptions. In the second part of the course, drugs are studied not only based on their pharmacological class, but also based on the organs and systems on which they act (e.g. heart and vascular system, lungs, autonomous neuronal pathways, respiratory system, endocrine system, etc). This course also covers the pharmacology of cancer therapy and drugs used to fight pathogens (antifungals, antibiotics, antivirals, antiparasitics). Journal club sessions are included to directly relate pharmacology instruction to topics currently debated in the field. **Credits:** 4.00

BMS 81500 - Veterinary Neuroscience

Credit hours: 2.00. This course provides an introduction to neuroscience and its diagnostic application in veterinary medicine. Students will acquire terminology describing the anatomy and basic physiology that characterize neural systems. Integration of function/structure relationships will be introduced in lectures and laboratories, by reference to case studies, and by problem-solving. **Credits:** 2.00

BMS 81600 - Applied Pharmacology II

Credit Hours: 1.50. This DVM curriculum course covers drugs used to fight pathogens (antifungals, antibiotics, antivirals, antiparasitics), and drugs for immunomodulation and cancer therapy. New topics are introduced according to upcoming developments in drug use such as pharmacogenomics. A journal club session is included to directly relate pharmacology instruction to topics currently debated in the field. **Credits:** 1.50

BMS 81800 - Basic And Applied Pharmacology II And Principles Of Toxicology

Credit Hours: 2.00. A continuation of BMS 81400. Includes the study of drugs with actions related to the nervous system, and chemotherapeutic agents (including antibacterial, antifungal, and antiparasitic drugs). Principles of toxicology are introduced. **Credits:** 2.00

BMS 81900 - Endocrine And Neural Basis Of Seasonal Activities Of Birds And Mammals In The Wild

Credit Hours: 1.00. This one-credit elective course will be offered to first and second year veterinary students annually (third year students may also take it). The course will explore the physiological basis of seasonal activities of mammals and birds in the wild. An emphasis will be placed on the neural and endocrine changes that are associated with the seasonal and cyclical activities including breeding, hibernation, migration, etc. **Credits:** 1.00

Biochemistry

BCHM 10000 - Introduction To Biochemistry

Credit Hours: 2.00. A survey of modern biochemistry using case studies that highlight general theories and unifying concepts. This course is open to all majors and does not require any college science courses as background or prerequisite. **Credits:** 2.00

BCHM 10100 - Introduction To Biochemistry Laboratory

Credit Hours: 1.00. An entry-level laboratory course to help freshmen students become interested and excited about scientific research, and at the same time, gain the skills necessary to become better prepared for undergraduate research opportunities. Students perform real-world experiments to identify single base-pair changes in a DNA sequence that can change a protein-protein interaction. Students learn common laboratory skills such as pipetting, centrifugation, and sterile technique. Students also learn how to display and interpret scientific results in written form. **Credits:** 1.00

BCHM 22100 - Analytical Biochemistry

Credit Hours: 3.00. Discussion of qualitative and quantitative analysis of biological compounds including pH measurement and control, spectrophotometry, measurement of radioactivity; theoretical basis of various separation techniques, including chromatography and electrophoresis; application of these methods to separation and analysis of biological compounds. Laboratory sessions will provide practical experience in the use of these methods. This course is designed for biochemistry majors. **Credits:** 3.00

BCHM 27500 - Honors Course - Lower Division

Credit Hours: 1.00 to 4.00. Utilized to offer a new honors course for a maximum of three years. Variable title, credit, and instructional type. Course may be repeated for credit if content and titles are different. Offered primarily to first- and second-year

students. Courses offered must be approved by departmental faculty and College of Agriculture Honors Committee. Restriction: Enrollment in an honors program. Permission of instructor required. **Credits:** 1.00 to 4.00

BCHM 29000 - Experimental Design Seminar

Credit Hours: 2.00. Introduction to fundamentals of scientific principles and practice in biochemistry. Students will learn how to develop hypotheses, design experiments, and critically analyze results to create new knowledge. Intended for sophomores. **Credits:** 2.00

BCHM 29800 - Introduction To Biochemistry Research

Credit Hours: 1.00 or 2.00. Supervised individual research. This course is intended to provide an introduction to independent undergraduate research. The primary goal of this experience is to learn the mechanics of laboratory science. Students will learn to work in a real laboratory situation where experiments are not preassembled for them. Students will record their data in laboratory notebooks, and gain experience in trouble-shooting and critically analyzing the results of their experiments. Permission of instructor required. **Credits:** 1.00 or 2.00

BCHM 29801 - Head Start To Introductory Biochemistry Research

Credit Hours: 0.50 or 1.00. Supervised individual research. Weeks 9-16. This course is intended to provide a brief introduction to independent undergraduate research. Students should plan on continuing their research in the same laboratory in the following semester. The primary goal of this course is to gain experience working side-by-side with researchers in a real laboratory setting. Students will begin to learn how to best record their data in laboratory notebooks, and gain experience in trouble-shooting and critically analyzing the results of their experiments. Permission of instructor required. **Credits:** 0.50 or 1.00

BCHM 30700 - Biochemistry

Credit Hours: 3.00. Students will have an understanding of the following content areas: structure/function of amino acids, carbohydrates, lipids and nucleic acids; protein structure, function and purification; basic enzymology; replication, transcription and translation; intermediary metabolism including glycolysis, the citric acid cycle, oxidative phosphorylation, photosynthesis. Students will also develop an appreciation for some of the contributions that have been made by biochemistry to society, including improvements to medicine, agriculture, and the economy. **Credits:** 3.00

BCHM 30900 - Biochemistry Laboratory

Credit Hours: 1.00. Experiments that introduce methods for analysis and separation of biological molecules and that illustrate the biochemical and metabolic concepts covered in BCHM 30700. **Credits:** 1.00

BCHM 32200 - Analytical Biochemistry II

Credit Hours: 2.00. Modern biochemical techniques for the purification and characterization of biological proteins. This is a project-oriented course where students begin by purifying a recombinant enzyme by affinity chromatography and then characterize various biochemical properties of the enzyme throughout the semester. Emphasis will be placed on quantitative analyses, including measurements of enzyme activity and inhibition, molecular interactions, and oligomeric state. Students will learn basic principles of designing assays to measure biochemical phenomena. Use of bioinformatics and computational modeling tools for protein structure analysis will be integrated. The course will culminate with preparation of a manuscript-style report describing the enzyme characterization. **Credits:** 2.00

BCHM 36100 - Molecules

Credit Hours: 3.00. A lecture course that relates biochemistry to organic chemistry. Chemical principles relevant to the assembly and function of macromolecules, the logic of biological free energy conversion, and enzyme catalysis are emphasized, all of which provide a foundation for the study of metabolism. **Credits:** 3.00

BCHM 39000 - Professional Development Seminar

Credit Hours: 1.00. The objective of this course is to help biochemistry students with professional development and career planning. Students will learn about career possibilities, interview skills, job search strategies, graduate and professional school applications, resume construction and industrial practices. Intended for juniors. **Credits:** 1.00

BCHM 39100 - Internship In Biochemistry

Credit Hours: 0.00. Professional internship with biochemistry related employers in industry, government or small business. Permission of department required.**Credits:** 0.00

BCHM 40000 - Biochemistry Study Abroad

Credit Hours: 0.00 to 8.00. Utilized to record credits earned through participation in Purdue study abroad programs with cooperating foreign universities. **Credits:** 0.00 to 8.00

BCHM 42100 - R For Molecular Biosciences

Credit Hours: 3.00. Students will acquire, assess, clean, visualize and analyze biological data sets with R. Students will be able to describe the link between complex biological phenomena and the data captured through human observation or scientific instrumentation. Students will learn how to organize data sets to optimize clarity and analytic possibilities while minimizing errors with examples drawn from the literature or biological databases. R will be taught starting with small-scale data such as drug sensitivity assays moving to genome-scale analyses such as gene expression and pathway analysis later in the course. These skills will be taught in the light of increasing data literacy and enabling reproducible research through clear documentation of data and communication of analyses. Relevant concepts from biology and statistics will be reviewed.**Credits:** 3.00

BCHM 42200 - Computational Genomics

Credit Hours: 3.00. This course introduces students to modern genomics and computational tools that will be used for screening. Students will review the notion of gene, genomic, transcriptome, and epigenome, and show how next generation sequencing technologies are utilized to measure these with cell.**Credits:** 3.00

BCHM 43400 - Medical Topics In Biochemistry

Credit Hours: 3.00. This course applies the principles of biochemistry and metabolic regulation to understand the diagnosis and treatment of human disease. The course emphasizes the biochemistry relevant to diabetes, blood disorders and the medical consequences of liver disease and aging. Roughly half of the class time is focused on small group activities including team-based learning and problem-based learning using patient cases. Students will search authoritative sources to discover links between biochemistry and clinical symptoms and communicate that information to their peers. **Credits:** 3.00

BCHM 46200 - Metabolism

Credit Hours: 3.00. A lecture course to provide students with a broad and thorough understanding of core metabolic pathways and how they are resulted. Anabolic and catabolic processes of metabolic pathways will be studied at the biochemical, structural, genetic and molecular levels. Students will learn to appreciate how the various metabolic pathways are integrated and how the fundamental metabolic pathways relate to medicine, agriculture and human disease. **Credits:** 3.00

BCHM 46500 - Biochemistry Of Life Processes

Credit Hours: 2.00. Major questions in biochemistry and contemporary approaches to these problems. Material covered in class will primarily be derived from primary literature. Students will continue to develop the skills needed to critically read, evaluate, and assimilate the primary scientific literature. **Credits:** 2.00

BCHM 47500 - Honors Course - Upper Division

Credit Hours: 1.00 to 4.00. Utilized to offer a new honors course for a maximum of three years. Variable title, credit, and instructional type. Course may be repeated for credit if content and titles are different. Offered primarily to third- and fourth-year students. Courses offered must be approved by departmental or program faculty and College of Agriculture Honors Committee. Permission of instructor required. **Credits:** 1.00 to 4.00

BCHM 49000 - Undergraduate Seminar

Credit Hours: 1.00. Discussion of individual student's research projects. Preparation of posters and public seminars based upon research results. Permission of instructor required. **Credits:** 1.00

BCHM 49500 - Special Assignments

Credit Hours: 1.00 to 3.00. Special work in biochemistry not included in other courses. Permission of instructor required. **Credits:** 1.00 to 3.00

BCHM 49800 - Research In Biochemistry

Credit Hours: 1.00 to 6.00. Supervised individual research. This course is intended to provide the opportunity for in-depth, independent undergraduate research. The students enrolled in this course will learn how to devise hypotheses, design experiments that test their hypotheses, record their data in laboratory notebooks, critically analyze the results of their analyses, and present their findings to others in written form. Permission of instructor required. **Credits:** 1.00 to 6.00

BCHM 49801 - Head Start To Biochemistry Research

Credit Hours: 0.50 to 2.00. Supervised individual research. Weeks 9-16. This course is intended to provide a brief research experience in preparation for in-depth, independent undergraduate research the following semester. The students enrolled in this course will begin to learn how to devise hypotheses, design experiments that test their hypotheses, record their data in laboratory notebooks, critically analyze the results of their analyses, and present their findings to others in written form. Permission of instructor required. **Credits:** 0.50 to 2.00

BCHM 49900 - Honors Thesis In Biochemistry

Credit Hours: 3.00. This course is intended to provide the opportunity for in-depth, independent undergraduate research. The students enrolled in this course will learn how to devise hypotheses, design experiments that test their hypotheses, record their data in laboratory notebooks, critically analyze the results of their analyses, and present their findings to others in the form of a written thesis. Permission of instructor required. **Credits:** 3.00

BCHM 52100 - Comparative Genomics

Credit Hours: 3.00. The course provides an understanding of the forces that act on genome content and organization, and the ability to interpret genetic variation between genomes. Students will acquire skills to utilize public genome databases, visualize genomic regions/features of interest using a genome browser, and perform phylogenetic analysis. The knowledge gained is

central within the fields of genetics, bioinformatics, microbiology, and evolutionary biology and have important applications in numerous related fields including medicine, biotechnology, agriculture, and ecology. **Credits:** 3.00

BCHM 53600 - Biological And Structural Aspects Of Drug Design And Action

Credit Hours: 3.00. (BIOL 53601) This course is aimed at expanding students' fundamental interests in biology, chemistry and biochemistry to how drugs work. The course will provide an overview of the modern day drug discovery pipeline and an in-depth look at the basic biology, structure, and mechanisms-of-action behind marketed therapeutics. The course will start with a historical account of the discovery of natural product drugs such as aspirin and penicillin and will then venture into the modern day era of drug discovery including structure-based drug design. We will explore different classes of antibiotics, antiviral, and anti-cancer drugs and their targets including small molecule drugs and modern biologics-based drugs. **Credits:** 3.00

BCHM 56100 - General Biochemistry I

Credit Hours: 3.00. This course provides upper-division undergraduate and graduate students with basic understanding of biochemical and structural properties of amino acids, nucleic acids, lipids, and carbohydrates. This course allows students to connect the relationship between structure and function of biomolecules. In addition, students learn to understand enzyme properties, enzyme mechanism of action, and enzyme regulation. **Credits:** 3.00

BCHM 56200 - General Biochemistry II

Credit Hours: 3.00. This course provides upper-division undergraduate and graduate students with an understanding of core metabolic pathways. Anabolic and catabolic processes of metabolic pathways are studied. Biochemical and structural knowledge is used to determine how enzymes and coenzymes are needed to regulate and control metabolic pathways. **Credits:** 3.00

BCHM 59500 - Current Topics In Biochemistry

Credit Hours: 1.00 to 4.00. Critical examination of developments in specialized fields of biochemistry not taught in other courses. Some topics include lecture, lab, directed reading or independent study. Permission of Instructor required. **Credits:** 1.00 to 4.00

BCHM 60100 - Critical Thinking And Communication In Biochemistry I

Credit Hours: 2.00. The objective of this course is to assist students in acquiring the skills needed to read critically, evaluate, and assimilate the primary scientific literature. This objective will be accomplished by instructor-guided discussions of the hypotheses, experimental data, conclusions, and scientific merit of assigned manuscript(s) taken from the fields of biochemistry and molecular biology. Topics for discussion initially will focus on the structure, organization, review process, and ethical issues related to scientific manuscripts. As the semester progresses, discussions will focus on the hypotheses being tested, quality of the data, and validity of the conclusions. Permission of instructor required. **Credits:** 2.00

BCHM 60200 - Critical Thinking And Communication In Biochemistry II

Credit Hours: 2.00. Builds on the skills developed in BCHM 601. Students will continue to enhance their analytical skills, and class discussions will be conducted at a more sophisticated level and will go into greater depth. Class discussions will focus more on the analysis and evaluation of current methodologies and hypotheses in the biochemical and molecular biological literature. Students will be evaluated primarily on their preparation and participation in each class discussion. Prerequisite: BCHM 60100. Permission of instructor required. **Credits:** 2.00

BCHM 60300 - Introduction To Graduate Research In Biochemistry I

Credit Hours: 6.00. This course is intended to provide the opportunity for in-depth, mentored graduate research in two biochemistry laboratories. Students enrolled in this course will learn how to devise hypothesis, design experiments that test their hypotheses, accurately record their data in laboratory notebooks, critically analyze the results of their analyses and present their findings to others in written and oral presentations. They will fully participate in laboratory group meetings, the Biochemistry seminar series, and presentations by other students and postdoctoral fellow. Co-requisites: BCHM 60100 and BCHM 60501. Permission of department required. **Credits:** 6.00

BCHM 60400 - Introduction To Graduate Research In Biochemistry II

Credit Hours: 3.00. This course builds upon BCHM 60300 to provide continued opportunity for in-depth, mentored graduate research in one biochemistry laboratory. Students enrolled in this course will learn how to devise hypothesis, design experiments that test their hypotheses, accurately record their data in laboratory notebooks, critically analyze the results of their analyses and present their findings to others in written and oral presentations. They will fully participate in laboratory group meetings, the Biochemistry seminar series, and presentations by other students and postdoctoral fellows. Co-requisite: BCHM 60200 and Prerequisites: BCHM 60300 and BCHM 60501. Permission of department required. **Credits:** 3.00

BCHM 60501 - Macromolecules

Credit Hours: 3.00. This course will provide students with an understanding of the basic principles that underlie the secondary and tertiary structure of proteins and nucleic acids which contribute to their function. It will inform students of current efforts to engineer macromolecules with novel functions. Students will become familiar with methods used to determine the three-dimensional structures of macromolecules, and they will learn to critically evaluate the accuracy of structural models. Special topics in the current literature, including membrane proteins, drug design and ribozymes, will be covered. The class will typically include students from a variety of departments, graduate programs, and scientific backgrounds. The course will be taught primarily from various textbook and from the primary literature. A biochemistry course designated for majors is a prerequisite of the course. Lack of the prerequisite will require approval of the instructor. Permission of Department required. **Credits:** 3.00

BCHM 61000 - Regulation Of Eukaryotic Gene Expression

Credit Hours: 3.00. This course will provide students with a basic understanding of gene expression mechanisms with a s specific focus on newly emerging topics. This course will be taught from current primary literature, using a textbook as a background resource. Topics will include transcription, messenger RNA decay, microRNAs and connections between gene expression steps. Students will learn how to read and interpret scientific literature through class presentations, discussions and take home assignments. Additionally, students will gain experience in developing and testing hypotheses within the class topic areas and writing a research proposal. Prerequisites: BCHM 56100 and 56200, or BCHM 60501. Lack of these prerequisites will require approval by the instructor. **Credits:** 3.00

BCHM 61100 - Chromatin Biology And Chromosome Dynamics

Credit Hours: 2.00. An exploration of current models and recent discoveries in chromatin biology and the relationship between chromatin and gene expression, as well as other aspects of chromosome structure and function. Prerequisites: BCHM 56100 and BCHM 56200 or BCHM 60501. **Credits:** 2.00

BCHM 61200 - Bioinformatic Analysis Of Genome Scale Data

Credit Hours: 3.00. This course provides a hands-on experience for life science researchers in the bioinformatic analysis of genome-scale data. The various disciplines in the life sciences are generating a wealth of experimental and annotation data. Today's graduate students need experience with modern tools that can help them to access, explore, analyze, interpret and manage the data that they generate in the lab. Students will use the R programming language and packages from Bioconductor, the R bioinformatics project, as their principal tools for this course. Students will develop workflows in R that bridge established algorithms for bioinformatics such as limma, edgeR or DESeq2, incorporating methods to import, QC, transform and visualize

genome-scale datasets derived from next generation sequencing experiments. A critical aspect of bioinformatics that is often inadequate is workflow documentation. This course will use Rmarkdown to integrate computer code, data and results to manage complex bioinformatics projects. The class has lecture, lab and distance components. Lectures will focus on the theoretical and biological aspects of bioinformatics analysis using recent examples from the literature. In lab, students will work on programming exercises or projects using published datasets. Advanced students will also have the opportunity to work with their own data. Distance instruction will include R tutorials and videos that students can work through at their own pace (subject to completion deadlines). Particular emphasis will be placed on the theoretical and practical limitations of next generation sequencing data. No prior computer programming experience is required, but it is assumed that students have a firm grasp of the fundamental principles of molecular biology and how they relate to complex processes such as gene expression and genome organization. Permission of instructor required.**Credits:** 3.00

BCHM 61501 - Pathways

Credit Hours: 3.00. An advanced level cell biology course offered to first or second year graduate students. Students will learn the major intracellular signaling pathways and cell cycle regulation of eukaryotes. Readings will be from the primary literature. Prerequisites: BCHM 65100 and BCHM 56200; or, BCHM 60501 (can be taken concurrently). **Credits:** 3.00

BCHM 62000 - Protein Mass Spectrometry And Proteomics

Credit Hours: 2.00. The goals of this course are to introduce students to 1) basic principles of mass spectrometry, 2) the most common instruments used for protein mass spectrometry including the advantages and disadvantages of each, 3) the most common applications of protein mass spectrometry in biological research, 4) current approaches to quantitative protein mass spectrometry and their use in proteomic studies 5) the skills necessary to analyze mass spec data from a variety of experiment types including the ability to use and understand common database search programs, and 6) contemporary issues associated with large-scale proteomics experiments (including technical challenges and limitations) culminating in the ability to design appropriate experiments to answer a specific proteomic question. Prerequisite: Students need to have taken an undergraduate level biochemistry course and be familiar with basic aspects of protein structure that are taught in such courses. In the absence of an undergraduate biochemistry course, students should discuss their qualifications with the instructor before registering. **Credits:** 2.00

BCHM 64000 - Metabolic Plant Physiology

Credit Hours: 3.00. (AGRY 64000, BIOL 64000, BTNY 64000 , HORT 64000) Topics include photosynthesis, respiration, carbohydrate and lipid metabolism, and nitrogen, sulfur, and secondary metabolism. This course is the third in a series of core courses in the Purdue Plant Biology Program graduate curriculum. Prerequisite: BCHM 56100, BTNY 55300 or HORT 55300, Prerequisite: BIOL 55100 or HORT 55100. **Credits:** 3.00

BCHM 69000 - Seminar In Biochemistry

Credit Hours: 1.00. Seminary In Biochemistry. Permission of instructor required. **Credits:** 1.00

BCHM 69500 - Special Topics In Biochemistry

Credit Hours: 1.00 to 4.00. Critical examination of developments in specialized fields of biochemistry. Open to candidates for the Ph.D. degree in biochemistry; others by special permission of the professor in charge. Permission of instructor required. **Credits:** 1.00 to 4.00

BCHM 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required. **Credits:** 1.00 to 18.00

BCHM 69900 - Research PhD Thesis

Credit Hours: 1.00 to 18.00. Research PhD Thesis. Permission of instructor required. **Credits:** 1.00 to 18.00

Biological Sciences

BIOL 101KN - Concepts Of Biology I

Credit Hours: 4.00 or 5.00. An introductory course emphasizing the principles of cellular biology; molecular biology; genetics; and plant anatomy, diversity, development, and physiology.**Credits:** 4.00 or 5.00

BIOL 5560N - Physiology I

Credit Hours: 3.00. General and comparative physiology. Principles of physiology. Nerve and muscle, temperature regulation, ion and water balance. The critical evaluation of original research papers.**Credits:** 3.00

BIOL 5590N - Endocrinology

Credit Hours: 3.00. The study of hormone function. Consideration will be given to the role of hormones in growth, development, metabolism, homeostasis, and reproduction.**Credits:** 3.00

BIOL 5610N - Immunology

Credit Hours: 3.00. Introduction to the basic principles and experimentation in cellular and humoral immunology.**Credits:** 3.00

BIOL 11000 - Fundamentals Of Biology I

Credit Hours: 4.00. This course is designed primarily to provide an introduction to the principles of biology for students in agriculture and health sciences. Principles of biology, focusing on diversity, ecology, evolution, and the development, structure, and function of organisms. **Credits:** 4.00

BIOL 11100 - Fundamentals Of Biology II

Credit Hours: 4.00. This course is designed primarily to provide an introduction to the principles of biology for students in agriculture and health sciences. Continuation of BIOL 11000. Principles of biology, focusing on cell structure and function, molecular biology, and genetics. **Credits:** 4.00

BIOL 11200 - Fundamentals Of Biology

Credit Hours: 2.00. This course is designed primarily to provide an introduction to the principles of biology. BIOL 11200, 11300 is a two-semester principles of biology sequence that introduces students to the major concepts of the discipline, with emphasis on the experimental and logical basis of the information presented. BIOL 11200/11300 includes lectures on diversity and evolution, and on the development, structure, and function of organisms, cell structure, cell function, ecology, genetics, biochemistry, and molecular biology. **Credits:** 2.00

BIOL 11300 - Fundamentals Of Biology

Credit Hours: 2.00. This course is designed primarily to provide an introduction to the principles of biology. BIOL 11200, 11300 is a two-semester principles of biology sequence that introduces students to the major concepts of the discipline, with emphasis on the experimental and logical basis of the information presented. BIOL 11200/11300 includes lectures on diversity and evolution, and on the development, structure, and function of organisms, cell structure, cell function, ecology, genetics, biochemistry, and molecular biology. **Credits:** 2.00

BIOL 11500 - Biology Resource Seminar

Credit Hours: 1.00. This course is designed to help integrate new biology students into the Department of Biological Sciences, to help them adjust to university life, and to assist them in developing academic and intellectual survival skills using the medium of introductory Biology courses. The course meets twice a week in groups of 20-25 students. Each section is led by an academic advisor and an undergraduate teaching intern. The class periods have an on-going emphasis on connecting students to one another as resources while learning information, critical thinking skills and problem-solving strategies. Topics include bioethics, time management, available academic resources, biology majors and curricula and career development. Students are exposed to opportunities in undergraduate research, summer internships, the study abroad program, and teaching internships. Throughout the course, students are encouraged to plan their college education rather than merely choose their courses. Permission of department required. **Credits:** 1.00

BIOL 12100 - Biology I: Diversity, Ecology, And Behavior

Credit Hours: 2.00. Creates a framework for ordering biology by examining the unity and diversity of life on earth with an emphasis on ecology, genetics, population biology, evolution, and behavior. **Credits:** 2.00

BIOL 13100 - Biology II: Development, Structure, And Function Of Organisms

Credit Hours: 3.00. Principles of development of plants and animals and the relationship between the structure and function of selected systems of these organisms. **Credits:** 3.00

BIOL 13500 - First Year Biology Laboratory

Credit Hours: 2.00. Laboratory exercises emphasizing student mastery of basic laboratory skills needed to succeed in the biological sciences; intended for beginning (first-year) biology majors. **Credits:** 2.00

BIOL 14501 - First Year Biology Laboratory With Neuro Research Project

Credit Hours: 2.00. This laboratory course has been designed under the goals of the Center for Authentic Science Practice in Education (CASPiE) which aims to expose students to novel research as a means to teach them laboratory science. This course is designed to engage students in authentic research while acquiring necessary skills and concepts to be successful as a biology major. Our topic is Neuroanatomy of Auditory Pathways. We will begin with a series of skills and knowledge building weeks and then transition into independent research projects that culminate in a public presentation of the data in a poster session. In this course, students will learn the fundamentals in neurobiology as well as use sophisticated analysis and instrumentation to answer a research question. Critical thinking in experimental design as well as interpretation and communication of data will be stressed. The goals for this course are to gain a foundation in basic biological measurements and techniques, hone the analytical skills, appreciate the excitement of scientific discovery, and have fun along the way. Permission of department required. **Credits:** 2.00

BIOL 14503 - First Year Biology Lab: Disease Ecology-Honors

Credit Hours: 2.00. The course will engage students in authentic research and acquiring the necessary skills and concepts to be a successful biology major. Our research topic will be disease ecology in freshwater systems. Disease ecology is a growing field investigating the causes and effects of pathogen transmission and epidemics, primarily in natural populations. We will begin with a series of skill and knowledge-building laboratories, and then transition into student-led research projects that culminate in a

presentation of the results in a poster session. Students will learn the fundamentals of disease ecology, basic laboratory techniques, how to perform scientific experiments, and gain experience communicating findings to other scientists and the public. **Credits:** 2.00

BIOL 14504 - First Year Lab: Diet Disease And Immune System-Honors

Credit Hours: 2.00. We are what we eat! The food we put into our bodies not only gives us the nutrients, vitamins and minerals we need to live, but it can also influence other ways in which our bodies function, right down to how well our immune system works. The immune system plays a critical role in defending our body from infection, but can also contribute to autoimmune disease when the immune response becomes dysregulated. Importantly, autoimmune disease is currently skyrocketing in countries that consume a "Western Diet" (i.e., high salt, high sugar, low fiber), suggesting that these dietary components, or lack thereof, may contribute to dysregulation of the immune response. CD4+ T cells, a kind of immune cell, play an important role in the immune system as they control the balance between protective immunity and autoimmune disease. Recent evidence indicates a strong correlation between "Western Diet" and dysfunction of this important immune cell type. Therefore, our goal is to examine the effects of these dietary components on CD4+ T cell function and how this might contribute to autoimmune disease. Students will work in teams and cover a distinct subset of microbial or dietary components. As such, each student will learn the necessary skills to perform scientific experiments starting from the literature search, experimental design, carrying out controlled experiments, interpreting results and conveying the results to the greater scientific community.**Credits:** 2.00

BIOL 14505 - First Year Biology Lab: Phages To Folds-Honors

Credit Hours: 2.00. Students will learn how to use bioinformatics to study a gene sequence of their choice from the local SEA-PHAGES program. Students will then use molecular biology and biophysical techniques to characterize their gene product. The goal of each project will be to gain insight into the 3-dimensional fold of each of these mysterious novel phage genes. Students will work in teams but will have their own individual project such that each student will learn the necessary skills to perform scientific experiments starting from the bioinformatics to cloning to purification to structural characterization to communicating their findings to others.**Credits:** 2.00

BIOL 19500 - Special Assignments

Credit Hours: 0.00 to 18.00. Reading, discussions, written reports, seminar presentations, and field or laboratory work provided for enrichment in special areas of the biological sciences. Permission of instructor required. **Credits:** 0.00 to 18.00

BIOL 19700 - Biology Freshman Honors Seminar

Credit Hours: 1.00. Discussion meetings with Freshman Honors students to cover various aspects of freshman biology, research opportunities in biology, and career choices in biology. Open only to students in the Biological Sciences Honors Program. The credit may be used only toward free electives. Permission of department required. **Credits:** 1.00

BIOL 20100 - Human Anatomy And Physiology

Credit Hours: 2.00. A survey of normal structure and function of the human organism. The human is treated as an open system with the capacity to transport material, transform energy, and maintain a homeostatic state. The capacities and limitations of the human to cope with changes in the environment are emphasized. All major systems of the human body and their functions are examined in relation to the living organism. Not available for credit toward graduation for majors in the Department of Biological Sciences. **Credits:** 2.00

BIOL 20200 - Human Anatomy And Physiology

Credit Hours: 2.00. BIOL 20200 is the second semester of a two-semester course that includes two 50-minute lectures designed to give the student a basic understanding of the anatomy, organization and function of the human body. To assist the student in

mastering the subject matter, there will be introductory lectures on the basic concepts of biochemistry and cell biology before the major topics of the course are dealt with. These topics include the organization of the human body; muscle and bone; the nervous system (including the special senses); the cardiovascular system, respiration; digestion; metabolism; excretion; fluid, electrolyte, and acid-base balance; the endocrine system; reproduction and genetics. The subject matter will be related to relevant questions of clinical or health-related importance. Not available for credit toward graduation for majors in the Department of Biological Sciences. **Credits:** 2.00

BIOL 20300 - Human Anatomy And Physiology

Credit Hours: 4.00. A survey of normal structure and function of the human organism. The human is treated as an open system with the capacity to transport material, transform energy, and maintain a homeostatic state. The capacities and limitations of the human to cope with changes in the environment are emphasized. All major systems of the human body and their functions are examined in relation to the living organism. Integrated into the study of the human organism are laboratory exercises that emphasize the essentials of human anatomy and physiology. Not available for credit toward graduation for majors in the Department of Biological Sciences. **Credits:** 4.00

BIOL 20400 - Human Anatomy And Physiology

Credit Hours: 4.00. Continuation of BIOL 20300. Not available for credit toward graduation for majors in the Department of Biological Sciences. **Credits:** 4.00

BIOL 20500 - Biology For Elementary School Teachers

Credit Hours: 3.00. Unifying concepts of biology taught with materials appropriate for future elementary school teachers. Does not satisfy requirements for College of Science Majors. Not available for credit toward graduation for majors in the Department of Biological Sciences. **Credits:** 3.00

BIOL 20600 - Biology For Elementary School Teachers

Credit Hours: 3.00. Continuation of BIOL 20500. Does not satisfy requirements for College of Science Majors. Not available for credit toward graduation for majors in the Department of Biological Sciences. **Credits:** 3.00

BIOL 22100 - Introduction To Microbiology

Credit Hours: 4.00. The isolation, growth, structure, function, heredity, identification, classification, and ecology of microorganisms; their role in nature; and significance to man. Not available for credit toward graduation for majors in the Department of Biological Sciences. CTL: Microbiology for the Health Sciences **Credits:** 4.00

BIOL 23000 - Biology Of The Living Cell

Credit Hours: 3.00. An introduction to modern cell biology for students who may not have taken a previous college course in biology. All students with the appropriate prerequisites are welcome, and this course will be of special interest to students from engineering, chemistry, physics and computer science. This course will provide a solid foundation in modern cell biology concepts for engineers and students from other disciplines.**Credits:** 3.00

BIOL 23100 - Biology III: Cell Structure And Function

Credit Hours: 3.00. An introduction to modern cell biology through an examination of the physical and chemical properties that lead to an understanding of the molecular basis for cell function. **Credits:** 3.00

BIOL 23101 - Bioinstrumentation Lab

Credit Hours: 1.00. Introduction of laboratory instruments used to measure physiological events. Stimulation and conduction of electric signals within the mammalian nervous system and other excitable tissues are demonstrated. Fundamental circuit elements and concepts include resistance, capacitance, inductance, op-amps, impedance, voltage, current, power, and frequency, following the content introduced in BME 231. Fundamental analog measurement concepts include adequate bandwidth and amplitude and phase linearity. Integrative design project emphasizes the practical aspects of quantitative physiological measurements. This course is to prepare learners with sufficient physics knowledge and lab skills to pursue the Bioinstrumentation and Imaging Depth Areas. Moreover, students are introduced to programming (using Python) to deepen the understanding of basic concepts and learn basic skills in data processing. SPICE software will be used throughout the course to design/simulate various analog circuits.**Credits:** 1.00

BIOL 23200 - Laboratory In Biology III: Cell Structure And Function

Credit Hours: 2.00. Laboratory exercises designed to illustrate the properties, functions, and growth of prokaryotic and eukaryotic cells and to introduce the student to modern experimental methods used to study cells and their separated components. **Credits:** 2.00

BIOL 24100 - Biology IV: Genetics And Molecular Biology

Credit Hours: 3.00. An introduction to the principles of classical genetics and to molecular genetics. Topics covered are transmission of the genetic material (both in eukaryotes and prokaryotes); changes in the genetic material, structure, and function of the genetic material; and the manipulation of genetic material (recombinant DNA technology). **Credits:** 3.00

BIOL 24200 - Laboratory In Biology IV: Genetics And Molecular Biology

Credit Hours: 2.00. Experiments in classical and modern genetics and exercises to acquaint the students with basic techniques in molecular biology. **Credits:** 2.00

BIOL 28600 - Introduction To Ecology And Evolution

Credit Hours: 2.00. Evolutionary processes and ecological principles associated with individuals, populations, communities, and ecosystems. Topics include genetic drift, natural selection, adaptation, life tables, population dynamics, competition, predation, biodiversity, and ecological stability, with emphasis on natural systems.**Credits:** 2.00

BIOL 29199 - Cooperative Experience I

Credit Hours: 0.00. Professional experience in biological sciences. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.**Credits:** 0.00

BIOL 29299 - Cooperative Experience II

Credit Hours: 0.00. Professional experience in biological sciences. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.**Credits:** 0.00

BIOL 29300 - Sophomore Seminar: Planning Your Future In Biology

Credit Hours: 1.00. Biology 29300 is a one-credit course designed for sophomores in the Department of Biological Sciences. This course will help students maximum the remainder of their undergraduate career. The course will cover biology career information and suggestions for professional development. Students will learn about the various disciplines that make up modern Biological Sciences. Students will learn about opportunities in undergraduate research and tour a research laboratory. In-depth presentations from biology alumni from a variety of fields are featured. Assignments include a Plan of Study, a resume, and a written paper evaluating the career path of one alumni speaker and describing the student's response to the presentation. **Credits:** 1.00

BIOL 29400 - Biology Research

Credit Hours: 1.00 to 4.00. Supervised individual research performed by freshman and sophomores. Project must be approved by the Honors Committee, Department of Biological Sciences. Honors Research Program students should register for BIOL 49900. Permission of department required. **Credits:** 1.00 to 4.00

BIOL 29500 - Special Assignments

Credit Hours: 0.00 to 18.00. Reading, discussions, written reports, or laboratory work selected for enrichment in special areas of the biological sciences. Permission of instructor required. **Credits:** 0.00 to 18.00

BIOL 31200 - Great Issues Genomics And Society

Credit Hours: 3.00. The course will revolve around genomics, the science and technology involved in determining the sequence of the entire DNA complement in an organism. Almost everyone has heard of the human genome project, but fewer are aware of the spectacular technical progress in this field and the fact that many thousands of genomes have been sequenced. Until recently, most of these have been microorganisms, but technological and computational progress has made it progressively easier and cheaper to sequence the genomes of higher organisms. This field may have more of an impact on your future lives than almost any other field of the life sciences - mostly because it touches on all areas of study. The course will focus on the impact that genomes will have in selected areas. It will begin with a basic understanding of the science and technology that gave rise to our current capabilities in sequencing and the fact that technology continues to provide greater capacity and cheaper prices. You will soon see that every field in the College of Science is well represented in the science and technology. We will then go on to see how genomics influences many topics that affect our daily lives and can possibly provide answers to some critical questions (or at least pose better questions): What is the basis of personalized medicine? What does genomics tell us about the genealogy of mankind? What impact will genomics have on our future food supply and our ability to feed a population of 9 billion people? What is the human microbiome and what does that mean to me? Similarly, what is the gut microbiome, the mouth microbiome, etc? What impact will genomics have on the development of alternative energy sources, especially biofuels? In every area, we will discuss the scientific challenges, but also the ethical and societal implications. In most cases, there is no one right answer, but a series of choices that can be guided by ethical considerations. **Credits:** 3.00

BIOL 31800 - The COVID-19 Pandemic

Credit Hours: 3.00. The course will cover the COVID-19 pandemic caused by the SARS-CoV-2. It will provide a window onto the intersection of science and society and the challenges created when leaders and the populace are inadequately informed. We will explore the biology of the virus and the disease caused by it. The primary literature will be reviewed with the aim of critically evaluating data and understanding the basis of inferences or lack thereof. Vaccine and antiviral approaches will be discussed. Historical approaches to pandemics, comparative analyses of responses by countries and states, investigations into the origins of SARS-CoV-2, and various conspiracy theories will be topics of deliberation. We will see how achieving scientific understanding is a dynamic process. The COVID-19 scientific literature will be dissected with a focus on publication ethics. Students will each make an oral presentation and write an essay on a relevant topic thereby allowing them to fulfill graduation requirements. These assignments will require the demonstration of the capacity to report data, organize the material, and convey it using formal English. All sources will need to be documented and assessed for credibility. The initial tranche of classes will be lectures by the Professor with discussion. Most of the remaining classes will be student presentations on assigned topics with moderation by the Professor. Guest lectures by appropriate experts will also be included. **Credits:** 3.00

BIOL 32101 - Experimental Design And Quantitative Analysis Honors

Credit Hours: 3.00. This course is aimed at preparing students in experimental design and quantitative analysis specifically as applied to Life Sciences in order to read the scientific literature critically, generate scientific questions, hypotheses and predictions, design research studies, analyze the data statistically, and communicate results. The course will use R and RStudio, which are open-source platforms that are increasingly used in the scientific community to analyze data quantitatively. **Credits:** 3.00

BIOL 32701 - Bioanalytical Chemistry

Credit Hours: 4.00. This course focuses on the detection, quantification, and characterization of proteins, nucleic acids, lipids, carbohydrates, and small bioactive molecules. Principles and applications of various analytical techniques, including spectroscopy, chromatography and mass spectrometry, will also be discussed.**Credits:** 4.00

BIOL 32800 - Principles Of Physiology

Credit Hours: 4.00. This course is designed to provide students with an introduction to physiology with an emphasis on cellular mechanisms that underlie anatomical and physiological adaptations used by animals to survive in their habitat. Topics covered will range from cellular respiration to the physical limits of animal performance as we deconstruct and then reconstruct the body to examine how animals can live in extreme environments. Goals for this course are for students to gain a foundation in basic physiological principles, to learn about the integrative nature of the systems of animals, and to appreciate how and why animals have evolved and strategies to help them survive in their unique environment. **Credits:** 4.00

BIOL 34010 - Silvics Of North America

Credit Hours: 3.00. Characteristics of trees and forest stands, including influences on growth, development, and reproduction. Additionally, the course will cover field identification and taxonomy of common trees and shrubs from North America.**Credits:** 3.00

BIOL 34900 - Environmental Science

Credit Hours: 3.00. Examines current major environmental issues through an investigation of the biological and political aspects of human population growth, degradation of natural resources, and environmental regulations. Cannot be used as a Group A or B elective for biology majors.**Credits:** 3.00

BIOL 36700 - Principles Of Development

Credit Hours: 2.00. This course deals with the process by which genes in a fertilized egg control cell behavior in the embryo and so determine the nature of the animal or plant. The emphasis is on early development and the laying down of body plan and organ systems in various model systems (Drosophila, nematode, Arabidopsis, zebrafish, mouse, chick, and frog). **Credits:** 2.00

BIOL 36701 - Principles Of Development Lab

Credit Hours: 1.00. This laboratory will offer students the experience working with different model systems to observe developmental processes, examine key regulatory gene expression, and manipulate gene functions used in different biochemical, molecular and genetic approaches. **Credits:** 1.00

BIOL 38700 - Macromolecules

Credit Hours: 2.00. The goal is to expose students to the world of macromolecules, their physicochemical properties, the influence of these properties on function and structure, and how these properties are determined and exploited. Permission of department required.**Credits:** 2.00

BIOL 39300 - Preparing For Your Future In Biology

Credit Hours: 1.00. Biology 39300 is a one-credit course for junior and seniors in the Department of Biological Sciences. This course will help students begin to prepare for life after Purdue. Students will learn about interviewing, job searching, graduate and professional school searching, resumes, industrial practices, and how to evaluate job/school offers. Construct a polished image on top of your solid biology foundation! Get the job or get admitted to the school you want. **Credits:** 1.00

BIOL 39399 - Cooperative Experience III

Credit Hours: 0.00. Professional experience in biological sciences. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.**Credits:** 0.00

BIOL 39499 - Extensive Cooperative Experience IV

Credit Hours: 0.00. Professional experience in biological sciences. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.**Credits:** 0.00

BIOL 39500 - Special Assignments

Credit Hours: 0.00 to 18.00. Reading, discussions, written reports, seminar presentations, and field or laboratory work provided for enrichment in special areas of the biological sciences. Permission of instructor required. **Credits:** 0.00 to 18.00

BIOL 39599 - Extensive Cooperative Experience V

Credit Hours: 0.00. Professional experience in biological sciences. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.**Credits:** 0.00

BIOL 39600 - Premedical Planning Seminar

Credit Hours: 0.00. This course is designed for sophomore and junior students who are planning to attend medical school. The course offers information and advice on the MCAT, the application process, the personal statement, the interview, and letters of recommendation. Students in the course will also formulate an alternative career plan. The course meets the first 10 weeks of the semester. **Credits:** 0.00

BIOL 39699 - Professional Practice Internship

Credit Hours: 0.00. To obtain professional practice with qualified employers within industry, government, or small business. Permission of department required. **Credits:** 0.00

BIOL 39800 - Biology Teaching

Credit Hours: 3.00. Supervised teaching experience for juniors. Must have approval of course instructor in advance. Permission of instructor required. **Credits:** 3.00

BIOL 41500 - Introduction To Molecular Biology

Credit Hours: 3.00. An introduction to modern molecular biology techniques and how they are used to address current topics in gene regulation. Emphasis will be placed on experimental procedures and model systems, such as site-directed mutagenesis of isolated genes and their subsequent introduction into prokaryotic and eukaryotic cells. Topics will address the molecular control mechanisms associated with DNA replication, RNA transcription, RNA processing, and differential gene expression. **Credits:** 3.00

BIOL 41600 - Viruses And Viral Disease

Credit Hours: 3.00. The objective of this course is to provide students with an introductory understanding of viruses and their impact on human health. The course will be divided into two sections. During the first section, we will discuss the cellular and organismal events that occur following virus infection, including viral entry, replication, modulation of cell biology by viral proteins, the host immune response to infection, evasion of the immune response by viruses, and resulting virus-induced disease. The emphasis of this first section will be on the general strategies used by viruses to establish and maintain infection in a population. In the second section, we will discuss in relative detail our current understanding of select important human viruses including influenza, HIV, smallpox, the herpesviruses, and tumor-causing viruses. The objective of this section will be to understand how the unique aspects of each virus's biology affect the outcome of infection with these pathogens. In addition to virus-associated diseases, we will discuss potential ways that viruses may provide symbiotic benefits to their hosts and thereby shape the course of human evolution. Throughout the course, we will emphasize societal and political aspects of virology and virus-derived technologies, including vaccine development, the use of viruses as gene therapy vectors, and the threat of viral bioterror of bio-error. **Credits:** 3.00

BIOL 42000 - Eukaryotic Cell Biology

Credit Hours: 3.00. Composition, structure, regulation, and growth of eukaryotic cells. **Credits:** 3.00

BIOL 43200 - Reproductive Physiology

Credit Hours: 3.00. This course provides an integrated approach to examining how tissues interact to regulate reproductive processes. Each section begins by describing fundamental commonalities of a reproductive event in a variety of species. This is followed by an emphasis on the difference in the details of that event among species. Students will be strongly encouraged to initiate and participate in discussions related to course topics during class. To gain a deeper understanding of physiological processes, students are asked to select a current research article related to reproductive physiology. Students are then required to present an analysis of article to the class in a formal presentation. Some of the topics to be covered in lecture include ovarian and testicular function, the hypothalamic-pituitary-gonadal axis, fertilization, establishment of the placenta, maternal support of pregnancy, parturition, and lactation. **Credits:** 3.00

BIOL 43600 - Neurobiology

Credit Hours: 3.00. This course will cover key aspects in molecular, cellular, and developmental neurobiology. Topics include: Cell biology of neurons and glia, electrophysiological properties of neurons, electrical and chemical signaling between neurons, synaptic integration and plasticity, development and regeneration of the nervous system, nervous system diseases. Up-to-date research findings and techniques will be included. A basic knowledge of cell biology and protein structure and function is strongly recommended. **Credits:** 3.00

BIOL 43800 - General Microbiology

Credit Hours: 3.00. An examination of microbial diversity that emphasizes the interrelationship of bacteria and their environments. This includes aspects of cell composition, metabolism, and growth of microorganisms. **Credits:** 3.00

BIOL 43900 - Laboratory In General Microbiology

Credit Hours: 2.00. Includes enrichment cultures to isolate microorganisms, studies of cell composition, measurements of cell growth, and examination of enzyme regulation. **Credits:** 2.00

BIOL 44100 - Biology Senior Seminar In Genetics

Credit Hours: 1.00. This is a required course for genetics majors. It provides exposure to current research in genetics and molecular biology via invited faculty speakers. Students enrolled in the course who have actively participated in research also give a presentation on their own work. Other students are assigned to review current literature in one aspect of the semester's topic. The topic selected for review is in an area of current research in genetics and may vary from year to year. **Credits:** 1.00

BIOL 44201 - Introductory Module: Protein Expression

Credit Hours: 2.00. This is a project-oriented course designed to give the student exposure to laboratory research through a series of five-week modules. During this five-week introductory module, the students will learn the basics of expression, isolation, and characterization of recombinant proteins in *E. coli* using SDS-PAGE and Western blotting. In the first half of the course, students work initially with one recombinant DNA construct and then are given a second construct to use to identify the protein expressed. *Note: additional hours as needed for particular experiments. **Credits:** 2.00

BIOL 44202 - Animal Physiology

Credit Hours: 2.00. This is a project-oriented course designed to give the student exposure to laboratory research through a series of five-week modules. This module involves measurements of respiratory, cardiovascular, neural and renal function. When appropriate measurements are made in both rats and humans. **Credits:** 2.00

BIOL 44203 - Bacterial Synthetic Biology Laboratory

Credit Hours: 1.00. This course will provide an introduction to state-of-the-art bacterial molecular genetics using the intestinal bacterium *Escherichia coli* as a model cell. **Credits:** 1.00

BIOL 44205 - Introduction To LabVIEW

Credit Hours: 1.00. This is an introductory course for LabVIEW programming. During this five-week module students will learn proper data acquisition techniques and be introduced to the fundamentals of the LabVIEW graphical programming environment. Through LabVIEW, students will learn the tools to develop programs capable of acquiring, processing, analyzing, saving and displaying data for engineering and scientific applications. **Credits:** 1.00

BIOL 44207 - Exploration Of Protein Structure

Credit Hours: 1.00. This module is a hands-on exploration of the principles of enzyme structure. Students will use computers to retrieve and inspect protein structures from publicly available databases. Through the performance and analysis of sequence structural alignments, students will explore the relationship between primary, secondary and tertiary structures and the final active form of a protein. **Credits:** 1.00

BIOL 44211 - Laboratory In Anatomy And Physiology

Credit Hours: 1.00. This module will study various organs, and also discuss diseases associated with it. The heart, brain, kidney, stomach, liver etc. will be studied in detail using histology, dissection, and instrumentation. Emphasis will be placed on problem solving using various case studies. The students will be required to give presentation. **Credits:** 1.00

BIOL 44212 - Microscopy And Cell Biology

Credit Hours: 1.00. In this five-week module, students will learn how to prepare specimens for viewing by fluorescence microscopy. Specimens include mammalian tissue culture cells and zebrafish embryos. The emphasis will be on the staining of the cytoskeleton in these preparations, utilizing antibodies and fluorescence probes. The specimens will be viewed by wide-field and confocal laser scanning fluorescence microscopy. Images will be acquired, processed and analyzed by modern computational methods. Students will learn the basics of cell culture, immunocytochemistry, fluorescence microscopy, digital image processing and data analysis. At the end of the course, students prepare a PowerPoint presentation of their images and data. **Credits:** 1.00

BIOL 44215 - Multidisciplinary Design Of Systems And Devices For Physiology Measurements

Credit Hours: 2.00. This physiology laboratory course will provide an opportunity for undergraduates from the College of Science (Department of Biology) to collaborate with students in other colleges (Agriculture, Education, Engineering, Health and Human Science & Technology) to experience and learn how to operate effectively as part of an interdisciplinary team to address physiological problems in the cardiovascular system, respiratory system and in biological transport. Specifically it will emphasize how these teams can use information, tools, techniques and theories from their disciplines to solve problems that are beyond the scope of any single discipline. In this process, the students will develop an appreciation of both engineering design and the classic hypothesis-driven experimental science as tools to solve complex real-world problems. This course will promote effective communication, systems thinking, laboratory skills, self-management and professional ethics. Students will learn to measure and quantify biological changes, analyze data (including statistical analysis) and interpret its meaning as it applied to the larger physiological question at hand. These skills will be necessary for teams to efficiently function in an interdisciplinary setting both in future courses and more importantly when they enter the workforce.**Credits:** 2.00

BIOL 44400 - Human Medical Genetics

Credit Hours: 3.00. An intermediate-level survey course of human genetics with a balanced review of both Mendelian and molecular aspects. Review of current development and application of DNA technology emphasized.**Credits:** 3.00

BIOL 44600 - Molecular Bacterial Pathogenesis

Credit Hours: 3.00. This course will focus on the interface of classical cell biology and microbiology, with emphasis on the exploitation of mammalian host cell by medically relevant pathogens, such as Yersinia, Salmonella, and Listeria. This course will cover the molecular mechanisms of infectious diseases. It will introduce modern cellular microbial strategies for studying the complex interaction between pathogens and their host cells. Topics and readings will be prepared from the most current literature. **Credits:** 3.00

BIOL 47500 - Senior Seminar In Neurobiology

Credit Hours: 1.00. Students are required to give a 30-45 minute talk based on primary journal articles chosen from a list on current developments in neuroscience or a related topic of the students choice. They are also required to read and contribute questions about each paper, and to provide anonymous feedback to each presenter. **Credits:** 1.00

BIOL 47800 - Introduction To Bioinformatics

Credit Hours: 3.00. (CS 47800) Bioinformatics is broadly defined as the study of molecular biological information, targeting particularly the enormous volume of DNA sequence and functional complexity embedded in entire genomes. Topics will include understanding the evolutionary organization of genes (genomics), the structure and function of gene products (proteomics), and the dynamics of gene expression in biological processes (transcriptomics). Inherently, bioinformatics is interdisciplinary, melding various applications of computational science with biology. This jointly taught course introduces analytical methods from biology, statistics and computer science that are necessary for bioinformatics investigations. The course is intended for junior and senior undergraduates from various science backgrounds. Our objective is to develop the skills of both tool users and tool designers in this important new field of research. **Credits:** 3.00

BIOL 48100 - Eukaryotic Genetics

Credit Hours: 3.00. This course presents the fundamental concepts of classical and modern molecular genetics in eukaryotic systems, using examples from the model genetic organisms, yeast, Drosophila, Caenorhabditis, Arabidopsis, maize, mice and humans. These concepts are applied to solving problems of genetic analysis. Recent advances in developmental, cancer, and behavioral genetics and genomics, and applications of genetic technology, are used to demonstrate the impact that modern genetics makes at the cutting edge of biological research. **Credits:** 3.00

BIOL 48300 - Great Issues: Environmental And Conservation Biology

Credit Hours: 3.00. Concerned with the application of ecological principles to environmental issues, the course introduces fundamental ecology, emphasizing the interplay of theoretical models, natural history, and experimentation. New research developments are stressed, with the outlook for application to environmental management and restoration. Whole-biosphere issues, such as the loss of biological diversity, frame a focus at the population level to understand local and global extinction and community stability. In-depth case studies of endangered ecosystems (both temperate and tropical), with computer modeling, field trips, and discussions of policy formulation, demonstrate the range of tools and information necessary to accomplish coexistence of humans with the rest of nature. **Credits:** 3.00

BIOL 49400 - Biology Research

Credit Hours: 1.00 to 4.00. Supervised individual research performed by juniors and seniors. Project must be approved by the Honors Committee, Department of Biological Sciences. Honors Research Program students should register for BIOL 49900. Permission of department required. **Credits:** 1.00 to 4.00

BIOL 49500 - Special Assignments

Credit Hours: 0.00 to 18.00. Readings, discussions, written reports, seminar presentations, and field or laboratory work provided for enrichment in special areas of the biological sciences. Permission of instructor required. **Credits:** 0.00 to 18.00

BIOL 49700 - Biology Honors Seminar

Credit Hours: 1.00. Required of all students participating in honors research. Discussions and presentations of research, including seminars by those students who are completing their honors research thesis. **Credits:** 1.00

BIOL 49800 - Biology Teaching

Credit Hours: 3.00. Supervised teaching experience for juniors and seniors. Must have approval of course instructor in advance. Permission of instructor required. **Credits:** 3.00

BIOL 49900 - Biology Honors Thesis Research

Credit Hours: 1.00 to 4.00. Research under the guidance of a scientist. Submission of honors tutorial petition and consent of faculty tutor and Honors Committee. Permission of department required. **Credits:** 1.00 to 4.00

BIOL 50330 - Disturbance Ecology

Credit Hours: 3.00. In the current age of the Anthropocene, the geological age of human activity, ecosystems throughout the world are subjected to both natural disturbance regimes (e.g. fire, floods) and anthropogenic disturbance (e.g., urbanization, dams, pollution). Over the centuries, the amount of anthropogenic disturbance has drastically increased, to the point that there are likely very few truly untouched ecosystems in the world. Thus, it is important for future environmentally driven professionals (really, anyone that will work with natural areas; conservationists, policymakers, etc.) to understand what are the causes and effects of disturbance, how ecosystems recover from disturbance events, and how disturbance can be used as a management tool. The purpose of this course is to provide students with an in-depth understanding of these, and more, topics while also providing them with practical experience in disturbance ecology research and management.**Credits:** 3.00

BIOL 50700 - Principles Of Molecular Biology

Credit Hours: 3.00. Molecular aspects of structure and function of nucleic acids and proteins, including recombinant DNA research. Prokaryotic and eukaryotic molecular biology are given equal weight.**Credits:** 3.00

BIOL 51099 - Neural Mechanisms In Health And Disease

Credit Hours: 3.00. An examination of the mechanisms by which nervous systems process information in normal and pathologic states. Cellular and systems-level information processing will be studied with a focus on sensory and motor systems. Students will gain some hands-on experience in the analysis of neural data. Some neuroanatomy will be included to understand how nervous systems are organized. Pathological states such as Alzheimer's, autism, and aging will be studied, both in terms of understanding the systems and cellular deficits as well as examining potential solutions to improve the outcomes for these neural disorders. **Credits:** 3.00

BIOL 51101 - Intro To X-Ray Crystallography

Credit Hours: 3.00. This course will provide an introduction to structure determination of macromolecules using X-ray crystallography and will attempt to balance theory and practice, consisting of ~60% lectures and ~40% lab modules. The course is divided into five 3-week modules covering (i) Crystallization, (ii) Data Collection, (iii) Molecular Replacement, (iv) Experimental Phasing, and (v) Model Building and Refinement, Validation, and Visualization. The goal of the course is to equip students with the necessary tools to develop and execute an X-ray crystallography project, starting from construct design to publication. By the end of the course, students should be familiar with the (i) structure determination pipeline, (ii) theory behind X-ray diffraction methods, (iii) methods for crystallization, (iv) phasing options for solving a crystal structure, and (v) contemporary crystallography software.**Credits:** 3.00

BIOL 51202 - Methods And Measures In Biophysical Chemistry

Credit Hours: 3.00. Biological applications of physical methods including absorption spectroscopy (UV-Vis, FTIR and Raman and CD spectroscopy), fluorescence spectroscopy and super high-resolution imaging, spin resonance methods (NMR and ESR spectroscopy), mass and thermodynamic based methods (thermophoresis, analytical ultracentrifugation, ITC and surface plasmon resonance) and diffraction/structural methods using NMR, cryo-EM and X-ray scattering/crystallography. Each topic is treated at an introductory level with examples from the literature. The course objective for students is to obtain a general understanding of the physical principles underlying each of the techniques, as well as the basic ability to apply the technique to biological systems of interest.**Credits:** 3.00

BIOL 51600 - Molecular Biology Of Cancer

Credit Hours: 3.00. A detailed course examining the molecular mechanisms controlling the growth of animal cells. Emphasis will be placed on current experimental approaches to defining the molecular basis of growth regulation in developing systems and the uncontrolled proliferation of cells in metabolic disorders, such as cancer. **Credits:** 3.00

BIOL 51606 - Pathways In Human Health And Disease

Credit Hours: 3.00. This course is intended for both upper-level undergraduate and graduate students. It will cover major intracellular signaling pathways in eukaryotes and their roles in human disease, with an emphasis on cancer but also touching on other major modern diseases such as COVID-19. We will explore avenues being pursued to target signaling mechanisms for therapeutic benefit. Topics include G protein-coupled receptors, receptor tyrosine kinases, nuclear hormone receptors, protein kinases and phosphatases, mTOR, the Wnt/s-catenin pathway, cell cycle control, DNA damage checkpoint control, regulated proteolysis, and programmed cell death. The course will be taught from current primary literature using a textbook as a background resource. Students will learn how to read and interpret scientific data through regular lectures, extramural seminars, in-class presentations, and take-home assignments.**Credits:** 3.00

BIOL 51700 - Molecular Biology: Proteins

Credit Hours: 2.00. Principles of protein three-dimensional architecture. The molecular and structural basis of protein folding, function, and evolution. **Credits:** 2.00

BIOL 52101 - Experimental Design And Quantitative Analysis In The Life Sciences

Credit Hours: 3.00. This course is aimed at preparing our students in experimental design and quantitative analysis specifically applied to the Life Sciences in order to read the scientific literature critically, generate scientific questions, hypotheses and predictions, design research studies, analyze the data statistically, and communicate results. The course will use R and RStudio, which are open-source platforms that are increasingly used in the scientific community to analyze data quantitatively.**Credits:** 3.00

BIOL 52900 - Bacterial Physiology

Credit Hours: 3.00. A detailed consideration of the central metabolic routes, their role in generation of energy and key intermediates, and the conversion of those intermediates to small molecule building blocks. Regulatory mechanisms will be stressed. **Credits:** 3.00

BIOL 52905 - Disease Ecology

Credit Hours: 3.00. Study of the ecological and evolutionary complexity inherent to host-pathogen interactions. Includes case studies from a diverse array of systems, including plants, animals, aquatic and terrestrial systems. Emphasis is on the interactions between multiple hosts and pathogens within complex, dynamic environments. Introduction to parasite and pathogen diversity, host-pathogen coevolution, community ecology and the importance of pathogens in conservation and management.**Credits:** 3.00

BIOL 53000 - Introductory Virology

Credit Hours: 3.00. Detection, titration, and chemistry of viruses; viral host interactions: bacteriophage-bacterium, animal virus-animal cell, plant virus-plant cell; tumor viruses: infection and transformation.**Credits:** 3.00

BIOL 53300 - Medical Microbiology

Credit Hours: 3.00. Host-parasite relationships. Immunology. Bacteria and viruses associated with infectious diseases. **Credits:** 3.00

BIOL 53601 - Biological And Structural Aspects Of Drug Design And Action

Credit Hours: 3.00. (BCHM 53600) This course is aimed at expanding students' fundamental interests in biology, chemistry and biochemistry to how drugs work. The course will provide an overview of the modern day drug discovery pipeline and an in-depth look at the basic biology, structure, and mechanisms-of-action behind marketed therapeutics. The course will start with a historical account of the discovery of natural product drugs such as aspirin and penicillin and will then venture into the modern day era of drug discovery including structure-based drug design. We will explore different classes of antibiotics, antiviral, and anti-cancer drugs and their targets including small molecule drugs and modern biologics-based drugs. **Credits:** 3.00

BIOL 53700 - Immunobiology

Credit Hours: 3.00. Readings and discussion in the structural, cellular, and genetic basis of the immune response. BIOL 42000 recommended as a prerequisite. **Credits:** 3.00

BIOL 53800 - Molecular, Cellular, And Developmental Neurobiology

Credit Hours: 3.00. Molecular mechanisms of neural cell biology and development are considered. Topics and readings are drawn from the current primary literature. BIOL 42000 recommended as a prerequisite. **Credits:** 3.00

BIOL 54100 - Molecular Genetics Of Bacteria

Credit Hours: 3.00. Advanced bacterial genetics, with emphasis on the use of genetics as a powerful and creative intellectual activity that enables us to discover biological functions and to construct new organisms by the manipulation of DNA. Major topics include: mutations, genetic selections, recombination, regulatory mechanisms, and genomic evolution. **Credits:** 3.00

BIOL 54200 - Modular Upper-Division Laboratory Course

Credit Hours: 1.00 or 2.00. This is a project-oriented course designed to give the student exposure to laboratory research through a series of 5-week modules. The student must complete the introductory 5-week module or have the consent of the instructor before taking the other modules. Topics may include animal cell culture, cloning and blot analysis, DNA fingerprinting, analysis of nucleic acid sequences, animal physiology, bacterial genetics, advanced neurophysiology, chromatin structure, eukaryotic gene expression, genomics, yeast molecular biology, and molecular virology, etc. **Credits:** 1.00 or 2.00

BIOL 54410 - Sensory Systems

Credit Hours: 3.00. The goal of Sensory Systems is to gain an understanding of the mechanisms that underlie sensory perception at the molecular, cellular, and systems level. This will be accomplished by examining how various forms of energy are transduced into the electrochemical messages of the nervous system, what pathways the information travels within the nervous system, and how this information is processed and perceived.**Credits:** 3.00

BIOL 54900 - Microbial Ecology

Credit Hours: 2.00. A study of microbial interactions with other organisms and the environment. Aquatic and terrestrial ecosystems as well as interactions between nonpathogenic microbes and plants and animals will be discussed. Offered in alternate years. **Credits:** 2.00

BIOL 55000 - Plant Molecular Biology

Credit Hours: 3.00. A comprehensive study of plant molecular biology and plant molecular genetics. Topics will include the structure and expression of plant nuclear, chloroplast, and mitochondrial genomes, and plant viruses.**Credits:** 3.00

BIOL 55001 - Eukaryotic Molecular Biology

Credit Hours: 4.00. This is a general survey course intended for advanced undergrads and beginning grad students. The course will draw upon examples from the plant, animal, and fungal kingdoms, and will familiarize students with the basic principles of molecular biology analyses as they apply to eukaryotic organisms. By the end of the course students should have knowledge of these molecular processes and should be able to design and analyze experiments dealing with these topics. This is not a first course in molecular biology. Permission of department required. **Credits:** 4.00

BIOL 55101 - Theory Of Molecular Methods

Credit Hours: 3.00. This course will introduce upper-level undergraduate students and graduate students to the theory and practice of many commonly used molecular biology methods. Emphasis will be placed on understanding the theoretical basis for these techniques, their utility in various circumstances, and their limitations. Although taught as a lecture, students should be able to take this knowledge back to the laboratory to help them in their research efforts. The course will be as close as possible to a laboratory experience without being in an actual laboratory setting. This course is designed to prepare students for other in-depth scientific courses, for graduate rotations, and for future laboratory work. Exams will be experimental in nature (e.g. design an experiment to do something or in this type of situation, which technique/vector/etc. would best be used, and why). Permission of instructor required.**Credits:** 3.00

BIOL 55600 - Physiology I

Credit Hours: 3.00. General and comparative physiology. Principles of physiology. Nerve and muscle, temperature regulation, ion and water balance. The critical evaluation of original research papers.**Credits:** 3.00

BIOL 55700 - Physiology II

Credit Hours: 3.00. A study of the human cardiovascular, pulmonary, blood, and gastrointestinal systems. Higher neuronal functions and intersystem interactions will be discussed.**Credits:** 3.00

BIOL 55900 - Endocrinology

Credit Hours: 3.00. The study of hormone function. Consideration will be given to the role of hormones in growth, development, metabolism, homeostasis, and reproduction. **Credits:** 3.00

BIOL 56010 - Clinical And Molecular Aspects Of Neurodegenerative Diseases

Credit Hours: 3.00. This course focuses on the molecular and clinical aspects of neurodegenerative diseases. The first part of the course will briefly introduce critical brain structures, with a focus on neurons and glia and will evaluate molecular mechanisms that underlie protein aggregation and cell death. The remainder of the course will focus on the multiple aspects of specific neurodegenerative diseases. Permission of instructor required.**Credits:** 3.00

BIOL 56100 - Immunology

Credit Hours: 3.00. Introduction to the basic principles and experimentation in cellular and humoral immunology.**Credits:** 3.00

BIOL 56200 - Neural Systems

Credit Hours: 3.00. (SLHS 50700, PSY 51200) Overview of the structure and function of neural systems including those involved with motor, somatosensory, visual, auditory, learning, memory, and higher cortical processes. Molecular and cellular

aspects of neural function are integrated with discussion of relevant neuroanatomy. Background in cell biology, psychobiology, physiology or anatomy is recommended. **Credits:** 3.00

BIOL 56310 - Protein Bioinformatics

Credit Hours: 3.00. Accumulation of biological data, such as genome sequences, protein structures and sequences, metabolic pathways, opened up a new way of research in biology-bioinformatics. Through the survey of the various active research topics in bioinformatics, in this course we will learn bioinformatics databases, tools, and algorithms behind these tools. Special emphasis is placed on protein sequence and structure analyses. Covered topics will include methods for protein sequence comparison, protein structure comparison, protein structure prediction/modeling, protein docking prediction, protein function prediction, and protein network analysis. **Credits:** 3.00

BIOL 56400 - Molecular Genetics Of Development

Credit Hours: 3.00. The course examines the genetics and developmental bases as well as phenotypes of 40 genetic disorders. Chromosomal, single gene, complex and developmental genetic disorders are studied in detail. Emphasis is placed on molecular techniques and understanding current primary literature.**Credits:** 3.00

BIOL 56600 - Developmental Biology

Credit Hours: 3.00. (West Lafayette, Fort Wayne, IUPUI, North Central) 4.00 (Calumet) Principles of development with emphasis on concepts and experimental evidence for underlying mechanisms, including molecular, cellular, and supracellular approaches.**Credits:** 3.00

BIOL 57110 - Advanced Cell Biology

Credit Hours: 3.00. In this lecture only course, we will explore in-depth cell structure and function. Topics covered include: protein structure; methods used to explore molecular mechanisms and visualize cell structures; membrane structure and transport; electrical properties of membranes; protein sorting and trafficking; structure and function of the cytoskeleton; cell signaling and communication; apoptosis, the cell cycle and how it is controlled; and cancer. Primary research studies will be incorporated to reinforce lecture topics. Prerequisites are BIOL 24300 Cell Biology and BIOL 24400 Genetics, or permission of instructor.**Credits:** 3.00

BIOL 57310 - Stem Cell Biology

Credit Hours: 3.00. In this course students will develop a clear understanding of stem cells' defining features, activities and potential utility. Stem cell research is pursued in nearly all areas of medicine. This course focuses on important definitions and characteristics of stem cells and develops a general overview of stem cell biology. The course builds on this overview of stem cell biology by examining specific example of developmental biology, methodology and the potential applications of stem cell therapy.**Credits:** 3.00

BIOL 58000 - Evolution

Credit Hours: 3.00. A study of evolution as a basic concept of the biological sciences; an examination of current methods of experimentation within the area, as well as evidences for the possible mechanisms of evolutionary change. **Credits:** 3.00

BIOL 58010 - Teaching Evolution: Online Course

Credit Hours: 3.00. Evolution is one of the most important and most widely misunderstood concepts in science. Teaching Evolution is an online course to help you deepen your understanding of evolutionary concepts, develop instructional strategies, and address obstacles in the teaching of evolution. **Credits:** 3.00

BIOL 58210 - Ecological Statistics

Credit Hours: 3.00. This course covers topics that are useful for successfully designing and analyzing statistically observational and experimental studies in ecology, animal behavior, evolutionary biology, forestry, wildlife sciences, fisheries, etc. Some topics are: differences between hypotheses and predictions, design of an ecological study, general linear models, assumptions, different types of designs (factorial, nested, repeated measures, blocks, split-plots, etc.), fitting models to data, etc. The course will focus on the conceptual understanding of these topics (e.g., interpreting the results of statistical tests) and practice with statistical programs and real datasets. **Credits:** 3.00

BIOL 58601 - Ecology

Credit Hours: 3.00. This is an advanced ecology course that examines the ecological process and dynamics of populations, communities, and ecosystems. Topics include the physical, physiological, behavioral, and population genetic factors that influence how organisms interact with one another and their environment, the nature of population growth, and attributes of community structure. Course material integrates case studies from field and laboratory experiments, simulations, and theoretical models to understand life histories, species interactions, and community and ecosystem processes.**Credits:** 3.00

BIOL 58602 - Laboratory In Ecology

Credit Hours: 1.00. This course is intended to complement many of the concepts discussed in BIOL 58601 Ecology Lecture. By studying selected topics in depth, both experimentally and through primary literature, you should gain a greater understanding of ecological principles and the process of science as it is applied to a variety of ecological topics. Permission of department required.**Credits:** 1.00

BIOL 58705 - Animal Communication

Credit Hours: 3.00. This course will be a broad-scaled analysis of animal communication. Topics will include the physics of sound- and light-signal production, propagation and reception of signals, the use of communication as a means of information transfer, and the evolution of signaling systems. Mathematical principles are covered (e.g. in the evolution of signals), so some background in mathematics (e.g. calculus or algebra and introductory physics) is helpful. **Credits:** 3.00

BIOL 59100 - Field Ecology

Credit Hours: 3.00 or 4.00 (West Lafayette); 4.00 (Fort Wayne, Northwest). A field course in ecology that stresses natural history and testing ecological theory under natural conditions. Group and individual projects include observational and experimental approaches. Emphasis is on the study of plant and animal species interactions in terrestrial (including montane and coastal) and aquatic habitats. Issues in community, population, behavioral, and conservation biology are addressed. Several all-day Saturday and two weekend field trips. Offered in alternate years. Permission of instructor required. **Credits:** 3.00 or 4.00

BIOL 59200 - The Evolution Of Behavior

Credit Hours: 3.00. An investigation of behaviors as adaptations: specializations of sensory and motor mechanisms involved in behavior; animal communication systems; behavioral ecology; patterns of social behavior as solutions to ecological problems, such as predator avoidance and resource exploitation. Emphasis will be on theoretical principles; examples will be broadly comparative, ranging from microorganisms to mammals. Offered in alternate years. **Credits:** 3.00

BIOL 59500 - Special Assignments

Credit Hours: 0.00 to 18.00. Special work, such as directed reading, independent study or research, supervised library, laboratory, or field work, or presentation of material not available in the formal courses of the department. The field in which work is offered will be indicated in the student's record. Permission of instructor required. **Credits:** 0.00 to 18.00

BIOL 60000 - Bioenergetics

Credit Hours: 2.00. Energy transduction in biological membranes: physical chemical foundations; electron transfer, proton translocation; and active transport. Atomic structures of integral membrane protein complexes responsible for respiratory, photosynthetic generation of electrochemical potential; ATPase motor, and structure-based mechanisms. Offered in alternate years. Prerequisite: BCHM 56100, BCHM 56200 and CHM 37300. **Credits:** 2.00

BIOL 60200 - Cellular Neurobiology

Credit Hours: 3.00. This course covers principles of neurophysiology and cell, molecular and developmental neurobiology for graduate students from a wide range of disciplines. Course material will involve lectures and assigned textbook readings, homework problems and in-class discussions based on selected readings of the primary literature, and computer-based simulations of neurophysiology. Grades will be based on participation in class discussions, graded homework sets and exams (a midterm and a final exam). **Credits:** 3.00

BIOL 61100 - Crystallography Of Macromolecules

Credit Hours: 3.00. The special techniques required in the structure determination of biological macromolecules. Symmetry of macromolecules. Data collection and processing. The isomorphous replacement technique. The molecular replacement technique. Use of anomalous dispersion. Restraint and constraint refinement. Computational techniques. Prerequisite: BIOL 51100. Permission of instructor required. **Credits:** 3.00

BIOL 62000 - Advanced Topics In Eukaryotic Cell Biology

Credit Hours: 3.00. A study of current areas of cell biological research, including the cytoskeleton, the regulation of the cell cycle, and the functions and dynamics of membrane-bound organelles. **Credits:** 3.00

BIOL 64700 - Membrane Protein Structural Biology

Credit Hours: 2.00. This course focuses on the structural basis of the functions and dysfunctions of diverse membrane proteins, analyzed by X-ray, electron microscopy, and spectroscopy. The functions include transport, biogenesis, and transmembrane signaling. Unique problems associated with the structure analysis of integral membrane proteins are discussed. **Credits:** 2.00

BIOL 65001 - Techniques In Molecular Biology

Credit Hours: 1.00. Techniques in Molecular Biology will introduce graduate students to the theory and practice of many commonly used methods. Emphasis will be placed on understanding the theoretical basis for these techniques, their utility in various circumstances, and their limitations. Although taught as a lecture, students should be able to take this knowledge back to the laboratory to help them in their research efforts. The course will be as close as possible to a laboratory experience without being in an actual laboratory setting. This course is designed to prepare students for other in-depth 600-level scientific courses, for their rotations, and for future laboratory work. Exams will be "experimental" in nature (e.g., "design and experiment to do something..." or "in this type of situation, which technique/vector/etc. would best be used, and why..."). **Credits:** 1.00

BIOL 65200 - Advanced Ecology Discussion

Credit Hours: 1.00. Weekly meetings to discuss and evaluate seminal papers in the fields of evolutionary, population, and community ecology. During the last week, students will critically evaluate a contemporary paper on a topic related to the "classic" papers discussed during the semester. Students will have a choice among papers submitted by participating faculty members; their critique will be assessed on content, originality, rigor, and clarity. **Credits:** 1.00

BIOL 66200 - Seminar Methods And Professional Development I

Credit Hours: 1.00. An introduction for incoming graduate students to methods of seminar presentation and critique and to various guidelines for professional development during their graduate school experience. Topics include research laboratory safety (REM), how to give a talk, acclimating to graduate studies (especially time management), how to select a major professor and an advisory committee, how to prepare for qualifying exams, Purdue University guidelines for responsible conduct of research, how to organize a poster presentation, how to negotiate with mentors, and expectations for success. The course also serves to socialize the incoming cohort of students among themselves and with more senior students in the broad range of research disciplines available. **Credits:** 1.00

BIOL 66300 - Seminar Methods And Professional Development II

Credit Hours: 1.00. This course is a continuation of BIOL 66200 and expands the introduction for incoming graduate students to methods of seminar presentation and critique and to various guidelines for professional development during their graduate school experience. Topics include seminar topic selection and 20-minute seminar design, tutorials on electronic services at the PU Library and Citation Management programs, and evaluating classmate presentations. Using the skills learned the previous semester, each student is required to make a 20-minute PowerPoint presentation to the class, based on a pre-approved topic of their choice. The speaker is asked questions and the presentation receives written evaluations by all members of the class. Each student practices with the course instructor prior to the public presentation. The course also continues to socialize the incoming cohort of students among themselves and with more senior students in the broad range of research disciplines available. **Credits:** 1.00

BIOL 69100 - Biological Research Methods

Credit Hours: 1.00. Open to graduate students in the Department of Biological Sciences and designed primarily for students in their first year of graduate study. The course consists of two laboratory assignments, each of which lasts about two months. Students may take one or two of these per semester. During each laboratory assignment, the student will be exposed to methods, equipment, and experimental procedures currently in use in a particular departmental research laboratory selected by the student and through arrangement with the professor in charge of that laboratory. Admission by consent of the departmental Graduate and Advanced Studies Committee. **Credits:** 1.00

BIOL 69500 - Special Assignments

Credit Hours: 0.00 to 18.00. Special work, such as directed reading; independent study or research; supervised library, laboratory, or field work; or presentation of material not available in the formal courses of the department. The field in which work is offered will be indicated in the student's record. Primarily for Ph.D. candidates. Permission of instructor required. **Credits:** 0.00 to 18.00

BIOL 69600 - Seminar

Credit Hours: 1.00. Each semester there are several separate seminar offerings. They will likely be on the following topics: biochemistry, crystallography, ecology and population biology, genetics, mechanisms of development, microbiology, neurobiology, and plant physiology. The student's record will indicate the specific seminars in which he/she has participated. Oral presentations required. At least two credits are required of Ph.D. candidates. **Credits:** 1.00

BIOL 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required. **Credits:** 1.00 to 18.00

BIOL 69900 - Research PhD Thesis

Credit Hours: 1.00 to 18.00. Research PhD Thesis. Permission of instructor required. **Credits:** 1.00 to 18.00

Biomedical Engineering

BME 19500 - Selected Topics In Biomedical Engineering

Credit Hours: 0.00 to 4.00. Specialized topic areas in BME for which there are not specific courses, workshops, or individual study plans, but having sufficient student interest to justify the formalized teaching of a course. **Credits:** 0.00 to 4.00

BME 20200 - Thermodynamics In Biomedical Engineering

Credit Hours: 3.00. The major objective for this course is to understand and exploit basic principles of thermodynamics as they apply to biological systems and biological processes. Specifically, the course will focus on biological processes across scales: from the nanometer scale of biomolecules, the micrometer scale of cells, the millimeter and meter scales of tissues and organisms, all the way up to the 100+ meter scale for bioprocess equipment and industry-scale production with a focus on dynamic behaviors of systems. The course can be loosely classified into two parts: (i) guiding principles and fundamental equations for thermodynamics in biological and biomedical engineering, and (ii) applications of engineering principles to the study of biological systems.**Credits:** 3.00

BME 21400 - Introduction To Biomechanical Analysis

Credit Hours: 3.00. The goal of this course is to provide a foundation in biomechanics (analysis of forces, moments, and stresses) that will allow students to quantify the loads in the skeleton as well as design surgical tools and total joint replacements. In addition to the topics on vectors, particle equilibrium, and rigid body mechanics one would expect in a classical mechanics course, biomedical engineers must also have a working knowledge of skeletal anatomy. Consequently, anatomical descriptions and anthropometric data will be incorporated throughout the course. As part of the implant design, students will also be introduced to more advanced topics in mechanics such as Hertz contact theory, shear-lag theory, and composite beam theory.**Credits:** 3.00

BME 21401 - Biomechanical Analysis Laboratory

Credit Hours: 1.00. This course provides hands-on training in engineering and biological principles of biomechanics. Topics include translation of theoretical vector and equilibrium calculations to three-dimensional body problems, computer aided design and finite element analysis, harvest and storage of biological samples, and tension, compression and bending testing with mechanical testers. A design project reinforces the mechanical testing skills learned in class, combining skill-building in group work and experimental design. This course will prepare students for deeper study of biomechanics.**Credits:** 1.00

BME 22000 - Biomolecules: Structure, Function, And Engineering Applications

Credit Hours: 3.00. Classes of molecules (biomolecules) such as sugars, lipids, proteins, and nucleic acids that form the cellular components of living organisms. Explores the chemistry behind the structure and function of these important classes of biological molecules. Hydrogen-bonding, hydrophobic forces, electrostatic interactions along with other weak interactions discussed with reference to their importance in biomolecular systems in an engineering context.**Credits:** 3.00

BME 22201 - Introductory Biomeasurements

Credit Hours: 3.00. The foundations of basic circuit theory are introduced including voltage-current characteristics of resistive and reactive elements, Ohm's and Kirchhoff's Laws, equivalent sources, transformations and superposition, transient response, instantaneous and average power, AC impedance, dynamic response of first and second order systems. Permission of department required.**Credits:** 3.00

BME 22400 - Biomeasurements Lab

Credit Hours: 1.00. Laboratory exercises will reinforce the foundations of basic circuit theory. Electronic instruments are used in the context of biomedical signal measurement and processing and include the use of oscilloscopes, function generators, transducers, electrodes, biopotential amplifiers and digital data collection and analysis. Laboratory exercises utilize industrially relevant instruments for measurement and acquisition of time varying signals arising from electronic and bioelectric sources. Permission of department required.**Credits:** 1.00

BME 23100 - Bioinstrumentation and Circuit Theory

Credit Hours: 3.00. In this course, we'll delve into the core principles of circuit theory, covering topics such as voltage-current relationships in resistive and reactive components, Ohm's Law, Kirchhoff's Laws, and source equivalency. We will also explore advanced concepts like transient responses, AC impedance, and the dynamic behavior of first and second-order systems. Students will gain proficiency in phasor analysis of sinusoidal signals, complex number calculations, signal sampling, and spectral analysis. We'll also touch on linear time-invariant systems, frequency response, and both the design and implementation of filters. A portion of the course will focus on control systems via the s-domain. To enrich your understanding and skill set, we will also introduce programming through Python, which will facilitate data processing and deepen your conceptual grasp. This course serves as a preparatory steppingstone for BME 33000 (Bioelectricity), equipping you with the essential physics knowledge and skills required for more advanced studies.**Credits:** 3.00

BME 23101 - Bioinstrumentation and Circuit Theory Lab

Credit Hours: 1.00. Introduction of laboratory instruments used to measure physiological events. Stimulation and conduction of electric signals within the mammalian nervous system and other excitable tissues are demonstrated. Fundamental circuit elements and concepts include resistance, capacitance, inductance, op-amps, impedance, voltage, current, power, and frequency, following the content introduced in BME 231. Fundamental analog measurement concepts include adequate bandwidth and amplitude and phase linearity. Integrative design project emphasizes the practical aspects of quantitative physiological measurements. This course is to prepare learners with sufficient physics knowledge and lab skills to pursue the Bioinstrumentation and Imaging Depth Areas. Moreover, students are introduced to programming (using Python) to deepen the understanding of basic concepts and learn basic skills in data processing. SPICE software will be used throughout the course to design/simulate various analog circuits.**Credits:** 1.00

BME 24101 - Introductory Biomechanics

Credit Hours: 3.00. This course uses didactic lecture material to introduce students to the principles of mechanics and how these concepts apply to musculoskeletal tissues. Permission of department required.**Credits:** 3.00

BME 24300 - Biomechanics Laboratory

Credit Hours: 1.00. This course uses laboratory experiments to introduce students to the principles of mechanics and how these concepts apply to musculoskeletal tissues. Permission of department required.**Credits:** 1.00

BME 25600 - Physiological Modeling In Human Health

Credit Hours: 3.00. Introduction to the physiology and medicine underlying practical problems in biomedical engineering, especially with respect to medical device development. Engineering skills taught and practiced within the context of human

disease, injury, and illness on extended problem sets which include mathematical modeling and problem solving with appropriate documentation. Main physiological systems of focus are cardiovascular, pulmonary, and renal, and common afflictions thereof. **Credits:** 3.00

BME 28000 - Frontiers In Biomedical Engineering

Credit Hours: 1.00. This course introduces the rapidly emerging field of biomedical engineering by exposing students to a wide range of research activities in the Weldon School and to a variety of experiential learning opportunities. Topics addressed include career paths, professional development opportunities, and career development skills including creating a plan of study, informational and job interviewing, writing a resume, technical writing, preparing effective oral presentations, and peer-editing.**Credits:** 1.00

BME 29199 - Cooperative Experience I

Credit Hours: 0.00. Professional experience in biomedical engineering. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

BME 29299 - Cooperative Experience II

Credit Hours: 0.00. Professional experience in biomedical engineering. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

BME 29500 - Selected Topics In Biomedical Engineering

Credit Hours: 1.00 to 4.00. Specialized topic areas for which there are no specific courses, workshops, or individual study plans, but having sufficient interest to justify the formalized teaching of a course. Permission of instructor required. **Credits:** 1.00 to 4.00

BME 29600 - Biomedical Engineering Projects

Credit Hours: 1.00 to 4.00. Individual research projects to be approved by the supervising faculty member before registering for the course. An approved written report is required. Permission of instructor required. **Credits:** 1.00 to 4.00

BME 30200 - Professional Development And Design In Biomedical Engineering

Credit Hours: 2.00. This course explores design, career, and professional topics in Biomedical Engineering. To prepare students for capstone and engineering practice, students will engage in case study design encompassing conceptualization, requirements generation and system design. Essential design elements such as user need, ideation, constraints, regulatory, and documentation will be reviewed and applied. Additional career and professional topics include resume writing, interviewing, and professional conduct; post-graduate education and life-long learning; and industrial, clinical, and research opportunities in Biomedical Engineering.**Credits:** 2.00

BME 31300 - Biofluid Mechanics

Credit Hours: 3.00. Fundamental concepts and principles of fluid mechanics in the context of biomedical applications. Governing equations of flow and transport are derived from the first principles and applied to conditions characteristic of the human circulatory system.**Credits:** 3.00

BME 31400 - Experimental Methods In Biomechanics

Credit Hours: 3.00. This course focuses on the concepts and applications of mechanics, imaging, and instrumentation methods towards evaluating experimental biomechanics at multiple length scales. Core concepts include mechanics of materials, dynamics, contact theory, and the simplifying assumptions and standardizations often needed to conduct experiments on biomaterials and living systems. Experimental methods may include atomic force microscopy, digital image correlation, and motion analysis.**Credits:** 3.00

BME 32000 - Introduction To Biomaterials Science And Engineering

Credit Hours: 3.00. This junior-level course will introduce fundamental materials science and biomaterial concepts to BME students and will lay the foundation for more advanced courses in biomaterials and tissue engineering. The course will introduce the vocabulary and technical concepts in biomaterials science relevant for problems in medical device, biotechnology, or biomaterials industries. The course material will present phenomena at the intersection of materials science and biology.**Credits:** 3.00

BME 32001 - Biomolecules And Biomaterials Laboratory

Credit Hours: 1.00. Introductory laboratory experience focused on engineering concepts and practices in the analysis of biomolecules and cells. Topics include fundamental quantitative techniques of analysis, methods of isolation, identification, and quantification of biomolecules and cells, and analysis of integrated biosystems. Concludes with student-driven design project.**Credits:** 1.00

BME 32200 - Probability, Statistics, And Applications In Biomedical Engineering

Credit Hours: 3.00. Probability theory and statistical methods are developed for life science applications. Analytical tools such as hypothesis testing, estimation of moments, sampling theory, correlation and spectral analysis are developed and applied to identifying underlying processes in biological systems, developing realistic models of physiological processes, designing experiments, and interpreting biological data.**Credits:** 3.00

BME 33000 - Bioelectricity

Credit Hours: 3.00. Fundamentals of bioelectricity of the mammalian nervous system and other excitable tissues. Passive and active forms of electric signals in both the single cell and cell-cell communication, tissue and systematic bioelectricity, mathematical analysis including Nernst equation, Goldman equation, linear cable theory, and Hodgkin-Huxley Model of action potential generation and propagation.**Credits:** 3.00

BME 33100 - Biosignals And Systems

Credit Hours: 3.00. This course applies mathematical analysis tools to biological signals and systems. Frequency analysis, Fourier and Laplace transforms, and state equations are used to represent and analyze continuous and discrete-time biosignals. Classic feedback analysis tools are applied to biological systems that rely on negative feedback for control and homeostasis. **Credits:** 3.00

BME 33400 - Biomedical Computing

Credit Hours: 3.00. This course explores computational approaches to analyzing biological data and solving biological problems. Students will fit and interpret biological data, apply probabilistic and differential equation modeling techniques to biological processes, and assess numerical tools for biomedical applications. Special attention is given to the built-in analysis functions of MATLAB.**Credits:** 3.00

BME 35200 - Cell And Tissue Mechanics

Credit Hours: 3.00. This course will explore the biological principles of cellular/tissue behaviors and properties. Topics include: fundamental concepts of cellular structure and tissue organization, biomolecular elements and their properties, cell shape, cell adhesion and migration, mechanotransduction, pattern formation in embryos, and stem cell and tissue regeneration.**Credits:** 3.00

BME 35400 - Cell And Tissue Laboratory

Credit Hours: 1.00. This course develops quantitative biomechanical methods to analyze cell/tissue behavior and properties and to solve biomechanical engineering problems. Topics include: bio viscoelasticity, failure, filament dynamics, membrane dynamics, biofluid dynamics, cellular dynamics, and tissue dynamics.**Credits:** 1.00

BME 35600 - Mathematical Models And Methods In Physiology

Credit Hours: 3.00. This course uses real-world engineering problems to introduce advanced analytical tools and concepts relevant to biomedical engineering design. Each topic is briefly introduced, and students work in small teams to investigate physical mechanisms involving human anatomy and physiology using mathematical models and methods. Group work is done during scheduled class periods and other times by arrangement. Topics include brain concussions and protective helmets, origin of the electrocardiogram and bi-ventricular pacing, and deep brain stimulation for Parkinson's disease. Mathematical methods include coupled linear and nonlinear differential equations, finite element analysis, and simulated annealing. Creation of custom computer code is required. Students prepare extensive and detailed written technical reports. A midterm and a final examination encourage individual accountability and understanding. **Credits:** 3.00

BME 35700 - Foundations Of Biomedical Data Science

Credit Hours: 3.00. This course presents foundational data science methods for analysis of complex biological datasets encountered in biomedical engineering research and applications. After a brief (1-2 weeks) introduction and review of mathematical concepts necessary for data science, the course will cover representative areas of regression, supervised machine learning, unsupervised machine learning, model evaluation, and uncertainty quantification. Assignments and exams will focus on practical examples spanning basic science, engineering, and medical applications.**Credits:** 3.00

BME 36000 - Introduction To Biomedical Imaging

Credit Hours: 3.00. The main focus of this course is on basic principles and modes of major bioimaging modalities. This course covers image characterization, interactions of electromagnetic radiation with tissue, fundamental principles in imaging and detection, and modes of imaging modalities (e.g., reflection, transmission, absorption, and emission). Conventional bioimaging modalities will be used to teach the topics. This course is particularly aimed at students in science and engineering interested in gaining a conceptual understanding of several critical biological and biomedical imaging methods, including optical microscopy, ultrasound, X-ray imaging, computed tomography, nuclear medicine, magnetic resonance imaging, and mobile health. Overall, this course provides a conceptual framework for biomedical imaging in a reasonably concise and understandable format (with minimal mathematical approaches). **Credits:** 3.00

BME 38000 - Professionalization In Biomedical Engineering

Credit Hours: 2.00. This active learning course covers standards of practice, regulatory and legal requirements, and moral and ethical issues; increases awareness of career paths; and addresses current and emerging trends and challenges at the frontiers of the field of biomedical engineering. Most class sessions will consist of a short introduction to a topic followed by a breakout session for active investigation of the topic. During the breakout sessions, course instructors will be available to guide discussion and answer questions. **Credits:** 2.00

BME 38100 - Implantable Materials And Biological Response

Credit Hours: 3.00. BME 381 combines biomaterials, their biological response, and interactions between implantable materials and biological systems. Materials science of implantable materials; overview of implantable biomaterials and interactions between implants and biosystem; in vitro and in vivo biocompatibility tests; and specific examples on implant-tissue interactions, biocompatibility, and evaluation tools are presented.**Credits:** 3.00

BME 38300 - Implantable Materials Laboratory

Credit Hours: 1.00. BME 38300 is a corequisite course to BME 38100, supplementing the basic science of BME 38100 with quantitative, analytical examples and problems related to fundamental engineering principles in implantable materials. Topics include: microstructure, phase transformation, processing and design issues related to major engineering materials used for implantation purposes.**Credits:** 1.00

BME 38800 - Applied Biomaterials

Credit Hours: 3.00. This course covers foundational knowledge in the fields of materials science and engineering. Emphasis is placed on the materials used in biomedical applications and the relationship between material properties and the performance of these biomaterials.**Credits:** 3.00

BME 38900 - Junior Experimental Design Laboratory

Credit Hours: 2.00. Practical experience with engineering design principles is presented through inquiry-based modules. Each module contains computer simulation, experimental design, implementation, and data analysis. Modules address biomedical applications in different areas of BME.**Credits:** 2.00

BME 39000 - Professional Development And Design In Biomedical Engineering

Credit Hours: 2.00. Introduction to a diverse spectrum of current topics relevant to the technical, professional, and career aspects of Biomedical Engineers. The course topics will focus on the early stages of the design process (e.g. need identification, problem formulation, innovation and idea generation), professional communication skills (e.g. written and oral reporting and documentation), and ethics of biomedical design and research (e.g. ethical codes and decision making, animal care and use in research and testing, authorship and intellectual property, social and environmental impact of design).**Credits:** 2.00

BME 39399 - Cooperative Experience III

Credit Hours: 0.00. Professional experience in biomedical engineering. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

BME 39499 - Extensive Cooperative Experience IV

Credit Hours: 0.00. Professional experience in biomedical engineering. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

BME 39500 - Selected Topics In Biomedical Engineering

Credit Hours: 1.00 to 4.00. Specialized topic areas for which there are no specific courses, workshops, or individual study plans, but having sufficient student interest to justify the formalized teaching of a course. Permission of instructor required. **Credits:** 1.00 to 4.00

BME 39599 - Extensive Cooperative Experience V

Credit Hours: 0.00. Professional experience in biomedical engineering. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

BME 39699 - Professional Practice Internship

Credit Hours: 0.00. To obtain professional practice with qualified employers within industry, government, or small business. Permission of department required. **Credits:** 0.00

BME 40100 - Mathematical & Computational Analysis Of Complex System Dynamics In Biology, Medicine, & Healthcare

Credit Hours: 3.00. An introduction to analysis of complex system dynamics that appear in biology, medicine, and healthcare. Key topics include nonlinear dynamical concepts associated with phase plane, bifurcation, stability diagram, oscillation, and chaotic systems along with concepts from discrete systems and stochastic processes. These topics are taught within the context of mathematical and computational models related to both non-communicable diseases (i.e. cancer) and communicable diseases (i.e. HIV/AIDS). Courses projects are drawn from recent literature. **Credits:** 3.00

BME 40500 - Biomedical Engineering Design Project

Credit Hours: 4.00. Design and management of biomedical engineering projects. Teams design and implement a solution to a biomedical engineering problem utilizing skills gained in previous course work. Oral and written presentation of design and demonstration of function are required. **Credits:** 4.00

BME 41100 - Quantitative Physiology

Credit Hours: 3.00. This course applies systems theory and explores feed forward and feedback control in the context of physiological systems. Control, frequency response, and linear systems concepts are applied to action potential generation, motor control, heart rate regulation, and other physiological processes.**Credits:** 3.00

BME 41101 - Quantitative Physiology In Biomedical Engineering

Credit Hours: 4.00. This course is an introductory course in physiological systems and an introductory course in classical feedback control theory for biomedical engineers. It aims to apply systems theory and classical feedforward and feedback control in the context of physiological. Control, frequency response, and linear systems concepts are applied to action potential generation, motor control, heart rate regulation, and other physiological processes. Approximately a third of the course will be devoted to physiological systems, a third to classical control theory and a third to the application of classical control and systems theory to physiological systems.**Credits:** 4.00

BME 41400 - Computational Mechanics In Biomedical Engineering

Credit Hours: 3.00. Teaches modeling methods for biomedical engineering problems with focus on fluid/solid mechanics. Students are introduced to the most common numerical techniques in biomedical engineering and will learn the applications of these techniques to biomechanical problems at various length scales, such as cardiac contraction and blood flow. The first half of

this course focuses on modeling based on ordinary differential equation (ODE) and partial differential equation (PDE) as well as on how we integrate these equations analytically or numerically using software packages such as MATLAB. The other half focuses on fundamentals of fluid/solid mechanics and also on the application of COMSOL or similar software to solving relevant biomechanical problems.**Credits:** 3.00

BME 43000 - Introduction To Bioimaging

Credit Hours: 3.00. Provides a conceptual framework for understanding the theory and technical principles behind major Bioimaging modalities. The main focus is on basic principles and modes of imaging involving interactions of electromagnetic radiation with biological tissue. Main concepts include imaging and detection, modes of imaging modalities (e.g. reflection, transmission, absorption, and emission), and basic image characterizations. Applications include several critical biological and biomedical imaging methods, such as optical microscopy, ultrasound, X-ray imaging, computed tomography, positron emission tomography, and magnetic resonance imaging. Demonstrations of conventional Bioimaging modalities are used to teach the topics. **Credits:** 3.00

BME 43100 - Neural Engineering

Credit Hours: 3.00. An introduction to Neural Engineering - an emerging field of developing and applying engineering solutions to research or translational problems concerning the brain. The course will cover a broad range of topics about neural sensing, modeling, stimulation, interface, and prosthetics. Course projects are drawn from real-world problems and experimental data.**Credits:** 3.00

BME 44200 - Biofluid Mechanics

Credit Hours: 3.00. This course explores fluid mechanics in the context of the human circulatory system. Principal equations are derived from differential analysis of fluid flow, and models of characteristic flow conditions are fully analyzed. Biofluid mechanics, vessel biomechanics, and hemodynamic analysis of the circulation system will also be discussed.**Credits:** 3.00

BME 45000 - Deep Learning For Medical Imaging

Credit Hours: 3.00. Teaches the foundation of neural network (aka "Deep Learning") approaches and applications to medical imaging: or how to create computable models of biological neural systems, in particular large-scale neural networks, for processing medical images and data. Drawing inspiration from neuroscience and statistics, Deep Learning introduces the basic background on neural networks, presents computable neuron models and extends to large networks of neurons. Students study deep learning with both real and artificial neural networks, along with methods of deep learning about the environment by applying back propagation, Boltzmann machines, auto-encoders, convolutional neural networks and recurrent neural networks. Students will explore how Deep Learning is impacting our understanding of intelligence and contributing to the practical design of automatic medical imaging tools that are able to augment expert medical personnel, enhance diagnosis accuracy and speed, and lower health-care costs. **Credits:** 3.00

BME 46000 - Cardiovascular Mechanical Support And Devices

Credit Hours: 3.00. Designed to expose students to state-of-the-art medical technologies being utilized in the treatment of patients with cardiovascular diseases, the course emphasizes the role of the biomedical engineer in the design, development and implementation of these technologies for therapeutic impact. Students completing this course will have an understanding of the role of biomedical engineers in clinical engineering and clinical research. The three components of the course, didactic presentations and discussions, laboratory dissections, and clinical shadowing are integrated throughout to teach concepts such as cardiovascular physiology, heart failure and vascular disease, treatments and treatment complications, and future directions. Clinical experts in cardiovascular diagnosis and treatment are frequent guest lecturers.**Credits:** 3.00

BME 46100 - Transport Processes In Biomedical Engineering

Credit Hours: 3.00. This course explores engineering principles in mass and other transport processes in biological systems. Topics covered include diffusion, convection, reaction kinetics, transport in porous and fluid mediums, etc. Mathematical models of transport are developed and applied to biomedical problems and physiological systems such as the kidney/renal and oxygen/arterial systems.**Credits:** 3.00

BME 47000 - Biomolecular Engineering

Credit Hours: 3.00. The course covers key chemical concepts one needs in order to modify existing biomolecules, link biomolecules with other (bio)molecules, link biomolecules with inorganic entities, create composite (bio)structures, modify specific properties of biomolecules, alter/enhance biomolecule functionality. Taken together, the rational application of these biological, chemical, and engineering tools can be used to; engineer new biomolecules, design sensors for molecular detection, create diagnostic tests, develop new imaging modalities, and design and test novel biomaterials, to name a few examples. **Credits:** 3.00

BME 48901 - Senior Design Project Lab

Credit Hours: 3.00. The biomedical engineering design process is completed starting from a preparatory design course, BME 39000, through a preliminary system design, build and test in Senior Design Project Lab. Students will work with their teammates to implement (e.g. build, test, iterate and evaluate) a solution to address a biomedical engineering problem statement and meet the technical specifications set forth. The resulting project design is presented and evaluated through an oral presentation, laboratory demonstration, and a final written document.**Credits:** 3.00

BME 49000 - Professional Elements Of Design

Credit Hours: 1.00. This course advances and enhances design tools, concepts, and knowledge relevant to biomedical engineering design. Students work individually and in small teams to investigate the topic within the context of their specific senior design project in preparation for their lab. Topics include project management, human and animal subjects, ethics, regulatory affairs, literature and patent searching, and entrepreneurship. **Credits:** 1.00

BME 49100 - Biomedical Engineering Design I

Credit Hours: 3.00. This course prepares students for engineering practice through a major design experience, encompassing conceptualization, requirements generation, and system and detailed design. Essential design constraints will be reviewed and applied including: safety, economics, and manufacturability. The course encompasses lectures, case studies, team formation, project assignments and generation of initial design.**Credits:** 3.00

BME 49101 - Biomedical Engineering Design

Credit Hours: 2.00. This course prepares students for engineering practice through a major design experience, encompassing conceptualization, requirement generation, and system and detailed design. Essential design constraints will be reviewed and applied including: safety, economics, and manufacturability. The course encompasses lectures, case studies, team formation, project assignments and generation of initial design.**Credits:** 2.00

BME 49200 - Biomedical Engineering Design II

Credit Hours: 3.00. This course continues the design experience from BME 491 with verification, validation, and re-design of student projects. Regulatory and ethical design constraints will be discussed. Oral presentation and report writing are required.**Credits:** 3.00

BME 49500 - Selected Topics In Biomedical Engineering

Credit Hours: 1.00 to 4.00. Specialized topic areas for which there are no specific courses, workshops, or individual study plans, but having sufficient student interest to justify the formalized teaching of a course. Permission of instructor required. **Credits:** 1.00 to 4.00

BME 49800 - Biomedical Engineering Projects

Credit Hours: 1.00 to 4.00. Individual research projects to be approved by the supervising faculty member before registering for the course. An approved written report is required. Permission of instructor required. **Credits:** 1.00 to 4.00

BME 50000 - Biomedical Engineering Graduate Seminar

Credit Hours: 0.00. A -0- credit hour graduate seminar course consisting of weekly, one hour technical presentations by Department of Biomedical Engineering and other engineering faculty at IUPUI, researchers from local and national academia, representatives from industry and peer graduate students in the BME Department. These seminars introduce graduate BME students to a wide variety of bioengineering related topics in academic research and commercial industries. The students are exposed to research questions, methodologies and technical developments both inside and outside of their topical concentration areas. Through open inquiry, discourse and application of the Socratic method the course moderator helps the BME graduate students enhance and refine their critical thinking and technical presentation skills. Permission of department required.**Credits:** 0.00

BME 50100 - Multivariate Analyses In Biostatistics

Credit Hours: 3.00. This course focuses on fundamental principles of multivariate statistical analyses in biostatistics, including multiple linear regression, multiple logistic regression, analysis of variance, and basic epidemiology. The fundamental theories are applied to analyze various biomedical applications ranging from laboratory data to large-scale epidemiological data. **Credits:** 3.00

BME 51000 - Neural Mechanisms In Health And Disease

Credit Hours: 3.00. An examination of the mechanisms by which nervous systems process information in normal and pathologic states. Cellular and systems-level information processing will be studied with a focus on sensory and motor systems. Students will gain some hands-on experience in the analysis of neural data. Some neuroanatomy will be included to understand how nervous systems are organized. Pathological states such as Alzheimer's, autism, and aging will be studied, both in terms of understanding the systems and cellular deficits as well as examining potential solutions to improve the outcomes for these neural disorders.**Credits:** 3.00

BME 51100 - Biomedical Signal Processing

Credit Hours: 3.00. An introduction to the application of digital signal processing to practical problems involving biomedical signals and systems. Topics include: overview of biomedical signals; filtering to remove artifacts; event detection; analysis of waveshape and waveform complexity; frequency domain characterization; modeling biomedical signal-generating systems; analysis of non-stationary signals; pattern classification and diagnostic decisions, MATLAB is used throughout to apply the theory and techniques discussed to biomedical signals. **Credits:** 3.00

BME 51500 - Practical MRI And Applications

Credit Hours: 1.00. This course covers basic theory and practical training for magnetic resonance imaging (MRI). Weekly labs allow students to directly train on an MRI system within the Purdue MRI Facility. Weekly lectures are provided on a broad range of applied and relevant topics, including image formation and contrast, pulse sequence basics, artifacts, advanced sequences, and safety. The course is ideally designed for students who want to make use of MRI to advance their research.**Credits:** 1.00

BME 52100 - Biosensors: Fundamentals And Applications

Credit Hours: 3.00. (ABE 56000) An introduction to the field of biosensors and an in-depth and quantitative view of device design and performance analysis. An overview of the current state of the art to enable continuation into advanced biosensor work and design. Topics emphasize biomedical, bioprocessing, environmental, food safety, and biosecurity applications. **Credits:** 3.00

BME 52500 - Neural Engineering

Credit Hours: 3.00. Neural engineering is an emerging engineering discipline that combines the various disciplines of engineering with the biological, physical and material sciences to find the means to access, understand, manipulate, and perhaps enhance the nervous system and the information it contains. The aim of this course is to provide an introduction to the field of neural engineering and will start with the introduction of the neuron, the bioelectric phenomenon and the neural/electronic interfaces placed in the extracellular space on the peripheral nervous system. These topics will be reinforced through hands-on practical experiments using electrodes for stimulation and recording.**Credits:** 3.00

BME 52600 - Cardiac Electrophysiology

Credit Hours: 3.00. This course will introduce the basic principles of cardiac-generated bioelectricity as measured at cellular, extracellular and body surfaces. The generation, detection and classification of abnormal cardiac rhythms will be emphasized. Clinical and engineering principles of relevant electro-therapies will also be studied including cardiac pacemakers, defibrillators and ablation therapies involving cardiac mapping and a variety of ablative energy sources. Modern signal processing methods as applied to electrocardiography will also be presented. Permission of department required.**Credits:** 3.00

BME 52700 - Implantable Systems

Credit Hours: 3.00. The course material and lectures will focus upon how the anatomy and physiology of the target organ system impacts the design specifications for biomedical and implants and the biosensors that can be part of the command and control strategy for the implant. The course material is roughly organized according to motor (skeletal, cardiac) and sensory (vision, audition, olfaction, touch) and visceral (lungs) organ systems. For each topic area there will be a brief introduction to the physiology and neuroanatomy of the target organ system or biological environment (e.g. subcutaneous implants). Each topic area will have companion lectures demonstrating the extent to which biomedical engineers have been able to fabricate functional replacement (prosthetic) or assistive (orthotic) devices and tissue interfaces (electrodes). For example, issues related to performance, powering, communications, command control and user interfaces for auditory and visual neuroprosthesis are presented immediately following lecture materials describing these organ systems. Although not central to the course content, tissue and cellular responses to materials will be stressed throughout the semester. Topics will include normal wound healing processes, host response to implants and general biocompatibility. Lectures will emphasize fundamental principles of bioengineering as related to the design of implantable systems and will require student participation in classroom discussions. Permission of instructor required. Permission of department required.**Credits:** 3.00

BME 52800 - Measurement And Stimulation Of The Nervous System

Credit Hours: 3.00. (ECE 52800) Engineering principles addressing questions of clinical significance in the nervous system: neuroanatomy, fundamental properties of excitable tissues, hearing, vision, motor function, electrical and magnetic stimulation, functional neuroimaging, disorders of the nervous system, development and refinement of sensory prostheses. **Credits:** 3.00

BME 53000 - Imaging Diagnostic Technologies For Medical And Biological Applications

Credit Hours: 3.00. This gateway course teaches the physics, engineering techniques associated with modern imaging and diagnostic tools for biological and medical applications. The course covers fundamental principles of radiology, optics, contrast generation (including genetically encoded probes and physiological indicators), image formation, detection, and analysis. The specific biomedical imaging modalities covered include: x-ray, computed tomography, nuclear medicine imaging, ultrasound,

optical microscopy and tomography, and MRI. The specific biological microscopy modalities covered include: phase contrast, DIC, confocal microscopy, two-photon microscopy and super-resolution microscopy. The course also teaches the principle concepts of adaptive optics, light sheet microscopy, 4Pi microscopy, and modern super-resolution microscopy techniques (PALM/STORM, STED and ISM). To bridge the technology and physics with the latest diagnostic advances and biomedical discoveries, research progresses in specific biomedical applications are presented by leading experts in their respective biomedical field such as OCT, ultrasound, MRI, fluorescence microscopy, electron microscopy, concurrent MRI and optical functional imaging, and super-resolution fluorescence microscopy. This course also includes a crash sub-course on MATLAB programming including both introductory content and contents of MATLAB-C API and MATLAB-C-CUDA (GPU computing).**Credits:** 3.00

BME 53700 - Experimental Methods In Biomedical Engineering

Credit Hours: 3.00. A 3-credit graduate level engineering course that covers issues related to general laboratory practice, techniques, instrumentation and analysis methods utilized by Biomedical Engineering researchers working in the life sciences. Both theoretical and practical aspects of experimental design and data analysis are covered using select examples from BME life science researchers here on the IUPUI campus. Most topic areas are presented from a decidedly analytical and engineering viewpoint. Students should have successfully completed courses in elementary analog electronic circuits and ordinary differential equations, and should be prepared to solve related homework problems using any available software programming tools (e.g. Matlab, Maple, Visual C, Visual Basic, etc.). No prior knowledge of the biological sciences is required although participants would benefit from having taken a first year undergraduate course in Chemistry and/or Biology. Permission of instructor required. Permission of department required.**Credits:** 3.00

BME 54000 - Biomechanics

Credit Hours: 3.00. Application of engineering mechanics to the study of normal and diseased musculoskeletal systems, including bone and soft tissue biology, musculoskeletal statics and dynamics, mechanical properties of biological tissues, and structural analysis of bone-implant systems. Permission of instructor required. **Credits:** 3.00

BME 54200 - Cell & Tissue Mechanics

Credit Hours: 3.00. This course develops and applies scaling approaches and simplified models to biomechanical phenomena at molecular, cellular, and tissue level. Topics include: Molecular forces; Viscous drag; Brownian motion; Diffusion; Polymer mechanics; Polymer dynamics; Molecular motors; Cytoskeleton; Viscoelasticity; Membrane; Cell migration; Cell adhesion; Mechanobiology; Mechanotransduction; Elastic, viscoelastic. and poroelastic behavior or tissues & Cell-matrix interaction.**Credits:** 3.00

BME 54400 - Musculoskeletal Biology And Mechanics

Credit Hours: 3.00. This course will cover topics relevant to skeletal tissues (bone, tendon, ligament, cartilage and meniscus, muscle) including skeletal morphology, physiology, cell biology, development, adult osteogenesis, tissue mechanics, mechanical adaptation, failure (fracture) and fracture fixation. Students will gain a working understanding of tissue biology and physiology and mechanical principles governing tissue formation, maintenance and adaptation and failure. Prerequisites: BME 24100 or comparable mechanics course. Note: Students with advanced math backgrounds as well as biochemistry and cell biology may be prepared to take this course at the discretion of the instructor. Permission of instructor required.**Credits:** 3.00

BME 54500 - Orthopaedic Tissue Mechanics

Credit Hours: 3.00. Orthopaedic tissues, such as bone, cartilage, tendon and ligament, serve functions that are largely mechanical in nature and that are critical for our health. This course is structured around classical topics in mechanics of materials and their applications in biomechanics and musculoskeletal tissues. Primary emphasis will be on the mechanical behavior of tissues, including elastic and failure properties as well as more advanced topics such as anisotropy, nonlinearity,

viscoelasticity, poroelasticity, damage, and fatigue. Importantly, the theories used to describe these mechanical properties were originally developed for advanced engineering materials such as fiber composites, polymers, elastomers, hydrogels, etc. Thus, while the theories will be presented in the context of biological materials, potential applications are much broader. Tissue microstructure and its importance to the material properties will be covered. Mechanics of whole bones and implants (composite and asymmetric beam theories) and the mechanical function of native and artificial joints (contact mechanics, lubrication and wear) may also be discussed, time permitting. Some homework assignments will emphasize the use of experimental data to develop and test theoretical models via nonlinear curve fitting and optimization using Matlab. Students will receive an introduction to tissue mechanics literature to better understand how the concepts presented in class are used in the research setting. Permission of department required.**Credits:** 3.00

BME 55100 - Tissue Engineering

Credit Hours: 3.00. (BMS 52300) Integrates the principles and methods of engineering and life sciences toward the fundamental understanding of structure-function relationships in normal and pathological mammalian tissues, especially as they relate to the development of biological substitutes to restore, maintain, or improve tissue/organ function. Current concepts and strategies, including drug delivery, tissue and cell transplantation, bioartificial organs, and in vivo tissue regeneration are introduced, as well as their respective clinical applications. Permission of instructor required. **Credits:** 3.00

BME 55300 - Biomedical Optics

Credit Hours: 3.00. Optical methods applied to address biological and biomedical problems. The course includes two parts: fundamentals of optical microscopy and advanced techniques that are currently used to probe and/or manipulate cell and tissue samples. Permission of instructor required. **Credits:** 3.00

BME 55500 - Magnetic Resonance Imaging Theory

Credit Hours: 3.00. This course covers fundamental aspects of magnetic resonance imaging systems with an emphasis on theory, methodology, and instrumentation. Key principles are derived from the Bloch equations and Maxwell's equations. Topics include pulse sequences, signal acquisition, spatial encoding in k-space, image reconstruction, and tissue contrast. Major components of an MRI scanner are examined, including the static magnet, gradient and shim coils, transmit and receive chains, and radiofrequency coils and arrays. Learning outcomes are assessed by solving problem sets integrating theory with practical applications. As a final research project, students survey recent literature to identify a specialized topic of interest and deliver a peer-evaluated presentation to the class. **Credits:** 3.00

BME 55600 - Introduction To Clinical Medicine For Engineering Solutions

Credit Hours: 3.00. This course introduces students to the physiology and medicine underlying major human diseases likely to become research targets in biomedical engineering and medical device development. It encourages students to upgrade research target selection to include projects that promise to improve patient care, with a major emphasis on pathophysiology and disease mechanisms. The information and intellectual approach offered will help students recognize needs for engineering solutions to current challenges in medicine. The course also previews the intellectual content of medical school, including rigor and level of detail, for engineering students considering designing medical solutions or translational engineering research as a career, emphasizing the key "11-points" necessary for practical understanding of any disease: definition of the condition, causes, functional abnormalities, structural abnormalities, early signs, history and physical findings, differential diagnosis, special studies (lab, imaging, etc.), treatment strategy, specific steps of treatment, and follow up, as well as current clinical needs for innovation and research opportunities for the future. To avoid possible redundancy with the Weldon School undergraduate curriculum, focal areas of the course include topics and body systems not covered in BME 25600, including infectious diseases, cardiopulmonary diseases, hematology-oncology, and gastrointestinal diseases. **Credits:** 3.00

BME 56100 - Preclinical And Clinical Study Design

Credit Hours: 3.00. Medical devices are developed, manufactured, and distributed in a highly regulated environment. This course concerns the preclinical and clinical study design processes for obtaining FDA marketing approval for biomedical devices. Prior to marketing a medical device in the US, specific governmental approval is required dependent on the type of device and the risk associated. This course is part of a three-course series dealing with various aspect of regulatory science. Regulatory science considers the scientific and technical foundations that support the practical testing and regulations that ensure the safety and effectiveness of medical devices. This course covers the responsible conduct of clinical and preclinical research, including evaluation of device tissue interactions and how they may be studied with preclinical animal models to predict safety and performance in human clinical trials that are necessary to gain regulatory approval for marketing. In the section on ethics we will cover several topics related to responsible conduct of clinical and preclinical research, including informed consent, risk assessment and ethical decisions, IRB oversight and ethical study design. **Credits:** 3.00

BME 56200 - Regulatory Issues Surrounding Approval Of Biomedical Devices

Credit Hours: 3.00. Medical devices are developed, manufactured, and distributed in a highly-regulated environment. This course primarily concerns the processes for obtaining FDA marketing approval or clearance for biomedical devices. Prior to marketing a medical device in the US, a specific governmental approval or clearance is required depending on the type of device and the risk associated with the device. This course is part of a three-course series dealing with various aspects of regulatory science. Regulatory processes for class I, II, and III devices, including combination devices, are covered with specific focus on 510(k) and PMA requirements. Approval requirements in the EU, Japan and other countries will also be briefly considered. Throughout the course, emphasis will be placed on regulatory science, regulatory strategy and principles of interacting with regulatory agencies. **Credits:** 3.00

BME 56300 - Quality Systems For Regulatory Compliance

Credit Hours: 3.00. Medical devices are developed and manufactured in a highly regulated environment. This course will provide an introduction, overview, and systematic study of the intent and impact of the major federal laws and regulations governing the development, manufacturing, distribution, and marketing of medical devices. Focus is on understanding the critical elements of regulatory science and quality compliance from a design control perspective. Instruction and mentoring in regulatory science skills is provided by academics and industry representatives with expertise in their fields. This course is part of a three-course series. **Credits:** 3.00

BME 56400 - Ethical Engineering Of Medical Technologies

Credit Hours: 3.00. This course examines many of the ethical challenges surrounding the design, development, and deployment of medical technologies. Issues will be analyzed from multiple frameworks and perspectives including industry, government, and society. Students will learn and practice identification and analysis of ethical issues. They will develop empathic and decision-making skills designed to prepare them as engineers to deal productively and ethically with issues in professional practice. **Credits:** 3.00

BME 57100 - Drug Delivery

Credit Hours: 3.00. This course explores the principles, techniques, and applications for therapeutic drug delivery and administration. This course will start with the fundamentals of drug administration: engineering principles such as diffusion and mass transport, with specific emphasis on transport in biological systems and barriers, pharmacokinetics, and drug distribution. We will examine the existing state of art in drug delivery systems: controlled release, biomaterials, and polymer-based delivery systems. Finally, we will also discuss the current field of biotechnology and biopharmaceutical: identification of novel drug targets, latest development in drug discovery, development, clinical trials, and product development, going from research to market using the latest examples from the pharmaceutical industry. Prerequisites: Basic mass transport background. Permission of instructor required.**Credits:** 3.00

BME 58100 - Bio-Micro-Electro-Mechanical Systems (BioMEMS) & Biomedical Microsystems

Credit Hours: 3.00. This course covers key topics in bio-micro-electro-mechanical systems (BioMEMS) and micro-integrated systems. Properties of useful materials will be discussed in context to BioMEMS. Micro-electronics process modules used in the design and fabrication of BioMEMS and micro-integrated systems will be presented. Applications of these systems in a variety of medical practices will be discussed in detail.**Credits:** 3.00

BME 58200 - Advanced Biomedical Polymers

Credit Hours: 3.00. This is an advanced polymer course that provides the most recent development of biomedical polymers and their applications and covers a variety of biomedical areas such as in cardiovascular, dental, orthopedic, ophthalmologic and wound healing research. Drug, cellular and gene delivery are also covered. This course is designed for all the graduate students (M.S. and Ph.D. level) in biomedical areas. Permission of instructor required.**Credits:** 3.00

BME 58300 - Biomaterials

Credit Hours: 3.00. Discussion of principles of biomaterial design, synthesis, and evaluation for various tissues/organs of the body, including orthopaedic/dental, cardiovascular, kidney, liver, lung, skin, nerve, and brain. Topics include fundamentals of materials science and engineering integrated into biology for the better regeneration of tissue. Offered in alternate years. Permission of instructor required. **Credits:** 3.00

BME 59500 - Selected Topics In Biomedical Engineering

Credit Hours: 1.00 to 3.00. This course is designed primarily for specialized topic areas for which there is no specific course, workshop, or individual study plan, but having enough student interest to justify the formalized teaching of a course. Permission of instructor required. **Credits:** 1.00 to 3.00

BME 60000 - Mentoring For Combined Degree (MD/PhD) Students In BME

Credit Hours: 0.00. Specialized course for M.D./Ph.D. students that is intended to maintain communication and orientation to the BME graduate program during the first two years of the combined degree program when students are completing medical school requirements on the Indianapolis campus. Requirements include attendance at one or more BME seminars on the West Lafayette campus; at least two research planning sessions with BME faculty members, BME graduate program coordinator, or assistant head; and participation in one additional graduate program activity. Permission of department required. Prerequisite is admissions to the Combined MD/PhD Degree program. **Credits:** 0.00

BME 64600 - Deep Learning - Theory And Practice Of Deep Neural Networks

Credit Hours: 3.00. This course teaches the theory and practice of deep neural networks from basic principles through state-of-the-art methods. The class blends hands-on programming, using a variety of state-of-the-art programming frameworks, with theoretical treatment based on current literature. Implementation will emphasize the use of the Pytorch language and the use of dynamic computational graphs. Some previous experience with optimization techniques is important for success in the course. **Credits:** 3.00

BME 68300 - Polymers In Biomedical And Pharmaceutical Systems

Credit Hours: 3.00. This course is designed to provide backgrounds in basic polymer chemistry, synthesis, characterization, solution properties, and recent advances in polymers for applications in drug delivery, biomedical devices, tissue engineering, biotechnology, and nanotechnology. **Credits:** 3.00

BME 69000 - Seminar In Biomedical Engineering

Credit Hours: 0.00. Seminar course covering a broad range of current research topics spanning Biomedical Engineering. Seminar presentations by representatives from industry and faculty from Purdue University and other external institutions. Required of Biomedical Engineering graduate students at Purdue; M.S. and Ph.D. students must complete two and four semesters (respectively) prior to graduation. **Credits:** 0.00

BME 69500 - Advanced Topics In Biomedical Engineering

Credit Hours: 1.00 to 3.00. This course is designed primarily for specialized topic areas for which there is no specific course, workshop, or individual study plan, but having enough student interest to justify the formalized teaching of an advanced course. Permission of instructor required. **Credits:** 1.00 to 3.00

BME 69600 - Advanced Biomedical Engineering Projects

Credit Hours: 1.00 to 6.00. Individual research projects to be approved by the supervising faculty member before registering for the course. An approved written report is required. Permission of instructor required. **Credits:** 1.00 to 6.00

BME 69699 - Biomedical Engineering Professional Practice Graduate Internship

Credit Hours: 0.00. Graduate-level internship course in Biomedical Engineering providing training in the professional skills that lead to career success in the biomedical field. Permission of instructor required. **Credits:** 0.00

BME 69700 - Directed Reading In Biomedical Engineering

Credit Hours: 1.00 to 3.00. Individualized reading course supervised by an appropriate faculty member. Approval for each reading course must be obtained from the department prior to registration. Permission of instructor required. **Credits:** 1.00 to 3.00

BME 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required. **Credits:** 1.00 to 18.00

BME 69900 - Research PhD Thesis

Credit Hours: 1.00 to 18.00. Research PhD Thesis. Permission of instructor required.**Credits:** 1.00 to 18.00

Botany and Plant Pathology

BTNY 11000 - Introduction To Plant Science

Credit Hours: 4.00. An introduction to the major groups in the plant kingdom, their origin, classification, and economic importance. The areas of anatomy, morphology, cytology, physiology, biochemistry, molecular biology, genetics, and ecology will be explored as they relate to plant sciences and agriculture. Course may also be offered for dual credit with cooperating Indiana high schools upon documented approval by the Department of Botany and Plant Pathology.**Credits:** 4.00

BTNY 12000 - Principles Of Plant Biology I

Credit Hours: 4.00. This course is the first of a two-semester series that introduces fundamental biological concepts and prepares students for more specialized plant biology studies. Lectures and laboratory exercises will cover the topics of plant diversity, morphology, physiology, and ecology. Throughout the course, emphasis will be placed on how scientific data is collected and interpreted, and the lab component will perfect key observational skills in botany. Our goal is to provide essential foundational knowledge in plant biology for progression to upper-level courses. **Credits:** 4.00

BTNY 12100 - Principles Of Plant Biology II

Credit Hours: 4.00. This course is an introduction to fundamental biological concepts designed to prepare students for more specialized study. Lectures and laboratory exercises will cover mechanisms and processes of genetics, molecular biology and cell biology. Our goal is to convey how these levels of organization are integrated. Throughout the course, emphasis will be made on the means by which scientific data is collected and interpreted, and key experiments performed in the lab component will be used to illustrate this process. **Credits:** 4.00

BTNY 20700 - The Microbial World

Credit Hours: 3.00. This course delivers a broad synthesis of microbiology, discussing all taxa of the microbial world. The course also discusses a wide range of subjects related to microbiology, including medical microbiology, but it has a strong emphasis on the botanical and environmental sciences. One particular characteristic that separates it from other microbiology courses is the reduced emphasis upon bacteriology, with discussions of the protists and viruses and, especially of the fungi, occurring in greater detail than the other general microbiology courses available. **Credits:** 3.00

BTNY 20800 - Introduction To Plant Science Research

Credit Hours: 1.00. The course is designed to expose students to the diversity of Plant Science research at Purdue and help students to get started in research and in the fantastic world of scientific discovery. Students will learn the importance of Plant Science research in society and how to become active participants of Purdue research discoveries. Students will learn about the scientific method and how discoveries are made to find answers to world problems. The students will explore department and campus resources to identify areas of research interest, learn how to search and apply for research/internship opportunities and find faculty that can serve as professional models and mentors. We will provide opportunities for students to interact and network with faculty members, professionals from industry and students involved in diverse research areas. **Credits:** 1.00

BTNY 26200 - Plant Structure And Tissue Biology

Credit Hours: 3.00. This course focuses on fundamental knowledge of the internal structure of plants, including distinct cell types, tissues, tissue systems, and organs that make up a plant. Lectures and laboratories will cover the structural parts that comprise the plant body including three major vegetative organs (roots, stems, and leaves) and a set of reproductive organs (flowers, fruits, and seeds). The goal of this course is to understand the internal organization of plants, to learn multiple lab techniques critical for plant science research, and to develop critical thinking and problem solving skills. **Credits:** 3.00

BTNY 27500 - Honors Course - Lower Division

Credit Hours: 1.00 to 4.00. Utilized to offer a new honors course for a maximum of three years. Variable title, credit and instructional type. Course may be repeated for credit if content and titles are different. Offered primarily to first-and second-year students. Courses offered must be approved by department or program faculty, and College of Agriculture Honors Committee. Permission of department required. **Credits:** 1.00 to 4.00

BTNY 28500 - Plants And Civilization

Credit Hours: 3.00. This course, intended primarily for non-majors, covers the history of agriculture, with focus on the centers of origin of our major food, fiber, and medicinal plants, and their historical, cultural, and economic relevance. The course also

surveys the biology of crop plants, with respect to taxonomy, anatomy, cell structure, physiology, development, and genetics. Discussions also center on the roles plant biotechnology may play in sustainable agriculture and in helping to alleviate problems caused by overpopulation and ecological stress. **Credits:** 3.00

BTNY 29800 - Research In Plant Science

Credit Hours: 1.00 to 3.00. Supervised individual laboratory or field research for freshmen and sophomore undergraduate students. A written report of work accomplished will be required. Up to 3 credits can be earned in BTNY 29800. Permission of department required.**Credits:** 1.00 to 3.00

BTNY 30100 - Introductory Plant Pathology

Credit Hours: 3.00. Basic principles of plant pathology, including etiology, symptomatology, control, and epidemiology of representative diseases of plants.**Credits:** 3.00

BTNY 30200 - Plant Ecology

Credit Hours: 3.00. This course will provide an introduction to the broad field of plant ecology. Through lectures and lab assignments, students will gain an in-depth understanding of ecological concepts regarding the distribution and abundance of plant species and populations. Students will also gain insights into the application of these concepts to the conservation and management of plant species and populations. **Credits:** 3.00

BTNY 30400 - Introductory Weed Science

Credit Hours: 3.00. A survey of the scientific principles underlying weed control practices; emphasis is on the ecology of weeds and control in crop associations. It is recommended that this course be followed by BTNY 50400. **Credits:** 3.00

BTNY 30500 - Plant Evolution And Taxonomy

Credit Hours: 3.00. This course focuses on the systematics and evolution of land plants, with an emphasis on plant identification in both laboratory and field. Topics covered include the diversity and evolution of land plants, plant systematics and biogeography. This is a lab and field intensive course consisting of multiple field trips and hands-on laboratories. Students will master the skills required for plant identification anywhere in the world. **Credits:** 3.00

BTNY 35000 - Biotechnology In Agriculture

Credit Hours: 3.00. (HORT 35000) A study of the methods used to produce genetically modified organisms, primarily using gene transfer technology, and the application of these organisms in agriculture. The uses of microbes, plants, and animals in agricultural biotechnology are examined. Social, economic, and ethical issues related to biotechnology are discussed. **Credits:** 3.00

BTNY 35700 - The Intoxicated Botanist - Flora Of Indiana

Credit Hours: 1.00. Over millions of years, plants have evolved the ability to biosynthesize thousands of compounds. In only the last few thousand years, humans have cultivated plants for their ability to feed, heal, intoxicate and even poison-depending upon the plant and the compounds they produce. The objective of this course is to learn and apply plant taxonomy to identify and study the regional flora of Indiana with a focus on flora used in the production 'intoxicants'. Individuals must be 21 years of age no later than the first day of class. Permission of instructor required.**Credits:** 1.00

BTNY 35710 - The Intoxicated Botanist - Study Abroad

Credit Hours: 3.00. Over millions of years, plants have evolved the ability to biosynthesize thousands of compounds. In only the last few thousand years, humans have cultivated plants for their ability to feed, heal, intoxicate and even poison-depending upon the plant and the compounds they produce. The objective of this course is to learn and apply plant taxonomy to identify and study the flora of Slovenia with a focus on flora used in the production 'intoxicants'. Permission of instructor required.**Credits:** 3.00

BTNY 39000 - Selected Topics In Plant Science

Credit Hours: 1.00 to 3.00. This course deals with special topics in botany not covered in regular undergraduate coursework. Credit depends upon work done. May be repeated once for credit. Permission of instructor required. **Credits:** 1.00 to 3.00

BTNY 40000 - Botany And Plant Pathology Study Abroad

Credit Hours: 0.00 to 8.00. Utilized to record credits earned through participation in Purdue study abroad programs with cooperating foreign universities. **Credits:** 0.00 to 8.00

BTNY 42000 - Plant Cellular And Developmental Biology

Credit Hours: 3.00. This course will focus on the fundamentals of plant cellular and developmental biology. Topics to be covered include: the structure and function of plant organelles and membranes; the cell cycle; DNA, RNA and protein synthesis; the secretory pathway, and the cellular basis of development and whole plant morphogenesis. **Credits:** 3.00

BTNY 43100 - Planning For International Engagement Methods

Credit Hours: 1.00. A team-based laboratory course for students who seek experience working with international partners to plan and conduct quality service-learning projects. Using established partner relationships, students will work with international partners to address hands-on, real-world, identified challenges to learn the principles of extension methodology and sustainable community development by integrating their discipline knowledge and technical skills from previous courses. Students will also learn the intercultural communication, market analysis, project design and planning, entrepreneurial business planning for micro-credit loans and business ventures, and cultural factors affecting community food security while they work in bi-national teams to determine how best to apply their classroom knowledge and experience to respond to partners' needs and local resource constraints. **Credits:** 1.00

BTNY 43110 - International Engagement Methods

Credit Hours: 1.00 to 3.00. Using established partner relationships, students will travel to and live in Cap Haitien for 8-10 days and work with Haitian partners and students to learn the principles of extension methodology, sustainable community development, and how to most effectively work with local leaders. Students will also learn the intercultural communication, entrepreneurial business planning, and cultural factors affecting community food security status while they work bi-national teams to determine how best to apply their classroom knowledge and experience. **Credits:** 1.00 to 3.00

BTNY 43120 - Evaluating International Engagement Methods

Credit Hours: 1.00. Designed for students who have just returned from the Engagement Methods for Int'l Food Security course or have previous experience working with our partners. In order to 1) fully comprehend the impact of the experience and 2) foster true long-term relationships with and service to our partners, it is required to work on our projects when we return. Matt McGregor, Former Exec. Dir. of Timmy Global Health, told us that "it's not really about the trip". It is essential that we accomplish: 1) Closure of trip experiences with partners and contacts - thank you's and complete follow-up; 2) Reflection of Purdue student experiences and personal goals/follow-up actions; 3) Promotion of food insecurity realities and opportunities for support; and 4) Planning, recommendations, and promotion of future service learning courses.

Credits: 1.00

BTNY 47500 - Honors Course - Upper Division

Credit Hours: 1.00 to 4.00. Utilized to offer a new honors course for a maximum of three years. Variable title, credit and instructional type. Course may be repeated for credit if content and titles are different. Offered primarily to third-and fourth-year students. Courses offered must be approved by department or program faculty, and College of Agriculture Honors Committee. Permission of department required. **Credits:** 1.00 to 4.00

BTNY 49700 - Undergraduate Seminar

Credit Hours: 1.00. Professional preparation for careers in plant sciences. Career development activities including resume and cover letter preparation, job search and interview preparation, and participation in career fairs. In addition, the student will polish skills in preparation of seminar, extension publications, press releases and communicating science to lay personnel based on current issues in pest management and crop protection. **Credits:** 1.00

BTNY 49800 - Research In Plant Science

Credit Hours: 1.00 to 3.00. Supervised individual laboratory or field research. A written report of work accomplished will be required. May be repeated once for credit. Permission of instructor required. **Credits:** 1.00 to 3.00

BTNY 49900 - Thesis Research

Credit Hours: 1.00 to 6.00. Thesis research. Admission to the honors program. Permission of instructor required. **Credits:** 1.00 to 6.00

BTNY 50400 - Advanced Weed Science

Credit Hours: 3.00. Emphasizes the mode and mechanism of herbicide action and herbicide interaction with plants, and the biology and ecology of weedy plants. Offered in odd-numbered years. **Credits:** 3.00

BTNY 50500 - Advanced Biology Of Weeds

Credit Hours: 3.00. Principles of weed biology and ecology, with focus on reproduction and ecophysiology, population dynamics, community ecology, and ecosystem level phenomena. Instruction will emphasize the development and refinement of critical thinking skills. Offered in even-numbered years. **Credits:** 3.00

BTNY 52500 - Intermediate Plant Pathology

Credit Hours: 3.00. Examines the biological and pathological characteristics of major causal agents; concepts of epidemiology and disease assessment; physiology, genetics, and molecular biology of host-pathogen interactions; disease management practices; and methods of disease diagnosis. **Credits:** 3.00

BTNY 53500 - Plant Disease Epidemiology

Credit Hours: 3.00. Plant disease epidemics occur due to the suitable combination of various elements of the agroecosystem. Many plant pathogens and diseases have increased their geographic distribution and intensity in the U.S. and the world. A lack of epidemiological understanding can exacerbate problems and significantly challenge the management of diseases at the field level. This course is an introduction to the epidemiological basis of disease management strategies. The course includes concepts in botanical epidemiology, disease assessment and measurement, disease modeling, epidemics comparison, and a revision of the traditional plant disease control principles. *Plant Disease Epidemiology* is an upper-level course for students interested in plant pathology, agronomy, data-driven Ag, national or international agriculture, or closely related areas. Although some pathosystems

are used as model systems, Plant Disease Epidemiology is not a "how-to" course on controlling specific plant diseases. **Credits:** 3.00

BTNY 55000 - Biology Of Fungi

Credit Hours: 3.00. Lectures cover general features of fungi, unique characteristics of major fungal groups, fungal interactions with other organisms, and principles of fungal genetics. Lab exercises include examination of representative species from major groups of fungi and classical and molecular manipulations of fungi. **Credits:** 3.00

BTNY 55101 - Plant Responses To The Environment

Credit Hours: 3.00. Future agricultural production and the environment will encounter multifaceted challenges from global climate change, heat and drought incidence and severity, and limited land and resources. An understanding of how plant responds to these changes is essential to develop new technologies and systems approaches to mitigate the negative impacts and enhance agricultural crop productivity. This is an advanced plant biology course covering the present state of understanding of phenological, physiological, and molecular and genetic mechanisms and processes by which plants acclimate to transient and chronic environmental extremes.**Credits:** 3.00

BTNY 55200 - Molecular Approaches In Plant Biology

Credit Hours: 3.00. This is mainly a laboratory exercise course designed to help students to be more familiar with common molecular techniques used in plant pathology studies. Techniques will include DNA/RNA isolation, hybridization, sequence analyses, various PCR reactions, library construction and screening, protein isolation, and plant transformation. Lectures will cover basic principles and applied aspects of molecular studies in plant pathology, and recent advances in genomics and proteomics techniques. **Credits:** 3.00

BTNY 55300 - Plant Growth And Development

Credit Hours: 3.00. (HORT 55300) Topics include seed dormancy, cell expansion and plant growth, pattern formation, phase transition, flowering, pollination and fertilization, seed development, fruit development, and senescence. This course is the second in a series of team-taught courses in the core curriculum of the Purdue Plant Biology Program. **Credits:** 3.00

BTNY 55800 - Pathogens Of Plants

Credit Hours: 3.00. Plant pathology is the science of plant diseases and of the microorganisms that cause them and of our attempts to manage plant diseases. The ultimate goal of plant pathologists is to reduce the losses caused by diseases, thereby, increasing both the quality and quantity of the world food supply. Plant diseases are caused by the same types of microorganisms that cause disease in animals and humans and, as such, many of the principles that apply to human and animal medicine apply to plant diseases. It is the objective of this course to introduce students to the major types of plant pathogens (plant pathogenic bacteria, viruses, nematodes, and fungi), their basic biology and examples of the types of diseases they cause. It will be expected that students have knowledge in plant pathology. **Credits:** 3.00

BTNY 56100 - Survey Of Mathematical Biology

Credit Hours: 3.00. This course is intended to help students understand why having some kind of model is probably essential to the scientific process. The intent is to show students that they probably already have a model in their heads, and they just don't know it! Few biologists realize that when they can draw a picture of their system, or explain important pathways in words, that this is a model. From there, it isn't hard to start some basic math. The course will be a broad overview of different techniques that can be used to model biological systems. Each lecture topic in this course could itself form an entire course, so students will not complete the course as experts in mathematical modeling. Instead, the objectives are to: 1) expose students to a number of tools

in mathematical modeling; 2) give students some practical experience with these tools; and 3) develop a component of their thesis research into a model. Permission of instructor required. **Credits:** 3.00

BTNY 56200 - Plant Hormone Biology

Credit Hours: 3.00. This course will provide a broad and integrated overview of the current status of plant hormone research. All aspects of plant hormones including biosynthesis, metabolism, transport, signal transduction will be discussed in relation to the role of hormones in plant growth and developmental processes. Cross-talk between hormones and how plants use hormones to integrate developmental or environmental signals to regulate plant growth will be included. In addition, practical aspects of hormones in the agriculture, horticulture, and pathogen responses will be covered to demonstrate the impacts of basic plant science to a modern agriculture. The course will consist of lecture and discussion of primary research papers. Upon completion of the course, the students will acquire a comprehensive knowledge of the action of plant hormones as growth regulators, critical thinking skills, and ethical research. **Credits:** 3.00

BTNY 59000 - Special Problems

Credit Hours: 1.00 to 3.00. Open to graduate students and qualified undergraduates who desire to study special problems in plant science not covered in regular coursework. Credit dependent upon work done. Permission of instructor required. **Credits:** 1.00 to 3.00

BTNY 60500 - Diagnosis Of Plant Diseases

Credit Hours: 2.00. Symptomatology and diagnosis of diseases of field crop, vegetable, fruit, ornamental, and tree plants. Emphasis is on the collection and study of diseases in field, greenhouse, and storage. Prerequisite: BTNY 30100. **Credits:** 2.00

BTNY 61300 - Advanced Plant Pathology

Credit Hours: 3.00. This course makes an exhaustive attempt to dissect the nature of plant disease and resistance mechanisms in plants. Special emphasis is placed on emerging concepts and paradigms that underlie a wide variety of plant-pathogen interactions, and how the knowledge gleaned from these studies is being used to devise effective and environmentally safe strategies of plant protection. It is expected that students have knowledge in genetics, molecular biology, biochemistry, and plant pathology. **Credits:** 3.00

BTNY 62000 - Plant Disease Management

Credit Hours: 3.00. Plant diseases cause billions of dollars in crop losses worldwide and play a large role in food security and the viable production of agronomic and horticulture crops. This course will center on the various aspects of managing these diseases. Specific focus areas include the effect of cultural practices and planting decisions (i.e., crop rotation, fertility, host resistance), pesticide delivery formulation, chemistry and mode of action, and integrated systems of organic and hybrid disease management. Prerequisite: BTNY 30100 or equivalent.**Credits:** 3.00

BTNY 66000 - Scientific Writing

Credit Hours: 3.00. This is a course on coping with publication in professional journals. It covers the full range of activities involved in carrying a piece of original research to completion as a primary research article in a refereed journal. Emphasis is on principles of clear and concise technical reporting. Topics include: research and writing goals; journals' policies; data presentations; effective style; organizing, writing, revising, and processing manuscripts; proofreading; peer review; ethics; and grant proposals. Students will use their own data to prepare a manuscript as if for publication. Permission of instructor required. **Credits:** 3.00

BTNY 69100 - Skills For Success In Grad School

Credit Hours: 1.00. This course is aimed at first year graduate students in the Botany department. Its purpose is to introduce the students to the department, teach them what it takes to be a successful graduate students, and to help them develop effective written and oral communication skills. **Credits:** 1.00

BTNY 69200 - Graduate Professional Practice

Credit Hours: 0.00 to 3.00. An internship experience with a for-profit, non-profit, or governmental entity to complement the student's academic coursework. The student must present a letter from the proposed employer documenting the work and expectations expected to be undertaken and must find a Botany and Plant Pathology faculty advisor/instructor to oversee the experience. Course may be taken in successive semesters. Must be enrolled in a Master's or PhD degree program in Botany and Plant Pathology and in good academic standing (cumulative GPA greater than 3.00). Permission of instructor required.**Credits:** 0.00 to 3.00

BTNY 69700 - Seminar In The Plant Sciences

Credit Hours: 1.00. Advanced study of contemporary topics in plant biology, plant pathology, and weed science. Graduate students enrolled will receive training and experience in preparing and presenting seminars. **Credits:** 1.00

BTNY 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required. **Credits:** 1.00 to 18.00

BTNY 69900 - Research PhD Thesis

Credit Hours: 1.00 to 18.00. Research PhD Thesis. Permission of instructor required. **Credits:** 1.00 to 18.00

Building Construction Management Technology

BCM 11201 - Construction Surveying Fundamentals

Credit Hours: 2.00. Introduction to basic surveying measurement and computations. Development of the surveying skills necessary to measure distances, angles, and elevations to required construction accuracies by eliminating mistakes and reducing errors. Calculation of corrections, traverse closures, coordinates, areas and construction layout data. Emphasis is placed on proper instrument use and note-keeping techniques. **Credits:** 2.00

BCM 17500 - Construction Materials And Methods

Credit Hours: 4.00. Students acquire basic skills in construction methods, quantity estimating, plan reading, and project documentation through hands-on laboratory experience assembling construction materials. Computer utilization includes word processing, spreadsheets, and computer graphics. **Credits:** 4.00

BCM 21200 - Construction Layout

Credit Hours: 3.00. Application of surveying skills relevant to the field of construction. Projects include layout of buildings, route centerlines, indirect determination of elevation and distance, referencing, establishment of grade, topographic mapping, and earthwork computations. Instruments used will include transit, theodolite, automatic level, laser, and EDM. **Credits:** 3.00

BCM 21500 - Mechanical Construction

Credit Hours: 3.00. Principles of code, design, methods, and materials are applied to plumbing, heating, ventilation, and air conditioning systems for buildings. The comprehension of mechanical construction plans and specifications is emphasized through exercises in mechanical estimating. **Credits:** 3.00

BCM 21601 - Electrical Construction

Credit Hours: 2.00. Principles of code and basic concepts in electrical theory, materials, methods, design and estimating are applied to electrical systems for buildings. Comprehension of electrical construction plans and specifications as well as installation exercises are emphasized through lab experiences. **Credits:** 2.00

BCM 23000 - Mechanical And Electrical Systems

Credit Hours: 3.00. Not open to building construction management technology students. An introductory study of piping, HVAC, and electrical systems, and related materials used in buildings. This course is a composite of BCM 23100, 23200, and 23300. **Credits:** 3.00

BCM 25001 - Construction Project And Administrative Management

Credit Hours: 2.00. The study of administrative functions and project delivery methods common in the construction industry. Documentation from project startup through closeout will be covered as well as ethics and professionalism and written and oral communications in construction. **Credits:** 2.00

BCM 27500 - Construction Plans And Measurements

Credit Hours: 3.00. Principles of graphic communication are applied to drawing and reading construction plans with emphasis on the use of computer-aided design software. Techniques for measuring items of construction work from plans and specifications are also covered. **Credits:** 3.00

BCM 28500 - Construction Mechanics

Credit Hours: 4.00. Principles of statics and strength of materials including properties of materials, forces, equilibrium, stresses, and strains are studied. Emphasis is placed on understanding the behavior of structural components associated with the construction process. **Credits:** 4.00

BCM 30101 - Introduction To Construction Company Financial Management

Credit Hours: 2.00. An introduction to methods for recognizing revenue for long-term construction contracts and each method's impact on financial statements. Includes introduction to analysis of financial statements and their use in developing company budgets, projecting cash needs, pricing construction projects, and forecasting the impact of business decisions on construction company profit. **Credits:** 2.00

BCM 31500 - Mechanical Construction Estimating

Credit Hours: 3.00. Costs conditioned by the contract documents for building mechanical systems are studied. The course will focus on the methods used to estimate the cost of commercial plumbing, heating, ventilating, and air conditioning systems. The course will utilize computer estimating systems. **Credits:** 3.00

BCM 31600 - Electrical Construction Estimating

Credit Hours: 3.00. Costs dictated by the contract documents for the electrical systems in residential, commercial, industrial, specialty, and line construction projects are studied. The course will utilize computer estimating systems. **Credits:** 3.00

BCM 31700 - Mechanical And Electrical Construction Management

Credit Hours: 3.00. The principles of project management are applied to case studies of mechanical and electrical construction projects. Topics include estimating, trade coordination, labor productivity, labor relations, scheduling, management of subcontractors and general contractors, document control and administration, contract law, and subcontractor's risk. **Credits:** 3.00

BCM 32000 - Introduction To Disaster Restoration And Reconstruction Management

Credit Hours: 3.00. Introductory topics in the DRR concentration are discussed; causes of disasters and dimensions of their effects, protocols, equipment, and techniques of restoration and reconstruction, including project and business management practices and imperatives of DRR contractors. **Credits:** 3.00

BCM 33000 - Introduction To Demolition And Reconstruction Management

Credit Hours: 3.00. This course introduces the opportunities and challenges in demolition and reconstruction management. Topics include: introduction to industry regulation, project planning, labor and equipment utilization, techniques and technologies, hazardous materials, issues involving historic properties, material reuse and recycling, safety and risk management, estimating and cost control, project feasibility, issues of ethics, and company management. **Credits:** 3.00

BCM 34000 - Introduction To Healthcare Construction Management

Credit Hours: 3.00. This course explores the allocation and distribution of construction resources in the healthcare construction sector and an overview of current theories and research. Topics include the demand for health care, health insurance, hospitals and the services of all the possible healthcare professional stakeholders. A thorough understanding of the environment of care and all codes and standards relative to the constructors approach to this complex environment. **Credits:** 3.00

BCM 34100 - Advanced Topics In Healthcare Construction Management

Credit Hours: 3.00. A study of all facilities used in the health-care industry, ranging from hospitals and clinics to nursing homes and laboratories, emphasizing the interrelationship of planning, design, and construction. Topics include infectious materials control, disruption avoidance, rapid technology changes, and advanced/non-typical mechanical and electrical systems. **Credits:** 3.00

BCM 34500 - Scheduling

Credit Hours: 3.00. A study of the planning and control of construction projects. Time schedules for materials, labor, and equipment. Emphasis is on critical path method (CPM) scheduling. **Credits:** 3.00

BCM 35000 - Construction Site Planning

Credit Hours: 3.00. A study of material handling principles and their application in preparing a site utilization plan. The selection and use of construction equipment are emphasized. **Credits:** 3.00

BCM 35501 - Construction Site Supervision

Credit Hours: 2.00. A study of the required skills, duties, responsibilities, and leadership of construction on-site supervisory personnel and how they related to managing people on a jobsite. Emphasis is placed on understanding the multiple stakeholders, communication, collaboration, planning, and problem-solving. This course will examine how the success of overall construction project is directly tied to the skills of key supervisors or superintendents. **Credits:** 2.00

BCM 36000 - Residential Construction

Credit Hours: 3.00. A study of the best building practices in residential construction, based upon green building standards, energy star, and other national programs. Course content includes partial fulfillment of the requirements for the certified green professional designation (CGP) from the National Association of Home Builders. **Credits:** 3.00

BCM 36200 - Construction Competition

Credit Hours: 2.00. This is a multi-disciplinary course where students from several majors work together as a team, developing a proposal for a construction of development project, which is presented at a student competition. Topics include a variety of project types, including land development, design/build, residential, commercial and heavy highway. Permission of instructor required. **Credits:** 2.00

BCM 37500 - Estimating

Credit Hours: 3.00. A study of the methods and procedures used to identify, measure, and value items of construction work. Application of computer software to estimating tasks is featured. **Credits:** 3.00

BCM 38000 - Concrete Construction

Credit Hours: 3.00. An overview of concrete construction, including material composition, behavior and handling of concrete, formwork, and concrete reinforcement. **Credits:** 3.00

BCM 38501 - Soils In Construction

Credit Hours: 2.00. This course is a study of the properties of soils as related to construction. Students will be introduced to soil testing and classification, subsurface soil investigation, soil compaction and stabilization, stress distribution in soil, strength, strength of soil, soil consolidation and related structure settlement. Other topics include earth pressure on retaining structures, stability analysis of slopes, and productivity/cost of earthmoving equipment. **Credits:** 2.00

BCM 41200 - Field Engineering

Credit Hours: 3.00. A study of the duties of the field engineer and their applications to projects involving construction surveying techniques, site utilization, and daily scheduling. Field trips required. **Credits:** 3.00

BCM 41700 - Design/Build For Mep Contractors

Credit Hours: 3.00. The student will study, develop, and analyze conceptual design and conceptual estimating of mechanical, electrical, plumbing, fire protection, and specialty systems in construction. The principles of design/build construction will be applied to case studies of actual residential, commercial, industrial, and specialty construction projects. Topics include building systems, criteria and selection, economic feasibility, value engineering, customer control, and value-added construction services. **Credits:** 3.00

BCM 45500 - Construction Company Management

Credit Hours: 3.00. Business policy and management aspects of construction companies are studied. Included are ethics, public relations, business development, business plans, bonds, insurance, and human resource management considerations. **Credits:** 3.00

BCM 45701 - Construction Safety

Credit Hours: 3.00. This course will examine the impact of safety on the construction industry, including in-depth discussions on the application of the Occupational Safety & Health Administration (OSHA) Safety and Health Standards for the construction industry. The emphasis of this course is to provide training for job sited supervisory personnel. This course will also fulfill the requirements for the OSHA 30-Hour Card. **Credits:** 3.00

BCM 46200 - Residential Design Build

Credit Hours: 2.00. A study of the design/build project delivery system for residential construction, including home design fundamentals, construction methods, disability code requirements, building code requirements. Course content includes partial fulfillment of the requirements for the National Association of Home Builders, Certified Aging-In-Place (CAPS) designation. **Credits:** 2.00

BCM 47500 - Construction Costs

Credit Hours: 3.00. A study of construction costs, including analysis of field records, job cost accounting, job cost control, and determination of unit prices. **Credits:** 3.00

BCM 48701 - Construction Capstone

Credit Hours: 3.00. This course provides a comprehensive summary of the construction industry. Emphasis is placed on the "big picture" and how the stakeholders, processes, and tasks come together to complete a complex construction project. Skills attained in previous coursework and internships will be used in industry simulations and comprehensive projects. Industry participants will provide real world coursework challenges. **Credits:** 3.00

BCM 49700 - Special Topics In Construction

Credit Hours: 0.00 to 4.00. Hours, subject matter, and credit to be arranged by staff. **Credits:** 0.00 to 4.00

BCM 49900 - Special Assignments

Credit Hours: 1.00 to 4.00. Special assignments for students who wish to undertake individual study on approved topics. Permission of instructor required. **Credits:** 1.00 to 4.00

BCM 51000 - Topics In Environmentally Sustainable Construction, Design And Development

Credit Hours: 3.00. This course explores environmental sustainability in all its forms, starting with the historical and theoretical basis and continuing through an understanding of sustainable building construction, design, development, and renewable energy strategies/management tools and how these can be applied in practice. **Credits:** 3.00

BCM 53500 - Construction Accounting And Financial Management

Credit Hours: 3.00. Accounting techniques, financial methods, and financial management for construction firm management. Analysis techniques for contemporary construction company accounting and finance practice with an emphasis on cash flow analysis and cash management. **Credits:** 3.00

BCM 54000 - Law For Construction Managers

Credit Hours: 3.00. A study of the legal system and its impact on the construction process. The focus is on the legal obligations, rights and remedies pertaining to the construction company. Topics include bidding, contracts, and construction changes.**Credits:** 3.00

BCM 57200 - Construction Research Fundamentals

Credit Hours: 1.00. Construction Research Fundamentals focuses on helping students to develop their thesis research through lecture and faculty guided individual or group activities. Using common research methodologies for construction research as a theme for discussion each week, students work together to build a better understanding of how to approach thesis research for their topic of interest and research topics chosen by other students in the class. **Credits:** 1.00

BCM 58100 - Workshop In Building Construction Management Technology

Credit Hours: 0.00 to 8.00. Advanced study of technical and professional topics. Emphasis is on new developments relating to technical, operational, and training aspects of industry and technology education. **Credits:** 0.00 to 8.00

Chemical Engineering

CHE 20000 - Chemical Engineering Seminar

Credit Hours: 1.00. An orientation course to inform students of the various areas in chemical engineering, to assist them in selection of electives suited to their particular abilities and interest, and to instill a sense of professional ethics and responsibility. Lectures drawn from all fields of chemical engineering. **Credits:** 1.00

CHE 20100 - Cooperative Seminar I

Credit Hours: 0.00. Lectures by faculty and students on subjects that relate the academic work and the industrial experience. Written reports on the industrial experience are required and will include a documentation of the student's success in finding application of specified academic activities. For students returning from the first and second work periods. **Credits:** 0.00

CHE 20500 - Chemical Engineering Calculations

Credit Hours: 4.00. Quantitative applications of steady-state mass and energy balances to solve problems involving multi-component systems and multi-unit chemical processes. Single-component and multi-component phase equilibria, single-reaction and multiple-reaction stoichiometry, coupled mass and energy balances, chemical processes involving bypass and recycle streams.**Credits:** 4.00

CHE 21100 - Introductory Chemical Engineering Thermodynamics

Credit Hours: 4.00. Basic principles and concepts of thermodynamics applied to chemical engineering problems; use of basic thermodynamic functions of enthalpy, entropy, free energy to solutions, phase equilibria, and chemical equilibria; thermodynamic processes and efficiencies; equations of state; and relation of macroscopic to molecular properties. **Credits:** 4.00

CHE 29199 - Cooperative Experience I

Credit Hours: 0.00. Professional experience in chemical engineering. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

CHE 29299 - Cooperative Experience II

Credit Hours: 0.00. Professional experience in chemical engineering. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

CHE 30000 - Chemical Engineering Seminar

Credit Hours: 1.00. Continuation of CHE 20000. Lectures to acquaint the junior students with professional ethics, career choices, including graduate studies, and services of professional societies.**Credits:** 1.00

CHE 30100 - Cooperative Seminar II

Credit Hours: 0.00. Continuation of CHE 20100. For students returning from the third and fourth work periods. **Credits:** 0.00

CHE 30600 - Design Of Staged Separation Processes

Credit Hours: 3.00. The application of equilibria and mass and energy balances for the design of staged separation processes. Use of various equilibrium data and thermodynamic principles for the design of batch and continuous distillation, absorption, stripping, and extraction systems. Stagewise calculations and graphical methods for design of binary systems. Design of multicomponent separators. Determination of stage efficiency and column size. **Credits:** 3.00

CHE 32000 - Statistical Modeling And Quality Enhancement

Credit Hours: 3.00. Statistical modeling methods, design of experiments, error analysis, curve fitting and regression, analysis of variance, confidence intervals, quality control and enhancement: emphasizes preparation for designing chemical engineering laboratory experiments and analyzing data.**Credits:** 3.00

CHE 33000 - Principles Of Molecular Engineering

Credit Hours: 3.00. Application of concepts of atomic and molecular bonding, solid microstructure, phase equilibria, and rate processes to the design of solid materials for specific engineering objectives. **Credits:** 3.00

CHE 34800 - Chemical Reaction Engineering

Credit Hours: 4.00. Application of kinetic rate equations, mass balances and energy balances to the analysis and design of chemical reactors involving homogeneous and heterogeneous chemical reactions. Chemical equilibria, kinetic rate equations for homogeneous and heterogeneously catalyzed reactions, design of ideal isothermal reactors, effects of non-isothermal operation, effects of diffusion in porous catalysts and non-ideal mixing in continuous flow reactors. **Credits:** 4.00

CHE 37700 - Momentum Transfer

Credit Hours: 4.00. Differential (microscopic) and integral (macroscopic) mass, momentum, and energy balances. Newtonian and non-Newtonian fluids. Fluid statics. One-dimensional steady and transient laminar flows. Turbulence. Dimensional analysis and similarity. Friction factors and drag coefficients. Applications to engineering analysis of practical problems. Introduction to numerical analysis and visualization of flows. **Credits:** 4.00

CHE 37800 - Heat And Mass Transfer

Credit Hours: 4.00. Macroscopic and differential energy balances. Heat transfer coefficients for free and forced convection and phase change. Conductive and radiative heat transfer. Applications to heat transfer equipment design and compressible fluid flow. Macroscopic and differential species balances. Mass transfer coefficients and analogies. Mass transfer with and without chemical reaction. Mass transfer equipment design. **Credits:** 4.00

CHE 38199 - Professional Practice Co-Op I

Credit Hours: 0.00. To obtain professional practice with qualified employers within industry, government, or small business. Permission of department required. **Credits:** 0.00

CHE 38299 - Professional Practice Co-Op II

Credit Hours: 0.00. To obtain professional practice with qualified employers within industry, government, or small business. Permission of department required. **Credits:** 0.00

CHE 38399 - Professional Practice Co-Op III

Credit Hours: 0.00. To obtain professional practice with qualified employers within industry, government, or small business. Permission of department required. **Credits:** 0.00

CHE 38499 - Professional Practice Cooperative IV

Credit Hours: 0.00. To obtain professional practice with qualified employers within industry, government, or small business. Permission of department required.**Credits:** 0.00

CHE 39399 - Cooperative Experience III

Credit Hours: 0.00. Professional experience in chemical engineering. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

CHE 39499 - Extensive Cooperative Experience IV

Credit Hours: 0.00. To obtain professional practice with qualified employers within industry, government, or small business. Permission of department required.**Credits:** 0.00

CHE 39599 - Extensive Cooperative Experience V

Credit Hours: 0.00. Professional experience in chemical engineering. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

CHE 39699 - Professional Practice Internship

Credit Hours: 0.00. To obtain professional practice with qualified employers within industry, government, or small business. Permission of department required. **Credits:** 0.00

CHE 40000 - Chemical Engineering Seminar

Credit Hours: 1.00. Continuation of CHE 30000. Lectures to acquaint the senior students with professional ethics, services of professional societies, and help them in the transition from being an undergraduate student to becoming a successful professional or graduate student.**Credits:** 1.00

CHE 40100 - Cooperative Seminar III

Credit Hours: 1.00 to 3.00. Continuation of CHE 30100. For senior students returning from the last work period. **Credits:** 1.00 to 3.00

CHE 41100 - ChE Undergraduate Research

Credit Hours: 1.00 to 4.00. Experience in chemical engineering science research or development; either directed or independent work that can be experimental or theoretical. Permission of instructor required. **Credits:** 1.00 to 4.00

CHE 41200 - Chemical Engineering Design Research Problems

Credit Hours: 1.00 to 4.00. Experience in chemical engineering design research or development; either directed or independent work that can be experimental or theoretical. Permission of instructor required. **Credits:** 1.00 to 4.00

CHE 42000 - Process Safety Management And Analysis

Credit Hours: 3.00. Develop knowledge of process safety management and analysis in the process industries, including hazard identification, hazard analysis and risk management. **Credits:** 3.00

CHE 43500 - Chemical Engineering Laboratory

Credit Hours: 4.00. Quantitative experimental study of projects involving problems in fluid mechanics and heat and mass transfer or operation and evaluation of equipment; projects include analysis and data-based design of operations involving mass transfer such as distillation, absorption, drying, humidification, etc; study of rates and equilibria in simple chemical reaction systems; study of chemical processes; application of methods of data analysis in practice; some library work; emphasis on group work, report writing, and oral communication. **Credits:** 4.00

CHE 44200 - Chemistry And Engineering Of High Polymers

Credit Hours: 3.00. Introduction to basic principles of polymer engineering, including the chemical structure and use of a variety of industrial polymers, polymerization mechanisms and kinetics, techniques for molecular and morphological characterization, polymer processing, and a variety of engineering properties. **Credits:** 3.00

CHE 45000 - Design And Analysis Of Processing Systems

Credit Hours: 4.00. Use of process synthesis methods and concepts; detailed design of unit operation equipment, the economics of chemical plants and flow sheet optimization methods. Synthesize, develop, and evaluate a preliminary design of a chemical

process that meets market requirements for a specific product. Analysis of design alternatives using case studies and optimization methods. **Credits:** 4.00

CHE 45600 - Process Dynamics And Control

Credit Hours: 3.00. Dynamic response and control of chemical processing equipment, such as heat exchangers, chemical reactors, and absorption towers. Use is made of fundamental techniques of servomechanism theory, such as block diagrams, transfer functions, and frequency response. Introduction to advanced control techniques. **Credits:** 3.00

CHE 46100 - Biomedical Engineering

Credit Hours: 1.00. An introduction to the field of biomedical engineering, with particular stress on the chemical engineer's role. **Credits:** 1.00

CHE 46300 - Applications Of Chemical Engineering Principles

Credit Hours: 3.00. Team-based design projects in materials transport, heat transfer, mass transfer, separations, chemical reactors. Emphasis on team operation and decision-making. Consideration of current technical challenges, societal and economic issues. **Credits:** 3.00

CHE 49500 - Chemical Engineering Study Abroad

Credit Hours: 1.00 to 3.00. Short term study abroad experience to expose chemical engineering undergraduate students to the academic and industrial environments across the globe. Each experience location play an important economic role and offer good examples of industrial and engineering development, as well as allow for interaction with Purdue alumni, and cultural aspects through immersion during their time abroad.**Credits:** 1.00 to 3.00

CHE 49700 - Special Topics In Chemical Engineering

Credit Hours: 1.00 to 4.00. Primarily designed for subject areas for which there is no specific course offered. Areas of study will deal with topics that have enough student interest to justify the teaching of specialized courses on a trial basis. The course can be repeated by a student as long as the topic being taught is not repeated. Permission of instructor required. **Credits:** 1.00 to 4.00

CHE 49800 - Undergraduate Thesis Research I

Credit Hours: 3.00. Individual research projects for students completing an undergraduate thesis. Requires prior approval of, and arrangement with, a faculty research advisor. Permission of instructor required. **Credits:** 3.00

CHE 49900 - Undergraduate Thesis Research II

Credit Hours: 3.00. Individual research projects for students completing an undergraduate thesis. Continuation of CHE 49800. Includes submission of written thesis and public oral presentation. Permission of instructor required. **Credits:** 3.00

CHE 50100 - Medical Devices - Development And Clinical Application

Credit Hours: 3.00. This course is an introduction to the medical device field, with emphasis on the ways in which chemical engineering processes provide the foundation for many device-related therapies. The course involves the application of several fundamental chemical engineering principles, including those related to mass transfer, separations, and fluid flow, to devices used for extracorporeal therapies and other treatments. The first part of the course addresses the relevant physiology and

pathophysiology serving as a foundation for subsequent clinical material. With the focus on extracorporeal devices, the interactions between blood and biomaterials in a general sense are also explored. The second part of the course assesses the extracorporeal treatment of kidney failure by dialysis, which is highlighted as the only long-term, device-based replacement therapy for terminal organ failure (end-stage renal disease). This analysis will not only consider the evolution of dialysis therapy from a technology perspective but also the forces that have shaped its development into a market generating annual revenue of nearly $100 billion on a global basis. In addition, extracorporeal support therapies used clinically not only for failure of other organs (namely the heart, liver, and lungs) but also systemic inflammation secondary to severe infection (sepsis) will be presented. The third segment of the course addresses industry-focused concepts pertaining to medical device development, including verification/validation, lean manufacturing, project management, and regulatory issues. Providing a real-world perspective based on broad experience in the medical device field, Ms. Michelle Chutka (see below) will lead this third part of the course. Permission of instructor required.**Credits:** 3.00

CHE 50200 - Analytical Approach To Healthcare Delivery

Credit Hours: 3.00. This course provides a "real world" overview of healthcare delivery in the United States (US). The major medical technology segments (pharmaceutical compounds and medical devices) are a significant focus, including their research and development processes, regulatory framework, and market approaches. Another highlight of the course is an assessment of a series of critical medical conditions having the highest impact on the US healthcare system. Clinical cases illustrating these conditions along with case studies designed to provide practical examples of healthcare developments and challenges are included. A number of emerging healthcare developments, including precision medicine, artificial intelligence, digital health, and value-based care, are addressed. In addition, the numerous ways in which the COVID-19 pandemic has affected patients and the manner in which they receive healthcare are discussed. Permission of instructor required.**Credits:** 3.00

CHE 52100 - Principles Of Tissue Engineering

Credit Hours: 3.00. This course is designed to provide background for the application of engineering principles with the life sciences to facilitate understanding of normal and pathological mammalian tissues. Applications of drug delivery, tissue and cell transplantation, bioartificial organs, tissue regeneration, disease models, and applications in clinical practice will be explored.**Credits:** 3.00

CHE 52300 - Engineering Applications Of Biological Molecules

Credit Hours: 3.00. This course introduces the applications of biological molecules in different engineering fields. The first part of the course will provide a general overview of fundamental molecular and cell biology, biophysics and biomechanics. The second part of the course will focus on three specific areas, namely 1) biopolymer, 2) nanobiotechnology and 3) genetic engineering. For each focus area, a general overview will be provided followed by in-class discussions of seminal papers of the field and team-based case studies. The goal of the course is to introduce the recent advances in the interface of biology and engineering to our students and prepare them for research and development work in interdisciplinary environments. **Credits:** 3.00

CHE 52500 - Biochemical Engineering

Credit Hours: 3.00. Enzyme kinetics, mathematical models of microbial growth, bioreactor design and operation, genetic and metabolic engineering, plant and animal cell culture, and purification of biological products. **Credits:** 3.00

CHE 53600 - Particulate Systems

Credit Hours: 3.00. A broad overview of the fundamental concepts in particulate systems including particle characterization, particle size measurement, sedimentation, fluidization, gas and liquid conveying, particle storage, fluid-particle separation, particle size enlargement and reduction, particle mixing and hazards associated with the handling of particulate solids. Practical applications are emphasized, with a focus on how particles behave differently than fluids. **Credits:** 3.00

CHE 53800 - Design And Processing Of Particulate Products

Credit Hours: 3.00. Characterization particulate systems, use of population balances to describe processes that make or transform particles, applications in important unit processes including crystallization, granulation, milling, aerosol processes. **Credits:** 3.00

CHE 54000 - Transport Phenomena

Credit Hours: 3.00. Continuation of CHE 37700 and CHE 37800. Topics in fluid mechanics, heat transfer and mass transfer including unsteady state transport problems, stream functions, potential flow, hydrodynamic and thermal layers, turbulence, and multicomponent diffusion. **Credits:** 3.00

CHE 54300 - Polymerization Reaction Engineering And Reactor Analysis

Credit Hours: 3.00. Polymerization kinetics, polycondensation, gelation, radical polymerization, ionic polymerization, copolymerizations, Ziegler-Natta polymerizations, polymerization in bulk, solution, suspension and emulsion, modeling, stochastic processes, Z-transforms, batch, CSTR and tubular reactors, stability analysis, computer control, separation, and drying. **Credits:** 3.00

CHE 54400 - Structure And Physical Behavior Of Polymer Systems

Credit Hours: 3.00. Statistical mechanics of chain molecules, thermodynamics of polymer solutions, phase separations, experimental methods of molecular weight determination, crystallization of polymers, polymer physics, rubber elasticity, viscoelasticity. **Credits:** 3.00

CHE 55100 - Principles Of Pharmaceutical Engineering

Credit Hours: 3.00. This course is designed to provide engineering, science and pharmacy students with an understanding of the structure, economic and regulatory context, product discovery and development pipeline dynamics, intellectual property considerations and common manufacturing technology of the global pharmaceutical industry. **Credits:** 3.00

CHE 55300 - Pharmaceutical Process, Development And Design

Credit Hours: 3.00. This course introduces the engineering methodologies involved in translating a laboratory recipe for a drug compound produced via synthetic organic chemistry methods to an industrial process. The basic features of common unit operations used in the pharmaceutical industry will be reviewed, including batch reaction, solid-liquid separation, crystallization, drying, mixing, batch distillation and other separation systems. Both dedicated and multi-product production system design and batch and semi-continuous operating modes will be covered. **Credits:** 3.00

CHE 55400 - Smart Manufacturing In Process Industries

Credit Hours: 3.00. This course surveys the tools and techniques, which are relevant to support the multiple levels of technical decisions that arise in modern integrated operation of manufacturing facilities in the chemical related process industries. The linkage of these decisions levels and sharing of associated data and knowledge via effective IT methodology is currently termed Smart Manufacturing in the US and Industry 4.0 in Europe. The topics covered in the course include the structure of the operations decision hierarchy, role of online process measurements, elements of sensor network design, information systems to support process operations, plant data reconciliation, detection and diagnosis of process faults, plant wide control, real time process optimization, production planning and scheduling, and supply chain management. Each topic will be addressed by first summarizing the basic role and scope of that component, then discussing the structure of the decision problem, and then will outline some representative tools available to address that decision problem. Each major topic will include a lecture given by an

industrial practitioner who will offer a perspective on the state of industrial practice. Permission of instructor required.**Credits:** 3.00

CHE 55500 - Computer Integrated Process Operations

Credit Hours: 3.00. Introduction to computer-aided process operations management. Topics include: process monitoring, regulatory control, data reconciliation, unit and plant-wide optimization, process fault diagnosis, supervisory control, planning, and scheduling. A design project involving a unified application of the presented methodologies is taken from a published industrial benchmark problem. **Credits:** 3.00

CHE 55800 - Rate-Controlled Separation Processes

Credit Hours: 3.00. Rate-controlled separation processes based on solute movement (adsorption, chromatography and ion exchange), membranes (reverse osmosis, ultrafiltration, and gas permeation), and crystallization. **Credits:** 3.00

CHE 56000 - Introduction To Energy Storage Systems

Credit Hours: 3.00. Energy Storage Systems Laboratory course is designed to introduce fundamentals of electrochemistry and electrochemical engineering of rechargeable lithium ion batteries (LIBs) to undergraduate and graduate students. The course will be reviewing working principles of LIBs, hands-on experience on their assembly, charge-discharge testing, data analysis and related safety aspects. Strong emphasis will be given on the Li-ion battery technology, nanotechnology implementation and the materials design. Beyond conventional Li-ion systems and Pb-acid batteries, next generation Na-ion, K-ion and Li-S batteries will be discussed and designed. Students will be fabricating and testing high energy density batteries utilizing engineered electrodes, electrolytes and separators. Broader perspectives on sustainable, cost effective, longer lasting battery manufacturing will be provided. **Credits:** 3.00

CHE 56200 - Battery Systems

Credit Hours: 3.00. This course is designed to introduce fundamentals of electrochemistry and electrochemical engineering of primary and rechargeable lithium ion batteries (LIBs) to undergraduate and graduate students. The course will be reviewing working principles of LIBs. Strong emphasis will be given on the Li-ion battery technology, primary batteries, nanotechnology implementation and the materials design. Beyond conventional Li-ion systems and Pb-acid batteries, next generation Na-ion, K-ion and Li-S batteries will be discussed. Students will be understanding energy density calculations, fabrication and testing mechanism of batteries utilizing engineered electrodes, electrolytes and separators. Broader perspectives on sustainable, cost effective, longer lasting battery manufacturing will be provided.**Credits:** 3.00

CHE 56400 - Organic Electronic Materials And Devices

Credit Hours: 3.00. This course introduces the synthesis, optoelectronic properties, transport physics, and device operation of organic and hybrid electronic materials and devices. This course will review how the molecular architecture of small molecule and polymer semiconductors can be tuned to alter the optoelectronic properties of the materials in solution and in the solid state. A number of relevant materials interactions will be covered, including: photoexcitation and recombination, intermolecular charge transport mechanisms, and energy transfer processes. Additionally, we will observe how these processes are relevant to applications such as organic field-effect transistors (OFETs), organic light-emitting diodes (OLEDs), organic photovoltaic (OPV) devices, and organic memory elements. Finally, a new type of organic-inorganic hybrid material called hybrid halide perovskite will be introduced.**Credits:** 3.00

CHE 59700 - Special Topics In Chemical Engineering

Credit Hours: 0.00 to 18.00. Hours and credits to be arranged. Permission of instructor required. **Credits:** 0.00 to 18.00

CHE 60000 - Approaches To Graduate Research In Chemical Engineering

Credit Hours: 3.00. This course is designed to prepare and enable students to make a rapid start on their research. Additionally, key skills in critical analysis of the literature, technical writing and delivery of oral presentations are included. **Credits:** 3.00

CHE 61000 - Advanced Chemical Engineering Thermodynamics

Credit Hours: 3.00. Properties of pure fluids and mixtures are described in the context of classical and statistical thermodynamics. Equations of state and solution theories are developed for this description of fluid phase equilibrium and chemical equilibrium. Fluids encountered in mass transfer and separation operations are treated. **Credits:** 3.00

CHE 61100 - Molecular Thermodynamics

Credit Hours: 3.00. This course aims at providing a systematic treatment of the microscopic foundation of thermodynamics as well as a working knowledge of the statistical formalism needed to predict microscopic properties from molecular interactions. Topics covered include kinetic theory of gases, statistical-mechanical ensembles and their correspondence with thermodynamics, ideal and imperfect gases, distribution function theory of liquids, lattice models of liquid and polymer solutions, and molecular simulation methods. Offered in alternating years. Prerequisite: CHE 61000. **Credits:** 3.00

CHE 62000 - Advanced Transport Phenomena I

Credit Hours: 3.00. Analysis of transport of momentum, energy, and mass by molecular and turbulent mechanisms. Prerequisite: CHE 52700. **Credits:** 3.00

CHE 62100 - Advanced Transport Phenomena II

Credit Hours: 3.00. Topics included are momentum transfer with interfacial effects, transport in porous and multiphase media, transport in dispersed phase systems, heat transfer, and multicomponent mass transfer. Prerequisite: CHE 62000 **Credits:** 3.00

CHE 62300 - Separation Processes

Credit Hours: 3.00. Design of binary and multicomponent separation processes. Analysis and synthesis of adsorption, ion exchange, and chromatography in packed beds, moving beds, simulated moving beds, and in cyclic operation. Design and operation of membrane separation techniques including dialysis, reverse osmosis, ultrafiltration, and dynamic membranes. Offered in alternate years. **Credits:** 3.00

CHE 63000 - Applied Mathematics For Chemical Engineers

Credit Hours: 3.00. Determinants and matrices: solution of a system of algebraic equations; applications to dimensional analysis, stoichiometry, thermodynamics, kinetics of first order reaction systems, and stagewise operations. Differential equations: series solutions, Sturm-Liouville systems, boundary value problems, applications to heat and mass transfer and chemical reactor problems. Elements of complex variables: LaPlace and infinite Fourier transforms, applications to heat and mass transfer problems. First order partial differential equations: applications to separation processes, chromatography. Prerequisite: MA 26200. **Credits:** 3.00

CHE 63200 - Linear Operator Methods In Chemical Engineering

Credit Hours: 3.00. Application of the spectral theory of linear self-adjoint and non-self-adjoint operators on abstract Hilbert spaces to problems in chemical engineering. Symmetrizable non-self-adjoint problems in finite and infinite dimensional spaces with applications to physical and chemical rate processes in homogeneous and composite media. Solution of transport equations

governing heat and mass transfer in deforming and chemically reacting media. Introduction to non-self-adjoint problems in chemical engineering. Offered in alternate years. Prerequisite: CHE 63000. **Credits:** 3.00

CHE 63300 - Probabilistic Methods In Chemical Engineering

Credit Hours: 3.00. Introduction to probability, random variables, and stochastic processes. Ito calculus and stochastic differential equations. Brownian dynamics and Bridge processes. Applications to chemical engineering systems. Master equations and system size expansion concepts to nonequilibrium processes. Stochastic point processes and population balance. Theory of fluctuations. Prerequisite: CHE 63000. **Credits:** 3.00

CHE 65500 - Safety In Chemical Engineering

Credit Hours: 1.00. This course will provide you with necessary safety information to comply with Purdue and other federal requirements (OSHA29 CFR 1910.1450 standard) for working safely in a chemical engineering laboratory setting/environment. The course will cover general safety principles (electrical safety, hazard assessment and controls, etc.) and fundamentals of laboratory safety practices specific to experimental work in chemical engineering laboratories. The course will provide valuable information on how to find, read, interpret and use the information in Safety Data Sheets (SDSs), chemical labels and other printed chemical safety information. Other topics covered include: gas cylinder safety, safety equipment (fume hoods, fire protection systems and building elements, eyewash stations and safety showers, etc.), laboratory equipment safety, hazard assessment and understanding of administrative and engineering controls, selection of suitable personal protective equipment (PPE) necessary for laboratory work with chemicals, etc. **Credits:** 1.00

CHE 65600 - Advanced Process Control

Credit Hours: 3.00. Topics in linear and nonlinear system theory applied to automatic control of processes. Subjects include stability analyses, phase plane methods, statistical disturbances, sampled systems, theoretical and experimental determination of process dynamics, optimization, and computer control. Prerequisite: CHE 45600. **Credits:** 3.00

CHE 66000 - Chemical Reaction Engineering

Credit Hours: 3.00. Heat, mass, and momentum transfer in the design and analysis of chemical reactor systems. Optimization techniques applied to reactor design. Prerequisite: CHE 34800. **Credits:** 3.00

CHE 66200 - Catalysis

Credit Hours: 3.00. Analysis of the kinetics of heterogeneous catalytic reactions, including the application of collision and transition state theories to the estimation of rate constants and calculation of rates over energetically nonuniform surfaces. Discussion of the chemical and physical properties of solid surfaces that influence catalytic reactions, and illustration of concepts of catalytic behavior with specific examples from catalytic cracking, reforming, oxidation, and hydrodesulfurization. Offered in alternate years. Prerequisite: CHE 34800. **Credits:** 3.00

CHE 66600 - Methods In Catalysis

Credit Hours: 3.00. Various spectroscopic and other techniques for characterizing catalysts and for probing the chemistry of solid surfaces and their interactions with adsorbing and reacting gases are discussed. Topics include infrared, X-ray photoelectron, Mossbauer, and secondary ion mass spectroscopies. Emphasis is on understanding the principles underlying each method and gaining an awareness of the kind of information each can provide in a broad spectrum of research problems. Offered in alternate years. **Credits:** 3.00

CHE 66800 - Colloidal And Interfacial Phenomena

Credit Hours: 3.00. Preparation, characterization, and stability of emulsions, aerosols, and other multiphase dispersions. Interparticle forces, electrokinetics, thermodynamics and kinetics of coagulation. Techniques for determining size, shape, orientation, and charge of particles. Capillary and wetting phenomena. Thermodynamics of interfacial tension and adsorption. Applications to surfactants, polymers, biodispersions, flotation, separations, oil recovery, etc. Offered in alternate years. **Credits:** 3.00

CHE 68500 - Educational Methods In Engineering

Credit Hours: 3.00. (ENE 68500) Students will learn how to teach in an engineering environment where both classroom and laboratory instruction is intertwined. Classroom techniques, such as lectures, cooperative groups, mastery and PSI, TV and video, and guided design will be studied, in addition to class preparation issues, such as ABET accreditation and design content. Students will study motivation, learning theories and cycles, and personality types. Includes teaching practice and group projects. Permission of Instructor required. **Credits:** 3.00

CHE 69000 - Seminar In Chemical Engineering

Credit Hours: 0.00. Required of all graduate students. **Credits:** 0.00

CHE 69700 - Special Topics In Chemical Engineering

Credit Hours: 0.00 to 18.00. Topics vary. Permission of instructor required. **Credits:** 0.00 to 18.00

CHE 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required. **Credits:** 1.00 to 18.00

CHE 69900 - Research PhD Thesis

Credit Hours: 1.00 to 18.00. Research PhD Thesis. Permission of instructor required. **Credits:** 1.00 to 18.00

Chemistry

CHM 1110N - Elementary Chemistry I

Credit Hours: 3.00 to 5.00. Essential principles of chemistry; atomic and molecular structure; bonding; properties and reactions of elements and compounds; stoichiometry; solutions; acids and bases. For students who are not planning careers in the sciences and for those with no previous course work in chemistry. Note: Most degree programs that include C1010 require the concurrent laboratory, C1210.**Credits:** 3.00 to 5.00

CHM 2610N - Organic Chemistry I

Credit Hours: 3.00. Comprehensive study of organic compounds. Valence bond theory, stereochemistry, and physical properties of organic compounds are discussed in detail. Introduction to reaction mechanisms and to spectroscopic identification. Synthesis and reactions of selected compounds are also discussed.**Credits:** 3.00

CHM 2650N - Organic Chemistry Laboratory I

Credit Hours: 1.00 or 2.00. Fundamental laboratory techniques of organic chemistry, introduction to spectroscopic methods of compound identification, and general synthetic methods.**Credits:** 1.00 or 2.00

CHM 10000 - Preparation For General Chemistry

Credit Hours: 3.00. An introduction to the basic ideas and laboratory techniques of chemistry, together with relevant parts of algebra and elementary physics. Intended for those whose background does not permit them to proceed directly with a general chemistry course. Not available for credit toward graduation in the School of Science. **Credits:** 3.00

CHM 11100 - General Chemistry

Credit Hours: 3.00. A basic introduction to the principles of chemistry including matter and energy, nomenclature, measurement, atomic structure, nuclear chemistry, chemical bonding, stoichiometry, classification of chemical reactions, kinetics, equilibria, gas laws, liquids, and solids. **Credits:** 3.00

CHM 11200 - General Chemistry

Credit Hours: 3.00. Continuation of CHM 11100. Liquids and solids; solutions; chemical kinetics; equilibrium; acids and bases; oxidation and reduction; electrochemistry; descriptive chemistry of the metals and nonmetals; introduction to organic chemistry; nuclear chemistry. Not available for credit toward graduation in the School of Science. **Credits:** 3.00

CHM 11500 - General Chemistry

Credit Hours: 4.00. Stoichiometry; atomic structure; periodic properties; ionic and covalent bonding; molecular geometry; gases, liquids, and solids; crystal structure; thermochemistry; descriptive chemistry of metals and non-metals. One year of high school chemistry or one semester of college chemistry required. CTL:IPS 1721 General Chemistry I w/lab **Credits:** 4.00

CHM 11510 - General Chemistry I

Credit Hours: 3.00. The foundational general chemistry course for engineering, science, and some agricultural majors. Prior knowledge of chemistry is strongly suggested. Topics covered can include thermochemistry, nuclear chemistry, quantum theory and atomic structure, periodic trends, models in bonding, shapes of molecules, intermolecular forces, organic chemistry, synthetic and biological polymers, and phase changes.**Credits:** 3.00

CHM 11520 - General Chemistry I - Laboratory

Credit Hours: 1.00. In-person laboratory class to accompany CHM 11510. Topics covered can include lab safety, measurement, thermodynamics, quantitative analysis, stoichiometry, chromatography, and crystallography.**Credits:** 1.00

CHM 11530 - General Chemistry I - Virtual Laboratory

Credit Hours: 1.00. Online laboratory class to accompany CHM 11510. Topics covered can include safety, measurement, thermodynamics, quantitative analysis, stoichiometry, chromatography, and crystallography.**Credits:** 1.00

CHM 11600 - General Chemistry

Credit Hours: 4.00. A continuation of CHM 11500. Solutions; quantitative equilibria in aqueous solution; introductory thermodynamics; oxidation-reduction and electrochemistry; chemical kinetics; qualitative analysis; further descriptive chemistry of metals and nonmetals. CTL:IPS 1722 General Chemistry II w/lab **Credits:** 4.00

CHM 11610 - General Chemistry II

Credit Hours: 3.00. A continuation of CHM 11510 (General Chemistry I). Topics covered can include solutions, quantitative equilibria in aqueous solutions, thermodynamics, oxidation-reduction and electrochemistry, chemical kinetics, qualitative analysis, and further descriptive chemistry of metals and nonmetals.**Credits:** 3.00

CHM 11620 - General Chemistry II - Laboratory

Credit Hours: 1.00. In-person laboratory class to accompany CHM 11610. Topics covered can include chemical reactions, thermodynamics, equilibrium, rates, kinetics, quantitative analysis, and acid-base equilibria.**Credits:** 1.00

CHM 11630 - General Chemistry II - Virtual Laboratory

Credit Hours: 1.00. Online laboratory class to accompany CHM 11610. Topics covered can include chemical reactions, thermodynamics, equilibrium, rates, kinetics, quantitative analysis, and acid-base equilibrium.**Credits:** 1.00

CHM 12500 - Introduction To Chemistry I

Credit Hours: 5.00. Principles of chemistry including stoichiometry; atomic structure and chemical bonding; properties of gases, liquids, and solids; thermochemistry; descriptive inorganic chemistry. Recommended for entering students intending to major in chemistry. One year of high school chemistry or one semester of college chemistry required. **Credits:** 5.00

CHM 12600 - Introduction To Chemistry II

Credit Hours: 5.00. A continuation of CHM 12500. Properties of solutions; chemical equilibrium calculations; elementary thermodynamics; oxidation-reduction reactions and electrochemical cells; rates of reaction; qualitative analysis; descriptive chemistry. **Credits:** 5.00

CHM 12901 - General Chemistry With A Biological Focus

Credit Hours: 5.00. An accelerated and comprehensive one-semester general chemistry course that emphasizes principles that are important in biological systems. This course is designed to cover the essential elements of general chemistry traditionally covered in a two semester series. Topics to be covered include: Stoichiometry and chemical equations; atomic theory and structure; periodic properties; electronegativity; ionic and covalent bonding; non-covalent forces; bond energies; Lewis structures; molecular geometry; gases, liquids, and solids; solutions, quantitative equilibria in aqueous solution; acid/base chemistry and buffers; introductory thermodynamics; oxidation-reduction; electrochemical and membrane potential; colligative properties; chemical and enzyme kinetics; nuclear chemistry; coordination chemistry. One year of high school chemistry is required.**Credits:** 5.00

CHM 13600 - General Chemistry Honors

Credit Hours: 4.00. A sophisticated treatment of the principles of chemistry. Atomic structure and bonding, spectroscopy, equilibria, thermodynamics and kinetics. Includes weekly laboratory experiments. Two years of high school chemistry recommended. Students with a grade of C or better in CHM 13600 who need 8 hours of credit in general chemistry may request credit for CHM 11500.**Credits:** 4.00

CHM 18300 - Cooperative Work Experience I

Credit Hours: 0.00. Cooperative Work Experience. Must be accepted for the program by the Cooperative Education Program coordinator. **Credits:** 0.00

CHM 18400 - Cooperative Work Experience II

Credit Hours: 0.00. Cooperative Work Experience. **Credits:** 0.00

CHM 19400 - Freshman Chemistry Orientation

Credit Hours: 1.00. Designed to provide incoming chemistry majors with the academic, survival, and computational skills to make a successful transition from high school to college. Discussion of opportunities within the chemistry department including degree options, co-op program, undergraduate research, careers in chemistry, use of spreadsheet software, graphing packages, and drawing programs for chemical structures. Attendance and performance on assigned projects are the basis of the assigned grades. **Credits:** 1.00

CHM 19700 - Chemistry Freshman Honors Research

Credit Hours: 1.00. Supervised individual research performed by student. **Credits:** 1.00

CHM 20000 - Fundamentals Of Chemistry

Credit Hours: 2.00. Integrative study of core concepts in chemistry that play a major role in governing the physical world. These core concepts are taught within the framework of important societal issues, such as atmospheric chemistry and nutrition. The pedagogy of this course is designed to provide reflective, interactive and hands-on-learning experiences that will assist elementary education majors to develop useful instructional strategies for their own classrooms. Required of students in elementary education program in the School of Education. Not available for credit toward graduation in the School of Science. **Credits:** 2.00

CHM 22400 - Introductory Quantitative Analysis

Credit Hours: 4.00. Introduction to titrimetric, gravimetric, and instrumental methods of analysis; principles of separation processes, including chromatography; recognition and evaluation of possible sources of error. Required of students majoring in biology who do not take CHM 32100. **Credits:** 4.00

CHM 24100 - Introductory Inorganic Chemistry

Credit Hours: 4.00. Descriptive inorganic chemistry dealing in a systematic way with the elements and the structures, properties, and reactions of their compounds. Required of students majoring in chemistry. **Credits:** 4.00

CHM 25500 - Organic Chemistry For The Life Sciences I

Credit Hours: 3.00. A study of aliphatic and aromatic hydrocarbons and their simple derivatives in terms of (a) structure, bonding, etc.; (b) general syntheses and reactions; and (c) a logical modern rationale for fundamental phenomena as supported by reactivity orders, orientation effects, stereochemistry, and relative rates. Recommended for biology majors.**Credits:** 3.00

CHM 25501 - Organic Chemistry For The Life Sciences Laboratory I

Credit Hours: 1.00. Laboratory experiments to accompany CHM 25500, illustrating methods of separation, instrumental methods of analysis, and the more common techniques and methods for preparing various types of organic compounds.**Credits:** 1.00

CHM 25600 - Organic Chemistry For The Life Sciences II

Credit Hours: 3.00. A continuation of CHM 25500 with various functional groups such as the carboxyl, amino, etc., and including such polyfunctional natural products as carbohydrates and peptides.**Credits:** 3.00

CHM 25601 - Organic Chemistry For The Life Sciences Laboratory II

Credit Hours: 1.00. A continuation of CHM 25501. Experiments are designed to illustrate principles discussed in CHM 25600. **Credits:** 1.00

CHM 25700 - Organic Chemistry

Credit Hours: 4.00. Introductory organic chemistry. Emphasis is on structure, nomenclature, reactions, and theory as applied to simple organic compounds. This course is designed for students who require a one semester overview in preparation for biochemistry. Not recommended for majors in the College of Science. Both CHM 25700 + CHM 25701= CTL:IPS 1723 Organic And Biochemistry w/lab **Credits:** 4.00

CHM 25701 - Organic Chemistry Laboratory

Credit Hours: 1.00. Laboratory experiments designed to accompany CHM 25700 and to illustrate methods of separation, identification, and preparation of selected organic molecules. Both CHM 25700 + 25701 = CTL:IPS 1723 Organic And Biochemistry w/lab **Credits:** 1.00

CHM 26100 - Organic Chemistry I

Credit Hours: 3.00. A comprehensive study of the chemical principles underlying aliphatic and aromatic compounds. The syntheses and reactions of these materials are discussed. Modern theory and stereochemistry are stressed to illustrate the logic inherent in the subject matter and to demonstrate the predictability of many chemical transformations. Recommended for students majoring in chemical engineering. If not a chemical engineering major, see CHM 26505 Organic Chemistry.**Credits:** 3.00

CHM 26200 - Organic Chemistry II

Credit Hours: 3.00. A continuation of CHM 26100, but a broader scope. The chemistry of a variety of functional groups is discussed. Theory is employed extensively to demonstrate the coherence underlying seemingly diverse transformations. Qualitative organic analysis is introduced, with particular emphasis on spectroscopic methods. **Credits:** 3.00

CHM 26300 - Organic Chemistry Laboratory I

Credit Hours: 1.00. Laboratory experiments designed to illustrate the lecture material of CHM 26100. Elementary laboratory techniques essential to organic chemistry are introduced, followed by the actual syntheses and purification of compounds discussed in CHM 26100. **Credits:** 1.00

CHM 26400 - Organic Chemistry Laboratory II

Credit Hours: 1.00. A continuation of CHM 26300 in that the experiments are designed to illustrate principles discussed in CHM 26200. A major portion of the course is devoted to methods employed in organic qualitative analysis. The student is expected to identify several unknown compounds and mixtures. **Credits:** 1.00

CHM 26500 - Organic Chemistry Laboratory I

Credit Hours: 2.00. Similar to CHM 26300 except that a larger number and more sophisticated organic syntheses are required. The preparations are designed not only to illustrate the classical reactions discussed in CHM 26100 or 26505, but to allow for an extrapolation of the principles involved to other systems. **Credits:** 2.00

CHM 26505 - Organic Chemistry I

Credit Hours: 3.00. A comprehensive study of the chemical principles underlying aliphatic and aromatic compounds. The syntheses and reactions of these materials are discussed. Modern theory and stereochemistry are stressed to illustrate the logic inherent in the subject matter and to demonstrate the predictability of many chemical transformations. Recommended for students majoring in chemistry. **Credits:** 3.00

CHM 26600 - Organic Chemistry Laboratory II

Credit Hours: 2.00. A continuation of CHM 26500. All experiments are designed to illustrate the principles discussed in CHM 26200 or 26605. A major portion of the course is devoted to the methods employed in organic qualitative analysis. The student is expected to identify unknowns and mixtures and is introduced to some modern instrumental techniques. **Credits:** 2.00

CHM 26605 - Organic Chemistry II

Credit Hours: 3.00. A continuation of CHM 26505, but a broader scope. The chemistry of a variety of functional groups is discussed. Theory is employed extensively to demonstrate the coherence underlying seemingly diverse transformations. Qualitative organic analysis is introduced, with particular emphasis on spectroscopic methods. **Credits:** 3.00

CHM 26700 - Organic Chemistry Laboratory I Honors

Credit Hours: 2.00. Laboratory experiments designed to accompany the lecture material of CHM 26505, but at an advanced level. Modern instrumentation is introduced to supplement the usual elementary laboratory techniques of organic chemistry. Multistep syntheses are employed to illustrate and supplement the reactions discussed in CHM 26505. **Credits:** 2.00

CHM 26800 - Organic Chemistry Laboratory II Honors

Credit Hours: 2.00. A continuation of CHM 26700. Experiments, more sophisticated than those in CHM 26600, are designed to illustrate and extend the concepts presented in CHM 26605. A major portion of the course is devoted to organic qualitative analysis. The student is expected to identify unknown compounds by classical methods as well as by the use of modern instrumentation like infrared gas chromatography and nuclear magnetic resonance. **Credits:** 2.00

CHM 28400 - Cooperative Work Experience III

Credit Hours: 0.00. Cooperative Work Experience. **Credits:** 0.00

CHM 29000 - Selected Topics In Chemistry For Lower-Division Students

Credit Hours: 1.00 to 4.00. Topics vary. Permission of instructor required. **Credits:** 1.00 to 4.00

CHM 29199 - Cooperative Experience I

Credit Hours: 0.00. Professional experience in chemistry. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

CHM 29299 - Cooperative Experience II

Credit Hours: 0.00. Professional experience in chemistry. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

CHM 29400 - Sophomore Chemistry Seminar

Credit Hours: 1.00. Discussion of undergraduate research opportunities, upper-division courses, career opportunities, laboratory safety, use of the library and chemical information, and topics of current interest in chemistry. Required of sophomores majoring in any chemistry curriculum. **Credits:** 1.00

CHM 32100 - Analytical Chemistry I

Credit Hours: 4.00. Quantitative measurements on complex chemical systems that show matrix effects or require isolation of a component prior to its determination; general approaches to quantitative problems at the trace level; critical comparisons of competitive procedures with emphasis on principles of separation processes, including chromatography; recognition and evaluation of possible sources of error; approaches for optimizing conditions so as to minimize time and/or effort required to attain prescribed levels of accuracy and precision. Required of students majoring in chemistry. **Credits:** 4.00

CHM 32300 - Analytical Chemistry I Honors

Credit Hours: 4.00. Open to students in the chemistry honors program. Topical coverage similar to CHM 32100. Laboratory will include a group of core experiments plus special experiments designed by students and staff to study original problems related to analytical chemistry.**Credits:** 4.00

CHM 32700 - Bioanalytical Chemistry

Credit Hours: 4.00. This course focuses on the detection, quantification, and characterization of proteins, nucleic acids, lipids, carbohydrates, and small bioactive molecules. Principles and applications of various analytical techniques, including spectroscopy, chromatography and mass spectrometry, will also be discussed.**Credits:** 4.00

CHM 33300 - Principles Of Biochemistry

Credit Hours: 3.00. Structure and function of biologically important molecules. Intended for students in life sciences. **Credits:** 3.00

CHM 33900 - Biochemistry: A Molecular Approach

Credit Hours: 3.00. This is a comprehensive one-semester biochemistry course that emphasizes molecules and molecular reaction mechanisms, building upon the principles conveyed in general chemistry and organic chemistry. This course is designed to cover the essential elements of biochemistry traditionally covered in a two semester series. Topics to be covered include: Amino acids, peptides and proteins, molecular models and structure-function relationships, enzymes, enzyme kinetics and enzyme mechanisms, carbohydrates and carbohydrate metabolism, aerobic metabolism, lipids and membranes, lipid metabolism, nitrogen metabolism and integration and regulation of metabolism. Special emphasis will be placed on connections between biochemical principles and the fields of medicine, human health and disease, nutrition and biotechnology. This course should serve as excellent preparation for higher-level biochemistry courses as well as standardized pre-health professional exams. CHM 33900 was designed as the 4lh semester of the 1-2-1 competency-based curriculum transformation in chemistry as it applies to pre-health professional and life science students at Purdue. However, this course is open to other students who meet the prerequisites.**Credits:** 3.00

CHM 33901 - Biochemistry Laboratory

Credit Hours: 1.00. CHM 33901 is a laboratory course based on two modules from the Undergraduate Research Inspired Experimental Chemistry Alternatives (URIECA) developed at MIT that are designed to introduce students to cutting-edge research topics in biochemistry. The course provides students with a research-inspired laboratory experience that introduces standard biochemical techniques in the context of investigating a current research topic, for example, acquired resistance to cancer drugs. Techniques include protein expression, purification, and gel analysis, PCR, site-directed mutagenesis, kinase activity assays, and protein structure viewing. CHM 33901 was designed as the 4th semester of the 1-2-1 competency-based curriculum transformation in chemistry as it applies to pre-health professional and life science students at Purdue. However, the course is open to other students who meet the prerequisites.**Credits:** 1.00

CHM 34200 - Inorganic Chemistry

Credit Hours: 3.00. Interpretation and correlation of the reactions and properties of inorganic compounds in terms of their electronic and molecular structures. A survey of the preparations and reactivities of important compounds of the representative elements, with an emphasis on group trends. The elementary chemistry of the transition metals, including magnetic and spectral properties of coordination compounds.**Credits:** 3.00

CHM 34201 - Inorganic Chemistry Laboratory

Credit Hours: 1.00. Laboratory work to accompany CHM 34200. **Credits:** 1.00

CHM 34800 - Bioinorganic Chemistry

Credit Hours: 3.00. The fundamentals and applications of metals in biology.**Credits:** 3.00

CHM 37000 - Topics In Physical Chemistry

Credit Hours: 3.00. Kinetic theory of gases; statistical thermodynamics; quantum mechanics; atomic and molecular structure and spectroscopy; properties of ionic phases. May not be used to satisfy requirements for graduation in chemistry.**Credits:** 3.00

CHM 37200 - Physical Chemistry

Credit Hours: 4.00. Principles of physical chemistry with emphasis on chemical thermodynamics and kinetics, illustrated examples from the biological sciences. Intended primarily for students in the life sciences. Other topics include physical and chemical equilibria, quantum mechanics, and spectroscopy.**Credits:** 4.00

CHM 37300 - Physical Chemistry I

Credit Hours: 3.00. Physical chemistry of matter. Properties of gases, liquids, and solids; equations of state; thermodynamics; energy, heat, and work; entropy; spontaneity and equilibrium; chemical potential; chemical equilibrium; phase diagrams; colligative properties.**Credits:** 3.00

CHM 37301 - Physical Chemistry Laboratory I

Credit Hours: 1.00. A physical chemistry laboratory course that will provide students with hands-on experience that illustrates the core concepts presented in the associated physical chemistry lecture course CHM 37300.**Credits:** 1.00

CHM 37400 - Physical Chemistry II

Credit Hours: 3.00. Physical chemistry of molecules. Wave properties of matter; quantum mechanics of translation, rotation, and vibration; atomic structure; molecular orbitals; quantum states; statistical mechanics; chemical kinetics; collision theory; transition state theory.**Credits:** 3.00

CHM 37401 - Physical Chemistry Laboratory II

Credit Hours: 1.00. A physical chemistry laboratory course that will provide students with hands-on experience that illustrates the core concepts presented in the associated physical chemistry lecture course CHM 37400.**Credits:** 1.00

CHM 37409 - Professional Practice I

Credit Hours: 0.00. Professional practice with qualified employers within industry, government, or small business. Industrial practice fee is attached to this course. **Credits:** 0.00

CHM 37509 - Professional Practice II

Credit Hours: 0.00. Professional practice with qualified employers within industry, government, or small business. Industrial Practice fee is attached to this course. **Credits:** 0.00

CHM 38600 - Cooperative Work Experience IV

Credit Hours: 0.00. Cooperative Work Experience. **Credits:** 0.00

CHM 39399 - Cooperative Experience III

Credit Hours: 0.00. Professional experience in chemistry. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

CHM 39499 - Extensive Cooperative Experience IV

Credit Hours: 0.00. Professional experience in chemistry. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

CHM 39500 - Chemistry Honors Seminar

Credit Hours: 1.00. Seminar for junior honors students. **Credits:** 1.00

CHM 39599 - Extensive Cooperative Experience V

Credit Hours: 0.00. Professional experience in chemistry. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

CHM 39699 - Professional Practice Internship

Credit Hours: 0.00. To obtain professional practice with qualified employers within industry, government, or small business. **Credits:** 0.00

CHM 42400 - Instrumental Analysis

Credit Hours: 4.00. Principles and application of optical and electrical methods of chemical analysis, including topics in instrumentation.**Credits:** 4.00

CHM 43300 - Biochemistry

Credit Hours: 3.00. A rigorous one-semester introduction to biochemistry, with in-depth coverage of biology at a molecular level. Topics covered include the classes of biological macromolecules, enzyme kinetics and inhibition, and significant metabolic pathways.**Credits:** 3.00

CHM 43800 - Introduction To Molecular Biotechnology

Credit Hours: 3.00. An examination of modern tools for the characterization, manipulation, and design of nucleic acids and proteins. Topics include DNA technology, recombinant proteins, bioinformatics, genetic modifications, gene expression and the interactions between nucleic acids and proteins. **Credits:** 3.00

CHM 44400 - Cosmochemistry

Credit Hours: 3.00. Stellar evolution, nucleosyntheses, and chemical abundances. Origin, composition, and structure of the solar system and objects in it. Cosmochronology with particular emphasis on meteorites. Emphasis upon recent developments in planetology. Offered in alternate years. **Credits:** 3.00

CHM 46200 - Intermediate Organic Chemistry

Credit Hours: 3.00. Theory and application of organic chemistry and reaction mechanisms to organic synthesis and contemporary research topics in closely related areas. Topics include stereochemistry, reactive organic intermediates, molecular orbital theory, photochemistry, organic materials chemistry, and chemical biology. **Credits:** 3.00

CHM 47509 - Professional Practice III

Credit Hours: 0.00. Professional practice with qualified employers within industry, government, or small business. Industrial Practice fee is attached to this course. **Credits:** 0.00

CHM 48100 - Environmental Chemistry

Credit Hours: 3.00. Survey of chemical aspects of environmental problems and the application of chemistry to their solution. Topics will include atmospheric pollution problems, groundwater pollution and waste disposal problems, inorganic water pollutants, and the occurrence and fate of toxic organic compounds and other substances in the environment. **Credits:** 3.00

CHM 48700 - Cooperative Work Experience V

Credit Hours: 0.00. Cooperative Work Experience. **Credits:** 0.00

CHM 49000 - Selected Topics In Chemistry For Upper-Division Students

Credit Hours: 1.00 to 4.00. Topics vary. **Credits:** 1.00 to 4.00

CHM 49400 - Junior-Senior Chemistry Seminar

Credit Hours: 1.00. Major emphasis on developing skills in oral and written presentations by students. The subject matter can be library material and/or accomplishments in undergraduate or co-op research. Department permission required.**Credits:** 1.00

CHM 49900 - Special Assignments

Credit Hours: 1.00 to 5.00. Undergraduate research. Individual research projects undertaken under faculty direction. Permission of instructor required.**Credits:** 1.00 to 5.00

CHM 50200 - Modern Chemistry In The High School

Credit Hours: 3.00. A critical discussion of the means by which the fundamentals of modern chemistry can best be introduced at the high school level. The laboratory will deal with the manufacture and use of lecture demonstration equipment, the use of films and film strips, and the problems involved in organizing and running a high school chemical laboratory. **Credits:** 3.00

CHM 51300 - Chemical Literature

Credit Hours: 1.00. Types of information in technical publications; exercises in finding, assembling, and using such data. **Credits:** 1.00

CHM 53300 - Introductory Biochemistry

Credit Hours: 3.00. A rigorous one-semester introduction to biochemistry. **Credits:** 3.00

CHM 53800 - Molecular Biotechnology

Credit Hours: 3.00. An examination of modern tools for the characterization, manipulation, and design of nucleic acids and proteins. **Credits:** 3.00

CHM 54800 - Radiochemistry

Credit Hours: 3.00. Nuclear properties, structure, and reactions; radioactive decay; interaction of radiation with matter; radioactivity in the environment; nuclear applications in chemistry. **Credits:** 3.00

CHM 56000 - Organic Spectroscopic Analysis

Credit Hours: 3.00. Identification of organic compounds and characteristic groups by the use of mass spectrometry, infrared, nuclear magnetic resonance, and ultraviolet spectroscopy. **Credits:** 3.00

CHM 57900 - Computational Chemistry

Credit Hours: 3.00. Theoretical basis and practical applications of computational methods relevant to chemical and biochemical research problems. **Credits:** 3.00

CHM 58100 - Atmospheric Chemistry

Credit Hours: 3.00. (EAPS 52100) An introduction to the chemistry of the earth's atmosphere. Covers evolution of the earth's atmosphere, its physical and chemical structure, its natural chemical composition and oxidative properties, and human impacts, including increasing tropospheric ozone, decreasing stratospheric ozone, climate change, and acidic deposition. **Credits:** 3.00

CHM 59900 - Special Assignments

Credit Hours: 1.00 to 4.00. Directed reading or special work not included in other courses. Permission of instructor required. **Credits:** 1.00 to 4.00

CHM 60500 - Safety In The Chemistry Laboratory

Credit Hours: 0.00. Lectures on safe practices in the chemistry laboratory. Required of students doing research in chemistry. **Credits:** 0.00

CHM 61000 - Topics In Chemical Education

Credit Hours: 2.00 or 3.00. A variable topics course for graduate students in chemistry, chemical engineering, medicinal chemistry, and biochemistry. This course provides an overview of the literature in one of the areas of chemical education, such as: chemistry misconceptions and conceptual change; theories of learning, from Piaget and Vygotsky to radical constructivism; distributed cognition; and developing and assessing instructional materials. Offered in alternate years. **Credits:** 2.00 or 3.00

CHM 61100 - Formulas For Successful Teaching

Credit Hours: 2.00. An introduction to the issues of successful teaching of chemistry at the college/university level for graduate students in chemistry, chemical engineering, medicinal chemistry, and biochemistry who are interested in academic careers. Offered in alternate years. **Credits:** 2.00

CHM 61500 - Principles Of NMR Spectroscopy

Credit Hours: 3.00. The course is intended to provide in-depth coverage of fundamental concepts in modern NMR spectroscopy. Included are the vector model of spin resonance, topics in signal processing, product operator formalism, discussion of important 2D experiments, Redfield relaxation theory, and methods for molecular structure determination. The emphasis is on general spectroscopic concepts, also used outside spin resonance spectroscopy. Spectrometer operation and data processing are also demonstrated. Prerequisite: Undergraduate degree or completed advanced coursework in chemistry, physics, biology, or engineering. Basic knowledge of NMR is expected, but not required. **Credits:** 3.00

CHM 61600 - Advanced Experimental Nuclear Magnetic Resonance Spectroscopy

Credit Hours: 2.00. The theory and practice of multidimensional nuclear magnetic resonance spectroscopy and advanced NMR techniques. Prerequisite: CHM 56000, CHM 61500. **Credits:** 2.00

CHM 62000 - Spectrochemical Instrumentation

Credit Hours: 3.00. A critical review of instrumental methods of analysis, with particular emphasis on spectroscopic techniques. Topics include: methods of measurement; analog and digital electronics; optics and spectrophotometric modules; and instrumental methods in UV-visible, infrared, and NMR spectroscopies. Prerequisite: introductory analytical and two semesters of physical chemistry. **Credits:** 3.00

CHM 62100 - Advanced Analytical Chemistry

Credit Hours: 3.00. A critical survey of recent developments in chemical and instrumental methods of analysis. Prerequisite: CHM 32100, CHM 42400. **Credits:** 3.00

CHM 62200 - Chemical Aspects Of Mass Spectrometry

Credit Hours: 3.00. A graduate-level treatment of chemical aspects of mass spectrometry. No prior knowledge in mass spectrometry is required. Prerequisite: Bachelor's degree in Chemistry. **Credits:** 3.00

CHM 62400 - Particle Spectroscopy

Credit Hours: 3.00. Introduction to the application of ion and electron beams in the chemical analysis of gases and of surfaces. Emphasis is on the unity of the phenomena that underlie the preparation, manipulation, and analysis of ion and electron beams and on the analogies between inelastic reactions of ions and electrons, including those with both gaseous and solid targets. Mass spectrometry is covered in some depth, and a number of newer aspects of particle spectroscopy are treated, including ion scattering spectrometry, Rutherford scattering, energy loss spectrometry (ion and electron), ion kinetic energy spectrometry, ion cyclotron resonance and Auger spectrometry. Applications of these techniques feature structural analysis (compositions of mixtures, molecular structure of organics, electronic state assignment in simple ions), chemical preparations (ion implantation), and isotopic analysis. The underlying chemistry is explored, particularly in considering the kinetics and dynamics of unimolecular fragmentation and in terms of the factors that affect the cross-sections of inelastic collisions. Offered in alternate years. Prerequisite: CHM 42400. **Credits:** 3.00

CHM 62900 - Chromatographic Methods Of Analysis

Credit Hours: 3.00. Principles underlying chemical separations are discussed, including mechanisms of selective transport and zone broadening. Relations are shown between chromatography and electrophoresis, as well as other separation methods. Current applications and current research activity in the field of chemical separations are included. Prerequisite: CHM 42400. Permission of department required. **Credits:** 3.00

CHM 63100 - Magnetic Resonance Spectroscopy

Credit Hours: 2.00. Theory, experimental practice, and current applications to biological systems of nuclear magnetic resonance spectroscopy and, to a lesser extent, electron paramagnetic resonance spectroscopy. Offered in alternate years. Prerequisite: CHM 53300, 56100, 57700, 57800. **Credits:** 2.00

CHM 63200 - Membranes: Structure And Function

Credit Hours: 3.00. The structure and molecular properties of biological membranes and appropriate model systems. Offered in alternate years. **Credits:** 3.00

CHM 63400 - Biochemistry: Structural Aspects

Credit Hours: 3.00. Chemistry of materials of biochemical interest; carbohydrates, lipids, proteins, amino acids, nucleic acids, porphyrins; biochemistry of blood. Prerequisite: CHM 26200, CHM 32100, CHM 37400. **Credits:** 3.00

CHM 63500 - Biochemistry: Dynamic Aspects

Credit Hours: 3.00. Enzymes, metabolism, and protein and nucleic acid biosynthesis. Prerequisite: CHM 63400. **Credits:** 3.00

CHM 63800 - Biophysical Chemistry

Credit Hours: 3.00. Applications of the principles and methods of physical chemistry in biochemistry with emphasis on the behavior of macromolecules in solution. Protein engineering. Offered in alternate years. Prerequisite: CHM 57800, CHM 63400. **Credits:** 3.00

CHM 64100 - Advanced Inorganic Chemistry

Credit Hours: 3.00. Survey of main group and transition metal chemistry. Main group special topics, bonding and structure of boron hydrides. Coordination chemistry, bonding models in coordination compounds. Transition metal organometallic chemistry, ligand types and reactivity patterns. Survey of inorganic NMR spectroscopy. Prerequisite: CHM 34200. **Credits:** 3.00

CHM 64200 - Advanced Inorganic Chemistry

Credit Hours: 3.00. Physical inorganic chemistry. Applications of group theory to chemistry and spectroscopy, especially vibrational and electronic spectra of transition metal complexes. Molecular orbital theory and theoretical bases for reactivity. Magnetic properties and electron paramagnetic resonance (EPR) spectroscopy of inorganic materials. Prerequisite: CHM 34200. **Credits:** 3.00

CHM 64400 - Solid State Chemistry

Credit Hours: 3.00. The chemistry of solids, including a discussion of ionic crystals, metals, alloys, and binary compounds, and their characterizations by various physical methods. Description of chemical reactions, phase changes, and catalysis in terms of current theories of the solid state. Prerequisite: CHM 34200, CHM 37400. **Credits:** 3.00

CHM 64600 - Kinetics And Mechanisms Of Inorganic Reactions

Credit Hours: 3.00. Chemical kinetics, reaction orders, mechanisms and rate expressions; experimental techniques; transition state theory; reactions in solution; complex mechanisms; linear free-energy relationships; acid-base catalysis and proton-transfer reactions; redox reactions (electron and atom transfer, oxidative addition-reductive elimination); substitution reactions of metal ion and organometallic complexes; homogeneous catalysis; and heterogeneous reactions. Prerequisite: CHM 34200. **Credits:** 3.00

CHM 64700 - Transition Metal And Organometallic Chemistry

Credit Hours: 3.00. A study of the chemistry and physical properties of compounds of the transition metals. Halides, oxides, and oxy-salts; transition metal carbonyls and derivatives; pi-bonded organometallic compounds; catalysis; spectral and magnetic properties of compounds. Prerequisite:CHM 64100. **Credits:** 3.00

CHM 64800 - Bioinorganic Chemistry

Credit Hours: 3.00. Provides a detailed perspective on the roles of metals in biology. Emphasis is placed upon principles guiding the field. The basics of biochemistry and inorganic chemistry are provided such that students from diverse backgrounds may participate. Readings are from the research literature. Offered in alternate years. **Credits:** 3.00

CHM 65100 - Advanced Organic Chemistry

Credit Hours: 3.00. Modern structural organic chemistry, including introductions to molecular orbital theory and reaction mechanisms. Prerequisite: a year's course in organic chemistry. **Credits:** 3.00

CHM 65200 - Synthetic Organic Chemistry

Credit Hours: 3.00. An advanced treatment of methods for preparing major types of organic functionalities and bonds, stressing stereochemical control and involving mechanisms for understanding the reactions employed. Prerequisite: CHM 65100. **Credits:** 3.00

CHM 66800 - Physical Organic Chemistry

Credit Hours: 3.00. The theoretical and mechanistic bases for structure and reactivity in organic chemistry is discussed. Individual topics include kinetics and thermodynamics, molecular orbital theory, stereochemistry and reactive intermediates as applied to the mechanisms of organic reactions. Prerequisite: CHM 56300 or 65100. **Credits:** 3.00

CHM 67100 - Advanced Physical Chemistry

Credit Hours: 3.00. Selected topics, including atomic and molecular structure and modern theories underlying thermodynamics and chemical kinetics. Prerequisite: CHM 57800. **Credits:** 3.00

CHM 67200 - Quantum Chemistry

Credit Hours: 3.00. Basic principles of classical and quantum mechanics, exact solutions for simple systems, approximation methods, atomic structure, spectroscopy, application of group theory, theory of molecular binding. Prerequisite: CHM 67100. **Credits:** 3.00

CHM 67300 - Computational Quantum Chemistry

Credit Hours: 3.00. Semiempirical and molecular-mechanics treatments of large molecules, ab initio methods, modern density functional theory, Green's functions, multichannel quantum defect theory, global optimization methods. Prerequisite: CHM 67100. **Credits:** 3.00

CHM 67500 - Chemical Kinetics

Credit Hours: 2.00 or 3.00. Experimental and theoretical consideration of chemical reaction rates and mechanisms. **Credits:** 2.00 or 3.00

CHM 67605 - Molecular Spectroscopy

Credit Hours: 3.00. Theoretical and experimental fundamentals of the interactions between molecules and electromagnetic waves. Topics include electronic, vibrational, and rotational spectroscopies, and laser-based methods. Prerequisites: CHM 67100. **Credits:** 3.00

CHM 67900 - Chemical Thermodynamics

Credit Hours: 3.00. Advanced thermodynamics of chemical and phase equilibria, of electrolytic and nonelectrolytic solutions, and of imperfect gases. Prerequisite: CHM 57800. **Credits:** 3.00

CHM 68200 - Statistical Thermodynamics

Credit Hours: 3.00. Application of statistical mechanics to the description of imperfect gases, liquids, and solutions; to order-disorder phenomena in solids and surfaces; and to absolute reaction rate theory. Prerequisite: CHM 67100, CHM 67900. **Credits:** 3.00

CHM 69500 - Seminar

Credit Hours: 0.00 or 1.00. Groups meeting for review and discussion of important current literature in analytical, biological, inorganic, organic, and physical chemistry. Each graduate student is required to attend the seminar of his or her major subject. **Credits:** 0.00 or 1.00

CHM 69600 - Special Topics In Chemistry

Credit Hours: 1.00 to 3.00. Lectures on selected topics of current interest. **Credits:** 1.00 to 3.00

CHM 69699 - Chemistry Graduate Internship

Credit Hours: 0.00. Graduate internship experience. Students submit final work report and company evaluation. Permission of instructor required.**Credits:** 0.00

CHM 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required. **Credits:** 1.00 to 18.00

CHM 69900 - Research PhD Thesis

Credit Hours: 1.00 to 18.00. Research PhD Thesis. Permission of instructor required. **Credits:** 1.00 to 18.00

Chinese

CHNS 10100 - Chinese Level I

Credit Hours: 4.00. A comprehensive course in elementary Mandarin, designed to develop basic proficiency in listening, speaking, reading, and writing. Systematic coverage of syntactical patterns. After oral foundation work, 20 characters are introduced each lesson in unsimplified and simplified forms. **Credits:** 4.00

CHNS 10200 - Chinese Level II

Credit Hours: 4.00. A continuation of the study of elementary Mandarin. Students will complete study of basic syntactical patterns. Character recognition will be built to 500. **Credits:** 4.00

CHNS 20100 - Chinese Level III

Credit Hours: 4.00. A course in intermediate Mandarin, with integrated spoken and written tracks emphasizing the cultural contexts of usage. Mastery of more advanced syntactic patterns, with enriched vocabulary. Character recognition built to 800. Introduction to Chinese dictionaries. **Credits:** 4.00

CHNS 20200 - Chinese Level IV

Credit Hours: 4.00. A continuation of the study of intermediate Mandarin. Development of enhanced oral narrative skills and listening comprehension skills through audio-visual supplements. Short exercises in expository composition. Character recognition built to 1,100-plus. Introduction to Chinese newspaper. **Credits:** 4.00

CHNS 24100 - Introduction To The Study Of Chinese Literature

Credit Hours: 3.00. Class reading and discussion of selected Chinese poetry, prose, and drama; introduction to the methods of literary criticism, applied to the reading of Chinese literary discourse. Texts, discussion, and written assignments primarily in Chinese. Permission of instructor required. **Credits:** 3.00

CHNS 28000 - Topics In Chinese Civilization And Culture

Credit Hours: 3.00. Selected topics on Chinese civilization and culture including history and geography, Confucianism, contemporary China, education, family, international cultural and economic cooperation. Course materials also cover most current issues on and in Chinese-speaking communities. Lectures in English. **Credits:** 3.00

CHNS 28100 - Introduction To Chinese Food Culture

Credit Hours: 3.00. Selected topics on Chinese food history, production, preparation, festivals, as well as food in literature, film, business and folk beliefs. Discussion will also include civilization and food as cultural diplomacy. Lectures in English. **Credits:** 3.00

CHNS 28500 - Chinese Calligraphy

Credit Hours: 1.00. Principles and techniques of writing Chinese characters. The aesthetics of Chinese calligraphy, its function as an art form, and its role in Chinese culture. Emphasis on training and practice in calligraphic writing. Conducted in English. **Credits:** 1.00

CHNS 30100 - Chinese Level V

Credit Hours: 3.00. Continued development of Chinese speaking, listening, reading, and writing abilities, using materials dealing primarily with everyday life and civilization from a variety of sources, e.g., newspapers, magazines, television, recent literature, etc. **Credits:** 3.00

CHNS 30200 - Chinese Level VI

Credit Hours: 3.00. Continued development of Chinese speaking, listening, reading, and writing abilities, using materials dealing primarily with everyday life and civilization from a variety of sources with stronger emphasis on authentic texts, e.g., newspapers, magazines, television, recent literature, etc. **Credits:** 3.00

CHNS 31300 - Reading And Writing Practice

Credit Hours: 3.00. Concentration on further development of reading and writing abilities for students with conversational proficiency, using materials primarily from modern social and cultural studies, including annotated literary texts. Conducted in Chinese. **Credits:** 3.00

CHNS 33000 - Introduction To Chinese Cinema

Credit Hours: 3.00. This course surveys the development of the Chinese cinema from its beginning to the present. Films from the mainland as well as Taiwan and Hong Kong will be examined in-depth for their aesthetic quality and techniques, and equally important, against their socio-historical, political, economic and cultural contexts. The class is conducted in English. Films are all in Chinese with English subtitles. **Credits:** 3.00

CHNS 34100 - Chinese Literature I: Traditional Chinese Literature

Credit Hours: 3.00. Reading and discussion of selected classical Chinese texts from major writers and genres. Introduction to methods of literary criticism as applied to Chinese literature. Texts, discussion, and written assignments are largely in Chinese. **Credits:** 3.00

CHNS 34200 - Chinese Literature II: Modern Chinese Literature

Credit Hours: 3.00. Study of selected poetry, drama, and fiction from the twentieth century. Students will read and discuss major authors and texts and will write critical essays on literary topics. Texts, discussion, and written assignments are largely in Chinese. **Credits:** 3.00

CHNS 39900 - Special Study Abroad Credit In Chinese

Credit Hours: 1.00 to 4.00. This course number is for assignment after the fact of credits in Chinese earned while enrolled at a foreign university on a Study Abroad program which cannot be appropriately accommodated under an established Purdue course number. It is not for use for courses offered at or conducted by Purdue. **Credits:** 1.00 to 4.00

CHNS 40100 - Chinese Level VII

Credit Hours: 3.00. Continued development of Mandarin Chinese speaking, listening, reading, and writing skills. Emphasis will be upon modern, everyday language and culture (with some introduction to traditional culture) using various sources such as textbooks, newspapers, and literary works. **Credits:** 3.00

CHNS 40200 - Chinese Level VIII

Credit Hours: 3.00. Further development of Mandarin Chinese speaking, listening, reading, and writing skills. Materials will include advanced textbooks and original texts such as newspapers and literary works. **Credits:** 3.00

CHNS 49000 - Special Topics In Chinese Language

Credit Hours: 1.00 to 3.00. Topics vary. Permission of instructor required. **Credits:** 1.00 to 3.00

CHNS 49300 - Special Topics In Chinese Literature

Credit Hours: 1.00 to 3.00. Study of a selected topic in Chinese literature. The topic will be announced in advance. Conducted in English; readings in English. Permission of department required. **Credits:** 1.00 to 3.00

CHNS 59400 - Special Topics In Chinese Literature

Credit Hours: 1.00 to 4.00. Special topics in Chinese Literature. Permission of instructor required. **Credits:** 1.00 to 4.00

Civil Engineering

CE 19100 - Civil Engineering Practice I

Credit Hours: 0.00. Practice in industry and written reports of this practice. For cooperative program students only. **Credits:** 0.00

CE 20300 - Principles And Practice Of Geomatics

Credit Hours: 4.00. This course provides a broad overview of geomatics engineering including fundamental principles required for practical geomatics applications. This course includes subjects in traditional surveying, GPS surveying, remote sensing, photogrammetry, laser scanning, and Geographic Information Systems (GIS). Basic concepts on these subjects are applied to solve practical problems in various civil engineering applications; including computations for engineering project control and construction layout; theory of error propagation; fundamental concepts of horizontal and vertical curves; topographic mapping using various geospatial data acquisition technologies from ground, air, and space; GIS for visualization and analysis of geospatial data. **Credits:** 4.00

CE 21101 - Thermal And Energy Sciences

Credit Hours: 3.00. This course includes applications of thermal science and energy fundamentals to civil engineering topics. Emphasis is placed on fundamental concepts of properties of materials, work, heat, internal energy, entropy, equilibrium, and relations derived from the first and second laws of thermodynamics. Example applications include: power plants; fluid flow in ducts/pipes; thermal properties of building/construction materials and processes; geothermal systems; heating, ventilation, and air conditioning (HVAC) processes; energy balances in buildings; refrigeration; hydroelectric power; contaminant transport in air, water, and soil; climate change; the urban heat island effect; and energy use in the transportation sector. **Credits:** 3.00

CE 22200 - Life Cycle Engineering And Management Of Constructed Facilities

Credit Hours: 3.00. The objective of this course is to introduce concepts relating to the engineering and construction of facilities throughout their life cycle. Topics that will be explored include the nature of the construction industry, construction contracts, legal and management organization of construction companies, basics of the design and construction process, as well as an introduction to the role estimating and project scheduling. Cost, time, safety and quality concepts of construction management relationships will also be discussed. **Credits:** 3.00

CE 23100 - Engineering Materials I

Credit Hours: 3.00. Nature and performance of materials under load. Structure of materials. Elastic, inelastic, and time-dependent behavior. Influences of composition and processing upon material properties. Composite materials particulate systems. Chemical effects on materials. **Credits:** 3.00

CE 27000 - Introductory Structural Mechanics

Credit Hours: 4.00. Loads; structural forms; analysis of axially loaded members, flexural members, torsional members; combined loading conditions; buckling. Basic behavioral characteristics of structural elements and systems illustrated by laboratory experiments. **Credits:** 4.00

CE 29199 - Cooperative Experience I

Credit Hours: 0.00. Professional experience in civil engineering. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

CE 29202 - Contemporary Issues In Civil Engineering

Credit Hours: 2.00. This course provides a forum on issues in the civil engineering profession in a contemporary context. Topics include professionalism and ethics, entrepreneurship, cultural differences, and collaborating globally. Students have interactions with engineering faculty and professionals outside the University. Guidance on the preparation of individual plans of study and information on civil engineering career options are provided. Students learn and apply fundamental aspects of written communication in professional settings. Emphasis is placed on delivery of technical and managerial content. Students will

compile a professional portfolio of communication assignments, including lab reports prepared in other CE courses. **Credits:** 2.00

CE 29299 - Cooperative Experience II

Credit Hours: 0.00. Professional experience in civil engineering. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

CE 29700 - Basic Mechanics I (Statics)

Credit Hours: 3.00. Statics of particles. Rigid bodies: equivalent systems of forces, equilibrium. Centroids and centers of gravity. Static analysis of trusses, frames, and machines. Friction. Area moments of inertia. **Credits:** 3.00

CE 29800 - Basic Mechanics II Dynamics

Credit Hours: 3.00. Kinematics of particles. Kinetics of particles and systems of particles. Kinematics of rigid bodies. Mass moments of inertia. Kinetics of rigid bodies. Mechanical vibrations. **Credits:** 3.00

CE 29900 - Civil Engineering Projects

Credit Hours: 0.00 to 18.00. Topics vary. Projects, special topics, or supplemental instruction. Arrange Hours and Credit. Permission of instructor required. **Credits:** 0.00 to 18.00

CE 30300 - Engineering Surveying

Credit Hours: 3.00. Horizontal and vertical control surveys on site and route projects for engineering design and construction layout. Geometric design of horizontal circular curves, spiral easement curves, and vertical parabolic curves. Earthwork volume computation and balancing. Use of coordinate geometry (COGO) design software including terrain and design surface modeling. Methods and tools used for construction layout, as-built surveys, and industrial measurements. **Credits:** 3.00

CE 31100 - Architectural Engineering

Credit Hours: 3.00. This course introduces energy efficiency, thermal comfort, indoor environmental quality and green building design concepts. The course covers engineering fundamentals required for the design and analysis of building systems such as thermodynamics, fluid mechanics, heat and mass transfer, light and sound transmission. The course presents engineering principles and selected applications related to hydrothermal analysis of building enclosures, air conditioning processes in heating, ventilating and air conditioning systems, building illumination, and building acoustics.**Credits:** 3.00

CE 32201 - Project Control And Life Cycle Execution Of Constructed Facilities

Credit Hours: 3.00. The objective of this course is to continue an introduction to construction management and engineering concepts for future engineers, contractors and owner representatives involved at different stages in the life-cycle of constructed faculties. Building on the broad framework introduced in the prerequisite course, this course develops further ability with analytical tools and extends the basic foundation for advanced topics in construction engineering and management. Specifically, this course focuses on the principles, tools, and procedures used in the construction industry for project selection and financing, advanced planning and scheduling techniques, resource management, and project monitoring. **Credits:** 3.00

CE 33100 - Engineering Materials II

Credit Hours: 3.00. A continuation of CE 23100. **Credits:** 3.00

CE 33500 - Civil Engineering Materials

Credit Hours: 4.00. An introduction to the relationships between fundamental structure of materials and their properties presented through a combination of materials science and engineering approaches. Emphasis on materials of particular interest for civil engineering applications, including metals, aggregates, portland cement concrete, bituminous materials, asphalt binders, asphalt mixtures, wood, polymers, composites, and masonry. Laboratory exercises illustrate atomic structure, elastic and inelastic properties, and demonstrate applications of selected principle of mechanics, testing of aggregates, as well as designing and testing of asphalt and concrete mixtures.**Credits:** 4.00

CE 34000 - Hydraulics

Credit Hours: 3.00. Fluid properties; hydrostatics; kinematics and dynamics of fluid flows; conservation of mass, energy, and momentum; flows in pipes and open channels. Formal laboratory experiments. **Credits:** 3.00

CE 34300 - Elementary Hydraulics Laboratory

Credit Hours: 1.00. The laboratory covers basic concepts in analysis of experimental data and methods in hydraulic measurements. A variety of simple laboratory experiments illustrating the principles of hydraulics are performed. **Credits:** 1.00

CE 35000 - Introduction To Environmental And Ecological Engineering

Credit Hours: 3.00. Introduction to water pollution, air pollution, noise, hazardous and solid wastes, and their control. Environmental impact statements and global pollution issues. Field trips required. **Credits:** 3.00

CE 35500 - Engineering Environmental Sustainability

Credit Hours: 3.00. (EEE 35500) An introduction to the examination of global-scale resource utilization, food, energy and commodity production, population dynamics, and their ecosystem impacts. **Credits:** 3.00

CE 36100 - Transportation Engineering

Credit Hours: 3.00. Transportation functions; transportation systems, including land, air, and marine modes; transportation system elements, including traveled way, vehicle, controls, and terminals; techniques of transportation system planning, design, and operation. **Credits:** 3.00

CE 37100 - Structural Analysis I

Credit Hours: 3.00. Stress resultants (reactions, axial forces, shear forces, and bending moments) for beams and framed structures. Deflections of beams and frames by geometric methods (moment-area theorems and applications; conjugate beam analogy). Analysis of statically indeterminate beams and frames by classical stiffness methods; slope deflection and moment distribution. Influence functions and their applications. **Credits:** 3.00

CE 38199 - Professional Practice Co-Op I

Credit Hours: 0.00. Professional experience in civil engineering. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

CE 38299 - Professional Practice Co-Op II

Credit Hours: 0.00. Professional experience in civil engineering. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

CE 38300 - Geotechnical Engineering I

Credit Hours: 3.00. Introduction to the nature and origin of soils and rocks; engineering significance of geologic landforms and soil deposits; identification and engineering classification of soils; engineering behavior and properties of soils; permeability, compressibility, shearing resistance; soil compaction. **Credits:** 3.00

CE 38399 - Professional Practice Co-Op III

Credit Hours: 0.00. Professional experience in civil engineering. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

CE 39201 - Technical Communication In Civil Engineering

Credit Hours: 2.00. This course will build upon the technical communication components of CE 29202, adding instruction in oral communication, projects, and working in teams. This course involves both individual and team assignments intended to offer students the opportunity to practice preparing and delivering written correspondence and reports, as well as oral presentations. These activities may be coordinated with other CE courses being taken by students in CE 39201. **Credits:** 2.00

CE 39399 - Cooperative Experience III

Credit Hours: 0.00. Professional experience in civil engineering. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

CE 39499 - Extensive Cooperative Experience IV

Credit Hours: 0.00. Professional experience in civil engineering. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

CE 39500 - Fundamentals Of Innovation Theory And Practice

Credit Hours: 3.00. This course is designed to provide students with initial exposure to the fundamental patterns, mindsets, behaviors, attributes, tools, and methods employed in the innovative activity of individuals and organizations. Emphasis is placed on understanding and effectively utilizing techniques to systematically drive innovation that are drawn from the fields of business, design, problem-solving, engineering, and the social sciences. Lecture, in-class small group activities, and individual and team assignments are employed across an array of contemporary socio-technical challenges to provide students with the opportunity to apply conveyed theory and methods to rigorously structure problems, understand involved stakeholders, utilize innovation motifs and analogical reasoning to develop robust views of potential solutions spaces, tailor solution design to stakeholder context, consider the full suite of functional, social, and emotional dimensions that could influence solution prioritization, and document and systematically assess underlying solution assumptions to iterate toward a viable and sustainable forward-looking plan that could achieve target outcomes. This course counts toward, serves as a required entry course for, the College of Engineering Minor in Innovation and Transformational Change. **Credits:** 3.00

CE 39599 - Extensive Cooperative Experience V

Credit Hours: 0.00. Professional experience in civil engineering. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

CE 39699 - Professional Practice Internship

Credit Hours: 0.00. Professional experience in civil engineering. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Permission of department required. **Credits:** 0.00

CE 39700 - Undergraduate Professional Internship

Credit Hours: 0.00. Professional experience in Civil Engineering. This internship experience is intended to complement the student's academic coursework and help prepare the student for a career as a practicing engineer. Program coordinated by school with cooperating employers. A written report is required. Permission of department required. **Credits:** 0.00

CE 39800 - Introduction To Civil Engineering Systems Design

Credit Hours: 3.00. An introduction to engineering economy and systems analysis. A systematic approach to the engineering method of design and problem solving. **Credits:** 3.00

CE 40800 - Geographic Information Systems In Engineering

Credit Hours: 3.00. This course provides an introduction to the application of geographic information systems (GIS) to civil engineering problems. GIS is a tool for analysis, modeling, and evaluation of civil engineering problems. The design of spatial databases, assembly of requisite data, and the development of analysis tools within GIS are presented. This course will address: definition of spatial data, data types, spatial relationships, computer operation on spatial data, topology in spatial data, representation of features in a GIS, data models, data dictionaries, data capture techniques; database types, composition of spatial queries, analysis of engineering data using a GIS, complex analysis of polygon and linear features, presentation of results, use of a GIS as an engineering model test bed. **Credits:** 3.00

CE 41300 - Building Envelope Design And Thermal Loads

Credit Hours: 3.00. This course discusses the basic thermal processes in buildings and presents comprehensive methods for thermal design of envelope assemblies in commercial and residential buildings. The first part of the course includes steady-state transient conduction through envelope assemblies, convection and radiation heat transfer in buildings, solar radiation and solar gains, thermal performance of windows, internal gains, ventilation and infiltration. The second part of the course considers surface and room energy balance equations and presents analytical and computational models for calculation of hourly heating and cooling loads throughout the year. Climate-based standards, passive solar design, advanced energy guides, and innovative technologies for high performance buildings are discussed. The course also includes a design project on analytical heating/cooling load calculations for a commercial building. **Credits:** 3.00

CE 41400 - Building Mechanical And Electrical System Design

Credit Hours: 3.00. This course covers the design of building mechanical and electrical systems. In the first part of the course students learn principles of designing and integrating heating, ventilation, and air conditioning systems into building air delivery systems, mechanical cooling and heating technologies, duct design and layout, blower and pump selection, and hydronic systems. They also learn to design heating, ventilation, and air conditioning systems within the constraint of achieving satisfactory

occupant thermal comfort in buildings. The second part of the course covers design concepts related to building electrical systems; including, single and three-phase power systems, motors, transformers, switching, and relays. The course includes a design project related to mechanical and electrical systems for a commercial building. **Credits:** 3.00

CE 44000 - Urban Hydraulics

Credit Hours: 3.00. Sources and distribution of water in urban environment, including surface reservoir requirements, utilization of groundwater, and distribution systems. Analysis of sewer systems and drainage courses for the disposal of both wastewater and storm water. Pumps and lift stations. Urban planning and storm drainage practice. **Credits:** 3.00

CE 44200 - Introduction To Hydrology

Credit Hours: 3.00. Description, measurement, and analysis of hydrologic processes: precipitation, evapotranspiration, infiltration, and runoff. Hydrograph analysis: unit and synthetic unit hydrographs and flood routing. Statistical analysis of hydrologic data. Fundamentals, budget, and yield analysis of groundwater flows; well hydraulics. Case studies illustrating the application of principles in both surface and groundwater flows. **Credits:** 3.00

CE 44300 - Introductory Environmental Fluid Mechanics

Credit Hours: 3.00. Kinematics of fluid flow. Differential equations for environmental fluid flows, including effects of variable density and rotation. Ideal fluid flow; boundary layer approximation; turbulence; water waves. **Credits:** 3.00

CE 45600 - Wastewater Treatment Processes

Credit Hours: 3.00. (EEE 45600) Fundamental design principles and practice of wastewater treatment to prepare students for designing wastewater treatment systems. The major topics include design and construction process, preliminary treatment of wastewater, primary treatment, wastewater microbiology, secondary treatment, nitrogen removal, phosphorus removal, attached microbial growth, secondary settling, disinfection and post-aeration, tertiary treatment, and wastewater plant residuals management. **Credits:** 3.00

CE 45700 - Air Pollution Control And Design

Credit Hours: 3.00. Fundamental concepts and design procedures for the removal of particulates, gases, and toxic air pollutants from waste gas streams. Problem assessment; characterization of exhaust gas streams; fan characteristics. **Credits:** 3.00

CE 46100 - Roadway And Pavement Design

Credit Hours: 3.00. Design of highway and airport pavement systems, subgrades, subbases and bases, soil stabilization, flexible and rigid pavements; cost analysis and pavement selection; quality control; drainage; earthwork; pavement evaluation and maintenance. **Credits:** 3.00

CE 46300 - Highway Transportation Characteristics

Credit Hours: 3.00. Analysis of basic characteristics of highway transportation systems and the elements influencing these characteristics: drivers, vehicles, pedestrians, flow, density, speed, travel time, delay, stream flow, intersection performance, capacity, accidents, traffic demand, and parking. Techniques used include experimental observation, deterministic and probabilistic queueing theory, probability and statistics, and graphical analysis. **Credits:** 3.00

CE 47000 - Structural Steel Design

Credit Hours: 3.00. The elements of structural steel design, including tension members and their connections; structural connections, including welding, and high-strength bolts; compression members; rolled and built-up flexural members; and combined axial and flexural loading effects. **Credits:** 3.00

CE 47300 - Reinforced Concrete Design

Credit Hours: 4.00. Design and behavior of reinforced concrete beams, one-way slabs, and columns. **Credits:** 4.00

CE 47400 - Structural Analysis II

Credit Hours: 3.00. Determination of deflections by the method of virtual work; analysis of trusses, continuous beams, and frames by direct stiffness method; approximate methods of analysis. **Credits:** 3.00

CE 47900 - Design Of Building Components And Systems

Credit Hours: 3.00. Design of simple floor and roof systems and load bearing walls; uses of building materials; fundamentals of design of metal form decking, steel joists, masonry (beams, columns and load bearing walls), and timber (beams, trusses, and mechanical connections). **Credits:** 3.00

CE 48300 - Geotechnical Engineering II

Credit Hours: 3.00. Subsurface investigations and techniques for sampling soils, lateral earth pressures, and stability of retaining structures; stability of earth slopes; shallow and deep foundations design. **Credits:** 3.00

CE 49700 - Civil Engineering Projects

Credit Hours: 0.00 to 18.00. Topics vary. Permission of instructor required. **Credits:** 0.00 to 18.00

CE 49800 - Civil Engineering Design Project

Credit Hours: 3.00. Planning, design, and analysis of a civil project; an integrated and realistic group project involves as much as possible all major aspects of the civil engineering profession. **Credits:** 3.00

CE 49900 - Research In Civil Engineering

Credit Hours: 0.00 to 18.00. Credit arranged. Permission of instructor required. **Credits:** 0.00 to 18.00

CE 50101 - Map Projection And Geometric Geodesy

Credit Hours: 3.00. The course will cover topics necessary for the modern "3D surveyor": it will give an overview of coordinate frames used in geodesy, surveying and mapping. What are the relationships between the various (3D) coordinate frames? How are the results of 1D/2D/3D surveys being mapped to a 2D, not necessarily flat, surface? Mapping models (projecting equations) and their characteristics will be discussed, based on the fundamentals of differential geometry and curvilinear coordinates. (Differential) Geometry and Multivariate Calculus: Cartesian, Spherical and Ellipsoidal coordinates and transformations between them. Radius of curvature. Jacobian and Metric Matrices. Geometric Geodesy: Earth-fixed frames. Geocentric, topocentric and local frames. Radius of curvature in the meridian and the prime vertical. [Differential coordinate transformations. Commutative diagram.] Reference sphere. Shortest distance over the sphere/ellipsoid. Reference ellipsoid. Reductions to the ellipsoid. Map projections: Basics of mapping. Conformal mapping. Mercator, Lambert, Stereographic. State Plane Coordinate Systems. Intro to Physical Geodesy: Shape of the Earth. Earth rotation. Inertial frames. Precession, Nutation, Polar Motion, Length of Day. Time

Systems. Gravity and Gravitation. Potential Energy. Equipotential surfaces. Geoid. Height differences and the flow of water. Orthometric heights. Geodetic Reference Datums/Frames/Systems: NAD27, NGVD29, IGSN71, WGS72, GRS80, NAD83, WGS84, NAVD88, IERS Standards 1992, HARNs, GEOID90, GEOID93, GEOID96, GEOID99, GEOID2003, GEOID2009. **Credits:** 3.00

CE 50301 - Digital Photogrammetric Systems

Credit Hours: 3.00. This course deals with various aspects related to 3D reconstruction from 2D imagery. The course starts with comprehensive coverage of data acquisition systems while focusing on different factors that affect the quality of image measurements. Then, the course focuses on the mathematical details for deriving 3D information from imagery including 2D/3D rotation, collinearity equations, projective transformation, direct linear transformation, theory of orientation, bundle adjustment, image resampling according to epipolar geometry, image matching, and orthophoto generation. The course also covers the similarities/differences between photogrammetric and computer vision approaches toward 3D reconstruction. **Credits:** 3.00

CE 50401 - Laser Scanning

Credit Hours: 3.00. This course covers laser scanning data acquisition and processing activities. The first half of the course deals with the operational principles of laser scanning including laser light generation, laser scanning patterns, georeferencing, point positioning equation, impact of random and systematic errors on derived point clouds, and system calibration. The second half deals with point cloud data processing including characterization, data structures, segmentation, quality control, and product delivery. The course also covers the similarities/differences between photogrammetric and laser scanning approaches for 3D reconstruction.**Credits:** 3.00

CE 50501 - UAS-Based Mapping: Basic Principles

Credit Hours: 1.00. This module covers the fundamentals of UAS-based mapping from imaging and ranging systems - including system integration, calibration strategies, and 3D reconstruction techniques.**Credits:** 1.00

CE 50502 - UAS-Based Photogrammetric Mapping

Credit Hours: 1.00. This module covers the principles and mathematical details of photogrammetric 3D reconstruction from imaging systems onboard UAVs.**Credits:** 1.00

CE 50503 - UAS-Based LiDAR Mapping

Credit Hours: 1.00. This module covers the principles and mathematical details of laser scanning-based 3D reconstruction using ranging sensors onboard UAVs.**Credits:** 1.00

CE 50601 - Adjustment Of Geospatial Observations

Credit Hours: 3.00. This course presents a thorough and comprehensive look at the topic of fitting data to a mathematical model. The techniques presented will free the scientist or engineer from dependence on restrictive software applications, and allow customization of solutions using weighting, constraints, parameter dependencies, and robust techniques which minimize the influence of blunders. Example applications include 2D/3D ranging, 2D/3D triangulation, curve and surface fitting, coordinate transformations, leveling, and image triangulation. Pre-analysis and design techniques permit the precision of unknown parameters to be determined in advance, prior to expending time and effort in field measurements. **Credits:** 3.00

CE 50701 - Geospatial Data Analytics

Credit Hours: 3.00. The course will introduce fundamental theories, analytical methods and programming skills that are needed to work with geospatial data. Students will learn the theories, methods, and techniques to visualize, analyze and model various geospatial data through hands-on computer programming practice based on various open source geospatial libraries. To be specific, the course will use R and its related packages as the basic tool for implementation. The goal is to enable the learners to develop their own geospatial analytical applications. **Credits:** 3.00

CE 50801 - Geographic Information Systems

Credit Hours: 3.00. This course covers a range of fundamentals in geographic information science and technology. Students will learn the use of current popular geographic information system (GIS) tools to handle various geographic data. Through working on real world geospatial problems, students shall gain extensive and hands-on experience in geographic data manipulation, visualization, and analysis. Course assignments are focused on both GIS theoretical basics and practical skills for students to achieve expected proficiency. The course will work with geospatial data in geography, topography, environmental science, hydrology, transportation, and geosocial science. It is targeted to students with interest in civil and environmental engineering, agriculture, geography, earth science, natural resources, smart cities or other related subjects. **Credits:** 3.00

CE 51200 - Urban Planning And Analysis

Credit Hours: 3.00. An introductory course that provides a framework for better understanding of the current urban planning process. Concepts and emerging trends are covered as well as an elementary description of planning methods and techniques. For planning majors and those in related design, development, and socioeconomic disciplines. **Credits:** 3.00

CE 51300 - Lighting In Buildings

Credit Hours: 3.00. This course focuses on the design of illumination systems in buildings (electric and natural lighting) in order to achieve energy efficiency and visual comfort. The first part of the course includes analytical lighting calculation techniques, visual perception, radiative transfer, lamp characteristics, electric lighting system design and control for calculation of required indoor illuminance levels. The second part of the course covers daylighting (natural lighting) systems, including state-of-the-art daylighting prediction models as well as design and control of such devices and advanced metrics. The course also has a lab section, in which the students learn how to work with lighting and daylighting tools and build their own computational transient lighting models in open programming languages, in order to design illumination systems and predict electricity consumption and potential energy savings. **Credits:** 3.00

CE 51401 - Building Controls

Credit Hours: 3.00. This course is designed to provide students with the knowledge of fundamentals, design, and analysis for building control systems. It primarily consists of three parts. The first part covers basic concepts, terminology, procedures and computations of control systems including block diagrams & transfer function, open-loop & closed-loop control, control system modeling, time response, root locus techniques, design via root locus, and digital control systems. The second part focuses on issues surrounding the building controls: interfacing components such as sensors and actuators, problems encountered, and state-of-the-art solutions for building energy efficiency and thermal comfort. The third part aims to develop students' ability to convert control system concepts into real building control sytems. The course provides a hand-on opportunity for students to complete three projects associated with the three primary components during the semester: indoor environmental quality assessment, building HVAC system commissioning and its control analysis, and new control algorithm development for building energy efficiency, occupant health, and individual productivity. **Credits:** 3.00

CE 51501 - Building Energy Audits

Credit Hours: 3.00. This course is designed to provide students with the necessary skills to perform an energy audit on commercial and residential buildings. Energy accounting procedures for all major building subsystems are covered in detail, along with operational cost analysis of these systems. Students learn fundamental techniques for auditing the building envelope;

electrical and lighting systems; heating, ventilation, and air conditioning systems; internal thermal loads; and building maintenance and operation procedures. Students also learn to analyze electric and natural gas utility tariffs and rate structures and apply their findings to the energy auditing process. **Credits:** 3.00

CE 52000 - Construction Project Control Systems

Credit Hours: 3.00. Techniques used for planning and scheduling, estimating, and cost control for construction projects. The interface of cost control with the financial management at the company level will be considered. Work breakdown structure as a method of control will be developed. **Credits:** 3.00

CE 52100 - Construction Business Management

Credit Hours: 3.00. Develops students' understanding of the fundamental theories and applied principles of management of U.S. construction companies. Exposes students to the present and future practice of business management at the construction company level. Provides insight into basic construction business operations including strategic planning, organizational structure, marketing, accounting, financing, risk analysis, quality, and international construction business practice. **Credits:** 3.00

CE 52200 - Computer Applications In Construction

Credit Hours: 3.00. A study of current computer usage in the construction industry; basic computer hardware and software concepts; computer applications in construction; commercially available software applications. **Credits:** 3.00

CE 52300 - Selection And Utilization Of Construction Equipment

Credit Hours: 3.00. A study of economics and functional applications for major categories of construction equipment. Operational characteristics are identified for selected equipment items and are applied to typical construction situations. **Credits:** 3.00

CE 52400 - Legal Aspects In Engineering Practice

Credit Hours: 3.00. Legal principles and landmark cases relevant to engineering. Subjects covered include contracts, torts, agency, real property, environmental and labor laws, expert testimony, arbitration, patents and copyrights, sureties and ethics. Three evenings may be required. **Credits:** 3.00

CE 52501 - Built Environment Modeling

Credit Hours: 3.00. A study of computational tools to model, analyze, and manage the built environment, specifically, the civil infrastructure from a life cycle and system's perspective. Such computational tools include geospatial technologies, engineering sensing technologies, engineering database, building information modeling, object-oriented modeling, and spatial analytics. **Credits:** 3.00

CE 52700 - Analytical Methods For The Design Of Construction Operations Sem. 1

Credit Hours: 3.00. Provides an investigation of quantitative methods used for the design and analysis of construction operations to maximize productivity and minimize resource idleness. Includes discussions on queuing theory, line of balance techniques, linear programming, and simulation. Comprehensive group projects involve modeling and analyzing actual construction operations. **Credits:** 3.00

CE 52900 - Smart Construction

Credit Hours: 3.00. Technologies are embedded throughout all communities, and the boundaries between humans and technologies are shrinking considerably. As a result, the construction industry is also changing rapidly. The questions are: Are we ready for this change? What skills are required to be better prepared as a future workforce? This course covers how these smart and advanced technologies are set to revolutionize the construction industry to achieve specific mission objectives (e.g., improving safety, quality, and productivity). This course will give students the opportunity to learn conceptual and practical foundations for designing and developing systems while also learning to harness technology to ensure a new generation of technologies would include humans in the loop. This course will be project-based, and students learn by actively engaging in various real-world case studies. Other topics include challenges in human-computer interaction, the internet of things, human behavior modeling, VR/AR/MR, wearable sensors, machine learning and artificial intelligence, trust in human-robot interaction, and ethics and fairness in the emerging smart technologies in the construction industry. This course follows Bloom's taxonomy to increase knowledge (cognitive domain), develop skills (psychomotor domain), or develop emotional aptitude (affective domain). The instructor will incorporate various techniques in each of the course concepts to facilitate higher-order thinking in their students by building up from lower-level cognitive skills. Each concept will be taught in five phases: 1) Knowledge (i.e., Lecture, podcasts, readings before class); 2) Understanding (i.e., presentations, peer review, discussion); 3) Application (i.e., case studies, problem-solving demonstration); 4) Analyzing and Evaluating (i.e., simulation, discussion); 5) Creating, Reflecting, and Debriefing (i.e., group presentations, case studies, discussion, reflection).**Credits:** 3.00

CE 53000 - Properties And Production Of Concrete

Credit Hours: 3.00. Basic properties of hydraulic cements and mineral aggregates and their interactions in concrete. Properties of plastic and hardened concrete. Modifications through admixtures. Production, handling, and placement problems. Specifications; quality control and acceptance testing; lightweight, heavyweight, and other special concretes. A one-day field trip is required. **Credits:** 3.00

CE 53101 - Nanotechnology For Civil And Environmental Applications

Credit Hours: 3.00. This course will introduce students to the field of nanotechnology with a special emphasis on nanomaterials synthesis, characterizations and their applications in civil and environmental engineering. The specific applications will include, but not limited to, tailoring mechanical property, durability, self-cleaning, self-sealing, self-sensing, energy harvesting and other multi-functionality. It integrates the fields of materials science, civil engineering and electrical engineering. The basic concepts will be discussed including nano-scale effect, process-structure-property relationship, nano- and micro-structure property characterizations, multi-functional materials, nano-device fabrication and their applications for energy harvesting, water infiltrations and environmental sensing. lab will be provided to students enrolled in the course to learn nano and micro-structure characterizations skills. **Credits:** 3.00

CE 53500 - Bituminous Materials And Mixtures

Credit Hours: 3.00. Consideration of major types of bituminous materials-asphalt cements, cutback asphalts, asphalt emulsions, and tars. Influence of chemical composition upon physical properties. Desirable aggregate characteristics for bituminous mixtures. Construction techniques. Current practices for determining optimum asphalt contents. Two one-day field trips are required. **Credits:** 3.00

CE 53600 - Non-destructive Testing And Sensing For Civil Infrastructures

Credit Hours: 3.00. This course will equip students with necessary fundamental knowledge related to the Non-Destructive Testing methods. The topics will be discussed including fundamental materials mechanical properties and linear fracture mechanics of materials, testing procedures of commonly used civil materials and structures. The content such as, elasticity, fracture mechanics, and wave propagation, will be covered. Various case studies will be discussed to help students understand and apply the knowledge to field inspection or monitoring of civil materials and structures.**Credits:** 3.00

CE 53800 - Experimental Methods In Construction Materials Research

Credit Hours: 3.00. This course will introduce the student to the fundamental aspects of the computer control of experimental equipment. Emphasis is placed on the difficulties of interfacing computers and instruments. Experimental techniques for measuring important properties of construction materials are discussed. For example, techniques involving the use of strain gages, optical measurements, and measurement of properties such as pore structure and surface area are considered. Emphasis is placed on the effects of experimental techniques on the resulting measurements. **Credits:** 3.00

CE 54000 - Open Channel Hydraulics

Credit Hours: 3.00. Energy and momentum principles, design of open channels for uniform and nonuniform flow, boundary layer and roughness effects, flow over spillways, energy dissipation, flow in channels of nonlinear alignment and nonprismatic section. **Credits:** 3.00

CE 54200 - Hydrology

Credit Hours: 3.00. Meteorology; precipitation; stream flow, evaporation, and transpiration; subsurface flows, well hydraulics; runoff relations and hydrographs; elements of stream flow routing, frequency and duration studies; extreme values statistics applied to flood and drought forecasting; application of hydrologic techniques. **Credits:** 3.00

CE 54300 - Coastal Engineering

Credit Hours: 3.00. An introduction to coastal engineering with emphasis on the interaction between oceanic dynamic processes (waves, currents, and tides) and coastal regions (beaches, harbors, structures, and estuaries) and on the engineering approaches necessary to prevent adverse effects caused by this interaction. **Credits:** 3.00

CE 54400 - Subsurface Hydrology

Credit Hours: 3.00. Basic principles of fluid flow in saturated and unsaturated materials. Darcy's law, well hydraulics, determination of hydraulic properties of aquifers. Infiltration theory. Discussions of artificial recharge, land subsidence, saltwater intrusion, ground water quality and contamination. **Credits:** 3.00

CE 54500 - Sediment Transport Engineering

Credit Hours: 3.00. Sediment properties and the mechanics of sediment transport. Threshold of movement. Riverbed load and suspended load theories. Regime theory and stable channel design. River diversion problems. Erosion. Geomorphologic and water quality aspects. **Credits:** 3.00

CE 54700 - Transport Processes In Surface Waters

Credit Hours: 3.00. Four main topics are covered: (1) density-stratified two-layer systems in lakes and channels, with applications to mixed-layer growth, oil-spill containment, salinity intrusions, (2) advection-diffusion modeling in channels, including analytical solutions to steady and unsteady, one- and two-dimensional problems, (3) mechanisms of diffusional transport, including turbulence in channels and longitudinal shear dispersion, and (4) near-field analysis of discharges, including similarity analyses of jets and plumes. **Credits:** 3.00

CE 54900 - Computational Watershed Hydrology

Credit Hours: 3.00. Use of professional computer programs for the calculation of the runoff from complex basins. Generation of unit hydrographs. Calculation of losses, channel and reservoir routing, parameter optimization, and application of Kinematic wave technique to urban catchments. Offered in alternate years. **Credits:** 3.00

CE 55000 - Physico-Chemical Processes In Environmental Engineering I

Credit Hours: 3.00. This is the first of a two-course sequence and covers physico-chemical processes as applied in water and wastewater treatment. Topics include: reactor theory, mixing, gravity separation, centrifugation, adsorption, ion exchange, disinfection kinetics, acid/base chemistry, neutralization, precipitation, and corrosion. **Credits:** 3.00

CE 55201 - Environmental Biotechnology

Credit Hours: 3.00. This course focuses on fundamental of molecular biology and biotechnology for environmental applications. The major topics include activated sludge processes, stoichiometry, bioenergetics, anaerobic digestion, biological nitrogen and phosphorus removal, molecular microbiology tools, biofouling, antibiotic resistance, viruses and biofuels. **Credits:** 3.00

CE 55401 - Water Chemistry For Environmental And Ecological Engineering

Credit Hours: 3.00. Principles of chemistry applied to the analysis and distribution of the chemical composition of natural waters and engineered water systems. Course topics include acid/base, complexation, precipitation/dissolution, sorption and redox reactions in the context of environmental and ecological engineering. Case studies focus on water chemistry in research and practice, such as lead in drinking water, recovery of valuable products from wastewater, chemistry of engineered carbon dioxide capture, and engineered treatment of surface waters. Case studies vary each year.**Credits:** 3.00

CE 55700 - Air Quality Management

Credit Hours: 3.00. Discussion of fugitive, mobile, and point sources of air pollution with attendant effects on materials, plants, and humans. Development and status of state and federal regulations with emphasis on the development and use of mathematical dispersion models including meteorological fundamentals and atmospheric transport. Discussion of concepts for ambient air quality control strategies including urban planning and transportation considerations. **Credits:** 3.00

CE 55900 - Water Quality Modeling

Credit Hours: 3.00. Mathematical modeling of chemical and biological processes occurring in natural aquatic systems. Classical oxygen demand and nutrient processes are modeled, as well as chemical specific transport and fate processes. Emphasis is placed on deterministic models, mass balance approaches, and chemical specific coefficients or parameters. **Credits:** 3.00

CE 56000 - Public Mass Transportation

Credit Hours: 3.00. Public mass transportation system technologies, design, operation, and planning including vehicle characteristics, bus transit, light rail and rail rapid transit, schedules and networks, capacity, passenger characteristics, and paratransit. **Credits:** 3.00

CE 56100 - Transportation Systems Evaluation

Credit Hours: 3.00. Concepts and principles of transportation economic analysis, transportation costs and benefits, user and nonuser consequences, needs studies, finance and taxation, methods of evaluation of plans and projects, cost-effectiveness, environmental impact assessment. **Credits:** 3.00

CE 56200 - Geometric Design Of Highways

Credit Hours: 3.00. Development and applications of concepts of geometric design for rural and urban highways. Design controls and criteria, elements of design including sight distance and horizontal and vertical alignment, cross-section elements,

highway types, intersection design elements, types of interchanges and interchange design elements, grade separations and clearance. **Credits:** 3.00

CE 56201 - Vehicular Cyber-Physical Systems

Credit Hours: 3.00. Cyber-physical systems (CPS) are a new frontier for computational systems that transform the way people interact with engineered systems, which benefit applications in fields like transportation, aerospace, manufacturing, and health care. This course introduces students to the theoretical and practical foundations of CPS, with an emphasis on their usage in connected and automated vehicles (CAV).**Credits:** 3.00

CE 56300 - Airport Design

Credit Hours: 3.00. Airport design requirements derived from using aircraft design parameters and operational characteristics; airport configuration; runway length and orientation; geometric design of taxiways, exits, and runways; apron design; airspace obstacles; effects of air traffic control; lighting and marking; asphalt pavement and rigid concrete pavement design; pavement overlays; evaluation of runway pavement; drainage; earthwork; and project management. A field trip is required. **Credits:** 3.00

CE 56401 - Data Science For Smart Cities

Credit Hours: 3.00. The availability of low-cost and ubiquitous sensors in city infrastructure provides high granular data at unprecedented spatiotemporal scales. "Smart Cities" is a concept to utilize this data to provide a healthy, happy and sustainable urban ecosystem by integrating the information and communication technology, Internet of things, and citizen participation to effectively manage and utilize city's infrastructure and services. 'Data science' is an interdisciplinary field of scientific methods, processes, algorithms, and systems to extract knowledge from data in various forms. This course will introduce techniques that will allow the analysis, inference, and prediction of large-scale data (e.g., GPS trajectories, individual social networks, etc.) that are present in urban networks. The course will focus both on the methods and their application to smart city problems. Python will be used to demonstrate the application of each method on datasets available to the instructor. Examples of applications that will be discussed as an example of applications of data science for smart city applications include: ridesharing platforms, energy modeling, smart and energy-efficient buildings, evacuation modeling, decision-making during extreme events, and urban resilience.**Credits:** 3.00

CE 56500 - Traffic Engineering: Operations And Controls

Credit Hours: 3.00. Traffic laws and ordinances; design and application of signs, markings, and signals; timing of isolated and interconnected signals; speed regulation; one-way streets; pedestrian, bicycle, and mass transit considerations; traffic engineering administration. **Credits:** 3.00

CE 56600 - Transportation Planning

Credit Hours: 3.00. Fundamentals of transportation planning. Historical development and current status of techniques used in travel demand forecasting: trip generation, trip distribution, mode choice, traffic assignment. Data collection and use of surveys. Applications to passenger and freight movement in urban and statewide contexts. Implications for policy formulation and analysis. **Credits:** 3.00

CE 56601 - Network Models For Connected And Autonomous Vehicles

Credit Hours: 3.00. This course provides an introduction to mathematical foundations of the analysis of transportation networks. The course will be divided into two main sections. Section 1 will introduce the basic foundations of network routing problems including user equilibrium (selfish routing) and system optimal games on networks. Various optimization-based formulations, algorithms and extensions will be discussed. A particular emphasis will be on devising efficient algorithms and computation on city networks. Students will be expected to know how to design efficient algorithms for network analysis and implement them on

various datasets. The second half of the course will tailor the network models learned in the first half to understanding the impacts of connected and autonomous vehicles (CAVs). This will be done by taking specific example problems such as autonomous intersection control, parking design, network design for CAVs, etc. Recent research papers will form the basis for developing these models. Extensive use of intuitive arguments, counterintuitive phenomenon (paradoxes) and network structures will be utilized to illustrate many situations graphically. In addition, computing the solutions efficiently using various network algorithms will be discussed. The course is research based and students in addition to learning the concepts will extend the concepts to a research project to be finished within the semester.**Credits:** 3.00

CE 56700 - Highway Traffic And Safety Analysis

Credit Hours: 3.00. Traffic and safety studies including: traffic and safety impact studies, control and geometry improvements, hazard and countermeasures identification, predicting safety benefits, before-and-after studies; data collection and computer tools for highway traffic and safety evaluation. **Credits:** 3.00

CE 56800 - Highway Infrastructure Management Systems

Credit Hours: 3.00. Processes and techniques of managing rehabilitation and maintenance of highway infrastructure facilities including roads and bridges. Three management systems are examined: pavement, bridge, and roadway maintenance. The primary emphasis is on data collection, life cycle cost analysis, priority setting and optimization, program development strategies, and institutional issues. **Credits:** 3.00

CE 56901 - Smart Logistics

Credit Hours: 3.00. This course provides a foundation of analytical tools, methods and applications of logistics systems in the context of planning and operations of integrated supply chain systems. The material is useful for students interested in managing supply chain systems providing a background on where and how specific methods can be used for improving overall performance of the supply chain. The course is broadly divided into two parts: (1) Science of Logistics which provides an introduction to unique characteristics of supply chain management; demand forecasting, planning and management; inventory control and planning; operational transportation issues such as vehicle routing and supply chain contracts and network design. (2) Business of Logistics which discusses the applications of the science to real-world logistics systems. Real-world case studies from past problems will be the basis for discussion and will include the nature of costs in supply chain networks, operational issues, vehicle routing problems, interactions of carriers and shippers using auctions and yield management. The course will use intuitive arguments and mathematical optimization tools will be used to illustrate many situations in a rigorous fashion.**Credits:** 3.00

CE 57000 - Advanced Structural Mechanics

Credit Hours: 3.00. Studies of stress and strain, failure theories, and yield criteria; flexure and torsion theories for solid and thin-walled members; and energy methods. **Credits:** 3.00

CE 57100 - Earthquake Engineering

Credit Hours: 3.00. The objectives of the course are to: (1) expose the fundamentals of structural design in earthquake regions; (2) explain the functions of linear, nonlinear, and limit analyses with respect to design; (3) describe the complex relationships between ground motion models and structural response models in the linear and nonlinear response ranges; and (4) provide the students perspectives about the behavior of building structures in the earthquake environment. **Credits:** 3.00

CE 57200 - Prestressed Concrete Design

Credit Hours: 3.00. Behavior and design of prestressed concrete structures, prestress losses, composite construction, flexure and shear design, deflections, and special topics. **Credits:** 3.00

CE 57300 - Structural Dynamics

Credit Hours: 3.00. Analysis of structural members and systems subject to dynamic loads such as wind and earthquake loads; basic theory for single-degree-of-freedom and multi-degree-of-freedom analytical models of civil engineering structures; free vibration, harmonic and transient excitation, foundation motion, resonance spectrum, Lagrange's equation, modal analysis, lumped parameter methods, computer methods. **Credits:** 3.00

CE 57500 - Experimental Methods In Structural Engineering

Credit Hours: 3.00. Theory, methods, and techniques for experimental studies of structural members and systems. Measurements fundamentals; transducers for measuring strain, displacements, force and torque, pressure, and temperature. Physical modeling principles: similitude, materials and their properties, and loading systems for application to studies of elastic and inelastic models. Case studies. Individual project required of each student. Permission of instructor required. **Credits:** 3.00

CE 57600 - Advanced Reinforced Concrete Design

Credit Hours: 3.00. Design and behavior of columns, two-way slab and slab-beam floor systems, and beam-column joints; strut-and-tie models. **Credits:** 3.00

CE 57900 - Structural Stability

Credit Hours: 3.00. Bending of structural members subjected to axial and lateral loads; buckling of compression members and frames in elastic and inelastic ranges, local buckling, lateral buckling of beams, design criteria. **Credits:** 3.00

CE 57910 - Foundations Analysis And Design

Credit Hours: 3.00. Exploration and engineering evaluation of subsoil and groundwater conditions for selection and design of foundations for structures and earth masses. Permission of instructor required.**Credits:** 3.00

CE 58000 - Advanced Geotechnical Engineering

Credit Hours: 3.00. Advanced treatment of topics in geotechnical engineering, including the engineering response to loading, soil properties, earth pressures, shear strength, soil compaction and fabric, permeability, and consolidation and settlement analysis. **Credits:** 3.00

CE 58300 - Slopes And Retaining Structures

Credit Hours: 3.00. Selected topics in soil response and technology needed in conventional geotechnical analysis and design; shearing behavior in clays; subsurface investigation; lateral earth pressures, retaining walls, and sheet pile walls; stability of slopes. **Credits:** 3.00

CE 58400 - Foundation Analysis And Design

Credit Hours: 3.00. Design of shallow foundations (isolated, combined, and strip footings), with specific attention to issues of mutual concern and interest to geotechnical and structural engineers. Review of factors that serve as the basis for selection of foundation type. Interpretation of subsurface exploration results. Settlement analyses and limit bearing capacity analyses. Communications and interaction between geotechnical and structural engineers. Structure and contents of a geotechnical report. Detailed treatment of geotechnical/structural design criteria and methodologies for various types of shallow and deep foundations. **Credits:** 3.00

CE 58700 - Soil Dynamics

Credit Hours: 3.00. Vibration of elementary systems, foundation vibratory theory, foundation design for vibratory loads, foundation isolation, wave propagation theory, response of soils to dynamic loading, dynamic soil properties, dynamic behavior of waste materials, field and laboratory methods for evaluation of dynamic soil properties, liquefaction of sands, vibratory compaction of granular materials. **Credits:** 3.00

CE 59100 - Advanced Structural Steel Design

Credit Hours: 3.00. Design and behavior of plate girders; design of composite beam and column members; behavior and design of bolted and welded connections, including moment-resistant connections, seated connections, and gusset-plate connections. **Credits:** 3.00

CE 59300 - Environmental Geotechnology

Credit Hours: 3.00. Review of regulations related to hazardous and solid waste disposal, including hazardous waste characterization. Discussion of contaminant transport in porous media and relationship with remediation technologies for hazardous waste sites. Discussions of soil properties relative to waste containment systems, soil stability, and permeability. **Credits:** 3.00

CE 59400 - Transportation Systems Analysis

Credit Hours: 3.00. Identifies concepts fundamental to the planning, design, operation, and management of transportation systems. Aims to impart a systems perspective to transportation problems. Incorporates concepts from economics, engineering, operations research, management, psychology, and public policy analysis. Topics include supply-demand microeconomic framework, analysis of transportation demand, system performance, network equilibrium, and associated case studies. **Credits:** 3.00

CE 59500 - Finite Elements In Elasticity

Credit Hours: 3.00. Fundamentals of theory of elasticity; variational principles; one-, two-, and three-dimensional elasticity finite elements; interpolation methods; numerical integration; convergence criteria; stress interpretation. **Credits:** 3.00

CE 59601 - Entrepreneurship And Business Strategy In Engineering

Credit Hours: 3.00. This course offers students the opportunity to learn and apply the core skills required to build and grow engineering- and technology-based businesses through lecture, case discussions, and weekly activities tied to a semester-long team project. Course content includes market analysis techniques to link technology attributes to opportunity and vice versa, combinatorial business design and planning methods, strategic innovation theories, competitive analysis, methods of emergent strategy and risk mitigation, as well as examination of team building, firm influence and navigation, and organizational design principles. Emphasis throughout is placed on the implications of research and development uncertainty, long-lifecycle economics, and the management of subcontracts and multi-disciplinary teams often encountered when developing and delivering complex engineering outputs. Case studies are used to contrast the challenges faced when creating new businesses (entrepreneurial) with those encountered in attempts to grow an existing enterprise (intrapreneurial). Coursework and project activities also facilitate development of business acumen, and skill building in conceptual thinking, synthesis, and persuasive communication. This course is particularly relevant for engineering students intending to progress into managerial roles in technology or R&D driven organizations. This course can be counted toward the College of Engineering Minor in Innovation and Transformational Change and the Burton D. Morgan Center for Entrepreneurship (BDMCE) Certificate in Entrepreneurship and Innovation. **Credits:** 3.00

CE 59700 - Civil Engineering Projects

Credit Hours: 0.00 to 18.00. Hours and credits to be arranged. Permission of instructor required. **Credits:** 0.00 to 18.00

CE 59800 - Graduate Professional Internship

Credit Hours: 0.00. Professional experience in Civil Engineering. This internship experience is intended to complement the student's academic coursework and help prepare the student for a career as a practicing engineer. Program coordinated by school with cooperating employers. Must complete one academic year in Civil Engineering. A written report is required. (May be repeated but may not be taken in successive semesters.) Permission of instructor required. **Credits:** 0.00

CE 59801 - Breakthrough Thinking For Complex Challenges

Credit Hours: 3.00. This course helps students learn and effectively employ high-impact design principles and structured problem solving methods to address complex multi-stakeholder socio-technical challenges. Case discussions of historical and contemporary high impact solutions to complex challenges are used to introduce techniques to frame problems, structure ambiguity, intentionally design non-incremental solutions, and communicate, trial, and iterate solutions to drive adoption and multifaceted sustainability. Techniques are drawn from multiple schools of thought such as business, design, engineering, and the social sciences. Over the course of the term, multidisciplinary student teams directly apply cumulative learning to address a real-world complex societal challenge in close collaboration with a partner organization in an experiential learning format. The course can be counted toward the College of Engineering Minor in Innovation and Transformational Change and the Burton D. Morgan Center for Entrepreneurship (BDMCE) Certificate in Entrepreneurship and Innovation. **Credits:** 3.00

CE 61400 - Statistical And Econometric Methods I

Credit Hours: 3.00. Basic and advanced statistical and econometric methods as applied to engineering-related problems. Introduction to ordinary least squares regression, count-data models including Poisson and Negative binomial regressions and their extensions, simultaneous equations models, multinomial logit models, ordered probability models, joint discrete/continuous models, and hazard-based duration models. Prerequisites: STAT 51100. **Credits:** 3.00

CE 63100 - Advanced Concrete And Aggregates

Credit Hours: 3.00. Microstructure of concrete. Physicochemical properties of cements and their hydration. Nature of hardened cement paste. Properties of aggregates. Workability, strength, shrinkage, creep, and fracture of concrete. Durability, freezing and thawing, air-entertainment, reactions of aggregates, chemical attack. Influence of microstructure on engineering properties of concrete. Prerequisite: CE 53000. **Credits:** 3.00

CE 65000 - Photochemical Reactors: Theory, Methods, And Applications Of Ultraviolet Radiation

Credit Hours: 3.00. This course provides comprehensive coverage of the foundational principles of photochemistry and fundamental photochemical reactor theory. Contemporary analytical and numerical methods used to simulate and design photochemical reactors are also presented, along with detailed presentations of several common and emerging applications of these devices. Prerequisite: CE 55000 or graduate status.**Credits:** 3.00

CE 66100 - Algorithms In Transportation

Credit Hours: 3.00. Modeling and analysis of transportation network problems through the design, analysis, and implementation of algorithms. Emphasis on the use of quantitative techniques of operations research to model system performance. Covers fundamental data structures, complexity analysis, memory management, recursive programs, application of graph theory and

network analysis to transportation problems, analytical formulations and solution algorithms for traffic assignment problems, and dynamic traffic assignment. Prerequisite: CE 59600 or IE 50100. **Credits:** 3.00

CE 67100 - Behavior Of Metal Structures

Credit Hours: 3.00. Study of the behavior of metal structural components and metal structural systems. The performance of civil engineering type metal structures in various loading environments is examined, and correlations between behavioral characteristics and various design specification requirements are reviewed. Primary emphasis is placed on the behavior of steel structures, although other metal systems also are discussed. Specific topics include material behavior, manufacturing processes, fatigue and fracture, bolting and welding procedures, and repair and retrofit techniques. Course material is augmented with a number of case studies. Prerequisite: CE 59100. **Credits:** 3.00

CE 67200 - Advanced Topics In Structural Engineering

Credit Hours: 1.00 to 3.00. A series of minicourses on special topics offered as CE 67000, CE 67200, etc. These special topic minicourses provide an opportunity for introducing students to topics of contemporary importance or special interest which fall outside the scope of the regular structural courses. Information about current offerings may be obtained from the schedule of classes or the structural engineering. **Credits:** 1.00 to 3.00

CE 67401 - Bridge Engineering

Credit Hours: 3.00. This course reviews a number of fundamental topics related to the structural design of highway bridges. Some of the key features include bridge types, aesthetics, structural analysis methods, vehicle load distribution, deck design and detailing, steel girder design, concrete girder design, integral abutment design, bearings, and construction. Concurrent prerequisites: CE 57200 and CE 59100. **Credits:** 3.00

CE 67500 - Finite Element Analysis

Credit Hours: 3.00. Theoretical basis of the finite element method; elements for use in the solution of two- and three-dimensional stress problems, plate-bending problems and shell problems; static and dynamic loadings; vibration and stability problems; geometrical or material nonlinearities; flow problems. Prerequisite: CE 57700 or 57800. **Credits:** 3.00

CE 67600 - Behavior Of Reinforced Concrete Members

Credit Hours: 3.00. Studies of the behavior and strength of reinforced concrete members, behavior of beam-columns, deflections, shear, bond, and cracking. Review of research and pertinent literature. Emphasis is placed on the background, use, and limitations of present design specifications. Prerequisite: CE 57600. **Credits:** 3.00

CE 68100 - Engineering Properties Of Soils

Credit Hours: 3.00. Engineering properties of soils, including compaction phenomena, with emphasis on strength and compressibility. Experiments to examine the nature and validity of strength and compressibility theories and their application to stability and settlement analysis. Measures of soil fabric; behavior of waste/marginal materials. Prerequisite: CE 48300. **Credits:** 3.00

CE 68200 - Ground Water And Seepage

Credit Hours: 3.00. Hydromechanics of confined and unconfined flow of water through soils, potential theory, conformal mapping transient flow. Applications to design of earth dams. Prerequisite: CE 483000. **Credits:** 3.00

CE 68400 - Geological Engineering

Credit Hours: 3.00. Principles describing the mechanical response of geomaterials subjected to disturbance by man. Relation between geology and engineering. Weathering and hydrothermal alteration of rock masses. Weathered rocks, problem soils, and transitional materials. Soluble rock terrain (karst). Applied geomorphology. Civil engineering design factors and case histories that relate to the behavior of rocks and sediments. Characterization of geomaterials behavior, exploration and measurement of their engineering properties. The focus of the course is on theoretical and practical solution of engineering problems. Prerequisite: CE 483000. **Credits:** 3.00

CE 68500 - Rock Mechanics

Credit Hours: 3.00. Mechanical properties governing rock behavior, from intact rock to fractured rock masses. Laboratory experiments and field tests. Failure criteria. Linear Elastic Fracture Mechanics. Rock mass deformability. Analytical and empirical approaches for the design and construction of civil engineering structures in rock masses. Slope stability. Bearing capacity of shallow and deep foundations. Prerequisite: CE 48300. **Credits:** 3.00

CE 68600 - Underground Construction

Credit Hours: 3.00. Planning, analysis, design, and construction of underground structures in soft ground and rock. Ground structure interaction. Static and seismic stresses on tunnel support. Relative stiffness method. Ground deformations. Construction methods, types of support, and their effects on the surrounding ground. The focus of the course is on the understanding of the interaction between ground and structure. Prerequisite: CE 48300. **Credits:** 3.00

CE 68901 - Plasticity Theory

Credit Hours: 3.00. The course covers stress analysis, strains analysis, elastic and inelastic constitutive relations, with emphasis on plasticity, and the solution of plastic boundary-value problems for a wide range of materials, including metals, soils and alloys of various types. Specific topics covered by the course include: tensors, stress analysis, strain analysis, laws of thermodynamics, basic concepts from elasticity, viscoplasticity as an extension of viscoelastic concepts, classical plasticity, principle of maximum plastic dissipation, Drucker's inequality, yield function and yield surface, flow rule, hardening rule, classical models (Tresca, Von Mises, Mohr-Coulomb, Drucker-Prager), bounding-surface plasticity, thermodynamics and constitutive models, causes of plasticity at the microstructural level, noncoaxial plasticity, limit analysis, method of characteristics (slipline method) and cavity expansion analysis. Prerequisite: AAE 55300 or ME 61200. **Credits:** 3.00

CE 69100 - Civil Engineering Seminar

Credit Hours: 0.00. An interdisciplinary seminar which provides a forum for invited speakers and staff to discuss new developments in practice and current research in civil engineering. **Credits:** 0.00

CE 69500 - Probabilistic Methods In Geotechnical Engineering

Credit Hours: 3.00. Examines the nature of particulate media and their description and characteristics. Compares deterministic and probabilistic approaches to the action and reaction of structures of, on, or in soil when subjected to loadings. Considers uncertainties in material parameters and their effect on designs. Stability is assessed in terms of reliability as well as customary factors of safety. Prerequisite: CE 58000. **Credits:** 3.00

CE 69700 - Civil Engineering Projects

Credit Hours: 0.00 to 18.00. Topics vary. Permission of instructor required. **Credits:** 0.00 to 18.00

CE 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required. **Credits:** 1.00 to 18.00

CE 69900 - Research PhD Thesis

Credit Hours: 1.00 to 18.00. Research PhD Thesis. Permission of instructor required. **Credits:** 1.00 to 18.00

Classics

CLCS 101CN - Ancient Greek Culture

Credit Hours: 3.00. This course is a historical and topical introduction to ancient Greek culture. From prehistorical to Hellenistic cultures, CLAS C1010 surveys the geography, economics, politics, philosophy, religion, society, technology, and daily lives of ancient Greeks by studying representative works of art, architecture, and literature.**Credits:** 3.00

CLCS 2350N - Classical Mythology

Credit Hours: 3.00. An introduction to Greek and Roman myths, legends, and tales, especially those which have an important place in the Western cultural tradition. Approved by Arts and Sciences for use in fulfilling the cultural studies requirement.**Credits:** 3.00

CLCS 18100 - Classical World Civilizations

Credit Hours: 3.00. Course introduces students to "Classical" civilizations on three continents (Europe, Africa, and Asia) demonstrably interconnected by an ancient world system. Course focuses on essential themes of past civilization: religion, philosophy, surviving texts, gender relations, urbanism, technology, social and political formations. **Credits:** 3.00

CLCS 22000 - Topics In Classical Literature

Credit Hours: 3.00. Selected topics in Greek and Roman literature. All readings in English translation. **Credits:** 3.00

CLCS 23010 - Survey Of Greek Literature In Translation

Credit Hours: 3.00. Introduction to Ancient Greek literature from homer to Plato. All readings in English. **Credits:** 3.00

CLCS 23100 - Survey Of Latin Literature

Credit Hours: 3.00. Highlights of literature written in Ancient Rome at times of political, social, and intellectual turbulence. Reading (all in English) includes Vergil's Aeneid, as well as selections from other influential Latin texts. **Credits:** 3.00

CLCS 23200 - Classical Roots Of English Words

Credit Hours: 3.00. This is an introduction to English etymology with emphasis on building vocabulary. Students will learn English derivatives from both classical Greek and Latin. All texts to be read in English. **Credits:** 3.00

CLCS 23300 - Comparative Mythology

Credit Hours: 3.00. Comparative study of the myths of major ancient cultures, with emphasis on shared typological features. **Credits:** 3.00

CLCS 23400 - Medical And Scientific Terminology From Greek And Latin Roots

Credit Hours: 3.00. Ninety to ninety-five percent of scientific technical vocabulary and medical terminology come from Latin and Greek roots and affixes. This course will enable students in scientific and medical disciplines to develop a foundational core of Greek and Latin roots and affixes from which they will be able to decipher and easily commit to memory the core terminology in the various sciences and medicine. **Credits:** 3.00

CLCS 23500 - Introduction To Classical Mythology

Credit Hours: 3.00. Study of the myths of western antiquity, as represented in ancient Greek and Latin texts and images. **Credits:** 3.00

CLCS 23600 - Ancient World Onscreen

Credit Hours: 3.00. How film represents ancient Mediterranean civilizations and retells ancient myths; how cinematic renderings of ancient history shape views of the past and how these are affected by contemporary sensibilities. No knowledge of Greek or Latin required. **Credits:** 3.00

CLCS 23700 - Gender And Sexuality In Greek And Roman Antiquity

Credit Hours: 3.00. How identities based on gender, sexual behavior and sexual desire, and socio-economic status are established in ancient Greece and Rome. Exploration of why these ancient views of gender and sexuality remain of continuing importance in the 21st century. All readings in English. **Credits:** 3.00

CLCS 23800 - The Tragic Vision

Credit Hours: 3.00. Greek and Roman tragedy from their beginnings until today. Readings in English from representative authors such as Aeschylus, Sophocles, Euripides, and Seneca; later receptions of ancient tragedy in drama and other media. Course may include performance, theories of comedy and tragedy, or recent and current expressions of the tragic in film and other media. **Credits:** 3.00

CLCS 23900 - The Comic Vision

Credit Hours: 3.00. This course investigates Greek and Roman comedy from their beginnings until today. The course will feature readings in English from representative authors such as Aristophanes, Menander, Plautus, and Terence, as well as later receptions of ancient comedy in drama and other media. This course may include performance, theories of comedy and tragedy, theories of humor, or recent and current expressions of the comic in film and other media. **Credits:** 3.00

CLCS 28000 - Topics In Classical Civilization

Credit Hours: 3.00. Selected topics in Ancient Civilization. **Credits:** 3.00

CLCS 33700 - The Ancient Epic

Credit Hours: 3.00. Study of the epic in four ancient cultures, with emphasis on its structure, nature, and social functions. Readings may include Gilgamesh, Iliad, Odyssey, Aeneid, Beowulf, Tain, Mahabharata, and others. **Credits:** 3.00

CLCS 38000 - Alexander The Great And Hellenistic World

Credit Hours: 3.00. Course examines the career of Alexander the Great and the rise of Macedonia in the Hellenistic Era. Topics include the emergence of Macedonia under Philip II; the achievements of Alexander the Great; and the wars of succession following his demise. **Credits:** 3.00

CLCS 38100 - Julius Caesar: Statesman, Soldier, Citizen

Credit Hours: 3.00. Course Examines the career of Julius Caesar by focusing on events from Caesar's birth (100 BCE) through his assassination in 44 BCE. Course places Caesar's complex personality within the context of political, military, economic, social, and cultural upheaval during the Late Roman Republic. **Credits:** 3.00

CLCS 38300 - The Roman Empire

Credit Hours: 3.00. Course examines developments from the Augustan Settlement to the end of the Roman Empire (27 BCE - 476 CE), along with aspects of religious, social, sexual and material culture throughout the Mediterranean at that time. **Credits:** 3.00

CLCS 38400 - Ancient Western Medicine

Credit Hours: 3.00. Historical and cultural study of Western medicine, from Mesopotamian origins to the late Roman Empire, based on written texts and archaeological evidence. Addresses the development of rational medical frameworks against the background traditional beliefs about illness as a sign of demonic possession, and charts the growth of the medical profession from individual avocation to institutional practice. **Credits:** 3.00

CLCS 38500 - Science, Medicine And Magic In The Ancient West

Credit Hours: 3.00. Study of the development of the idea of rationality in the West through examination of the evolution of Greek and Roman sciences, with emphasis on medicine and astronomy. **Credits:** 3.00

CLCS 38600 - Ancient Greek Religion

Credit Hours: 3.00. Study of the religious beliefs and practices of ancient Greece, based on written, artistic, and archaeological evidence of their forms and functions. **Credits:** 3.00

CLCS 38700 - Roman Religion

Credit Hours: 3.00. Study of the religious beliefs and practices of ancient Rome, based on written, artistic, and archaeological evidence of their forms and functions. **Credits:** 3.00

CLCS 48000 - Potters And Society In Antiquity

Credit Hours: 3.00. Course covers the range of eastern Mediterranean ceramics encountered in Rough Cilicia Archaeological Survey Project from the Bronze Age to the Later Roman Empire. Course also explores strategies employed by archaeologists and historians to exploit ceramics as research materials. **Credits:** 3.00

CLCS 48100 - Culture And Society In The Age Of Pericles

Credit Hours: 3.00. Course explores interrelationships between the emergence of Greek democracy and the cultural, political, social, and economic rise of Athens in the fifth century BCE. More broadly, course surveys history of the Greek world from the Late Bronze Age to 362 BCE. **Credits:** 3.00

CLCS 48300 - Republican Rome

Credit Hours: 3.00. Course examines the military, political, economic, and social developments that enabled the Roman people to expand from an Italian city-state to a trans-Mediterranean empire, and the consequences that initiated the decline and transition in their republican form of government. **Credits:** 3.00

CLCS 49900 - Special Topics In Classics

Credit Hours: 1.00 to 4.00. Special Topics in Classics. Permission of instructor required. **Credits:** 1.00 to 4.00

CLCS 59000 - Directed Reading In Classics

Credit Hours: 1.00 to 4.00. Directed readings in Classics. Permission of instructor required. **Credits:** 1.00 to 4.00

CLCS 59300 - Special Topics In Classical Literature

Credit Hours: 1.00 to 4.00. Special topics in Classical Literature. Permission of instructor required. **Credits:** 1.00 to 4.00

Clinical Pharmacy

CLPH 43500 - Pediatric Pharmacotherapy

Credit Hours: 2.00. This elective course will focus on the pharmacotherapeutics and pathophysiology of the more common disorders that apply to the pediatric population. The purpose of the course is to discuss the relevant differences between the adult and pediatric population in regards to the diagnosis, treatment options, desired therapeutic outcomes and therapeutic drug monitoring parameters. Instruction will be provided through a combination of lectures, case discussions, homework assignments, and group presentations. **Credits:** 2.00

CLPH 44800 - Therapeutic Case Studies

Credit Hours: 2.00. This course is intended to complement instruction of other courses in the second professional year of the Doctor of Pharmacy curriculum and to review many of the topics previously addressed in the Integrated Pharmacotherapy courses and Professional Program Laboratories. It is hoped that students who elect this course will enhance their development of a strong foundation of knowledge, clinical skills and abilities in order to meet the school's professional outcome abilities. Team-based problem-solving methodology will be utilized to discuss patient cases related to topics covered in the IP sequence. **Credits:** 2.00

CLPH 44900 - Introduction To Psychiatric Pharmacy Practice

Credit Hours: 1.00. This course that provides an overview of psychiatric pharmacy practice, introduction to stigma and diversity issues in mental illness, and disease state overviews in a lecture format. In one class period, the students are able to interact with 4th year pharmacy students and/or pharmacy residents who have worked or are working in the area of psychiatric pharmacy. Four of the class periods also provide live presentations and interactions with persons living with severe mental illness and mental health workers who work with them. Mental Health America of Tippecanoe County works with the instructor to schedule these

live presentations. Students are assessed for attendance and participation and also for a reflection written about each class period. **Credits:** 1.00

CLPH 45000 - Formulary Dossier Management

Credit Hours: 1.00. This course will focus on preparing students for competing in the annual Academy of Managed Care Pharmacy (AMCP) P&T Competition and is intended to give students a variety of experiences that will enhance their knowledge in analyzing complex therapeutic and pharmacoeconomic data, research and public presentation. The course offers an opportunity for students to engage in simulated formulary management by utilizing comparative studies andcost-effectiveness analysis to make real-life decisions on whether or not to add a drug to hospital or health plan formulary. Students will be paired into teams with each team consisting of 4 students. Each team will work independently to analyze the product dossier and prepare a monograph and presentation for the local and/or national competition. Course lectures will focus on information needed to accurately and adequately prepare students in completing the above noted tasks. Class participation is expected, and students will need to be able to engage in selfdirected learning outside of class to complete the project in a timely manner. All students are welcome. This course is not intended to focus on students from a specific professional year. **Credits:** 1.00

CLPH 45100 - Pharmacy Practical Training

Credit Hours: 1.00. Course allows students to gain practice-related employment experience in a pharmacy setting. Pre-approval of enrollment through ISS is required prior to employment experience. Permission of instructor required. **Credits:** 1.00

CLPH 45300 - Advanced Primary Literature Evaluation: A Focus On Therapeutic Issues

Credit Hours: 2.00. The purpose of this elective course is to enhance the primary literature evaluation skills of the student prior to clerkship rotations. The course is designed to meet the needs of students with an interest in pursuing post-graduate training programs to enhance their ability to discuss the medical literature. Instruction is provided through a combination of lectures and class discussions of recently published literature articles with a cardiovascular focus. **Credits:** 2.00

CLPH 45400 - Advanced Practice In Psychiatric Pharmacy

Credit Hours: 2.00. The purpose of this course is to provide the student with knowledge and insight regarding the use of medications in persons with mental illness. Instruction will be provided in the following areas (but not limited to): (1) psychiatric disease states; (2) psychiatric medications - usual dosing, adverse effects, drug interactions; (3) clinical use of psychiatric medications in psychiatric pharmacy practice; (4) useful and appropriate monitoring parameters; (5) the interaction of medical illness in the treatment of psychiatric disorders; (6) strategies to improve medication adherence and minimize adverse events; (7) utilization of recognized treatment guidelines in clinical care. Case-based learning will be utilized to emphasize important points in clinical use and monitoring of psychiatric medications and disorders. Permission of instructor required. **Credits:** 2.00

CLPH 45700 - Pharmaceutical Care In Developing Countries

Credit Hours: 2.00. This elective will emphasize the major disease states, rational drug selection, especially with a limited medication formulary, desired therapeutic outcomes, and the provision of complete pharmaceutical care to patients in developing countries. The impact of drug therapy on health care, economics, and quality of life for diverse populations will be emphasized. Students will prepare to provide care in a cross-cultural environment in which resources are limited. Instruction is provided through a combination of lectures, discussions, and presentations. Enrollment is limited to Doctor of Pharmacy students (068) DP-C status or by consent of course coordinator. **Credits:** 2.00

CLPH 45900 - International Advanced Pharmacy Practice Experience Preparation

Credit Hours: 1.00. This course is designed to help students who are participating in rotations based in London, Wales, Kenya or Colombia be prepared to practice upon arrival into your specified country. The course content will include intercultural learning, travel preparation and practice site knowledge. Permission of department and instructor permission required. **Credits:** 1.00

CLPH 49000 - Special Topics

Credit Hours: 1.00 to 3.00. An honors course to be used to relate to, and supplement, an existing course. Subject matter and method of approach individually directed by instructor. Permission of instructor required. **Credits:** 1.00 to 3.00

CLPH 63500 - Principles Of Pharmacokinetics And Pharmacodynamics

Credit Hours: 3.00. The goal of this is to provide students a comprehensive knowledge of concepts related to drug absorption, distribution, metabolism, excretion and action and the relationship to pharmacokinetics parameters such as bioavailability, clearance, volume of distribution, and half-life; and physiological and pharmacological factors affecting these parameters. At the end of the course, students are expected to communicate effectively, establish a basic understanding at a clinical utility skill level of fundamental PK and PD terminology and principles. Provide a working-knowledge level understanding of the mathematics of PK and PD. Clearly distinguish and characterize the use of PK/PD as tools in Research (Discovery), Drug Development (Characterize PK/PD), and Clinical Therapeutics (TDM, Drug Interactions). Provide participants with the basic skills of PK/PD providing an understanding of the scope, complexity and critical importance these disciplines to their use in Research, Drug Development, and Clinical Therapeutics. Permission of instructor required.**Credits:** 3.00

CLPH 65100 - Internship In Pharmacy Industry

Credit Hours: 0.00. The internship experience is a valuable opportunity for students to apply the procedures, theories, skills, and techniques learned in the graduate program to a professional work experience in the pharmaceutical industry or government agency. The internship is to be representative of the degree program and clinical work that provides students the opportunity to acquire invaluable work experience in the field outside of the academic setting. Permission of instructor required. **Credits:** 0.00

CLPH 65101 - Internship In Pharmaceutical Industry

Credit Hours: 1.00 to 3.00. The internship experience is a valuable opportunity for students to apply the procedures, theories, skills, and techniques learned in the graduate program to a professional work experience in the pharmaceutical industry or government agency. The internship is to be representative of the degree program and clinical work that provides students the opportunity to acquire invaluable work experience in the field outside of the academic setting. Permission of instructor required. **Credits:** 1.00 to 3.00

CLPH 69000 - Special Problems

Credit Hours: 1.00 to 3.00. Individual research topics pertaining to the practice of clinical pharmacy in institutions and the community. Permission of instructor required. **Credits:** 1.00 to 3.00

CLPH 69600 - Seminar In Pharmacy

Credit Hours: 1.00. Designed to provide the student with experience in the oral and written presentation of special topics of interest to clinical pharmacists and researchers. Discussion of current problems relating to the clinical practice of pharmacy. **Credits:** 1.00

Communication

COM 1140N - Fundamentals of Speech Communication

Credit Hours: 3.00. Theory and practice of public speaking; training in thought process necessary to organize speech content for informative and persuasive situations; application of language and delivery skills to specific audiences. A minimum of six speaking situations.**Credits:** 3.00

COM 10000 - Introduction To Communication Studies

Credit Hours: 1.00. This semester-long course will introduce students to many opportunities offered by the Brian Lamb School of Communication. Permission of department required. **Credits:** 1.00

COM 10200 - Introduction To Communication Theory

Credit Hours: 3.00. Overview of approaches treating communication as an individual, functional activity and as a social, structuring activity. Covers definitions and models of communication, core processes (interpretations, sending, receiving), structures (language, nonverbal behavior), and key contexts (personal, organizational, public). **Credits:** 3.00

COM 11400 - Fundamentals Of Speech Communication

Credit Hours: 3.00. A study of communication theories as applied to speech; practical communicative experiences ranging from interpersonal communication and small group process through problem identification and solution in discussion to informative and persuasive speaking in standard speaker-audience situations. NOTE: Concurrent registration is not permitted for ENGL 10600 and COM 11400. CTL:ICM 1103 Fundamentals Of Public Speaking**Credits:** 3.00

COM 20400 - Critical Perspectives On Communication

Credit Hours: 3.00. Introduction to critical thinking and writing about communication. Draws on humanistic and qualitative traditions to help students learn and apply critical approaches to understanding communication. **Credits:** 3.00

COM 21000 - Addressing Public Issues

Credit Hours: 3.00. Survey of argumentation and persuasion theories addressing contemporary public issues. Readings and discussions on cultural norms, audience reasoning, civic discourse, and constructing appeals addressing policies and practices. Preparation of appeals for public campaigns and social movements. **Credits:** 3.00

COM 21200 - Approaches To The Study Of Interpersonal Communication

Credit Hours: 3.00. A study of the basic characteristics of human communication and the theoretical and practical implications of these characteristics for various forms of oral communication. CTL:ICM 1101 Interpersonal Communication **Credits:** 3.00

COM 21700 - Science Writing And Presentation

Credit Hours: 3.00. Students learn to effectively communicate scientific and technical information both verbally and in writing to a variety of audiences.**Credits:** 3.00

COM 22400 - Communicating In The Global Workplace

Credit Hours: 3.00. This introductory course explores communication issues that arise in the global workplace. The course develops an appreciation of the relationship among culture, communication, and ways of organizing and doing business. **Credits:** 3.00

COM 25000 - Mass Communication And Society

Credit Hours: 3.00. A survey of the print, broadcast, and film media in their relationship and influence on society. Study topics include: mass communication theories, documentaries, commercialism, news media, media effects and control, feedback, educational broadcasting, and audience analysis. CTL:ICM 1102 Introduction To Mass Communication **Credits:** 3.00

COM 25100 - Communication, Information, And Society

Credit Hours: 3.00. This course provides an introduction to information and communication technologies, including media and computer-related technologies. Basic information and technical literacy skills are developed, while discussing fundamental concepts of mediated communication in 21st century contexts. **Credits:** 3.00

COM 25200 - Writing For Mass Media

Credit Hours: 3.00. Labor intensive course teaches basics of newspaper writing, broadcast writing, news releases, and online journalism. **Credits:** 3.00

COM 25300 - Introduction To Public Relations

Credit Hours: 3.00. An analysis of public relations theory and practice from their origins to the present. From a communication perspective, the course examines public relations environments, audiences, and message strategies. **Credits:** 3.00

COM 25600 - Introduction To Advertising

Credit Hours: 3.00. An analysis of commercial persuasion from colonial times to the era of mass communication. The course examines the structure of advertising messages, how they are adapted to specific audiences, and the social settings in which they occur.**Credits:** 3.00

COM 25700 - Public Relations Techniques

Credit Hours: 3.00. This class introduces students to a range of public relations techniques, with a focus on writing. From press releases to new media, this class offers practice and feedback on how to use common public relations tools. **Credits:** 3.00

COM 26099 - Professional Practice Parallel Co-Op Summer I

Credit Hours: 0.00. Cooperative Education (Co-Op) is an academic program with oversight provided by assigned Faculty Coordinators who serve as the Instructor for participating students. Parallel Co-Op program participants are undergraduate students, who work part-time (more than 11 hours per week and less than 30 hours per week) in paid positions during the academic year terms (fall and spring semesters) for an employer with a local business or office. During the summer term, Parallel Co-Op students work in part-time or full-time positions at any location offered by the employer. A minimum of a one-year commitment is required for Parallel Co-Op students and employers. During the academic year, Parallel Co-Op students register for 6 to 11 credit hours of academic course load, and also for an appropriate 0-credit hour Parallel Co-Op course that carries half-time student status to recognize the academic impact of the experience. The combination of both academic courses and Parallel Co-Op course registrations provides students with full-time status. During the summer term, Parallel Co-Op students register for a zero-credit hour Parallel Co-Op Summer course that carries full-time student status. Permission of Instructor required. **Credits:** 0.00

COM 26100 - Introduction To Digital Video Production

Credit Hours: 3.00. Basic production principles and practices. Emphasis on preplanning and conceptualizing skills in addition to practical production techniques. Required for admission to all television production courses. Permission of department required. **Credits:** 3.00

COM 27100 - Podcasting

Credit Hours: 3.00. This directed study is designed as an introduction to podcasting. Students in the course will learn about the structure and development of podcasting campaigns, then create their own weekly recording. Recording begins in the third week of classes, giving students 14 opportunities to develop their program.**Credits:** 3.00

COM 28500 - Introduction To Publication Design

Credit Hours: 3.00. Introduction to pre-press production of professional-quality publications. Emphasis on computer applications for publication layout, design and production. Topics include composition, readability, typography, graphic resolution, and color management systems.**Credits:** 3.00

COM 29199 - Cooperative Experience I

Credit Hours: 0.00. Professional experience in communication. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

COM 29299 - Cooperative Experience II

Credit Hours: 0.00. Professional experience in communication. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

COM 30300 - Intercultural Communication

Credit Hours: 3.00. Study of the complex relationship between culture and communication in a variety of interpersonal, group, organizational, and computer-mediated settings. Application of theory and research to development of the knowledge, attitudes, and skills associated with intercultural communication competence. **Credits:** 3.00

COM 30301 - Mentored Intercultural Communication Experience

Credit Hours: 1.00 to 3.00. This class is intended as a companion to a study abroad or international internship experience. Through a series of guided assignments that integrate experiential activities embedded in the host community with reflective writing that solicits feedback from both peers and an intercultural mentor, students will be challenged to develop intercultural competencies while living in a different culture.**Credits:** 1.00 to 3.00

COM 30390 - Intercultural Dialogue Facilitator Training

Credit Hours: 1.00. This theoretical and practical training introduces students to intercultural peer dialogue methodology and effective facilitation techniques. Students will engage in scaffolded dialogue experiences first as participants and then as co-leaders, building skills through reflection and guidance from a mentor. Permission from the Instructor is required.**Credits:** 1.00

COM 30399 - Intercultural Dialogue Facilitation Practicum

Credit Hours: 1.00. In an internship model, students apply the training they received in the Intercultural Dialogue Facilitator Training course. The aim of this course is to provide students with opportunities to hone their leadership and communication skills by facilitating peer dialogues. Each student taking this course is paired with a mentor who provides feedback to students and guides their goal-setting and reflection. The course may be repeated with other dialogue topics and/or participants for additional credit.**Credits:** 1.00

COM 30400 - Quantitative Methods For Communication Research

Credit Hours: 3.00. Introduction to the development and application of quantitative research methods pertinent to communication problems. Fundamental concepts of problem identification, reliability and validity of both measurement and research design, and statistical analyses of data. **Credits:** 3.00

COM 31100 - Copy Editing

Credit Hours: 3.00. Study of, and practice in, copyreading and headline writing. Laboratory practice includes copy editing on video-display terminals. **Credits:** 3.00

COM 31200 - Rhetoric In The Western World

Credit Hours: 3.00. An explanation of major theoretical and philosophical concepts concerning rhetoric; the relationships between rhetoric and political, social, and personal decisions are explored. Ancient and modern authors will be read. **Credits:** 3.00

COM 31400 - Advanced Presentational Speaking

Credit Hours: 3.00. Development of a marked degree of skill in the composition and delivery of various types of speeches including presentations in corporate board rooms, orientation meetings, banquet halls, public forms. Special emphasis on speeches related to the student's major vocational area. **Credits:** 3.00

COM 31500 - Speech Communication Of Technical Information

Credit Hours: 3.00. The organization and presentation of information of a practical technical nature. Emphasis is placed upon the study, preparation, and use of audiovisual materials in such presentations. **Credits:** 3.00

COM 31800 - Principles Of Persuasion

Credit Hours: 3.00. Persuasion and its effects, ranging from individual influences to societal impacts. Various perspectives and models of persuasion are examined, including classical and modern approaches. Both theoretical and pragmatic considerations are introduced.**Credits:** 3.00

COM 32000 - Small Group Communication

Credit Hours: 3.00. A study of group thinking and problem-solving methods; participation in, and evaluation of, committee, and informal discussion groups. Focus on the roles, networks, and messages employed by small group communicators. **Credits:** 3.00

COM 32400 - Introduction To Organizational Communication

Credit Hours: 3.00. An introduction to fundamental concepts and basic research related to communication behavior in organizational settings. Units cover message processing, leadership communication, communication climates, communication training, and communication audits. Students participate in an organizational simulation in some sections. **Credits:** 3.00

COM 32500 - Interviewing: Principles And Practice

Credit Hours: 3.00. Theory and practice of methods in selected interview settings: informational, employment, and persuasive. Emphasis on communication between two persons, questioning techniques, and the logical and psychological bases of interpersonal persuasion. **Credits:** 3.00

COM 32800 - Diversity At Work: A Rhetorical Approach

Credit Hours: 3.00. Introduces students to theories and experiences related to issues dealing with both diversity in the workplace and diversity at work to change or influence the world. **Credits:** 3.00

COM 33000 - Theories Of Mass Communication

Credit Hours: 3.00. An examination of mass communication theories and theorists. Readings and discussion of McLuhan, Lippman, De Fleur, Lazarsfeld, Schramm, Stephenson, and other significant contributors. **Credits:** 3.00

COM 33200 - Television Production

Credit Hours: 3.00. Basic principles of producing, writing, and directing for television. Treats program types and television criticism, and explores creative treatment of visual, artistic, and nonverbal elements of communication in television. Permission of department required.**Credits:** 3.00

COM 33600 - Advertising Media Strategy

Credit Hours: 3.00. Theory and practice of advertising as applied to advertising media strategy. Students build on a foundation of integrated marketing communication to develop digital advertising campaigns. **Credits:** 3.00

COM 33701 - Producing Digital Advertising

Credit Hours: 3.00. This course is designed as an advanced level production course. Through lectures, discussions, critiques, screenings, and various exercises, you will gain experience designing video advertisements. You will develop and refine critical viewing/listening abilities to effectively analyze video content for aesthetic elements and overall message. Additionally, you will apply production techniques pertaining to producing, directing, shooting and editing in the creation of projects for real clients. The coursework consists of three major video projects, and a series of assignments organized under the corporate role that would be performing those tasks.**Credits:** 3.00

COM 35100 - Mass Communication Ethics

Credit Hours: 3.00. A survey of various ethical approaches applied to situations confronting contemporary mass communicators, including misrepresentation in newsgathering, protection of sources, suppression of information, reporting of terror and violence, pressure from management and advertisers, and reporter bias. **Credits:** 3.00

COM 35200 - Mass Communication Law

Credit Hours: 3.00. Study of Anglo-American traditions and trends as well as current American conditions of the laws of libel, privacy, fair comment and criticism, privilege, property rights, and copyright as such factors affect the print journalist and the broadcaster. Emphasis is on existing state and federal regulations and precedents. **Credits:** 3.00

COM 35300 - Problems In Public Relations

Credit Hours: 3.00. Approaches to problems in public relations as they occur in industry, government, education, social agencies, and other institutions. **Credits:** 3.00

COM 35600 - Problems In Advertising

Credit Hours: 3.00. Approaches to problems in advertising as they involve the planning, creation, and evaluation of commercial messages. **Credits:** 3.00

COM 36000 - Forensics Practicum

Credit Hours: 1.00. Forensics is the study and practice of evidence-based argumentation. This course cultivates skills associated with researching and constructing arguments - and then applies these skills to contemporary societal, national, and global issues with an eye turned toward generating practicable solutions. Students will be required to move beyond passively consuming information to critically appraising information related to broadly general as well as highly specific and technical topics. The course also emphasizes the development of advanced argumentation and communication skills, as well as the application and adaptation of these skills to diverse audiences. Permission of instructor required. **Credits:** 1.00

COM 36001 - Mock Trial Practicum

Credit Hours: 1.00. This course prepares students to represent Purdue University in American Mock Trial Association competitions by focusing on legal reasoning, argumentation, and advocacy. Mock Trial students will become familiar with the United States' legal system and conduct a trial over a fictional civil or criminal case. Students develop and deliver opening statements, introduce and examine testimonial, physical, and demonstrative evidence, examine and cross examine witnesses, and develop and deliver closing statements. Permission of instructor required.**Credits:** 1.00

COM 36099 - Professional Practice Parallel Co-Op Summer II

Credit Hours: 0.00. Cooperative Education (Co-Op) is an academic program with oversight provided by assigned Faculty Coordinators who serve as the Instructor for participating students. Parallel Co-Op program participants are undergraduate students, who work part-time (more than 11 hours per week and less than 30 hours per week) in paid positions during the academic year terms (fall and spring semesters) for an employer with a local business or office. During the summer term, Parallel Co-Op students work in part-time or full-time positions at any location offered by the employer. A minimum of a one-year commitment is required for Parallel Co-Op students and employers. During the academic year, Parallel Co-Op students register for 6 to 11 credit hours of academic course load, and also for an appropriate 0-credit hour Parallel Co-Op course that carries half-time student status to recognize the academic impact of the experience. The combination of both academic courses and Parallel Co-Op course registrations provides students with full-time status. During the summer term, Parallel Co-Op students register for a zero-credit hour Parallel Co-Op Summer course that carries full-time student status. Permission of Instructor required. **Credits:** 0.00

COM 36100 - Multiplatform Journalism

Credit Hours: 3.00. This course is an introduction to video journalism, including critical examination of various styles of video journalism from news websites to local TV news to national/international television news programs. Students will produce video stories using video cameras and audio equipment to record interviews and natural sound, learn professional lighting techniques, find stories, interview for video, write scripts, review video journalism ethics, and related content.**Credits:** 3.00

COM 36199 - Professional Practice Parallel Co-Op Semester I

Credit Hours: 0.00. Cooperative Education (Co-Op) is an academic program with oversight provided by assigned Faculty Coordinators who serve as the Instructor for participating students. Parallel Co-Op program participants are undergraduate students, who work part-time (more than 11 hours per week and less than 30 hours per week) in paid positions during the academic year terms (fall and spring semesters) for an employer with a local business or office. During the summer term, Parallel Co-Op students work in part-time or full-time positions at any location offered by the employer. A minimum of a one-year commitment is required for Parallel Co-Op students and employers. During the academic year, Parallel Co-Op students register for 6 to 11 credit hours of academic course load, and also for an appropriate 0-credit hour Parallel Co-Op course that carries half-time student status to recognize the academic impact of the experience. The combination of both academic courses and Parallel Co-Op course registrations provides students with full-time status. During the summer term, Parallel Co-Op students register for a zero-credit hour Parallel Co-Op Summer course that carries full-time student status. Permission of Instructor required. **Credits:** 0.00

COM 36200 - Broadcast Performance

Credit Hours: 3.00. This course will immerse students in both the foundational concepts of broadcasting and nuanced performance techniques necessary to take the craft to the next level as on-camera/on-air presenters. Through hands-on, experiential learning, students will refine existing journalistic and creative skills (such as prior reporting, video production, hosting, anchoring, or online media experience) and also develop new talents and portfolio pieces.**Credits:** 3.00

COM 36299 - Professional Practice Parallel Co-Op Semester II

Credit Hours: 0.00. Cooperative Education (Co-Op) is an academic program with oversight provided by assigned Faculty Coordinators who serve as the Instructor for participating students. Parallel Co-Op program participants are undergraduate students, who work part-time (more than 11 hours per week and less than 30 hours per week) in paid positions during the academic year terms (fall and spring semesters) for an employer with a local business or office. During the summer term, Parallel Co-Op students work in part-time or full-time positions at any location offered by the employer. A minimum of a one-year commitment is required for Parallel Co-Op students and employers. During the academic year, Parallel Co-Op students register for 6 to 11 credit hours of academic course load, and also for an appropriate 0-credit hour Parallel Co-Op course that carries half-time student status to recognize the academic impact of the experience. The combination of both academic courses and Parallel Co-Op course registrations provides students with full-time status. During the summer term, Parallel Co-Op students register for a zero-credit hour Parallel Co-Op Summer course that carries full-time student status. Permission of Instructor required. **Credits:** 0.00

COM 36800 - Sociolinguistic Study Of African American English

Credit Hours: 3.00. A study of the history, structure, uses, and educational concerns of African American English in African American speech communities and the U.S. culture at large.**Credits:** 3.00

COM 37200 - Communication In Relationships

Credit Hours: 3.00. An examination of communication in personal relationships (including dating and marital relationships, friendships, and families) and professional relationships (including co-worker and supervisor-supervisee relationships and relationships in specific professions, such as doctor-patient and attorney-client). **Credits:** 3.00

COM 37400 - Social Interaction Skills: Assessment And Development

Credit Hours: 3.00. An examination of several major communication skills and procedures for their development. Focus is on skill measurement, methods of enhancement, assessment of training programs, and personal skill development. Skills examined include those for conversing, managing conflict, providing support, and influencing. **Credits:** 3.00

COM 37500 - Conflict And Negotiation

Credit Hours: 3.00. This course surveys theory and research focused on the role of communication in conflict and negotiation, and helps students develop skills needed to manage conflict effectively in their personal and professional relationships. **Credits:** 3.00

Students in the course will be responsible for the programming and promotion of the Brian Lamb School of Communication's channel space on Boiler TV. A mini internship experience is introduced in the second half of the semester, giving the student an opportunity to sample what these opportunities are like. **Credits:** 3.00

COM 45300 - Reporting Of Science News

Credit Hours: 3.00. Study of, and practice in, the techniques of gathering and reporting news of scientific developments to the general public through the examination of samples of science news and regular reporting exercises. Attention given to professional demands made of science reporters. **Credits:** 3.00

COM 45600 - Advertising Writing

Credit Hours: 3.00. The theory and practice of copy writing in various advertising contexts. **Credits:** 3.00

COM 46099 - Professional Practice Parallel Co-Op Summer III

Credit Hours: 0.00. Cooperative Education (Co-Op) is an academic program with oversight provided by assigned Faculty Coordinators who serve as the Instructor for participating students. Parallel Co-Op program participants are undergraduate students, who work part-time (more than 11 hours per week and less than 30 hours per week) in paid positions during the academic year terms (fall and spring semesters) for an employer with a local business or office. During the summer term, Parallel Co-Op students work in part-time or full-time positions at any location offered by the employer. A minimum of a one-year

commitment is required for Parallel Co-Op students and employers. During the academic year, Parallel Co-Op students register for 6 to 11 credit hours of academic course load, and also for an appropriate 0-credit hour Parallel Co-Op course that carries half-time student status to recognize the academic impact of the experience. The combination of both academic courses and Parallel Co-Op course registrations provides students with full-time status. During the summer term, Parallel Co-Op students register for a zero-credit hour Parallel Co-Op Summer course that carries full-time student status. Permission of Instructor required. **Credits:** 0.00

COM 46399 - Professional Practice Parallel Co-Op Semester III

Credit Hours: 0.00. Cooperative Education (Co-Op) is an academic program with oversight provided by assigned Faculty Coordinators who serve as the Instructor for participating students. Parallel Co-Op program participants are undergraduate students, who work part-time (more than 11 hours per week and less than 30 hours per week) in paid positions during the academic year terms (fall and spring semesters) for an employer with a local business or office. During the summer term, Parallel Co-Op students work in part-time or full-time positions at any location offered by the employer. A minimum of a one-year commitment is required for Parallel Co-Op students and employers. During the academic year, Parallel Co-Op students register for 6 to 11 credit hours of academic course load, and also for an appropriate 0-credit hour Parallel Co-Op course that carries half-time student status to recognize the academic impact of the experience. The combination of both academic courses and Parallel Co-Op course registrations provides students with full-time status. During the summer term, Parallel Co-Op students register for a zero-credit hour Parallel Co-Op Summer course that carries full-time student status. Permission of Instructor required. **Credits:** 0.00

COM 46400 - American Political Communication

Credit Hours: 3.00. This course examines the content, processes, and effects of communication within the American political system. Designed for students to experience the breadth of the field of political communication, the course emphasizes relevant theories and practical skills. **Credits:** 3.00

COM 46499 - Professional Practice Parallel Co-Op Semester IV

Credit Hours: 0.00. Cooperative Education (Co-Op) is an academic program with oversight provided by assigned Faculty Coordinators who serve as the Instructor for participating students. Parallel Co-Op program participants are undergraduate students, who work part-time (more than 11 hours per week and less than 30 hours per week) in paid positions during the academic year terms (fall and spring semesters) for an employer with a local business or office. During the summer term, Parallel Co-Op students work in part-time or full-time positions at any location offered by the employer. A minimum of a one-year commitment is required for Parallel Co-Op students and employers. During the academic year, Parallel Co-Op students register for 6 to 11 credit hours of academic course load, and also for an appropriate 0-credit hour Parallel Co-Op course that carries half-time student status to recognize the academic impact of the experience. The combination of both academic courses and Parallel Co-Op course registrations provides students with full-time status. During the summer term, Parallel Co-Op students register for a zero-credit hour Parallel Co-Op Summer course that carries full-time student status. Permission of Instructor required. **Credits:** 0.00

COM 47800 - Health Communication Campaigns

Credit Hours: 3.00. This course is an introduction to the processes and theories that are used to design both informational and persuasive health communication campaigns. The course will also introduce students to proper evaluation procedures to determine a campaign's efficacy. Students will be able to contribute to their portfolios by applying theory and primary research in the construction of a health communication campaign plan for a client. **Credits:** 3.00

COM 47900 - Introduction To Risk Communication

Credit Hours: 3.00. This course introduces students to theories that show how people express, perceive, exchange, and deliberate information about risk as well as how this understanding can be used to improve risk communication practice. This course examines risk communication theory and practice from multiple perspectives including social, psychological, cultural, and communicative.**Credits:** 3.00

COM 48900 - Research Experience In Communication

Credit Hours: 1.00 to 3.00. This course grants credit to students who participate in structured research projects within the Brian Lamb School of Communication. Permission of instructor required. **Credits:** 1.00 to 3.00

COM 49000 - Internship In Communication

Credit Hours: 1.00 to 6.00. Credit Hours: 3.00. This course examines the role of public relations and mass media in sports communication. It provides an understanding of the operation of sports media and communication and how sports information departments perform their functions. Emphasis is on written communication from athletics communication perspective. **Credits:** 3.00

COM 49502 - Travel Writing

Credit Hours: 3.00. Travel writing is writing about places, persons, and things in other places-also writing about how to travel, when to travel, and advice on traveling-all with the reader in mind. It's about relaying your travel experiences to others so that they may emulate them or at the very least not make the same mistakes you did. And it's writing about things in your own back yard that are exotic to everyone else-a local farmer's market, historic site, restaurant, museum. In this class, you will explore the various ways travel writers can excite and assist readers. **Credits:** 3.00

COM 49503 - Public Relations For Social Change

Credit Hours: 3.00. The overarching goal of this course is for students to work cooperatively with a community partner to identify, define and address that organization's PR problems and opportunities from a long-term, in-house perspective, building on the work of previous students and incorporating social change theory from a relationship management perspective of PR. The applied work of this course will have the dual benefit of providing students the opportunity to gain contextualized, real-world experience at PR problem-solving and advancing the mission of a nonprofit organization that is important to the wellbeing of the Greater Lafayette community as a whole. **Credits:** 3.00

COM 49504 - Social Media For Social Good

Credit Hours: 3.00. Nonprofit organizations advance their missions through communication. This course is designed to introduce students to the use of social media by nonprofit organizations to create their brand and reach stakeholders. It will focus on best practices and critically assess local nonprofits return on social media investment.**Credits:** 3.00

COM 49505 - Sports Communication

Credit Hours: 3.00. This class will help students learn to think critically about sports communication, but it will also help students learn to do sports communication. Through the use of sports books and movies, guest speakers, field trips, and case studies, students will learn not only about sports communication as a field of study and a profession, but also how they can be more thoughtful consumers of sports communication in its various forms. **Credits:** 3.00

COM 49507 - Executive Communication

Credit Hours: 3.00. This course defines executive communication, offers a rationale for its importance, provides a catalog of deliverables (or tactics) involved in the practice, teaches students how to create those deliverables, and provides students with the tools to serve as strategic advisors to senior leaders. The ultimate goal of the course is to help students become more well-rounded and successful communication professionals.**Credits:** 3.00

COM 49600 - Special Topics In Corporate Communication

Credit Hours: 3.00. This course offers students the opportunity to explore in-depth, thorough readings, lectures and written assignments on current issue in corporate communication. Topics may include diversity in the workplace, organizational assessments, or spirituality in organizations. Permission of instructor required. **Credits:** 3.00

COM 49700 - Special Topics In Mass Communication

Credit Hours: 3.00. Offers students the opportunity to explore in-depth, thorough readings, lectures and written assignments, a current topic or trend in Media, Technology and Society. Possible offerings include Media and Social Change, Online Communities, and Technology and International Communication. **Credits:** 3.00

COM 49701 - Live Sports Broadcasting Summer

Credit Hours: 1.00. In this experiential Live Sports Broadcasting course in partnership with the Lafayette Aviators, students will have the opportunity to work in the studio at Loeb Stadium in Lafayette, operate cameras on the field, produce promotional material to be used before, during, and after games, and interview players for segments on The Purdue Channel. The class spans the home season of the Aviators. Students are expected to register for all 3 1-credit modules in a summer. Permission of instructor required.**Credits:** 1.00

COM 49702 - Video Games And Society

Credit Hours: 3.00. This course focuses on video games as a form of mass communication. Primarily, this focus entails understanding how video games communicate to mass audiences, using features distinctive to video games, and how that communication might impact game players (i.e., media psychology). There is a secondary focus on how game players communicate with each other. The course will primarily examine these issues from social scientific perspectives. Topics include the influence of society on game creation, the impact of games on players, gaming cultures, and game industries.**Credits:** 3.00

COM 49800 - Practicum In Human Relations

Credit Hours: 3.00. This course provides students within the Human Relations major an opportunity for an internship or directed research. **Credits:** 3.00

COM 50000 - Introduction To Graduate Studies In Communication

Credit Hours: 3.00. Introduces basic conventions of the principles and procedures of scholarly research, surveys research methods utilized in the communication discipline, applies research methods to various subjects, and offers an overview of degree requirements. Course restricted to graduate students only. **Credits:** 3.00

COM 50200 - Classroom Communication

Credit Hours: 3.00. An introduction to fundamental concepts and basic research related to communicative behavior in the classroom. The primary focus is on the study and application of principles of effective classroom communication through personal inquiry. Among topics discussed are components of classroom communication, systematic observation as a method of studying classroom communication, and applications of systematic observation in a variety of classroom communication settings. Department permission required. **Credits:** 3.00

COM 50300 - Cross Cultural Communication

Credit Hours: 3.00. In this course, we examine the scholarly history of intercultural and cross-cultural communication along with conceptual and empirical challenges in doing this type of inquiry. Several contexts will be studied from the point of view of forms of cultural wisdom and variation in practices. Larger questions of idenity, diversity, and intercultural competence will be explored, especially through filters of globalization and ethical issues in intercultural relations. Students will have regular reading assignments, short reaction papers, give oral presentations, and write a final research paper or proposal, depending on their stage in their programs.**Credits:** 3.00

COM 50700 - Introduction To Semiotics

Credit Hours: 3.00. (ANTH 51900, AUSL 58900, ENGL 57000, LC 57000) The study of languages, literatures, and other systems of human communication. Includes a wide range of phenomena, which can be brought together by means of a general theory of signs. The course deals with three fundamental areas: 1) verbal communication, 2) nonverbal communication (iconic systems, gestures, body language, etc.), and 3) communication through art forms. **Credits:** 3.00

COM 50800 - Nonverbal Communication In Human Interaction

Credit Hours: 3.00. An examination of theoretical writings and critical studies in selected areas of nonverbal communication, e.g., the environmental influences, space and territory relationships, physical appearance and dress, physical behavior, and vocal cues. One unit will deal specifically with measurement, recording, or transcription methods used in nonverbal study. **Credits:** 3.00

COM 51200 - Theories Of Interpersonal Communication

Credit Hours: 3.00. Review of contemporary theories, analysis of concepts, models, and pertinent research across the broad spectrum of interpersonal communication. **Credits:** 3.00

COM 51800 - Theories Of Persuasion

Credit Hours: 3.00. Review of contemporary theories, including analysis of concepts, models, and pertinent research across the broad spectrum of persuasive communication. **Credits:** 3.00

COM 52000 - Small Group Communication

Credit Hours: 3.00. Survey and critical evaluation of theoretical and empirical literature dealing with human communication within small group settings. **Credits:** 3.00

COM 52700 - Introduction To Cultural Studies In Communication

Credit Hours: 3.00. An examination of selected cultural studies perspectives on mass communication. Covers cultural studies philosophies, theories, and/or approaches to the study of cultural artifacts and practices that may include some of the following: postmodernism, deconstruction, feminism, and postcolonialism, and privileging context as a means of understanding culture. **Credits:** 3.00

COM 53100 - Special Topics In Mass Communication

Credit Hours: 3.00. Critical analysis and evaluation of current and continuing problems in both commercial and public mass communication. **Credits:** 3.00

COM 55800 - Historical Trends In Mass Communication Research

Credit Hours: 3.00. An examination of research on the process and effects of mass communication. Early studies on radio and film effects, propaganda, attitude formation and change, public opinion and voting, and the interpersonal dimensions of mass communication. **Credits:** 3.00

COM 55900 - Current Trends In Mass Communication Research

Credit Hours: 3.00. An examination of current research as it contributes to understanding the process and effects of mass communication. Topics covered include gatekeepers and information control, audience selection processes and uses of the media, persuasive effects of the media, media content and social learning, the effects of adult programming on children, and the effects of the media on the governmental process. **Credits:** 3.00

COM 56500 - Sociolinguistics

Credit Hours: 3.00. (ANTH 56500, AUSL 56500, ENGL 56500, LC 56500) An introduction to language in its social context, focusing on uses and users of language. Topics include social class, ethnic group, gender, language attitudes, and bilingualism. **Credits:** 3.00

COM 57400 - Organizational Communication

Credit Hours: 3.00. Survey of the theoretical and empirical literature dealing with human communication behavior as it occurs within the context of complex organizations. Among topics covered are superior-subordinate communication, communication

networks, message distortion, feedback processes, internal corporate mass media, managerial-communication climate, semantic and stylistic dimensions of messages, and communication in decision making. **Credits:** 3.00

COM 57600 - Health Communication

Credit Hours: 3.00. Survey of health communication theory and research. Examines issues such as patient-provider and everyday communication, broader community-societal discourse, and organizational and mass health communication. Prepares participants for subsequent more specialized seminars and enriched study in allied specialties. **Credits:** 3.00

COM 58200 - Descriptive/Experimental Research In Communication

Credit Hours: 3.00. Introduction to the fundamental tools of quantitative research in communication, including data analysis, statistical design and methods, basic measurement concepts, and designs for descriptive and experimental research. Individual and/or group research projects are planned, conducted, and reported. Permission of instructor required. **Credits:** 3.00

COM 58500 - Qualitative Methods In Communication Research

Credit Hours: 3.00. An introduction to qualitative research methods in communication studies. Provides students with an overview of several techniques for, and issues in, gathering, analyzing, writing-up, and using qualitative data. Department permission required. **Credits:** 3.00

COM 59000 - Directed Study Of Special Problems

Credit Hours: 1.00 to 3.00. Directed study of special problems. Permission of instructor required. **Credits:** 1.00 to 3.00

COM 59700 - Special Topics In Communication

Credit Hours: 3.00. Seminar of current topics of interest within the discipline of communication. **Credits:** 3.00

COM 60000 - Foundations Of Human Communication Inquiry I

Credit Hours: 3.00. Introduces doctoral students to major and emerging approaches to understanding human communication and provides them with the theoretical background and analytic skills needed to navigate the tensions among these approaches. Reviews the intellectual history of communication inquiry, overviews traditional and innovative questions about human communication, examines the ways in which these questions can be addressed from different perspectives, addresses some of the varied forms that knowledge about human communication can take, and explores how different research traditions go about making and warranting knowledge claims. **Credits:** 3.00

COM 60100 - Foundations Of Human Communication Inquiry II

Credit Hours: 3.00. Following COM 60000, this course continues to introduce doctoral students to major and emerging approaches to understanding human communication and provides theoretical background and analytic skills needed to navigate the tensions among these approaches. Reviews the intellectual history of communication inquiry, overviews traditional and innovative questions about human communication, examines the ways in which these questions can be addressed from different perspectives, addresses some of the varied forms that knowledge about human communication can take, and explores how different research traditions go about making and warranting knowledge claims. Prerequisite: COM 60000. **Credits:** 3.00

COM 60111 - Seminar In Strategic Communication

Credit Hours: 3.00. This graduate course will survey the theories and processes of strategic communication and its practice by business, government, politicians, and non-profits - in domestic and international arenas. The course will emphasize the application of theory to provide an in-depth understanding of planning, executing, and evaluating strategic communication plans. Prerequisite: Graduate student in communication. Permission of department required. **Credits:** 3.00

COM 60211 - Seminar In Global Strategic Communication

Credit Hours: 3.00. This course provides students with a global perspective in strategic communication and provides knowledge and understanding of how to address communication issues with international audiences. This class emphasizes such questions as how strategic communication plans can be successfully implemented in other countries and how plans can be measured and evaluated. Prerequisites: Graduate student in communication and COM 60111. Permission of department required. **Credits:** 3.00

COM 60311 - Seminar In Crisis Communication

Credit Hours: 3.00. This graduate course will focus on how to communicate in a time of crisis in order to manage the situation and disseminate key messages to various stakeholders. Prerequisite: Graduate student in Communication and COM 60111. Permission of department required. **Credits:** 3.00

COM 60411 - Seminar In Communication Research Methods

Credit Hours: 3.00. This graduate course serves as the methodological foundation of strategic communication. Students in this class will survey core research methods (qualitative and quantitative) in professional and applied settings. This class is fully online. Students will interact with faculty and other students throughout the week. Permission of department required. **Credits:** 3.00

COM 60511 - Strategic Communication And Professional Writing

Credit Hours: 3.00. This graduate course covers topics related to professional writing and strategic communication. Topics include grammar basics, audience considerations, credibility and ethics, and documentation style. In addition, writing will be discussed in a variety of contexts such as media, public relations, advertising, and business communication. Permission of department required. **Credits:** 3.00

COM 60611 - Seminar In Financial And Investor Relations

Credit Hours: 3.00. This course will provide students with a theoretical and practical overview of theory and practice in financial and investor relations. Student will learn about how the potential investors in public companies are and how to reach them. An emphasis will be placed on communicating with investors to facilitate informed investor decision-making. Prerequisite: COM 60111 Permission of department required. **Credits:** 3.00

COM 60711 - Strategic Communication And Fundraising Management

Credit Hours: 3.00. This graduate course serves as an introduction to the concepts, elements, and best practices of fundraising. Permission of department required. **Credits:** 3.00

COM 60811 - Leadership And Global Strategic Communication

Credit Hours: 3.00. Over the last decade, the field of strategic communication has grown rapidly. The work of strategic communication professionals requires coordinated responses between distinct organizational units that are often separated by time and space. These conditions necessitate effective leadership. Further complicating leadership in these contexts is the fact that the work of strategic communication has increasingly become global in nature. This course provides students with theoretical

background in leadership and global strategic communication, as well as the opportunity to apply what they learn to strategic communication cases and to their own professional experiences. It also encourages them to think proactively about leadership challenges in these contexts and to articulate theoretically-informed analyses and evaluations of leadership in action. Permission of department required. **Credits:** 3.00

COM 60911 - Strategic Public Relations

Credit Hours: 3.00. Strategic communication is composed, in part, of integrated marketing communication (IMC), advertising, and public relations. This course highlights public relations scholarship, which is one of the strengths of the Brian Lamb School of Communication. As such, it builds on the general strategic communication course by providing an in-depth understanding of public relations. Specifically, the class will cover public relations theories, ethics, concepts, principles, and applications. Permission of department required. **Credits:** 3.00

COM 61000 - Special Topics In Public Relations

Credit Hours: 3.00. Intensive study, varying from semester to semester, in public relations. Permission of instructor required. **Credits:** 3.00

COM 61011 - Strategic Communication And Ethics

Credit Hours: 3.00. This graduate course introduces the application of ethical principles and decision making. In this course, students will study both philosophical and practical ethical questions related to strategic communication. Permission of department required. **Credits:** 3.00

COM 61200 - Seminar: Special Topics In Interpersonal Communication

Credit Hours: 3.00. Intensive study of selected topics, varying from semester to semester, from the theoretical and research literature of interpersonal communication. Topics may include communication models, information theory, systems theory, general semantics, sociolinguistics, etc., as they relate to the study of interpersonal communication. Prerequisite: COM 51200. **Credits:** 3.00

COM 62100 - Seminar: Special Topics In Rhetorical Theory

Credit Hours: 3.00. Intensive study of selected topics, varying from semester to semester, from the literature of rhetorical theory. Prerequisite: COM 521 **Credits:** 3.00

COM 62111 - Seminar In Strategic Communication And Social Media

Credit Hours: 3.00. This course will provide an overview of social media and its relationship to strategic communication. Students will learn about the available forms of social media (e.g., Blogs, Social Networks, and Wikis) as well as their uses, strengths and weaknesses for building and managing relationship with stakeholders. Students will also gain exposure to methods for analyzing social media metrics as a framework for evaluating the effectiveness of social media strategies as tools for developing corporate, nonprofit, and governmental images and brands. Permission of department required. **Credits:** 3.00

COM 62411 - Focus Groups And Interviewing For Strategic Communication

Credit Hours: 3.00. This course provides students with an overview of qualitative research in public relations with a particular emphasis on focus group and interview methodologies. The course will consider practical applications of these protocols in strategic communication contexts. Prerequisite: COM 60411 Permission of department required. **Credits:** 3.00

COM 62511 - Survey Design, Analysis, And Reporting For Strategic Communication

Credit Hours: 3.00. This course provides students with an overview of quantitative research in public relations with a particular emphasis on survey design analysis. The course will cover the design and delivery of questionnaires, the use and interpretation of descriptive and inferential statistical methods, and reporting of quantitative results. The course will consider practical applications of these methods in professional strategic communication contexts. Prerequisite: COM 60411 Permission of department required. **Credits:** 3.00

COM 63200 - Seminar: Special Topics In Mass Communication

Credit Hours: 3.00. Intensive study of selected topics, varying from semester to semester, from the literature of mass communication. Topics may include institutional analysis, mass communication law, information diffusion, uses of mass communication, or other issues. Permission of instructor required. **Credits:** 3.00

COM 64011 - Seminar In Advertising

Credit Hours: 3.00. This course provides an overview of the strategic planning process for advertising including identifying the target audience, determining a positioning strategy and developing a communication media strategy. The course will provide information on theory and best practices that inform the planning and implementation process for successful advertising campaigns. **Credits:** 3.00

COM 64100 - Integrated Marketing Communication

Credit Hours: 3.00. Developing cohesive and integrated external and internal communication initiatives across traditional and social media channels is becoming increasingly important for strategic communication professionals. Traditionally, Public Relations, Marketing, and Advertising/Promotion have had separate functions; increasingly the role of strategic communication practitioners is to ensure the consistency of the brand story and message across all channels of communication. Prerequisites: Students must be admitted into the Online Masters of Science of Communication program. COM 60111. **Credits:** 3.00

COM 64200 - Persuasive Communication

Credit Hours: 3.00. This course focuses on the creation of persuasive messages in a variety of contexts from interpersonal to mass media. Specifically, students will review several of the prominent persuasion theories and models and examine the message, audience, and situational characteristics that influence the success of persuasive efforts. Understanding these theories and factors can assist students in the development of persuasive messages and persuasive strategies. Prerequisites: Students must be admitted into the Online Masters of Science of Communication program. COM 60111 **Credits:** 3.00

COM 64400 - Strategic Personal Branding

Credit Hours: 3.00. This graduate course will examine the theories and processes of personal brand development and self-marketing. The course will examine best practices, trends, and creative strategies used in contemporary personal branding. An emphasis will be placed on experiential learning, self-awareness, image and perceptual management, career development, self-promotion, brainstorming, and effective communication. **Credits:** 3.00

COM 64500 - Healthcare Communication

Credit Hours: 3.00. The healthcare environment is increasingly complex, and poses many challenges for communication professionals seeking to improve communication with key health industry stakeholders, including patients, providers, payers, government agencies, and others. This course provides an overview of a broad range of unique communication challenges associated with health and the healthcare industry. Topics include review and discussion of key issues such as, major health

communication theories, issues associated with patient-provider interaction, adoption and use of health information and communication technologies, the development and implementation of health campaigns and other behavior change initiatives, and marketing and public relations issues commonly faced by healthcare organizations. Prerequisites: Students must be admitted into the Online Masters of Science of Communication program. COM 60111 **Credits:** 3.00

COM 64600 - Strategic Corporate Branding

Credit Hours: 3.00. This graduate course will survey the theories and processes of business brand design, development, and implementation. The course will examine best practices, trends, and creative strategies used in contemporary business branding. An emphasis will be placed on experiential learning, case study analysis, and the application of relevant theory to provide an in-depth understanding of the development, planning, execution, and evaluation of business brands. **Credits:** 3.00

COM 65000 - Communication And Leadership

Credit Hours: 3.00. Communication is the essence of leadership, and this course aims to identify how communication can fuel productivity, drive consensus and push the organization to a leadership position within a market. At the same time, communication can sabotage one's success or be used as a weapon to silence voices and promote political agendas. This course aims to empower you to shape leadership throughout the organization and to know how to advise other leaders in their efforts to overcome communication challenges. Permission of department required. **Credits:** 3.00

COM 65100 - Organizational Culture And Internal Communication

Credit Hours: 3.00. The modern workplace had transformed well before a global pandemic magnified the paradigm shift already under way. In the United States, both consumers and the first five-generation workforce began to demand more from brand statements and value propositions. Those demands include genuine commitment to inclusion and diversity internally and corporate social responsibility externally. This course highlights the vital role professional communicators have in conveying brand and value statements that emanate from the organization's cultural core and carry forward to the consumer universe. **Credits:** 3.00

COM 65200 - Communication Education And Training

Credit Hours: 3.00. This course is designed to introduce fundamental concepts related to learning theory and learning design as applied to training and educational settings. The course will examine best practices and strategies with a focus on assessing and enhancing communication-related skills.**Credits:** 3.00

COM 65500 - Health Advocacy

Credit Hours: 3.00. This course considers how federal, state, and local policy influence health status and health improvement. Through this course students gain an understanding of the role of health communication campaigns in health advocacy efforts. To engage their understanding, students will apply an advocacy campaign model to address a relevant health issue. **Credits:** 3.00

COM 67400 - Seminar: Special Topics In Organizational Communication

Credit Hours: 3.00. Intensive study of selected topics, varying from semester to semester, from the theoretical and research literature of organizational (including business and industrial) communication; analysis of recurring communication problems in complex organizations; critique of research findings and methodologies. **Credits:** 3.00

COM 67600 - Seminar: Special Topics In Health Communication

Credit Hours: 3.00. Intensive study of selected topics, varying from semester to semester, from the theoretical and research literature on health communication. Prerequisite: COM 57600 **Credits:** 3.00

COM 68200 - Seminar: Special Topics In Quantitative Research

Credit Hours: 3.00. Intensive study, varying from semester to semester, of different aspects and applications of quantitative research in communication. Prerequisite: COM 58200 **Credits:** 3.00

COM 69500 - Curricular Practical Training

Credit Hours: 1.00 to 3.00. Internship providing practical field experience under professional supervision in selected situations related to the student's area of specialization. Good standing in the graduate program of the Department of Communication and an approved plan of study including the internship. Permission of instructor required. **Credits:** 1.00 to 3.00

COM 69800 - Research MA Or MS Thesis

Credit Hours: 1.00 to 18.00. Research MA Or MS Thesis. Permission of instructor required. **Credits:** 1.00 to 18.00

COM 69900 - Research PhD Thesis

Credit Hours: 1.00 to 18.00. Research PhD Thesis. Permission of instructor required. **Credits:** 1.00 to 18.00

Comparative Literature

CMPL 23000 - Crossing Borders: Introduction To Comparative Literature

Credit Hours: 3.00. (LC 23000) Foundations for comparison of works in different languages, thematic (philosophical, sociological, psychological), and structural (genre, composition, use of linguistic devises); parallel interrelation of theme and structure in works of different literatures. The importance of literary norms and systems of genres. Examination of crosscurrents in different literatures during successive periods of development. **Credits:** 3.00

CMPL 23700 - Our Common Bond: Languages And Cultures In A Global Context

Credit Hours: 3.00. (LC 23700) Students learn what lies behind the concept of Liberal Arts: the capabilities, insights and skills of individuals who think critically and freely. It exposes students from across the university to the ideas, skill-set and inspiration that emanates from the liberal arts. They will be introduced to the discipline of Comparative Literature by examining the specific roles that languages and cultures play in the globalized world. The course also demonstrates how a Language and Cultures degree will put students at a greater advantage in career opportunities. **Credits:** 3.00

CMPL 26600 - World Literature: From The Beginnings To 1700 A D

Credit Hours: 3.00. (ENGL 26600) World literature in translation. A comparative and chronological survey of the masterpieces of Eastern and Western literature. **Credits:** 3.00

CMPL 26700 - World Literature: From 1700 A D To The Present

Credit Hours: 3.00. (ENGL 26700) World literature in translation. A comparative and chronological survey of the masterpieces of Eastern and Western literature. **Credits:** 3.00

CMPL 33000 - International Cinema

Credit Hours: 3.00. This course is designed to develop students' seeing, reading, speaking, writing, and critical thinking skills, and especially to improve visual competency, awareness of visual culture, and knowledge of selected international cinema. All films will be shown with English subtitles. **Credits:** 3.00

CMPL 49000 - Special Topics In Comparative Literature

Credit Hours: 3.00. Topics vary from section to section.**Credits:** 3.00

CMPL 59000 - Directed Reading In Comparative Literature

Credit Hours: 1.00 to 3.00. Directs the reading of students with special interests. Guides students in profitable reading in subjects of their own choice. Individual conferences. No class meetings. Permission of instructor required. **Credits:** 1.00 to 3.00

CMPL 63000 - Comparative Literature: Function And Methods

Credit Hours: 3.00. (LC 63000) An introduction to methods, problems, and the bibliographical tools pertaining to comparative study. **Credits:** 3.00

CMPL 65000 - Seminar In Comparative Literature

Credit Hours: 3.00. (ENGL 66500 and LC 63900) Exploration of a significant topic in comparative literature, e. g., the arts of translation, thematology, genre studies, literary movements, literary relations among countries. **Credits:** 3.00

CMPL 69900 - Research PhD Thesis

Credit Hours: 1.00 to 18.00. Research PhD Thesis. Permission of instructor required. **Credits:** 1.00 to 18.00

Comparative Pathobiology

CPB 15000 - Clinical Pathology I-DL

Credit Hours: 2.00. This course is the first of three courses that provide basic instruction in the concepts of clinical pathology to the veterinary technician student. This course will place an emphasis on the terminology used in clinical pathology, as well as red blood cell production, function, and morphology. **Credits:** 2.00

CPB 15100 - Clinical Pathology II-DL

Credit Hours: 1.50. This course is the second of three courses that provide basic instruction in the concepts of clinical pathology to the veterinary technician student. This course will place an emphasis on white blood cell production, function, as well as white blood cell morphology characteristics and identification. **Credits:** 1.50

CPB 15200 - Clinical Pathology III-DL

Credit Hours: 1.00. This course is the third of three courses that provide basic instruction in the concepts of clinical pathology to the veterinary technician student. This course will place an emphasis on the basic concepts of clinical chemistry, urinalysis evaluation, as well as the fundamentals of cytological sample handling and evaluation. **Credits:** 1.00

CPB 22500 - Parasitology For Veterinary Technicians I - DL

Credit Hours: 1.00. This course is the first of two courses that provide basic instruction in the concepts of parasitology for the veterinary technician student. This course will place an emphasis on the basic information needed to accurately identify parasites commonly encountered in veterinary medicine. Emphasis will be placed on life cycles and the zoonotic aspects of the parasites. **Credits:** 1.00

CPB 22600 - Parasitology For Veterinary Technicians II - DL

Credit Hours: 1.00. This course is the second of two courses that provide basic instruction in the concepts of parasitology for the veterinary technician student. This course will place an emphasis on the basic information needed to accurately identify parasites commonly encountered in veterinary medicine. Emphasis will also be placed on life cycles and the zoonotic aspects. Students are expected to be able to make accurate identifications and to communicate effectively. **Credits:** 1.00

CPB 25500 - Clinical Pathology-VN

Credit Hours: 4.00. Basic instruction in clinical pathology, including theory and techniques of hematology, clinical chemistry, urinalysis, cytology, and specimen handling. **Credits:** 4.00

CPB 35100 - Microbiology-VN

Credit Hours: 2.00. Biology and laboratory identification of bacteria and fungi that cause infectious diseases in animals. Emphasis will be placed on the collection of specimens for culture, the isolation and identification of pathogenic organisms, and antibiotic susceptibility testing. Procedures and commercial systems available to veterinary practices will be utilized.**Credits:** 2.00

CPB 35200 - Parasitology-VN

Credit Hours: 2.00. Biology and life cycles of selected protozoan, helminth, and arthropod parasites of veterinary importance. Emphasis will be placed on laboratory procedures for the identification of common parasites of domestic and laboratory animals.**Credits:** 2.00

CPB 46400 - Clinical Toxicology-VN

Credit Hours: 2.00. The common toxicants and advanced topics on the drugs most commonly encountered in veterinary medicine. Emphasis is on mechanisms, indications, contraindications, and proper applications and handling of these drugs. Permission of department required.**Credits:** 2.00

CPB 48000 - Seminar In Animal Welfare And Human-Animal Interaction-VN

Credit Hours: 2.00. This course will be required for students involved in the interdisciplinary Animal Welfare and Societal Concerns program of study. Seminar in Animal Welfare and Human-Animal Interaction is for discussion of current topics in animal welfare and other areas involving the interaction of humans and animals. Outside speakers will present their perspectives in various areas. Journal articles will also be presented and discussed.**Credits:** 2.00

CPB 57600 - Biology And Management Of Laboratory Animals

Credit Hours: 2.00. A didactic course focusing on basic principles of the biology of laboratory animals and how they are managed in a vivarium. Covers regulatory aspects, anatomy, biological techniques, research uses, and management of mice, rats,

hamsters, guinea pigs, gerbils, other rodents, rabbits, dogs, carts, ferrets, and various species of primates, reptiles, and avians in experimental applications. Offered in alternate years. Permission of department required.**Credits:** 2.00

CPB 57800 - Animal Models Of Human Disease

Credit Hours: 2.00. A mixed didactic and discussion course focusing on animal models used in biomedical research. Didactic instruction on principles of model development and use will be coupled with student presentations of models currently used in various research disciplines or disease states. Advantages and limitations of research with various spontaneous and experimentally induced models of human disease, including genetically engineered models. Offered in alternate years. **Credits:** 2.00

CPB 57900 - Seminar In Comparative Medicine

Credit Hours: 2.00. A discussion course focusing on current issues of laboratory animal medicine. Review of current activities, health surveillance reports, etc. Selected cases are presented in detail, including clinical presentation, interpretation of diagnostic tests, and gross and microscopic pathology. In addition, this seminar includes discussions on animal resource management; surgery; animal experimentation; current journal reports; zoonoses; and clinical animal disease diagnosis, prevention, treatment, and control, and other species and topics not formally covered in other core courses. **Credits:** 2.00

CPB 58000 - Special Topics

Credit Hours: 1.00 to 4.00. Directed readings, discussions, and other intensive studies in specialized topics of the disciplines of the department. The topic of study will be selected and announced prior to the semester offered and will be indicated in the student's record. Permission of instructor required. **Credits:** 1.00 to 4.00

CPB 59000 - Special Topics In Animal Welfare And Human-Animal Interaction

Credit Hours: 1.00 to 4.00. Individual study and directed readings in specialized areas of interest of animal welfare or human-animal interaction either for advanced undergraduate or beginning graduate students. Permission of instructor required. **Credits:** 1.00 to 4.00

CPB 60000 - Special Problems In Pathology

Credit Hours: 0.00 to 4.00. Selected problems in veterinary pathology. The topic will be indicated in the student's record. Permission of instructor required. **Credits:** 0.00 to 4.00

CPB 60100 - Advanced Veterinary Clinical Pathology

Credit Hours: 0.00 to 8.00. Comparative hematology, clinical chemistry, diagnostic cytology, and surgical microscopic pathology in the diagnosis of diseases of animals, including laboratory application. Prerequisite: DVM degree. Permission of instructor required. **Credits:** 0.00 to 8.00

CPB 60200 - Advanced Veterinary Anatomic Pathology

Credit Hours: 0.00 to 8.00. Comparative gross and microscopic pathology in the diagnosis of diseases of animals. Prerequisite: DVM degree. Permission of instructor required. **Credits:** 0.00 to 8.00

CPB 60300 - Graduate Teaching Practicum

Credit Hours: 1.00. Graduate students assist in running the laboratory sessions in a sophomore DVM course. They also grade exams and may give one lecture in or make a scholarly contribution to the course. Permission of instructor required. **Credits:** 1.00

CPB 60400 - Neoplastic Diseases Of Animals

Credit Hours: 3.00. Histogenesis and structure of neoplasms of animals; consideration of clinical and pathological entities within groups of neoplasms. Prerequisite: CPB 55600. **Credits:** 3.00

CPB 60500 - Pathology Of Avian Diseases

Credit Hours: 2.00. Avian diseases presented from a gross and histopathological viewpoint. Pathogenesis and differential diagnosis of avian diseases discussed. Prerequisite: DVM degree. **Credits:** 2.00

CPB 61100 - Veterinary Pathology Literature Review Seminar

Credit Hours: 1.00. Understanding of principles of veterinary pathology is required. The class will provide the graduate students with in-depth knowledge in current pathology research and diagnostics. Permission of department required.**Credits:** 1.00

CPB 61400 - Topics In Advanced General Pathology

Credit Hours: 0.50 or 1.00. Discussion of current topics in the following areas of general pathology: cellular injury, fluid and hemodynamic alterations, inflammation, immunopathology, neoplasia, genetic and developmental disorders, pathogenesis of infectious diseases, and nutritional disorders. Class meets one hour in alternate weeks. Prerequisite: DVM degree. Permission of instructor required. **Credits:** 0.50 or 1.00

CPB 61600 - Molecular Diagnostics

Credit Hours: 2.00. The purpose of this course is to enable the student to have an understanding of the impact of molecular techniques in the clinical diagnostic laboratory, the range of techniques available, how they are effectively implemented, and how they are applied for diagnostic and research purposes. Permission of department required. Prerequisites: molecular biology or biochemistry course. Offered every even year.**Credits:** 2.00

CPB 61800 - Ethical Issues In Biomedical Research

Credit Hours: 2.00 or 3.00. Examination of moral reasoning as it applies to epidemiologic inquiry and the methods of biomedical research. Topics include obligations to human and animal research subjects, ethical considerations in research design, data interpretation and fraud, funding of research, and public policy. **Credits:** 2.00 or 3.00

CPB 61900 - Design, Conduct, And Analysis Of Clinical Trials

Credit Hours: 2.00. Reviews the various types of clinical trials that are used in medical research (e.g., therapeutic and preventive). The stages and activities in a "typical" trial are defined along with factors that influence study design. Key elements of data collection, organization, analysis, and interpretation and reporting of results are discussed and illustrated using published reports of clinical trials. Differences in the design and conduct of trials in human and veterinary medicine are considered, including the ethical concerns and costs. Prerequisite: Graduate-level coursework in Biostatistics. **Credits:** 2.00

CPB 62000 - Advanced Immunology

Credit Hours: 2.00. Teaches advanced concepts in basic immunology and applications to disease prevention and therapy. Emphasis is on recent developments and experimental approaches in this rapidly evolving discipline. Topics include antigen presentation, T-cell development, signal transduction in B and T lymphocytes, immunoglobulin structure, type I hypersensitivity (asthma), neuroendocrine regulation of the immune response, immune response in viral infections (influenza and HIV), and tumor immunology. Permission of instructor required. **Credits:** 2.00

CPB 62200 - Microbial Pathogenesis

Credit Hours: 2.00. Provides advanced study of the concepts of microbial pathogenesis and host-microbe interaction. The virulence factors and molecular mechanisms of infection used by bacteria, viruses, and protozoa to cause disease will be examined. Specific diseases will be studied as examples of how microbes affect animals as well as humans. Permission of instructor required. **Credits:** 2.00

CPB 62400 - Advanced Laboratory Animal Medicine

Credit Hours: 0.00 to 8.00. Experiential training and practice in laboratory animal medicine. Prerequisite: DVM degree. Restriction: Only CPB graduate students in Laboratory Animal Medicine may enroll in this course. **Credits:** 0.00 to 8.00

CPB 62500 - Clinical Biostatistics

Credit Hours: 2.00. Intended for veterinary medical and biological science graduate students, this course is designed to familiarize them with the appropriate usage (and reporting) of different statistical tests in biomedical research. Students are taught the basic theories underlying the different tests, the data assumptions underlying the application of those tests, and review/critique published scientific articles that employed these tests. Students have the opportunity to describe the appropriate statistical methods to be used in their proposed research and/or report the usage or appropriate statistical tests on their own data. **Credits:** 2.00

CPB 62600 - Design And Analysis Of Epidemiologic Studies

Credit Hours: 3.00. Focuses on epidemiologic study design and applications of statistical software to the analysis of data derived from health research. Includes an overview of epidemiologic study designs, frequency and association measures, generalized linear models and survival analysis. Hands-on computer laboratories are provided using data derived from field studies. Prerequisites: One graduate-level course in biostatistics. **Credits:** 3.00

CPB 63000 - Advanced Veterinary Avian Pathology

Credit Hours: 0.00 to 8.00. Comparative gross and microscopic pathology in diagnosis of avian diseases. Prerequisites: At least one Statistics course must be taken before or during the non-thesis MS/Residency Graduate Program. See list of courses. STAT courses: CPB 61900; CPB 62500; STAT 50300; STAT 51200; STAT 51400: STAT 52400. A DVM Degree is required to enroll in the non-thesis MS/Residency Grad Program. Permission of instructor required. **Credits:** 0.00 to 8.00

CPB 63100 - Avian Immunology

Credit Hours: 2.00. The avian immune system is significantly different than the mammalian immune system. This course compares and contrasts mammalian and avian immune systems. Prerequisites: At least one graduate or undergraduate course in biology or poultry science. Permission of instructor required. **Credits:** 2.00

CPB 63200 - Avian Medicine

Credit Hours: 2.00. This disease-based course is designed to introduce students to poultry medicine. It covers all the major diseases and conditions that affect poultry. Permission of instructor required. **Credits:** 2.00

CPB 63300 - Preventive Avian Medicine Practice

Credit Hours: 1.00. The course introduces students to issues/practice in commercial poultry production. Brief discussions will relate how these practices influence poultry health. Permission of instructor required. **Credits:** 1.00

CPB 63400 - Diseases Of Laboratory Animals

Credit Hours: 3.00. A didactic course focusing on basic understanding of the diseases of laboratory animal medicine, and concentrating on effects of the disease on research productivity, prevention programs, and pathogenesis. Etiology, pathogenesis, gross and microscopic pathology, diagnosis, control, and research complications of diseases of rats and mice, primates, rabbits, guinea pigs, hamsters, and ferrets; and health assessment programs. Permission of department required.**Credits:** 3.00

CPB 63500 - Advanced Veterinary Diagnostic Microbiology

Credit Hours: 0.00 to 8.00. Veterinary clinical and diagnostic microbiology training. Prerequisite: DVM degree or equivalent. Permission of instructor required. **Credits:** 0.00 to 8.00

CPB 63600 - Veterinary Microbiology Seminar

Credit Hours: 0.00 to 8.00. This class will provide graduate students with in-depth knowledge in current microbiology research and clinical diagnostics. Students will review current literature related to veterinary infectious disease with the intent of explaining its application to clinical and diagnostic microbiology. Permission of instructor required.**Credits:** 0.00 to 8.00

CPB 68000 - Special Topics

Credit Hours: 1.00 to 4.00. Directed readings, discussions, and other intensive studies in specialized topics of the disciplines of the department. The topic of study will be selected and announced prior to the semester offered and will be indicated in the student's record. Permission of instructor required. **Credits:** 1.00 to 4.00

CPB 69100 - Seminar In Veterinary Pathology

Credit Hours: 0.00 to 2.00. Discussions of selected current disease problems with emphasis on gross and microscopic tissue changes and pathogenesis. Required of all graduate students in veterinary pathology each semester in residence. **Credits:** 0.00 to 2.00

CPB 69400 - Special Topics In Immunology

Credit Hours: 1.00. Understanding of principles of immunology is required. Journal club style class geared to provide graduate students with in-depth knowledge in current immunology. Faculty will participate in class to facilitate the students' understanding and discussion. Students present one-two times depending on the number of participating students. They select a research paper, recently published in the area of immunology, assigned for the semester and have it approved by the course organizer. **Credits:** 1.00

CPB 69500 - Seminar In Epidemiology

Credit Hours: 1.00. Discussion of recent research in epidemiology, emphasizing study design, analysis, and public health significance. Discussion topics will be selected from the following areas: clinical epidemiology, infectious disease epidemiology, chronic disease epidemiology, and environmental epidemiology. Required of graduate students with a principal field of study in epidemiology. Prerequisite: Course work in Statistics and Epidemiology. **Credits:** 1.00

CPB 69700 - Research Seminar

Credit Hours: 0.00 or 1.00. Discussion of current concepts and research results in epidemiology, immunology, microbiology, parasitology, pathology, virology, host-parasite relationships, and other aspects of veterinary pathobiology. Each graduate student is expected to register each semester and to make one oral presentation per year. A grade of pass/not-pass and one credit will be awarded for the semester the presentation is given. Permission of instructor required. **Credits:** 0.00 or 1.00

CPB 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required. **Credits:** 1.00 to 18.00

CPB 69900 - Research PhD Thesis

Credit Hours: 1.00 to 18.00. Research PhD Thesis. Permission of instructor required. **Credits:** 1.00 to 18.00

CPB 81900 - Veterinary Toxicology

Credit Hours: 2.00. This course will provide an introduction to small and large animal toxicology. It will cover the most common toxicoses encountered in veterinary medicine with emphasis on recognizing clinical signs of toxicoses, discerning differential diagnoses for these cases, and assigning appropriate diagnostic tests. Prerequisites: Completion of first year in the DVM program. **Credits:** 2.00

CPB 83300 - Preventative Avian Medicine Practice

Credit Hours: 1.00. This course will cover practical veterinary management of commercial poultry. The first portion of the course will concentrate on types of commercial poultry and management of large flocks. In addition, the course will include environmental impact of commercial poultry farms, waste management, and animal welfare. Management of waste and animal welfare are crucial components of veterinary and agricultural workers. The students need to appreciate the intricacies of poultry production to be able to assess the welfare, environmental, and public health regulations pertaining to the poultry industry. Introduction to the role of the poultry veterinarian in non-traditional practice will also be covered. **Credits:** 1.00

CPB 84000 - Use And Care Of Laboratory Animals

Credit Hours: 1.00. Topics will include the history of animal use in research; ethical thought related to animal use in research; alternatives; government regulatory requirements; statistical considerations in designing animal studies; animal models; use of the National Agricultural Library Animal Welfare Information Center; biology, husbandry, techniques, and diseases of common laboratory animal species; hygiene and occupational health; biohazard control; perioperative care and aseptic surgical techniques; anesthesia; analgesia; and euthanasia. **Credits:** 1.00

CPB 84100 - Use And Care Of Laboratory Animals II

Credit Hours: 1.00. Priority will be given to students that have completed CPB 84000. This course teaches skills useful for the role of a laboratory animal veterinarian. Course is project-based and includes hands-on techniques in laboratory rodents. **Credits:** 1.00

CPB 85100 - General Pathology

Credit Hours: 3.00. An overview of the basic cellular reactions that develop in response to injurious agents. Focuses on the gross and microscopic alterations in tissues, events leading to the development of those alterations, and the consequences of those changes on the health of animals. Includes degenerative, necrotic, inflammatory, and neoplastic changes in various animal species. **Credits:** 3.00

CPB 85203 - Veterinary Parasitology

Credit Hours: 3.50. This course will provide an introduction to parasites of animal health importance. Specifically, this course covers the important helminth, protozoal and arthropod diseases of animals with emphasis placed on the pathogenesis, epidemiology, clinical features, diagnosis, control and zoonotic implications. This course will also cover the principles and practice of laboratory tests for detection of parasitic infections and identification of important parasites. **Credits:** 3.50

CPB 85204 - Veterinary Parasitology

Credit Hours: 3.00. Covers the important helminth, protozoal and arthropod diseases of animals. Emphasis is placed on the pathogenesis, epidemiology, clinical features, diagnosis, control, and zoonotic implications of protozoal and arthropod infections in this semester of the course. **Credits:** 3.00

CPB 85300 - Principles Of Veterinary Immunology

Credit Hours: 2.00. An overview of the fundamental concepts of immunology, with an emphasis on the immune system of domestic animals and comparative immunology. Focuses on the interactions between the host and microbial pathogens and on mechanisms that underlie hypersensitivity reactions, autoimmune diseases, and immune deficiencies. Discusses the principles of vaccination and serologic tests. **Credits:** 2.00

CPB 85400 - Principles Of Epidemiology

Credit Hours: 1.00. An introduction to the principles of epidemiology as it relates to evaluating and describing the health of human and animal populations. An emphasis is placed on the appropriate use by veterinarians of information derived from epidemiologic studies in making clinical decisions regarding the diagnosis, treatment, prognosis, and prevention of disease in individual patients. A goal is to demonstrate why epidemiology is considered by some as "a basic science for clinicians." **Credits:** 1.00

CPB 85401 - Epidemiology And Evidence-Based Veterinary Medicine

Credit Hours: 2.00. The fundamentals of descriptive and analytical epidemiology will be developed as they relate to problems in veterinary and comparative medicine. A primary goal of the course is to expose future health professionals to the information and thought processes that are essential for critically evaluating the medical literature and for making decisions regarding health care for individuals and populations. **Credits:** 2.00

CPB 85500 - Veterinary Hematology And Cytology

Credit Hours: 2.00. Provides an overview of veterinary hematology and cytology. Normal morphology and function of the cells of the hematopoietic system are reviewed. Laboratory analyses of the different cell types are discussed. The responses of the hematopoietic cells that can be seen during different disease processes are presented. Fundamentals of veterinary diagnostic cytology are introduced. **Credits:** 2.00

CPB 85602 - Veterinary Bacteriology And Mycology

Credit Hours: 4.00. The lecture portion provides an introduction to bacterial and fungal agents of animal diseases. The taxonomy, morphology, and physiology of the organisms are discussed. Pathogenic features of the infectious agents and host responses to infection will be emphasized. Epidemiology, diagnosis, and control of the various diseases will be presented. The laboratory portion of the course covers laboratory safety, sterilization and disinfection in addition to microbiological techniques, antimicrobial susceptibility testing and interpretation, and identification of cultured bacteria and dermatophytes. **Credits:** 4.00

CPB 85603 - Veterinary Bacteriology And Mycology

Credit Hours: 3.00. An overview of bacterial and fungal pathogens of veterinary species. Topics will include discriminating features of the organisms, the pathogenesis of diseases caused by these agents, diagnostics, management and therapeutics.**Credits:** 3.00

CPB 85700 - Veterinary Systemic Pathology

Credit Hours: 5.00. Provides coverage of system specific pathologic terminology and characteristic pathologic responses of the various body systems to injury. This is followed by presentation of representative examples of diseases of various etiologies, including, but not limited to, infectious and noninfectious diseases.**Credits:** 5.00

CPB 86000 - Veterinary Virology

Credit Hours: 3.00. Principles of medical virology and discussions of important viral diseases of animals. **Credits:** 3.00

CPB 86100 - Veterinary Clinical Chemistry

Credit Hours: 2.00. Laboratory techniques and interpretation of laboratory data as profiled by organ system are presented. Integration of data to explain pathophysiologic changes as an aid to diagnosis, prognosis and progression of disease is emphasized. **Credits:** 2.00

CPB 86200 - Clinical Epidemiology For Companion Animals

Credit Hours: 1.00. Fundamentals of experimental epidemiology and clinical decision-making are explored, particularly as they relate to the practice of companion animal medicine. Methods for disease detection and prevention are emphasized in catteries and kennels. The computer laboratories illustrate the software available for problem-solving in population medicine. **Credits:** 1.00

CPB 86300 - Epidemiology For Livestock Production

Credit Hours: 1.00. Study of the fundamental concepts for epidemiologic implications in livestock production, including design of epidemiologic studies in livestock populations, investigation of disease outbreaks, use of diagnostic tests, infectious disease control, and animal health economics. Rationale, strategies, and concepts of animal disease control are emphasized with examples. **Credits:** 1.00

CPB 86900 - Veterinary Public Health And Zoonoses

Credit Hours: 2.00. A survey of fundamental topics on diseases that are caused by viral, bacterial, rickettsial, and parasitic agents and are known to be transmissible from animals to humans, as well as those diseases that are common to humans and animals. Topics emphasize the epidemiology and methods for prevention and control of these diseases in animal and human populations. Food safety and foodborne diseases, with particular emphasis on foods of animal origin, are discussed. Risk assessment of occupational and environmental health conditions to which veterinarians are likely to be exposed in training or the workplace also is covered. **Credits:** 2.00

CPB 87000 - Diagnostic Veterinary Cytology

Credit Hours: 1.00. A combination of didactic and wet laboratory microscopic sessions are used to demonstrate applications of diagnostic cytology. Consists of weekly sessions with a brief lecture overview of the basic cytologic features of a particular organ system followed by microscopic review of collected cytology material from that particular organ system. The didactic and laboratory sessions are supplemented by Internet-based and digital-format archived images for student review. Typically offered Spring, Summer.**Credits:** 1.00

CPB 88300 - Public Health

Credit Hours: 3.00. This course is designed for senior veterinary students to fulfill their interests in public health and preventive veterinary medicine. There will be a classroom and field component, focusing on topics including epidemiology, food safety, infectious diseases, environmental health and health communications. Visits to various agencies will complement the course material by offering inside views of the day to day operations of the facilities as well as the career experiences of the employees working in them. Students will also gain field experience in actual or devised research projects that will include activities such as study design, questionnaire development, collecting epidemiologic data, date input, analysis, and interpretation. Students will be asked to design a study, produce an information brochure, and prepare a verbal presentation for elementary school children about topics relating to being safe with your pets. Total clinic hours 129.**Credits:** 3.00

CPB 88400 - Laboratory Animal Medicine

Credit Hours: 3.00. Students will participate in laboratory animal medicine practice which can include facility inspections, protocol review, preventative medicine, monitoring disease status, and diagnosis and treatment of spontaneous diseases in laboratory animals. Total clinic hours 129.**Credits:** 3.00

CPB 88501 - Necropsy I

Credit Hours: 1.00. This is one of three concurrent courses (CPB 88501, CPB 88502, CPB 88503) in which senior veterinary students will be enrolled. Students will actively participate in the diagnostic necropsy service within the ADDL. The student is expected to gain basic clinical experience and training in necropsy and diagnostic pathology as they contribute to and support the practice of veterinary medicine. Students are expected to actively assist faculty in performing necropsies, discuss pathophysiology of cases and submit reports of their observation. Total clinic hours 43. **Credits:** 1.00

CPB 88502 - Microbiology I

Credit Hours: 1.00. This is one of three concurrent courses (CPB 88501, CPB 88502, CPB 88503) in which senior veterinary students will be enrolled. This course is designed for senior veterinary students to gain additional training in diagnostic microbiology (bacteriology, mycology, virology and molecular diagnostics) in relation to clinical diseases. Students will actively participate in self study and discussion of selected diagnostic microbiology cases as well as hands-on logistically approached laboratory procedures for culture and isolation of microbial agents. The students are expected to be proficient and competent in veterinary diagnostic microbiology at the end of rotation. Total clinic hours 43.**Credits:** 1.00

CPB 88503 - Clinical Pathology I

Credit Hours: 1.00. This is one of three concurrent courses (CPB 88501, CPB 88502, CPB 88503) in which senior veterinary students will be enrolled. In addition to clinical pathology, students must be enrolled in microbiology and diagnostic pathology (necropsy). The main goal of this rotation is to insure that each participant is at a level of competency that every graduating senior should have attained. Through a combination of self study and small group periods in a classroom as well as on a multi-headed microscope, a set of core objectives will be explored. These objectives have been chosen as a representation of basic clinical pathology skills that students should have mastered to practice veterinary medicine competently. In addition, an approved

journal article or comparable piece of literature will be evaluated and summarized. An objective examination at the end of the rotation will test the student's knowledge of the objectives. Total clinic hours 43. **Credits:** 1.00

CPB 88600 - Diagnostic Pathology

Credit Hours: 3.00. Advanced training in diagnostic approaches to identification of the causes and pathogenesis of disease in mammals. Total clinic hours 129. **Credits:** 3.00

CPB 88700 - Avian Medicine

Credit Hours: 3.00. This course is designed for senior veterinary students to receive advanced training in avian disease diagnosis and health management in commercial poultry flocks. Critical poultry infectious and non-infectious diseases will be discussed. The student will visit production facilities for layers, broilers, turkeys, or ducks. Vaccination and medication programs for these species will be discussed. Necropsy experience will be gained from poultry, game bird, and pet bird accessions to the Animal Disease Diagnostic Laboratory (ADDL). Total clinic hours 129. **Credits:** 3.00

CPB 88800 - Microbiology II

Credit Hours: 3.00. This course is designed for senior veterinary students to gain advanced training in clinical microbiology in relation to clinical diseases. Microbial diseases of veterinary importance and zoonotic significance will be addressed. Students will actively pursue selected microbiology accessions to the Animal Disease Diagnostic Laboratory (ADDL) in depth by applying problem-based learning approach, using correct laboratory procedures, and searching related literature to reach microbiological diagnosis and conclude the cases. Written reports, oral presentations, case discussion will be highlighted in the rotation to enrich the learning experience and insure the proficiency and competency in veterinary clinical microbiology. Total clinic hours 129. **Credits:** 3.00

CPB 88900 - Clinical Pathology II

Credit Hours: 3.00. This advanced clinical pathology rotation is designed to take the core skills mastered in CPB 88503 and expand on them. Through daily interaction to the consulting office on clinical cases, students will learn to critically evaluate cytologic and hematologic specimens as well as laboratory data. Activities that the student will engage in include the resident's journal club, weekly clinical pathology rounds, large animal clinical pathology rounds and other small group sessions with residents and pathologists. The goal for the rotation is to begin building a broad base of experience to continue building on in the future. Total clinic hours 129. **Credits:** 3.00

Computer and Information Technology

CIT 20200 - Networking Fundamentals

Credit Hours: 3.00. This course will provide students with the fundamental skills necessary to design, implement, troubleshoot and manage a small to medium sized Local Area Network. Students will gain hands-on experiences in a lab environment, configuring a client server network, working with connectivity devices, troubleshooting hardware and software issues. Students will explore topics including network performance, network management and network security.**Credits:** 3.00

CIT 20300 - Information Security Fundamentals

Credit Hours: 3.00. This course provides students with an overview of the field of Information Security and Assurance. Students will explore current encryption, hardware, software and managerial controls needed to operate networks and computer systems in a safe and secure manner. In addition, students will participate in a semester project to re-enforce key concepts such as policy development and business contingency planning.**Credits:** 3.00

CIT 20700 - Data Communications

Credit Hours: 3.00. This course provides the foundation for the understanding of data communication systems and computer networks. Topics include information representation and transmission, medium types and configuration, telephony, error handling, TCP/IP and internetworking, and diagnostic techniques.**Credits:** 3.00

CIT 21200 - Web Site Design

Credit Hours: 3.00. This course is designed to give students an introduction to web site design and site creation. The course involves learning current standard XHTML fundamentals, CSS and design concepts. The proper design approach for constructing Web site and related techniques will also be covered.**Credits:** 3.00

CIT 21300 - Systems Analysis And Design

Credit Hours: 3.00. This course provides students with the concepts, processes, and tools of system analysis and systems design. Object-oriented methods and tools are utilized with a focus on developing web-based interfaces and prototypes.**Credits:** 3.00

CIT 21400 - Introduction To Data Management

Credit Hours: 3.00. Introduction to basic database development concepts. Extensive exploration of data manipulation using a relational DBMS and SQL. Students develop database applications using the most current database technologies.**Credits:** 3.00

CIT 21500 - Web Programming

Credit Hours: 3.00. This course will provide students with the knowledge and techniques of introductory web programming.**Credits:** 3.00

CIT 22000 - Quantitative Analysis II

Credit Hours: 3.00. A continued investigation into the problem solving tools and techniques that focus on both hardware systems and quantitative data analysis. The course is designed for CIT majors in their second full year of study.**Credits:** 3.00

CIT 24200 - Introduction To ASP.Net Programming

Credit Hours: 3.00. This course will provide students with the tools and techniques to build dynamic Web sites using the ASP.Net programming environment. Students gain hands-on experience building a database-driven Web site.**Credits:** 3.00

CIT 27000 - Java Programming I

Credit Hours: 3.00. This course is an introduction to the Java Programming language. Students will learn the syntax of the language, how to use objects, classes, and methods, and will perform programming exercises that illustrate how Java is used in stand alone applications and applets.**Credits:** 3.00

CIT 30400 - Database Programming

Credit Hours: 3.00. This course explores advanced database programming techniques for enterprise-wide databases and their implementation using programmatic extensions to Structured Query Language (SQL). Topics include advanced data manipulation, stored procedures, triggers, and query optimization.**Credits:** 3.00

CIT 30900 - Cybersecurity And Network Programming

Credit Hours: 3.00. Course teaches students skills necessary to develop programs and scripts to solve cybersecurity and networking problems such as automating manual tasks, parsing data, and data analysis. Students gain hands-on experience, combining the theory and practice of relevant tools, techniques, and programming technologies used in daily real-world cybersecurity and networking profession.**Credits:** 3.00

CIT 31300 - Commercial Web Site Development

Credit Hours: 3.00. This project-based course will have students develop a data driven web site to support business processes. Students will utilize both client and server side languages in developing the site.**Credits:** 3.00

CIT 32000 - Quantitative Analysis III

Credit Hours: 3.00. A continuation of statistical inference introduced in Quantitative Analysis II with emphasis on confidence intervals, hypothesis testing, analysis of variance, forecasting including linear regression and correlation, and quality control as they apply to information technology.**Credits:** 3.00

CIT 32700 - Wireless Communication

Credit Hours: 3.00. Students will learn about the growing range of wireless technologies and their applications. The course will explore the fundamentals of each wireless technology from basic signaling properties to current and future market uses. Students will have the opportunity to gain hands-on experience with various wireless technologies.**Credits:** 3.00

CIT 34400 - Database Security

Credit Hours: 3.00. This course will cover fundamentals of database security, data auditing, basic security models, and best practices. Topics may include security architecture, access control policies, auditing and monitoring. The course combines lectures with hands-on activities through lab sessions and an application oriented project using a database system such as Oracle or SQL Server.**Credits:** 3.00

CIT 35600 - Network Operating Systems Administration

Credit Hours: 3.00. Design and administration of network servers and workstations. Focus on basic network concepts such as user account administration, resource allocation, security issues and internet service management.**Credits:** 3.00

CIT 37300 - Visual Design For Software

Credit Hours: 3.00. Examination of best practices in software interface development for a variety of platforms. A study of the integration of visual elements into the systems analysis and design process, based on business and technical requirements. Topics include study of common design patterns, a review of prototyping tools, multi-modal design concepts, navigation strategies, and user acceptance testing.**Credits:** 3.00

CIT 37400 - Systems And Database Analysis

Credit Hours: 3.00. Intensive exploration of application and database analysis in a synergistic environment. Students engage in collaborative, project-based activities to learn about project management, requirements analysis, modeling, prototyping, employing problem solving, and team-building skills. Object-oriented and data modeling tools are used to apply class concepts.**Credits:** 3.00

CIT 38100 - Unix Programming And Administration

Credit Hours: 3.00. This course will teach students to effectively administer and develop applications in Linux/Unix. Emphasis will be on the ability to read, write, and debug shell script programs. An exploration of Windows scripting languages will also be covered.**Credits:** 3.00

CIT 40200 - Design And Implementation Of Local Area Networks

Credit Hours: 3.00. The design, implementation, and configuration of local area networks. Students install the necessary hardware and software to set up a LAN server with several clients. Students will explore topics including "inter-networking", network management, network performance, and security.**Credits:** 3.00

CIT 40600 - Advanced Network Security

Credit Hours: 3.00. This course provides students with the in-depth study and practice of advanced concepts in applied systems and networking security, including security policies, access controls, IP security, authentication mechanisms and intrusion detection and protection.**Credits:** 3.00

CIT 41500 - Advanced Network Administration

Credit Hours: 3.00. In this course, students will learn advanced concepts for installing, configuring and securing various types of network servers including enterprise, web and mail servers. The course also covers the documentation of network systems infrastructure and the testing of hardware and software network components.**Credits:** 3.00

CIT 41800 - Native Android Application Development

Credit Hours: 3.00. This advanced programming course gives students hands-on experience developing applications for Google mobile computing devices running the Android operating system. Students will build data-driven and location-aware applications using object-oriented software design patterns common to mobile application development. A variety of data storage and remote datasource-driven applications will be introduced.**Credits:** 3.00

CIT 42100 - Big Data Analytics

Credit Hours: 3.00. This course will cover both the fundamentals and concepts of data analytics. The focus is on emerging advanced data analytics techniques and their applications to practical problems for different disciplines, such as IT, health care, and economics. Machine learning algorithms and distributed computing environments will be explored. Students will apply these advanced techniques in labs and a project to resolve an applied problem and identify scientific findings by using public data sets. A project report is required at the end of the course.**Credits:** 3.00

CIT 43100 - Applied Secure Protocols

Credit Hours: 3.00. This course will emphasize the applied facets of cryptography for the information assurance and security professional. By the end of the course students will be able to apply important cryptographic principles and tools to allow networks to communicate securely.**Credits:** 3.00

CIT 44400 - Advanced Database Design

Credit Hours: 3.00. This course addresses enterprise data management and logical database design concepts with an emphasis on needs determination and data modeling skills from an organizational perspective. Students will create data models and apply

forward and reverse engineering techniques and will work through the full life cycle of the development of a software application. A project-based learning approach is used in this course.**Credits:** 3.00

CIT 45100 - IT Security Risk Assessment

Credit Hours: 3.00. Students will learn the basic tools of security risk assessment and risk management. Students will be able to identify and assess security risk, conduct information asset valuation, and apply risk control strategies. Other topics discussed will be: security policies, NIST Security Models, and training education and awareness. At the end of the course students will be able to assess vulnerabilities and document them according to published assessment standard.**Credits:** 3.00

CIT 47900 - Database Implementation And Administration

Credit Hours: 3.00. Extends knowledge of database concepts. Topics include physical database design, client/server implementation and database administration. Given a logical database design, students develop physical database structures and implement a database application. Students carry out database design, construction, administration, and programming activities using client/server technology.**Credits:** 3.00

CIT 48500 - The Living Lab

Credit Hours: 1.00 to 6.00. The Living Lab allows students to apply networking, security, database, website, and application development concepts and techniques learned from prior CIT courses to internal and/or external projects. The Living Lab emulates an industry IT department in which students work on one or more projects as part of an IT team. Permission of instructor required.**Credits:** 1.00 to 6.00

CIT 50700 - Measurement And Evaluation In Industry And Technology

Credit Hours: 3.00. This course is an introduction to measurement strategies and evaluation of data in industry and technology within the context of research design and implementation. Students will learn not only basic statistics in this course but will also learn about the research process by designing, conducting, and analyzing the data for a small empirical research project using real world data. The material in this course is directly relevant to student professional development. Data collection and interpretation are key day-to-day aspects of social and behavioral science, humanities, communication, economics, physical science, biological and medical science, technology, education, psychology, business, environmental science, education and government. In addition, the ability to use computers and other technologies around data has become a critical element in most professional decision-making processes.**Credits:** 3.00

CIT 51102 - Android Mobile Application Development

Credit Hours: 3.00. This advanced programming course teaches students to create data-driven, location-aware mobile applications for the Android platform. Students will learn common mobile app design patterns and will integrate cloud computing services into their applications. Prerequisite: Any programming course equivalent to 300-level programming; any relational database.**Credits:** 3.00

CIT 51600 - Database Security

Credit Hours: 3.00. This course provides a strong foundation in database security and auditing. It will cover topics on security, profiles, password policies, privileges and roles, Virtual Private Databases, and auditing. The course also covers advanced topics such as SQL injection, database management security issues such as securing the DBMS, enforcing access controls, and related issues. Permission of instructor required.**Credits:** 3.00

CIT 52600 - Applied Data Analytics

Credit Hours: 3.00. This course will cover both the fundamentals and concepts of the data analytics and the advanced data analytics techniques. The focus is on emerging advanced data analytics techniques and their applications to practical problems for different disciplines, such as IT, health care, and economics. Both advanced supervised learning and unsupervised learning algorithms will be explored along with data visualization techniques. Students will apply these advanced techniques in labs and a research project to resolve an applied research problem and identify scientific findings by using public data sets. A research project report is required at the end of the course and the quality of the research report is expected to align with the requirements of IEEE or ACM international conferences.**Credits:** 3.00

CIT 52800 - Information Security Risk Assessment

Credit Hours: 3.00. (CNIT 52800) Covers information security risk assessment, including the following topics: steps in performing information security risk assessment, threats to information security, technical, managerial, and operational vulnerabilities, methods for analyzing controls, methods for determining likelihood of and impact from an information security breach, and methods for determining risk. Emphasizes the development and utilization of security metrics in the risk assessment process.**Credits:** 3.00

CIT 53200 - Wireless Security And Technology

Credit Hours: 3.00. This course will provide in-depth coverage of wireless communications and security. Fundamentals and state of the art developments in the wireless security area will be covered, including advances in cellular, personal communications systems (PCS), wireless LANs, and fixed wireless networks. Significant details of wireless devices and corresponding security issues will be addressed. Emerging challenges and solutions in wireless vulnerabilities, attacks, and solutions at various layers of the protocol stack, spanning the stack from aspects of physical communication to application and service security issues, will also be covered.**Credits:** 3.00

CIT 58100 - Topics In Computer Information Technology

Credit Hours: 1.00 to 6.00. Advanced study of technical and professional topics relating to computer and information technology. Emphasis is on the cutting edge technologies and new developments relating to advanced information technologies. Permission of instructor required.**Credits:** 1.00 to 6.00

CNIT 300IN - Human-Computer Interaction

Credit Hours: 3.00. The analysis of human factors and the design of computer application interfaces. A survey of current best practices with an eye toward what future technologies will allow.**Credits:** 3.00

CNIT 10500 - Introduction To C Programming

Credit Hours: 3.00. This course is an introduction to computer programming using the "C" language. The emphasis is on structured programming principles, and understanding the basic concepts that apply to engineering problems. Among topics covered in this course are: problem solving using top down design, using flowcharts to explain the program logic, selection structure, repetition structure, bitwise operations, arrays, pointers, strings, passing arguments, and sequential files. **Credits:** 3.00

CNIT 10700 - Computers And Software Packages

Credit Hours: 1.00 to 4.00. Prerequisites vary with course content. Does not carry credit toward degree requirements in Computer Technology. Topics and skills associated with specific computer(s) and/or specific software package(s). Level of coverage varies according to audience. Various applications packages may be offered under this title. **Credits:** 1.00 to 4.00

CNIT 11100 - Computer Literacy

Credit Hours: 1.00. Introduction to computers and applications for students admitted to the Horizons program. **Credits:** 1.00

CNIT 13600 - Personal Computing Technology And Applications

Credit Hours: 3.00. This course provides an intermediate coverage of PC technology and problem solving. Topics include computer hardware, operations and ethics, and operating systems and environments. Students will gain hands-on skills with applications such as desktop and file management; word processing; spreadsheets; presentation graphics; electronic mail; personal information management; and internet browsing, searching, and publishing. **Credits:** 3.00

CNIT 14100 - Internet Foundations, Technologies, and Development

Credit Hours: 3.00. (CGT 14100) This course explores the history, architecture and development of the World Wide Web. Current tagging and scripting languages are covered in a tool independent environment. Topics also include authoring tools, design, graphic and multimedia formats, and commerce, implementation and security issues. PC literacy required. **Credits:** 3.00

CNIT 15500 - Introduction To Object-Oriented Programming

Credit Hours: 3.00. This course introduces fundamental software development concepts common to most programming languages. Topics include: problem solving and algorithm development, debugging, programming standards, variable, data types, operators, decisions, repetitive structures, modularity, array, user interface construction, software testing and debugging. A broad range of examples will be used throughout the course to show how each programming concept applies to real life problems. **Credits:** 3.00

CNIT 15501 - Introduction To Software Development Concepts

Credit Hours: 3.00. This course introduces fundamental software development concepts common to most programming languages. Topics include problem solving and algorithm development, debugging, programming standards, variables, data types, operators, decisions, repetitive structures, modularity, arrays, user interface construction, software testing and debugging. A broad range of examples will be used throughout the course to show how each programming concept applies to real life problems. **Credits:** 3.00

CNIT 16100 - Introduction To Programming And Data Management For Smart Manufacturing

Credit Hours: 3.00. This course introduces a programming language and provides an overview of coding, data analysis and data manipulation in a database. Topics include fundamentals of programming, introduction to data manipulation and analysis, and an introduction to relational databases and the Structured Query Language (SQL). **Credits:** 3.00

CNIT 17500 - Visual Programming

Credit Hours: 3.00. This course introduces event-driven application development and programming using a visual programming environment. Topics include problem solving and program design, control structures, objects and events, user interface construction, documentation, and program testing. Credit may be established in only one of: CPT 15500 or CPT 17500 or CPT 25000. PC literacy required.**Credits:** 3.00

CNIT 17600 - Information Technology Architectures

Credit Hours: 3.00. A conceptual and technological survey of information technology architectures inclusive of operating systems, network operating systems, distributed systems architectures, and distributed application architectures. Interoperability

between these architectural components is explored. Current technology and trends in each architectural element are reviewed. PC literacy required. **Credits:** 3.00

CNIT 18000 - Introduction To Systems Development

Credit Hours: 3.00. This course introduces information systems development. Topics include types of information systems, system development, database management systems, and problem solving. Students will read/create UML, ERD, and data flow diagrams to model information system objects, data, processes, and logic. Labs emphasize modeling and SQL/QBE querying to prepare students for later systems, programming, and database classes. Given user requirements students will design, construct, and test a personal computer information system. PC literacy required. **Credits:** 3.00

CNIT 18101 - Topics In Computer Information Technology I

Credit Hours: 3.00. This variable title course is used to pilot new course offerings. **Credits:** 3.00

CNIT 18200 - System And Organizational Security

Credit Hours: 3.00. This class focuses on the security of the design, procurement, testing, analysis and maintenance of components that are integrated into larger systems. Protecting organizations from cybersecurity threats and managing risk to support the successful accomplishment of the organization's mission is also covered.**Credits:** 3.00

CNIT 19900 - Topics In Computer And Information Technology

Credit Hours: 1.00 to 3.00. Hours and subject matter arranged by staff. Individual study under directed leadership of professor. Primarily for students with special aptitudes. Permission of instructor required. **Credits:** 1.00 to 3.00

CNIT 22700 - Introduction To Bioinformatics

Credit Hours: 2.00. Survey course in Bioinformatics for information technology specialists including topics such as: virtual bio-instrumentation, data reduction and mining algorithms and tools, data visualization, pattern matching, modeling and simulation, computational methods, and collaborative application environments. **Credits:** 2.00

CNIT 23500 - Management Information Systems And Collaboration Technology

Credit Hours: 3.00. This course introduces management information systems, project management topics and technologies, and collaboration technologies. PC literacy required. **Credits:** 3.00

CNIT 24000 - Data Communications And Networking

Credit Hours: 3.00. This course provides a comprehensive introduction to data communications and networks. Topics include communication standards and concepts, protocols, the Open Systems Interconnect (OSI) model, point-to-point communication, and local area networks. Business issues from both provider and user perspectives are discussed. Current technology and trends in each architectural element are reviewed.**Credits:** 3.00

CNIT 24200 - System Administration

Credit Hours: 3.00. This course provides a comprehensive introduction to system administration. Topics include authentication and authorization, directory services, system management and system security. Emphasis is placed on enterprise level systems. **Credits:** 3.00

CNIT 25500 - Programming For The Internet

Credit Hours: 3.00. This course introduces software development concepts common to modern object-oriented programming languages. Topics include: intermediate data types, decisions, repetitive structures; methods; arrays and collections; encapsulation; inheritance, and polymorphism; exception handling; data persistence; Database Management System (DBMS) connectivity; user interface construction; software testing and debugging; and working in teams. **Credits:** 3.00

CNIT 25501 - Object-Oriented Programming Introduction

Credit Hours: 3.00. This course introduces software development concepts common to modern object-oriented programming languages. Topics include: intermediate data types, decisions, repetitive structures; methods; arrays and collections; encapsulation, inheritance, and polymorphism; exception handling; data persistence; Database Management System (DBMS) connectivity; user interface construction; software testing and debugging; and working in teams.**Credits:** 3.00

CNIT 26700 - Introduction To C++ Language Programming

Credit Hours: 3.00. This course is an introduction to C++ language programming for persons with prior programming experience. Course topics include data types, control flow, operators and expressions, and an introduction to class construction including other object-oriented concepts and constructs. Applications are designed for business, manufacturing, or technology, depending on audience. **Credits:** 3.00

CNIT 27000 - Cybersecurity Fundamentals I

Credit Hours: 3.00. This course introduces cybersecurity fundamentals and concepts. Security models that provide a basis for overarching security solutions are introduced to provide a basis for discussion. Risks and vulnerabilities are examined along with technical controls that can be used to mitigate them. The role of security policy and the incident management framework are examined. Emphasis is placed on building a strong foundation for further study in the field.**Credits:** 3.00

CNIT 27100 - Cybersecurity Fundamentals II

Credit Hours: 3.00. Course will investigate additional foundational ideas in cybersecurity and serves as a survey course in the field. The course provides extended exposure to utilizing tools to secure/harden aspects of info systems such as mandatory access control, wireless security, hardware security, cloud security and others.**Credits:** 3.00

CNIT 27200 - Database Fundamentals

Credit Hours: 3.00. A study of relational database concepts. These concepts include data design, modeling, and normalization; the use of Structured Query Language (SQL) to define, manipulate, and test the database; programmatic access to a database and practical issues that database developers must handle.**Credits:** 3.00

CNIT 27600 - Systems Software And Networking

Credit Hours: 3.00. Introduction to a wide range of topics in the networking field. Topics include: systems and network administration support practices, desktop and server support, security, disaster recovery, ethics, change management, help desks, networks, network operating systems, and directory services. The students will gain hands-on experience in the laboratory with installing and configuring network operating systems and application software. **Credits:** 3.00

CNIT 28000 - Systems Analysis And Design Methods

Credit Hours: 3.00. Comprehensive introduction to information systems development. Topics include the systems analyst, the systems development life cycle, methodologies, development technology, systems planning, project management, systems analysis, systems design, systems implementation, and systems support. Introduction to tools and techniques for systems development.**Credits:** 3.00

CNIT 28101 - Topics In Computer Information Technology II

Credit Hours: 3.00. This variable title course is used to pilot new course offerings. **Credits:** 3.00

CNIT 28500 - Topics In Programming Languages

Credit Hours: 3.00. A programming course in one or more programming languages not covered in other CPT courses. Application of structured or event-driven program design, construction, debugging, testing, and documentation techniques. Topics, projects, and languages vary with course offering. **Credits:** 3.00

CNIT 29500 - Object-Oriented Programming

Credit Hours: 3.00. This course focuses on using object-oriented programming languages in the development of modern, business applications. Topics include object-oriented design, encapsulation, object interfaces, inheritance, aggregation, abstract classes, polymorphism, data structures, and exception handling. **Credits:** 3.00

CNIT 29900 - Topics In Computer And Information Technology

Credit Hours: 1.00 to 6.00. Hours and subject matter to be arranged by staff. Individual study under directed leadership of professor. Primarily for students with special aptitudes. Permission of instructor required. **Credits:** 1.00 to 6.00

CNIT 30500 - Information Technology

Credit Hours: 3.00. A survey of contemporary trends in information technology, including applications, languages, hardware, software, and communications. Integration of information and systems. Emphasis on database management and administration. **Credits:** 3.00

CNIT 30600 - Game Development I: Core Skills And Technologies

Credit Hours: 3.00. (CGT 24500) This course introduces students to the fundamental technologies and skill sets required to develop video games. Students will be taught agile development methodologies in a team-based environment. **Credits:** 3.00

CNIT 30800 - Game Development II: Design And Psychology

Credit Hours: 3.00. (CGT 25500) This course examines video game design, theory, and development from aesthetic, psychological, and technical perspectives. Students will gain experience with a commercial game development platform. Advanced game development techniques will be taught in this course. **Credits:** 3.00

CNIT 31500 - Systems Programming

Credit Hours: 3.00. This course introduces concepts of lower level systems programming in C/C++ on a UNIX/Linus operation system platform. Command level development, algorithms, data structures, iteration and recursion, algorithms and analysis will be covered.**Credits:** 3.00

CNIT 32000 - Policy, Regulation, And Globalization In Information Technology

Credit Hours: 3.00. This course provides students with opportunities to study how technology is intertwined with larger economic, social, cultural, and ethical dynamics in an era of intensified globalization. The course examines technology in a global environment. Students will explore concepts and issues related to law, policy, regulation, outsourcing, offshoring, globalization, global competitiveness, global communications, cultural differences and quality of life issues. Students will examine ethical situations that arise as a result of the impact of technology. In summary, the course is designed to help students understand what it means to identify as, and/or work with, technology in a global environment. **Credits:** 3.00

CNIT 32100 - Enterprise Collaboration

Credit Hours: 3.00. This course focuses on enterprise social media and global information technology. Topics include social media software applications such as communication, collaboration, multimedia and entertainment software, globalization, global information technology issues, cultural differences, understanding the role of culture and communicating across cultures. An emphasis will be placed on how companies are integrating enterprise social media applications and the impact of these technologies on the globalization of information technology. **Credits:** 3.00

CNIT 32200 - Research Methodology And Design

Credit Hours: 3.00. This course will discuss scientific research versus pseudoscience, experimental vs. quasi-experimental designs, different research controls and validity issues, and how study designs are used to answer research questions. Students will gain hands-on experience conducting observational and experimental research designs, and the process of writing a formal research paper.**Credits:** 3.00

CNIT 32300 - Basic Cyberforensics

Credit Hours: 3.00. This course introduces students to the fundamentals of cyberforensics and cyber-crime scene analysis. The various laws and regulations dealing with computer forensic analysis are discussed. Students are introduced to the emerging international standards for cyberforensic analysis, as well as a formal methodology for conducting computer forensic investigations.**Credits:** 3.00

CNIT 32500 - Object-Oriented Application Development

Credit Hours: 3.00. This course focuses on using object-oriented programming languages in the development of modern, business applications. Topics include object-oriented design, encapsulation, object interfaces, inheritance, aggregation, abstract classes, polymorphism, data structures, and exception handling.**Credits:** 3.00

CNIT 33100 - Game Development III: Environment Modeling For Games

Credit Hours: 3.00. (CGT 34500) This course teaches the techniques and principles needed to create realistic three-dimensional virtual environments in game engines. The course will examine the principles of physics that determine how light propagates through the world and is eventually perceived by a human eye. Global illumination techniques that approximate these principles are described, followed by an in-depth examination of how game engines then approximate these solutions in order to create virtual environments that can run at real-time frame rates. **Credits:** 3.00

CNIT 34000 - UNIX Administration

Credit Hours: 3.00. This course focuses on the tasks and issues involved in the administration of UNIX systems. Topics include installation, networking, software management, scripting, and user management. In the laboratory portion of the course, students implement and maintain UNIX systems. **Credits:** 3.00

CNIT 34010 - UNIX Fundamentals

Credit Hours: 1.00. This course focuses on the use and basic administration of UNIX systems. Topics include installation, networking, software management, user management, and security of UNIX systems. **Credits:** 1.00

CNIT 34200 - Advanced System And Network Administration

Credit Hours: 4.00. This course focuses on the tasks and issues involved in the installation of distributed computing systems. Topics include the administration of network operating systems and network system interoperability. In the laboratory portion of the course, students implement and maintain a comprehensive network service infrastructure. **Credits:** 4.00

CNIT 34210 - Storage Area Networking

Credit Hours: 2.00. This course introduces storage area network (SAN) technologies. Storage area networking concepts, architectures, protocols, and best practice implementation techniques are examined. Techniques for remotely booting systems over a SAN are covered. Students implement and maintain an industry standard SAN and network booting solutions.**Credits:** 2.00

CNIT 34220 - Network Administration

Credit Hours: 2.00 or 3.00. This course focuses on the tasks and issues involved in the installation and administration of distributed computing systems. Topics include the administration of network operating systems and network system interoperability. Students will implement and maintain a comprehensive network service infrastructure.**Credits:** 2.00 or 3.00

CNIT 34400 - Network Engineering Fundamentals

Credit Hours: 3.00. This course presents the foundations and intermediate levels of understanding required to effectively design, implement, and manage today's networked environments. Details of basic models; network addressing and operations; network protocol interactions; and enterprise-class hardware applications of both wired and wireless networks are provided. Students will gain experience with enterprise-class hardware through laboratory projects and assignments.**Credits:** 3.00

CNIT 34500 - Internetwork Design And Implementation

Credit Hours: 3.00 or 4.00. This is an advanced course in network architecture. Students learn to design and implement local and wide area networks capable of simultaneous transport of real-time traffic and multiprotocol data over packet-switched and circuit-switched networks. An emphasis is placed on the integration of diverse communications technologies, while considering the effects of engineering decisions on overall performance, from both business and technology perspectives.**Credits:** 3.00 or 4.00

CNIT 34600 - Wireless Networks

Credit Hours: 3.00 or 4.00. This course introduces wireless networking. Topics include fundamental wireless communication concepts, wireless local area networks (LANs), and cellular systems. Wireless specific protocol elements are addressed in typical application environments. Data communications in multiple wireless environments are emphasized. In the laboratory section, students implement wireless solutions and integrate them into wired LAN environments.**Credits:** 3.00 or 4.00

CNIT 35500 - Mobile Programming

Credit Hours: 3.00. This is an advanced programming course that teaches students the skills necessary to develop applications for mobile computing devices (e.g. Smartphones and tablet computers). Combining theory and practice, this course gives students

hands-on experience with the latest technologies, tools and techniques used to develop mobile software solutions for business and entertainment.**Credits:** 3.00

CNIT 36100 - Software Redesign Using COBOL

Credit Hours: 3.00. An introduction to COBOL programming with an emphasis on redesign of legacy COBOL applications to extend their useful lifetime in contemporary organizations. Topics include user interface redesign, structured design, object-oriented programming, and transition from conventional files to databases. Students learn to analyze existing programs to isolate legacy code problems, develop and test solutions, and integrate solutions into software libraries. **Credits:** 3.00

CNIT 37000 - Introduction To Cryptography

Credit Hours: 3.00. Cryptography is an essential component to protect information in cyber systems. This course introduces the inner workings of cryptographic primitives and how to correctly use them. Specifically, the course covers cryptographic algorithms, protocols and techniques. The algorithms illustrate the art of encryption and secure hashing. The cryptographic protocols will expose the students to the world of building trust in an untrusted environment. Cryptographic techniques used in key management and algorithm choice will be explored. **Credits:** 3.00

CNIT 37100 - Cyberlaw And Ethics

Credit Hours: 3.00. This course focuses on Cyberlaw, a legal framework of cyber activities and cyber operations subject to a diverse array of international, constitutional, U.S. federal, and state law and regulatory policies. Students will learn fundamental concepts designed to help ensure that the cyber operations in which they participate are consistent with the laws, regulations, and values of the society they serve. **Credits:** 3.00

CNIT 37200 - Database Programming

Credit Hours: 3.00. This course explores advanced database programming techniques for enterprise-wide databases and their implementation. It uses programmatic extensions to Structured Query Language (SQL) supported by today's enterprise-class Relational Database Management Systems (RDBMS). Topics include advanced data manipulation, storage considerations, data transformation techniques to enhance interoperability of data, stored procedure and trigger design and implementation, and query optimization. **Credits:** 3.00

CNIT 37600 - Information Storage And Management

Credit Hours: 3.00. This course provides a comprehensive introduction to information storage technology. It prepares students to make more informed decisions about data storage and also to learn advanced concepts, technologies, and products. Topics include the architectures, features, and benefits of intelligent storage systems; networked storage technologies such as FC-SAN, NAS, and IP-SAN; and long-term archiving solutions such as CAS. Other topics include business continuity, back-up and recovery, virtualization, security, and management. Students will gain hands-on experience with installing and configuring storage management technologies. **Credits:** 3.00

CNIT 38000 - Advanced Analysis And Design

Credit Hours: 3.00. This course is an advanced study of system analysis and design methods and techniques used by systems analysts to develop information systems. Object-oriented tools and the Unified Modeling Language (UML) will be used for describing object structure and behavior, and use cases will be used for modeling functional processes. Topics include rapid development concepts, application architecture and system design, transition from object-oriented analysis and models to components and services, graphical user interface design, web interface design, prototyping, and commercial software package integration. Emphasis is also placed on the use of an object-oriented CASE tool. This course surveys other important skills for the

systems analyst, such as fact-finding (requirements discovery), communications, project management, and cost-benefit analysis. **Credits:** 3.00

CNIT 38101 - Topics In Computer Information Technology III

Credit Hours: 3.00. This variable title course is used to pilot new course offerings. **Credits:** 3.00

CNIT 38301 - Packaged Application Software Solutions

Credit Hours: 3.00. This course introduces knowledge, skills, tools, and techniques used to select and implement packaged application software solutions, both small and large (including ERP). Topics will include the make-verses-buy decision, critical success factors for packages, economic analysis, requirements analysis, identifying vendors and products, request for proposals, analysis of vendor proposals, decision analysis, implementation service providers, contracting for software and service, implementation project planning, life-cycle architecture, software installation and configuration, business process redesign organizational change management, integration with legacy system, customization verses adaptation, data conversion, system and application testing, training and support, system cutover and post go-live considerations. The course will focus on best practices, and consequences of less than best practices. This course will benefit students with career aspirations as systems analysts, business analysts, consultants, data and database administrators, and IT managers. **Credits:** 3.00

CNIT 38501 - Advanced Systems Design And Integration

Credit Hours: 3.00. A continuation of CNIT 38000 with an emphasis on knowledge, skills, tools, and techniques that systems analysts and architects use to translate functional systems requirements into design specifications that can be subsequently implemented. Students will learn methods for developing specifications that fulfill desired quality properties such as performance, scalability, maintainability, security, privacy, and protection of corporate property, interoperability, and usability, to name a few. Special emphasis is placed on integrating new systems with older systems, as well as with business processes. This course takes a holistic view of design and integration that specifies a complete information technology or information systems solution from the perspectives of different stakeholders, and from different systemic viewpoints and perspectives. Increasingly, the result of design and integration is referred to as a solution's architecture. **Credits:** 3.00

CNIT 39000 - Supervised Practicum

Credit Hours: 1.00 to 3.00. An instructor-directed practicum designed to combine University study with work experience directly related to the student's plan of study. Designed to be scheduled during a regular semester. Credit awarded upon the completion of department-approved project. Maximum of three credit hours may be applied to the CPT bachelor degree. **Credits:** 1.00 to 3.00

CNIT 39200 - Enterprise Data Management

Credit Hours: 3.00. This course examines advanced design techniques and physical issues relating to enterprise-wide data management. Topics include advanced design concepts, enhanced modeling and constructs, objects and unstructured and semi-structured data in databases, data management in non-business contexts, implementation of an enterprise data architecture, and data quality and stewardship. **Credits:** 3.00

CNIT 39900 - Topics In Computer And Information Technology

Credit Hours: 1.00 to 4.00. Hours and subject matter to be arranged by staff. Primarily for students with special aptitudes. **Credits:** 1.00 to 4.00

CNIT 40500 - Software Development Methodologies

Credit Hours: 3.00. This course explores methodologies and practices commonly used in contemporary software development projects. Topics include programming standards, code ownership and accountability, source code management and version control, productivity and quality metrics, software testing, and software process maturity models. **Credits:** 3.00

CNIT 41500 - Advanced Coding Security

Credit Hours: 3.00. This course allows students to gain proficiency in secure coding principles. Security risks from common coding errors are examined. Techniques for integrating secure coding practices into the development process is detailed with an emphasis on ensuring that applications are designed and implemented with proper security requirements. **Credits:** 3.00

CNIT 41700 - Critical Infrastructure Security

Credit Hours: 3.00. In the socio-political context of nation state sponsored threat actors and cyber cold wars, critical infrastructure (such as water supply and power generation) is a strategic target for attackers. This course investigates the current threat landscape and vulnerabilities in critical infrastructure. Students then investigate system and network architectural solutions to the problem. Students build a model industrial system and will implement these protections in their model environment.**Credits:** 3.00

CNIT 42000 - Basic Cyber Forensics

Credit Hours: 3.00. This course introduces students to the fundamentals of cyber forensics and cyber-crime scene analysis. The various laws and regulations dealing with computer forensic analysis are discussed. Students are introduced to the emerging international standards for cyber forensic analysis, as well as a formal methodology for conducting computer forensic investigations. **Credits:** 3.00

CNIT 42100 - Mobile Forensics

Credit Hours: 3.00. This course will help students understand the issues, techniques, and vulnerabilities of small scale digital device forensics. Emphasis will be placed on the forensically sound acquisition, preservation, analysis and presentation of small scale digital devices as evidence. Specific investigations will cover devices such as Personal Digital Assistants (PDA's), Cell Phones, and Smart Phones.**Credits:** 3.00

CNIT 42200 - Cyber Criminology

Credit Hours: 3.00. This course examines both the traditional and contemporary forms of cybercrime, including hacking, insider threat, Internet child pornography, cyberbullying, hacktivism, and cyberterrorism. Students will learn how computers can be either the target (e.g., hacking) or the tool (e.g., child pornography) for committing cybercrimes. In addition, this course will apply a variety of sociological, psychological, and criminological theories to help explain, "Why do some people engage in cybercrimes when others do not?" Theories discussed include: social learning theory, space transition theory, routine activity theory, social cognitive theory, techniques of neutralization, and personality characteristics.**Credits:** 3.00

CNIT 42300 - Advanced Cyberforensics

Credit Hours: 3.00. This course covers specialized and advanced content in digital forensics discipline. The focus of the course is on advancing and expanding the knowledge of the students regarding digital forensics investigation process particularly on emerging and contemporary technologies. Application of best practices in cyberforensics are emphasized in this course.**Credits:** 3.00

CNIT 42500 - Advanced Mobile Programming

Credit Hours: 3.00. This programming course teaches students the skills necessary to develop complex applications for mobile computing devices (e.g. smartphones and tablet computers). This course gives students hands-on experience developing mobile applications that use advanced features found on the latest mobile computing devices.**Credits:** 3.00

CNIT 43500 - Advanced Network Services

Credit Hours: 3.00. This course covers the concepts and technologies required to deploy advanced network services such as telephony and television over modern data networks. The underlying network structure and enabling services will be detailed along with a comprehensive analysis of protocols and services required to deploy such services. **Credits:** 3.00

CNIT 44500 - Advanced Internetwork Routing And Switching

Credit Hours: 3.00. This course extends routing and switching knowledge with specific attention given to emerging trends. This course focuses on the concepts of traffic shaping, advanced exterior gateway routing protocols, label switching technologies, and quality of service. The necessary perspectives of integration of these topics into enterprise networks are addressed in both lecture and laboratory. **Credits:** 3.00

CNIT 44600 - Advanced Wireless Networks

Credit Hours: 3.00. This course is an advanced course in wireless networking. Building on knowledge gained from the introductory wireless local area network course, this course addresses wireless network design and implementation on a large scale. Topics include mesh networking, broadband wireless access, backhauling, WiMAX and cellular systems. The laboratory portion of the course includes implementing and simulating these technologies in an outdoor setting. **Credits:** 3.00

CNIT 45000 - Enterprise Application Development

Credit Hours: 3.00. This course explores advanced application development techniques in a large enterprise-wide setting. Topics include component development and reuse, distributed object technologies, multi-tier applications, data marshalling, transaction processing, concurrency problems and resolutions, load balancing and tuning, and application installation and deployment issues. **Credits:** 3.00

CNIT 45500 - Network Security

Credit Hours: 3.00. This course explores business, conceptual, and technological aspects of network security for voice and data networks. The course deals with the analysis, design, implementation, and management issues surrounding effective network security. Key concepts and technology include virus protection, firewalls, authentication, encryption, wireless security, security protocols, physical security, and network security architecture and policy development. **Credits:** 3.00

CNIT 45600 - Wireless Security And Management

Credit Hours: 3.00. This course is an advanced course concerning security and management issues as they apply to wireless networking. Students will gain knowledge on the problems and solutions the wireless industry face when implementing large scale networks. Issues addressed include encryption weaknesses, security methodology tradeoffs, large scale network management techniques and systems, and advanced wireless network architecture. The laboratory portion of the course enforces the learning outcomes with hands-on experiences in implementing secure, manageable complex wireless networks. **Credits:** 3.00

CNIT 45800 - Biomedical Informatics

Credit Hours: 3.00. This course explores the tools and objectives of research in the medical and life sciences industry relevant to the skills of information technology. The driving outcome of this course is for students to understand the domain demands

inherent to information systems in healthcare, bioinformatics and computational life sciences, with respect to their role in commercialism, therapeutic decision support and discovery support systems. Topics include information technology application in support of health care delivery, a brief overview of healthcare delivery, the history of healthcare informatics, an overview of the state of current systems and the professional opportunities in Health Informatics. In bioinformatics, introduce the concepts of genomics and proteomics, biotechnology, biological databases and file structures, common computational methods for exploiting biological databases, integrating computational methods within the life sciences industry, and a survey of successful computational life science applications. **Credits:** 3.00

CNIT 46000 - High Performance Computing Systems

Credit Hours: 3.00. This course provides an introduction to high performance, cluster, and grid computing from a systems perspective. The driving outcome for this course is for students to understand and apply high performance computing concepts, architectures, and software components to develop and operate a high performance computing environment. Topics include: high performance computer architectures, network architectures for High Performance Computing (HPC), commodity and open-source cluster architectures, and software systems. **Credits:** 3.00

CNIT 46100 - Parallel Data Systems

Credit Hours: 3.00. This course provides an introduction to the techniques and technologies used in high performance computing for developing, using and managing high performance data systems. Topics covered in this course will focus on aspects of the design, implementation, and use of high performance storage systems progressively from the hardware layer through the operating system up to the application level. Topics will include: commodity hardware and novel architectural storage components; the architecture and use of parallel file systems, including PVFS2 and Lustre; reliability and scheduling; virtualization and fault tolerant strategies for Petascale computing; system architectures for data intensive computing and workflows; parallel I/O systems; and grid and cloud computing architectures. The driving outcome for this course is for students to understand and apply advanced high performance computing concepts, architectures, and software components to develop and operate a high performance computing environment. **Credits:** 3.00

CNIT 46500 - Senior Software Development Project

Credit Hours: 3.00. This capstone course integrates the software development technologies and techniques taught in prior courses. Over the duration of the semester, students work as a team to develop an automated system of real value and quality. Class lectures explore project-related topics such as project planning and management, user and management expectations, system architecture and design, and quality management. **Credits:** 3.00

CNIT 47000 - Incident Response Management

Credit Hours: 3.00. This course will bridge business operations to IT support of the critical systems that support day-to-day operations. Techniques to detect anomalous behaviors through the configuration and monitoring of modern Intrusion Detection systems, analyzing and decoding network flows, system logs, and reports is covered along with appropriate remediation actions. Multiple approaches, theories, standards, and suggestions for incident response handling will be examined.**Credits:** 3.00

CNIT 47100 - Vulnerability Analysis And Testing

Credit Hours: 3.00. This course will focus on advanced security techniques often referred to as vulnerability analysis or network penetration testing (pen testing). Students will learn the methods, techniques, and tools to test the security of computer networks, infrastructure and applications. The activities will be based in an environment that allows testing and "hacking" that does not risk possible legal, ethical, and network availability issues.**Credits:** 3.00

CNIT 47200 - IT Data Analytics

Credit Hours: 3.00. Students learn decision strategies as well as Big Data and data analytics concepts using a variety of methods. Students will have "hands-on" opportunities using tools to assist in these efforts. Permission from instructor required. **Credits:** 3.00

CNIT 47500 - Electronic Commerce And Business Implementation

Credit Hours: 3.00. This course is an in-depth study of electronic commerce and electronic business implementation. The focus is on e-business topics and concepts including business models, electronic payment systems, infrastructure, implementation concerns, design criteria, solution of business problems through case studies, and related Web topics. Students will develop web-based applications that support e-business activities. **Credits:** 3.00

CNIT 47700 - Blockchain

Credit Hours: 3.00. This course focuses on blockchain technologies. As IT practitioners and cybersecurity professionals, knowing the inner workings of blockchain technology is necessary for career preparation and development. This course aims to demystify blockchain technology by looking into its fundamental aspects, such as data structure, network consensus, economic incentives, security and privacy, applications, and regulations.**Credits:** 3.00

CNIT 48000 - Managing Information Technology Projects

Credit Hours: 3.00. This course introduces the application of knowledge, skills, tools, and techniques that project managers use to plan, staff, estimate, and manage information technology projects. Special emphasis is placed on learning and applying the concepts of managing scope, risk, budget, time, expectations, quality, people, communications, procurement, and externally provided services. Students will apply project management technology and techniques to business problems.**Credits:** 3.00

CNIT 48101 - Topics In Computer Information Technology IV

Credit Hours: 3.00. This variable title course is used to pilot new course offerings. **Credits:** 3.00

CNIT 48200 - Six Sigma Data Quality For Continuous Improvement

Credit Hours: 3.00. A study of data quality for Six Sigma level of improvement, applying a Six Sigma DMAIC (Define, Measure, Analyze, Improve and Control) improvement methodology, utilizing information tools and techniques. The course addresses advanced topics in statistical based continuous improvement, data quality; and Big Data Analytics concepts, as pertains to systematic problems. An embedded certificate in SS is included in the body of knowledge. **Credits:** 3.00

CNIT 48300 - Applied Machine Learning

Credit Hours: 3.00. In the past decade, we have observed the expeditious evolution and tremendous applications of machine learning, such as unmanned vehicle, autonomous language translation, and smart healthcare. This course will introduce both the fundamental knowledge and design/application insights of machine learning techniques via a series of hands-on real-world examples. The overall aim is to provide the students with a good understanding of machine learning technologies, building machine learning models, and applying machine-learning technologies to address real-world problems. In this course, students will also have an opportunity to explore the cutting-edge machine learning technologies, such as deep learning, adversarial attacks, and meta learning, and develop their own machine learning-based solutions.**Credits:** 3.00

CNIT 48400 - Applications In Data Science

Credit Hours: 3.00. Students investigate practical applications of Data Science and evaluate their effectiveness in guiding decision making. Students will employ tools to assist in these efforts.**Credits:** 3.00

CNIT 48700 - Database Administration

Credit Hours: 3.00. This course explores tools and techniques for managing an organization's database technology. Topics include database architecture, database technology installation, database creation and maintenance, Database Management System (DBMS) operation and troubleshooting, and database performance tuning. In the laboratory, students engage in activities performed by a typical database administrator. **Credits:** 3.00

CNIT 48800 - Data Warehousing

Credit Hours: 3.00. The design and implementation of data warehouses (including data marts and operational data stores) are studied using current database technologies. Topics include data modeling for warehouses, data warehousing infrastructure and tool selection, data exploration, data synthesis and reduction, organizational metadata, data warehouse administration, and other contemporary issues. **Credits:** 3.00

CNIT 48900 - Advanced Topics In Database Technology

Credit Hours: 3.00. This course will provide students with a chance to explore contemporary issues in the database arena. These issues may be related to new or breakthrough concepts, technologies, and techniques. **Credits:** 3.00

CNIT 49000 - Senior Project

Credit Hours: 1.00 to 3.00. Team industrial experience for seniors who undertake a significant controlled project experience for an actual client and problem. Permission of instructor required. **Credits:** 1.00 to 3.00

CNIT 49900 - Topics In Computer And Information Technology

Credit Hours: 1.00 to 3.00. Hours and subject matter to be arranged by staff. Possible individual study under directed leadership of professor. Permission of instructor required. **Credits:** 1.00 to 3.00

CNIT 51000 - Data Literacy

Credit Hours: 3.00. This course examines concepts, models, and methods useful for applying data analytics in business environments. Focusing on hypothesis generation, the capturing, storage and expression of data, analysis for research and visualizations.**Credits:** 3.00

CNIT 51100 - Foundations In Homeland Security Studies

Credit Hours: 3.00. An interdisciplinary course addressing prevention, mitigation, preparation, response, and recovery from catastrophic events that threaten private and public sector resources and infrastructures. Course contents will include: characteristics of security; personal/corporate perspectives; identification of assets; assessing cost/benefits of protecting assets; risk assessment and risk management; crisis decision making; emergency management resources and response infrastructures; best practices in emergency management and risk and crisis communication; business continuity; and the importance of a collaborative response. Case studies include the 9-11 attacks and Hurricane Katrina. External experts will present and career opportunities will be discussed. Permission of instructor required. **Credits:** 3.00

CNIT 51200 - Managing Resources And Applications For Homeland Security

Credit Hours: 3.00. An interdisciplinary course providing examples and practice in applying and managing the resources, including technologies, used in the private and public sectors for homeland security programs. Course contents will include: terrorism; corporate security; biosecurity; health care preparedness; personal/community preparedness; risk transfer; and

information security and privacy. Additional content includes discussion of local, state, and federal preparedness programs issues in the public/private sectors that are designed to ensure survival during a continuum of emergency events, and continued practice in using collaborative application of team building skills. Permission of instructor required. **Credits:** 3.00

CNIT 51900 - Natural Language Technologies

Credit Hours: 3.00. This course serves as an introduction to natural language processing with the focus on current and emerging technologies and applications. The topics will review the state of the art of natural language processing, discuss their advantages and disadvantages for computational language processing, and look at some case studies. The assignments will range from pen and paper analysis to actual computational implementations. **Credits:** 3.00

CNIT 52300 - File System Forensics

Credit Hours: 3.00. The plethora of strategies to store information in different formats continues to expand. This course examines the various media and strategies of storing information and the processes of documenting the collection, imaging, and processing of forensic evidence. Topics include file formats, file systems, hardware, and software involved in forensic investigation. The overall pattern of forensic evidence in file systems will be examine along with the acquisition, analysis, and reporting of evidence artifacts found in file systems. **Credits:** 3.00

CNIT 52500 - Mobile And Embedded Device Forensics

Credit Hours: 3.00. Consumer technologies are rapidly moving forward with items integrating processing, storage, and transmission into their base functionality. The enterprise issues with the trend of "bring your own device" has rapidly expanded requirements on forensics investigators to address a plethora of mobile device types. Whether it is the automobile black box or a home thermostat, there are various elements of interesting evidence possible to be gained. The embedded and consumer device pantheon is developing as an important area of forensic science. This course explores techniques for conducting forensic analyses on a wide variety of mobile and embedded devices. **Credits:** 3.00

CNIT 53000 - Information Technology Business Analysis

Credit Hours: 3.00. This course introduces the application of knowledge, skills, tools, and techniques that business analysts use to solve business problems related to information technology projects. Special emphasis is placed on learning and applying the concepts of enterprise analysis, business analysis planning, stakeholder management, requirements management, and solution evaluation. Permission of department required. **Credits:** 3.00

CNIT 53100 - Information Technology Requirements Analysis And Modeling

Credit Hours: 3.00. This course introduces and develops the skills that business analysts will need to solve business problems and effectively model and analyze stakeholder requirements in order to define workable solutions and effective communicate customer needs. Permission of department required. **Credits:** 3.00

CNIT 53200 - IT Enterprise Analysis

Credit Hours: 3.00. This course introduces the application of knowledge, skills, tools, and techniques that enterprise level business analyst use to create accurate requirements statements, organization level needs analysis and accurate business cases which assist the project team in developing schedules and budgets as well as strategic management teams in selecting the right projects to execute. Special emphasis is placed on learning and applying the concepts of innovation driven management. Permission of Department required. **Credits:** 3.00

CNIT 53500 - Advanced Topics In IT Business Analysis

Credit Hours: 3.00. The course explores the topics and tools used by today's information system professionals to lead the requirements gathering, estimating, developing, and delivery efforts of custom software applications. Course emphasis focuses on agile methodologies. Emphasis is also placed on requirements gathering and estimating technics commonly used with agile teams. Permission of Department required. **Credits:** 3.00

CNIT 53600 - IT Policy, Law, And Ethics

Credit Hours: 3.00. This course examines the policy, legal, and ethical aspects of information technology. Issues covered include ethical decision making, policy development, professionalism, privacy, freedom of expression, intellectual property, liability, and social responsibility. Included will be the philosophical ethical theories that underpin ethical decision making in the context of executing IT based projects.**Credits:** 3.00

CNIT 53700 - Professional Research And Communication

Credit Hours: 1.00. This course explores aspects of research and communications that pertains to technology-based projects and professions as well as informed changes in business process. Specifically, the methods involved in objective driven research within and across technology and business domains, as well as the use of rationale for a concisely written summary of research methods and findings for a working professional.**Credits:** 1.00

CNIT 54100 - Cyberlearning Research And Development

Credit Hours: 3.00. This design-based research course explores and applies methodological and theoretical perspectives to the research, design, and evaluation of learning experiences and environments that integrate computational thinking or cyberlearning within a certain STEM discipline. Design-based research seeks to shape and even engineer learning environments and experiences "in the wild." Is a series of approaches with the intent of producing new theories, artifacts, and practices that account for and potentially impact learning and teaching in naturalistic settings.**Credits:** 3.00

CNIT 54200 - Design-Based Research Applications

Credit Hours: 3.00. The course provides an opportunity for students to study and apply design-based research to evaluate and improve learning environments. Specifically, the course focuses on using design-based research as a methodological approach to combine instructional design and research in a cyclical and interdependent manner. Students are expected to apply this approach with the goal of simultaneously solving practical problems and developing a sharable theory by connecting design features to valued outcomes. Students should have prior knowledge of educational research methods, have an educational project to work on or a dataset ready to be analyzed. (added last statement from proposed restrictions)**Credits:** 3.00

CNIT 54300 - Human-Computer Interaction Applied To Games And Education

Credit Hours: 3.00. This course will explore Human-Computer Interaction (HCI) as applied to both the field of education and games. Students will engage in reading in these three fields. Specifically, they will develop a foundational understanding of common approaches in studying HCI, as well as current broad intersections with education and gaming. The course will be heavily focused on a semester-long research project in which students will participate in HCI, games, and education research. Permission of instructor required.**Credits:** 3.00

CNIT 54600 - The Internet Of Things For Information Technology

Credit Hours: 3.00. This course will explore the emergence of technologies and vertical solutions in the Internet of Things (IoT) domain. The course explores the top-level problems that IoT promises to solve, the business drivers, the attributes of IoT-enabled enterprise and consumer markets, and how IoT is different from the contemporary Internet. The course will discuss and apply IoT components such as the "things", the data, the people, and the processes, as well as vertical markets. Emphasis will be placed on types of architecture, reference models, and standards (both open and proprietary), underlying technologies, commercial

products, issues (such as security), and research efforts in the Internet of Things. The lab component will focus on the complete IoT ecosystem (sensors, actuators, networks, etc.), but will specifically emphasize the functionality of IoT cloud platforms. Permission of instructor is required.**Credits:** 3.00

CNIT 55000 - Organizational Impact Of Information Technology

Credit Hours: 3.00. An enterprise view of the organizational impact of information technology as the most effective means for achieving "better, faster, cheaper operations" in today's highly competitive business environment. Examines how information technology has enabled new organizational forms and changes in business processes, products, markets, delivery systems, ways of working, and people management issues and challenges. Permission of instructor required. **Credits:** 3.00

CNIT 55100 - Information Technology Economics

Credit Hours: 3.00. Examines the economics of information systems and information technology as it relates to business performance. Topics include strategic information technology planning, alignment with business planning, value assessment, and performance measurement. Special emphasis is placed on issues relevant to strategic information technology infrastructure management, both for the information technology unit as well as the business as a whole. Permission of instructor required. **Credits:** 3.00

CNIT 55200 - Information Technology Project Management

Credit Hours: 3.00. Explores the necessary skills and knowledge to successfully initiate, plan, manage, control, and report on information technology projects. Special emphasis is placed on learning the PMBOK and its practices concerning integration management, scope management, time management, cost management, quality management, human resource management, communications management, risk management, and procurement management. Practical examples are used to demonstrate the concepts and techniques, plus hands-on experience is received by working on a case study. Permission of instructor required. **Credits:** 3.00

CNIT 55300 - Quality Management In Information Technology

Credit Hours: 3.00. This course explores quality and productivity models used to ensure quality in information technology systems development processes. Special emphasis is on learning and understanding process metrics and measurement, as well as initiatives such as Total Quality Management, Continuous Process Improvement, Six Sigma, and the Software Engineering Institute Capability Maturity Model. Permission of instructor required. **Credits:** 3.00

CNIT 55500 - Advanced Network Security

Credit Hours: 3.00. Advanced conceptual and technological aspects of network security for voice and data networks. Deals with the advanced analysis, design, implementation, and management issues surrounding effective network security. Technology research and presentation of results, as well as security technology implementation, are required course outcomes. Permission of department required. **Credits:** 3.00

CNIT 55501 - Social Engineering Mitigation In Information Technology

Credit Hours: 3.00. Human vulnerability is currently one of the biggest threats to cybersecurity. Social engineering is one of the primary tools used to take advantage of this vulnerability. In this course, students will learn about some techniques used in social engineering, the psychology harnessed to carry out social engineering attacks, and learn to identify possible avenues of attack and procedures to prevent and mitigate specific risks. Permission of instructor required. **Credits:** 3.00

CNIT 55600 - Basic Computer Forensics

Credit Hours: 3.00. Covers the fundamentals of the maturing discipline of computer forensics. The focus of the course is on gaining a broad understanding of the field of study and how technology and law interact to form this forensic science. Emerging standards and current and future issues related to the field are also explored. Examines law and public policy, the computer forensic methodology, report presentation, and expert witness testimony, as well as anti-forensic techniques that can be used to obfuscate evidence. Students are exposed to theory and practice with lab exercises, thought and term papers, and a practical, as well as written, final exam. **Credits:** 3.00

CNIT 55700 - Advanced Research Topics In Cyber Forensics

Credit Hours: 3.00. Provides students at the advanced degree level the opportunity to expand their knowledge of cyber forensics. Students are expected to have fundamental understanding of cyber forensics and digital forensic science. The emphasis is on directed learning and scholarly inquiry. Possible research topics range from law and public policy to software and/or hardware development. Permission of instructor required. **Credits:** 3.00

CNIT 55800 - Bioinformatics Computing And Systems Integration

Credit Hours: 3.00. This is a graduate-level course for students interested in the application of computational methods and information technology in the pharmaceutical, biotechnology, and life sciences arena. An overall understanding of information technology and systems is assumed, as well as an in-depth knowledge of one or more areas of information technology. Permission of instructor required. **Credits:** 3.00

CNIT 55900 - Data Warehousing

Credit Hours: 3.00. The design and implementation of data warehouses (including data marts and operational data stores) are studied using current database technologies. Topics include data modeling for warehouses, data warehousing infrastructure and tool selection, data exploration, data synthesis and reduction, organizational metadata, data warehouse administration, and other contemporary issues. Preference is given to students having graduate status in the College of Technology with a CIT concentration. Permission of instructor required. **Credits:** 3.00

CNIT 56000 - Advanced High Performance Computing Systems

Credit Hours: 3.00. This course is a graduate level course that covers advanced topics in high performance, cluster, and grid computing in detail from a systems perspective. Topics covered in this course will focus on aspects of the design, implementation, and use of high performance computing systems at each level of the system, including: commodity hardware and novel architectural components, such as graphics processing units; operating systems for HPC systems, including low-noise OS and light-weight kernels; system reliability and job scheduling; virtualization systems and fault tolerance for HPC; data intensive computing and workflows; parallel I/O systems; and grid and cloud computing architectures. Experience in Linux systems administration is a prerequisite for this course. **Credits:** 3.00

CNIT 56100 - Advanced Parallel Data Systems

Credit Hours: 3.00. This course is a graduate level course that covers advanced topics in high performance, cluster, and grid computing in detail from a systems perspective. Topics covered in this course will focus on aspects of the design, implementation, and use of high performance storage systems progressively from the hardware layer through the operating system up to the application level. Topics will include: commodity hardware and novel architectural storage components; the architecture and use of parallel file systems, including PVFS2 and Lustre; reliability and scheduling; virtualization and fault tolerant strategies for Petascale computing; system architectures for data intensive computing and workflows; parallel I/O systems; and grid and cloud computing architectures. Experience in Linux systems administration is a prerequisite for this course. **Credits:** 3.00

CNIT 56200 - Six Sigma Black Belt For Operations Excellence

Credit Hours: 3.00. A study of the Six Sigma quality and process improvement methodology, using the define, measure, analyze, improve, and control (DMAIC) process. This course addresses advanced topics in statistical quality; introduces quality management concepts as they pertain to the Six Sigma methodology; and provides an opportunity to earn a for Six Sigma Black Belt. Permission of instructor required. **Credits:** 3.00

CNIT 56300 - Software Design And Development For Robotics

Credit Hours: 3.00. The purpose of this graduate-level course is to provide students with hands-on experience in designing, implementing, programming, and debugging robotic software systems. The course begins with an introduction to fundamental concepts and skills in robotics, encompassing both hardware and software components. Students will gain proficiency in working with embedded processors such as Arduino and Raspberry Pi, and they will have the opportunity to construct their robots using a dedicated robotic development platform. Subsequently, students will explore programming tools such as Matlab and Simulink, along with robot simulators, to acquire a deep understanding of the principles and best practices in software design and development within the field of robotics. Additionally, students will actively engage in discussions and debates, gain insights from guest speakers within the robotics field, and collaborate on team projects. Through hands-on involvement in a project, students will gain valuable experience in addressing real, non-trivial challenges. This course equips students with the skills and knowledge needed to excel in the dynamic and rapidly evolving field of robotics, fostering a strong foundation in both theoretical concepts and practical application.**Credits:** 3.00

CNIT 56400 - Assistive Technology And Robotics

Credit Hours: 3.00. The purpose of this graduate-level course is to equip students with the practical skills required to engage in effective and impactful research within the realm of assistive technologies and assistive robotics. The course encompasses a comprehensive exploration of key topics and research areas in assistive robotics and related technology fields, including mobility, vision, hearing, speech, and cognitive aids. Throughout the course, students will acquire a strong foundation in the essential components of conducting research in these domains. This includes conducting needs assessments, conducting comprehensive literature reviews, implementing user testing and iterative solution development processes, evaluating solutions, and engaging in prototyping activities. Emphasizing a holistic approach to learning, students will actively participate in dynamic discussions and debates, engage in insightful site visits, interact with guest speakers, and collaborate on both team and individual projects. A pivotal aspect of the course involves the practical application of acquired knowledge in a research project. Students will have the opportunity to design, implement, and/or evaluate assistive technologies or robots tailored to address specific challenges faced by individuals with disabilities and the elderly. This hands-on experience will enable students to put theory into practice and contribute meaningfully to the advancement of assistive technology solutions.**Credits:** 3.00

CNIT 56500 - Information Security Management

Credit Hours: 3.00. Information Security Management explores the issues surrounding the alignment of business and information security. More precisely, once the context of information security is understood in terms of the business and the problems with the current state of Information Security Management are identified, the course pursues solutions to those problems in terms of people, policy, process, procedures, and technology. The product produced as a result of this pursuit is an Enterprise Security Architecture, mapping business needs to technology implementation. The enterprise security architecture produced is dynamic and maintainable, thereby assuring traceability and accountability. Permission of instructor required. **Credits:** 3.00

CNIT 57000 - IT Data Analytics

Credit Hours: 3.00. Students learn decision strategies as well as Big Data and data analytics concepts using statistical inference, regression, predictive analytics, and data mining. Students will have "hands-on" opportunities using tools such as R to assist in these efforts. The primary mission of this course is to provide students 1) an awareness of the primary approaches, techniques, and tools used for business/data analytics in industry, 2) opportunities to see their applications in a variety of areas, and 3) practical experience in applying them to challenges of interest to the students. Of primary emphases are the roles and responsibilities of Information Technology in enabling and supporting data analytics in organizations. Upon successful

completion of this course, students will be able to understand key business/data analytics concepts and apply analytics approaches, techniques, and tools for decision making purposes. Permission of instructor required. **Credits:** 3.00

CNIT 57100 - Responsible Data Science

Credit Hours: 3.00. This course examines advanced topics relating to algorithmic fairness, transparency, and interpretability of data-driven decision-making systems. Topics include the data science lifecycle, data quality, algorithmic bias, debugging and mitigating bias, and transparency of data and algorithms.**Credits:** 3.00

CNIT 57500 - Data Analysis

Credit Hours: 3.00. This course will teach students how data analysis can inform decision-making. Students will develop analytical skills and focus is placed on predictive analysis to evaluate business decision. Students will develop logical reasoning and communication skills related to quantitative outputs. This course will also develop the ability to collect large datasets, organize, and combine them using Tableau software. **Credits:** 3.00

CNIT 58000 - Advanced Topics In Information Technology Project Management

Credit Hours: 3.00. The course explores and applies the advanced concepts, skills, knowledge, techniques, and tools required to successfully initiate, plan, manage, execute, control, and report on information technology projects. Special emphasis is placed on applying the PM BOK in a real life business case study as well as researching and learning concepts, techniques, and processes experienced project and program managers employ to successfully plan and manage projects. This course enables the student to learn project management through the application of project approaches in a team based setting. Through the application of project methodologies, tools and templates, the student learns the project life-cycle approach as demonstrated through actual and simulated project situations. Permission of Department required.**Credits:** 3.00

CNIT 58100 - Workshop In Computer Technology

Credit Hours: 0.00 to 8.00. Advanced study of technical and professional topics. Emphasis is on new developments relating to technical, operational, and training aspects of industry and technology education. **Credits:** 0.00 to 8.00

CNIT 58200 - IT Project Estimating, Control And Scheduling

Credit Hours: 3.00. An exploration of the body of knowledge, skills, processes, methods, and techniques that IT project managers can use to create and manage time and cost estimates, as well as the creation of accurate schedules with dependencies. The course reviews research of best practices in schedule management and budget management. Students will apply these skills and techniques to business problems. Permission of Department required. **Credits:** 3.00

CNIT 58300 - IT Program And Portfolio Management

Credit Hours: 3.00. Program and Portfolio Management deliver benefits to organizations by enhancing current abilities or developing new capabilities for the organization to use. This CNIT Graduate course will provide a detailed understanding of Program and Portfolio Management and its relationship to Project management and will present concepts that promote efficient and effective management and communications among various groups. This course curriculum is consistent with the Project Management Body of Knowledge (PM BOK) and related Standards for Program and Portfolio Management published by the Project Management Institute. Permission of Department required. **Credits:** 3.00

CNIT 58500 - Organizational Change Management For IT Projects

Credit Hours: 3.00. An exploration of the body of knowledge, skills, processes, methods, and techniques that IT project managers can use to manage the "people" side of organizational change that results from IT projects that implement new technologies, systems, services, and products into the workplace. This is sometimes called stakeholder management. The course reviews research of best practices in change management and their impact on project metrics such as schedule, budget, scope, stakeholder satisfaction. Students also learn how to identify and document the organizational and people impacts of new information technology solutions, and then develop a formal project plan to manage the organizational change. Permission of Department required. **Credits:** 3.00

CNIT 58600 - IT Requirements Management

Credit Hours: 3.00. The course explores the approaches used by today's information system professionals to conduct and manage the requirements development process. Course emphasis focuses on contemporary techniques for requirements elicitation, requirements analysis, requirements specification, requirements validation and verification. Emphasis is also placed on identifying stakeholders through the use of formal stakeholder analysis techniques, the use of formal change control, requirements traceability and the use of requirements management tools. The course is designed based on the principles and competencies prescribed by the Project Management institute's PM BOK (Project Management Body of Knowledge) and Business Analyst Guide as well as the International Institute of Business Analysis's BABOK (Business Analysis Body of Knowledge). Permission of Department required. **Credits:** 3.00

CNIT 59000 - Special Problems In Computer Technology

Credit Hours: 1.00 to 6.00. Independent study of a special problem under the guidance of a member of the staff. Does not substitute for either M.S. thesis or M.S. project credit. Permission of instructor required. **Credits:** 1.00 to 6.00

CNIT 59800 - Directed MS Project

Credit Hours: 1.00 to 3.00. A formal investigation of a particular problem under the guidance of the advisory committee. Not applicable to a thesis option plan of study. Enrollment during at least two consecutive terms for a total of three credits is required. Permission of instructor required. **Credits:** 1.00 to 3.00

CNIT 60100 - Applied Statistics In Information Technology

Credit Hours: 3.00. This course will survey the field of applied statistics in information technology. Students will gain hands-on experience running statistical analyses on samples from a variety of populations. Students will learn the process of data cleaning, data transforming/coding, identifying the appropriate statistical analyses (descriptive and inferential), as well as writing and interpreting the results. Specifically, this course will survey the following statistical approaches: correlations, t-test, analysis of variance, analysis of co-variance, factorial ANOVA, simple regression, multiple regression, logistic regression, chi-square analysis, factor analysis, and nonparametric tests. In this course, students will be able to differentiate statistical analyses and identify appropriate statistical analyses depending on the research question and variables of interest. Permission of instructor required. **Credits:** 3.00

CNIT 61700 - Cyberphysical Security Seminar: Research Topics In Cyberphysical Security

Credit Hours: 3.00. This course meets the requirements of a research seminar for the CIT graduate program. Students focusing on homeland security and related research areas are encouraged to take this course to expand their knowledge of the field in general and in their specific research areas. The students will present their research to one another to gain knowledge of topics in the subject area. The student numbers will include PHSI student research assistants, interns, and students focused on homeland security research topics. The creation of this course will provide these students more structure for engagement, learning and research. Students taking the course will construct a research paper formatted for publication in a homeland security research

journal. This course will also promote the interdisciplinary nature of homeland security from information technology to public policy generation and agent-based computer modeling. Permission of Instructor required. **Credits:** 3.00

CNIT 62300 - Contemporary Computer Technology Problems

Credit Hours: 1.00 to 8.00. Theory and practice in the development of comprehensive solutions to problems in industrial, technical, and human resource development environments. Solutions based on emerging procedures will be emphasized. Permission of instructor required.**Credits:** 1.00 to 8.00

CNIT 62500 - Research Methods In Computing

Credit Hours: 3.00. The goal of this course is to provide you with the tools necessary to not only understand how to create your own research study on cyber-physical systems, but how to critically assess the different methodologies and components in various research designs used in applied information technology. In this course, you will learn about the landscape of research in information technology. You will learn to differentiate between different research methodologies used in IT, identify threats to validity, learn specific protocols for commonly used methods in IT, and synthesize empirical literature and theory in order to design a scientific research study. The end product of this course will be the ability to design and report on an IT-related research project. Permission of instructor required. Prerequisites: STAT 50100 or STAT 51100 or other statistics course; 6 credits of CNIT at the 500 level. **Credits:** 3.00

CNIT 64000 - Advanced Research Topics In Blockchain Technology

Credit Hours: 3.00. Blockchain is gaining momentum and of increasing interest to both academia and industry. The underlying distributed ledger technology was first introduced in the cryptocurrency Bitcoin by Satoshi Nakamoto and its adoption will dramatically reshape the landscape of IT infrastructure of a diverse range of sectors, such as manufacturing, finance, government, healthcare, and insurance, from centralized control to decentralized cooperation. Under the hood, cryptography, distributed consensus, economic incentives, and autonomous management/computation are consolidated to support Blockchain technology. In this research-focused course, we will explore a variety of active research areas in the evolving Blockchain technology, identify the challenges of the current development and attempt to answer open questions. Permission of instructor required.**Credits:** 3.00

CNIT 69100 - Natural Language In Information Assurance, Security, And Privacy

Credit Hours: 3.00. This course will serve as seminar in natural language applications with the emphasis in information assurance, security, and privacy. The topics will review the state of the art of general information assurance, security, and privacy with the focus on natural language text and information received from and implied in it. The course will focus in a wide range of papers describing various techniques and applications, with identifiable advantages and disadvantages. The assignments will range in class paper presentations to group projects and written reports. **Credits:** 3.00

CNIT 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required. **Credits:** 1.00 to 18.00

CNIT 69900 - Research PhD Dissertation

Credit Hours: 1.00 to 18.00. Dissertation-level research (for CIT PhD degree). Permission of instructor required.**Credits:** 1.00 to18.00

Computer Graphics Technology

CGT 132NN - Game Design Psychology: Theory And Prototyping

Credit Hours: 3.00. This course explores the application of cognitive psychology and theories of learning and motivation to the design and prototyping of games. Students learn how to create games that are fun to play, and evaluate and improve games that may not be, based on psychological concepts, theories, and findings.**Credits:** 3.00

CGT 10101 - Foundations Of Computer Graphics Technology

Credit Hours: 2.00. This course provides a foundational overview of computer graphics. The topics include the applications of computer graphics in today's world, basic technical elements of computer graphics, a review of current and future career opportunities in the field, and areas of potential research and study in computer graphics technology. **Credits:** 2.00

CGT 10501 - Introduction To Games

Credit Hours: 3.00. Students learn the history of computer game design. Students engage in learning activities that help them remember basic game design principles. These principles are then applied using simple exercises within game engine technology. **Credits:** 3.00

CGT 11000 - Technical Graphics Communications

Credit Hours: 3.00. This course is an introduction to the graphic language used to communicate design ideas using CAD. Topics include sketching, multiview drawings, auxiliary views, pictorial views, working drawings, dimensioning practices, and section views. **Credits:** 3.00

CGT 11100 - Designing For Visualization And Communication

Credit Hours: 3.00. An introductory design course for computer graphics majors. Students develop an understanding of the basic design elements and principles, composition, and typography through exercises and projects. The focus is on visual thinking, exploring the relationship between type and image, and developing multiple solutions to a given problem. **Credits:** 3.00

CGT 11200 - Sketching For Visualization And Communication

Credit Hours: 3.00. This course applies fundamental computer graphics concepts of visualization, communication, and creativity within a sketching metaphor. Exercises and projects in graphic theory, problem solving, and sketching skill development provide students with activities that focus on further development within the discipline. A variety of sketching techniques are used to gather critical information and transform data into effective communication instruments.**Credits:** 3.00

CGT 11505 - Scripting And Computational Thinking

Credit Hours: 3.00. This course introduces the students to computer programming, computational thinking, and the mathematics of graphics programming. The act of programming is viewed through the lenses of Decomposition, Pattern Matching, Abstraction and Algorithms and then applied to writing some simple games in current scripting languages. No prior programming experience is required. The principal objective of the course is to provide a working knowledge of programming fundamentals to game designers and artists as well as to prepare game programmers for more advanced game programming coursework. As computer programming is an applied discipline, this course uses an active learning approach that combines lecture time with extensive lab assignments.**Credits:** 3.00

CGT 11600 - Geometric Modeling For Visualization And Communication

Credit Hours: 3.00. A core introductory computer graphics course that provides entry-level experiences in geometric modeling. Students develop geometric analysis and modeling construction techniques and processes to produce accurate computer models for graphic visualization and communication.**Credits:** 3.00

CGT 11700 - Illustrating For Visualization And Communication

Credit Hours: 3.00. This foundation course stresses the use of pictorial illustration for visualization and communication. Various projection systems are introduced with discussion focusing on the appropriate use of view and system utilized to accentuate and provide clear communication. A variety of digital tools are used to construct, extract and render pictorial views using vector and raster tools.**Credits:** 3.00

CGT 11800 - Fundamentals Of Imaging Technology

Credit Hours: 3.00. This course provides a foundation for the development and use of raster and vector images for a variety of industries. Full-color images and illustrations are produced using computer technologies, with a focus on both technical and aesthetic aspects. Topics include color theory and perception, surface and lighting analysis, rendering techniques, and technical characteristics. **Credits:** 3.00

CGT 12300 - Animation Foundations

Credit Hours: 3.00. In this course, students are introduced to the core concepts and principles of animated motion. The course includes an overview of animation history and the evolution of animation technology. Principles of animation production are explored through practical exercises executed in a range of animation software types. These exercises will familiarize students with different approaches to creating animated motion, with a focus on keyframed digital animation. **Credits:** 3.00

CGT 14100 - Internet Foundations Technologies And Development

Credit Hours: 3.00. (CNIT 14100) The course explores the history, architecture, and development of the World Wide Web. Current tagging and scripting languages are covered in a tool-independent environment. Topics also include authoring tools, design, graphic and multimedia formats, and commerce, implementation, and security issues. PC literacy required.**Credits:** 3.00

CGT 14700 - Visual Effects Introduction

Credit Hours: 3.00. This course introduces students to the visual effects techniques using common methodologies and tools. Topics include procedural frameworks, 3D pipeline implementation, vector operations, and simulating physical phenomena for entertainment graphics. Special emphasis is placed on achieving aesthetically please entertainment-grade graphics using visual effects techniques. **Credits:** 3.00

CGT 17207 - User Experience Design Experience Studio I

Credit Hours: 3.00. This course allows students to practice as a UX designer in a company-like environment. Students learn about the roles they can pursue and build foundational collaboration and project management skills. Projects utilize a human-centered design approach to provide a rich user experience.**Credits:** 3.00

CGT 17208 - User Experience Design Studio I: Fundamentals

Credit Hours: 3.00. Introduction to the fundamental components of human-centered design, focusing on interactive computer systems. Students learn the basic tenets and methods of user-centered design, including usability and visual design principles, user research, and low-fidelity prototyping. The course is platform-independent and encourages students to experiment with new and emerging technologies.**Credits:** 3.00

CGT 20200 - Motion And Video I

Credit Hours: 3.00. The movement of graphics and incorporation of video is become ever prevalent within commercial production. No longer are these elements done solely by the Hollywood elite or used strictly within the film industry. Professionals are utilizing all kinds of tools in digital video, audio, graphic design and animation to create moving elements that tell a story and communicate concepts to solve communication problems. Students will learn basics in the production process, framing and movement, key framing, and design principles. Students will also learn basics in client relationship and business etiquette. Initial projects will focus on commercial creation and the utilization of typography as it relates to storytelling.**Credits:** 3.00

CGT 20400 - Introduction To Themed Attraction Design

Credit Hours: 3.00. An introduction to immersive attraction; including the consideration of operations, graphics, engineering, technology and design. Students will apply their knowledge in narration and graphic principles to concept projects in immersive spaces.**Credits:** 3.00

CGT 20500 - Portfolio Review

Credit Hours: 0.00. Portfolio review for students in Computer Graphics Technology. **Credits:** 0.00

CGT 21100 - Raster Imaging For Computer Graphics

Credit Hours: 3.00. Digital images are produced using a variety of computer technologies. Advanced color theory, surface rendering, and light control are emphasized in relation to technical illustration, hardware characteristics, and software capabilities. **Credits:** 3.00

CGT 21500 - Computer Graphics Programming I

Credit Hours: 3.00. This course focuses on programming fundamentals, logic, and problem solving necessary for advancement into upper level CGT courses. A cross-section of languages and technologies will be introduced and demonstrated.**Credits:** 3.00

CGT 21600 - Vector Imaging For Computer Graphics

Credit Hours: 3.00. Full-color vector illustrations for a variety of uses are produced using computer methods. Color theory, surface analysis, and rendering techniques are emphasized as they apply to vector-based illustrations. **Credits:** 3.00

CGT 21801 - Open Studio - Interactive Art And 3D Animation

Credit Hours: 3.00. This interdisciplinary course invites Purdue students to reflect on global culture, location and society, while simultaneously learning practical knowledge in programming, interactive visualization, locative media, 3D modeling and animation. The class integrates field trips, brainstorming sessions and technical training to create context-based interactive art. **Credits:** 3.00

CGT 22600 - Introduction To Constraint-Based Modeling

Credit Hours: 3.00. This course explores the techniques used in the construction and manipulation of constraint-based solid models and assemblies. Emphasizes extracting data from databases. Downstream applications of data and the impact on overall product design processes are explored. **Credits:** 3.00

CGT 24100 - Introduction To Computer Animation

Credit Hours: 3.00. This course introduces the knowledge base on which digital animation and spatial graphics technology are founded and developed. Emphasis will be placed on developing a working knowledge of the mechanics of 3D geometric formats, spline-based modeling with polygon mesh & NURBS, procedural mapping of raster images, simplified polygon modeling, rendering methods, hierarchical linking, and kinematic fundamentals. **Credits:** 3.00

CGT 24500 - Game Development I: Core Skills And Technologies

Credit Hours: 3.00. (CNIT 30600) This course introduces students to the fundamental technologies and skill sets required to develop video games. Students will be taught agile development methodologies in a team-based environment.**Credits:** 3.00

CGT 24600 - Compositing I

Credit Hours: 3.00. This course focuses on applying node-based video compositing techniques as applied to 3D visual effects and animation. Students explore the major areas of video compositing, including node-based workflows, integration with 3D animation and visual effects tools, image tracking, rotoscoping, and chroma keying. Special emphasis is placed on creating aesthetically pleasing video composites using production tools and techniques.**Credits:** 3.00

CGT 24700 - Visual Effects - Particles And Procedural Effects

Credit Hours: 3.00. This course focuses on simulating and rendering particles. Special emphasis is placed on volumes, sparks, dust, and smoke effects. Techniques for minimizing render times and meeting production requirements are explored. Emphasis is placed on the use of production tools and techniques to create aesthetically pleasing graphics.**Credits:** 3.00

CGT 24800 - Visual Effects - Pyrotechnics And Destruction Effects

Credit Hours: 3.00. This course focuses on the application of visual effects methodology to create effects based on destruction techniques and pyrotechnics. Students implement projects using methods for simulating destruction, fire, and smoke. Emphasis is placed on using production tools and techniques to produce realistic and aesthetically pleasing graphics. **Credits:** 3.00

CGT 25001 - Computer Graphics Professional Practices I

Credit Hours: 1.00. CGT 25001 is a course in the CGT professional practices sequence, with a focus on student professional development and communications in the field of computer graphics. Emphasis will be placed on industry engagement for the development and refinement of a student's professional resume and portfolio; and professional communications practices necessary for securing professional practical work experience. CGT 25001 will be taught in a seminar format with one meeting per week focused on guest speakers, status checks for portfolio and resume development, and professional networking. **Credits:** 1.00

CGT 25100 - Principles Of Creative Design

Credit Hours: 3.00. This course is an exploration of conceptualization and problem-solving using the integration of type and image as both visual and verbal communication. Topics such as systems of organization, visual hierarchy, creativity, typography, color, and navigation are introduced and explored. **Credits:** 3.00

CGT 25500 - Game Development II: Design And Psychology

Credit Hours: 3.00. (CNIT 30800) This course examines video game design, theory, and development from aesthetic, psychological, and technical perspectives. Students will gain experience with a commercial game development platform. Advanced game development techniques will be taught in this course.**Credits:** 3.00

CGT 25600 - Principles Of User Experience Design

Credit Hours: 3.00. This course introduces students to the process of user-centered design of computer systems humans interact with. Students learn how to draw upon principles of usability and user interface design rooted in human psychology and user research in order to conceptualize, prototype, and evaluate computer systems. Topics include processes such as user research, conceptual design, prototyping, and evaluation and concepts such as visual hierarchy, usability, information architecture, navigation, and more. The course is platform-independent and encourages students to experiment with new and emerging technologies. **Credits:** 3.00

CGT 26505 - Video Game Level, Mission, And World Design

Credit Hours: 3.00. This course teaches the techniques required to make game environments and levels from a game level design perspective. Students learn the process of designing play spaces through a structured process of paper design, blockout, and iteration. Architectural principles are discussed, in addition to case studies from published games. Environment art and lighting techniques are discussed and implemented, all with the goal of enhancing the interactivity of the given play space.**Credits:** 3.00

CGT 27000 - Introduction To Data Visualization

Credit Hours: 3.00. This course is designed for students with little or no background in Data Visualization. It provides an introductory examination of data visualization through lecture, readings and hands-on experience with current visualization tools. Students will obtain an overview of the various types of data, the fundamentals of the visualization process for information and scientific visualization, and examine detail visualizations workflows that aim to answer "when" (temporal data), "where" (geospatial data), "what" (topical data), and "with whom" (trees and networks) questions when visualizing data. After taking the course students will have both the theoretical foundation and practical skills needed to create insightful visualizations for a wide range of data types.**Credits:** 3.00

CGT 27001 - Topics In Data Visualization

Credit Hours: 1.00. This course provides students with first-hand knowledge about the field of data visualization and explore a collection of competencies that will help students think through, think about, and think with visual representation of data. Students will explore and examine current careers in data visualization and learn what skills they should work to refine in preparation for future internships and jobs. This course will provide insight into current data visualization literacy requirements in today's data driven world.**Credits:** 1.00

CGT 27108 - User Experience Design Studio II: Screen

Credit Hours: 3.00. Intermediate exploration of various approaches to human-centered design. Students learn intermediate research and design methods and create high-fidelity prototypes. The course is platform-independent and encourages students to experiment with new and emerging technologies.**Credits:** 3.00

CGT 27207 - User Experience Design Experience Studio II

Credit Hours: 3.00. This course allows students to practice as a UX designer in a company-like environment. Students continue to develop their abilities and contribute significantly to projects. Projects utilize a human-centered design approach to provide a rich user experience.**Credits:** 3.00

CGT 27208 - User Experience Design Studio III: Cross-Channel

Credit Hours: 3.00. Advanced exploration of cross-channel approaches to human-centered design such as service design that span digital and physical experiences. Students utilize principles of usability and user experience to create and evaluate physical

prototypes. The course is platform-independent and encourages students to experiment with new and emerging technologies.**Credits:** 3.00

CGT 27500 - Data Visualization II

Credit Hours: 3.00. This course provides a practical introduction to exploratory data analysis and data mining to better inform data visualization applications. The course introduces a practical approach for making sense out of data. Students are introduced to issues inherent to the data analysis process or data mining projects. The course covers: (1) how to *prepare* data prior to analysis, (2) how to *generate* summaries of the data, (3) how to *identify* non-trivial facts, patterns and relationships in the data and (4) how to *create* models from the data to better understand the data and make predictions. After data is analyzed students will use the data visualization process and techniques to *visually represent* the data. The course will also introduce the use of high-level programming languages for data analysis and data visualization. **Credits:** 3.00

CGT 28500 - Cross Cultural Game Development

Credit Hours: 3.00. This course presents current methods of design and development of digital games for extra-cultural audiences. Students are instructed using an experiential learning model in which multi-cultural student teams lead independent game development projects targeted at a non-native cultural audience. Topics include: dimensions of cultural, game engine scripting, art asset utilization, ethnographic data collection methods, cross-cultural team building, cultural observation, and project management. This course is taught in the US but is co-taught as a distance learning course with a foreign partner institution. Students who take 28500 may not also take 28510 (the study abroad version of the course). **Credits:** 3.00

CGT 29000 - Computer Graphics

Credit Hours: 1.00 to 3.00. Course topics will be determined by the CGT faculty. Hours and subject matter shall be arranged by the instructor and approved by the CGT curriculum committee. This course will not be used for independent study.**Credits:** 1.00 to 3.00

CGT 30505 - Portfolio II

Credit Hours: 0.00. Students present online portfolios, and the course instructors review and give feedback to help direct students' online presence in efforts to meet industry standards. **Credits:** 0.00

CGT 30800 - Prepress Production And Design

Credit Hours: 3.00. This course focuses on the process of designing, creating, and preparing documents for commercial printing. Students will develop proficiency with publishing software. Topics include page layout, font and image management, color, printing processes, papers, bindings and proofing methods. Projects emphasize designing single and multi-page documents for business and advertising such as identities, flyers, brochures, forms, catalogs, newsletters and booklets. **Credits:** 3.00

CGT 30900 - Internship In Computer Graphics Technology

Credit Hours: 2.00 or 3.00. Internship course in computer graphics technology. Practical experience totaling at least 240 hours in computer graphics technology. Permission of department required.**Credits:** 2.00 or 3.00

CGT 31000 - Drawing, Acting And Scripts For Animation

Credit Hours: 3.00. This course analyzes the symbiotic relationship between thinking and physical action, between emotion and its expression. Students will explore the visual storytelling process for film, animation, video games or multimedia. Students will learn the history of and gain needed drawing skills to create storyboards, animatics, along with the learning the importance to the

production process. Students will learn how animation scripts are developed as well as how visual stories are told through technical elements such as composition, lighting, framing and perspective. Students will explore how to tap into their creativity and create interesting original animations. **Credits:** 3.00

CGT 31300 - Digital Painting I For Computer Graphics

Credit Hours: 3.00. This course introduces students to digital painting techniques for graphical visualization and communication. Topics include industry standard practices and instruction in digital brush creation, digital mark making, value under painting, color palettes, and lighting and rendering to produce various computer graphics.**Credits:** 3.00

CGT 31400 - Advanced Motion Design

Credit Hours: 3.00. This course builds on the basic principles of motion design. Students will learn advanced techniques in visual storytelling, puppetry/rigging and integration of 3D elements into the design environment. Advanced design principles will also be discussed as sell as post-production techniques for animators with a focus on commercial production.**Credits:** 3.00

CGT 31500 - Computer Graphics Programming II

Credit Hours: 3.00. A continuation of the study of computer graphics programming concepts with an emphasis on interactive graphics and application development. Topics include polygon tessellation, vector imaging, interactive programming techniques, application development, and game development. **Credits:** 3.00

CGT 31700 - Planning And Communicating Themed Attraction Design

Credit Hours: 3.00. Building on students knowledge of narrative creation and design, students will learn about the fundamentals of operations, graphics, engineering, technology and design to create theme-based immersive attractions. This course will focus on design concepts, technical design, management and creation of immersive experiences.**Credits:** 3.00

CGT 32101 - Digital Illustration

Credit Hours: 3.00. This course applies fundamental computer graphics concepts of visualization, communication and creativity using a painting metaphor. Exercises and projects in graphic theory, problem solving and painting skill development provides students with projects that focus on further development within the digital illustration discipline. A variety of traditional digital drawing and painting techniques are used to transform concepts into communicative visual artifacts. **Credits:** 3.00

CGT 32500 - Animation For Games

Credit Hours: 3.00. In game industry, computer animation is the foundation giving life to human-like virtual characters. A thorough understanding of the motion capture and interactive computer animation is a requisite element of the game development process. This course introduces students to the fundamental techniques and skills required to develop animations for video games using a modern motion capture device and software packages. Students are taught using lectures and lab sessions. The focus of this course is primarily on the technical, artistic, and functional dimensions of animation for games, prioritizing the required technical skills. Production of user controller interactive virtual characters is required. **Credits:** 3.00

CGT 32600 - Graphics Standards For Product Definition

Credit Hours: 3.00. Introduction to product data exchange and interoperability standards, ANSI and NIST product documentation standards, product modeling standards, methodologies for technology selection, implementation, and evaluation. This course supports the product archival and communication processes in a PLM environment. **Credits:** 3.00

CGT 32800 - Business Of Themed Entertainment

Credit Hours: 3.00. This course provides an insider's look at the skills needed to succeed in themed entertainment industry as well as provide an overview of the experience economy. Students will get an insider understanding of the project process, working with outside vendors, team communication, common constraints and budgeting.**Credits:** 3.00

CGT 33300 - Modeling For Entertainment Graphics

Credit Hours: 3.00. This course offers students a chance to comprehensively explore Polygon Modeling, with consideration of how choices made in modeling can affect all other aspects of the animation pipeline. **Credits:** 3.00

CGT 33500 - Game Scripting

Credit Hours: 3.00. Students gain a deeper understanding into video game scripting. Utilizing a common project, students use scripted objects to customize and enhance a small existing game. While the projects are individualized for the student, they are trained to utilize best practices for team based, industry applications of their work. Permission of department required.**Credits:** 3.00

CGT 34000 - Digital Lighting And Rendering For Computer Animation

Credit Hours: 3.00. The development of a working knowledge of perspective display of three-dimensional models and the resulting effects of projected light sources on shade, shadow, color, texture, and atmospheric effects in architecture, product illustration, and animation. Emphasis will be placed on lighting design, analysis, and photorealistic simulation for commercial graphic applications. **Credits:** 3.00

CGT 34100 - Motion For Computer Animation

Credit Hours: 3.00. An applied course covering three-dimensional computer graphic animation for graphics specialists and professionals involved in the use of technical design, time and motion study, surface texture mapping, digital lighting, color, and the technology required to produce computer animations for commercial applications in manufacturing design, marketing, and training. **Credits:** 3.00

CGT 34500 - Game Development III: Environment Modeling For Games

Credit Hours: 3.00. (CNIT 33100) This course teaches the techniques and principles needed to create realistic three-dimensional virtual environments in game engines. The course will examine the principles of physics that determine how light propagates through the world and is eventually perceived by a human eye. Global illumination techniques that approximate these principles are described, followed by an in-depth examination of how game engines then approximate these solutions in order to create virtual environments that can run at real-time frame rates.**Credits:** 3.00

CGT 34505 - Environment Modeling For Games

Credit Hours: 3.00. This course teaches the techniques and principles needed to create realistic three-dimensional virtual environments rendered in game engines. This course will examine design, modeling, material creation and lighting of environments displayed in a real-time game engine environment. Amongst the topics that will be covered is: Direct input modeling, procedural modeling, digital sculpting, material authoring and real-time lighting using current 3D tools. **Credits:** 3.00

CGT 34600 - Digital Video And Audio

Credit Hours: 3.00. Covers the use of digital technologies for video and audio in multimedia, hypermedia, and animation products. Students examine the methods for creating, sampling, and storing digital video and digital audio and the constraints placed on these media assets when used for media-based products. Emphasis is placed upon the technology of digital video and audio, including formats, data rates, compressors, and the advantages and disadvantages of the different technologies. **Credits:** 3.00

CGT 34800 - Photorealistic Shaders

Credit Hours: 3.00. This course focuses on the creation and application of photorealistic custom shaders to visual effect problems. Students learn to tender common material photorealistically using common industry tools and techniques. Emphasis is placed on meeting specified aesthetic and photorealistic requirements within computationally constrained environments.**Credits:** 3.00

CGT 35300 - Principles Of Interactive And Dynamic Media

Credit Hours: 3.00. This course explores the development of interactive and dynamic media components for web and interactive media products. The course examines the design, creation and integration of 2D animation, 2D games, text, sound, video, programming, and databases for use in web and other interactive media.**Credits:** 3.00

CGT 35600 - Web Programming, Development And Data Integration

Credit Hours: 3.00. A course focusing on the development of dynamic content and applications to facilitate information distribution. The course stresses development strategies for managing the rapidly changing information of corporations and organizations for just-in-time distribution, using authoring programs to create interactive multimedia products that utilize database management systems, file systems, and XML to provide a method for visualizing and manipulating that data. Significant time is spent on intermediate to advanced programming and scripting. **Credits:** 3.00

CGT 36500 - Game Development Practicum

Credit Hours: 3.00. This course provides an opportunity for teams of game developers to focus on a project without distraction by competing course deliverables. Students propose a game project and spend the entire semester working only on that project. Course instructors will function as facilitators, producers, and supervisors, helping each student team scaffold their work such that all course goals are met.**Credits:** 3.00

CGT 36700 - Previsualization In Themed Entertainment

Credit Hours: 3.00. This course provides an overview of themed entertainment development from concept to previsualization and communication. Students will have the opportunity to take initial concepts for themed experiences and visualize them to communicate to multiple external audiences.
Credits: 3.00

CGT 37000 - Interactive Data Visualization

Credit Hours: 3.00. Data visualization is the art and science of putting quantitative numbers into pictorial or graphical format that are easy for users to understand, use, and take action upon the data. In this course, we will learn basic data visualization design principles, theories, data management skills, and fundamental web technologies to design and develop web based interactive date visualizations. The students will be able to design the proper visual representations of the data based on the data's characteristics, business needs, and prospective users. **Credits:** 3.00

CGT 37108 - User Experience Design Studio IV: Strategy

Credit Hours: 3.00. Advanced exploration of strategic human-centered design that aligns user experience with organizational strategy and business goals, using approaches such as agile, waterfall, and lean UX. Students utilize visual, information, and usability principles as well as various approaches and methods of human-centered design to create interactive digital prototypes. The course is platform-independent and encourages students to experiment with new and emerging technologies.**Credits:** 3.00

CGT 37207 - User Experience Design Experience Studio III

Credit Hours: 3.00. This course provides students with opportunities to explore opportunities in a company-like environment. Students are knowledgeable project members and beginning to transition into subject matter experts and managers. Projects utilize human-centered design principles to provide a rich user experience.**Credits:** 3.00

CGT 37208 - User Experience Design Studio V: Specialization

Credit Hours: 3.00. This course prepares students to lead complex and strategic design projects. Students become proficient in the most advanced approaches, methods and techniques of human-centered design. The course is platform-independent and encourages students to experiment with new and emerging technologies.**Credits:** 3.00

CGT 37500 - Game Audio

Credit Hours: 3.00. Students learn the basics of audio production as it relates to game development. Students edit and create audio effects using off-the-shelf tools and implement these sounds in a game engine. Microphones, digital audio workstations, and sound effect libraries are utilized in a framework that focuses on direct implementation into interactive media. **Credits:** 3.00

CGT 37700 - Scientific Visualization

Credit Hours: 3.00. This course is an introduction to the use of computer graphics to help user gain insight into scientific datasets. Applications from atmospheric science, medicine and physics will be explored. Topics will include the fundamental approaches to scalar-valued data (volume rendering, iso-surface extraction), vector-valued data (glyphs, streamlines), and tenors-valued data (ellipsoidal, quadric and super quadric glyphs). **Credits:** 3.00

CGT 38500 - Game Production

Credit Hours: 3.00. This course uses intensive project-based, student-led learning in game development to cultivate skills in quality assurance, leadership, communication, time management, contingency planning, technology integration, autonomy and accountability. Students act in an executive role with students in other project-oriented classes and in so doing cultivate supervisory production experience. Each student must engage with instructors and students to hone real-world hard and soft skills through situated experiences and student-led teaching opportunities. Student producers must develop a functioning development pipeline, meet regularly with their teams, and maintain industry-standard documentation and project management processes. Permission of Instructor required. **Credits:** 3.00

CGT 39000 - Computer Graphics

Credit Hours: 1.00 to 3.00. Course topics will be determined by the CGT faculty. Hours and subject matter will be arranged by the instructor and approved by the CGT curriculum committee.**Credits:** 1.00 to 3.00

CGT 40400 - Self Promotion For Computer Graphics

Credit Hours: 3.00. This course has been designed to introduce students to the professional practice of branding oneself as commonly used in industry. Students will learn how to critique their own work, and the work being done by peers in the industry.**Credits:** 3.00

CGT 40500 - Senior Portfolio Review

Credit Hours: 0.00. Portfolio review for seniors in Computer Graphics Technology.**Credits:** 0.00

CGT 40700 - Current And Future Trends In Themed Attraction Design

Credit Hours: 3.00. Students will learn about current trends in immersive attractions. Current technologies will be explored that can be used to enhance the narrative in a themed immersive space. Students will explore technologies, narrative techniques and integration of engineering.**Credits:** 3.00

CGT 41100 - Contemporary Problems In Applied Computer Graphics

Credit Hours: 3.00. Groups will identify, design, qualify, manage, create, and present a final project relative to existing or emerging issues within applied computer graphics. Activities and experiences will explore related topics such as project planning and management, user expectations, interpersonal communications skills, and quality management. The course concludes with faculty, peers, and practicing professionals evaluating oral, written, and media presentations of final projects. **Credits:** 3.00

CGT 41101 - Contemporary Problems In Applied Computer Graphics I

Credit Hours: 2.00. Groups will identify, design, qualify, and plan a final project relative to existing or emerging issues within applied computer graphics. This project will be done in conjunction with industry and faculty engagement. Activities and experiences will explore related topics such as project planning and management, user expectations, interpersonal communications skills, and quality management. This course is followed by CGT 41201 which includes the execution and evaluation of the capstone project planned in CGT 41101.**Credits:** 2.00

CGT 41201 - Contemporary Problems In Applied Computer Graphics II

Credit Hours: 2.00. CGT 41201 is the second course in the CGT applied computer graphics capstone sequence with a focus on execution and evaluation of the senior capstone project. Emphasis will be placed on industry engagement for the execution of the project plan that was developed in CGT 41101. Students will work in teams to execute the project plan; develop and execute a project evaluation plan, and make a professional final presentation to industry members, faculty, and peers. Students will execute a project refinement process based on feedback received and incorporate that into a final presentation and project report. CGT 41201 will be taught in a seminar format with one meeting per week focused on project status checks, evaluation plan development and execution, and project presentations. **Credits:** 2.00

CGT 41600 - Senior Design Project

Credit Hours: 3.00. This capstone course requires students to engage in a substantive endeavor directed at solving problems related to computer graphics. Activities include the creation and management of graphic systems and media assets per the requirements of the senior design proposal. Students are required to demonstrate professional attitudes and attributes in the timely completion and presentation of their project.**Credits:** 3.00

CGT 42300 - Product Data Management

Credit Hours: 3.00. This course provides an understanding of the types of data generated and used in the product lifecycle, the current tools and methodologies in the management of that data, and system analysis and implementation techniques for using PDM as the backbone supporting a company's product development and implementation activities. Interaction between various enterprise systems is also discussed. **Credits:** 3.00

CGT 42500 - Game Design

Credit Hours: 3.00. This course is about the discovery, summarization, application, analysis, and synthesis of novel game design techniques. Discovery and summarization are done through research and in-class presentations. These presentations are then used to create prototypes in the game engine of the student's choice. Students are expected to collect data on these prototypes. This data is then used to iterate on the prototypes throughout the semester. The course culminates in a polished prototype that is published on any valid public gaming platform or student portfolio. This is an advanced course that assumes the student has existing skills in game creation (particularly game scripting, game art, and game design). Permission of instructor required. **Credits:** 3.00

CGT 42600 - Industry Applications Of Simulation And Visualization

Credit Hours: 3.00. This course focuses on developing mathematically accurate physical-visual simulations of mechanisms, systems, and assemblies. Topics include physical system analysis; coordinate systems; inverse kinematics; linear, rotational, and reciprocating motion. Simulations will be created using modeling technology, programmed scripting, and diverse software. **Credits:** 3.00

CGT 43500 - Virtual Reality And 3D User Interfaces

Credit Hours: 3.00. The purpose of this course is twofold: (a) to provide students with a deep understanding of the fundamentals of virtual reality environments and 3D user interfaces and (b) to offer students practical experience with consumer-grade virtual reality systems. Students will explore the challenges of developing and analyzing virtual reality systems and 3D user interfaces that are effective and comfortable, motivated by design goals and constrained by the real world. We will also explore the relationship of virtual reality to entertainment, medical, and manufacturing domains.**Credits:** 3.00

CGT 44200 - Production For Computer Animation

Credit Hours: 3.00. An applied course covering advanced spline modeling techniques, lighting techniques, applied shading, motion dynamics and controllers, particle systems, application customization programming, and pre-production development and planning. Study of emerging advancements in computer animation and spatial graphic technologies will be included. **Credits:** 3.00

CGT 44400 - The History And Technique Of Visual Effects In Film

Credit Hours: 3.00. This lecture-based course presents the history and technique of special or visual effects in film from the 19th Century (George Me'lie's) to the current digital age of visual effects. Emphasis is placed on the use of effects in fantasy, science fiction, and horror genres. These effects can range from the recreation of historical venues, to fictional characters and to worlds not yet seen. This course serves not only to address this facet of the history of film and cinema, but also the techniques and technology of visual effects including practical effects, miniatures, stop-motion, makeup, mechanical effects, optical effects, motion control, and the digital realm.**Credits:** 3.00

CGT 44500 - Game Development IV: Procedural Asset Creation For Games

Credit Hours: 3.00. This course teaches a procedural approach to game development ranging from geometric modeling techniques, crowd simulation, particle systems, fluid simulation and flame simulation. The course will examine procedural nondestructive workflows that can be translated into real-time assets for game development. Students will learn how to set up nodal and parameter based graphs that carry the ability to be interactively updated and changed, thus having the flexibility expected in an industry pipeline.**Credits:** 3.00

CGT 44600 - Post-Production And Special Effects For Computer Animation

Credit Hours: 3.00. A variety of commercial applications of technical animation and spatial graphics are analyzed and produced, with special emphasis upon client development, design, organization, scripting, storyboarding, technical production, management, and evaluation. **Credits:** 3.00

CGT 45000 - Professional Practices

Credit Hours: 3.00. This course prepares students for professional employment in Computer Graphics related professions. Topics include ethical and legal issues, contracts, copyright, and freelancing as well as portfolio planning, design, preparation, and presentation. **Credits:** 3.00

CGT 45001 - Computer Graphics Professional Practices II

Credit Hours: 1.00. Preparation for professional employment in computer graphics professions. Topics covered include professional and technical writing, correspondence, corporate and freelance employment considerations; portfolio planning; and interviewing. Students will arrange interviews and portfolio reviews. **Credits:** 1.00

CGT 45600 - Advanced Web Programming, Development And Data Integration

Credit Hours: 3.00. This course presents the advanced technologies available for use on the World Wide Web and within corporate intranet environments. Emphasis and discussion is focused on the advantages and disadvantages of these technologies as well as on implementation to create unique solutions for business and industry. Strategies for planning, development, and implementation will be discussed and demonstrated. Significant time is spent on advanced programming and scripting as well as manipulation and visualization of data from various sources, including robust database management systems. Students are required to plan, design and implement a major project. **Credits:** 3.00

CGT 47000 - Data Visualization Studio

Credit Hours: 3.00. This course will teach students design and develop interactive data visualization systems to communicate and analyze complicated datasets. Students will learn interaction and visual design principles, draw from human perception and cognition theories, and focus on hands-on practice of developing interactive data visualization systems that enable users to see, understand, and analyze complex data and relations. At the end of the class, students will apply the design principles and use proper technologies to create a comprehensive interactive visualization system for data analysis.**Credits:** 3.00

CGT 47407 - UXD Experience Studio VI Management

Credit Hours: 3.00. This is an advanced-level course where students are project managers in a company-like environment within the Purdue Experience Studios. Students learn about management expectations within a UX design company as they work with multi-level teams on corporate-sponsored projects. Projects utilize a human-centered design approach with an emphasis on designing for the user experience. Students learn how to manage team leadership, including training project owners by planning, organizing, and running training and mentoring workshops. Permission of instructor required.**Credits:** 3.00

CGT 48500 - Honors Game Production

Credit Hours: 3.00. This course provides an opportunity for students to acquire real-world experience working as a game studio producer for one or more student Career Project (capstone) teams. Students may enroll in this course via invitation only. As this is an Honors course, students are expected to bear greater individual responsibility and produce very high quality results. Students should be capable of working with a high degree of autonomy and be prepared to adapt to open-ended problems and deliverables expectations that may shift according to project needs. Student producers will coordinate development efforts and logistics between Career Project teams (CGT 365) and the various Outsourcer courses that the Career Project teams depend upon. Students must function as leaders and accept responsibility for their team's results. This course fulfills the requirement for work experience as defined by the CGT department. Permission of instructor required. **Credits:** 3.00

CGT 49000 - Computer Graphics

Credit Hours: 1.00 to 3.00. Senior-level course topics will be determined by the CGT faculty. Hours and subject matter shall be arranged by the instructor and approved by the CGT curriculum committee. This course will not be used for independent study.**Credits:** 1.00 to 3.00

CGT 49100 - Special Topics In Computer Graphics

Credit Hours: 1.00 to 6.00. A variable title, variable content course pertaining to problems and research in graphical methods and representation. Permission of instructor required.**Credits:** 1.00 to 6.00

CGT 49800 - Undergraduate Research In Computer Graphics Technology

Credit Hours: 1.00 to 3.00. Students will conduct research in the area of computer graphics technology with a primary investigator. The primary focus of the course is to contribute to ongoing research, while learning current research techniques. Contributing to research design, analyzing data, determining courses of action, developing critical thinking, and presenting results are emphasized. Requires prior approval of, and arrangement with, a faculty research advisor. Permission of instructor required. **Credits:** 1.00 to 3.00

CGT 49900 - Selected Tropics in Computer Graphics

Credit Hours: 1.00 to 3.00. Hours and subject matter to be arranged by staff.**Credits:** 1.00 to 3.00

CGT 50100 - Seminar In Computer Graphics Technology

Credit Hours: 0.00 to 3.00. A variable topics course that addresses contemporary problems and issues related to M.S. students in Computer Graphics Technology. Permission of instructor required. **Credits:** 0.00 to 3.00

CGT 51100 - The Development Of Graphics In Technology

Credit Hours: 3.00. An introduction to the historical development of visual science in western civilization and its effect on computer graphics techniques and practices. Topics include the historical, contemporary, and future developments in computer graphics. Emphasizes the study of visual science and the significance of computer graphics as a communications medium. **Credits:** 3.00

CGT 51200 - Foundational Readings Of User Experience Design

Credit Hours: 3.00. This course provides an overview of the field of human-computer interaction (HCI) and user experience (UX) design. Students will explore the main themes, paradigms, and theories of HCI and UX from its inception to the present. The course takes a broad, chronological approach, examining the history and evolution of HCI and UX, including its major intellectual shifts, successes and failures, and its dynamic relationship to other fields. Students will read seminal works from leading researchers. This course is intended to provide a solid foundation for further research. No specific technical or programming experience is required. **Credits:** 3.00

CGT 51300 - Interactive Multimedia Development And Research

Credit Hours: 3.00. A survey of the interactive multimedia development process, knowledge base, and applications in business and industry. Particular attention is paid to research issues surrounding theoretical, technological, and interactive techniques, and validating those approaches through applied research. Emphasis is placed on the interdisciplinary nature of the development of new media tools. **Credits:** 3.00

CGT 51500 - Virtual Environments

Credit Hours: 3.00. This course provides deep exposure to the most prominent and important research within the fields of virtual reality, games, and any application area where virtual environments are constructed or inhabited. Students will study experiential, cultural, and phenomenological aspects of habitation within virtual environments as well as become familiar with technical aspects involved in virtual environment creation. Students will generate original research data and analysis, prepare a publishable manuscript, and build their own virtual worlds as applicable. **Credits:** 3.00

CGT 51600 - Collaborative Virtual And Augmented Environments

Credit Hours: 3.00. A study of the field of collaborative virtual and augmented environments in shared, multi-user, same-site and multi-site immersive environments. Students will gain knowledge in the following research areas: multi-user interaction, collaborative virtual and augmented environments, and latest software and hardware tools. In this collaborative environment, students not only interact within the same virtual environment but collaborate between physically different environments through distributed environments. Knowledge of 3D computer graphics fundamentals, openGL, and C/C++, or consent of instructor. **Credits:** 3.00

CGT 51800 - Augmented Reality

Credit Hours: 3.00. Augmented Reality, a form of presenting virtual information within a perspective of the real world. This course instructs students in the foundations, practice and use of AR (Augmented Reality) as well as the technology required to produce an AR visualization. The concepts covered in this class include: physical tracking systems, computer vision, image processing techniques, 3D virtual environment visualization and calibration, display systems for AR and usage of AR in multimedia & tech culture. Some experience in Unity 3D preferred. **Credits:** 3.00

CGT 51900 - Projects In Graphics

Credit Hours: 3.00. This course instructs students in current methods of conducting research on computer graphics and the content development process. Topics covered in the course include biofeedback, user experience, measurement and analysis, development pipelines, publication strategies and methodologies. LaTeX document preparation, simulation, and qualitative approaches to conducting research in the field of computer graphics. **Credits:** 3.00

CGT 52000 - Computer Graphics Programming

Credit Hours: 3.00. This course provides a working knowledge of computer graphics programming using OpenGL and C++. OpenGL is the platform independent industrial standard APL and the leading edge technology for computer graphics application design. It has been used in the gaming industry, as well as in research and for scientific visualizations. The course focuses on creating real-time and interactive applications and is structured into several blocks; OpenGL introduction, modeling, texturing, transformations, lighting, and interactive application design. Students will develop various applications through the course focusing different aspects of computer graphics programming. **Credits:** 3.00

CGT 52100 - Advanced Real-Time Computer Graphics

Credit Hours: 3.00. This course focuses on a working knowledge of real-time rendering and shaders using GPI. Students will learn how to program advanced computer graphics techniques and how to benefit from the existing graphics hardware in an efficient way. The main focus is on programming modern graphical processing units (GPUs) using the GLSL, CG and OpenGL. Students will learn what the data-flow programming model is, and how to write vertex, geometry, tessellation, and fragment shaders. Another output is using texturing and lighting on the low level of the GPU and the next step is to provide animations using vertex shaders. Advanced texturing techniques such as bump mapping or environment mapping will be explained. Permission of instructor required. **Credits:** 3.00

CGT 52200 - UX Design Graduate Studio I: Fundamentals

Credit Hours: 3.00. This course is an introduction to the fundamental components of human-centered design, focusing on interactive computing systems. Students learn basic tenets and methods of user-centered design, including usability and visual design principles, user research, low-fidelity prototyping, and high-fidelity prototyping. The course is platform-independent and encourages students to experiment with new and emerging technologies.**Credits:** 3.00

CGT 52300 - Intelligent Virtual Agents

Credit Hours: 3.00. Intelligent Virtual Agents (IVAs) are interactive virtual characters that exhibit human-like qualities, including communicating using natural human modalities such as facial expressions, speech, and gesture. They are capable of real-time perception, cognition, emotion, and action that allow them to participate in dynamic social environments. This course introduces students to the interdisciplinary research on the design, application, and evaluation of IVAs. Students will be taught theory, methodologies, and algorithms, which they will then apply to individual projects. These individual projects will provide students with a common base for authoring IVAs for various application domains, including virtual assistants, pedagogical agents, human-agent task/problem co-solving, human-agent collaboration, and more. Prior background in virtual reality or technical animation is assumed, as the course will provide students the opportunity to further develop these competencies through hands-on assignments within a commercial game engine. The focus of this course is primarily on the computational and functional dimensions of IVAs; however, design and creativity are also important aspects of all projects. This course uses an active learning approach that involves lab assignments, presentations, independent research, and group ideation and collaboration.**Credits:** 3.00

CGT 52500 - Virtual Reality

Credit Hours: 3.00. This course introduces students to the hardware, software, and cognitive underpinnings necessary for creating cutting-edge virtual reality (VR) applications with a strong emphasis on immersive and interactive experiences, allowing students to explore and innovate within the realm of VR. Students will engage with various topics throughout the course, including computer graphics, human-computer interaction, applied perception, optics, and display technologies. Practical experience with consumer-grade virtual reality systems will empower students to design, develop, and analyze VR applications that are effective and comfortable for the user. This course aims to explore the vast potential of VR beyond traditional applications, highlighting its impact on entertainment, healthcare, education, and various other industrial domains. Through a combination of lectures, hands-on projects, and assignments, students will tackle the challenges of VR development, guided by design principles and real-world constraints. By the end of this course, students will be equipped with both knowledge and practical skills needed to design and develop VR experiences that push the boundaries of immersion and interactivity.**Credits:** 3.00

CGT 53200 - UX Design Graduate Studio II: Cross-Channel

Credit Hours: 3.00. This course is an advanced exploration of cross-channel approaches to human-centered design, such as service design, that span digital and physical experiences. Students utilize principles of usability and user experience to create and evaluate physical prototypes. The course is platform-independent and encourages students to experiment with new and emerging technologies. **Credits:** 3.00

CGT 53700 - Applied Artificial Intelligence For Computer Graphics

Credit Hours: 3.00. This graduate-level survey course offers a comprehensive exploration of how AI technologies are revolutionizing computer graphics and applications, including animation, augmented reality (AR), virtual reality (VR), digital media, and interaction techniques. With a focus on both the theoretical foundations and practical applications of AI, the curriculum delves into machine learning, deep learning, neural networks, and their specific uses in creating visual content and interactive digital media applications. Students will engage in hands-on projects, ranging from individual experiments to collaborative efforts, designed to demonstrate AI's transformative potential in enhancing both the visual and interactive dimensions of computational media. By the end of this course, students will not only understand the current landscape of AI in

computational media but also possess the technical, analytical, and creative skills needed to contribute meaningfully to this rapidly evolving field.**Credits:** 3.00

CGT 54000 - Current Topics In 3D Animation

Credit Hours: 3.00. This course addresses recent research and development in 3D animation. Permission of instructor required. **Credits:** 3.00

CGT 54300 - Experimental Animation

Credit Hours: 3.00. This course introduces key theoretical and applied concepts of experimental animation. Evolving technology consistently provides new opportunities for experimental practices in animation production. In this course, students will engage with experimental creative practices including abductive reasoning, abstraction, generative animation, motion graphics, simulations, glitch and mixed digital media. These experimental animations are suitable for a wide range of outputs including experimental short film, installation, projection mapping and a range of online platforms.**Credits:** 3.00

CGT 54400 - Animation History, Technology And Technique

Credit Hours: 3.00. This course traces the history of animation by reviewing the evolution of animation technology and the nexus between these technologies, production practices and crafts and the resulting styles, movements and genres of animation. The course reviews major technological developments of the 20th century that have impacted commercial animation production, as well as lesser known independent studios and artists, fringe technologies and sub genres. The course culminates with a consideration of current animation technology and the limits and opportunities it creates. **Credits:** 3.00

CGT 54500 - Game Development I

Credit Hours: 3.00. In both research and industry game engines are the foundation for nearly all graphics-intensive interactive applications. A thorough understanding of how game engines work is therefore a requisite element of the game development process and lever for research in most domains involving interactive simulations and games. As game engine development, research, and application is a large and complex topic, the course is split into two semesters of study. The two courses are structured similarly but cover different aspects of development on and within game engines. This course introduces students to the fundamental technologies and skills required to develop video games using a modern game engine. Students are taught using a student-led, active-learning pedagogy in which students co-develop and present lectures, demonstrations, and assignments for their peers, with facilitation by the course instructor. The focus of this course is primarily on the technical, functional, and theoretical dimensions of game development, prioritizing technical soundness over design and creativity (which are covered more explicitly in a separate course). As research in this field continues to rapidly iterate, the latest findings are incorporated into each new offering of the course, refreshing its content as the technology evolves in its implementation and theoretical underpinnings. Production of original research focused upon an aspect of game development or game engine design is required. **Credits:** 3.00

CGT 55400 - Configuration Management In The Digital Enterprise

Credit Hours: 3.00. This course will cover Configuration Management (CM) in the context of the digital enterprise and Product Lifecycle Management (PLM). Configuration Management applies processes, resources and controls to establish and maintain consistency between product configuration information and the product. Configuration information includes product requirements and changes to the product. This course provides preparation for IpX CM2 Certification at the Application Specialist level. **Credits:** 3.00

CGT 55500 - Game Development II

Credit Hours: 3.00. This course introduces students to the advanced concepts, technologies, skills that enable the creation of sophisticated video games, simulations, and game systems. Students are taught using student-led, active-learning pedagogy in

which students co-develop and present lectures, demonstrations, and assignments for their peers, with the facilitation of the course instructor. A thorough understanding of how game engines work is therefore a requisite element of the game development process and lever for research in most domains involving interactive simulations and games. As game engine development, research, and application is a large and complex topic, the course material is distributed across two semesters. In addition to the continuation of technical topics this course also emphasizes the experiential, conceptual, and aesthetic dimensions of game development, prioritizing implementation completeness with creative, aesthetically-pleasing implementations that are informed by current research. As research in this field continues to rapidly iterate, the latest findings are incorporated into each new offering of the course, refreshing its content as the technology evolves in its implementation and theoretical underpinnings. Production of original research focused upon an aspect of game development or game engine design is required. Permission of instructor required. **Credits:** 3.00

CGT 56200 - Cognition And Human-Computer Interaction

Credit Hours: 3.00. This course provides an overview of the role of human cognition in the use of interactive digital technologies. Students will learn fundamental theories and concepts of cognitive science that are relevant to interactive technology. The course takes a broad chronological approach, examining the history and development of cognitive theories and models in the field of human computer-interaction (HCI). Students will read seminal works from leading researchers in cognitive science and HCI. The course covers older well-established theories and models as well as newer speculative ones. Students will develop a sound understanding of the origins, development, and future directions of cognition research in HCI. Topics covered include: classical cognition; the cognitive revolution; mediated cognition; activity theory; situated action; embodied cognition; distributed, external, and extended cognition; enactive cognition; thinking and epistemic coping; make-believe and imagination; scaffolding and cognitive offloading; internal and external representations. Students are encouraged to make appropriate connections to their own research areas. No specific technical or programming experiences is required. **Credits:** 3.00

CGT 57000 - Information Visualization

Credit Hours: 3.00. This course provides a systematic, comprehensive framework to study principles, design choices, and development toolkits on information visualization design and development. It focuses on creating innovative and intuitive visualization solutions to provide users with peripheral awareness of meaningful information from a complex data set. Employing a user-centric approach, this course studies and analyzes visualization design and development from data, tasks, and visualization and interactions. The students will learn perception theories on visualization and use visual elements such as space and color to encode data, compare, evaluate, choose among different visualization forms and interaction methods. Through a project-based learning approach, students will conduct case studies on various visualization designs, analyze the user, data, tasks, and design choices in the visualizations, and finally design and develop information visualization solutions as course projects. Students should have finished their undergraduate study in domains that are closely related to one or more of the following: business analysis, statistics, knowledge management, computer science, software engineering, interaction design, human-centered computing, scientific visualization or information visualization. Permission of department required. **Credits:** 3.00

CGT 57200 - Special Topics In Human-Centered Design And Development

Credit Hours: 3.00. This course offers students the opportunity to explore current topics in human-centered design and development of systems with graphical user interfaces in-depth through readings, discussions, design projects and design critiques. Topics vary by semester. Possible offerings include Critical Design, Design for Behavior Change, Participatory Design, Design for Social Good, Service Design, Social Interaction Design. **Credits:** 3.00

CGT 57207 - UX Design Graduate Experience Studio

Credit Hours: 3.00. This course immerses students in a company-like environment where they work on semester-long design projects that are sponsored by industry partners. Students learn about the various roles within a UX environment as they build collaboration and project management skills. Projects utilize a human-centered design approach with an emphasis on designing for the user experience. Students will engage in substantial research and evaluation activities, informed by seminal literature in

the field, along with their design work. Students are expected to take responsibility for project deliverables and mentor junior students. Permission of department required.**Credits:** 3.00

CGT 57500 - Data Visualization Tools And Applications

Credit Hours: 3.00. This course provides hands-on experience in data visualization tools and applications. The course is designed for students with little or no background in Data Visualization. It introduces students to design principles for creating meaningful displays of quantitative and qualitative data to facilitate insight and decision-making. The goal is to introduce visualization as a tool, explore and identify which visualization tools are better suited to visualize different types of data, and understand the role visualization plays in understanding what the data represent. This course gives students an in-depth view of the various branches of visualization and the visualization tools in each area. After taking the course students will be able to evaluate data visualization tools and determine which tool to use for different types of data. This course is targeted towards students interested in using visualization in their own work and future academic courses. **Credits:** 3.00

CGT 58100 - Workshop In Computer Graphics Technology

Credit Hours: 0.00 to 8.00. Advanced study of technical and professional topics. Emphasis is on new developments relating to technical, operational, and training aspects of industry and technology education. **Credits:** 0.00 to 8.00

CGT 59000 - Special Problems In Computer Graphics Technology

Credit Hours: 1.00 to 6.00. Independent study of a special problem under the guidance of a member of the staff. Does not substitute for either M.S. thesis or M.S. project credit. Permission of instructor required. **Credits:** 1.00 to 6.00

CGT 59700 - Directed MS Capstone

Credit Hours: 3.00 to 6.00. An original investigation of a particular problem under the guidance of the instructor(s). The resulting product is a substantial project report with an evaluation or research component. Not applicable to a thesis option plan of study. Enrollment for a total of six credits is required. Permission of department required. **Credits:** 3.00 to 6.00

CGT 59800 - Directed MS Project

Credit Hours: 1.00 to 3.00. A formal investigation of a particular problem under the guidance of the advisory committee. Not applicable to a thesis option plan of study. Enrollment during at least two consecutive terms for a total of three credits is required. Permission of instructor required. **Credits:** 1.00 to 3.00

CGT 61000 - Visual Intelligence And Perception

Credit Hours: 3.00. This course focuses on the fundamentals of perception and cognition relative to vision and its implications to the field of computer graphics technology and the creation of graphics. Students will examine the foundations of human perception of form, shape, color, and motion, developing an understanding of why and how humans perceive visual information. Permission of instructor required. **Credits:** 3.00

CGT 62000 - Graphics Processing Unit Computing

Credit Hours: 3.00. This course provides a working knowledge of general-purpose graphics processing unit computing (GPGPU) using CUDA, OpenCL, and C++. OpenCL and CUDA are the platform independent industrial standard API and leading edge technology for GPGPU. The course focuses on utilizing, GPU for advanced tasks of scientific computing on parallelization of creating real-time and interactive applications and is structured into several blocks; parallel programming and synchronization

tasks, GPU architecture, CUDA programming model, the OpenCL programming model. Permission of instructor required. **Credits:** 3.00

CGT 62100 - Compute Shader Programming

Credit Hours: 3.00. Compute shaders allow graphics programmers to leverage the parallel processing power of the GPU for tasks besides rendering. Kinematics and other simulations, collision detection and image processing are common applications. In this class we will use several different shading languages to implement a variety of algorithms in both stand-alone applications and in game engines. Pre-Requisite: CGT 52000 (Concurrent Pre-Requisite) or CGT 52100 (Concurrent Pre-Requisite) or instructor permission.**Credits:** 3.00

CGT 63700 - Creative AI: Machine Learning For Creativity And Design

Credit Hours: 3.00. This graduate seminar offers an in-depth exploration into the creative and innovative intersections of artificial intelligence (AI) and machine learning with arts and design. As we witness a surge of breakthroughs in AI, this course aims to uncover the creative potential of new interaction techniques and art forms within these technological advances. Students will delve into how machine learning reshapes disciplines such as computational design, media arts, music, gaming, human-computer interaction, virtual reality, and graphics. The seminar has a dual focus: firstly, surveying the landscape of contemporary creative applications of deep learning across various fields; and secondly, empowering students to conceive and execute their own creative projects that leverage AI technologies. Coursework will be organized around the development of creative AI projects, to be completed either individually or collaboratively in small groups. Prerequisite: CGT 53700 or by permission of instructor.**Credits:** 3.00

CGT 64500 - Games Research

Credit Hours: 3.00. This course instructs students in current methods of conducting research on digital games, ludology, and the game development process. The most current or impactful research in the field is presented, analyzed, and extrapolated upon. The course surveys a wide variety of specific topics that shift as new research findings are published. Previous topics have included: biofeedback, user experience evaluation in games, gameplay measurement and analysis, development pipelines, mathematical modeling of game design, publication strategies and methodologies, scientific document preparation, and simulation. Quantitative and qualitative approaches to conducting research in the field of digital and traditional games. Production of original research focused upon an aspect of games, ludology, game development, or simulation is required. **Credits:** 3.00

CGT 67000 - Applications In Visual Analytics

Credit Hours: 3.00. Visual Analytics (VA) provides a fast way for people to make sense of large number of data, and has applications in many sectors. This course will introduce Visual Analytics through foundational theories and a broad range of techniques and tools, focusing on using visualization methods to reason and solve complex problems in a wide variety of applications. Visual analytics is the science of analytical reasoning facilitated by interactive visual interfaces that synthesize human and computational ability to attack large complex problems. It is concerned with analytical reasoning, interaction, data transformations, data visualization, analytic reporting, and technology transition. While the different visual analytics applications share common theories and strategies, each of them has its unique data composition, visual representations, and analytical needs and strategies. Through survey and study a broad range of visual analytics applications, students will be able to apply visual analytics on their own applications, analyze and break down a complex analytical problem into proper components and steps, evaluate different visual analytic techniques and strategies, and finally design and develop an effective visual analytics solution toward the problem. **Credits:** 3.00

CGT 68100 - Workshop In Computer Graphics Technology

Credit Hours: 0.00 to 6.00. This variable topics course focuses on advanced study of technical and professional research topics, primarily for doctoral students. Permission of instructor required. **Credits:** 0.00 to 6.00

CGT 69000 - Research Projects In Computer Graphics Technology

Credit Hours: 1.00 to 6.00. This course provides a means of independent study of a special problem under the guidance of a graduate faculty member who holds a terminal degree. It is assumed that projects in this course are research projects independent of one's doctoral research. Although not required, it is likely that a major result of the course will be a conference or journal publication. This course does not substitute for dissertation research credit on the plan of study. Permission of instructor required. **Credits:** 1.00 to 6.00

CGT 69400 - CGT Graduate Seminar

Credit Hours: 0.00. The CGT Graduate Seminar is designed to provide opportunities for students to experience the breadth and depth of academic inquiry, raising their awareness of key challenges and opportunities for graduate research within the field of the department. Through participation in a series of interactive sessions and presentations, students will gain valuable insights into the diverse research areas within the department, discover potential research avenues, and become aware of critical issues in the fields.**Credits:** 0.00

CGT 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required. **Credits:** 1.00 to 18.00

Computer Sciences

AIS 20000 - Introduction To Data Science

Credit Hours: 3.00. This course introduces data science and programming in the R statistical computing environment. Students learn relevant concepts from statistics, mathematics, and computer science. Topics include data manipulation, analysis, modeling, and visualization. Students gain experience analyzing real-world datasets from science, government, and industry.**Credits:** 3.00

AIS 30000 - Collaborative Human-AI Systems

Credit Hours: 3.00. This course introduces human-AI interaction design for systems that solve problems neither humans nor artificial intelligence could solve alone. Topics include interpretability, transparency, trust, and AI ethics. Student projects focus on developing applications where AI provides cognitive and perceptual augmentation to humans.**Credits:** 3.00

CS 514 - Numerical Analysis

Credit Hours: 3.00. (MA 51400) AIternative methods for solving nonlinear equations; linear difference equations, applications to solution of polynomial equations; differentiation and integration formulas; numerical solution of ordinary differential equations; roundoff error bounds. Typically offered Fall.**Credits:** 3.00

CS 571 - Artificial Intelligence

Credit Hours: 3.00. Artificial Intelligence (AI) systems are increasingly being deployed in many real-world tasks. This course provides an introduction to the fundamental principles and applications of AI. The course covers classic material including search-based methods, probabilistic reasoning, game playing, decision making, exact and approximate inference, causal learning, and reinforcement learning as well as selected advanced topics. The focus of the course is on foundational methods and current techniques for building AI systems that exhibit 'intelligent' behavior and can 'learn' from experience. The course assumes students are familiar with basic concepts in analysis, linear algebra, optimization, discrete mathematics, elementary probability, statistics,

data structures, and algorithms. Students are expected to have good programming and software development skills and have a working knowledge of Python and Java.**Credits:** 3.00

CS 573 - Data Mining

Credit Hours: 3.00. (CSCI 57300) Data Mining has emerged at the confluence of artificial intelligence, statistics, and databases as a technique for automatically discovering summary knowledge in large datasets. This course introduces students to the process and main techniques in data mining, including classification, clustering, and pattern mining approaches. Data mining systems and applications are also covered, along with selected topics in current research. Offered in alternate years. Typically offered Fall.**Credits:** 3.00

CS 578 - Statistical Machine Learning

Credit Hours: 3.00. This introductory course will cover many concepts, models, and algorithms in machine learning. Topics include classical supervised learning (e.g., regression and classification), unsupervised learning (e.g., principle component analysis and K-means), and recent development in the machine learning field such as variational Bayes, expectation propagation, and Gaussian processes. While this course will give students the basic ideas and intuition behind modern machine learning methods, the underlying theme in the course is probabilistic inference. Typically offered Fall.**Credits:** 3.00

CS 590 - Topics In Computer Sciences

Credit Hours: 1.00 to 5.00. Directed study for students who wish to undertake individual reading and study on approved topics. Permission of instructor required. Typically offered Fall Spring.**Credits:** 1.00 to 5.00

CS 592 - Computer Science Seminar

Credit Hours: 3.00. A seminar course for in-depth exploration of a specific topic. Topics vary. Classes consist of both instructor and student presentations. Students read, present and discuss research papers, and may complete and present a research project in the area. For each offering, inclusion on a plan of study is determined by the CS Graduate Study Committee. If approved, may be included on a CS MS or PhD plan of study according to relevant ruleset. Typically offered Fall Spring.**Credits:** 3.00

CS 10100 - Digital Literacy

Credit Hours: 3.00. Survey of the digital world, computers as multi-purpose machines, digital information, definition of programming, computers everywhere (the Internet of things), computers that perform simultaneous computations, how apps work, data storage and searching, databases, digital audio, graphics, video, computer networks and the Internet, the World Wide Web and Internet sharing services, network and Internet performance, real-time services, artificial intelligence, cloud computing, security, and privacy. CS students may take course for elective credit only. Typically offered Spring.**Credits:** 3.00

CS 15900 - C Programming

Credit Hours: 3.00. Fundamental principles, concepts, and methods of programming in C, with emphasis on applications in the physical sciences and engineering. Basic problem solving and programming techniques; fundamental algorithms and data structures; and use of programming logic in solving engineering problems. Students are expected to complete assignments in a collaborative learning environment. Credit cannot be obtained for both CS 15900 and any of CS 15600, CS 15800 and CS 18000. **Credits:** 3.00

CS 17600 - Data Engineering In Python

Credit Hours: 3.00. The course introduces students to programming fundamentals in Python, including loops, functions and different data types, and provides an introduction to data engineering including working with common data formats and learning the basics of data wrangling. Students will format, extract, clean, filter, transform, search, combine, summarize, aggregate, and visualize a diverse range of data sets. Python libraries including Matplotlib and Pandas are used.**Credits:** 3.00

CS 17700 - Programming With Multimedia Objects

Credit Hours: 4.00. Introduction to computers and programming: number representations, primitive data types and operations, basic control structures, programming applets and applications using graphical user interfaces, programming for detecting events and performing actions, processing multimedia objects such as images and sounds. Throughout the course, examples are drawn from a variety of fields in the natural sciences. Not open to CS majors with a grade of C or better in CS 18000. Not open to non-CS majors with a grade of C or better in any course in computer programming. **Credits:** 4.00

CS 18000 - Problem Solving And Object-Oriented Programming

Credit Hours: 4.00. Problem solving and algorithms, implementation of algorithms in a high level programming language, conditionals, the iterative approach and debugging, collections of data, searching and sorting, solving problems by decomposition, the object-oriented approach, subclasses of existing classes, handling exceptions that occur when the program is running, graphical user interfaces (GUIs), data stored in files, abstract data types, a glimpse at topics from other CS courses. Intended primarily for students majoring in computer sciences. Credit cannot be obtained for both CS 18000 and any of 15600, 15800 and 15900. Not open to students with credit in CS 24000. **Credits:** 4.00

CS 18200 - Foundations Of Computer Science

Credit Hours: 3.00. Logic and proofs; sets, functions, relations, sequences and summations; number representations; counting; fundamentals of the analysis of algorithms; graphs and trees; proof techniques; recursion; Boolean logic; finite state machines; pushdown automata; computability and undecidability.**Credits:** 3.00

CS 18300 - Professional Practice I

Credit Hours: 0.00. Professional Practice. Permission of instructor required. **Credits:** 0.00

CS 18400 - Professional Practice II

Credit Hours: 0.00. Professional Practice. Permission of instructor required. **Credits:** 0.00

CS 19000 - Topics In Computer Sciences

Credit Hours: 1.00 to 5.00. Topics vary. Permission of instructor required. **Credits:** 1.00 to 5.00

CS 19100 - Freshman Resources Seminar

Credit Hours: 1.00. This course is intended to integrate freshman majors in computer sciences into the department, help them adjust to university life, and assist them in developing academic and intellectual survival skills. Weekly recitation sections enable the students to work in teams. Strongly recommended for freshmen. The credit may be used only toward free electives. **Credits:** 1.00

CS 19300 - Tools

Credit Hours: 1.00. This course is designed to introduce new Computer Science students to various programming tools which will aid them in their Computer Science classes, personal projects, and software development job experiences. **Credits:** 1.00

CS 19700 - Freshman Honors Seminar

Credit Hours: 1.00. A seminar dealing with the history, context, and future of computer science. Open only to students in the Computer Sciences Honors Program. The credit may be used only toward free electives. **Credits:** 1.00

CS 21100 - Competitive Programming I

Credit Hours: 2.00. CP1 teaches applied algorithmic ideas and problem solving techniques to solve programming interview and competitive programming questions including usage of basic data structures such as [array, set, map, stack, queue, deque, priority queue], the four main algorithm paradigms: [complete search, greedy, divide and conquer, dynamic programming], other algorithmic ideas including [binary search the answer/bisection, meet-in-the-middle, prefix sum and difference arrays, two pointers, sliding window], and basic graph algorithms covering [strongly/connected components, floodfill, topological sort, shortest paths].**Credits:** 2.00

CS 23500 - Introduction To Organizational Computing

Credit Hours: 3.00. People and organizations, decision-making, information systems, telecommunications, desktop systems, integration tools, collaboration and groupware, multimedia, authoring multimedia documents, emerging technologies. May not be taken for credit by Computer Science majors. **Credits:** 3.00

CS 24000 - Programming In C

Credit Hours: 3.00. The UNIX environment, C development cycle, data representation, operators, program structure, recursion, macros, C preprocessor, pointers and addresses, dynamic memory allocation, structures, unions, typedef, bit-fields, pointer/structure applications, UNIX file abstraction, file access, low-level I/O, concurrency. **Credits:** 3.00

CS 24200 - Introduction To Data Science

Credit Hours: 3.00. (STAT 24200) This course provides a broad introduction to the field of data science. The course focuses on using computational methods and statistical techniques to analyze massive amounts of data and to extract knowledge. It provides an overview of foundational computational and statistical tools for data acquisition and cleaning, data management and big data systems. The course surveys the complete data science process from data to knowledge and gives students hands-on experience with tools and methods. Basic knowledge of Python required. Computer Science majors cannot count this course as a degree requirement but can take it for credit as a free elective if taken before CS 37300, 34800, 47100, 47300, 44800.**Credits:** 3.00

CS 24300 - Artificial Intelligence Basics

Credit Hours: 3.00. This course provides an introduction to foundational areas of artificial intelligence and current techniques for building intelligent systems. As an entry-level course for Artificial Intelligence, the primary goals of this course are: Teach fundamental building blocks of an intelligent system, namely, knowledge representation; learning; model validation, diagnosis, and visualization; reasoning and decision-making; probabilities and uncertainty in AI. Provide students with first-hand experiences in building a working machine learning and an automated reasoning system. Provide an overview of current state-of-the-art technologies in multiple domains of artificial intelligence. Broaden the students' horizon and spark their interests via learning about exciting applications of artificial intelligence in many aspects of human society.**Credits:** 3.00

CS 25000 - Computer Architecture

Credit Hours: 4.00. Digital logic: transistors, gates, and combinatorial circuits; clocks; registers and register banks; arithmetic-logic units; data representation: big-endian and little-endian integers; ones and twos complement arithmetic; signed and unsigned values; Von-Neumann architecture and bottleneck; instruction sets; RISC and CISC designs; instruction pipelines and stalls; rearranging code; memory and address spaces; physical and virtual memory; interleaving; page tables; memory caches; bus architecture; polling and interrupts; DMA; device programming; assembly language; optimizations; parallelism; data pipelining. **Credits:** 4.00

CS 25100 - Data Structures And Algorithms

Credit Hours: 3.00. Running time analysis of algorithms and their implementations, one-dimensional data structures, trees, heaps, additional sorting algorithms, binary search trees, hash tables, graphs, directed graphs, weighted graph algorithms, additional topics. **Credits:** 3.00

CS 25200 - Systems Programming

Credit Hours: 4.00. Low-level programming; review of addresses, pointers, memory layout, and data representation; text, data, and bss segments; debugging and hex dumps; concurrent execution with threads and processes; address spaces; file names; descriptors and file pointers; inheritance; system calls and library functions; standard I/O and string libraries; simplified socket programming; building tools to help programmers; make and make files; shell scripts and quoting; Unix tools including sed, echo, test, and find; scripting languages such as awk; version control; object and executable files (.o and a.out); symbol tables; pointers to functions; hierarchical directories; and DNS hierarchy; programming embedded systems.**Credits:** 4.00

CS 25300 - Data Structures And Algorithms For DS/AI

Credit Hours: 3.00. This course gives a broad introduction to the most important data structures and algorithms in computer science. The emphasis is on data structures and their use in algorithms relevant for data science and AI and their applications. The course focuses on developing and comparing efficient implementations, assessing suitability of data structures for massive data sets, and understanding effective use, modifications, and extensions. This course will not fulfill CS 25100 requirement for any Computer Science major or minor.**Credits:** 3.00

CS 28400 - Professional Practice III

Credit Hours: 0.00. Professional Practice. Permission of instruction required. **Credits:** 0.00

CS 28401 - Professional Practice Part-Time

Credit Hours: 0.00. Professional Practice Part-Time. The instructor determines the adequacy of the student's preparation for the work assignment proposed by the prospective employer for the student. Permission of Instructor required. **Credits:** 0.00

CS 29000 - Topics In Computer Sciences

Credit Hours: 1.00 to 5.00. Topics vary. Permission of instructor required. **Credits:** 1.00 to 5.00

CS 29100 - Sophomore Development Seminar

Credit Hours: 1.00. Presentations by corporate partners about careers in computer science. Presentations by faculty about careers in academia and research. Students learn about upper-division courses, tour research laboratories, and attend job fairs. **Credits:** 1.00

CS 29199 - Cooperative Experience I

Credit Hours: 0.00. Professional experience in computer science. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

CS 29299 - Cooperative Experience II

Credit Hours: 0.00. Professional experience in computer science. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

CS 30700 - Software Engineering I

Credit Hours: 3.00. An introduction to the methods and tools of software engineering; software life cycle; specification and design of software, software testing, cost and effort estimation; laboratory exercises with design, testing, and other tools.**Credits:** 3.00

CS 31100 - Competitive Programming II

Credit Hours: 2.00. CP2 teaches experienced programmers additional techniques to solve interview and competitive programming problems and builds on material learned in CP1. This includes specific algorithmic techniques such as [shortest paths, topological sort, MST, union find, range queries], advanced algorithms surrounding trees and DAGs, advanced problem types in [dynamic programming, backtracking/simulation, mathematics, string processing], and more. It can be viewed as a programming complement to CS 38100, with some overlap in content.**Credits:** 2.00

CS 31400 - Numerical Methods

Credit Hours: 3.00. Iterative methods for solving nonlinear equations; direct and iterative methods for solving linear systems; approximations of functions, derivatives, and integrals; error analysis. **Credits:** 3.00

CS 33400 - Fundamentals Of Computer Graphics

Credit Hours: 3.00. Fundamental principles and techniques of computer graphics. The course covers the basics of going from a scene representation to a raster image using OpenGL. Specific topics include coordinate manipulations, perspective, basics of illumination and shading, color models, texture maps, clipping and basic raster algorithms, fundamentals of scene constructions. CS 31400 is recommended. **Credits:** 3.00

CS 34800 - Information Systems

Credit Hours: 3.00. File organization and index structures; object-oriented database languages; the relational database model with introductions to SQL and DBMS; hierarchical models and network models with introductions to HDDL, HDML, and DBTG Codasyl; data mining; data warehousing; database connectivity; distributed databases; the client/server paradigm; middleware, including ODBC, JDBC, CORBA, and MOM.**Credits:** 3.00

CS 35100 - Cloud Computing

Credit Hours: 3.00. Introduction to cloud computing. Cloud data center infrastructure, public and private clouds, servers and virtualized servers, data center networks and virtualized networks, virtualized disk, file, and object storage, the concept of scale-out, algorithms and programming systems used in the design and implementation of cloud-native software, especially using containers and orchestration systems, microservices, serverless designs, controller-based designs, edge and fog computing, security in a cloud environment, programming models.**Credits:** 3.00

CS 35200 - Compilers: Principles And Practice

Credit Hours: 3.00. Should not be taken concurrently with CS 35400. The theory and practice of programming language translation, compilation, and run-time systems, organized around a significant programming project to build a compiler for a simple but nontrivial programming language. Modules, interfaces, tools. Data structures for tree languages. Lexical analysis, syntax analysis, abstract syntax. Symbol tables, semantic analysis. Translation, intermediate code, basic blocks, traces. Instruction selection, CISC and RISC machines. Liveness analysis, graph coloring register allocation. Supplemental material drawn from garbage collection, object-oriented languages, higher-order languages, dataflow analysis, optimization, polymorphism, scheduling and pipelining, memory hierarchies. **Credits:** 3.00

CS 35300 - Principles Of Concurrency And Parallelism

Credit Hours: 3.00. Important concepts, models, algorithms, abstractions, and implementation aspects of concurrent and parallel programs. Topics include: techniques used to describe concurrent programs (e.g., threads, events, co-routines, continuations), abstractions for shared-memory and message-passing programs, relaxed memory models, livelock and deadlock detection, lock-free algorithms, data races and atomicity, scheduling techniques, process calculi, and software transactions. **Credits:** 3.00

CS 35400 - Operating Systems

Credit Hours: 3.00. Should not be taken concurrently with CS 35200. Introduction to operating systems. Computer system and operating system architectures, processes, inter-process communication, inter-process synchronization, mutual exclusion, deadlocks, memory hierarchy, virtual memory, CPU scheduling, file systems, I/O device management, security. **Credits:** 3.00

CS 35500 - Introduction To Cryptography

Credit Hours: 3.00. An introduction to cryptography basics: Classic historical ciphers including Caesar, Vigenere, and Vernam ciphers; modern ciphers including DES, AES, Pohlig-Hellman, and RSA; signatures and digests; key exchange; simple protocols; block and stream ciphers; network-centric protocols.**Credits:** 3.00

CS 36000 - Software Engineering

Credit Hours: 3.00. The course presents the common forms of the software life cycle, which are used throughout the commercial, industrial, institutional, and even governmental communities when a single development effort is appropriate. We will discuss the nature of software and software projects, software development models, software design, software process maturity, project planning, management, and communication. We will study methods for analysis, design, testing, and implementation of various software systems. **Credits:** 3.00

CS 36100 - Great Issues In Computer Science

Credit Hours: 3.00. This course provides an overview of current and essential professional and ethical issues in computing and their impact on society. Topics specialize in the impact of computing, including algorithmic bias, motives behind design decisions, data ethics, privacy and security, and legal issues. The goal of this course is to equip students with the framework and context necessary to think critically about the impact of computing. Discussions and readings will include current events.**Credits:** 3.00

CS 37300 - Data Mining And Machine Learning

Credit Hours: 3.00. This course will introduce students to the field of data mining and machine learning, which sits at the interface between statistics and computer science. Data mining and machine learning focuses on developing algorithms to automatically discover patterns and learn models of large datasets. This course introduces students to the process and main

techniques in data mining and machine learning, including exploratory data analysis, predictive modeling, descriptive modeling, and evaluation.**Credits:** 3.00

CS 38001 - C++ Programming

Credit Hours: 1.00. This course builds on the CS 24000 (Programming In C) course to teach C++ extensions. This 5-week one-credit course teaches C++ programming and helps students improve their understanding of object-oriented programming. It also teaches how to use an Integrated Development Environment (IDE) when programming in C++. **Credits:** 1.00

CS 38002 - Advanced Java Programming

Credit Hours: 1.00. This course builds on the Java course CS 18000 (Problem Solving And Object Oriented Programming) to teach advanced topics in Java. This 5-week one-credit course will teach advanced topics such as Network Programming in Java, JDBC, JNI, and J2EE to write web applications in Java. You will also improve your understanding of Object Oriented Programming. **Credits:** 1.00

CS 38003 - Python Programming

Credit Hours: 1.00. This course teaches the Python programming language assuming that students have already taken a course in computer programming. This 5-week one-credit course teaches the Python language, the most common modules used in Python, as well as how to write Python web applications. **Credits:** 1.00

CS 38100 - Introduction To The Analysis Of Algorithms

Credit Hours: 3.00. Techniques for analyzing the time and space requirements of algorithms. Application of these techniques to sorting, searching, pattern-matching, graph problems, and other selected problems. Brief introduction to the intractable (NP-hard) problems.**Credits:** 3.00

CS 38600 - Professional Practice IV

Credit Hours: 0.00. Professional Practice. Permission of instructor required. **Credits:** 0.00

CS 39000 - Topics In Computer Sciences

Credit Hours: 1.00 to 5.00. Topics vary. Permission of instructor required. **Credits:** 1.00 to 5.00

CS 39100 - Junior Resources Seminar

Credit Hours: 1.00. This seminar course engages a number of outside speakers who typically present information on the role of research in computer science, how the research components of computer science relate to each other, approaches to software development in industry, different types of application development paradigms, technological trends, and societal, ethical, and legal issues. The credit may be used only toward free electives. **Credits:** 1.00

CS 39399 - Cooperative Experience III

Credit Hours: 0.00. Professional experience in computer science. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

CS 39499 - Extensive Cooperative Experience IV

Credit Hours: 0.00. Professional experience in computer science. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

CS 39599 - Extensive Cooperative Experience V

Credit Hours: 0.00. Professional experience in computer science. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

CS 39700 - Honors Seminar

Credit Hours: 0.00. A seminar for all sophomores, juniors, and seniors in the Computer Sciences Honors Program. Meets eight times each semester under the supervision of the Honors coordinator. The meetings focus on honors research projects, helping students to identify appropriate projects and form groups, and providing a forum for juniors and seniors to report on their projects as required in the honors program. **Credits:** 0.00

CS 40700 - Software Engineering Senior Project

Credit Hours: 3.00. A capstone course combining all the concepts students have learned in the Software Engineering Track: software and software engineering, working as a team leader and as a team member, Agile Software Development, Scrum Software Development, Version Control, basing software development on reusable technology, developing requirements (User Stories and Use Cases), modelling with classes, design patterns, focusing on users, modelling interactions and behavior, architecting and designing software, testing and inspecting, managing the software development process. This is a project course. Students are organized into 4-6 student teams. Each team completes a full-semester software engineering project. Each team creates a Project Charter, Product Backlog, Design, and for 3 Sprints -- Planning Document, Demo, Retrospective Document. The final demo is a formal presentation. **Credits:** 3.00

CS 40800 - Software Testing

Credit Hours: 3.00. Preliminaries: errors and testing; software quality, requirements, behavior, and correctness; testing, debugging, verification; control flow graphs, dominators; types of testing; Test selection: from requirements, finite state models, and combinatorial designs; regression testing and test minimization; Test adequacy assessment: control and data flow; mutation based; testing tools.**Credits:** 3.00

CS 41100 - Competitive Programming III

Credit Hours: 2.00. CP3 teaches experienced programmers additional techniques to solve competitive programming problems and builds on material learned in CP1 and CP2. This includes algorithmic techniques in topics such as [network flow, computational geometry, graph matching, NP-hard problems]. Primarily, CP3 prepares students to compete in programming contests, which means most class time is focused on simulating contest environments and teaching teamwork and communication alongside problem practice.**Credits:** 2.00

CS 42200 - Computer Networks

Credit Hours: 3.00. Undergraduate-level introduction to computer networks and data communication. Low-level details of media, signals, and bits: time division and frequency division multiplexing; encoding; modulation; bandwidth, throughput, and noise. Packet transmission: Local Area Network (Ethernet, FDDI) and Wide Area Network technologies (ATM); wireless

networks; network interconnection with repeaters, bridges, and switches; DSU/CSU; xDSL and cable modems. Internetworking: router-based architecture; IP addressing; address binding with ARP; datagram encapsulation and fragmentation; UDP and TCP, retransmission; protocol ports; ICMP and error handling. Network applications: client/server concept; port demultiplexing; program interface to protocols (API); use by clients and servers; domain name system; TELNET; Web technologies including HTTP, CGI, Java; RPC and middleware; network management. **Credits:** 3.00

CS 42600 - Computer Security

Credit Hours: 3.00. A survey of the fundamentals of information security. Risks and vulnerabilities, policy formation, controls and protection methods, database security, encryption, authentication technologies, host-based and network-based security issues, personnel and physical security issues, issues of law and privacy. **Credits:** 3.00

CS 43400 - Advanced Computer Graphics

Credit Hours: 3.00. Advanced concepts and techniques of computer graphics. The course covers, in complete detail, going from a scene representation to a raster image without using OpenGL or other graphics packages. The course develops a complete graphics implementation in which the students implement every aspect of the graphics pipeline. This involves a substantial software project in C/C++. **Credits:** 3.00

CS 43900 - Introduction To Data Visualization

Credit Hours: 3.00. The course offers an introduction to the fundamentals principles, design strategies, and techniques needed to visually communicate, explore, and analyze data. The course focuses primarily on the visual representation of inherently non-spatial data (e.g., tables and spreadsheets, graphs and networks, trees, text, and time series), but also considers the visualization of maps and of data in geospatial context.**Credits:** 3.00

CS 44000 - Large Scale Data Analytics

Credit Hours: 3.00. This course provides an integrated view of the key concepts of modern algorithmic data analytics. It focuses on teaching principles and methods needed to analyze large datasets in order to extract novel, transformative insights for the underlying application. The course emphasizes the duality between formulating questions that can be answered by statistical data analysis tools (the statistical perspective) and the algorithmic challenge of actually extracting such answers using available parallel and distributed computational resources from massive datasets. The topics cover three areas: (1) algorithmic concepts necessary for big data analytics, (2) big data systems, including data management and programming, and (3) advanced analytic methods to address characteristics of real-world big data problems.**Credits:** 3.00

CS 44100 - Data Science Capstone

Credit Hours: 3.00. The Capstone course aims at providing students with an opportunity to integrate their accumulated knowledge and technical and social skills in order to identify and solve realistic or real-world data science problem, with an emphasis on the application domain. Capstone projects are often sponsored by corporate partners or by academic or non-academic research groups. The Capstone course serves as preparation for students entering into the profession of Data Science. Students will conduct a team-based project through the entire data science pipeline, by following the six phases of the CRISP-DM (Cross-Industry Standard Process for Data Mining) methodology. Students get experience in working as teams, participating in project planning, writing reports, and giving presentations.**Credits:** 3.00

CS 44800 - Introduction To Relational Database Systems

Credit Hours: 3.00. An in-depth examination of relational database systems including theory and concepts as well as practical issues in relational databases. Modern database technologies such as object-relational and Web-based access to relational

databases. Conceptual design and entity relationship modeling, relational algebra and calculus, data definition and manipulation languages using SQL, schema and view management, query processing and optimization, transaction management, security, privacy, integrity management.**Credits:** 3.00

CS 45600 - Programming Languages

Credit Hours: 3.00. Concepts for structuring data, computation, and whole programs. Object-oriented languages, functional languages, logic- and rule-based languages. Data types, type checking, exception handling, concurrent processes, synchronization, modularity, encapsulation, interfaces, separate compilation, inheritance, polymorphism, dynamic binding, subtyping, overloading, beta-reduction, unification. **Credits:** 3.00

CS 45800 - Introduction To Robotics

Credit Hours: 3.00. Any intelligent robot system interacting with our environment needs to have perception, planning, and control methods in its cognition process. The perception module outlines the robot's procedures to gather and interpret sensory observations into world models. The underlying planning and control modules use those world models to plan robot behaviors and their interaction with our natural environments. Therefore, this course will cover the fundamental topics in robot perception, planning, and control to design general-purpose robot cognition algorithms. Overall, this course is divided into four modules: Robot perception: This covers fundamental techniques needed for robot localization and mapping from raw 3D sensory data. Robot planning: This module will discuss robot behavior planning techniques such as A*, RRT*, and trajectory optimization. Robot Control: This introduces basic control techniques such as PID controller to execute the robot's planned behaviors in the real world. Robot Learning: This part will briefly introduce machine learning techniques for robot decision-making and control.**Credits:** 3.00

CS 47100 - Introduction To Artificial Intelligence

Credit Hours: 3.00. Students are expected to spend at least three hours per week gaining experience with artificial intelligence systems and developing software. Basic problem-solving strategies, heuristic search, problem reduction and AND/OR graphs, knowledge representation, expert systems, generating explanations, uncertainty reasoning, game playing, planning, machine learning, computer vision, and programming systems such as Lisp or Prolog.**Credits:** 3.00

CS 47300 - Web Information Search And Management

Credit Hours: 3.00. This course teaches important concepts and knowledge of information retrieval for managing unstructured data such as text data on Web or in emails. At the same time, students will be exposed to a large number of important applications. Students in the course will get hands on experience from homework and a course project. The first part of the course focuses on general concepts/techniques such as stemming, indexing, vector space model, and feedback procedure. The second part of the course shows how to apply the set of techniques on different applications such as Web search, text categorization, and information recommendation.**Credits:** 3.00

CS 47500 - Human-Computer Interaction

Credit Hours: 3.00. The goal of this course is to teach students how to design useful and usable interactive systems that address important needs of people. Students will experience the entire user-centered design life cycle, from need finding to usability evaluation. Topics covered in the course include user-centered design principles, usability heuristics, need-finding methods such as semi-structured interviews and contextual inquiry, quick prototyping techniques, usability evaluation methods such as hallway testing and human-subjects user study, and theories about user interaction and decision making. As we are entering a new era of AI, the course will also include a brief introduction on how to apply the HCI principles and techniques to AI-powered systems. This course is project-based. Students will form project teams among themselves to work on a semester-long project and apply the user-centered design principles, theories, and techniques that they have learned in class to build a useful and usable

interactive system such as a mobile application. This course is also highly interactive, including a series of design studios and in-class activities that require active participation, communication, and discussion with other students.**Credits:** 3.00

CS 47800 - Introduction To Bioinformatics

Credit Hours: 3.00. (BIOL 47800) Bioinformatics is broadly defined as the study of molecular biological information, targeting particularly the enormous volume of DNA sequence and functional complexity embedded in entire genomes. Topics will include understanding the evolutionary organization of genes (genomics), the structure and function of gene products (proteomics), and the dynamics of gene expression in biological processes (transcriptomics). Inherently, bioinformatics is interdisciplinary, melding various applications of computational science with biology. This jointly taught course introduces analytical methods from biology, statistics and computer science that are necessary for bioinformatics investigations. The course is intended for junior and senior undergraduates from various science backgrounds. Our objective is to develop the skills of both tool users and tool designers in this important new field of research. **Credits:** 3.00

CS 48300 - Introduction To The Theory Of Computation

Credit Hours: 3.00. Turing machines and the Church-Turing thesis; decidability; halting problem; reducibility; undecidable problems; decidability of logical theories; Kolmogorov complexity; time classes; P, NP, NP-complete; space classes; Savitch's theorem, PSPACE-completeness, NL-completeness; hierarchy theorems; approximation theorems; probabilistic algorithms; applications of complexity to parallel computation and cryptography. Typically offered Fall Spring.**Credits:** 3.00

CS 48700 - Professional Practice V

Credit Hours: 0.00. Professional Practice. Permission of instructor required. **Credits:** 0.00

CS 48900 - Embedded Systems

Credit Hours: 3.00. Software for embedded systems; programming with extreme constraints on memory, storage, and processing power; programming models, including synchronous, asynchronous, and concurrent; programming systems that run forever; use of Finite State Machines (FSMs); review of embedded hardware and available boards; asynchronous and synchronous serial connections (e.g., RS232 and SPI); General Purpose I/O (GPIO) pins; relays, servos, and other peripherals; design for low power; battery characteristics; systems that communicate over computer networks and the Internet; current industry practices; design of embedded projects; working in teams. CS 35200 (Compilers) and CS 35400 (Operating Systems) are recommended, but not required. Typically offered Fall Spring.**Credits:** 3.00

CS 49000 - Topics In Computer Sciences For Undergraduates

Credit Hours: 1.00 to 5.00. Supervised reading and reports in various fields. Permission of instructor required. **Credits:** 1.00 to 5.00

CS 49700 - Honors Research Project

Credit Hours: 3.00. One semester of the project may be counted as one of the seven computer science courses at or above the 300 level required for the bachelor's degree. One more semester, if approved by the honors coordinator, can be used as a free elective. A group research project directed by Computer Sciences faculty members. Each group must submit a technical report describing its work and the results obtained. **Credits:** 3.00

CS 50010 - Foundational Principles Of Information Security

Credit Hours: 3.00. This course covers foundational principles relevant to information security including data structures, algorithm design, computational complexity, probability theory, number theory, and basics of cryptography. This course is restricted to CS graduate students. This course is required for students in the Master of Science in Computer Science Concentration in Information Security for Professionals Program. The course may not be used on the Plan of Study for any CS graduate students other than those in the Concentration in Information Security for Professionals program. Programming experience and computer science knowledge equivalent to that of a minor in CS. Incoming students are expected to have programming skills in at least one procedural programming languages, e.g., C,C++,Java, or Python. Typically offered Summer.**Credits:** 3.00

CS 50011 - Introduction To Systems For Information Security

Credit Hours: 3.00. The course covers computer systems principles relevant to information security and it serves as a prerequisite for the later courses in the MS in IS program. The material includes features in the C/C++ programming languages for understanding security-critical software vulnerabilities, basic knowledge in computer architecture and assembly languages, knowledge of the compiling process, operating systems, networking, databases, and web applications relevant to information security. This course is restricted to CS graduate students. This course is required for students in the Master of Science in Computer Science Concentration in Information Security for Professionals Program. The course may not be used on the Plan of Study for any CS graduate students other than those in the Concentration in Information Security for Processionals program. Programming experience and computer science knowledge equivalent to that of a minor in CS. Incoming students are expected to have programming skills in at least one procedural programming languages, e.g., C,C++,Java, or Python. Typically offered Fall Summer.**Credits:** 3.00

CS 50023 - Data Engineering I

Credit Hours: 1.00. The course introduces students to the fundamentals of Data Engineering with a focus on tools and computational techniques to gather, construct, manipulate, summarize, and visualize data sets as a means to extract knowledge from the underlying data. Python and Python libraries are used. Completion of the course will allow learners to perform basic data analysis on data sets. Experience in Python Programming and Linear Algebra is required. The course also prepares learners for additional instruction in the courses Data Engineering II and Foundations of Decision Making. Typically offered Fall Spring Summer.**Credits:** 1.00

CS 50024 - Data Engineering II

Credit Hours: 1.00. This course introduces students to the fundamentals of database management systems (DBMS) from a user's perspective. The principles of modeling an enterprise using Entity-Relationship diagrams and transforming the model into a relational or NoSQL database are illustrated through a range of examples. The SQL language is used to create, query, aggregate, and update a relational database. NOSQL databases and the related data models (column, graph, and document-based) are introduced. Experience in Python Programming is required. Typically offered Fall Spring Summer.**Credits:** 1.00

CS 50025 - Foundations Of Decision Making

Credit Hours: 1.00. This course provides an overview of data science methods used for data-driven discovery, extraction of knowledge, and informed decision making. The course covers fundamental computational methods and statistical techniques used to correctly reason about uncertainty, conduct hypothesis tests, infer causal relationships, and apply and evaluate predictive models. The course highlights how sampling biases can impact fairness in decision making. Throughout, students get hands-on experience on how to make correct and explainable inferences from data. Experience in Python Progamming, Probability, Statistics and Linear Algebra is required. Typically offered Fall Spring Summer.**Credits:** 1.00

CS 50100 - Computing For Science And Engineering

Credit Hours: 3.00. Credit in this course may not be used toward a graduate degree in Computer Sciences. Computational concepts, tools, and skills for computational science and engineering scripting for numerical computing, scripting for file processing, high performance computing, and software development. Project may be required. Typically offered Fall.**Credits:** 3.00

CS 50200 - Compiling And Programming Systems

Credit Hours: 3.00. Basic principles of compilers and compiler design; control of translation, loading, and execution; symbolic coding systems; lexical and syntactic analysis, design and operation of assemblers and macroprocessors; design of interpretive systems. Students are expected to complete a large programming project as part of the course. Typically offered Fall.**Credits:** 3.00

CS 50300 - Operating Systems

Credit Hours: 3.00. Basic principles of operating systems: addressing modes, indexing, relative addressing, indirect addressing, stack maintenance; implementation of multitask systems; control and coordination of tasks, deadlocks, synchronization, mutual exclusion; storage management, segmentation, paging, virtual memory; protection, sharing, access control; file systems; resource management; evaluation and prediction of performance. Students are expected to spend at least three hours per week gaining hands-on experience in using and modifying a small operating system. Typically offered Fall Spring.**Credits:** 3.00

CS 50500 - Distributed Systems

Credit Hours: 3.00. Foundations for building reliable distributed systems, including failure and system models, and basic communication and agreement problems; crash failures, recovery, partition, Byzantine failures; asynchronous systems, failure detectors, communication channels, wireless and sensor networks; software clocks, causality, and cuts. Examples of problems include reliable broadcast consensus, leader election, group communication, and replication. Permission of department required. Typically offered Spring.**Credits:** 3.00

CS 51000 - Software Engineering

Credit Hours: 3.00. Software life cycles, requirements engineering, software design, design of distributed systems, verification and validation, software architecture, process metrics and models, and research methods in software engineering. Typically offered Spring.**Credits:** 3.00

CS 51500 - Numerical Linear Algebra

Credit Hours: 3.00. Direct and iterative solvers of dense and sparse linear systems of equations, numerical schemes for handling symmetric algebraic eigenvalue problems, and the singular-value decomposition and its applications in linear least squares problems. Typically offered Spring.**Credits:** 3.00

CS 51501 - Parallelism In Numerical Linear Algebra

Credit Hours: 3.00. This course examines both theoretical and practical aspects of numerical algorithm design and implementation on parallel computing platforms. In particular, it provides an understanding of the tradeoff between arithmetic complexity and management of hierarchical memory structures, roundoff characteristics if different from the sequential schemes, and performance evaluation and enhancement. Applications are derived from a variety of computational science and engineering areas.**Credits:** 3.00

CS 51520 - Operating Systems

Credit Hours: 3.00. This course is about the concepts and principles of modern operation systems. It includes: design and implementation of multi-process systems; process synchronization, mutual exclusion; CPU scheduling, deadlock, memory management, segmentation, paging, virtual memory; storage management, file system management, protection and security, evaluation and prediction of performance. Reading the latest paper about operation systems and presentations are required. Every student should participate in debates based on the case studies of Linux System and Windows 7. Prerequisites: CS 30200. Permission of department required.**Credits:** 3.00

CS 52000 - Computational Methods In Optimization

Credit Hours: 3.00. A treatment of numerical algorithms and software for optimization problems with a secondary emphasis on linear and nonlinear systems of equations: unconstrained and constrained optimization; line search methods; trust region methods; Quasi-Newton methods; linear programming; calculating derivatives; quadratic programming; global optimization, including simulated annealing. Typically offered Spring.**Credits:** 3.00

CS 52300 - Social, Economic, And Legal Aspects Of Security

Credit Hours: 3.00. This course focuses on social, legal, and economic aspects of information security and privacy, also including ethics, policies, and human behavioral issues. The course covers the interactions between non-technological aspects of information security as well as relevant technological aspects. It focuses on how non-technological facets can inform and guide technological choices, and how technological choices can enhance or detract from the broader organizational and societal goals. Typically offered Fall Spring.**Credits:** 3.00

CS 52500 - Parallel Computing

Credit Hours: 3.00. Parallel computing for science and engineering applications: parallel programming and performance evaluation, parallel libraries and problem-solving environments, models of parallel computing and run-time support systems, and selected applications. Typically offered Spring.**Credits:** 3.00

CS 52540 - Data Mining, Machine Learning And Statistical Analysis

Credit Hours: 3.00. This course combines computer science algorithms and statistics analysis for data mining and machine learning. The course introduces rule-based decision tree systems, statistical learning, supervised and unsupervised learning, and multi-layer Neural Networks deep learning. Students will do modeling with C5, Neural Networks and R, and implement multiple algorithms in the programming languages C and Python.**Credits:** 3.00

CS 52600 - Information Security

Credit Hours: 3.00. (CSCI 52600) Basic notions of confidentiality, integrity, availability; authentication models; protection models; security kernels; secure programming; audit; intrusion detection and response; operational security issues; physical security issues; personnel security; policy formation and enforcement; access controls; information flow; legal and social issues; identification and authentication in local and distributed systems; classification and trust modeling; and risk assessment. Typically offered Fall.**Credits:** 3.00

CS 52700 - Software Security

Credit Hours: 3.00. This course focuses on software security fundamentals, secure coding guidelines and principles, and advanced software security concepts. Students will learn to assess and understand threats, learn how to design and implement secure software systems, and get hands-on experience with common security pitfalls. Restricted to CS MS and CS PHD students. Significant programming experience and skills are required to complete the labs and projects. Typically offered Spring.**Credits:** 3.00

CS 52800 - Network Security

Credit Hours: 3.00. The course focuses on the principles and foundations of building secure network systems and on security and privacy challenges in existing and emerging networks. The course compares and analyzes network architectures and network protocols from the physical layer to the access control, network, transport and application layer from an adversarial standpoint to understand how to build more secure protocols that can withstand attacks. Restricted to CS MS and CS PHD students. Significant programming experience and skills are required to complete the projects. Typically offered Spring.**Credits:** 3.00

CS 52900 - Security Analytics

Credit Hours: 3.00. This course focuses on applied data mining, machine learning, data analytics techniques, and their application and relevance in information security. The course covers basic concepts of data mining and machine learning, computation platforms in support of big data analytics including Map-Reduce and Spark, machine learning algorithms such as classification trees, logistic regression, naive Bayes, k Nearest Neighbors, Support Vector Machines, Artificial Neural Networks (including Feed Forward, Convolutional, and Recurrence), the application of these algorithms to security tasks such as Spam/Phishing detection, malware detection, intrusion detection, and situational awareness. The future and potential role of applying machine learning techniques in information and data security is explored.**Credits:** 3.00

CS 53000 - Introduction To Scientific Visualization

Credit Hours: 3.00. Teaches the fundamentals of scientific visualization and prepares students to apply these techniques in fields such as astronomy, biology, chemistry, engineering, and physics. Emphasis is on the representation of scalar, vector, and tensor fields; data sampling and resampling; and reconstruction using multivariate finite elements (surfaces, volumes, and surfaces on surfaces). Typically offered Fall.**Credits:** 3.00

CS 53100 - Computational Geometry

Credit Hours: 3.00. Computational geometry studies how to compute with and reason about geometric objects. The subject is playing an increasingly important role in computer graphics, game software, geometric modeling, geographic information systems, and many other applications. Course topics include convex hull, segment manipulations, triangulations, range searching, Voronoi diagrams, window queries, Delaunay triangulation, and duality. Some key algorithms are implemented. Questions of floating-point accuracy and robust algorithm design are considered throughout the course. Typically offered Fall Spring.**Credits:** 3.00

CS 53200 - Geometric Modeling Algorithms

Credit Hours: 3.00. The geometric modeling course will first introduce computational and mathematical concepts needed for 3D shapes, such as points, vectors, linear combinations, metrics, continuity, differentiability, and transformations. Then, it will describe mathematical descriptions of shapes and their implementations, starting from curves to free-form and subdivision surfaces, meshes and their simplifications, volumetric structures such as meshes, and constructive solid geometry. It will also provide knowledge of the fundamentals of procedural modeling (fractals, L-systems, terrain, and vegetation modeling). This course will also discuss modern AI-oriented methods for 3D shape generation. **Credits:** 3.00

CS 53500 - Interactive Computer Graphics

Credit Hours: 3.00. The principles of computer graphics and interactive graphical methods for problem solving. Emphasis placed on both development and use of graphical tools for various display devices. Several classes of graphics hardware considered in detail. Topics include pen plotting, storage tubes, refresh, dynamic techniques, three dimensions, color, modeling of geometry, and hidden surface removal. Part of the laboratory involves use of an interactive minicomputer graphics system. Knowledge of programming required. Typically offered Fall.**Credits:** 3.00

CS 53600 - Data Communication And Computer Networks

Credit Hours: 3.00. Data communications: communication hardware technologies including local area and longhaul network hardware, circuit and packet switching, interfaces between computer and network hardware, and performance issues. Network architecture: protocol software and conceptual layering, reliable delivery over an unreliable channel, transport protocols, virtual circuits, datagrams, internetworking as a fundamental design concept, the client-server paradigm, naming and name binding, name servers, addressing and address resolution, routing and routing algorithms, congestion and flow control techniques, network file systems, distribution of computation, and DARPA internet protocols (TCP/IP) as examples of protocol organization. Typically offered Fall.**Credits:** 3.00

CS 54100 - Database Systems

Credit Hours: 3.00. Fundamentals for the logical design of database systems. The entity-relationship model, semantic model, relational model, hierarchical model, network model. Implementations of the models. Design theory for relational databases. Design of query languages and the use of semantics for query optimization. Design and verification of integrity assertions, and security. Introduction to intelligent query processing and database machines. Typically offered Fall.**Credits:** 3.00

CS 54200 - Distributed Database Systems

Credit Hours: 3.00. Fundamental issues in distributed database systems that are motivated by the computer networking and distribution of processors and databases. The theory, design, specification, implementation, and performance of distributed database systems. Typically offered Spring.**Credits:** 3.00

CS 54300 - Introduction To Simulation And Modeling Of Computer Systems

Credit Hours: 3.00. Simulation: discrete event simulation, process oriented simulation, generating random numbers, simulation languages, simulation examples of complex systems. Nondeterministic models: random variables, Poisson process, moment generating functions, statistical inference and data analysis. Modeling: elementary queuing models, networks of queues, applications to performance evaluation of computer systems. Typically offered Fall.**Credits:** 3.00

CS 54701 - Information Retrieval

Credit Hours: 3.00. Basic principles and practical algorithms used for information retrieval and text mining: statistical characteristics of text, several important retrieval models, text categorization, recommendation system, clustering, federated text search, link analysis, etc. Typically offered Fall Spring.**Credits:** 3.00

CS 55100 - Cloud Computing Fundamentals

Credit Hours: 3.00. A comprehensive course that investigates all aspects of cloud computing, including: cloud data centers and infrastructure (equipment for processing, storage, communication, and special-purpose facilities); the use of virtualized servers (virtual machines and containers), virtualized storage (Storage Area Networks, Network Attached Storage, object storage), and virtual networks; automation; orchestration systems, such as Kubernetes; programming paradigms used to construct cloud-native software, such as MapReduce, microservices, controllerbased computing, and serverless computing; edge computing; security and privacy in cloud systems; software models. The course emphasizes researching new ways to use cloud computing and research into new ways to design and build cloud systems. The course includes a project. Students should have completed coursework in or have equivalent familiarity with operating systems and computer networks. **Credits:** 3.00

CS 55500 - Cryptography

Credit Hours: 3.00. (CSCI 55500) Concepts and principles of cryptography and data security. Cryptography (secret codes): principles of secrecy systems; classical cryptographic systems, including Vigenere and Vernam ciphers; the Data Encryption Standard (DES); public-key encryption; privacy-enhanced email; digital signatures. Proprietary software protection; information theory and number theory; complexity bounds on encryption; key escrow; traffic analysis; attacks against encryption; basic legal issues; e-commerce; and the role of protocols. Typically offered Spring.**Credits:** 3.00

CS 55600 - Data Security And Privacy

Credit Hours: 3.00. Data security and privacy is an important part of information security. This course provides an introduction to the fundamental principles and techniques for data security and privacy. The course covers fundamental theories of access control, discretionary access control, mandatory access control, and role-based access control, database access control approaches including grant revoke, virtual private databases and labelled databases, database encryption. On privacy, it covers data anonymization, re-identification attacks, definition, primitives, and applications of differential privacy.**Credits:** 3.00

CS 55800 - Introduction To Robot Learning

Credit Hours: 3.00. Intelligent robot systems are in high demand in many real-world tasks, leading to growing interest in designing scalable robot algorithms for automation. From improving healthcare systems to enhancing the manufacturing capacity of various industrial sectors, the role of Robotics has been acknowledged worldwide. They are now also being considered as necessary tools to build large-scale assistive technologies such as smart vehicles and delivery drones to improve people's quality of life. This course covers topics in robot motion planning, estimation, learning, and control to design algorithms for robots to safely interact with their environments and perform various challenging tasks under constraints. The first part of this course focuses on classical techniques such as search, sampling-based planning, PID control, Model Predictive Control (MPC), and Bayesian Kalman filters. The second part covers modern imitation learning and deep reinforcement learning techniques and their application to planning and decision-making in robotics. The course assumes students are familiar with basic concepts in linear algebra, optimization, elementary probability, statistics, data structures, and algorithms. Students are expected to have good programming and software development skills and have a working knowledge of Python.**Credits:** 3.00

CS 56000 - Reasoning About Programs

Credit Hours: 3.00. The course focuses on the logical foundations and algorithmic techniques used to ensure program correctness. With an emphasis on automated program verification and synthesis, the course covers classical concepts and techniques such as Hoare logic, abstract interpretation, abstraction-refinement and bounded model checking. The course also exposes students to approaches for program synthesis, a new frontier for program reasoning, such as inductive synthesis, synthesis using version space algebras, constraint-based synthesis and synthesis based on machine-learning techniques. The courses emphasizes both theoretical foundations as well as hands-on experience with verification/synthesis tools and SAT/SMT solvers. Students are expected to have completed undergraduate coursework in Foundations of Computer Science (CS 18200) or equivalent, Systems Programming (CS 25200) or equivalent, and Introduction to the Analysis of Algorithms (CS 38100) or equivalent. Mathematical maturity is expected. Typically offered Fall.**Credits:** 3.00

CS 56500 - Programming Languages

Credit Hours: 3.00. An exploration of modern or unconventional concepts of programming languages, their semantics, and their implementations; abstract data types; axiomatic semantics using Hoare's logic and Dijkstra's predicate transformers; denotational semantics; functional, object-oriented, and logic programming; concurrency and Owicki-Gries theory. Example languages include ML, Ada, Oberon, LISP, PROLOG, and CSP. Typically offered Spring.**Credits:** 3.00

CS 56900 - Introduction To Robotic Systems

Credit Hours: 3.00. (ECE 56900) The topics to be covered include: basic components of robotic systems; selection of coordinate frames; homogeneous transformations; solutions to kinematic equations; velocity and force/torque relations; manipulator

dynamics in Lagrange's formulation; digital simulation of manipulator motion; motion planning; obstacle avoidance; controller design using the computed torque method; and classical controllers for manipulators. **Credits:** 3.00

CS 57700 - Natural Language Processing

Credit Hours: 3.00. This course will cover the key concepts and methods used in modern Natural Language Processing (NLP). Throughout the course several core NLP tasks, such as sentiment analysis, information extraction, syntactic and semantic analysis, will be discussed. The course will emphasize machine-learning and data-driven algorithms and techniques, and will compare several different approaches to these problems in terms of their performance, supervision effort and computational complexity. Prerequisites: A background in linear algebra, calculus, statistics and probability, and completion of CS 57800 or equivalent are highly recommended. Strong programming skills in any modem language (Python, Java, C++) are required. Typically offered Fall Spring.**Credits:** 3.00

CS 57800 - Statistical Machine Learning

Credit Hours: 3.00. This introductory course will cover many concepts, models, and algorithms in machine learning. Topics include classical supervised learning (e.g., regression and classification), unsupervised learning (e.g., principle component analysis and K-means), and recent development in the machine learning field such as variational Bayes, expectation propagation, and Gaussian processes. While this course will give students the basic ideas and intuition behind modern machine learning methods, the underlying theme in the course is probabilistic inference.**Credits:** 3.00

CS 57900 - Bioinformatics Algorithms

Credit Hours: 3.00. Review of Genomes, DNA, RNA, proteins, proteomes. Biological Sequences: dynamic programming; pairwise global, local, and semi-global alignments of genes and proteins; constant, affine, and general gap penalties; RNA alignments; BLOSUM and PAM scoring matrices. Multiple alignment of proteins: approximation algorithms; iterative and progressive alignment methods. Database search for sequences: BLAST and variants. Phylogenetic Trees: distance-based methods, ultrametric and additive distance functions; parsimony, and maximum likelihood methods. Whole Genome Alignment: suffix trees and suffix arrays. Systems Biology: Module discovery in biological networks, spectral algorithms for graph clustering. Network alignment: quadratic programming formulations and graph matching. Genetic Variation: haplotype inference, the perfect phylogeny problem and chordal graphs. Additional topics such as next-generation sequencing, analysis of multidimensional data from flow cytometry, and gene expression data, if time permits. Typically offered Fall.**Credits:** 3.00

CS 58000 - Algorithm Design, Analysis, And Implementation

Credit Hours: 3.00. Basic techniques for designing and analyzing algorithms: dynamic programming, divide and conquer, balancing. Upper and lower bounds on time and space costs, worst case and expected cost measures. A selection of applications such as disjoint set union/find, graph algorithms, search trees, pattern matching. The polynomial complexity classes P, NP, and co-NP; intractable problems. Typically offered Fall Spring.**Credits:** 3.00

CS 58400 - Theory Of Computation And Computational Complexity

Credit Hours: 3.00. The theory of general purpose programming systems. Recursive and partial-recursive functions; recursive and recursively enumerable sets. The Church-Turing thesis. The recursion theorem, Rogers' translation theorem, Rice's undecidability theorem. The general theory of computational complexity: there are no general solutions to natural optimization problems. Complexity for specific models of computation: the polynomial complexity classes P, NP, and PSPACE; NP-hard and PSPACE-hard problems, inherently exponential problems. Typically offered Spring.**Credits:** 3.00

CS 58500 - Theoretical Computer Science Toolkit

Credit Hours: 3.00. This course covers fundamental techniques and a range of mathematical tools that underlie today's research in theoretical computer science. The course material is essential for research in theoretical computer science as well as machine learning theory. The course is targeted at students who plan to pursue research in these areas. Topics will be chosen from four core areas: Convex Analysis and Optimization, Spectral Methods, Concentration Inequalities, and Discrete Fourier Analysis. Depending on student and instructor interest, additional topics will be chosen and may include applied analysis, coding theory, probabilistic proofs, and more advanced topics in discrete Fourier analysis. Students will read papers in theoretical computer science and machine learning theory using, exploring and extending the covered techniques and tools. Students are expected to be proficient in probability theory, have the maturity to follow and carry out basic analysis proofs, and have completed courses in calculus, linear algebra, discrete mathematics, and analysis of algorithms. More specifically, the course expects mastery of the material covered in Calculus III, Linear Algebra, Probability, Foundations of CS, and Analysis of Algorithms.**Credits:** 3.00

CS 58700 - Foundations Of Deep Learning

Credit Hours: 3.00. This course provides an integrated view of the key concepts of deep learning (representation learning) methods. This course focuses on teaching principles and methods needed to design and deploy novel deep learning models, emphasizing the relationship between traditional statistical models, causality, invariant theory, and the algorithmic challenges of designing and deploying deep learning models in real-world applications. This course has both a theoretical and coding component. The course assumes familiarity with coding in the language used for state-of-the-art deep learning libraries, linear algebra, probability theory, and statistical machine learning.**Credits:** 3.00

CS 58800 - Randomized Algorithms

Credit Hours: 3.00. The area of randomized algorithms has grown from being a tool in computational number theory to finding widespread application in algorithms in all areas of computer science. Two practical benefits of randomization are its simplicity and speed. Deep and important computational complexity connections have been developed, from bridging the gap between discrete and continuous optimization, bypassing deterministic barriers in online settings, summarizing massive data in polylogarithmic space, probabilistically checkable proofs, privacy enhancing techniques, modeling the web and other large networks, and sparsifying and compressing complicated combinatorial structures such as graphs. Randomization is an essential key ingredient in the algorithmic breakthroughs today and in the future. This course presents the basic concepts in the design and analysis of randomized algorithms and shows how to apply them to algorithms for a wide range of problems. The course covers a broad range of problems benefitting from randomized computation including data structures, graph algorithms, online algorithms, geometric algorithms, streaming algorithms, derandomization techniques, and tools for probabilistic analysis of algorithms. Typically offered Fall.**Credits:** 3.00

CS 59000 - Topics In Computer Sciences

Credit Hours: 1.00 to 5.00. Directed study for students who wish to undertake individual reading and study on approved topics. Permission of instructor required.**Credits:** 1.00 to 5.00

CS 59100 - Seminar

Credit Hours: 1.00. A weekly seminar presented by faculty and invited speakers, normally in a specific area. Typically offered Fall Spring.**Credits:** 1.00

CS 59300 - New Topics In CS

Credit Hours: 3.00. A variable title course for topics not currently covered in the CS graduate curriculum. Each offering follows a traditional course structure with textbook(s), assignments, exams, and week-by-week content synopsis described in a syllabus. A CS 59300 offering does not imply that a course is intended to become, or will become, a regular course in the CS graduate curriculum. May be included on a CS MS or PhD plan of study according to the relevant ruleset.**Credits:** 3.00

CS 59799 - Graduate Professional Practice

Credit Hours: 0.00. Internship experience to complement the student's academic coursework and help prepare the student for employment in computer science. The student must present a letter from the proposed employer describing to a reasonable extent the work to be undertaken and find a member of the Computer Science Graduate Faculty to be the instructor. The student must have completed at least one semester as a computer science graduate student at Purdue, West Lafayette. May not be taken in successive semesters. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 0.00

CS 61500 - Numerical Methods For Partial Differential Equations I

Credit Hours: 3.00. (MA 61500) Finite element method for elliptic partial differential equations; weak formulation; finite-dimensional approximations; error bounds; algorithmic issues; solving sparse linear systems; finite element method for parabolic partial differential equations; backward difference and Crank-Nicolson time-stepping; introduction to finite difference methods for elliptic, parabolic, and hyperbolic equations; stability, consistency, and convergence; discrete maximum principles. Prerequisite: CS 51400, MA 52300. Typically offered Spring.**Credits:** 3.00

CS 62600 - Advanced Information Assurance

Credit Hours: 3.00. Advanced topics in information assurance, including selections from the following: penetration testing, formal verification of systems, formal models of information flow and protection, distributed system authentication, protocol design and attack, computer viruses and malware, intrusion and anomaly detection models, multi-level security, active defenses, investigation and forensics, network firewalls, anonymity and identity, e-commerce support, and database security models and mechanisms. Offered every third semester. Prerequisite: CS 52600, CS 55500. Typically offered Fall Spring.**Credits:** 3.00

CS 63500 - Capturing And Rendering Real-World Scenes

Credit Hours: 3.00. Advanced techniques for automated modeling and visualization of complex environments, such as rooms, buildings, urban scenes, and landscapes. Topics covered are at the confluence of computer graphics, computer vision and engineering, and include: capture technologies, acquisition device calibration, view registration, panoramic images, 3D reconstruction from images, view morphing, 3D image warping, lightfield modeling and rendering, visual hulls, point-based modeling and rendering, view dependent texture mapping, and application development issues and examples. Prerequisite: CS 58000, CS 53500 or a solid foundation in computer graphics, programming proficiency in C or C++ and basic linear algebra. Typically offered Spring.**Credits:** 3.00

CS 63600 - Internetworking

Credit Hours: 3.00. Principles of Internetwork architecture and communication protocols underlying interoperable systems. Topics include universal interconnection, Internet addressing and routing, address binding, control of Internet congestion and flow, examples of Internet protocol suites (TCP/IP and XNS), round trip time estimation, naming and name resolution, Internet applications programs, and the ISO/OSI model. Prerequisite: CS 50300. Typically offered Fall.**Credits:** 3.00

CS 63800 - Multimedia Networking And Operating Systems

Credit Hours: 3.00. For graduate students in computer sciences who have a background in networking and operating systems and are interested in research in networked multimedia systems. The course consists of a selection of networking and operating system topics for realizing high performance, predictable, scalable, flexible, and secure multimedia systems. Topics may vary to reflect timely research issues and the current interests of the instructor(s). Students are expected to complete a term project. Presentations also may be required. Undergraduate background in computer science required. Prerequisite: CS 53600 or CS 50300. Typically offered Fall Spring.**Credits:** 3.00

CS 64100 - Multimedia Database Systems

Credit Hours: 3.00. Prepares students for research in multimedia database systems. Students are exposed to a variety of emerging innovative techniques to store, manipulate, communicate, visualize, and reason with multimedia systems. Prerequisite: CS 54100 or CS 54200. Typically offered Fall Spring.**Credits:** 3.00

CS 65500 - Advanced Cryptology

Credit Hours: 3.00. Advanced topics in cryptography and cryptanalysis, including selections from the following: Steganographic methods, Cryptanalytic techniques, including differential cryptanalysis, and chosen plaintext attacks. Message digest algorithm construction. Digital cash. Quantum cryptography. N-key systems. Minimal and zero-knowledge systems. Protocol design and failure. Verification of algorithms. Key generation and management. Traffic analysis. VPN construction and operation. Politics, espionage, and law enforcement concerns. Offered every third semester. Prerequisite: CS 52600, CS 55500. Typically offered Fall Spring.**Credits:** 3.00

CS 66200 - Pattern Recognition And Decision-Making Processes

Credit Hours: 3.00. (ECE 66200) Introduction to the basic concepts and various approaches of pattern recognition and decision-making processes. Topics include various classifier designs, evaluation of classifiability, learning machines, feature extraction, and modeling. Prerequisite: ECE 30200. Typically offered Fall.**Credits:** 3.00

CS 69000 - Seminar On Topics In Computer Sciences

Credit Hours: 0.00 to 5.00. Topics vary. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 0.00 to 5.00

CS 69010 - Seminar On Topics In Computer Science

Credit Hours: 0.00 to 5.00. Topics vary. Permission of instructor required. **Credits:** 0.00 to 5.00

CS 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. The student is expected to follow safe research practices, to follow ethical research practices, to maintain communication with the instructor, to formulate a set of reasonable semester research progress milestones with instructor, optionally in writing. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 1.00 to 18.00

CS 69810 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. The student is expected to follow safe research practices, to follow ethical research practices, to maintain communication with the instructor, to formulate a set of reasonable semester research progress milestones with instructor, optionally in writing. Permission of instructor required.**Credits:** 1.00 to18.00

CS 69900 - Research PhD Thesis

Credit Hours: 1.00 to 18.00. Research PhD Thesis. The student is expected to follow safe research practices, to follow ethical research practices, to maintain communication with the instructor, to formulate a set of reasonable semester research progress milestones with instructor, optionally in writing. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 1.00 to 18.00

CSCI 23000 - Computing I

Credit Hours: 4.00. The context of computing in history and society, information representation in digital computers, introduction to programming in a modern high-level language, introduction to algorithms and data structures, their implementation as programs.**Credits:** 4.00

CSCI 24000 - Computing II

Credit Hours: 4.00. Continues the introduction of programming begun in CSCI 23000, with a particular focus on the ideas of data abstraction and object oriented programming. Topics include programming paradigms, principles of language design, object-oriented programming, programming and debugging tools, documentation, recursion, linked data structures, and an introduction to language translation.**Credits:** 4.00

CSCI 24100 - Introduction To Web Design

Credit Hours: 3.00. Introduction to writing content for the Internet and World Wide Web. Emphasis on servers, hand-coded HTML, Cascading Style Sheets and extending HTML with other Web technologies.**Credits:** 3.00

CSCI 31100 - Advanced Database Programming, Oracle

Credit Hours: 3.00. Focus on the concepts and skills required for database programming and client server development. Concepts will apply to any modern distributed database management system. Emphasis on developing Oracle SQLPlus scripts, PL/SQL server side programming, and Oracle database architecture. Students with programming experience in ODBC compliant languages will be able to practice connecting such languages to an Oracle database. Lecture and laboratory.**Credits:** 3.00

CSCI 34000 - Discrete Computational Structures

Credit Hours: 3.00. Theory and application of discrete mathematics structures and their relationship to computer science. Topics include mathematical logic, sets, relations, functions, permutations, combinatorics, graphs, Boolean algebra, digital logic, recurrence relations, and finite-state automata.**Credits:** 3.00

CSCI 36200 - Data Structures

Credit Hours: 3.00. A study of the design and analysis of data structures and algorithms. Abstract data types: arrays, stacks, queues, lists, trees, graphs, etc. Algorithms: sorting, searching, hashing. File structures: organization and access methods.**Credits:** 3.00

CSCI 40300 - Introduction To Operating Systems

Credit Hours: 3.00. Operating system concepts; history, evolution and philosophy of operating systems. Concurrent processes, process coordination and synchronization, CPU scheduling, deadlocks, memory management, virtual memory, secondary storage and file management, device management, security and protection, networking, distributed and real-time systems.**Credits:** 3.00

CSCI 41400 - Numerical Methods

Credit Hours: 3.00. Error analysis, solution of nonlinear equations, direct and iterative methods for solving linear systems, approximation of functions, numerical differentiation and integration, numerical solution of ordinary differential equations. Not open to students with credit in CSCI 512.**Credits:** 3.00

CSCI 44300 - Database Systems

Credit Hours: 3.00. Relational database systems: architecture, theory, and application. Relational data structure, integrity rules, mathematical description, data manipulation. Standard SQL and its data manipulation language, engineering aspects of database design in industry, introduction to non-relational database systems.**Credits:** 3.00

CSCI 45000 - Principles Of Software Engineering

Credit Hours: 3.00. Tools and techniques used in software development. Lifecycle concepts applied to program specification, development, and maintenance. Topics include overall design principles in software development; the use of structured programming techniques in writing large programs; formal methods of program verification; techniques and software tools for program testing, maintenance, and documentation.**Credits:** 3.00

CSCI 48400 - Theory Of Computation

Credit Hours: 3.00. Introduction to formal languages and automata theory; finite automata, regular expressions, regular languages, context-free languages and pushdown automata, context sensitive languages, Turing machines, undecidability, P and NP. Design and analysis techniques for divide-and-conquer algorithms, greedy algorithms, dynamic programing, amortized analysis.**Credits:** 3.00

CSCI 49000 - Topics In Computer Sciences For Undergraduates

Credit Hours: 1.00 to 5.00. Supervised reading and reports in various fields.**Credits:** 1.00 to 5.00

CSCI 49500 - Explorations In Applied Computing

Credit Hours: 1.00 to 6.00. Explorations in Applied Computing is an undergraduate capstone experience. Students will work in teams, advised by faculty and external liaisons, to solve real-world computing problems. This hands-on experience will cultivate technical expertise, utilization of analytical thinking, quantitative reasoning, project management skills, and communication skills.**Credits:** 1.00 to 6.00

CSCI 49600 - Computer Science Internship Capstone

Credit Hours: 3.00. A professional experience providing students the opportunity to incorporate material learned in CSCI coursework in a supervised internship position. The approved internship position will cultivate technical expertise, utilization of analytical thinking, quantitative reasoning, project management skills, and communication skills.**Credits:** 3.00

INFO I3000 - Human-Computer Interaction

Credit Hours: 3.00. The analysis of human factors and the design of computer application interfaces. A survey of current best practices with an eye toward what future technologies will allow.**Credits:** 3.00

Construction Engineering and Management

CEM 18000 - Construction Engineering Pre-Professional Development

Credit Hours: 1.00. Online course consisting of 8 sessions and 1 module (10 hour OSHA training) is intended to be completed before the student's first work session (internship) in order to prepare the student in the form of oral and written communication that will assist them in being successful in their experiential learning opportunities within industry. This course will also

introduce the students to the construction industry relative to office and field requirements and introduce the student to professional skills that will be needed for their experiential learning opportunities including but not limited to: verbiage and acronyms, tools, software platforms, and general business etiquette and ethics.**Credits:** 1.00

CEM 19100 - Construction Internship I

Credit Hours: 0.00. First of three work periods required for students in the construction engineering and management program. The off-campus location for each work period is designated by the construction organization that sponsors the construction internship. Student intern receives compensation from the sponsor during each work period. A typical first internship period emphasizes the field-based activities of the sponsor. Recommended, but not required, to be preceded by CE 22000. Available to CEM students only. **Credits:** 0.00

CEM 20100 - Life Cycle Engineering And Management Of Constructed Facilities

Credit Hours: 3.00. This course introduces concepts relating to the engineering and construction of facilities throughout their life cycle. Topics that will be explored include the nature of the construction industry, construction contracts, legal and management organization of construction companies, basics of the design and construction process, as well as an introduction to the role of estimating and project scheduling. Cost, time, safety and quality concepts of construction management relationships will also be discussed. Prerequisite: First Year Engineering Curriculum must be completed. **Credits:** 3.00

CEM 28000 - Construction Engineering Professional Development I

Credit Hours: 1.00. This course will prepare the student for professional practice in construction engineering including information on careers and issues in construction industries; History and Culture of the U.S. Construction Industry; Engineering Ethics and Preparation for Leadership. Information and assistance is also provided related to minors and selections associated with the plan of study; student's organizations; opportunities for construction research and community outreach at Purdue. Guest speakers with be utilized to enhance the experience. The guest speakers include industry partners as well as faculty and staff. There will be an emphasis on written and oral communication. **Credits:** 1.00

CEM 29100 - Construction Internship II

Credit Hours: 0.00. Second of three internship periods and a continuation of that described for CEM 19100. Typically, experience emphasizes the office-based activities of the sponsor. **Credits:** 0.00

CEM 29199 - Cooperative Experience I

Credit Hours: 0.00. Professional experience in Construction Engineering and Management. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.**Credits:** 0.00

CEM 29299 - Cooperative Experience II

Credit Hours: 0.00. Professional experience in Construction Engineering and Management. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.**Credits:** 0.00

CEM 29700 - Experimental Course

Credit Hours: 1.00 to 6.00. This course is required to assist in the development and testing of new courses for either residential or online delivery. Initially, there may be more residential courses than online due to faculty availability and/or workload. **Credits:** 1.00 to 6.00

CEM 30100 - Project Control And Life Cycle Execution Of Constructed Facilities

Credit Hours: 3.00. This course continues an introduction to construction management and engineering concepts for future engineers, contractors and owner representatives involved at different stages in the life-cycle of constructed facilities. Specifically, this course focuses on the principles, tools, and procedures used in the construction industry for project selection and financing, advanced planning and scheduling techniques, resource management, and project monitoring. **Credits:** 3.00

CEM 30200 - Practical Applications For Construction Engineering

Credit Hours: 3.00. This course teaches practical applications of the theories, tools and skills taught in CEM 20100 and CEM 30100. Construction processes will be studied through hands on exercises working with actual contract plans and specifications and computerized project scheduling of the sample project that is the focus of the class. Topics that will be explored are Contract Format, Understanding Contract Specifications. Permission of department required. **Credits:** 3.00

CEM 32100 - Construction Engineering Materials Lab

Credit Hours: 1.00. The nature and performance of materials under load stress. Important engineering materials for evaluation of physical and mechanical properties include ferrous and nonferrous metals, plastics, bituminous materials, Portland cement, aggregates, concrete, timber, and particulate systems. **Credits:** 1.00

CEM 32400 - Human Resource Management In Construction

Credit Hours: 3.00. Introduce a broad set of fundamental topics regarding management of people in engineering and construction organizations in the U.S. Subjects include labor-management relations (laws, regulations and practices affecting construction workers and organizations); worker motivation, productivity, and training; roles and practices of managers; construction safety; management of quality. **Credits:** 3.00

CEM 35100 - Foundations Of Architectural Design

Credit Hours: 3.00. Contemporary humans spend most of our time directly engaging with architecture; it is the context in which we live our lives. This course introduces the demands ('tasks') and methods ('tools') inherent to the practice of architectural design. In other words, the problems architects address through design and the ways in which they do so. These two sets of topics are presented in tandem through historical and contemporary examples, along with selected case-studies and readings. Success in the course will provide a foundation for richly experiencing, critically assessing, and productively engaging the development of our built environment. **Credits:** 3.00

CEM 38000 - Construction Engineering Professional Development II

Credit Hours: 1.00. This course will build upon the topics discussed in CEM 28000 to further prepare students for their work in the construction industry. A focus of this class will be on presentation skills. By utilizing the first or last hour of CEM 42500 - Construction Practice Project, the students of CEM 38000 will have the opportunity to present and also participate as an audience and active participant in CEM 42500 Construction Practice Project. The presentations of CEM 38000 will consist of their required Summer Internship Reports, which are a compilation of the work they have completed and skills they have learned in their first two internships (CEM 19100 and CEM 29100). **Credits:** 1.00

CEM 39100 - Construction Internship III

Credit Hours: 0.00. Third, and last, of required internships. It typically emphasizes the project management activities of the sponsor. Actual assignments to a student may vary from sponsor to sponsor. **Credits:** 0.00

CEM 39399 - Cooperative Experience III

Credit Hours: 0.00. Professional experience in Construction Engineering and Management. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.**Credits:** 0.00

CEM 39499 - Extensive Cooperative Experience IV

Credit Hours: 0.00. Professional experience in Construction Engineering and Management. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.**Credits:** 0.00

CEM 39599 - Extensive Cooperative Experience V

Credit Hours: 0.00. Professional experience in Construction Engineering and Management. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required.**Credits:** 0.00

CEM 39700 - Experimental Course

Credit Hours: 1.00 to 6.00. This course is required to assist in the development and testing of new courses for either residential or online delivery. Initially, there may be more residential courses than online due to faculty availability and/or workload. **Credits:** 1.00 to 6.00

CEM 40100 - Critical Thinking In Construction Engineering

Credit Hours: 3.00. This course introduces the concepts of critical thinking and why acting in our 'comfort zone' can result in discomfort. Students will explore a number of simulated and actual problems that challenge understanding of the situation and require additional investigation or analysis. Problems will cover the entire building life-cycle from development of a project plan, through design, project risk analysis for bidding, controlling the project, project recovery, and project handover. Guest speakers will present examples of projects where critical thinking was applied to resolve project issues or avoid a significant error. **Credits:** 3.00

CEM 42501 - Construction Engineering Capstone I

Credit Hours: 2.00. The capstone senior design course for construction engineering and management majors. Working in teams in a realistic engineering practice environment, students use an actual construction project to accomplish open-ended project planning and systems design. Course covers construction project strategy, cost estimating and bidding, constructability analysis, project scheduling, contract conditions, project organization, site analysis and development, safety and quality management, and information systems design. Comprehensive written submittals and oral presentations require integration of knowledge gained in previous courses and in construction internships. **Credits:** 2.00

CEM 42502 - Construction Engineering Capstone II

Credit Hours: 2.00. The capstone senior design course for construction engineering and management majors. Working in teams in a realistic engineering practice environment, students use an actual construction project to accomplish open-ended project planning and systems design. Course covers construction project strategy, cost estimating and bidding, constructability analysis,

project scheduling, contract conditions, project organization, site analysis and development, safety and quality management, and information systems design. Comprehensive written submittals and oral presentations require integration of knowledge gained in previous courses and in construction internships. **Credits:** 2.00

CEM 43100 - Introduction To Facility Engineering And Management

Credit Hours: 3.00. This course introduces students to the field of facility engineering and management, the operation of constructed facilities to ensure efficient operation, meet stakeholder needs, and preserve the facility for its intended life. The course is a technical elective for Construction Engineering and Management students who are familiar with the delivery of capital construction projects and provides an owner/operator perspective of capital construction and ongoing operations. The course focuses on the different capital construction types (buildings, roads, bridges, tunnels, water treatment facilities, and industrial facilities). Guest speakers will be used to present the challenges specific to individual facility types. Methods and tools to develop the needed management and annual operational plans for facilities will be used. Case studies will be used to demonstrate the application of methods and tools. **Credits:** 3.00

CEM 45100 - Integrative Building Design

Credit Hours: 3.00. This course introduces the architectural and constructive challenges of comprehensive, integrated building design. In lectures, the range of constituent systems (active and passive) that combine to produce contemporary buildings will be presented with particular attention to the specific parameters and metrics that drive their functionality and performance. The central project is an extended exercise in design modeling: applying iterative refinements to introduce additional layers of systemic complexity and to respond to specific analytical measures of building performance. Success in this course will support the ability to productively contribute to building and construction projects from a variety of specific roles. **Credits:** 3.00

CEM 45500 - Temporary Structures In Construction

Credit Hours: 3.00. This course will cover the design and construction of various temporary structures and systems used in building and transportation construction. The course describes not only design issues of temporary structures such as formwork, falsework, bracing, earth retention systems, scaffolding, cofferdams, and so forth by providing lectures and design examples, but it also covers business aspects associated with the design and construction of temporary structures in the real world such as business practice, legal aspects, and design philosophy. **Credits:** 3.00

CEM 45600 - Design-Build Project Delivery Method For Engineers

Credit Hours: 3.00. This course presents traditional project delivery methods and contrasts them with design-build project delivery. The course focuses on the principles, tools, and procedures used in the design-build project delivery method. It provides students with sufficient education to become certified (following additional examination) by the Design Build Institute of America as an Associate Member and dependent on employment experience, a full Member. Traditional project delivery methods, Design-Bid-Build, Construction Manager as Agent, 'Fast Track', and other 'rip and read' methods are losing popularity to project delivery methods that take a more collaborative approach. Collaboration requires a different way of thinking about a capital construction project and working with others in project delivery. Constructors must move from a transactional, arms-length relationship where the project is viewed as a low-price commodity to a full-suite delivery of services resulting in a high-value product. This requires collaboration with the Owner and other members of the project delivery process, something that has been missing from traditional project delivery methods. Active student participation is required. Student participation will be facilitated through assigned presentations, in-class projects, field trips to local projects, and guest lectures. Students who complete the course and achieve DBIA's minimum requirements (Fundamentals of Project Delivery, Principles of Design-Building Project Delivery, Post Award, and Contracts & Risk Management) will be eligible for recognition by DBIA. **Credits:** 3.00

CEM 45700 - Inland Navigation Engineering

Credit Hours: 3.00. This course teaches detailed elements of Inland Navigation Structures, primarily in the United States. Students will become familiar with how waterways are conceived, planned, designed and constructed. Engineering Design Manuals for Locks and Dams will be reviewed. A primary focus will be on a new Corps of Engineers Lock and Dam currently under construction. The students will thoroughly review the Plans and Specifications as well as Construction Photos and Videos taken during construction. Various marine construction equipment and techniques will be presented. **Credits:** 3.00

CEM 48500 - Legal Aspects Of Construction Engineering

Credit Hours: 3.00. This course will cover legal principles and landmark cases relevant to civil and construction engineering. Specific subjects covered include contracts, torts, agency, professional liability, labor laws, insurance, expert testimony, arbitration, patents and copyrights, sureties and ethics. **Credits:** 3.00

CEM 49700 - Construction Engineering Projects

Credit Hours: 0.00 to 4.00. Topics vary. Permission of department required. **Credits:** 0.00 to 4.00

CEM 50100 - Leadership And Advanced Project Management

Credit Hours: 3.00. This course will focus on the first ten years of the student's professional career. It will introduce concepts relating to development of the leader-manager, advanced project management techniques that will assist the student towards success in the construction industry, and developing a business plan on starting a small engineering or construction company. Guest speakers provide learning from entrepreneurs who got their start utilizing the systems taught in the course. **Credits:** 3.00

CEM 53100 - Facilities Engineering And Management

Credit Hours: 3.00. This course provides the student with an understanding of the issues related to facilities management for owner organizations. The course is oriented toward upper class and graduate students familiar with the delivery of capital construction projects and provides an owner's perspective of capital construction and ongoing operation. The course will focus on the total life-cycle cost of a capital construction project beginning with planning, business rationale, economic analysis, and programmatic specifications. The owner's perspective on annual operating costs will be examined including calculation of daily, weekly, monthly, and annual operating costs. The implications of stewardship and customer service will be reviewed and analyzed including the implications on total life-cycle costs. The human resources implications of operating a facility will be reviewed including determination of staffing requirements to meet various levels of service as well as tools and techniques to determine and manage contracted services. Numerous case studies will be described and discussed which will demonstrate the importance of careful planning and budgeting of annual and periodic maintenance. Issues of sustainability, regulations, and other legal factors will be discussed and examined. **Credits:** 3.00

CEM 53200 - Infrastructure Planning

Credit Hours: 3.00. This course provides the student with an in depth understanding of the issues related to infrastructure planning, engineering, and economics. The focus will be on the prioritization, stewardship, management and decision-making roles within the engineering division of a large public works agency. Various infrastructure planning concepts will be reviewed and discussed. Numerous case studies will be described and discussed, which will demonstrate that in order to plan and implement a successful public works project, many controversial issues must be faced and difficult problems must be solved. Decision-making at agency and other levels of government will be discussed with respect to reports prepared by planners covering engineering feasibility, environmental and social impact assessments, and financial and economic analyses. Evolving modern planning issues will be introduced and discussed, including sustainability; environmental economics; environmental justice; uncertainty and risk-benefit analysis; partnerships with private entities versus total privatization; and the optimum staff-mix utilization in-house versus outsourcing. **Credits:** 3.00

CEM 53300 - Infrastructure Analytics

Credit Hours: 3.00. This course investigates the data sources and numerical tools required to assess the status of constructed facilities and to make informed decisions from the data. The course is oriented toward upper class and graduate students familiar with the delivery of capital construction projects (buildings, roads, bridges, earthworks, utilities, rail/transit, ports, and canals) and includes numerical analysis techniques. The course will focus on data sources, either direct or indirect, and analysis methods to identify the current condition or project future conditions of built infrastructure. Course format will be highly interactive with discussion about recent infrastructure projects in both instructor, guest speaker, and student-led discussions. Issues of sustainability, regulations, and other factors will be discussed and examined. **Credits:** 3.00

CEM 58500 - Temporary Structures

Credit Hours: 1.00. This class will provide construction and design professionals the skills to understand construction loads and their combinations, wind loads and their impacts, timber design, bracing and guying design, designing vertical forming systems, and shoring analysis for vertical construction.**Credits:** 1.00

CEM 58600 - Development Of Underground Space

Credit Hours: 3.00. This course has been designed to support students with civil engineering and construction engineering and management background. New underground construction projects are planned all over the world, and the course equips students to contribute to these exciting developments. This course includes an overview of the application for tunneling and underground space as well as construction methods. The course will cover various sizes of underground opening from small diameters built by micro-tunneling to common tunnels used in civil and mining applications to large caverns, often found in different end uses such as storage or hydropower construction.**Credits:** 3.00

CEM 58700 - Underground Infrastructure Asset Management

Credit Hours: 3.00. Most of the U.S. water and wastewater conveyance infrastructure was installed during the first half of the 20th century and is coming to an end of its useful life. "Out of sight, out of mind" describes the awareness and significance that has been placed on these underground lifeline systems which support societies' quality of life, public health, economic development and living standard. Historically, management of these systems has been described as "crises management." They only get attention when there is a failure. It has been determined that a reactive management approach is not sustainable. The Environmental Protection Agency (EPA) has been instrumental in assisting utilities transition from reactive management practices to proactive practices. This approach involves the principles and practices of Asset Management (AM). AM is a comprehensive approach which involves every aspect of the organization to develop and implement best business practices to address: (a) the current state of the assets, (b) levels of service, (c) critical assets, (d) life-cycle costing, and (e) funding. This course prepares students to utilize sound engineering judgment and principles for managing the construction, repair, rehabilitation, and maintenance of buried infrastructure systems including pipes, tunnels, chambers, etc.**Credits:** 3.00

CEM 59700 - Experimental Masters Course

Credit Hours: 1.00 to 3.00. This course will allow CEM to develop and test new courses for graduate level delivery. Possible courses include: Robotics in Construction; Tunneling; Process Plant Construction; Waterway Engineering; Construction Visualization; Remote Monitoring and Inspection; Cost/Benefits of Planning Details; Heavy Construction Innovation; Site Pollutant Reduction & Control; Statistical Methods in Construction; Infrastructure Decay Mechanisms; Time Buffers and Task Durations; BIM Tools and Applications; Sustainable Construction Methods; Construction Operations & Productivity; Construction Accounting; and Construction Leadership.**Credits:** 1.00 to 3.00

Construction Management

CM 10000 - Introduction To Construction Management

Credit Hours: 3.00. This course is a survey of the construction industry. Topics include the overall construction process, career opportunities in the construction industry, an introduction to construction materials as well as management and technology tools used in the industry. There will be an emphasis on construction specific vocabulary. **Credits:** 3.00

CM 11000 - Construction OSHA Ten-Hour Certification

Credit Hours: 1.00. This course provides safety training following the OSHA (Occupational Safety and Health Administration) requirements for entry level workers of the construction industry. Upon successful completion of this course students will obtain their OSHA 10-hour card. **Credits:** 1.00

CM 15000 - Construction Management Fundamentals

Credit Hours: 6.00. An introductory course dealing with construction materials and methods, contracts, and layout of basic commercial, residential, heavy/civil, and industrial projects. Students will acquire fundamental skills in quantity estimating, construction plan reading, project layout, and project documentation through hands-on laboratory experiences. **Credits:** 6.00

CM 16000 - Surveying

Credit Hours: 3.00. Fundamental concepts and practical applications related to measurement of vertical and horizontal distances and angles using the tape, level, and total station. Computations of grades, traverses, areas, and curves. Basic concepts and applied use of topography, contours, and topographical maps.**Credits:** 3.00

CM 16400 - Graphics For Civil Engineering And Construction

Credit Hours: 2.00. An introductory course in the area of computer graphics documentation for civil engineering- and construction-related professions. Experiences focus on accepted industry graphic standards and their technical visual applications. The course emphasizes creation and distribution of graphics to enable communication. **Credits:** 2.00

CM 20000 - Intermediate Pre-Construction Management

Credit Hours: 9.00. A project course covering intermediate level commercial, residential, heavy/civil, and industrial construction projects. Students will expand their understanding of construction company management, design, cost, project controls, and safety. In addition, students will explore the areas of concentration within the construction management program. **Credits:** 9.00

CM 20001 - Intermediate Pre-Construction Management

Credit Hours: 6.00. A project course covering intermediate level commercial, residential, heavy/civil, and industrial construction projects. Students will expand their understanding of construction company management, design, cost, project controls, and safety.**Credits:** 6.00

CM 20002 - Intermediate Pre-Construction Management

Credit Hours: 4.00. A project course covering intermediate level commercial, residential, heavy/civil, and industrial construction projects. Students will expand their understanding of construction company management, design, cost, project controls, and safety.**Credits:** 4.00

CM 21000 - Construction Management Portfolio I

Credit Hours: 0.50. Creation of a portfolio demonstrating developing and emerging levels of competence within the construction management discipline. Students will meet individually and in small groups with faculty mentors to review and critique progress. **Credits:** 0.50

CM 21500 - Mechanical Construction

Credit Hours: 3.00. Principles of code, design, methods, and materials are applied to plumbing, heating, ventilation, and air conditioning systems for buildings. The comprehension of mechanical construction plans and specifications is emphasized through exercises in mechanical estimating.**Credits:** 3.00

CM 21601 - Electrical Construction

Credit Hours: 2.00. Principles of code and basic concepts in electrical theory, materials, methods, design and estimating are applied to electrical systems for buildings. Comprehension of electrical construction plans and specifications as well as installation exercises are emphasized through lab experiences.**Credits:** 2.00

CM 23301 - Mechanical, Electrical And Piping Systems In The Built Environment

Credit Hours: 3.00. An introductory course dealing with construction materials and methods related to building systems, focusing on mechanical, electrical, and piping (MEP) systems. Students will acquire fundamental skills in MEP construction plan reading, quantity estimating, basic systems' design and construction execution through lectures, laboratories and integrated project team exercises. **Credits:** 3.00

CM 25000 - Intermediate Construction Management

Credit Hours: 9.00. A project course covering intermediate level commercial, residential, heavy/civil, and industrial construction projects. Students will expand their understanding of construction materials and methods, layout, documentation, site planning, site supervision, cost control, and MEP systems. **Credits:** 9.00

CM 26000 - Introduction To Modeling For BIM

Credit Hours: 3.00. This is an introduction to the materials and processes used when generating 3D modeled solutions to construction problems using traditional and emerging construction documentation standards. Construction documents are created based on current Architectural, Engineering and Construction (AEC) standards with a focus on residential settings - introduction sketching into 2D documentation that will progress into 3D modeling. **Credits:** 3.00

CM 26200 - Introduction To Construction Graphics

Credit Hours: 3.00. Study of graphic solutions to problems conditioned by traditional and emerging construction document standards. Construction document creation is based on current architectural engineering and construction (AEC) standards with a focus on residential settings. Introductory 2D documentation will progress into 3D modeling techniques. **Credits:** 3.00

CM 27000 - Statics

Credit Hours: 3.00. Forces acting on bodies at rest, including coplanar, concurrent, and non-concurring systems; equivalent force systems and distributed forces. Use of free body diagrams and equations of equilibrium in solving problems for array of determinate structural systems: trusses, pin frames, arches, cables, retaining walls, and beams. Load tracing to examine the overall structural conditions with regards to lateral and gravity loads.**Credits:** 3.00

CM 30000 - Advanced Pre-Construction Management

Credit Hours: 9.00. A project course covering advanced level commercial, residential, heavy/civil, and industrial construction projects. Students will further develop their understanding of construction company management, design, cost, project controls, and safety. In addition, students will pursue their desired area of concentration within the construction management program.**Credits:** 9.00

CM 30001 - Advanced Pre-Construction Management

Credit Hours: 6.00. A project course covering advanced level commercial, residential, heavy/civil, and industrial construction projects. Students will further develop their understanding of construction company management, design, cost, project controls, and safety.**Credits:** 6.00

CM 30002 - Advanced Pre-Construction Management

Credit Hours: 4.00. A project course covering advanced level commercial, residential, heavy/civil, and industrial construction projects. Students will further develop their understanding of construction company management, design, cost, project controls, and safety.**Credits:** 4.00

CM 30101 - Introduction To Construction Company Financial Management

Credit Hours: 2.00. An introduction to methods for recognizing revenue for long-term construction contracts and each method's impact on financial statements. Includes introduction to analysis of financial statements and their use in developing company budgets, projecting cash needs, pricing construction projects, and forecasting the impact of business decisions on construction company profit.**Credits:** 2.00

CM 31000 - Equipment And Field Operations

Credit Hours: 3.00. Study of heavy equipment used in construction operations with an emphasis on equipment selection, application, cost, productivity, safety, and economics.**Credits:** 3.00

CM 33000 - Design And Construction I

Credit Hours: 6.00. A course which introduces students to projects and the design information of the built environment as communication tools representing space and proportion. Through a blend of lectures and studio work, students obtain working knowledge of the traditions, documents and standards utilized in the planning for a built structure. Students will also experience how design decisions and programing are influenced by a multitude of outside influences.**Credits:** 6.00

CM 33100 - Design And Construction II

Credit Hours: 6.00. A course where students exert criticism and evaluation of existing design through a blend of lectures and studio work. Students will be exposed to typical impediments to the design of the built environment as they demonstrate integrative decision making in creating an aesthetic and functional design program that meet the needs of society in a resource efficient and sustainable manner. Students will regularly critique the work of others and have their work critiqued as they seek to shape and implement informed design decisions.**Credits:** 6.00

CM 33200 - Architectural Design, Construction Techniques And Society

Credit Hours: 3.00. A course in which students will be exposed to the evolution of architecture and building techniques that influenced the western built environment. Emphasis will be given to the use of appropriate vocabulary and also how social and cultural factors have influenced the design of the built environment throughout the centuries. The course will survey topics from XVII century to recent times. **Credits:** 3.00

CM 35000 - Advanced Construction Management

Credit Hours: 9.00. A project course covering advanced level commercial, residential, heavy/civil, and industrial construction projects. Students will further develop their understanding of construction materials and methods, layout, documentation, site planning, site supervision, cost control, and MEP systems. **Credits:** 9.00

CM 36000 - Applications Of Construction Documentation I

Credit Hours: 3.00. Standards applied to the creation and distribution of documentation within the construction enterprise. Construction documents are created as products of a computer model. Residential modeling is followed by an introduction to light commercial documentation. Topics include a study of blueprint reading and 5D building information modeling (BIM) estimation of material extracted from a model.**Credits:** 3.00

CM 36200 - Construction Competition

Credit Hours: 2.00. This is a multi-disciplinary course where students from several majors work together as a team, developing a proposal for a construction of development project, which is presented at a student competition. Topics include a variety of project types, including land development, design/build, residential, commercial and heavy highway. Permission of instructor required. **Credits:** 2.00

CM 36400 - Jobsite Management

Credit Hours: 3.00. Examination of construction project management on the jobsite. Topics include, submittals, record keeping, jobsite layout, meetings, negotiations, dispute resolution, labor relations, safety, subcontracting, quality, cost control, waste management, changes, claims, progress payments, and project closeout.**Credits:** 3.00

CM 36500 - BIM For Project Managers And Field Supervision

Credit Hours: 2.00. One of the most important components of the construction industry is to visualize the project during its design, construction and over entire life cycle of structure, enabling invested parties to change/adjust the project. A construction project manager' job description is a person who can plan and oversee a construction project from initiation to close with the help of software, technology, resources and a reasonable budget. BIM has delivered a significant impact all aspects and types of AEC projects in terms of economic as well as technical viability. BIM plays a vital role in the management of the project. A project manager can leverage the capability of BIM to deliver a successful construction project and BIM reduces the burden on the project manager of manually calculating and managing tasks. It seems clear that for a construction project to be successful today, project managers would do well to adopt BIM technology. This course is the start that seeks to better understand & address student needs as a on job-site project manager utilizing advanced technologies coupled with Building Information Modeling to produce a form of Building Information Management. It will be given across the multiple disciplines/curricula in anticipation of integrating said new technologies extracted from BIM. Permission of instructor required.**Credits:** 2.00

CM 37000 - Heavy Civil Construction Management

Credit Hours: 3.00. This course will focus on the construction of roads, bridges, and other major transportation-related infrastructure. Topics include construction of concrete pavements, asphalt pavements, deep foundations, and underground utilities. Management of traffic, road construction safety, quality and master planning will also be covered. **Credits:** 3.00

CM 37100 - Industrial Construction Management

Credit Hours: 3.00. This course will focus on the design and construction of industrial systems and processes including Infrastructure for energy, chemical, and water/wastewater systems. Topics studied include piping, welding, heavy lift cranes, and high voltage systems. **Credits:** 3.00

CM 37200 - Planning, Design, And Construction Process For The Healthcare Built Environment

Credit Hours: 3.00. This course will focus on the construction of healthcare facilities including hospitals, clinics, nursing homes and laboratories. The course will emphasize the interrelationship of planning, design, and construction. **Credits:** 3.00

CM 37300 - Healthcare Construction Management - Systems, Occupied Space Work, And Related Industries

Credit Hours: 3.00. This course will focus on the construction of healthcare facilities and include topics related to infectious materials control, disruption avoidance, rapid technology changes, emergency routes, and advanced mechanical and electrical systems. **Credits:** 3.00

CM 37400 - Mechanical And Electrical Construction Management I

Credit Hours: 3.00. This course will focus on the process of analyzing the elements of mechanical, electrical, and plumbing (MEP) construction inherent in producing a MEP construction estimate. Topics include using work product documentation to present and shape the proposal, establishing a conceptual framework of the estimating process, examining commercial/industrial methods and materials, symbol identification, equipment application, and studying the estimating process sequence from project overview to final pricing. **Credits:** 3.00

CM 37500 - Mechanical And Electrical Construction Management II

Credit Hours: 3.00. This course will focus on an in-depth investigation of the elements of mechanical, electrical, and plumbing (MEP) construction on real-world projects. The student will be involved in investigating the equipment and components for the MEP systems and selecting the optimum project delivery method. Estimating will include topics such as solar arrays, EV charging, electrical vehicle charging station projects, smart grids, and energy conservative strategies and equipment. Cost saving strategies will also be examined for MEP system installations utilizing Building Information Modeling (BIM), pre-fabrication, and value engineering. **Credits:** 3.00

CM 37600 - Residential Construction Management-Green Construction And Sustainability

Credit Hours: 3.00. A study of the best building practices in residential construction, based upon the National Green Building Standard and other national green/sustainable building practices. **Credits:** 3.00

CM 37700 - Residential Construction Management Design-Build

Credit Hours: 3.00. A study of the design-build project delivery system for residential construction, including home design fundamentals, construction methods, disability code requirements, building code requirements, and aging-in-place design coupled with best practices of universal design. **Credits:** 3.00

CM 38000 - Soils And Foundations

Credit Hours: 3.00. Study of soils and foundations in the construction projects. Topics include, fundamental soil engineering theories, properties of soils, soil classification, compaction, permeability, stress, shear strength, consolidation, and bearing capacity.**Credits:** 3.00

CM 39000 - Construction Work Experience I

Credit Hours: 1.00. This course shall be taken when approximately half of a student's required 800 hours of work experience within the construction industry are completed. Students will be required to share their experiences with faculty and other construction management students. Permission of department required. **Credits:** 1.00

CM 40000 - Construction Capstone I

Credit Hours: 6.00. A project course covering specialized construction projects related to a student's area of concentration within the construction management program. Students will synthesize their previous knowledge of pre-construction management into a capstone project.**Credits:** 6.00

CM 41000 - Construction Management Portfolio II

Credit Hours: 0.50. Creation of a portfolio demonstrating emerging and proficient levels of competence within the construction management discipline. Students will meet individually and in small groups with faculty mentors to review and critique progress. **Credits:** 0.50

CM 42100 - Construction Management And Technologies For Disaster Recovery

Credit Hours: 3.00. Introductory topics in disaster recovery management: causes of disasters and dimensions of their effects; protocols, equipment, and techniques of disaster restoration and reconstruction; and project and business management practices and imperatives of disaster recovery contractors. **Credits:** 3.00

CM 42200 - Structural Demolition For Construction Managers

Credit Hours: 3.00. Introductory topics in demolition and reconstruction management: situations requiring structural demolition and its effect; protocols, equipment, and techniques of structural demolition; and project and business management practices and imperatives of structural demolition contractors. **Credits:** 3.00

CM 43300 - Risk Management And Legal Issues In Design And Construction Integration

Credit Hours: 2.00. An advanced course dealing with risk management and legal issues as they pertain to the interaction of designers, contractors, and owners. Students will learn to identify and mitigate potential risks that may affect the multiple stakeholders and the business organizations they represent during design and construction activity. The course will also deal with trust and teamwork issues within collaborative processes in the built environment.**Credits:** 2.00

CM 45000 - Construction Capstone II

Credit Hours: 6.00. A project course covering specialized construction projects related to a student's area of concentration within the construction management program. Students will synthesize their previous knowledge of construction management into a capstone project. **Credits:** 6.00

CM 45001 - Construction Capstone II

Credit Hours: 3.00. A project course covering specialized construction projects related to a student's area of concentration within the construction management program. Students will synthesize their previous knowledge of construction management into a capstone project.**Credits:** 3.00

CM 45701 - Construction Safety

Credit Hours: 3.00. This course will examine the impact of safety on the construction industry, including in-depth discussions on the application of the Occupational Safety & Health Administration (OSHA) Safety and Health Standards for the construction industry. The emphasis of this course is to provide training for job sited supervisory personnel. This course will also fulfill the requirements for the OSHA 30-Hour Card.**Credits:** 3.00

CM 46000 - Building Information Modeling For Commercial Construction

Credit Hours: 3.00. The study of commercial jobsite planning and coordination. Trade coordination, visualization, and communication are emphasized. Activities include collision detection reports, construction animations, and professional presentations.**Credits:** 3.00

CM 46200 - Applications Of Construction Documentation II

Credit Hours: 3.00. Creating, archiving, integrating, qualifying and utilizing computer-generated, three-dimensional architectural models in a light commercial construction enterprise. Topics include components of MEP, fire protection, blueprint reading and 4D BIM scheduling. Credit cannot be obtained for both CM 36000 and CM 46200.**Credits:** 3.00

CM 47500 - Construction Costs

Credit Hours: 2.00. A study of construction costs, including analysis of field records, job cost accounting, job cost control, and determination of unit prices.**Credits:** 2.00

CM 48100 - Emerging Topics In Construction

Credit Hours: 3.00. Study of emerging topics related to construction and construction related fields.**Credits:** 3.00

CM 49000 - Construction Work Experience II

Credit Hours: 1.00. This course completes a student's required 800 hours of work experience within the construction industry. Students will be required to share their experiences with faculty and other construction management students. Permission of department required. **Credits:** 1.00

CM 49900 - Special Topics In Construction

Credit Hours: 0.00 to 4.00. Variable title, variable credit course (Independent Study). Hours, subject matter, and credit to be arranged by staff. Permission of Instructor required. **Credits:** 0.00 to 4.00

CM 50500 - Construction Finance And Company Management

Credit Hours: 3.00. This course provides students with knowledge and research training to construction finance and company management.**Credits:** 3.00

CM 50800 - Human Factors In Construction And Transportation

Credit Hours: 3.00. This course provides students with knowledge and research training to identify and solve design problems and safety issues of human factors specifically in construction and transportation. **Credits:** 3.00

CM 51000 - Topics In Environmentally Sustainable Construction, Design And Development

Credit Hours: 3.00. This course explores environmental sustainability in all its forms, starting with the historical and theoretical basis and continuing through an understanding of sustainable building construction, design, development, and renewable energy strategies/management tools and how these can be applied in practice. **Credits:** 3.00

CM 51100 - Energy Conserving Building Retrofit

Credit Hours: 3.00. This course introduces energy related reconstruction of buildings with an emphasis on light commercial buildings. Retrofit topics include: Basic thermodynamics, Energy conserving technologies, Impact of site characteristics, Indoor air quality, Water conservation measures, Measuring and benchmarking energy performance, Cost/Benefit Analysis, Financing energy improvements, as well as Building operation and management to reduce energy and water use. **Credits:** 3.00

CM 51800 - Building Information Modeling And Sustainability

Credit Hours: 3.00. This course explores environmental sustainability in all its forms, starting with the historical and theoretical basis and continuing through an understanding of sustainable building construction, design, development, and renewable energy strategies/management tools. In this course students explore Building Information modeling technology to assess and compare the design impact on the environment.**Credits:** 3.00

CM 52000 - Preconstruction Project Management

Credit Hours: 3.00. Management and control of projects from authorization to start of construction. Project success factors, conceptual and parametric estimating, design planning and management constructability review techniques and value engineering methods. Real estate transactions. Land zoning, platting, development and pro forma calculations. **Credits:** 3.00

CM 52500 - Managing Construction Quality And Production

Credit Hours: 3.00. Advanced techniques for assessing the success of construction project management including schedule cost, safety and quality measurements. Impacts of pre planning, human factors, and communication systems on quality and productivity. Statistical methods for analysis of construction operations. **Credits:** 3.00

CM 52600 - Value Engineering - Functional Analysis Of Systems And Techniques

Credit Hours: 3.00. This course applies value engineering principles and life cycle costs to the built environment with particular focus on the effect of the decisions made in the design, construction, operation and maintenance of the built environment on the quality and cost.**Credits:** 3.00

CM 53000 - Construction Operations And Strategic Management

Credit Hours: 3.00. Principles of construction company business management for U.S. companies. Executive-level construction functions including strategic planning, organizational structure, and ownership structure including succession planning. **Credits:** 3.00

CM 53500 - Construction Accounting And Financial Management

Credit Hours: 3.00. Accounting techniques, financial methods, and financial management for construction firm management. Analysis techniques for contemporary construction company accounting and finance practice with an emphasis on cash flow analysis and cash management. **Credits:** 3.00

CM 53600 - Highway Construction And Quality Control

Credit Hours: 3.00. This course provides students with knowledge of methods, materials, equipment, and procedures in construction of highways. Students will acquire the concepts and applications of quality control and quality assurance in construction of highways. Students will learn to design appropriate work zones to improve efficiency and safety of highway construction. This course will provide graduate students with a much-needed venue to gain the theory, technology, and practice of highway construction, rehabilitation, maintenance, and quality control.**Credits:** 3.00

CM 53800 - Roadway Infrastructure Management

Credit Hours: 3.00. This course provides students with theories and practices of managing roadways to achieve maximum benefit in the system and network level with limited available funds and resources. Students will learn the concepts of roadway performance measures in terms of physical conditions, service levels, and safety. As a graduate level course, this course will introduce basic methods to find optimal solutions for real-world problems and provide graduate students analytical and mathematical tools for effectively conducting research related to problem formulation, optimal decision-making, and maximizing benefits/effectiveness and minimizing costs. **Credits:** 3.00

CM 54000 - Law For Construction Managers

Credit Hours: 3.00. A study of the legal system and its impact on the construction process. The focus is on the legal obligations, rights and remedies pertaining to the construction company. Topics include bidding, contracts, and construction changes. **Credits:** 3.00

CM 54500 - Construction Management Training And Development

Credit Hours: 3.00. Identification, training and development of future company leaders. Mentorship as a required, managerial activity, effective delegation of responsibility, and empowerment of subordinates to take initiative. **Credits:** 3.00

CM 54700 - Collaborative Project Delivery Models And Practices

Credit Hours: 3.00. A project-focused course covering advanced topics on collaborative project delivery models such as Integrated Project Delivery (IPD), Design-Build (DB), and Partnering. Collaborative project delivery methodologies aim to integrate project teams, stakeholders, systems, business structures, and practices to facilitate collaboration at all levels within a project and to produce the most optimal project outcomes. Students will develop and expand their interdisciplinary collaborative team working skills, communication, and understanding of essential elements underlying collaborative project delivery models. **Credits:** 3.00

CM 54900 - Advanced Topics In Mechanical And Electrical Construction

Credit Hours: 3.00. A project-focused course covering advanced topics on mechanical and electrical construction installation practices and processes. This course teaches the student how to plan, organize, and execute mechanical and electrical construction operations. Students will develop and expand their knowledge about mechanical and electrical work sequencing, coordination, commissioning, and relationship to facility operations and management.**Credits:** 3.00

CM 55000 - Risk Management In Construction

Credit Hours: 3.00. Analysis of the depth and breadth of risk in construction. Defining key terms and concepts used in various risk management arenas - legal statutes, precedent and case studies relevant to construction risk management, insurance, and surety bonding. Subjects include: contracts, torts, insurance, surety, safety laws, quality, and risk management models. Analysis of case studies to utilize risk management tools and identify issues and possible approaches. Project risk control including management of foreseeable hazards as well as unforeseen conditions. **Credits:** 3.00

CM 55500 - Construction Leadership And Marketing

Credit Hours: 3.00. Analysis of organizational leadership at the executive level. The goals of this course are to introduce and stimulate thought and discussion of leadership theories, characteristics and behaviors of successful leaders, contextual factors affecting leader effectiveness, dynamics of leader-follower relationships, communication, decision-making and contemporary challenges confronting organizational leaders as well as marketing theory, marketing vs. business development, the marketing process, and an introduction to a construction marketing dashboard. **Credits:** 3.00

CM 56000 - Academic Writing Seminar I

Credit Hours: 1.00. Analysis of the requirements of research reports. Emphasis on research methods and concepts, identifying major issues, academic literature reviews, data collection and presentation methods, and selecting a research topic. **Credits:** 1.00

CM 56500 - Academic Writing Seminar II

Credit Hours: 1.00. Provides a higher level understanding of scholarly writing as it is applied to the individual student's research. Students also learn to present his or her technical work to an audience in a clear, easily understandable form. **Credits:** 1.00

CM 57000 - Analysis Of Research In Construction

Credit Hours: 4.00. Analysis of research and evaluation of research reports. Emphasis on understanding the application of business research procedures including fundamental statistical methods in the solution of a construction industry relevant problem. **Credits:** 4.00

CM 58100 - Workshop In Building Construction Management Technology

Credit Hours: 0.00 to 8.00. Advanced study of technical and professional topics. Emphasis is on new developments relating to technical, operational, and training aspects of industry and technology education.**Credits:** 0.00 to 8.00

CM 59000 - Special Problems In Building Construction Management Technology

Credit Hours: 1.00 to 6.00. Independent study of a special problem under the guidance of a member of the staff. Does not substitute for either M.S. thesis or M.S. project credit. Permission of instructor required**Credits:** 1.00 to 6.00

CM 59800 - Directed MS Project

Credit Hours: 1.00 to 3.00. A formal investigation of a particular problem under the guidance of the advisory committee. Not applicable to a thesis option plan of study. Enrollment during at least two consecutive terms for a total of three credits is required. Permission of instructor required.**Credits:** 1.00 to 3.00

CM 61000 - Urban Built Environment

Credit Hours: 3.00. This provides students with advanced theories and applications of analyzing multiple performance indicators in urban built environments. Students will learn the concepts of energy, environment, human comfort, and mobility performance in urban built environments. This course will offer an overview of various analysis techniques using Geographic Information System, Building Energy Modeling and Simulation, and Spatial Analytics using a programming language. Graduate students will learn problem-solving skills through project-based learning, and how to apply the skills to effectively conduct research related to urban built environment planning, design, and development. Prerequisite: CM 51000. **Credits:** 3.00

CM 62500 - Smart Infrastructure System

Credit Hours: 3.00. Applying advanced cutting-edge technologies to the civil and construction industry to address traditional infrastructure problems is becoming more popular. One of the very hot areas is developing smart infrastructure. How to make our civil infrastructures smarter and more resilient plays a vital role for our society. The first half of this course will cover the fundamental knowledge of some cutting-edge technologies and smart infrastructure including sensing, signal processing, data collection and transmission, and closed-loop control. The second half of this course will focus on smart infrastructure applications including smart bridges, smart grid, smart building and smart railways. This advanced-level course will provide advanced knowledge of cutting-edge technologies to develop smart infrastructure systems. Through this course, student will polish their research skills in different aspects including: conducting literature review, developing their own research idea, implementing their ideas, presenting their work and publishing their results. In addition, at the end of this course, students will be able to implement various types of systems, create smart infrastructure systems and check their performance. Prerequisite: CM 58100.**Credits:** 3.00

CM 63500 - Advanced Facilities Management

Credit Hours: 3.00. This course provides advanced facilities management (FM) practices in the life cycle of the built environment, including core competencies, compliance and standards, operations & maintenance, risk management, sustainability, health & safety, real estate and financial management, human resources management, and workplace and utility management. In addition, FM practices include emergency preparedness, business continuity, leadership, contracts, capital and maintenance planning, outsourcing, procurement, space planning, occupant comfort and productivity, and energy management. The role of the facilities manager in hard (space and infrastructure) and soft services (grounds, custodial, waste management, pest control, parking, workspace management, catering) will be analyzed with case studies emphasizing the need for their integration in the design and construction process. The students will be able to interpret and analyze critical management principles in the operations phase of the built environment by identifying the fundamentals of facilities management theory and practice. Prerequisite: CM 52600.**Credits:** 3.00

CM 63600 - Future-Proof Construction And Infrastructure

Credit Hours: 3.00. The course provides advanced tools and methods to optimize the maintainability, resilience, flexibility and responsiveness of infrastructure and construction so to ensure that these provide an adequate level of service under uncertain future conditions. This includes methods to rigorously quantify the level of service, model the uncertainty over variable parameters, identify maintainable, resilience flexible and responsive design solutions, run simulations to estimate their impact (i.e., costs of interventions and risk on the service) and identify the optimal balance with the costs of construction. Prerequisite: CM 51000.**Credits:** 3.00

CM 63700 - Computer Vision Application For Smart Infrastructure Management

Credit Hours: 3.00. This graduate-level course is for students who major in Construction Management Technology, Construction Engineering and Management, Civil Engineering, and other related majors in the architecture, engineering, and construction domain. Computer vision (CV) technology can play a critical role in constructing and managing built environments (infrastructure systems and facilities). It promises to become even more critical in the next few decades as technologies are more efficient and effective for infrastructure inspection and maintenance. The CV technologies include the principles and utilization of object detection, action recognition, and 3D reconstruction technologies. This course will offer the students the advanced knowledge and ability to come up with a solution for infrastructure and facility management challenges by evaluating current

computer vision technologies. After this course, the students can evaluate appropriate computer vision algorithms and develop frameworks for various infrastructure management problems by creating their own training data sets and models.**Credits:** 3.00

CM 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required.**Credits:** 1.00 to 18.00

CMGT 12000 - Materials And Methods

Credit Hours: 3.00. Introduction to common construction terminology, materials, methodologies, building codes, structural fundamentals, and contract documents related to buildings, industrial facilities, and infrastructure. Field trips to production / fabrication facilities for each type of material (wood, steel, concrete, and masonry).**Credits:** 3.00

CMGT 15000 - Surveying

Credit Hours: 3.00. Fundamental concepts and practical applications related to measurement of vertical and horizontal distances and angles using the tape, level, and total station. Computations of grades, traverses, areas, and curves. Basic concepts and applied use of topography, contours, and topographical maps.**Credits:** 3.00

CMGT 21000 - Quantity Take-Off

Credit Hours: 3.00. Study of methods to estimate material quantities for construction projects. Topics include, interpreting construction drawings, fundamental construction technology, quantity take-offs. Excel and take-off software are used.**Credits:** 3.00

CMGT 25000 - Mechanical And Electrical Systems

Credit Hours: 3.00. Methods for design, construction and inspection of mechanical and electrical systems for buildings. Emphasis on heating and cooling loads, equipment selection, duct and pipe sizing, codes, safety installation, inspection, commissioning, and estimating. Responsibilities of the general contractor for HVAC (heating, ventilating, and air-conditioning), electrical and plumbing work.**Credits:** 3.00

CMGT 26000 - Statics

Credit Hours: 3.00. Forces acting on bodies at rest, including coplanar, concurrent, and non-concurring systems; equivalent force systems and distributed forces. Use of free body diagrams and equations of equilibrium in solving problems for array of determinate structural systems: trusses, pin frames, arches, cables, retaining walls, and beams. Load tracing to examine the overall structural conditions with regards to lateral and gravity loads.**Credits:** 3.00

CMGT 31000 - Cost Estimating

Credit Hours: 3.00. Study of methods to estimate quantities and costs for material, labor and equipment; establishing direct overhead and markups including indirect overhead and profit for a construction project; software applications for estimating; conceptual estimating procedures; and subcontractor qualifications and scope of work.**Credits:** 3.00

CMGT 32000 - Scheduling And Project Control

Credit Hours: 3.00. A study of the planning and control of construction schedules. Topics include Gantt charts, critical path method (CPM) network scheduling, and monitoring and controlling the schedule. Lab work includes the application of MS Project for creating, presenting, revising, updating and controlling construction schedules.**Credits:** 3.00

CMGT 33000 - Contract Administration And Specifications

Credit Hours: 3.00. Study of the contractual organization and administration of a construction project. Topics include, analysis of delivery systems, working with contracts, general and special conditions of the contract, specifications, project communication, payment applications, change orders and close out. Project management software is used.**Credits:** 3.00

CMGT 35000 - Materials Testing

Credit Hours: 2.00. Laboratory and field testing of structural materials to determine their mechanical properties and behavior under load. Materials included are steel, aluminum, concrete, wood, and asphalt.**Credits:** 2.00

CMGT 36000 - Strength Of Materials

Credit Hours: 3.00. Stress-strain relationships of construction materials. Consideration of strength issues related to major classes of engineering materials including steel, concrete, and wood. Composite analysis; shear forces and bending moments in beams. Introduction to analysis and design of steel and wood beams and columns, beam deflections.**Credits:** 3.00

CMGT 38000 - Infrastructure Planning, Engineering, And Economics

Credit Hours: 3.00. Introduction to the planning and analysis of infrastructure projects. The focus will be on the prioritization, stewardship, management and decision-making roles within the division of a large public works agency. This course will cover municipal infrastructure system, infrastructure alternatives, financial and economic analyses, environmental and social impact assessment, uncertainty and risk-benefit analysis, sustainability, and public-private partnerships including numerous case studies.**Credits:** 3.00

CMGT 39000 - Construction Experience III

Credit Hours: 1.00. Supervised pre-professional learning experience that allows students to apply their skills and knowledge in a professional setting. This experience is designed to enhance the student's preparedness for an intended career in the construction profession. A minimum of 400 work-hours is required.**Credits:** 1.00

CMGT 41000 - Equipment And Field Operations

Credit Hours: 3.00. Study of heavy equipment used in construction operations with an emphasis on equipment selection, application, cost, productivity, safety, and economics.**Credits:** 3.00

CMGT 42000 - Safety And Inspection

Credit Hours: 3.00. Study of safety regulations, practices, policies, and procedures required for construction projects. Topics include, accident investigation, record keeping, OSHA reporting requirements, inspections, and hazards. Included is an OSHA safety card.**Credits:** 3.00

CMGT 43000 - Jobsite Management

Credit Hours: 3.00. Examination of construction project management on the jobsite. Topics include, submittals, record keeping, jobsite layout, meetings, negotiations, dispute resolution, labor relations, safety, subcontracting, quality, cost control, waste management, changes, claims, progress payments, and project closeout.**Credits:** 3.00

CMGT 44000 - Project Management Capstone

Credit Hours: 3.00. Students apply the knowledge and skills, acquired during their construction management program of study, to simulate the construction management process on an actual construction project. Includes role playing and a formal oral presentation.**Credits:** 3.00

CMGT 45000 - Structural Systems And Analysis

Credit Hours: 3.00. Analysis of the structural characteristics of common construction materials, including: wood, steel, concrete, masonry, and light gauge metal in order to integrate structural elements into complete structural systems in the construction of modern buildings and structures to withstand gravity, wind, earthquake, and other environmental forces.**Credits:** 3.00

CMGT 46000 - Soils And Foundations

Credit Hours: 3.00. Study of soils and foundations in the construction projects. Topics include, fundamental soil engineering theories, properties of soils, soil classification, compaction, permeability, stress, shear strength, consolidation, and bearing capacity.**Credits:** 3.00

Consumer Science

CSCI 31700 - Computation For Scientific Applications

Credit Hours: 3.00. Prerequisite: N207 or equivalent. This course gives a survey and overview of popular computational software used in multiple scientific domains to support data processing and scientific research. This class focuses on teaching how to use software to efficiently process data in terms of modeling, simulating, visualizing and data-mining. Fundamental concepts related to scientific computing are introduced briefly.**Credits:** 3.00

CSCI 36100 - Fundamentals Of Software Project Management

Credit Hours: 3.00. Tools and techniques used to manage software projects to successful completion. Problem solving focus to learn specification development and management, program success metrics, UML modeling techniques, code design and review principles, testing procedures, usability measures, release and revision processes, and project archival.**Credits:** 3.00

CSR 10000 - Introduction To CSR

Credit Hours: 1.00. A workshop to familiarize students with the CSR department, department majors, advising resources, and major requirements. Special emphasis on basic freshman survival skills. **Credits:** 1.00

CSR 10300 - Introduction To Personal Finance

Credit Hours: 3.00. This course will provide knowledge and skills for young adults to be active, informed, and rational managers of their financial life. The course will particularly address the following 4 areas of personal finance. Managing money: Why it's useful to plan ones financial affairs, budgeting, being an informed manager of ones money and consumer of financial products. Financing large items using savings and credit: Know how credit works, how to use it wisely, and how to avoid over indebtedness. Learn savings strategies to maximize the growth of your money. Using financial markets: What are the different

ways to invest, and how to make them work for you and your objectives (such as retirement). Managing risk: How to use financial tools (such as insurance) to protect yourself against risk. The course will emphasize age-relevant knowledge and practical advice, with the objective to help students make better financial decisions and adopt better financial behaviors for the long term. Typically offered Fall Spring.**Credits:** 3.00

CSR 12800 - Introduction To Apparel Design

Credit Hours: 3.00. This course introduces the fundamentals of the Apparel industry, design, and assembly through lectures, discussions, readings and application in an Apparel laboratory. The student will learn the proper operation of industrial garment production equipment. Further, the course will introduce the manufacturing standards of apparel assembly through garment construction, principles of fit and fiber, and fabric performance. Typically offered Fall.**Credits:** 3.00

CSR 20000 - Professional Development In Consumer Science

Credit Hours: 1.00. Professional Development in Consumer Sciences & Retailing is a required course that will provide the necessary techniques to manage job search skills and career development for both current and future professional needs. The covered topics will expose students to on-campus resources, opportunities to gain key networking skills, and establish their professional identity to better prepare students for the current job market. **Credits:** 1.00

CSR 20100 - Introduction To Professional Sales

Credit Hours: 3.00. Introduction to sales process, business to business communication strategies, and expectations of a sales professional.**Credits:** 3.00

CSR 20900 - Introduction To Retail Management

Credit Hours: 3.00. Retail career paths, management training, merchandise control, organization and service structure, and a comparison of store types. **Credits:** 3.00

CSR 21500 - Textile Industry

Credit Hours: 3.00. Fundamentals of the textile industry addressing the lifecycle of textile products beginning with the source and properties of textile fibers to the steps in the production of textile products and their impact on product performance and consumer satisfaction. Generate an awareness of the global textile industry as it relates to the impact on the environmental and social communities. Emphasis on retail, apparel, and interior design applications. **Credits:** 3.00

CSR 22000 - Apparel Design I

Credit Hours: 3.00. Introductory course that deals with the evolution of apparel design through the principles of flat pattern design, three-dimensional draping, and computer-aided design (CAD for pattern design). Fundamentals for apparel design. Students create designs for a basic, sleeveless, collarless top. **Credits:** 3.00

CSR 22100 - Apparel Design II

Credit Hours: 3.00. Continued development of apparel design from concept to finished product through the application of flat pattern design, draping, and computer-aided design. Building on the introductory course to create apparel wear design that includes sleeves, collars, blouses/shirts, dresses, pants, and skirts. Introduction to pattern grading manually and through CAD, and marker for apparel production. **Credits:** 3.00

CSR 22200 - CAD For Apparel Pattern Design

Credit Hours: 3.00. Study of computer-aided-design for apparel pattern making, pattern grading, and marker making for the manufacture of apparel and other sewn products. Operation of CAD system from Gerber Technology AccuMark PDS & GMS, and PDM (Product Data Management) are incorporated in this course. **Credits:** 3.00

CSR 25500 - Apparel Showcase

Credit Hours: 2.00. Production of annual apparel showcase of apparel original designs and artwork of Apparel Design majors. All students in the Apparel Design major work on teams to produce the annual event. **Credits:** 2.00

CSR 28200 - Customer Relations Management

Credit Hours: 3.00. A course that provides insight into the structure and working of customer relations management and its role in business and government agency. Analysis of how consumer needs, complaints, and education are handled. Customer relations' management in the real world and techniques used in managing customer relations toward the goal of maximizing customer satisfaction. This course has a real-world focus and is more applied than the usual introductory course. **Credits:** 3.00

CSR 30000 - Field Experience In Retail Management

Credit Hours: 1.00. Approved in-service training, a total of 140 hours; development of activities plan; and report of activities. Recommended for semesters 3,4,5, or 6. Advance approval of director and employer and attendance at pre- and post-organizational meeting is required. Permission of instructor required. **Credits:** 1.00

CSR 30700 - Field Experience In Selling And Sales Management

Credit Hours: 1.00. Approved in-service training and supervised work experience in selling and sales management. Total of 140 hours required with in-depth report and analysis of activities. Permission of department required. **Credits:** 1.00

CSR 30900 - Leadership Strategies

Credit Hours: 3.00. Provides knowledge of humanistic processes that contribute to development of effective leadership. **Credits:** 3.00

CSR 31000 - Buying Of Merchandise

Credit Hours: 3.00. Principles of volume buying applicable to department, chain, specialty, and independent stores.**Credits:** 3.00

CSR 31500 - Relationship Selling

Credit Hours: 3.00. This course focuses on long-term relationship selling. The course is organized around a seven-step selling process which has proven to be effective. The course adds to this process some principles of marketing and business strategy. The elements are necessary for the success of professional salesperson both in successful prospecting and making strategic choices as to how to allocate their time within the territory. Important to the learning process is actually practice of principles. Students will do various exercises of principles such as prospecting and negotiation. At the end of the semester, students will hone the skills learned through the semester with a series of role plays designed to put them in position of both seller and buyer.**Credits:** 3.00

CSR 32200 - Field Experience In Apparel Design And Technology

Credit Hours: 1.00 to 3.00. Approved in-service in the apparel industry and any related sewn product company and/or theatrical production. This field experience is intended to provide the opportunity for a student to apply skills and expertise gained through

the study in apparel design courses. Required report of daily responsibilities plus a final report. Minimum of 140 hours of work per credit hour; Required 2 credits minimum. Advanced approval of director and employer; and attendance at organization meeting. Permission of department required. **Credits:** 1.00 to 3.00

CSR 32300 - Visual Merchandising

Credit Hours: 3.00. Creative experimentation, production, and analysis of promotional formats for merchandising of product in a retail setting. Study of the elements and principles of design and their application for promotion of retail merchandise and/or services. **Credits:** 3.00

CSR 32800 - Apparel Art And Design

Credit Hours: 3.00. Exploration and experimentation of creative rendering of apparel design through the use of various media. Opportunity for the students to develop their own unique style of illustrating fashion. **Credits:** 3.00

CSR 33100 - Consumer Behavior

Credit Hours: 3.00. An interdisciplinary survey of consumer behavior theory focused on psychological, sociological, and cultural influences on consumer choice and use of products and services. Credit will not be given for both CSR 33100. **Credits:** 3.00

CSR 33200 - Cross-Cultural Marketing And International Retailing

Credit Hours: 3.00. Examination of marketing/retail practices used to target domestic and global consumer market segments. Development of successful retail and marketing strategies is stressed. **Credits:** 3.00

CSR 34100 - Luxury Brand Management

Credit Hours: 3.00. Students examine the innovation and creativity that foster the development of luxury brands in the current business environment. A key facet of this course is the opportunity to develop unique brand strategies that generate social, aesthetic, quality, and emotional value for luxury consumers. Students learn the ways brands tailor services, products, and experiences to achieve these goals.**Credits:** 3.00

CSR 34200 - Personal Finance

Credit Hours: 3.00. The class covers a comprehensive discussion of investments, consumer credit, insurance and retirement issues. The goal is to show how these components are interconnected in order to create a complete picture of financial health of an individual. CTL:IPO 1811 Personal Finance **Credits:** 3.00

CSR 34400 - Fundamentals Of Negotiations

Credit Hours: 3.00. This course is designed to be relevant to the broad spectrum of bargaining "problems" that are traditionally faced by the manager, sales personnel and financial advisors. The course explores the processes of bargaining and negotiation as social and managerial activities. Special emphasis will be given to the areas of interpersonal and interpersonal and intergroup conflict, in addition to the interpersonal influence techniques and the tactics and strategies involved with improved bargaining and negotiation. The major purpose of the course is for each student to gain insight into his or her own negotiating style and to become a more effective negotiator, as well as a more astute observer of social process. The course will involve extensive use of cases, role-plays, and related participative activities, enhanced by rigorous self-review and introspection. **Credits:** 3.00

CSR 35500 - Apparel Showcase

Credit Hours: 1.00. Planning of annual apparel showcase of apparel original designs and artwork of Apparel Design majors. All juniors and seniors in the Apparel Design major work with co-leaders to plan the annual event. This course will be an avenue to work with special projects as requested by outside interest groups. **Credits:** 1.00

CSR 35700 - Retail Technology: Merchandise Planning And Allocation

Credit Hours: 3.00. The application of software technology in retail merchandising, planning and allocation systems. Builds on basic knowledge of buying functions utilizing industry software, to develop skills needed in higher-order planning and allocation of merchandise. Students apply knowledge and skills through simulations with real-world data.**Credits:** 3.00

CSR 38600 - Risk Management

Credit Hours: 3.00. The course includes principles of insurance, analysis and evaluation of risk exposures, legal aspects of insurance, insurance needs and analysis, policy selection, and insurance company selection and due diligence. Types of insurance that are studied include: property and casualty, health, life, long-term care, disability and general business liability. **Credits:** 3.00

CSR 39000 - Undergraduate Special Problems

Credit Hours: 1.00 to 6.00. Individual participation, supervised reading, laboratory or field experiments, or research in special areas of the field. Permission of instructor required. **Credits:** 1.00 to 6.00

CSR 39100 - Undergraduate Structured Problems

Credit Hours: 1.00 to 3.00. Group participation in an organized class, a structured workshop, or research problem in a particular area of the field. Permission of instructor required. **Credits:** 1.00 to 3.00

CSR 39500 - Special Projects

Credit Hours: 1.00 to 6.00. Individual participation in supervised undergraduate project. Open to qualified upperclassmen. Permission of department required. **Credits:** 1.00 to 6.00

CSR 39700 - Directed Honors Research

Credit Hours: 1.00 to 3.00. Directed independent honors research for CFS Honors Program students. Students must select a faculty advisor for the course. Permission of instructor required. **Credits:** 1.00 to 3.00

CSR 39800 - International Special Topics

Credit Hours: 1.00 to 6.00. Course taken during an International experience that is recognized by the University. Permission of department required. **Credits:** 1.00 to 6.00

CSR 39900 - Undergraduate Special Topics In CSR

Credit Hours: 1.00 to 6.00. Various topics that may change from semester to semester are presented by CSR faculty. Permission of department required. **Credits:** 1.00 to 6.00

CSR 40300 - Retail Management Internship

Credit Hours: 3.00. A supervised full-time internship in retail and related industries. This experience will enable students to further develop their professional interests and skills. Prior field experience and completion of application and pre-approval of internship by internship director and attendance at pre- and post-organization meetings is required. Permission of department required. **Credits:** 3.00

CSR 40600 - E-Retailing

Credit Hours: 3.00. To provide understanding of the technological and retail infrastructure that underlines doing retailing over the internet. Build an understanding of business strategies over the net. To identify management issues and consumer issues in e-retailing. **Credits:** 3.00

CSR 41500 - Sales Force Management

Credit Hours: 3.00. An introduction to sales force management. An examination of the sales force management process, including principles of recruiting and selecting, training, compensation, motivation, supervision, and evaluation. Planning skills, including sales force deployment and the role of the sales force in sales forecasting, are also covered. **Credits:** 3.00

CSR 41600 - Retail Supply Chain Management

Credit Hours: 3.00. Supply chain management is a set of approaches utilized to efficiently integrate all parties of the supply chain to fulfill a request from a customer. Companies like Amazon, Zara, Walmart, Toyota, Dell, and Procter & Gamble are proof that excellence in supply chain management is a must to achieve industry leadership. With increasing competition around the globe, supply chain management is both a challenge and an opportunity for companies. The main goal of this course is to introduce you to the key concepts and techniques that will allow you to analyze, manage and improve supply chain processes for different industries. The course is a combination of lectures, case studies, in-class exercises, and games with the goal of defining key tradeoffs that managers need to understand and evaluate to successfully manage complex supply chains. Quantitative tools designed to evaluate these tradeoffs will be studied and used extensively throughout the course. Topics that will be covered in this course include: Managing inventory, forecasting in supply chains, the optimal design of the supply chain, transportation and distribution, bullwhip effects and dealing with uncertainty, sourcing and supply contracts.**Credits:** 3.00

CSR 41800 - Selling And Sales Management Capstone

Credit Hours: 3.00. A capstone course in advanced professional selling taught in a seminar format and designed to prepare students for the transition from student to professional. Students are introduced to practitioner-focused issues involved in long-term, major B2B account sales and an emphasis is placed on professional presentation skills. Students will complete a senior group research project and a major account sales project. Professional dress code from business-casual to full-business attire required based on the scheduled day-to-day activity. **Credits:** 3.00

CSR 42100 - Apparel Design III

Credit Hours: 3.00. Creation of apparel product line or collection from concept to consumer. Application of principles of apparel design from rendering, technical sketches, pattern design, pattern grading, marker making, and construction of several apparel garments from the line or collection. **Credits:** 3.00

CSR 42300 - Apparel Portfolio/Professional Development

Credit Hours: 3.00. Exploration of employment-seeking skills including cover letters and resume writing, networking, job-seeking organization and interview practice. Creation and development of various forms of computer-generated art for the portfolio including fashion illustration, textile design, storyboards, and line brochures as well as stationary and business card design. **Credits:** 3.00

CSR 48000 - Financial Counseling And Planning Internship

Credit Hours: 1.00. Supervised internship in the financial services industry. The experience will enable students to develop their professional interest and skills. Attendance at a pre-planning meeting required. Permission of department required. **Credits:** 1.00

CSR 48100 - Ethics And Behaviors In Financial Planning

Credit Hours: 3.00. As research in behavioral finance makes increasingly clear, understanding the psychology of financial behaviors is a critical skill for financial planners. Simultaneously, understanding ethical challenges to financial planners' own behaviors, and complying with new and ever more complex regulations, is a key requirement of successful and relevant financial planning and advice-giving. The course will enable students to be better financial planners by reviewing rules of behaviors for financial planners, improving students' capacity to provide fiduciary advice, and enhance their ability to integrate psychological insights into customers' financial behavior throughout the financial planning process. **Credits:** 3.00

CSR 48400 - Consumer Investment And Savings Decisions

Credit Hours: 3.00. A survey of consumer investment alternatives, with emphasis on financial assets. **Credits:** 3.00

CSR 48500 - Case Studies In Financial Planning

Credit Hours: 3.00. Financial planning principles and practice. Course utilizes a case study approach toward financial planning for upper- and middle-income households. Business calculator required. **Credits:** 3.00

CSR 48600 - Retirement Planning And Employee Benefits

Credit Hours: 3.00. Analysis of employee benefit plans, retirement needs analysis, and types of retirement plans including employer-sponsored plans and participant-directed plans. **Credits:** 3.00

CSR 49000 - Independent Study

Credit Hours: 1.00 to 4.00. Independent study. Permission of instructor required. **Credits:** 1.00 to 4.00

CSR 49700 - Honors Research Project

Credit Hours: 1.00 to 4.00. The completion of the independent honors research project for CFS Honors Program students. Must have an approved Honors Project Proposal. Permission of instructor required. **Credits:** 1.00 to 4.00

CSR 50300 - Transitional Health Disparities: Research, Practice, And Policy

Credit Hours: 3.00. This course will provide an overview of quantitative and qualitative research methods, measurement models, and research skills relevant to translational health science and the transfer/translation of knowledge from the research setting to applied practice settings. Course material will place special emphasis on research skills for developing health disparities translational researchers and strategies for being culturally competent, and career-minded in the mediation, cultivation, and development of translational research skills, and the implementation of evidence-based practices. Emphasis is placed on service needs of marginalized populations. Typically offered Fall. **Credits:** 3.00

CSR 58100 - Social Marketing And Social Change

Credit Hours: 3.00. Healthy lifestyle impacts people's quality of life at the individual and population level. Social marketing, as a process, applies marketing principles and techniques to benefit the target audience and the society through its approach for developing programs to promote healthy living. This course aims to equip learners the knowledge, skills, and technologies of social marketing to develop strategies for reaching out to target clients and effectively collaborate with the clients in addressing their behavior of health concern given their unique culture and social environment. Prerequisites: Prior learning of marketing and/or health related subject matters is preferred. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 3.00

CSR 59000 - Special Problems In Consumer Sciences And Retailing

Credit Hours: 1.00 to 4.00. Credit variable. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 1.00 to 4.00

CSR 60000 - Introduction To Research In Consumer Sciences And Retailing

Credit Hours: 3.00. Introduction to research development, evaluation and analysis in the consumer sciences and retail management. Emphasis on preliminary stages of the research process including critical reading, preparation of literature reviews, scholarship standards, and preliminary proposals for research. Required of all graduate students entering CSR. Typically offered Fall.**Credits:** 3.00

CSR 60300 - Advanced Writing For Consumer And Public Health

Credit Hours: 3.00. This course is designed to focus on one of the most essential professional and academic skills: writing. This course will provide resources and support for students to achieve goals in composing public health research-based manuscripts for publication and presentation, skillfully crafting grant applications for internal and external funding, and exploring publishing beyond academic journals. Typically offered Spring.**Credits:** 3.00

CSR 62300 - Design And Analysis Of Public Health Interventions

Credit Hours: 3.00. (HK 67500) Professional competencies in design, implementation, evaluation and diffusion of health interventions in community settings. Program planning paradigms, determinants of health behavior, and behavior change strategies serve as a basis for analyzing health interventions. Typically offered Fall Spring Summer.**Credits:** 3.00

CSR 63100 - Consumer Behavior Theories

Credit Hours: 3.00. An examination of research methods, principles, and theories of social science as they apply to the study of consumer behavior and marketing sciences. Prerequisite: STAT 50100, STAT 50200, or PSY 60000, PSY 60100. Typically offered Fall Spring.**Credits:** 3.00

CSR 68100 - Consumption Theories

Credit Hours: 3.00. Analysis of theories of consumption with emphasis on their relation to current practices and to the history of economic thought. Permission of instructor required. Typically offered Summer Spring.**Credits:** 3.00

CSR 68200 - Analytical Tools For Consumer Economists

Credit Hours: 3.00. Economic and analytical skills needed to interpret and conduct research in family and consumer economics. Focuses on consumer theory and includes theory of the firm, price theory, and welfare economics. Prerequisite: ECON 25100, ECON 25200, and 3 credit hours at the lower division undergraduate level in Economics. Enrolled in Selling & Sales Mgmt, Retail Management, Apparel Design & Tech or Financial Counsel & Planning.**Credits:** 3.00

CSR 69000 - Independent Study In Consumer Sciences And Retailing

Credit Hours: 1.00 to 6.00. Topic and credit to be arranged. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 1.00 to 6.00

CSR 69700 - Final Non-Thesis Paper

Credit Hours: 1.00 to 3.00. The curriculum of consumer behavior and family and consumer economics has evolved in the past decades with the changing market trend to currently encompassing specializations for meeting the diverse and integrated needs of individual consumers, their families, and communities. The non-thesis option is called to respond to the increasing market demand for professionals who are able to solve practical issues in the field in addition to mere epistemological pursuits. This proposed new course is designed for the students from this option to organize their learnings in the option in a way that provides propositions and strategies for addressing their topics of interest. Hence, this course should be taken during the last semester of the student's Master's program. The students will work with their major advisors for the topic and design of the study. Prerequisites: The students should take this course during the last semester of their non-thesis master's program. It is preferably taken after the students have completed the recommended core courses. Permission of Instructor required. Typically offered Fall Spring Summer.**Credits:** 1.00 to 3.00

CSR 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 1.00 to 18.00

CSR 69900 - Research PhD Thesis

Credit Hours: 1.00 to 18.00. Research PhD Thesis. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 1.00 to 18.00

Critical Disability Studies

CDIS 23900 - Introduction To Disability Studies

Credit Hours: 3.00. Introduces students to the principles of and debates within disability studies. Topics explored include ideas of normalcy; the social model of disability; history of eugenics and its current manifestations; relations between disability and other identity categories; issues of social and physical access; cultural representations of disabled people. **Credits:** 3.00

CDIS 29000 - Special Topics In Critical Disability Studies

Credit Hours: 3.00. Various topics in critical disability studies, changing from semester to semester as presented by different instructors.**Credits:** 3.00

Dance

DANC 10100 - Modern Dance Technique I

Credit Hours: 2.00. An introduction to the techniques and principles of modern dance. Typically offered Fall Spring.**Credits:** 2.00

DANC 10200 - Ballet I

Credit Hours: 2.00. An introduction to the techniques and principles of classical ballet. Typically offered Fall Spring.**Credits:** 2.00

DANC 10300 - Jazz Dance I

Credit Hours: 2.00. An introduction to the principles of jazz dance techniques: alignment, isolations, rhythmic patterns, and basic locomotion. Typically offered Fall Spring.**Credits:** 2.00

DANC 20100 - Modern Dance Technique II

Credit Hours: 2.00. A continuation and refinement of the modern dance techniques and principles addressed in DANC 10100. Typically offered Fall Spring.**Credits:** 2.00

DANC 20200 - Ballet II

Credit Hours: 2.00. A continuation of the principles and techniques of classical ballet addressed in DANC 10200. **Credits:** 2.00

DANC 20300 - Jazz Dance II

Credit Hours: 2.00. A continuation and refinement of the jazz dance concepts and movement vocabulary addressed in DANC 10300. **Credits:** 2.00

DANC 23000 - Biomechanics Of Dance, Movement and Strength

Credit Hours: 2.00. This course will provide conceptual and experiential understanding of biomechanical approaches to dance technique. Through studio, lecture, movement exercises and assignments, the students will learn to perform all types of dance and movement with ease, strength and economy of motion. Typically offered Fall Spring.**Credits:** 2.00

DANC 24000 - Dance Composition

Credit Hours: 3.00. An introduction to the theory and practice of the principles and utilization of choreographic tools; movement exploration, manipulation of basic dance elements, development of movement themes, and application of compositional dance forms. Typically offered Fall Spring.**Credits:** 3.00

DANC 24500 - Practicum In Dance Performance And Production

Credit Hours: 1.00 to 2.00. Open through audition. The study and practice of dance rehearsal, performance and basic concert production techniques, culminating in a main-stage dance concert. Permission of instructor required.**Credits:** 1.00 to 2.00

DANC 26000 - Dance Improvisation

Credit Hours: 3.00. In this course students explore a variety of techniques for creating movement. While physically researching concepts from a broad spectrum of improvisational artists, students expand their boundaries and definitions of dance, art and creativity. Important concepts include choice making, moving from internal motivations, and ensemble collaboration. All backgrounds in dance and movement are welcome, and will benefit from this course.**Credits:** 3.00

DANC 26100 - Contact Improvisation

Credit Hours: 3.00. This course is both a physical practice and philosophical exploration of the techniques and underlying premise of this contemporary partner dance form. CI training involves a practice of movement improvisation while developing the body's ability to attend to the effects of gravity, muscle tone, and anatomical structures on dancing solo and in partnership. While increasing their body awareness, respect, sensitivity and connection, students learn about collaborative community creativity, which can be applied in other settings including design, performance, and social activism. DANC 26000 is a good preparation for this course, but not required. Course may be repeated for credit. **Credits:** 3.00

DANC 30000 - Performance Production

Credit Hours: 3.00. This course teaches many aspects of producing a performance, from backstage to onstage. Students will learn the technical aspects of creating a professional performance by both observing performance production and developing an actual performance, which this semester is the Xperimental 2024 Concert. Students may participate in the production in a variety of active roles; however, they will be exposed to all aspects through observation, participation, and discussion. Production roles include: director and assistant director, choreographer, performer, lighting design and staging, sound design and technical support, and stage crew (stage manager, house manager, ticket manager, setup and strike support). Occasional class sessions cover skills to enhance your knowledge of some areas of production such as sound design, and lighting technology. For many students who are at the university level, the art of performance is defined almost totally by the act of being on stage performing, in studios or on stages. This course is designed to invite students to learn about all the activities that are done behind the scenes in order for live performances to be presented to an audience. We will discuss what is involved in both large institutional performance spaces, and compare this to our university performance. Then we will discuss what this scenario looks like for performance professionals after college. This course will greatly enhance students' ability to produce their own events in the future, and develop greater appreciation for the collaborative nature of live performance as art form. **Credits:** 3.00

DANC 30100 - Modern Dance Techniques III

Credit Hours: 2.00. A continuation and refinement of the modern dance techniques and principles addressed in DANC 20100 . Emphasis placed on expressive qualities of movement. Typically offered Fall Spring.**Credits:** 2.00

DANC 34500 - Choreography

Credit Hours: 3.00. This course focuses on methods and practices of choreographing contemporary dance works. It teaches the choreographic process: how to create original movement and expand and build both solo and group dance works. Basic compositional elements of exploring and manipulating movement and structuring choreographed material are utilized. The development of production elements are taught to support choreographic intent. Highly recommended before enrolling in this course: DANC 24500 and DANC 30100. Typically offered Fall Spring.**Credits:** 3.00

DANC 34600 - Intermediate Choreography

Credit Hours: 1.00 or 2.00. A study of selected principles underlying the design of group performance in modern dance. Permission of instructor required. Typically offered Fall Spring.**Credits:** 1.00 or 2.00

DANC 35000 - Dance For The Camera

Credit Hours: 3.00. An introduction to technical and aesthetic techniques to create screendance or dance film, with an emphasis on camera use, editing techniques, development and production of choreographic projects designed specifically for film format.**Credits:** 3.00

DANC 35100 - Intermedia Dance Technology

Credit Hours: 3.00. An introduction to dance and intermedia within the choreographic process. Integration of movement and various forms of technology which might involve digital images, film, animation, programming, sensors, sound, lighting and/or robotics.**Credits:** 3.00

DANC 36800 - Dance Sound Design

Credit Hours: 1.00. The study and application of sound design for dance, with emphasis on creation of sound scores for Modern Dance concerts. Instructor permission required. Typically offered Fall Spring.**Credits:** 1.00

DANC 37800 - Survey Of Concert Dance History

Credit Hours: 3.00. This course is a broad a survey of concert dance history predominately in the 20th and 21st century in Western cultures. The direct relationship and influence of the culture, training, choreographic, and performative records of dance practices, to socio-political ideologies of gender, race, sexuality, and national identities will be the area of investigation. Students will read, watch, research and actively participate in discussion regarding important dance figures, movements, eras, and their social and cultural reverberations. Dance's relationship to other art practices throughout history will also be a subject of lecture and discussion. Typically offered Fall Spring.**Credits:** 3.00

DANC 37900 - The Art Of Protest: An Examination Of The Role Of Arts, Artists, Activism, & Social Transformation

Credit Hours: 3.00. Throughout history, art has been used to advocate for political movements and provoke social action and transformation. This course examines the role of the arts and the artist and their relationship to activism throughout history and beyond. We will investigate how art has been used as a tool to transform cultural perspectives, alter policies, and promote social change. We will explore a range of artists whose methodologies, materials and approach challenge the cultural norms. From printmakers to musicians, to choreographers, to performance artists, students will engage and evaluate the act of art-making as a tactic of resistance and the responses to those acts. We will investigate readings that argue for and against the need for artists to make work that politically challenge their society. Once a foundation of knowledge has been laid, we will turn to the creative process through an investigation of materials and practices -performance, mixed media, and photography. Students will research, watch, discuss, create, and perform their own projects that promote social transformation. **Credits:** 3.00

DANC 49000 - Special Problems In Dance

Credit Hours: 1.00 to 3.00. Individual readings, topics, or projects in dance. Permission of instructor required. Typically offered Fall Spring.**Credits:** 1.00 to 3.00

Earth Atmospheric and Planetary Sciences

EAPS 1000N - Earth And Our Environment

Credit Hours: 3.00. An introduction to geology through discussion of geological topics that show the influence of geology on modern society. Topics include mineral and energy resources, water resources, geologic hazards and problems, geology and health, and land use.**Credits:** 3.00

EAPS 1110N - How The Earth Works

Credit Hours: 3.00. Introduction to processes within and at the surface of the earth. Description, classification, and origin of minerals and rocks. The rock cycle. Internal processes: volcanism, earthquakes, crustal deformation, mountain building, plate tectonics. External processes: weathering, mass wasting, streams, glaciers, ground water, deserts, coasts. With laboratory GEOL G1200, equivalent to IU GEOL GEOL G1030, IU GEOL GEOL G1110, and PU GEOS 11100.**Credits:** 3.00

EAPS 10000 - Planet Earth

Credit Hours: 3.00. An introduction to the Geosciences-Earth science, oceanography, atmospheric science and astronomy. The course emphasizes topics (earthquakes, volcanoes, ocean pollution, climate change, severe weather, etc.) that are of general interest and relevance, and the interconnections between various Earth processes. Typically offered Fall Spring. CTL:IPS 1730 Earth Science**Credits:** 3.00

EAPS 10400 - Oceanography

Credit Hours: 3.00. Origin of the oceans and marine life. Seafloor spreading and marine geology; currents, waves, and tides; marine organisms and ecology; beaches and nearshore life. Man's use and abuse of the sea, including contemporary problems and future opportunities. The role of oceans in climate and evolution of the biosphere. Typically offered Fall Spring Summer.**Credits:** 3.00

EAPS 10500 - The Planets

Credit Hours: 3.00. This course is designed for science and non-science majors alike to learn about the origin and characteristics of the bodies in our Solar System, including planets, moons, asteroids, comets, exoplanets beyond, and the search for extraterrestrial life. We'll discuss how solar systems form and die, the origin of the terrestrial versus giant planets and their orbits, the evolution of planetary surfaces due to asteroid impacts and volcanism, the development of atmospheres, the formation of planetary rings, the origin of moons, the hazards of space travel, and why Pluto IS a planet.**Credits:** 3.00

EAPS 10600 - Geosciences In The Cinema

Credit Hours: 3.00. This course is designed for science and non-science majors alike to learn about natural hazards based on the depictions of such hazards in movies. Topics include earthquakes, tsunamis, volcanoes, tornadoes, hurricanes, climate change, asteroid impacts, space exploration, and wildfires. The course focuses on the accuracy of the depiction of natural hazards in the movies, the underlying processes that control their formation and the dangers they represent, how they influence society, and how students can prepare for them and keep themselves safe. **Credits:** 3.00

EAPS 10900 - The Dynamic Earth

Credit Hours: 3.00. This course covers the formation and development of the solid earth, atmosphere, hydrosphere, and biosphere. The course studies the whole earth as a system of many interacting parts and focuses on the changes within and between these parts. This course is intended for all majors in earth and atmospheric sciences. Typically offered Fall.**Credits:** 3.00

EAPS 11100 - Physical Geology

Credit Hours: 3.00. Geologic processes and the development of land forms. Laboratory covers the study of minerals and rocks, the interpretations of topographic and geologic maps, and field investigations. Typically offered Summer Fall Spring. CTL: Physical Geology**Credits:** 3.00

EAPS 11200 - Earth Through Time

Credit Hours: 3.00. The history of the planet Earth from its beginnings to the present. This course will explore the causes and effects of processes that have changed the Earth's surface and subsurface through time, the impacts of these changes on the evolution of life, and how scientist interpret Earth history from the geologic record. The laboratory will provide hands-on experience in interpreting various geologic and fossil records. This course may be taken on its own, or as a year-long lab series with EAPS 11100. EAPS 11100 and EAPS 11200 will fulfill the two course sequence laboratory experience outside the major department. Typically offered Spring.**Credits:** 3.00

EAPS 11600 - Earthquakes And Volcanoes

Credit Hours: 3.00. A survey class on earthquakes and volcanoes. Topics include earthquake hazards and forecasting, the use of seismic waves to investigate the earth's interior, volcanoes and tectonics, volcanic hazards, and the influence of volcanoes on climate. Examples of recent and historic earthquakes and volcanic eruptions are presented. Typically offered Spring.**Credits:** 3.00

EAPS 11700 - Introduction To Atmospheric Science

Credit Hours: 3.00. The weather/climate system. Solar variability and Milankovitch Theory. Atmospheric scales of motion. Chemistry of greenhouse gases and aerosols. Fundamental laws of meteorological dynamics and radiation. Weather systems, air masses and fronts. Severe storms, hurricanes and tornadoes. (Required for atmospheric sciences majors.). Typically offered Spring.**Credits:** 3.00

EAPS 11800 - Introduction To Earth Sciences

Credit Hours: 3.00. Introduction to a range of topics in Earth Science, including: Origin and geological history of Earth, including geological records of climate and evolution; Earth materials (minerals and rocks); Chemical and physical composition and structure of the Earth; Rock weathering, erosion, and sedimentary processes; Geological timescale; Geologic structures including their map and field expression; Tectonic processes; The hydrological cycle with emphasis on groundwater and physical and chemical oceanography; Energy and mineral resources; Astrobiology. (Required for Geology and Geophysics and Earth and Space Science Teaching majors.) Typically offered Spring.**Credits:** 3.00

EAPS 12000 - Introduction To Geography

Credit Hours: 3.00. Introduction to the major themes of modern geography, designed to enhance your spatial thinking skills, geographic literacy, and to help you understand the relevance of geographic concepts and how they relate to our changing world. This course will expand your awareness of global issues and provide you with tools to understand how the world around you changes at local, regional, and global scales.**Credits:** 3.00

EAPS 12500 - Environmental Science And Conservation

Credit Hours: 3.00. (AGRY 12500, FNR 12500, NRES 12500) Introduction to environmental science and conservation includes topics in ecological principles, conservation and natural resource management, human impacts on the environment, toxic waste disposal, climate change, energy, air and water pollution, environmental geology and geologic hazards. Typically offered Fall Spring.**Credits:** 3.00

EAPS 12900 - Earth System Dynamics

Credit Hours: 3.00. Provides foundational knowledge and critical thinking skills to discuss the Earth's changing climate and environment and their impacts. Introduces how the components of the Earth system - atmosphere, hydrosphere, lithosphere, and biota -- interact with each other in response to various forcings. Course is designed to enhance learners' geospatial-temporal thinking skills and geoscience literacy, as well as analyze some of the 'what if' scenarios using a 'systems approach'. Typically offered Fall Spring Summer.**Credits:** 3.00

EAPS 13700 - Freshman Seminar In Earth, Atmospheric, And Planetary Sciences

Credit Hours: 1.00. Seminar presented by guests in different fields of the Earth and Atmospheric Sciences to expose students to the range of topics included in the department and in possible career paths. Typically offered Fall Spring.**Credits:** 1.00

EAPS 13800 - Thunderstorms And Tornadoes

Credit Hours: 3.00. Not open to juniors and seniors majoring in atmospheric science. An elementary treatment of the physical structure of the atmosphere and the dynamical conditions that lead to the development of convective clouds, thunderstorms, and severe weather (including tornadoes, hail, wind, rain, lightning, and flash floods). This course will also focus on storm climatology, the socioeconomic impact of severe weather, as well as prediction, detection, warnings, and safety procedures. Analysis of severe weather events will include tornado movies and case studies of ground/aerial surveys of storm damage. Typically offered Fall.**Credits:** 3.00

EAPS 19100 - Introductory Topics In Earth And Atmospheric Science

Credit Hours: 1.00 to 3.00. Introductory special topics in earth and atmospheric sciences. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 1.00 to 3.00

EAPS 20000 - Water World: Processes And Challenges In Global Hydrology

Credit Hours: 3.00. Introduction to the Hydrological Sciences designed for undergraduate students. Course uses an Earth-systems approach to emphasize the interconnections and feedback between the hydrosphere, geosphere, biosphere, and atmosphere. Course topics will include: global water-balance, techniques for measuring components of the water-balance, hydrological uncertainties, groundwater, surface-water, vadose zone, forest and watershed hydrology, global change hydrology, human and climate impacts on water resource, and water on the worlds. Typically offered Fall Spring Summer.**Credits:** 3.00

EAPS 20500 - Fundamentals Of Planetary Science

Credit Hours: 3.00. This course provides a quantitative understanding of the fundamental principles that govern the behavior of planetary systems, including their atmospheres, surfaces, interiors, and orbital dynamics. This course is intended to be a quantitative follow-on to EAPS 10500, and aims to provide students with hands-on experience with physics-based problem solving, scientific programming, and developing research projects. Lecture periods will include lectures as well as group work on problems, and lab periods will focus on programming projects in Python. By the end of the course, students will have a strong foundation in the principles and techniques of planetary science and be well-prepared to engage in upper-year courses and conduct planetary science research. It is recommended that students have completed EAPS 10500 The Planets, PHYS 17200 Modern Mechanics or equivalent, and have some previous programming experience (preferably in Python).**Credits:** 3.00

EAPS 22100 - Survey Of Atmospheric Science

Credit Hours: 3.00. (NRES 23000) An introductory course for both science and nonscience students. A general study of the atmosphere, basic meteorological principles, and weather systems. Relationships of the changing atmosphere to climate ozone depletion, and other contemporary issues. Typically offered Summer Fall Spring.**Credits:** 3.00

EAPS 22500 - Science Of The Atmosphere

Credit Hours: 3.00. This course provides a quantitative introduction to how to use the laws of physics to understand the behavior of the Earth's atmosphere. Emphasizes key processes that govern the climate system and the weather phenomena that arise within it. Topics covered may include the Earth's energy balance, heat transfer, the greenhouse effect, atmospheric convection, precipitation, the general circulation, the Coriolis effect, atmospheric chemistry, weather systems, weather forecasting, and climate change. **Credits:** 3.00

EAPS 22700 - Introduction To Atmospheric Observation And Measurements

Credit Hours: 3.00. Survey of principal techniques, tool, and instruments used in atmospheric science research. Students work on research projects designed in coordination with EAPS faculty. Topics are complimentary to those covered in EAPS 22500 and may include either observational analysis, numerical modeling, or both. Topics to be covered include hypothesis formulation, literature search, training on the necessary instruments and numerical modeling tools, experiment design and execution, statistical analysis, student-designed experiment revision, scientific writing, and presentation of findings to the class and interested EAPS faculty.**Credits:** 3.00

EAPS 23000 - Laboratory In Atmospheric Science

Credit Hours: 2.00. A laboratory course that introduces the fundamentals of atmospheric science through quantitative exercises. The theoretical exercises include the vertical structure of the atmosphere, the Earth's energy budget, atmospheric moisture, saturation and stability, clouds and precipitation and atmospheric motion. Data and map analysis exercises include mid-latitude cyclones, thunderstorms and tornadoes, hurricanes and controls of climate. Prior or current course work in introductory atmospheric science is required. This course may not be taken for credit by students in the atmospheric science option of the Department of Earth and Atmospheric Sciences.**Credits:** 2.00

EAPS 23001 - Laboratory In Atmospheric Science: Introduction To Weather And Climate Datasets

Credit Hours: 2.00. This course is a Python-based introduction to the array of weather and climate datasets freely available on the internet in an online computational laboratory setting. The course will emphasize the importance of having data be freely available and "FAIR" (Findable, Accessible, Interoperable, Reusable) from the point of view of the philosophy of science, from a data science perspective, and from a practical "how to do it" perspective.**Credits:** 2.00

EAPS 24300 - Mineralogy

Credit Hours: 4.00. Elements of crystallography, physical and chemical properties of rock-forming minerals, and minerals of economic importance. Origin and occurrence of minerals. Prior course work in dynamic earth or physical geology is required.**Credits:** 4.00

EAPS 24400 - Earth Materials II

Credit Hours: 4.00. The study of common igneous, sedimentary, and metamorphic rocks. The origin and occurrence of rocks, weathering, and alteration processes. Prior course work in earth materials or mineralogy is required. Typically offered Spring.**Credits:** 4.00

EAPS 30100 - Oil!

Credit Hours: 3.00. Petroleum is a common thread that interweaves Geoscience with the Political-Economic history of the 20th century. Its dominance in current society has major repercussions on our current and future society and environment. The unequal distribution of petroleum and natural gas, coupled with innovative geologists and engineers, has set the stage for the modern geo-political world. This course is a unique survey into the multitude of aspects of petroleum -- from its formation to "resource wars". Typically offered Fall.**Credits:** 3.00

EAPS 30900 - Computer-Aided Analysis For Geosciences

Credit Hours: 3.00. Application of computer analysis techniques including error analysis, line and surface fitting, spatial and temporal correlations, contouring, interpolation, and map projections. These methods are discussed in terms of specific geologic applications. All exercises and examples are developed using commercial mathematical software package. A three-hour-per-

week computer laboratory tutorial provides hands-on experience with the techniques discussed in class. Prior course work in computer programming is required.**Credits:** 3.00

EAPS 31000 - Introductory Statistics For Geosciences

Credit Hours: 3.00. Introductory course in statistics and quantitative reasoning for students in geosciences. Topics covered include probability distributions of discrete and continuous random variables, simulation, confidence intervals and hypothesis tests for one and two samples, inference for regression and correlation. Typically offered Fall Spring.**Credits:** 3.00

EAPS 31201 - Earth Systems Science For Elementary Teachers

Credit Hours: 3.00. An Earth Systems Science perspective draws upon the wealth of Earth systems science research in both content and pedagogy. This approach has served as a guiding framework for how students learn, engage in, and develop deep understandings of the interconnections among Earth's many different systems of geosphere, hydrosphere, atmosphere, and biosphere and the important role that human civilization plays in affecting Earth's other systems. This course takes an Earth Systems Science approach - an emerging transdisciplinary endeavor - to build students' understanding of the structure and functioning of the Earth as a complex, adaptive system.**Credits:** 3.00

EAPS 31500 - Biogeochemistry

Credit Hours: 3.00. The course examines the main element cycles of Earth: carbon, oxygen/hydrogen, nitrogen, sulfur, phosphorous, and trace metals, and how they are interconnected from terrestrial, aquatic/ocean, and atmospheric perspectives. General chemistry concepts such as equilibrium, free energy, electrochemistry are used to understand the energetics of the cycles. Connection between the cycles and environmental problems, such as climate change and air pollution will be emphasized. Typically offered Fall or Spring.**Credits:** 3.00

EAPS 31900 - Exploring Earth Through Time

Credit Hours: 3.00. The course will explore the history of the Earth from its beginning 4.5 billion years ago to the present. Our understanding and insight into the history of the Earth has greatly expanded during the last several decades. Emphasis will be placed on the relationships of tectonic processes that shaped the surface of the Earth and the evolution of the Earth's biosphere. The course will also examine how the role of evolution of life has played in the history of the atmosphere and oceans. Typically offered Spring.**Credits:** 3.00

EAPS 32500 - Aviation Meteorology

Credit Hours: 3.00. This course is designed for students who have an interest in topics in meteorology applied to aviation operations with emphasis on meteorological hazards for instrument flight. Topics covered include obtaining and evaluating weather data, review of synoptic meteorology, map analysis, the ICAO standard atmosphere, pressure and altimetry, atmospheric thermodynamics, moisture and stability, low-IFR operations, aircraft icing, turbulence, thunderstorms and associated hazards, and interpretation and use of radar and satellite imagery. Prior course work in introductory atmospheric science and pre-calculus is required. Typically offered Spring.**Credits:** 3.00

EAPS 32700 - Climate, Science And Society

Credit Hours: 3.00. This course will examine the broad problems of climate change by examining the relationship between science, politics, and society by using climate change as a lens through which to examine larger issues. Students will be encouraged to identify similar themes in their own experiences as emerging scientists, engineers and global leaders. Adequate preparation to write essays and perform basic arithmetic calculations needed. Prior knowledge of climate change science is not necessary. Typically offered Fall Spring.**Credits:** 3.00

EAPS 34400 - Igneous And Metamorphic Petrology

Credit Hours: 4.00. This course provides an overview of igneous and metamorphic petrology including, but not limited to, the following topics: experimental petrology and phase diagrams, melting of the Earth's interior, understanding the relationship between mineralogy, chemical composition, and physical conditions, relating magmatism and metamorphism to different tectonic environments, and exploring the similarities, and differences, between magmatism on Earth and other planetary bodies. The lectures and labs emphasize developing a basic understanding of petrology and petrologic processes, rather than the simple memorization of terms, definition, and facts.**Credits:** 4.00

EAPS 35200 - Structural Geology

Credit Hours: 3.00. This course deals with the nature and evolution of structures in rock deformed naturally by flow and fracture, as deduced from experimental, theoretical and field studies. Specific topics include: structures in three dimensions using descriptive geometry and stereonets, field measurements of rock geometry, tensors, strain and stress, the theory of brittle and plastic rock behavior, theory and field observation of folds and faults, structural analysis of an outcrop, the structure and mechanics of mountain belts. Students will be expected to show competency with using a general set skills, techniques, and tools commonly used by professional geoscientists. Typically offered Spring.**Credits:** 3.00

EAPS 35300 - Earth And Planetary Surface Processes

Credit Hours: 3.00. Introduction to a variety of topics in sediment transport and deposition, emphasizing linkages between active processes, landscape evolution, and the rock record. Comparisons will be made between surface processes occurring on Earth and other planetary bodies in the Solar System. Topics include: introductory fluid mechanics; sediment transport by water, ice, and wind, and the development of fluvial bed forms, glacial landscapes, and sand dunes; groundwater geochemistry and the development of karst and caves; impact cratering; comparative planetology. Each major topic is accompanied by field projects that emphasize local geologic history. **Credits:** 3.00

EAPS 35400 - Earth And Planetary Geophysics

Credit Hours: 3.00. This course will explore geophysical processes from the scales of individual stresses that deform rocks, to plate motions, to planetary-scale interiors and phenomena. Emphasis will be focused on sources of stress and how this stress is manifested, heat transfer, and fluid processes. Seismic waves, gravity data, planetary shape, and what information they provide about the interior of solid planets will be discussed. The course material will be applied to Earth, other rocky worlds like the Moon and Mars, and icy moons like Europa and Enceladus. This course is an introduction to geophysical processes and serves as a stepping-stone to upper level geophysics courses such as EAPS 35200, EAPS 45000, and EAPS 55700.**Credits:** 3.00

EAPS 36000 - Great Issues In Climate Change And Society

Credit Hours: 3.00. This course develops basic skills and knowledge critical to analyze issues of energy use, climate change, and sustainability that incorporate both societal and scientific perspectives. The goal of this course is not to arrive at particular consensus solutions to the problems associated with these issues but instead to foster an informed (through information literacy) debate that will ultimately be waged as solutions are sought. Working in teams the students work throughout the semester to complete a capstone teamwork project and a group presentation. Counts for Great Issues course in College of Science.**Credits:** 3.00

EAPS 36400 - Natural Hazards: Science And Society

Credit Hours: 3.00. This course will investigate the role of data and science in policy and decision-making as it relates to natural hazard resiliency. The scientific fundamentals of specific hazards will be introduced along with an explanation of how available data, various policies, programs, and real-time decisions can impact a community's response and recovery from disasters. Guest speakers describe their role in specific disasters, and in framing the policies and decisions made in the aftermath of the natural

hazards. This course counts as a Great Issues course in the College of Science for Juniors and Seniors. Typically offered Spring.**Credits:** 3.00

EAPS 36700 - Survey Of Planetary Atmospheres

Credit Hours: 3.00. This course is intended to serve as an introduction to the diversity of planetary atmospheres in our solar system and beyond for those without an atmospheric science background. Topics to be covered in this class include: The basic structure and properties of an atmosphere, how planetary atmospheres form / are eroded, the balance of radiation and its effect on atmospheric motions, the presence and formation of hazes, clouds, and aerosols, fundamental atmospheric compositions and chemistry, the connections between planetary interiors, surfaces, and atmospheres, and how we measure and interpret observations of exoplanet atmospheres. To achieve this, we will learn about Earth's atmosphere and us our terrestrial template to compare, contrast, and explore the atmospheres of other astronomical bodies.**Credits:** 3.00

EAPS 37500 - Great Issues - Fossil Fuels, Energy And Society

Credit Hours: 3.00. Prosperity of the 20th century was based on abundant and cheap energy; during the 21st century we will be faced with difficult challenges. Our society will face higher energy prices, decline of petroleum based fuels supplies, increased environmental effects of fossil fuels usage, and the challenge of solving the technological problems of developing alternative fuels. This course will review the structure, economics, and geopolitical issues faced by fossil fuel industries and the mitigation strategies that will be needed to change to low fossil fuel use society based on low polluting renewable energy sources. Counts for Great Issues course in College of Science for Juniors and Seniors. Typically offered Fall Spring.**Credits:** 3.00

EAPS 38500 - Principles Of Engineering Geology

Credit Hours: 3.00. Application of geology to evaluation of design and construction problems relating to dams, highways, tunnels, and reservoirs; review of construction material sources and their utilization. A field investigation is required. Prior course work in mineralogy, petrology or geology for engineers is required. Typically offered Spring.**Credits:** 3.00

EAPS 39000 - Geologic Field Methods

Credit Hours: 3.00. Introduction to geologic mapping principles on quadrangle (7 1/2 min., 15 min., 1:250,000 scales) maps. Application of aerial photography, GPS, and GIS techniques. Emphasis on construction of cross sections, measurement of stratigraphic sections, and preparation of geologic reports. Several weekend field exercises will be required. Typically offered Spring.**Credits:** 3.00

EAPS 39100 - Topics In Earth And Atmospheric Sciences

Credit Hours: 1.00 to 4.00. Intermediate special topics in the earth and atmospheric sciences. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 1.00 to 4.00

EAPS 39500 - Astrobiology

Credit Hours: 3.00. Course explores current ideas on how life originated on Earth and may have originated elsewhere in the universe. Lectures will cover zones of habitability in stellar systems, planetary surface and atmosphere evolution and the environment of the early Earth. Topics include how life on Earth functions and its earliest evolution, SETI, planetary quarantine, panspermia, mass extinctions and the potential for life elsewhere in our own solar system. Typically offered Fall.**Credits:** 3.00

EAPS 40000 - Planetary Sciences Senior Capstone

Credit Hours: 3.00. In this course, students will use the knowledge they have gained as part of their education at Purdue to develop a comprehensive science-driven planetary exploration strategy. First, students will review the history of planetary exploration. Next, students will understand the current landscape for planetary exploration including missions and instruments which will soon fly. Throughout the course, student-led research and presentation exercises will build to the development of a mission concept for planetary exploration.**Credits:** 3.00

EAPS 41900 - Internship In Environmental Geosciences

Credit Hours: 1.00 to 6.00. This course provides students with an opportunity to gain practical work experience in environmental geoscience. The student works with a faculty advisor to set up an internship consisting of the equivalent of at least six weeks of full-time employment with a government agency, business, or consulting company. Internships typically involve field, laboratory, and office work. A portion of the internship may be part-time work during a regular semester, but at least three consecutive weeks must be full-time work. One credit hour per week of unpaid internship. Six week internship. Prior course work in upper level EAPS courses is required. Permission of department required. Typically offered Fall Spring Summer.**Credits:** 1.00 to 6.00

EAPS 42000 - Global Change Modeling

Credit Hours: 3.00. Understanding, monitoring, and modeling global environmental change. Each session examines the response of the interrelated earth systems to different geological, ecological, atmospheric, oceanic, or societal impacts. Topics include global warming, major biogeochemical cycles, atmospheric ozone, coevolution of life and climate, asteroid impacts, and ecological disruptions. The laboratory uses object-oriented modeling software and current NASA satellite data. No prior knowledge of computer programming is required. Typically offered Spring.**Credits:** 3.00

EAPS 42100 - Atmospheric Thermodynamics

Credit Hours: 3.00. (AGRY 43100) Structure and composition of the atmosphere. Thermodynamics of dry and moist air, including adiabatic and pseudo-adiabatic processes, hydrostatic stability, and air mass determination. Prior course work in introductory atmospheric science, second semester physics or thermodynamics is required. Typically offered Fall.**Credits:** 3.00

EAPS 42200 - Atmospheric Dynamics I

Credit Hours: 3.00. (AGRY 43200) A study of the general system of equations governing mass and momentum changes in the atmosphere; special horizontal wind representations, thermal wind relationships; circulation, vorticity, divergence, and vertical motion. Prior course work in atmospheric thermodynamics and differential equations is required. Typically offered Spring.**Credits:** 3.00

EAPS 42300 - Atmospheric Dynamics II

Credit Hours: 3.00. (AGRY 43300) An extension of EAPS 42200, with emphasis on perturbation theory and hydrodynamics stability, air mass and frontal theory, barotropic and baroclinic models, wave cyclone theory, and numerical weather prediction. Typically offered Fall.**Credits:** 3.00

EAPS 42501 - Physics Of Climate

Credit Hours: 3.00. To understand climate we describe and synthesize physical processes in the atmosphere and their coupling to the ocean, ice, and land. We quantitatively explore climatology with an equal balance of physical principles and scrutiny of available modern data. Topics include: visualization of atmospheric/land surface/oceanographic climatological data sets; theories of climate dynamics; and climate change. Beginning with radiative balance and simple energy balance models, the course progresses toward understanding the effects of radiative-convective forcing and rotation on the fluid envelopes. Analysis of data

in an interactive computer-enabled environment is an important part of the course. By the end of this course, the student should know how the Earth System behaves at large scales and grasp the physical understandings of why.**Credits:** 3.00

EAPS 43100 - Synoptic Laboratory I

Credit Hours: 1.00. (AGRY 44100) Analysis of vertical distributions of temperature and moisture with applications to adiabatic and pseudo-adiabatic processes, hydrostatic stability, and air mass determination. Prior course work in atmospheric thermodynamics is required. Typically offered Fall.**Credits:** 1.00

EAPS 43200 - Synoptic Laboratory II

Credit Hours: 1.00. Analysis of horizontal distributions of pressure, temperature, wind, vorticity, and vertical motions. Applications to synoptic-scale wave propagation. Prior course work in atmospheric thermodynamics and synoptic lab I is required. Typically offered Spring.**Credits:** 1.00

EAPS 43300 - Synoptic Lab III

Credit Hours: 1.00. (AGRY 44300) Diagnoses of midtropospheric wave propagation and growth. Analysis of surface pressure fields and fronts and their relationships to upper air features. Extensive use is made of teletype and facsimile weather information. Prior course work in atmospheric dynamics and synoptic lab II is required. Typically offered Fall.**Credits:** 1.00

EAPS 43400 - Weather Analysis And Forecasting

Credit Hours: 3.00. (AGRY 44400) In-depth study of contemporary weather analysis and forecasting techniques and problems. Extensive use is made of teletype and facsimile data and numerical weather prediction guidance provided by the National Meteorological Center. Typically offered Spring.**Credits:** 3.00

EAPS 44500 - Spacecraft Design

Credit Hours: 3.00. Senior students perform a team-based spacecraft design, requiring application of the education and skills developed in the planetary sciences curriculum. Components include analysis methods for preliminary design, development of an initial spacecraft and mission concept, and development of a complete numerical model of the mission, culminating in oral and written reports by the teams. Typically offered Fall, Spring.**Credits:** 3.00

EAPS 44600 - Geochemistry

Credit Hours: 3.00. This course provides an overview of the processes controlling the distribution of elements within the solid Earth as well as the hydrosphere and atmosphere.**Credits:** 3.00

EAPS 45000 - Physics And Chemistry Of Solid Earth

Credit Hours: 4.00. Physics of the earth's interior, including seismic velocity and density structure, seismic wave propagation, and gravitational and magnetic fields. Thermal history of the earth. Chemical and mineralogical composition of the earth, radioactivity, isotopes, and geochronology. Magma generation, crustal evolution, and tectonic models. Prior course work in chemistry, physics, calculus, earth materials, and plate tectonics is required. Typically offered Fall Spring.**Credits:** 4.00

EAPS 47400 - Sedimentary Geology

Credit Hours: 4.00. Systematic study of continental and marine depositional environments. Interpretation of sedimentary facies, structures, and microfacies. Principles and applications of stratigraphy, including applications of paleontology, field relations, paleomagnetism, well logs, seismic reflections, and chemistry. Field investigations may be required. Prior course work in earth materials, mineralogy and petrology is required.**Credits:** 4.00

EAPS 47500 - Geology And Geophysics Field Camp - Wasatch-Uinta Field Camp

Credit Hours: 6.00. The Wasatch-Uinta Field Camp is a six-week capstone course designed to prepare students for successful careers in the geosciences. This course emphasizes scientific methodology and traditional techniques that provide a strong foundation for the broad range of modern technologies used by today's industry, academic, government and private workforces. Students learn to develop research strategies, collect field observations and measurements, compile detailed rock descriptions, measure stratigraphic sections, and construct geologic maps and cross sections. Field exercises are located in geologically ideal locations in the Wasatch and Uinta mountains of Utah, the San Rafael Swell of southeastern Utah, Grand Teton National Park in Wyoming, and the Carlin-type gold deposits of Nevada. The Wasatch-Uinta Field Camp was established in 1967 by the University of Minnesota. The camp is operated by a consortium that currently includes Purdue University, the University of Minnesota-Duluth, University of Wisconsin-Madison, the University of Nebraska, and the University of Illinois.**Credits:** 6.00

EAPS 49000 - Field Geology In Rocky Mountains

Credit Hours: 6.00. Field studies in sedimentary, igneous, and metamorphic terrains. Studies may involve geologic mapping, stratigraphic section measuring, structural analysis and interpretation, geomorphic interpretation, and interpretation of geologic history. Field excursions include visits to several classical geologic localities in the Colorado Plateau, Great Basin, and Rocky Mountains with discussions and interpretations of features observed. Transportation fee plus room and board at field station required. Rigorous field work requires physical conditioning. Six-week session, including field excursion. Prior course work in earth materials, surface processes, and plate tectonics is required. Permission of instructor required.**Credits:** 6.00

EAPS 49700 - Earth And Atmospheric Sciences Undergraduate Readings And Research

Credit Hours: 1.00 to 6.00. Supervised reading and/or research in various fields. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 1.00 to 6.00

EAPS 50300 - Mars Seminar

Credit Hours: 3.00. This seminar course will introduce students to the origin and evolution of Mars through reading classic papers on the geology, atmosphere, and Interior of Mars, as well as in-class lectures, discussions, and a final paper.**Credits:** 3.00

EAPS 50400 - Geologic Dating Methods

Credit Hours: 3.00. This course covers general theory and applications of geochronology and thermochronology to questions in Earth and planetary science.**Credits:** 3.00

EAPS 50600 - Cosmochemistry And Geochemistry

Credit Hours: 3.00. The course focuses on the chemical processes involved in the formation and evolution of our solar system and our planet. The course includes discussion of nucleosynthesis and chemical abundances, the origin and composition of various planetary objects and their constituent materials, and the distribution and cycling of elements within and between different Earth systems, including the solid Earth, atmosphere, and oceans.**Credits:** 3.00

EAPS 50700 - Introduction To Analysis And Computing With Geoscience Data

Credit Hours: 3.00. Course teaches computing techniques including error analysis, line and surface fitting, interpolation, map projections, geospatial and temporal correlations, signal processing, and visualization with discussions on specific and practical geoscience applications. Lectures with computer exercises and team project reporting using open-source computer software. Cannot get credit for both EAPS 50900 and EAPS 50700.**Credits:** 3.00

EAPS 50701 - Geospatial Data Analytics

Credit Hours: 3.00. The course will introduce fundamental theories, analytical methods and programming skills that are needed to work with geospatial data. Students will learn the theories, methods, and techniques to visualize, analyze and model various geospatial data through hands-on computer programming practice based on various open-source geospatial libraries. To be specific, the course will use R and its related packages as the basic tool for implementation. The goal is to enable the learners to develop their own geospatial analytical applications. **Credits:** 3.00

EAPS 50801 - Geographic Information Systems

Credit Hours: 3.00. This course covers a range of fundamentals in geographic information science and technology. Students will learn the use of current popular geographic information system (GIS) tools to handle various geographic data. Through working on real-world geospatial problems, students shall gain extensive and hands-on experience in geographic data manipulation, visualization, and analysis. Course assignments are focused on both GIS theoretical basics and practical skills for students to achieve expected proficiency. The course will work with geospatial data in geography, topography, environmental science, hydrology, transportation, and geosocial science. It is targeted to students with interest in civil and environmental engineering, agriculture, geography, earth science, natural resources, smart cities or other related subjects. **Credits:** 3.00

EAPS 50900 - Data Analysis Techniques In Earth And Atmospheric Sciences

Credit Hours: 3.00. Application of statistical techniques to analyze and interpret data containing substantial information about the dynamics of our planet Earth. Emphasis on fundamentals with elements of atmospheric/climate time series analysis and weather and climate extremes (necessary for understanding current research) interwoven with computer-intensive bootstrap methods (which work for complex data sets typical in geosciences). Offered Spring.**Credits:** 3.00

EAPS 51000 - Climate Time Series Analysis

Credit Hours: 3.00. This course in time series analysis combines traditionally taught basics with topics of central importance in current weather and climate research, including long memory, extremes, nonlinear time series, chaos and complexity. Typically offered Fall Spring.**Credits:** 3.00

EAPS 51201 - Planetary Origins

Credit Hours: 3.00. The goal of this course is to introduce students to our current understanding of how planetary systems form and evolve. We will focus on the physical theories describing how the structures of planetary systems develop and how planets, moons, and other heavenly bodies form. We will also consider the relationship between these theories and observations (astronomical, geophysical, cosmochemical) of the Solar System and extrasolar planetary systems. This will include some discussion how the Solar System fits into our understanding of the veritable menagerie of planetary systems. **Credits:** 3.00

EAPS 51400 - Glacial And Quaternary Geology

Credit Hours: 3.00. Formation, dynamics, and regimen of glaciers. Erosional and depositional processes and landforms developed by alpine and continental glaciation. Glaciation of North America during the Ice Age, with emphasis on stratigraphy, soils, climates, biology, and physical changes resulting from glacial processes and environments. Application of glacial studies to agronomy, life sciences, climatology, oceanographic studies, and engineering problems. A one-day field investigation is required. Typically offered Spring.**Credits:** 3.00

EAPS 51500 - Geodata Science

Credit Hours: 3.00. Course covers a range of topics with applications of mathematical, statistical, numerical, and distributed parallel computing methods for modeling and understanding complex and large spatio-temporal geoscience datasets in the formats common to in-situ observations, asynoptic remote sensing data, volumetric gridded analysis, etc. Typically offered Fall Spring.**Credits:** 3.00

EAPS 51800 - Soil Biogeochemistry

Credit Hours: 3.00. This course will provide an introduction to the physical and microbial processes governing the cycling of photosynthetically-produced organic matter on land and in streams and rivers. Organic geochemical transformations in the soil and litter will be highlighted along with methods of characterization of the organic constituents. Biogeochemical concepts of stabilization and destabilization of soil organic matter and stress response of terrestrial ecosystems will be reinforced through manipulation of actual data sets.**Credits:** 3.00

EAPS 52000 - Theory Of Climate

Credit Hours: 3.00. A general introduction to the theory of climate at an intermediate level. A brief survey of physical climatology and paleoclimates. Theoretical development of climate models. Theories of climatic stability and climatic change.**Credits:** 3.00

EAPS 52100 - Atmospheric Chemistry

Credit Hours: 3.00. An introduction to the chemistry of the earth's atmosphere. Covers evolution of the earth's atmosphere, its physical and chemical structure, its natural chemical composition and oxidative properties, and human impacts, including increasing tropospheric ozone, decreasing stratospheric ozone, climate change, and acidic deposition. Typically offered Fall.**Credits:** 3.00

EAPS 52300 - Radar Meteorology

Credit Hours: 3.00. Origin and evolution of radar. Modern weather radar systems and their component parts. Propagation of microwave energy in the atmosphere. Rayleigh and Mie scattering theory, with application to scattering by precipitation. Utilization of radar systems in forecasting quantitative analyses and cloud physics research. Recent refinement and future potential. Prior coursework in synoptic meteorology labs and atmospheric physics is required. Typically offered Fall Spring.**Credits:** 3.00

EAPS 52400 - Laboratory Analysis

Credit Hours: 3.00. This course focuses on becoming familiar with various laboratory techniques used in the analysis of earth and planetary materials and understanding what questions data products from these techniques can answer. This course will include discussion of the instruments and how they operate, as well as provide hands-on experience working in the lab and processing data. **Credits:** 3.00

EAPS 52500 - Boundary Layer Meteorology

Credit Hours: 3.00. (AGRY 53500) A study of the physical nature of the lowest layers of the atmosphere. The energy balance concept and the turbulent transfer of heat, momentum, and water vapor are discussed in detail. Some specific microclimates are studied in this context. Typically offered Fall.**Credits:** 3.00

EAPS 52600 - Introductory Geofluid Dynamics

Credit Hours: 3.00. Provides a fluid dynamics background for graduate students interested in atmospheric sciences, oceanography, mantle convection, hydrology, turbulence, or pollution. Topics covered include: basic assumptions and deviations of Navier Stokes equations, conservation laws, vorticity, divergence, waves, and applications in atmosphere, ocean, and geophysics. Typically offered Spring Summer.**Credits:** 3.00

EAPS 52700 - Principles Of Terrestrial Ecosystem Ecology

Credit Hours: 3.00. The objective of this course is to build a conceptual model of terrestrial ecosystems and to provide students with the state-of-the-art mechanisms by which terrestrial ecosystems work. Topics include ecosystem concept, Earth's climate system, geology and soils, terrestrial water and energy balance, terrestrial production processes, terrestrial decomposition, terrestrial plant nutrient use and cycling, biogeochemical pathways, and ecosystem temporal and spatial dynamics. Permission of instructor required. Typically offered Spring.**Credits:** 3.00

EAPS 52900 - Modeling Ecosystems And Biogeochemical Cycles

Credit Hours: 3.00. Process-based models are powerful tools for studying ecosystem dynamics and geochemical cycles in Earth System Sciences. In this course, we will explore how various components of ecosystems can be modeled following principles of biology, physics, and chemistry. We will also examine techniques for using modeling to study: 1) responses of the structure and functioning of ecosystems to changing climate, atmospheric composition, environmental conditions, and human activities; and 2) exchanges of major greenhouse gases (e.g., CO2, CH4, and N2O) between the atmosphere and the biosphere. During the course, we will go through the whole cycle of system modeling approach including model conceptualization, formulation, parameterization, sensitivity and uncertainty analysis, verification, and application. Typically offered Fall.**Credits:** 3.00

EAPS 53000 - Extreme Weather And Climate: Science And Risk

Credit Hours: 3.00. Trains students in the analysis of risk due to meteorological hazards, including climate change. Focus on integrating the basics of probability theory, including calculation of hazard return periods and exceedance curves, with the fundamental physics of meteorological hazards. Hazards may include hurricanes, tornadoes, and floods. Typically offered Fall Spring Summer.**Credits:** 3.00

EAPS 53200 - Atmospheric Physics I

Credit Hours: 3.00. Cloud and precipitation physics and basic atmospheric radiative transfer. Introduction to computer-aided problem solving.**Credits:** 3.00

EAPS 53300 - Atmospheric Physics II

Credit Hours: 3.00. A continuation of EAPS 53200, covering the following selected advanced topics in atmospheric physics: gaseous absorption, Mie scattering, the equation of transfer, and radiative transfer in cloudy and hazy atmospheres. The application of radiative transfer in active and passive remote sensing. Advanced topics in atmospheric thermodynamics, such as heterogeneous systems, kinetic theory of gases, and planetary atmospheres. Basic ozone photochemistry applied to stratospheric and tropospheric pollution. Typically offered Fall.**Credits:** 3.00

EAPS 53400 - Tropical Meteorology

Credit Hours: 3.00. This course tackles the observed structure of the Earth's tropical atmosphere and the core theories that explain this structure and its variability. Topics include the 3D annual and seasonal mean state, the energy budget, the Hadley cell, monsoons, the Walker cell, equatorial waves, ENSO, convective aggregation, easterly waves, and tropical cyclones. **Credits:** 3.00

EAPS 53500 - Atmospheric Observations And Measurements

Credit Hours: 3.00. A course that introduces students to direct and remotely sensed observations of the atmosphere. Directly measured quantities discussed include temperature, pressure, moisture, wind, solar radiation, chemical properties of the atmosphere, etc. Remote sensing of cloud, precipitation, and air motion by weather radars, satellites, profilers, lidars, and other emerging technologies is reviewed. Students will gain experience in observation techniques and data interpretation, and will learn uncertainty and error assessment. Prior course work in atmospheric science and statistics is required. Typically offered Fall.**Credits:** 3.00

EAPS 53600 - Introduction To General Circulation

Credit Hours: 3.00. This course provides an overview of the general circulation of the atmosphere and oceans. Topics include: global energy balance, hydrological cycle, atmospheric general circulation and climate, ocean general circulation and climate, history and evolution of Earth's climate, climate sensitivity and feedback mechanisms, global climate models, natural climate change and anthropogenic climate change. Typically offered Fall Spring.**Credits:** 3.00

EAPS 53900 - Mesoscale Meteorology

Credit Hours: 3.00. Review of the theories applied in mesoscale meteorology, including semi-geostrophic systems and frontogenesis, symmetric instability, rainbands and inertia-gravity waves, sea-breeze, terrain effects, mountain waves, lee-vortices and cyclogenesis, convection, convective instability, low-level jets, drylines, and squall lines. Prior course work in synoptic labs and vector calculus is required. Typically offered Fall Spring.**Credits:** 3.00

EAPS 54000 - Introduction To Geodesy

Credit Hours: 3.00. Course offers an introduction and overview of theory, techniques, data sources, and applications of geodesy. Provides understanding of how various geodetic techniques work and how they can be used to investigate a number of geological, atmospheric, and related problems. Evaluation of the robustness and quality of data as well as assessment of models and conclusions derived from geodetic methods. Typically offered Fall Spring.**Credits:** 3.00

EAPS 54100 - Geodetic Data And Applications

Credit Hours: 3.00. This course will provide students with hands-on experience in the selection, processing, and analysis of geodetic data sets, particularly InSAR and GPS. Students will learn how to select data, evaluate its strengths and weaknesses, process and analyze the data, and apply it to the investigation of geological problems. Typically offered Fall Spring.**Credits:** 3.00

EAPS 54200 - Economic Geology: Petroleum

Credit Hours: 3.00. Fundamental principles of the origin, migration, accumulation, exploration, and development of petroleum. Study of reservoir fluids, reservoir mechanics, and primary and secondary production techniques. Methods of prospect and leasehold evaluation and economic appraisal. Offered in alternate years. Typically offered Fall Spring.**Credits:** 3.00

EAPS 55000 - Advanced Geophysical Field Studies.

Credit Hours: 1.00 to 3.00. Individual geophysical field investigations including organizing, conducting and reducing, and interpreting data under the guidance of a staff member. Permission of instructor required. Typically offered Fall Spring.**Credits:** 1.00 to 3.00

EAPS 55501 - Numerical Modeling Of Planetary Orbits

Credit Hours: 3.00. The goal of the course is twofold. First, you will develop quantitative skills to understand the orbital motions of planets and minor bodies in planetary systems, both in our solar system and in exosolar systems. Second, you will develop practical skills and techniques for using computers to solve scientific problems. We will begin with classical analyses of the two-body and N-body problems. We will then learn about modern, powerful, analytical and numerical techniques. We will then see how these techniques are applied to solving real problems in understanding the origin and evolution of planetary systems. These problems will include understanding planet formation, planet migration, resonance dynamics and resonance capture, tidal evolution of planets and natural satellites, and the collisional evolution of small body populations. Permission from instructor required. **Credits:** 3.00

EAPS 55600 - Planetary Surface Processes

Credit Hours: 3.00. The application of petrology and structural geology to other planets. Topics include: theories of star and solar system formation, orbital dynamics and Kepler's laws, petrology and geochemistry of meteorites, age dating techniques, structure and composition of the terrestrial, giant, and icy planets, planetary surfaces, planetary atmospheres, and theories of the formation of the moon. Offered in alternate years. Prior course work in earth materials is required.**Credits:** 3.00

EAPS 55700 - Introduction To Seismology

Credit Hours: 3.00. Theory of propagation to seismic waves in elastic media. Solution of wave equations for compressional, shear, and surface waves. Analysis of travel-times, amplitudes, and attenuation of seismic waves in terms of ray and wave theory. Principles of the seismograph. Structure of the earth as determined by seismological studies. Investigation of the causes, effects, distribution, and characteristics of earthquakes. Earthquake prediction. Typically offered Fall.**Credits:** 3.00

EAPS 55900 - Topics In Seismology

Credit Hours: 1.00 to 3.00. This course covers current topics in seismology. Recent topics have included seismic structure of the crust and mantle, seismic anisotropy, and earthquake sources. Professor Nowack. Permission of instructor required. Typically offered Fall Spring.**Credits:** 1.00 to 3.00

EAPS 56700 - Planetary Atmospheres

Credit Hours: 3.00. This course is intended to for upper-level undergraduates and graduate students and will provide an in-depth look into the to the diversity of planetary atmospheres in our solar system and beyond. Topics to be covered in this class include: The processes by which atmospheres are constructed and eroded over plants lifetime, radiative balance, general circulation, the formation of hazes, clouds, and aerosols, atmospheric compositions and chemistry, the link between planetary interiors, surfaces, and atmospheres, how we measure and interpret observations of exoplanet atmospheres, and much more. To achieve this, we will briefly introduce the properties and components of an atmosphere, visit the planetary atmospheres in our solar system to learn more, and finally explore exoplanetary atmospheres. **Credits:** 3.00

EAPS 57300 - Basin Analysis

Credit Hours: 3.00. Advanced study of tectonic evolution and stratigraphic history of sedimentary basins. Topics include formative mechanisms of different sedimentary basins; tectonic, eustatic, and climatic controls on basin stratigraphy; relationship of depositional systems to basin types; subsidence and thermal histories; and application of basin analysis to petroleum reservoir and ground water aquifer assessment. Required field trips. Offered in alternate years. Prior course work in sedimentology and stratigraphy is required. Typically offered Fall.**Credits:** 3.00

EAPS 57700 - Remote Sensing Of The Planets

Credit Hours: 3.00. Introduction to key planetary and Earth science satellite remote sensing datasets, including visible and thermal imagery, visible through mid-infrared spectroscopy, radar, gamma ray and neutron spectroscopy, and laser altimetry.

Students will receive hands-on-experience with data acquisition, image processing in IDL, spectral analysis in ENVI and Davinci, crater counting, and geologic mapping in GIS programs. Includes 1-2 full-day field trips. Junior, Senior, or Graduate status required. Recommended minimum background for undergraduates: Introductory knowledge of Earth or planetary surface processes and basic programming skills. Typically offered Fall Spring.**Credits:** 3.00

EAPS 58000 - Geodynamics

Credit Hours: 3.00. This course will provide students with a first order understanding of geophysical processes by developing analytical solutions to a variety of geophysical and planetary thermo-mechanical problems. Topics will include stress and strain, rheology, elasticity and flexure, faulting, and conductive heat transfer, and fluid mechanics. We will develop governing analytical equations based on first order principles, such as the conservation of mass, energy, and momentum, and solve these equations for a number of boundary conditions. Typically offered Fall, Spring.**Credits:** 3.00

EAPS 58300 - Geology Of Landfills

Credit Hours: 3.00. This course consists of the application of the geological sciences to the siting, exploration and site evaluation for solid waste disposal landfills, plus the evaluation of existing landfill facilities as they pertain to soils, bedrock, stratigraphy, landforms, geologic processes, and hydrogeology. Included are soil and rock exploration, laboratory testing, installation of ground water monitoring devices, and evaluation of contaminant transport. Both attenuation and confinement landfill systems are considered. Geological aspects of solid waste disposal regulations are reviewed and compared to those for hazardous waste disposal. Classroom discussions include evaluation of specific landfill examples and a semester project on a landfill evaluation. A one-day field investigation is required. Typically offered Fall.**Credits:** 3.00

EAPS 58400 - Hydrogeology

Credit Hours: 3.00. Investigates the qualitative and quantitative aspects of ground water location, occurrence, movement, evaluation, and development, and the influence of man upon this resource. Geologic and engineering aspects of ground water systems are discussed. Classroom teaching is complemented by problem sets and field trips. Typically offered Fall.**Credits:** 3.00

EAPS 58801 - Impact Cratering

Credit Hours: 3.00. Impact cratering is arguably the most pervasive geologic process in the solar system. In this course, we will study the physical process of impact cratering and its place in planetary science. The course will take a process-oriented approach to understanding impact cratering with firm foundations in geologic observation and impact experiments. To explore the extreme process of impact cratering, we will use continuum/rock mechanics, thermodynamics, numerical modeling, experiments, and observations. Principal topics will include the formation of craters from contact of the projectile to final crater morphology; shock metamorphism; impact ejecta and products; cratered terrains; impacts and planetary evolution; and impact hazards. **Credits:** 3.00

EAPS 59000 - Field Geology North America

Credit Hours: 2.00. Advanced study of tectonic evolution and stratigraphic history of specific geologic provinces. Particular emphasis on the relationship between tectonics, basin development, and sedimentation. Field component deals with application of field techniques used in basin analysis and structural studies. A 10-day field trip is required. Permission of instructor required. Typically offered Spring.**Credits:** 2.00

EAPS 59100 - Advanced Topics In Earth And Atmospheric Sciences

Credit Hours: 0.00 to 18.00. Specialized study offered on an individual basis or through specially arranged courses. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 0.00 to 18.00

EAPS 60000 - Writing Successful Science Proposals

Credit Hours: 3.00. This course is designed to teach graduate students the skills necessary to successfully garner extramural graduate, postdoctoral, and project funding. Topics will include identification of funding sources and development of research objectives and strategies. Emphasis will be on writing concise fellowships and full NSF-type research proposals. Class meetings will be interactive with an emphasis on peer review. Each student will complete a quality research proposal based upon their own research. Any graduate student with a nascent idea for a science or engineering project is encouraged to enroll. We have found that this course works especially well to help newer MS or PhD graduate students develop a research project, improve communication with their advisor, and organize their research priorities regardless of whether they use this course to submit a proposal. Typically offered Fall Spring.**Credits:** 3.00

EAPS 60200 - New Graduate Student Seminar

Credit Hours: 3.00. This course will provide students with the tools to succeed as a graduate student in the Department of Earth, Atmospheric, and Planetary Sciences, which include good communication with their advisors, graduate fellowship proposal writing, giving good talks and posters, giving and receiving critical reviews, an understanding of regulations and graduate timelines, formulating a plan of study, and resources available to help graduate students succeed. Permission of instructor required. **Credits:** 3.00

EAPS 62000 - Aerosols, Clouds And Climate

Credit Hours: 3.00. An exploration of the complex relationships between aerosols, clouds and climate, including the so-called "direct effect" of aerosol on the radiation balance and their numerous influences upon relevant cloud properties called "indirect effects", the impact of different cloud types upon incoming solar radiation and outgoing longwave radiation, the effects of anthropogenic aerosol and climate change on precipitation efficiency, and the representation of aerosol, clouds and cloud processes in climate models. Typically offered in alternating years Fall Spring.**Credits:** 3.00

EAPS 65000 - Advanced Topics In Geophysics

Credit Hours: 3.00. Specialized topics in geophysics such as heat flow, rock magnetism, and marine geophysics; varied depending on interest. Permission of instructor required. Typically offered Fall Spring.**Credits:** 3.00

EAPS 65200 - Folding Of Rocks

Credit Hours: 3.00. Theory and application of finite strain to the study of folded rocks, with numerous illustrations from literature. Presentation of modern theories of folding and density instability of single- and multi-layered rocks, with special emphasis on basic folding mechanisms. Treatment of linear viscous and power-law fluids. Second- and third-order analysis of causes of basic fold forms, such as concentric, chevron and kink folds, and mullion structure. Causes of drag folds and reverse drag folds. Offered in alternate years. Typically offered Fall.**Credits:** 3.00

EAPS 65300 - Fracturing Of Rocks

Credit Hours: 3.00. Description and analysis of joints and faults from the point of view of field geology and fracture mechanics. Three basic modes of fracture and their analogs in the Earth's crust. Also examined are structures, such as folds, pressure solution surfaces, basins, and mountain ranges associated with faults. Offered in alternate years. Prerequisite: differential equations. Typically offered Spring.**Credits:** 3.00

EAPS 65700 - Geophysical Inverse Theory

Credit Hours: 3.00. Investigates problems of determining physical parameters of the earth from remote observations of wave and potential fields. The theoretical topics include spectral and singular value decompositions, maximum likelihood and stochastic inversion, Backus and Gilbert theory, Green's function and linear operators, and the physics of layered media. Geophysical applications include seismic tomography, deconvolution, gravity and magnetics, earthquake sources, geodetics, and remote sensing. Offered in alternate years. Prior course work in advanced differential equations, physics, and chemistry of the earth is required. Typically offered Spring.**Credits:** 3.00

EAPS 68000 - Contaminant Hydrogeology

Credit Hours: 3.00. Covers the basic theory and applications of problem-solving exercises in hydrogeology, fluid mechanics, and chemistry of contaminated sites; flow and transport equations and models; investigational methods; remediation methods; case studies; and pertinent environmental laws. Prior course work in chemistry, computer programming, differential equations, and hydrogeology is required. Typically offered Spring.**Credits:** 3.00

EAPS 69100 - Colloquium In Earth, Atmospheric, And Planetary Sciences

Credit Hours: 1.00. This course is intended to expose students to the wide range of topics studied throughout the Department of Earth, Atmospheric, and Planetary Sciences, allows for interactions with outside experts and networking, and provides the opportunity for students to synthesize high level topics that may not be directly related to their scientific endeavors.**Credits:** 1.00

EAPS 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 1.00 to 18.00

EAPS 69900 - Research PhD Thesis

Credit Hours: 1.00 to 18.00. Research PhD Thesis. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 1.00 to 18.00

Economics

ECON 270EN - Introduction To Statistical Theory In Economics And Business

Credit Hours: 3.00. Describing populations and samples; introduction to inference, including confidence intervals and hypothesis testing; correlation and simple and multiple regression; Chi-square, non-parametric, test of independence. Uses a popular statistical package for demonstrating and solving statistical problems.**Credits:** 3.00

ECON 510 - Applied Game Theory

Credit Hours: 2.00. Game theory is a powerful tool that facilitates a decision making process of individuals. Games are characterized usually by two or more players where any player's action has an impact on other player's payoff. Players are decision making units, e.g. individuals, firms, workers, managers, countries etc. Game theory analyzes situations in which people (or other animals) interact by breaking these situations down into basic descriptions of the set of players, the strategies available to these players, and the payoffs that the players receive for different combinations of strategy choices. Permission of department required.**Credits:** 2.00

ECON 573 - Financial Econometrics

Credit Hours: 2.00. This course offers an introduction of basic principles of econometric analysis that will help students understand finance theories and their empirical applications. It will also equip students with appropriate statistical techniques for doing applied financial research. The statistical techniques are particularly well suited for analyzing financial time-series data. Permission of department required. Typically offered Spring**Credits:** 2.00

ECON 574 - Microeconometrics

Credit Hours: 2.00. This is a graduate-level course in microeconometrics. This course is primarily related to the specification and estimation of various models commonly encountered in microeconomic applications. The course will first briefly cover the theory of maximum likelihood estimation (MLE), and apply MLE in some introductory settings. These methods will then be applied to various latent-variable economic models including binary choice models (the logit, probit, and other alternatives), censored regression models (e.g., the tobit) and models for count data. Permission of department required. Typically offered Fall.**Credits:** 2.00

ECON 590 - Problems In Economics

Credit Hours: 1.00 to 4.00. Open only to a limited number of seniors and graduate students. Arrange with instructor before enrolling. Supervised reading and reports in various subjects. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 1.00 to 4.00

ECON 2510N - Introduction To Microeconomics

Credit Hours: 3.00. An analysis of evolution of market structure using the analytical concepts of supply and demand, opportunity cost, and marginal analysis. Applications include a variety of concurrent microeconomic issues.**Credits:** 3.00

ECON 2520N - Introduction To Macroeconomics

Credit Hours: 3.00. An introduction to macroeconomics which studies the economy as a whole; the level of output, prices and employment, how they are measured and how they can be changed; money and banking; international trade; and economic growth.**Credits:** 3.00

ECON 16500 - The Marketplace Of Economic Ideas Honors

Credit Hours: 3.00. Every day, every one of us makes choices and engages in social interactions, including exchange. We do this within a context of institutions - formal rules and informal norms that shape our incentives. The outcomes that emerge, and the value we create in the process, depends on those institutions and incentives. Economics is a broad and diverse body of ideas that helps us understand those everyday choices and the kinds of outcomes they generate. We will explore these economic ideas and the ways that institutions affect outcomes, from informal social norms all the way to big questions of social organization such as the contrast between capitalism and socialism. Our main method of exploring economic ideas will be communicating those ideas - through writing, video, and other multimedia approaches; we will build and deepen our understanding of economic ideas in society by explaining them, applying them, and sharing them with others. Course readings will include work by some of the most eloquent and effective economics communicators over the past 250 years up to today. Typically offered Fall.**Credits:** 3.00

ECON 21000 - Principles Of Economics

Credit Hours: 3.00. This course presents the principles upon which the social science of economics is based. Specifically, it examines how individuals, firms, and the government interact through markets. It also examines several important macroeconomic issues including unemployment, inflation, international trade, and economic growth. Students are expected to be able to apply these economic principles to analyze current events, work decisions, and personal choices. Typically offered Fall Spring Summer.CTL:ISH 1040 Introduction To Economics**Credits:** 3.00

ECON 21900 - Economics For Future Elementary Teachers

Credit Hours: 3.00. A principles of economics course designed for future elementary and social studies teachers. The purpose of this course is to: 1) introduce the future teacher to basic economic concepts required by the Indiana Academic Standards for Social Studies, K-6, 2) learn methods for teaching these concepts in the K-6 curriculum, and 3) develop a catalog of curriculum materials appropriate for teaching economics in grades K-6. No credit for management students. Typically offered Fall Spring.**Credits:** 3.00

ECON 21910 - Economics For Future Secondary Teachers

Credit Hours: 3.00. Upon completion of this course students will be able to analyze economic events in order to make more intelligent choices as consumers, workers, and voting citizens; identify and understand the basic concepts and principles of economics in order to meet standards at the secondary school level; identify supplemental materials and programs from variety of sources used in your teaching major, minor or as supplements in your classrooms; and review and organize lessons that teach economic concepts. No credit for management students. The course content is principles-level economics and is designed for social studies education students who are beginning their sequence of required economics courses. The course is designed to be taken before upper-division economic content courses. Typically offered Fall Spring.**Credits:** 3.00

ECON 25100 - Microeconomics

Credit Hours: 3.00. Microeconomics studies the choices individuals make and the incentives that influence those choices. Emphasis is on the incentives that determine market prices and resource allocation. The role of public policy in influencing incentives and efficiency is also addressed. Typically offered Fall Spring Summer. CTL:ISH 1042 Microeconomics**Credits:** 3.00

ECON 25200 - Macroeconomics

Credit Hours: 3.00. This course examines how the US economy functions and provides an overview of important macroeconomic issues including: unemployment, inflation, social security, national debt, international trade, the sub-prime crisis, and business cycles. Emphasis is placed upon the role and limits of government fiscal and monetary policy in promoting economic growth and stable prices.Typically offered Fall Spring Summer. CTL: ISH 1041 Macroeconomics**Credits:** 3.00

ECON 26000 - Data Visualization And Inference

Credit Hours: 3.00. Economics 260 is a self-contained introduction to statistics with economic applications. The goals of this course are to help students develop a working knowledge of data production and interpretation in an economics context, recognize the fundamental interconnectedness of economics and data, and introduce the basic concepts in statistics needed for further study of econometrics and provide basic preparation for ECON 36000. Topics include the organization, analysis, and interpretation of data; descriptive statistics; probability theory; sampling distributions; inference and hypothesis testing; and simple linear regression analysis. The approach of the class includes both learning the concepts behind basic statistics and also how to apply these concepts to make data-informed, real-world economic decisions. Students will become familiar with the common statistical techniques and databases for analyzing data by using both hand-calculations and STATA to analyze data. Typically offered Fall.**Credits:** 3.00

ECON 29000 - Sophomore Level Problems In Economics

Credit Hours: 1.00 to 4.00. Arrange with instructor before enrolling. Investigation in a specific economics field. Permission of instructor required.**Credits:** 1.00 to 4.00

ECON 29199 - Cooperative Experience I

Credit Hours: 0.00. Professional experience in economics. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

ECON 29299 - Cooperative Experience II

Credit Hours: 0.00. Professional experience in economics. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

ECON 30100 - Managerial Economics

Credit Hours: 3.00. This course provides a practical and business-focused approach to microeconomic theory. The course covers topics from consumer behavior and demand, decision under uncertainty, production and cost, factor demand, market structure, pricing strategies, and strategic behavior. Emphasis is placed on the tools used to analyze decisions made by managers at firms. This is a required course for several majors in the School of Management and for the business economics minor, but is not intended for economics majors. Typically offered Fall Spring Summer.**Credits:** 3.00

ECON 31200 - Energy Economics: Competition, Regulatory, And Environmental Policy

Credit Hours: 3.00. This course will introduce you to energy economics, divided into two broad categories - fuels (oil and natural gas) and electricity - and across three different areas of applied microeconomic theory: competition policy, regulatory policy, and environmental policy. We will analyze economic regulation in both fuels and electricity, developing the economic theory of regulation and exploring how regulation affects the decisions and behavior of regulated firms differently in the two different types of energy industries. We will also develop economic models to analyze the environmental consequences of energy use. Typically offered Spring.**Credits:** 3.00

ECON 32200 - Economics Of Public Policy

Credit Hours: 3.00. The examination and analysis of public finance practices and problems in the federal fiscal system. Government activities that involve spending and taxation are analyzed applying basic principles of economics. Topics include public education, social security, healthcare, environment and tax systems. State and local government issues are also addressed.**Credits:** 3.00

ECON 32500 - Economics Of Sports

Credit Hours: 3.00. This class applies economic principles to the professional sports entertainment industry and its derivative input markets. The class begins by examining the microeconomics of demand for (by fans) and supply of (by teams) sports entertainment. The labor markets for the primary input, athletic talent, receive significant attention. Coordination among economic agents, taking the forms of leagues, players' unions, and government, is considered at the end of the class, with an emphasis on how they affect the efficiency of the markets related to sports entertainment. Quantitative empirical analysis is emphasized throughout the class. This is not a sports trivia or fantasy sports strategy class. Typically offered Fall Spring.**Credits:** 3.00

ECON 34000 - Intermediate Microeconomic Theory

Credit Hours: 3.00. This course provides students with the techniques needed to model and analyze the behavior of individual economic agents. It introduces a variety of techniques that will allow students to solve business problems and make informed personal economic decisions. The course covers topics from consumer behavior and demand, decisions under uncertainty, production and cost, factor demand, market structure, pricing strategies, and strategic behavior. This is an upper-division

economics course required for all economics majors and it serves as a foundation for higher level elective courses in economics.**Credits:** 3.00

ECON 35200 - Intermediate Macroeconomics

Credit Hours: 3.00. This course offers a rigorous introduction to macroeconomic theory and empirics with real-world applications. We examine longstanding stylized facts about long-run economic growth, short-run economic fluctuations (booms and recessions), and the aggregate effects of government policy. We study determinants of equilibrium in labor, consumption, investment, and money markets as well as the role of fiscal and monetary policies in closed and open economies.**Credits:** 3.00

ECON 36000 - Econometrics

Credit Hours: 3.00. This course examines the statistical techniques economists use to analyze data, estimate causal effects, make predictions, and test economic theory. It emphasizes estimating multiple regression models including models of firm output, product prices, and wages. Students learn to make statistical and practical inferences about the true causal relationships. The course covers the data analysis skills required for careers as a consultant, financial analyst, researcher, or economist in the private and public sectors. The skills practiced in the course include using statistical software to analyze data.**Credits:** 3.00

ECON 36100 - Antitrust And Regulation

Credit Hours: 3.00. This course studies the influence of laws and regulations on market performance and on the functioning of a free-enterprise system. The focus is on two types of government policies: antitrust law and economic regulation. Antitrust laws define the rules by which firms are supposed to compete. Regulations may require that firms obtain approval to set prices, change prices, or enter new markets. They may require firms to adhere to environmental or safety standards. The focus is on current topics in both areas, including comparison of U.S. practice with that of European Union and elsewhere. Typically offered Spring.**Credits:** 3.00

ECON 36200 - Health Economics

Credit Hours: 3.00. This course is designed to introduce upper level undergraduate students in economics to the field of health economics. We will analyze health and health care theories, institutions, and key policy issues using tools from intermediate microeconomic theory. The course begins with an analysis of health care as a commodity and why health is different from other consumer goods. The course then examines the demand for and the production of health and health care, and the behavior and organization of health care providers. The discussion then switches to information asymmetries and the functioning of health insurance markets. Afterwards, the course turns to the analysis of government involvement in the health care system. The class concludes with an examination of medical care systems around the world, paying particular attention to the U.S. health care system.**Credits:** 3.00

ECON 36500 - History Of Economic Thought

Credit Hours: 3.00. The course traces the development of theories of value and economic growth from the seventeenth century to Karl Marx. Among the authors studied are the mercantilists, Hume, Smith, Ricardo, and Marx. Excerpts from the original works are read and evaluated in light of modern theory. Typically offered Spring.**Credits:** 3.00

ECON 36700 - Law And Economics

Credit Hours: 3.00. It has become increasingly clear to economists, legal scholars and political scientists that it is impossible to understand economic institutions without first having an understanding of the legal framework within which they operate. Similarly, it is impossible to understand the impact of law on society without first having an understanding of economic principles. This problem is further complicated by the fact that there are often ambiguities in the written law that lead to significant differences between what the law appears to say and how the law is interpreted in the courts. This course is designed

to give the student an understanding of both legal and economic principles and the relationship between them. Finally, through the use of economic analysis, the student will acquire the tools to predict the likely outcomes of particular laws and how they will affect their family and business decisions. Typically offered Spring Summer.**Credits:** 3.00

ECON 37000 - International Trade

Credit Hours: 3.00. Develops an understanding of the economics of globalization, including the movement of goods, people, capital, and ideas across countries. Using the tools of intermediate economic theory, we discuss the benefits and costs of globalization, the implications of globalization for wages, earnings, and national welfare, and their intersection with government policies. Typically offered Fall Spring Summer.**Credits:** 3.00

ECON 37200 - Experimental Economics

Credit Hours: 3.00. This course will explore how experiments are used in economics to test economic theory, understand behavior, and evaluate new policies. Focusing on recent research, we read research papers on a variety of policy topics including labor market discrimination, payday lending, organ transplantation, media censorship, and voting. Applying the concepts from class, students will identify their own original research questions and design new experiments. **Credits:** 3.00

ECON 37300 - Computational Economics

Credit Hours: 3.00. The main goal of this course is to introduce economics students to the computation, programming, and data analysis in Python. In the first part of the course, we will cover basic programming techniques and the use of popular Python packages for data analysis. In the second part of the course, we will consider more advanced programming techniques including numerical methods, dynamic programming, and simulation-based methods. Throughout the course we will consider a number applications related to microeconomics, macroeconomics, and econometrics covered in the Economics program curriculum.**Credits:** 3.00

ECON 37600 - Economics Of The European Union

Credit Hours: 3.00. Current economic structure of the European Union, and the economic challenges it is now facing. Typically offered Fall Spring.**Credits:** 3.00

ECON 38000 - Money And Banking

Credit Hours: 3.00. The course analyzes the economics of money, monetary systems, investments, and financial intermediaries in modern industrial economies. Topics considered include the origin of money and the banking industry, financial asset markets, the role of central banks, and the effects of various monetary policies. The theory will be presented side by side with current economic and financial news, and the students will learn how to track financial and economic data via The Wall Street Journal. Typically offered Fall Spring Summer.**Credits:** 3.00

ECON 38500 - Labor Economics

Credit Hours: 3.00. The purpose of this course is to introduce important topics, theories, institutions, and policy issues relating to the functioning of labor markets. Topics to be considered include labor supply decisions, investments in human capital, compensating wage differentials, labor contract theory, unions, compensation programs, signaling in labor markets, the economics of unemployment, and government employment, retirement, and workplace safety.**Credits:** 3.00

ECON 39000 - Junior Level Problems In Economics

Credit Hours: 1.00 to 4.00. Investigation into a specific topic area of economics. Permission of instructor required.**Credits:** 1.00 to 4.00

ECON 39040 - Economics Internship

Credit Hours: 1.00. An Economics-related work experience. This internship experience is intended to complement the student's academic plan-of-study and help prepare him/her for his/her future role in Economics. A letter from the prospective employer stating the period of employment, hours per week, job title, job qualifications, and job description may be requested before registration will be permitted. Permission of instructor required. Typically offered Fall Spring.**Credits:** 1.00

ECON 39399 - Cooperative Experience III

Credit Hours: 0.00. Professional experience in economics. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

ECON 39499 - Extensive Cooperative Experience IV

Credit Hours: 0.00. Professional experience in economics. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

ECON 39599 - Extensive Cooperative Experience V

Credit Hours: 0.00. Professional experience in economics. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

ECON 42200 - Public Finance And Taxation

Credit Hours: 3.00. This course examines the role of government in market economies. The aim of the course is to provide an understanding of the reasons for government intervention in the economy and how individuals and firms respond to taxation and other government actions and how to evaluate the benefits of public programs. For example, what effects do taxes have on incentives to work, save, and invest? Emphasis is placed on current U.S. policy issues including Social Security, health care, education, environmental regulation, welfare programs, and tax reform. Typically offered Spring.**Credits:** 3.00

ECON 43200 - Economics Of Growth & Innovation

Credit Hours: 3.00. Part one: we focus on this fact: the richest countries in the world have incomes nearly 200 times greater than the poorest, with profound consequences for the lives (and deaths) of their citizens. Why nations are poor and how they can become rich is one of the most important questions in Economics. We will look at the role of investment, schooling, population growth and technology. Part two: we explore how globalization affects productivity and innovation. This includes how international trade and domestic policies affect allocative efficiency, accelerate structural change, and discipline competitive behaviors by domestic firms. We explore how firms grow on global markets, how technology is embodied in traded inputs, and how international markets for ideas and the possibility of imitation can lead to explosive growth. Part three: we explore a rapidly growing literature on the economics of innovation. We'll wrestle with the questions of: where new ideas come from, and whether it is becoming more difficult to innovate; how cities become hotbeds of innovation and how this will be affected by remote work; and how innovation can be shaped by choices of firms and by government policies.**Credits:** 3.00

ECON 45100 - Game Theory

Credit Hours: 3.00. In the course, economic, political, and social interactions are represented as games, in which strategies and resulting outcomes can be analyzed. The analysis of these interactions is then used to demonstrate how one can make optimal decisions under uncertainty. This course uses Calculus. Typically offered Fall Spring Summer.**Credits:** 3.00

ECON 45200 - Empirical Macroeconomics

Credit Hours: 3.00. The course will combine theory and empirical evidence to analyze macroeconomic trends and policy questions. The topics to be covered are motivated by current debates in the economics profession and current challenges facing economic policymakers. Students will use state-of-the-art models and economic model-solving software to predict outcomes. Typically offered Fall Spring.**Credits:** 3.00

ECON 45500 - Historical Development Of Modern Economics

Credit Hours: 3.00. The development of economic thought and economic methodology from the advent of the mercantilists to the formation of current approaches in economics in the early 20th century. The course will focus on economics as an evolving body of thought and an ongoing conversation, with strong emphasis the movement from classical economics to neoclassical economics as a foundation for modern economic theory. Typically offered Fall.**Credits:** 3.00

ECON 45600 - Urban Economics

Credit Hours: 3.00. Examines the market forces that lead to the development, growth, and size of cities. In addition, this course covers the theory of location and land use, principles of local public finance, policy problems in the areas of urban housing, transportation, crime, and pollution.**Credits:** 3.00

ECON 46100 - Industrial Organization

Credit Hours: 3.00. This course examines the determinants of firm and market structure and the resulting market performance in imperfectly-competitive markets. Advanced topics include advertising, research and development, imperfectly competitive international markets, and market integration. Emphasis is placed on using theoretical models of firm and industry behavior to explain and analyze real-world examples of firm behavior. Typically offered Spring Summer.**Credits:** 3.00

ECON 46300 - Advanced Data Analysis And Machine Learning

Credit Hours: 3.00. This is an advanced applied econometrics course that introduces students to a variety of techniques and methods for the empirical study of economic data. This course focuses on the practical aspects of economic data analysis, including data organization (such as merging and appending datasets) and the implementation of econometric models. This course will cover multivaraite linear regression, non-linear least squares, models for binary and categorical outcomes, model selection using machine learning, and panel data models. As part of the course, students will learn to conduct empirical analysis of economic data using Stata, a statistical software package.**Credits:** 3.00

ECON 46600 - International Economics

Credit Hours: 3.00. Analyzes topics in international economics, using more advantage techniques and more detailed treatment than in ECON 37000 or 37100. While coverage varies somewhat with instructor, some topics could include: economic growth, innovation and technology transfer, and the role of multinational corporations. Typically offered Spring Summer.**Credits:** 3.00

ECON 47100 - Behavioral Economics

Credit Hours: 3.00. Students learn about human behavior in economic environments, with a strong emphasis on classroom laboratory exercises. Topics considered include behavior in a variety of markets - for example, markets with price controls,

markets for financial assets and auction markets -- and behavior in social dilemmas that arise when people try to provide public goods voluntarily or when sellers try to conspire to fix prices. Students will also learn how people bargain with, trust each other, and show social preferences towards others. Decision-making and anomalies for risky and uncertain choices will also be covered.**Credits:** 3.00

ECON 48500 - Economics Of Racial And Gender Discrimination

Credit Hours: 3.00. This course focuses on quantifying the extent of, and determining the underlying causes of racial and gender disparities in the labor market. Topics include the impact of prejudice on labor market outcomes, statistical discrimination, early childhood factors and differences in environment, and fertility and reproductive technology. Typically offered Spring.**Credits:** 3.00

ECON 49000 - Problems In Economics

Credit Hours: 1.00 to 4.00. Arrange with instructor before enrolling. Supervised reading and reports in various subjects. Open only to a limited number of seniors with superior records in previous courses. Permission of instructor required.**Credits:** 1.00 to 4.00

ECON 49900 - Economics Capstone Research

Credit Hours: 3.00. The course combines experiential learning with a hands-on research project that unfolds over the course of a semester, serving as a culminating experience at the end of their degree program. The overarching objective of the capstone project is for students to understand how business problems can be addressed with empirical methods. This course is designed to help students develop a more comprehensive and integrative understanding of the major, apply their knowledge to develop and execute a methodologically rigorous research a project, and demonstrate their mastery of critical thinking and research skills they have acquired throughout their time in the major. In addition to a paper, completion of the research project may involve the presentation of the findings in a seminar or workshop setting. **Credits:** 3.00

ECON 50000 - Mathematics For Economists

Credit Hours: 2.00 or 3.00. This is a Master's level course in mathematics and its application to economics. Students in this class will review and practice the mathematical methods required to solve micro and macroeconomic theoretical models, especially constrained optimization problems. Content covers algebra, univariate and multivariate calculus and constrained optimization methods**Credits:** 2.00 or 3.00

ECON 50100 - Statistical Analysis For Economists

Credit Hours: 1.00 to 3.00. A master's level course in statistics and its application to economics. Course will familiarize students with the elements of statistics needed to perform econometrics.**Credits:** 1.00 to 3.00

ECON 51100 - Intermediate Economics I

Credit Hours: 3.00. Consumer behavior and demand, production and cost, factor demand, market structure, general equilibrium and welfare. Emphasis on the tools used to analyze the behavior of individual economic units. Not open to students with credit in ECON 34000. Typically offered Fall Summer.**Credits:** 3.00

ECON 51200 - Intermediate Economics II

Credit Hours: 3.00. Course content includes money and banking, national income and aggregative economics; the analysis of the determination of national income, employment, the price level, and the balance of payments. Consideration of both theory and economic policy. Not open to students with credit in ECON 35200. Typically offered Spring.**Credits:** 3.00

ECON 51400 - Microeconomics

Credit Hours: 2.00. An introduction to microeconomic theory. Analysis of consumer demand, output and input decisions of firms, price determination, economic efficiency, market structures, and market failure. Typically offered Fall Spring.**Credits:** 2.00

ECON 51500 - Macroeconomics

Credit Hours: 1.00 to 3.00. Investigation of the causes of macroeconomic fluctuations in the economy. Looks at changes in inflation, unemployment, real output, interest rates, and exchange rates, and explores why they occur, what their effects are, and what, if any, role government should play in dealing with these problems. A mixture of theory and case studies with reference to historical case studies. Current macroeconomic problems will be discussed with a focus on the international aspects of macroeconomic problems. Typically offered Fall Spring Summer.**Credits:** 1.00 to 3.00

ECON 51900 - Economics For Pre-College Educators

Credit Hours: 1.00 to 3.00. Economics and economic education materials and instructional strategies for pre-college teachers in all grade levels and subject areas. Most sections, or workshops, survey both microeconomics and macroeconomics concepts and current public policy issues. Some workshops, however, deal with special themes or contemporary economics problems, and vary each time they are offered, e.g., international economics, economics in literature and children's literature or energy and environmental economics. Participants are usually expected to develop a package of classroom activities and supplements. Typically offered in the Summer, but occasionally in the Fall and Spring semesters.**Credits:** 1.00 to 3.00

ECON 52000 - Industrial Economics

Credit Hours: 2.00. This course will explore the division of economic activity among industries in developed and less-developed countries. It will examine patterns of private and public ownership in different countries. It will discuss the determinants of market and firm structure, firm conduct, and market performance in imperfectly competitive markets, and different approaches to regulating such markets. Emphasis is placed on using basic economic models of firm and industry behavior to explain and analyze real-world markets. Permission of department required. Typically offered Fall.**Credits:** 2.00

ECON 53600 - Public Economics

Credit Hours: 2.00. This course is designed to introduce masters' students in economics to the field of health economics. We will analyze health and health care theories, institutions, and key policy issues. The course covers how the markets for health and health services are different from other goods, with a particular emphasis on the role of government and market failure. We will examine the demand for and the production of health and health care, and the behavior and organization of health care providers. We will also explore information asymmetries and the functioning of health insurance markets. We will consider health and healthcare systems around the world, paying particular attention to the U.S. health care system and recent reforms to it.**Credits:** 2.00

ECON 53700 - Health Economics

Credit Hours: 2.00 or 3.00. This course is designed to introduce masters' students in economics to the field of health economics. We will analyze health and health care theories, institutions, and key policy issues. The course covers how the markets for health and health services are different from other goods, with a particular emphasis on the role of government and market failure. We will examine the demand for and the production of health and health care, and the behavior and organization of health care providers. We will also explore information asymmetries and the functioning of health insurance markets. We will consider

health and healthcare systems around the world, paying particular attention to the U.S. health care system and recent reforms to it. **Credits:** 2.00 or 3.00

ECON 53800 - International Economics

Credit Hours: 2.00 or 3.00. The course covers selected topics in international trade with a focus on real world applications. Typically offered Fall Spring Summer.**Credits:** 2.00 or 3.00

ECON 53900 - Wage Discrimination

Credit Hours: 1.00. This course is an applied economics course that focuses on race and gender discrimination in the labor market. We will use the tools you have developed so far in the MA program to study the extent, causes and consequences of disparities in wages and employment across race and gender.**Credits:** 1.00

ECON 55000 - Personnel Economics

Credit Hours: 2.00. Personnel Economics applies micro- and macroeconomic theory to the workings of the labor market while maintaining a focus on incentives in the workplace. The course will investigate the determination of wages and compensation (based on a study of labor demand and supply) and the differences in these forms of payment for labor services across workers within an occupation, across occupations, and across cultures. Other topics to be considered include the connection between investments in education and training and labor market outcomes and estimates of the costs and benefits of immigration and employee turnover and discuss the impact of unions, as well as discrimination in the labor market issues. Permission of department required. Typically offered Spring.**Credits:** 2.00

ECON 56200 - Econometrics I

Credit Hours: 3.00. This masters-level course in econometrics covers the tools that will enable students to conduct empirical analysis using economics data. The course examines the statistical techniques used in testing economic theories, estimating casual effects, and making predictions. Emphasis is placed on estimating a single equation (e.g., a demand function) and the problems associated with such estimation. As part of the course, students will estimate equations using STATA, a statistical software package. Permission of department required. Typically offered Fall.**Credits:** 3.00

ECON 56500 - Law And Economics

Credit Hours: 2.00. This course is designed to give the student an understanding of both legal and economic principles and the relationship between them. It will also show the student how to access various data bases, Lexis/Nexis, to get a formal statement of the law and how the laws have actually been interpreted and enforced. Finally, through the use of economic analysis, the student will acquire the tools to predict the likely outcomes of particular laws and how they will affect their family and business decisions. Permission of department required. Typically offered Fall.**Credits:** 2.00

ECON 56700 - Managerial Economics And Business Strategy

Credit Hours: 1.00 to 4.00. This course studies optimal decision-making processes made by managers and policymakers within firms and other organizations. The course is based on microeconomics and applies advanced microeconomics-related concepts with an emphasis on pricing strategies. The course covers topics such as monopolies (price discrimination, optimal pricing strategies), advanced strategic decision-making and imperfect competition (optimal pricing and production), new product introductions, product variety offered on the market, and entry deterrence strategies. We use a variety of examples and applications, and operate with modern tools (Game Theory) that facilitate the decision-making process for individuals, policymakers and managers. The main goal of this course is to provide a basis for a good understanding of the logical mechanics, and to provide a good intuition in managerial economics and business decision-making processes that facilitate the understanding of daily business problems. Permission of instructor required. **Credits:** 1.00 to 4.00

ECON 57000 - International Economics

Credit Hours: 2.00 or 3.00. Study of the economic characteristics of the contemporary transportation market with emphasis on the impact of governmental policies on resource allocation within the sector. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 2.00 or 3.00

ECON 57200 - Econometrics II

Credit Hours: 2.00. This course reviews basic concepts in probability, mathematical statistics and linear algebra in order to obtain a more rigorous understanding of the linear regression model, its representation and assumptions, procedures for estimation and properties associated with the OLS estimator. We move on and apply what we have learned to the linear regression model. We discuss estimation and prediction, establish properties such as efficiency, unbiasedness, consistency and convergence in mean square. We conclude by considering a few nonlinear models appropriate for modeling binary outcomes. Permission of department required. Typically offered Fall Spring Summer.**Credits:** 2.00

ECON 57300 - Financial Econometrics

Credit Hours: 2.00. This course offers an introduction of basic principles of econometric analysis that will help students understand finance theories and their empirical applications. It will also equip students with appropriate statistical techniques for doing applied financial research. The statistical techniques are particularly well suited for analyzing financial time-series data. Permission of department required.**Credits:** 2.00

ECON 57600 - Statistical & Machine Learning

Credit Hours: 2.00 or 3.00. This is an introductory course in statistical and machine learning. It will cover fundamental concepts and essential tools that are critical in understanding
cutting-edge machine learning techniques. Students will develop skills in applying a wide
variety of modeling and prediction methods. Topics include linear regression, classification, regularization and shrinkage methods, tree-based methods, and support vector machines. An integral part of this course is the extensive use of the open source statistical software R. Students will gain hands-on experience in analyzing datasets commonly used in business and economics.**Credits:** 2.00 or 3.00

ECON 57700 - Quantitative Economics With Python

Credit Hours: 2.00 or 3.00. Introduce students to computational and programming in Python.**Credits:** 2.00 or 3.00

ECON 58400 - Experimental Economics

Credit Hours: 2.00 or 3.00. This course introduces you to the experimental methods used by economists to study human behavior. These methods analyze data collected in controlled laboratory experiments. Throughout the course, we will discuss different types of experiments that have been extensively researched by experimental economists. To help introduce and motivate each topic, you will participate in weekly synchronous experiments with your classmates over the internet. You will then complete an assignment analyzing the data generated by your class in the online experiment. The following lecture will provide an overview of the theoretical framework and experimental predictions. We will also discuss commonly observed behavior and any relevant explanations for such behavior.**Credits:** 2.00 or 3.00

ECON 58500 - Behavioral Economics

Credit Hours: 2.00 or 3.00. This course explores human economic behavior, with a strong emphasis on laboratory and field experiment methodology used in behavioral economics research. Topics considered include behavior in markets for financial

assets and auction markets, and behavior in social dilemmas that arise when people try to provide public goods voluntarily or increase economic surplus through trust. Students will also study how people bargain with and exhibit social preferences towards others. Decision-making and anomalies for risky uncertain choices will also be covered. Typically offered Fall Spring Summer.**Credits:** 2.00 or 3.00

ECON 58700 - Advanced Quantitative Economics With Python

Credit Hours: 3.00. The main goal of this course is to extend the computational and programming toolkit developed in Quantitative Economics with Python course. In particular, we will cover advanced methods for working with, visualizing and analyzing data in Python. In addition, we will consider more advanced programming techniques including stochastic optimization and dynamic programming. Throughout the course, we will consider a number of applications related to microeconomics, macroeconomics, and econometrics covered in the MS Econ program curriculum.**Credits:** 3.00

ECON 59100 - Financial Valuation And Decision Making

Credit Hours: 2.00 or 3.00. A comprehensive introduction to finance. The object of this course is to provide the computational framework necessary to appreciate and understand how to make decisions based on sound financial reasoning.**Credits:** 2.00 or 3.00

ECON 60000 - Teaching Economics

Credit Hours: 1.00 to 3.00. This course traces the development of economic theory from the Mercantilist writers through the contributions of J. S. Mill and Karl Marx. Topics covered include the development of value theory (especially labor theories of value), theories of economic growth and business cycles, the classical debate over the meaning and validity of Say's Law, and changing views regarding the appropriate role of government in the marketplace. In each case, the contributions of the authors considered are evaluated in light of our modern understanding of economic theory. Typically offered Spring.**Credits:** 1.00 to 3.00

ECON 60600 - Microeconomics I

Credit Hours: 1.00 to 3.00. An introduction to basic consumer and producer theory, competitive markets (including using the continuum to model competition), basic general equilibrium theory, and basic risk/uncertainty. Co-requisite: ECON 61500. Typically offered Fall.**Credits:** 1.00 to 3.00

ECON 60700 - Microeconomics II

Credit Hours: 1.00 to 3.00. Building on Microeconomics I, more advanced consumer and producer theory using support functions, risk/uncertainty and information, and basic game theory and oligopoly. Prerequisite: ECON 60600. Typically offered Fall.**Credits:** 1.00 to 3.00

ECON 60800 - Macroeconomic Theory I

Credit Hours: 2.00 or 3.00. An introduction to general equilibrium macroeconomic models in both deterministic and stochastic settings. Topics studied include: static neoclassical models, social planner problems, dynamic programming, growth and capital accumulation, stochastic economies, asset pricing, and overlapping generations models. Typically offered Fall.**Credits:** 2.00 or 3.00

ECON 60900 - Microeconomics III

Credit Hours: 1.00 to 3.00. An advanced course in game theory and general equilibrium theory. Among the topics covered are: games in strategic form, games in extensive form, games of incomplete information, cooperative games with side payments, mechanism design, consumer choice theory, Pareto optimality, the Arrow-Debreu-McKenzie model, and the existence and stability of competitive equilibria. Prerequisite: ECON 60600. Typically offered Spring.**Credits:** 1.00 to 3.00

ECON 61000 - Advanced Game Theory

Credit Hours: 1.00 to 3.00. An advanced course in game theory and its applications. Among the topics covered are: extensive form games, normal form games, Nash equilibrium, mixed strategies equilibrium, subgame perfect equilibrium, learning and equilibrium, games with incomplete information, repeated games, cooperative games, noncooperative bargaining, and auctions. Prerequisite: ECON 60600. Typically offered Fall Spring.**Credits:** 1.00 to 3.00

ECON 61100 - Macroeconomic Theory II

Credit Hours: 2.00 or 3.00. An introduction to selected topics in macroeconomics, including theories of business cycles, economic growth, microfoundations of labor markets and some miscellaneous issues. Topics covered include: theories of business cycles (real business cycles, information imperfections, coordination failures), economics of growth (neoclassical model, human capital model, endogenous growth), microfoundations of labor markets (recursive competitive equilibrium models, search and matching models, efficiency wages, implicit contracts, insider-outsider model), miscellaneous issues including monetary economics (cash-in-advance constraint models), the Lucas critique, time inconsistency, and endogenous cycles. Prerequisite: ECON 60800. Typically offered Spring.**Credits:** 2.00 or 3.00

ECON 61200 - Macroeconomic Theory III

Credit Hours: 1.00 to 3.00. Selected topics in contemporary research in macroeconomic theory. Emphasis on the implications of uncertainty in macroeconomic theory, including such topics as search theory, asset selection under uncertainty, stochastic optimal control, and asymmetric information. Typically offered Fall Summer.**Credits:** 1.00 to 3.00

ECON 61300 - Topics In Microeconomics

Credit Hours: 3.00. Economic theory workshop, with presentations given by departmental and external speakers. Typically offered Fall Spring.**Credits:** 3.00

ECON 61400 - Economics Of Information

Credit Hours: 1.00 to 3.00. An introduction to the economics of information. Key topics considered are nonexpected utility theory and the various implications of asymmetric information-either hidden action(s) and/or hidden types, including extensions of the basic principal-agent model as well adverse selection issues, mechanism design, and screening/signaling models. Other topics that may be considered include the value of information/real option theory, herd behavior, capital asset pricing models, stochastic calculus and options pricing models, organizational decision making, search theory and price dispersion models, and herd behavior. Prerequisite: ECON 60600. Typically offered Fall Spring.**Credits:** 1.00 to 3.00

ECON 61500 - Mathematical Analysis For Economists

Credit Hours: 2.00 or 3.00. Topics include constrained optimization, comparative statics, and elementary topics in mathematical analysis. Students should be familiar with calculus, linear algebra, basic probability, and have a grasp of microeconomic theory (such as the material covered in ECON 51100). Typically offered Fall.**Credits:** 2.00 or 3.00

ECON 61800 - Advanced Topics In Economics

Credit Hours: 3.00. Macro/international theory workshop. Topics on macroeconomics and international economics are presented by departmental and external speakers. Typically offered Fall Spring.**Credits:** 3.00

ECON 62000 - Industrial Organization

Credit Hours: 1.00 to 3.00. A survey of some of the major theoretical issues in the field of industrial organization. Topics include: the welfare economics of competition and monopoly, static and dynamic oligopoly theory, differentiated products models, and entry deterrence. Typically offered Fall Spring.**Credits:** 1.00 to 3.00

ECON 62100 - Applied Industrial Organization

Credit Hours: 1.00 to 3.00. A continuation of ECON 62000, with emphasis on empirical analysis and the application of theory to real-world situations. Topics covered include: empirical estimation of market structure, empirical tests of market conduct, the effect of anti-competitive behavior on economic performance, antitrust practice, regulation theory and practice, and experimental industrial economics. The material is selected from current journal articles. Prerequisite: ECON 62000. Typically offered Fall Spring.**Credits:** 1.00 to 3.00

ECON 62400 - Estimating Game Theoretic Models

Credit Hours: 2.00 or 3.00. This course examines topics in empirical industrial organization (I.O.), which aims to use data to draw conclusions about how market and firm structure, firm conduct, and market performance interact in imperfectly competitive markets. We will take a "structural" approach, focusing on estimating the parameters of game theoretic models using real industry data, and then simulating those same models to generate predictions under alternative ("counterfactual") scenarios. We will cover theory only to the extent that it provides intuition or testable conclusions. The course is divided into two unequal parts. In the first part, we will learn about static games in the context of mergers, market power, and entry. In the second part, we will focus on the estimation of dynamic games, after first understanding how to solve and estimate dynamic single-agent problems.**Credits:** 2.00 or 3.00

ECON 63000 - Dynamic Macroeconomics

Credit Hours: 1.00 to 3.00. Covers current literature on decentralized monetary economies. Topics are selected from recent research publications that include: studies related to endogenous determination of pattern of exchange, valuation of assets and currencies, price determination and dispersion, and international finance. The material is selected from current journal articles. Prerequisite: ECON 53000. Typically offered Fall Spring.**Credits:** 1.00 to 3.00

ECON 63100 - Industrial Organization

Credit Hours: 1.00 to 3.00. A study of asset selection within the expected utility approach, with some attention given to the nonexpected utility decision models. Topics covered include axioms for measurable utility, monetary models under uncertainty, models of capital budgets, and security-selection models. Prerequisite: Master's student standing or higher. Typically offered Fall Spring.**Credits:** 1.00 to 3.00

ECON 63200 - Labor Economics

Credit Hours: 1.00 to 3.00. An area seminar. Theoretical and empirical research on the financial markets. Prerequisite: ECON 63000. Typically offered Fall Spring.**Credits:** 1.00 to 3.00

ECON 63400 - International Trade

Credit Hours: 1.00 to 3.00. Application of microeconomic techniques to international trade. Topics include: classical, neoclassical, and modern theories of international trade; the theory of tariffs and commercial policy, (including aspects of political economy), welfare aspects of trade and tariff theory, and related topics. The material is selected from current journal articles. Prerequisite: ECON 60700. Typically offered Fall Spring.**Credits:** 1.00 to 3.00

ECON 63500 - Monetary International Economics

Credit Hours: 1.00 to 3.00. A research seminar on international monetary issues. Topics include: theories of balance of payments and exchange-rate determination, international asset markets and capital flows, breakdowns of pegged exchange-rate regimes, currency substitution, monetary integration, international impacts of alternative monetary, and fiscal and intervention policies. Assignments are based on selected articles. Prerequisite: ECON 60800. Typically offered Fall Spring.**Credits:** 1.00 to 3.00

ECON 63600 - Topics And Research In International Trade

Credit Hours: 1.00 to 3.00. A course in international trade theory and empirics, with emphasis on surveying the recent developments in the field-including empirical applications of material covered in ECON 634. While specific subject matter may vary from year to year, likely topics include: theory and empirics on trade and wages, trade and the environment, trade in the presence of multinational firms and vertical specialization, empirical evaluation of the positive theories of trade (especially factor endowment and variety models), and the identification and measurement of trade barriers and their effects. Material is selected from current journal articles. Prerequisite: ECON 60700. Typically offered Fall Spring.**Credits:** 1.00 to 3.00

ECON 63800 - Advanced Topics In International Trade

Credit Hours: 1.00 to 3.00. Specific subject matters may vary year to year reflecting recent developments in the field of international trade. Generally, we first review benchmark models of trade that explain basic facts in international trade. Our focus remains on unifying these theories as well as learning tools to bring the theories to data to conduct policy and welfare analysis. Material is selected from current journal articles. Throughout the course, we study several applications including the impact of tariffs and trade agreements, the interaction between trade and labor market, the interaction between trade and environment, economic geography and the impact of spatial policies, and agricultural production and trade in the global economy. Typically offered Fall Spring.**Credits:** 1.00 to 3.00

ECON 64000 - Economic And Social Policy

Credit Hours: 2.00 or 3.00. The role of government in the American economy. Policies relating to the environment, energy, transportation, labor markets, the distribution of income, macrostability, and international trade are analyzed. Prerequisite: ECON 51300 , Master's student standing or higher and Management majors only. Typically offered Fall Spring Summer.**Credits:** 2.00 or 3.00

ECON 64100 - Agent-Based Computational Economics

Credit Hours: 2.00 or 3.00. Computational study of economic systems involving interacting agents who do not necessarily possess perfect rationality and information. In addition to equilibrium analysis, agent-based models focus on out-of-equilibrium dynamics that may or may not lead to equilibrium in the long run,**Credits:** 2.00 or 3.00

ECON 64200 - Computational Economics

Credit Hours: 2.00 or 3.00. The purpose of this class is to give you a computational toolbox you can apply to economic questions. We will introduce and use numerical methods on computationally tractable problems. The goal of the course is to encourage Ph.D. students to apply these techniques to their own research. Our in-class applications
will primarily be public policy and macro-oriented, by solving and simulating the problems of microeconomic agents and aggregating the results.**Credits:** 2.00 or 3.00

ECON 65000 - Applied Microeconometrics

Credit Hours: 1.00 to 3.00. Topics in labor economics. While the specific subject matter varies from year to year, recent seminars have examined such topics as dynamic labor demand and supply analysis, human capital theory, screening and signaling theories, contract theory, efficiency wages, job matching, search, unions, and internal labor markets. Material is selected from current journal articles. Typically offered Fall Spring.**Credits:** 1.00 to 3.00

ECON 65200 - Economics Of Labor Markets

Credit Hours: 2.00 or 3.00. Study of labor force concepts and measurements, the macroeconomic behavior of employment and earnings, and the functioning of labor markets. Emphasis is placed on empirical findings and research methods. Typically offered Fall.**Credits:** 2.00 or 3.00

ECON 65300 - Topics In Early Childhood Development

Credit Hours: 2.00 or 3.00. This course is the second in the Ph.D. Labor Economics sequence. We will focus on the economics of skill formation and its consequences on later outcomes like schooling choices, health, social behaviors and labor market variables. We will do this, by analyzing both static and dynamic settings, in which we recognize that skill formation is a process where early inputs affect the productivity of later ones. This course will be econometrically intense, covering from reduced form techniques to structural ones. We will pay special attention to econometric identification of effects and the analysis of skills as unobserved heterogeneity, its consequences on empirical estimation and models to address it. This course will emphasize the connection between theory and practice.**Credits:** 2.00 or 3.00

ECON 65400 - Topics In Empirical Labor & Public Economics

Credit Hours: 2.00. Provide an introduction to the baseline models of labor supply, including static and dynamic model of labot supply. Introduce students to several seminal and new papers on labor supply. Provide students with the conceptual understanding and computational tools (Stata and Matlab) required to adapt and apply the models presented in the course to address new research questions in labor and public economics. Provide students with an basic understanding of the Current Population Survey (CPS). Motivate and illustrate simulation-assisted estimation as a method for estimating structural models of labor supply.**Credits:** 2.00

ECON 65500 - Public Economics

Credit Hours: 2.00 to 3.00. Knowledge of various types of government programs, public policies and program administration. Prerequisite: ECON 65000.**Credits:** 2.00 to 3.00

ECON 65600 - Labor Economics II

Credit Hours: 2.00. This course is the third in the PhD Labor Economics sequence. This course is designed to be primarily a "topics" course. Class will focus on some of the most popular open questions in labor economics, however, we will take a long view to these questions in order to understand the progress that has been made over the last half-century.**Credits:** 2.00

ECON 66200 - Game Theory

Credit Hours: 2.00 or 3.00. In this course, we will examine some of the basic elements of Game Theory. Game Theory studies strategic environments in which each individual's payoff depends upon both their own actions as well as the actions of others. Game Theory attempts to develop an understanding of such situations and to provide a formal framework and solution concepts for making better strategic choices.**Credits:** 2.00 or 3.00

ECON 66800 - Topics In Applied Economics

Credit Hours: 3.00. Applied micro workshop. Topics on applied macroeconomics are presented by departmental and external speakers. Typically offered Fall Spring.**Credits:** 3.00

ECON 67000 - Probability And Statistics

Credit Hours: 2.00 or 3.00. An introduction to probability theory and the basic statistical estimation methods. Topics include: axiomatic development of probability theory, counting methods, conditional probability and Bayes' theorem, random variables and distributions, expectation, variance, covariance and correlation, special distributions, statistical inference, maximum likelihood estimators, unbiased estimation, and testing hypotheses. Prerequisite: ECON 61500. Typically offered Fall.**Credits:** 2.00 or 3.00

ECON 67100 - Econometrics I

Credit Hours: 1.00 to 3.00. An introduction to the modern techniques of econometrics and their applications. Topics include: the classical linear regression model (specification, estimation, inference, and prediction), specification analysis, functional form, heteroscedasticity, and autocorrelation. Prerequisite: ECON 67000. Typically offered Spring.**Credits:** 1.00 to 3.00

ECON 67200 - Econometrics II

Credit Hours: 1.00 to 3.00. Topics include generalized method of moments, estimation and inference with weak instruments, panel data models and bootstrap methods. Prerequisite: ECON 67100. Typically offered Fall.**Credits:** 1.00 to 3.00

ECON 67300 - Time Series Econometrics

Credit Hours: 1.00 to 3.00. This advanced course gives an up-to-date and comprehensive treatment of modern time series analysis and empirical macroeconomics. Topics include: ARIMA processes, spectral analysis, forecasting, covariance-stationary vector processes, vector autoregressions, state space representations in the Kalman filter, non-stationary time series and fractional integrated processes, and time series models of heteroscedasticity. Prerequisite: ECON 67200. Typically offered Fall Spring.**Credits:** 1.00 to 3.00

ECON 67400 - Microeconometrics

Credit Hours: 1.00 to 3.00. This advanced course covers the econometrics and statistical methods needed to study data on individual agents in general qualitative response models and models of limited dependent variables. Special emphasis is placed on applying the alternate estimation and inference techniques to actual or simulated datasets. Topics include: univariate binary models, multinomial and multivariate qualitative response models, choice based sampling, distribution-free estimation methods, and Tobit models. Prerequisite: ECON 67200. Typically offered Fall Spring.**Credits:** 1.00 to 3.00

ECON 67600 - Economics Of Uncertainty And Information I

Credit Hours: 2.00 to 4.00. Covers topics in decision theory and the economics of information. Topics include: insurance, nonexpected utility theory, capital asset pricing models, stochastic calculus and options pricing models, organizational decision making, herd behavior, search theory and price dispersion models, principal-agent models, multiple agents, multiple tasks, multiple periods, incomplete contracts, and adverse selection topics. Applications of these models arise in industrial organization, labor economics, and public economics, as well as various areas in management. Course readings are primarily from journal articles. Prerequisite: ECON 60700. Typically offered Fall Spring.**Credits:** 2.00 to 4.00

ECON 67700 - Economics Of Uncertainty And Information II

Credit Hours: 1.00 to 3.00. Continuation of ECON 67600. Prerequisite: ECON 67600. Typically offered Fall Spring.**Credits:** 1.00 to 3.00

ECON 67800 - Search Theory And Applications

Credit Hours: 2.00 or 3.00. This course provides an overview to the tools and applications of search theory, which has been a very active area of research. The aim of this course is to provide students with a solid understanding of the search approach and to get started on engaging in research.**Credits:** 2.00 or 3.00

ECON 68500 - Experimental Economics I

Credit Hours: 1.00 to 3.00. An overview of seminal and recent developments in experimental economic research. Provides practical training in designing and conducting experiments and the analysis of experimental data. Content varies from year to year. Applications include: industrial organization, game theory, finance, international trade, information economics, and monetary economics. Course readings are primarily from journal articles. Prerequisite: ECON 60700. ECON 61000. Typically offered Fall Spring.**Credits:** 1.00 to 3.00

ECON 68600 - Experimental Economics II

Credit Hours: 2.00 or 3.00. Covers topics different from ECON 685, and they vary from year to year. May be taken prior to ECON 685. Course readings are primarily from journal articles. Prerequisite: ECON 60700. 61000. Typically offered Fall Spring.**Credits:** 2.00 or 3.00

ECON 68900 - Experimental And Behavioral Economics

Credit Hours: 2.00. The course will cover: (i) experimental methodology; (ii) statistical considerations in experiments; (iii) behavioral game theory (including psychological games and boundedly rational thinking in games); (iv) loss aversion and reference points (including prospect theory, expectations-based reference points, and goal setting); and (v) experiments on gender. We will also discuss how to develop good research ideas in experimental economics, and how to write papers in a way that appeals to top journals in the field. Typically offered Fall Spring.**Credits:** 2.00

ECON 69000 - Advanced Problems In Economics

Credit Hours: 1.00 to 4.00. Advanced individual reading and investigation in a specific economic field at the graduate level. Open to individual students with superior records. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 1.00 to 4.00

ECON 69100 - Advanced Topics In Panel Data

Credit Hours: 2.00 or 3.00. This course covers selected topics in the econometrics of panel data with an emphasis on developing a clear understanding of the methodological issues involved as well as identifying a set of substantive empirical issues where such methods can be applied. Prerequisite: ECON 67100 and ECON 67200.**Credits:** 2.00 or 3.00

ECON 69200 - Advanced Topics In Time Series

Credit Hours: 2.00 or 3.00. This course covers a set of selected topics of current interest in eco-nomic forecasting. It is designed for students interested in conducting theoretical research related to the development and evaluation of new forecasting techniques as well as those inclined towards the application of state-of-the-art techniques to economic data.**Credits:** 2.00 or 3.00

ECON 69300 - Bayesian Econometrics I

Credit Hours: 2.00 or 3.00. This is a first course in Bayesian Econometrics. The overarching goal of the course is to expose students to the Bayesian perspective and get them up-to-speed with modern Bayesian simulation methods.**Credits:** 2.00 or 3.00

ECON 69400 - Bayesian Econometrics II

Credit Hours: 2.00 or 3.00. This is a second course in Bayesian Econometrics. After completion student should be able to conduct research in Bayesian econometrics using state-of-the-art models and techniques. Pre-requisite: ECON 69300.**Credits:** 2.00 or 3.00

ECON 69700 - Research Methods In Economics

Credit Hours: 2.00 or 3.00. The first steps in doing a thesis research paper, proposal/idea, growing the proposal/idea. Developing a set of critical professional skills. Pre-requisite: ECON 60700 and ECON 60800.**Credits:** 2.00 or 3.00

ECON 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 1.00 to 18.00

ECON 69900 - Research PhD Thesis

Credit Hours: 1.00 to 18.00. Research PhD Thesis. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 1.00 to 18.00

Education-Curriculum and Instruction

EDCI 20001 - Special Populations Seminar: Focus On Students With Disabilities And Differentiation Approaches

Credit Hours: 1.00. (EDPS 20001) This seminar is focused on special populations of learners for teacher education majors with an emphasis on exceptional students and approaches to curricular differentiation. Students will engage in mentoring activities and ongoing support in their development as a professional. The goal of the seminar is to connect theory to practice by engaging in an immersive field experience that connects to content and courses taken concurrently. The seminar provides an environment conducive to fostering rich relationships with schools and communities, pursuing common inquiry, thinking critically about theory, content and practice and advocating for equitable schooling. This seminar includes a field experience targeting schools and classrooms including exceptional students. This seminar is intended to be taken concurrently with EDPS 24800 and EDPS 26501. Typically offered Fall Spring Summer.**Credits:** 1.00

EDCI 20002 - Special Populations Seminar: English Language Learners And Students With Gifts And Talents

Credit Hours: 1.00. (EDCI 20002) This seminar is focused on special populations of learners for teacher education majors with an emphasis on students who are English learners and students with gifts, talents, and creativity. Students will engage in mentoring activities and ongoing support in their development as a professional. The goal of the seminar is to connect theory to practice by engaging in an immersive field experience that connects to content and courses taken concurrently. The seminar provides an environment conducive to fostering rich relationships with schools and communities, pursuing common inquiry, thinking critically about theory, content and practice and advocating for equitable schooling. This seminar includes a field experience targeting schools and classrooms with ELLs and students with gifts, creativity, and talents. This seminar is intended to be taken concurrently with EDPS 24000 and EDCI 37001. Typically offered Fall Spring Summer.**Credits:** 1.00

EDCI 20500 - Exploring Teaching As A Career

Credit Hours: 2.00 to 3.00. Students will become familiar with the work of teachers and begin to develop their educational philosophies through examining what it means to teach and to learn and the nature and purpose of schools. Students will critically evaluate teaching as their chosen profession. This course includes a required weekly field-based experience in an elementary, middle, or high school classroom. **Credits:** 2.00 to 3.00

EDCI 20700 - Construction And Textile Lab Management

Credit Hours: 3.00. A lecture/lab course which provides clothing construction and textile science content to be applied in the secondary family and consumer sciences classroom. Typically offered Fall.**Credits:** 3.00

EDCI 21000 - Education Scholars Program I

Credit Hours: 1.00 to 3.00. EDCI 21000 is the first course in a two course, introductory sequence for College of Education students enrolled in the Honors College and/or DeVito Program scholarship recipients. In this course, we will examine key concepts and ideas in educational thought and research, understand what research is, and begin to explore individual students' research interests.**Credits:** 1.00 to 3.00

EDCI 21100 - Education Scholars II

Credit Hours: 1.00 to 3.00. This is the second course in a two course, introductory sequence for College of Education students enrolled in the Honors College and/or DeVito Program scholarship recipients. In this course, students will work on a research project with a faculty mentor, will participate in reflection and discussion of that research experience, will participate in seminars with faculty to read and discuss research, and continue to explore their own research interests and campus resources. **Credits:** 1.00 to 3.00

EDCI 21510 - Language & Literacy Foundations For Teachers

Credit Hours: 1.00. The goal of the course is to provide background information in language and literacy necessary for success in literacy methods courses. The course will address basic linguistics and phonetic patterns of English, as well as the structures of literature and literary terms. Typically offered Fall Spring Summer.**Credits:** 1.00

EDCI 21610 - Teaching History: Standards And Strategies

Credit Hours: 1.00. Course prepares students for teaching history in powerful, exciting and innovative ways through a topical study (e.g., American Civil Rights Movement) approach. Required for all Social Studies Education majors. Typically offered Fall Spring Summer.**Credits:** 1.00

EDCI 21710 - Teaching Geography: Standards And Strategies

Credit Hours: 1.00. Course prepares students for teaching geography in powerful, exciting and innovative ways through a study of geographic concepts within the framework of inquiry design model (IDM) and an inquiry-based curriculum. Required for all Social Studies Education majors. Typically offered Fall Spring Summer.**Credits:** 1.00

EDCI 21810 - Teaching Civics And Government: Standards And Strategies

Credit Hours: 1.00. Course prepares students for teaching civics and government in powerful, exciting and innovative ways through a study of civics and political science concepts within the framework of inquiry design model (IDM) and an inquiry-based curriculum Required for all Social Studies Education majors. Typically offered Fall Spring Summer.**Credits:** 1.00

EDCI 21910 - Teaching For Economic Literacy: Developing An Economic Way Of Thinking

Credit Hours: 1.00. Course focuses on preparing students in the social studies education licensure program to teach high school economics and to integrate economics into other middle and/or high school social studies courses. Course addresses issues of economic pedagogy. It will address economic content/concepts specifically and only in a way to illustrate/expand on the teaching ideas, resources, methods, and assessment. Typically offered Fall Spring.**Credits:** 1.00

EDCI 22200 - Knowing The World Through Mathematics

Credit Hours: 3.00. In this course, *Knowing the World Through Mathematics*, students will connect their situated experiences to larger trends in equity and social justice around the globe through mathematical investigations embedded in the context of the United Nations 2030 Agenda (United Nations, 2015). Students in this course will make use of mathematics and global policy documents to critically interpret, model, and represent world phenomena. Students will collaboratively analyze quantitative information gathered through trustworthy, globally representative data sets and individual survey and questionnaire items to investigate local experiences in relation to students' area(s) of interest. Students will learn about and utilize the GAISE Framework for Statistical Problem Solving (Franklin, et al., 2005) and the Four Dimensions of Equity in Mathematics Education (Gutiérrez, 2012) to ground their discussions and deliverables for *Knowing the World Through Mathematics*. Typically offered Fall Spring Summer.**Credits:** 3.00

EDCI 22550 - Mathematics Education Seminar

Credit Hours: 1.00. In this course, students will be introduced to many aspects of mathematics education, including pedagogies, professional organizations, standards, research, lesson planning, technology, etc. In addition, they will have opportunities to get to know others in their major earlier in their program. Typically offered Spring.**Credits:** 1.00

EDCI 25000 - Professional Development In Family And Consumer Sciences Education

Credit Hours: 1.00 or 2.00. This course focuses on students' professional development as family and consumer sciences educators. Characteristics and relationships among middle and high school family and consumer sciences standards, resources, and learning experiences; the Purdue Family and Consumer Sciences Education program; and expectations for Indiana FCS teacher-licensure are emphasized. Includes participation in professional organizations and meetings.**Credits:** 1.00 or 2.00

EDCI 27000 - Introduction To Educational Technology And Computing

Credit Hours: 1.00 to 3.00. Addresses fundamentals of educational technology, including the integration of instructional design, media, computers and related technologies within the classroom setting. **Credits:** 1.00 to 3.00

EDCI 28500 - Multiculturalism And Education

Credit Hours: 2.00 to 3.00. This course integrates an understanding of multiculturalism with principles of democratic education. Historical, sociological, cultural, political, philosophical, and pedagogical foundations of multiculturalism are explored and related to issues of pedagogy in a pluralistic society. Typically offered Fall Spring Summer.**Credits:** 2.00 to 3.00

EDCI 30101 - Inquiry Into Teaching And Learning In K-2

Credit Hours: 1.00. The goal of the seminar is to connect theory to practice by engaging in an immersive field experience that connects to content and courses taken concurrently through cycles of inquiry. In particular, this seminar is intended to be an inquiry space for questions and topics related to teaching using pedagogies of care in the K-2 classroom. Admission to Teacher Education required. Cannot be taken concurrently with EDCI 30002.**Credits:** 1.00

EDCI 30102 - Inquiry Into Teaching And Learning In 3-6

Credit Hours: 1.00. The goal of the seminar is to connect theory to practice by engaging in an immersive field experience that connects to content and courses taken concurrently through cycles of inquiry. In particular, this seminar is intended to be an inquiry space for questions and topics related to teaching using pedagogies of care in the 3-6 classroom. Admission to Teacher Education is required. Cannot be taken concurrently with EDCI 30101.**Credits:** 1.00

EDCI 30900 - Reading In Middle And Secondary Schools: Methods And Problems

Credit Hours: 1.00 to 3.00. For prospective teachers at junior and senior high schools. An overview of reading processes, fundamentals of reading instruction, factors that influence the ability to read text materials, strategies and materials for identifying and reducing reading problems, school resources, and programs for normal and deficient readers. Concurrent enrollment with program-specified methods course.**Credits:** 1.00 to 3.00

EDCI 31100 - Media For Children

Credit Hours: 3.00. Books and other resources designed for children and adolescents are studied and evaluated in terms of literary theory and aesthetic appreciation. Emphasis is placed on literature and its place in the child's world. **Credits:** 3.00

EDCI 31101 - Integrating Media In The K-2 Classroom

Credit Hours: 2.00. The goal of the course is for teacher candidates to understand how to choose and evaluate children's literature and media to use in K-2 classroom, develop ways to integrate literature and understanding of literature and media using a variety of methods, select appropriate materials for individual student's needs, and assess student's learning. Admission to Teacher Education is required.**Credits:** 2.00

EDCI 31102 - Integrating Media In The 3-6 Classroom

Credit Hours: 1.00. The goal of the course is for teacher candidates to understand how to choose and evaluate children's literature and media to use in the 3-6 classroom, develop ways to integrate literature and media throughout the curriculum, support students' understanding of literature and media using a variety of methods, select appropriate materials for individual student's needs, and assess students' learning.**Credits:** 1.00

EDCI 31950 - Approaches To English Learner Education

Credit Hours: 3.00. This course addresses English language instruction and content instruction for English Learning students in mainstream classrooms. The purpose of this course is to provide information necessary to the design of materials and instructional strategies for English Language Learners in K-12 context. In this course, we will focus on current issues and techniques in instruction for ELL students who are at different stages of English language acquisition in the K-12 school context. The course will also consider the nature of immigrants' experiences of a new country and school context. Practical field experiences integrated into the course will provide students with the opportunity to apply and demonstrate principles and strategies presented in the course.**Credits:** 3.00

EDCI 32250 - Physical Education In The Elementary School

Credit Hours: 2.00. Current conceptions of elementary school physical education, with a particular emphasis on curriculum implementation.**Credits:** 2.00

EDCI 32500 - Literacy In The Early Childhood Classroom

Credit Hours: 3.00. Students will study how children's oral language develops, how children learn to read and write in early childhood/K3 settings, and the teacher's role in this process. Students will learn how phonemic awareness, phonics, fluency, vocabulary, and comprehension influence children's literacy development. Students will learn how to select appropriate instructional materials; employ teaching strategies to meet the cognitive and affective literacy needs of all children; and collect, interpret, and use data from various types of assessments to inform literacy teaching and learning processes. **Credits:** 3.00

EDCI 32501 - Teaching Literacy In K-2

Credit Hours: 2.00. Students will study how children's oral language develops, how children learn to read and write in primary grade settings, and the teacher's role in this process. Students will learn how phonemic awareness, phonics, fluency, vocabulary and comprehension influence children's literacy development. Students will learn how to select appropriate instructional materials; employ teaching strategies to meet the cognitive and affective literacy needs of all children, and collect, interpret, and use data from various types of assessments to inform literacy teaching and learning processes.**Credits:** 2.00

EDCI 32600 - Literacy In The Intermediate Classroom

Credit Hours: 3.00. This course includes a field-based component. Students will build on material learned in EDCI 32500. They will concentrate on increasing student's literacy skills with a focus on fluency, phonics, strategic reading, vocabulary, literary analysis, content area reading, the writing process, and building comprehension skills. They will learn to select appropriate materials, employ strategies to meet the cognitive and affective literacy needs of all children; and create integrate, and use data from various forms of assessment to inform the teaching and learning process. **Credits:** 3.00

EDCI 32602 - Teaching Literacy In 3-6

Credit Hours: 2.00. Students will build on material learned in EDCI 32501. They will concentrate on increasing student's literacy skills with a focus on fluency, phonics, strategic reading, vocabulary, literary analysis, content area reading, the writing process, and building comprehension skills. They will learn to select appropriate materials, employ strategies to meet the cognitive and affective literacy needs of all children, and create integrate, and use data from various forms of assessment to inform the teaching and learning process.**Credits:** 2.00

EDCI 32650 - Introduction To Linguistics And Language Acquisition In Education

Credit Hours: 3.00. This course addresses foundational knowledge in language and linguistics for pre-service teachers and educational researchers. The purpose of this course is to survey linguistics, the study of the science of language. In this course, we will focus on phonetics, phonology, morphology, syntax, and semantics. These topics will be discussed in terms of theory, as well as in the context of ESL classroom instruction, materials development, and assessment.**Credits:** 3.00

EDCI 33500 - Reading Instruction For Tier 1 And Tier 2

Credit Hours: 2.00. Given the needs of struggling/striving readers throughout the educational system, this class will focus on effective interventions from the primary grades through high school. Instructors will present a balance of theoretical and practitioner-oriented aspects of reading development and instruction. The course will also examine a number of reading models and instructional approaches designed to ensure all students have access to effective, research-based literacy instruction. The goal is to ensure students complete the semester with a range of essential tools for working with this population. Typically offered Fall Spring.**Credits:** 2.00

EDCI 35000 - Community Issues & Applications For Educators

Credit Hours: 1.00 to 3.00. This course is an examination of diverse individual, family, and community characteristics and issues, and potential impacts on teaching and learning processes. Includes service learning with human service agencies and

personnel in the school and community. As part of this course, students complete certification to meet the Indiana Department of Education suicide prevention training requirement for teacher licensure.**Credits:** 1.00 to 3.00

EDCI 35001 - Tanzania Seminar

Credit Hours: 2.00. In this course, we will prepare for the Maymester in Tanzania study abroad program in a variety of ways, including investigating the history and culture of Tanzania, beginning to learn Kiswahili, conceptualizing service learning experiences, and collaborating on a plan for program logistics.**Credits:** 2.00

EDCI 35002 - International Comparative Education

Credit Hours: 3.00. In this course, students will explore the education system in an international context and compare particular aspects of the system (e.g., equity, funding, language, accessibility) to their own experiences with, and knowledge of, education in the United States. Students will consider the range of schools and policies in both countries in terms of issues of social justice (e.g., redistribution, recognition, representation).**Credits:** 3.00

EDCI 35003 - Knowing Africa Through Literature

Credit Hours: 3.00. Through a set of texts, this course will offer opportunities to understand, broaden and question a new (to you) and significantly different culture and your experiences in that culture. You will read a variety of African literature, including short stories, novels, and poetry, in order to investigate perspectives on African history, culture, language and education. You will then draw upon your personal encounters and activities while in Tanzania to extend your learning. Typically offered Summer.**Credits:** 3.00

EDCI 35004 - History, Culture, And Language In Tanzania

Credit Hours: 3.00. This course is a component of the Maymester in Tanzania study abroad program. In this course, students will study the history, culture, and language of Tanzania through experiences in local schools and the community, supplemented by course readings, assignments, discussions, and service learning projects. Typically offered Summer.**Credits:** 3.00

EDCI 35600 - Career Education In Family And Consumer Sciences

Credit Hours: 3.00. Examination of middle and high school career education accomplished through family and consumer sciences, including (1) life and career exploration and planning; (2) analysis of career paths and opportunities in family and consumer sciences; and (3) career preparation through laboratory and cooperative education programs. Historical and contemporary foundations for career education in family and consumer sciences is also are addressed. Includes observations and interactions with students and teachers in career-education programs and participation in professional meetings.**Credits:** 3.00

EDCI 35950 - Content Area Instruction For English Learners

Credit Hours: 3.00. This course identifies the linguistic challenges faced by English language learners (ELLs) in the content areas of English language arts, mathematics, science, and the social studies. Participants will learn to describe how language varies in the way it presents knowledge in different content areas. The course links these challenges to English language instruction and subject-matter instruction in English for ELLs who are in general education classrooms. The course emphasizes assessment tools designed to assess content knowledge and links these students' English language development. Participants will describe academic tasks that require advanced levels of reading and writing and the expectations for the development of academic literacy as ELLs move from elementary to secondary "literacy" contexts, or the kinds of meaning-making typical of secondary and postsecondary education.**Credits:** 3.00

EDCI 36000 - Curriculum And Instruction In Family And Consumer Sciences: Middle School

Credit Hours: 3.00. Instructional program development for family and consumer sciences. Developmental needs and issues of early adolescents; study of adolescent literacy; and curriculum integration of language arts, math, and other content areas are emphasized. Development of a comprehensive unit of instruction that incorporates standard-based curriculum, assessment, and instruction for family and consumer sciences is a major component of the course. Includes observations and interactions with family and consumer sciences teachers and students and participation in professional meetings.**Credits:** 3.00

EDCI 36100 - Social Studies In The Elementary School

Credit Hours: 3.00. Provides students with an overview of the field of social studies, of selected issues in the field, and of best practice strategies for teaching social studies to elementary school children. Encourages participants to reflect on social studies knowledge, skills and dispositions, how students learn these most effectively, and how best to teach social studies. Includes a field-based experiential component. No undergraduate students may be enrolled in any of these undergraduate courses until they have been admitted to teacher education. **Credits:** 3.00

EDCI 36101 - Teaching Social Studies In K-2

Credit Hours: 2.00. This course provides students with an overview of the field of social studies, of selected issues in the field, and of best practice strategies for teaching social studies to children in the K-2 classroom. Students will work to identify the most important social studies knowledge, skills and dispositions; investigate how K-2 children learn social studies most effectively. Students will then use their new understandings to implement lessons, analyzing the effectiveness of their instruction for children in the K-2 grades. Admission to Teacher Education is required.**Credits:** 2.00

EDCI 36102 - Teaching Social Studies In 3-6

Credit Hours: 2.00. This course provides students with an overview of the field of social studies, of selected issues in the field, and of best practices strategies for teaching social studies to children in the 3-6 classroom. Students will work to identify the most important social studies knowledge, skills and dispositions; investigate how 3-6 children learn social studies most effectively. Students will then use their new understandings to implement lessons, analyzing the effectiveness of their instruction for children in the 3-6 grades.**Credits:** 2.00

EDCI 36300 - Literacy In The Elementary School II

Credit Hours: 3.00. Focuses on teaching children who experience difficulty acquiring literacy. Assessments of children's strengths and needs are used to plan and evaluate instruction. Strategies for helping children develop more mature literacy understandings are applied in weekly small-group instructional sessions. Includes a field-based experiential component. Taken concurrently with EDPS 43000. **Credits:** 3.00

EDCI 36303 - Literacy Teaching And Assessment In K-6

Credit Hours: 2.00. This course is an undergraduate, elementary education course designed to provide preservice teachers with classroom and practicum experiences focused on literacy instruction for children experiencing difficulty learning to read and write. Students learn to administer and analyze individual assessments to determine the strengths and needs of a struggling reader/writer and set tutoring goals based on these results. Application of appropriate instructional strategies for developing comprehension, letter and word study, vocabulary, and fluency is the focus of twice-weekly, 30 minute tutoring sessions (22+ total) in local elementary schools. Teaching is designed around children's social justice concerns. Admission to Teacher Education is required.**Credits:** 2.00

EDCI 36400 - Mathematics In The Elementary School

Credit Hours: 3.00. Focuses on teaching mathematics in the elementary school. Students learn what it means to teach mathematics when reasoning, problem-solving, communication, and connections are the foci. Includes a field-based experiential component. **Credits:** 3.00

EDCI 36401 - Teaching Mathematics In K-2

Credit Hours: 2.00. This course focuses on teaching mathematics in the elementary school, grades K-2, and encouraging children as mathematical problem posers. Students learn what it means to teach math interactionally using children's ideas, beliefs, and experiences as primary resources. Eliciting and interpreting children's mathematical thinking as well as mathematical reasoning, problem solving, communication, and connections are foci. Admission to Teacher Education required.**Credits:** 2.00

EDCI 36402 - Teaching Mathematics In Grades 3-6

Credit Hours: 2.00. Focuses on teaching mathematics in the elementary school grades 3-6. Students learn what it means to teach mathematics interactionally using children's ideas, beliefs, and experiences as primary resources. Mathematical reasoning, problem solving, communication, and connections are foci.**Credits:** 2.00

EDCI 36500 - Science In The Elementary School

Credit Hours: 3.00. Investigates ways children learn science as a basis for planning, enacting, and assessing science curriculum and instruction. State and national standards, teaching cases, and science lab experiences are used as tools for reflecting on practice. Includes a field-based experiential component. Taken concurrently with EDCI 36400 and EDCI 37000. **Credits:** 3.00

EDCI 36501 - Teaching Science Through Design In Grades K-2

Credit Hours: 2.00. One of the primary goals of this course is to provide you with opportunities to enhance your pedagogical knowledge and skills so that you can become a culturally inclusive and effective teacher. Hence, learning to teach science in this class will involve conceptualizing science as a verb and not as a noun. To make the distinction more precise, we prefer to use the term critical cross-cultural science education instead of science education when referring to the teaching and learning of science in the increasingly culturally diverse context of schools in the US. Critical cross-cultural science education is defined as the process of actively engaging students in collaborative inquiry about what science is; whose interests are served by science; who decides what science is and what gets funded as science; and what kinds of individual and collective roles individuals could play as informed and responsible citizens in supporting the advancement of science to benefit society. Admission to teacher education required. At least 9 credits of science content required.**Credits:** 2.00

EDCI 36502 - Teaching Science Through Design In Grades 3-6

Credit Hours: 2.00. The aim of this course is to prepare students to teach science, engineering, and computational thinking with grade 3-6 learners by building on existing pedagogical and subject matter knowledge in science. Students will engage in science and engineering learning experiences; identify and analyze children's ideas and background experiences; and examine instructional strategies for leveraging students' sense making. Using this knowledge, students will plan for and implement standards-based lessons, reflecting on the strengths and areas of improvement of their instruction for grade 3 through 6 learners. At least 9 credits of science content courses are required.**Credits:** 2.00

EDCI 37001 - Teaching And Learning English As A New Language

Credit Hours: 2.00 or 3.00. This course builds foundational knowledge on the theories and practices related to the English language development of English language learners in the P-12 contexts. Particular attention is given to the current issues as well

as on techniques for instructing and assessing students at different stages of English language development in the school context. Students will learn to identify students' strengths and current needs in English, to design classroom experiences across the curriculum, and to assess student performance using current WIDA standards.**Credits:** 2.00 or 3.00

EDCI 38100 - Teaching For Social Justice: Culturally And Linguistically Diverse Learners

Credit Hours: 3.00. This course builds on the content of EDCI 28500 (Multicultural Education) with specific attention to issues of social justice related to literacy and linguistic diversity. Within this framework, students will learn strategies for teaching English language learners, deconstruct deficit perspectives of dialectical differences, and consider approaches to classroom management. Additionally, a field experience component with an ELL teacher will be included in the course. Typically offered Fall.**Credits:** 3.00

EDCI 42100 - The Teaching Of Biology In Secondary Schools

Credit Hours: 3.00. The rationale, objectives, methods, and materials of teaching biology and life science in junior and senior high schools. Extensive use of multimedia resources in planning specifically for the student teaching experience. No undergraduate students may be enrolled in any of these undergraduate courses until they have been admitted to teacher education. **Credits:** 3.00

EDCI 42200 - The Teaching Of English In Secondary Schools

Credit Hours: 3.00. Explores a wide variety of instructional practices suitable for teaching middle and high school English including language, literature, and writing - addressing specific pedagogical issues such as teaching diverse learners and developing cohesive units of instruction.**Credits:** 3.00

EDCI 42300 - The Teaching Of Social Studies In Secondary Schools

Credit Hours: 3.00. The purpose of this course is the development of a theoretical framework and pedagogical skills necessary to teach social studies to middle and high school students. Students are introduced to the general issues involved in planning and organizing a social studies curriculum.**Credits:** 3.00

EDCI 42400 - The Teaching Of Earth And Physical Science In The Secondary Schools

Credit Hours: 3.00. The methods and materials needed for the teaching of chemistry, earth-space, physics, and general science in the secondary schools, including field experience. No undergraduate students may be enrolled in any of these undergraduate courses until they have been admitted to teacher education. May be taken for two credits (no field experience) by students who are enrolled in another methods course with field experience. **Credits:** 3.00

EDCI 42500 - Teaching Of Secondary Mathematics - Methods I

Credit Hours: 3.00. This is the first of two methods courses designed for students who are planning to be secondary mathematics teachers. The course content is organized around principles of equity, curriculum, teaching, learning, assessment and technology. It also focuses on the cycle of effective teaching, which includes justifying planning decisions, analyzing teaching, and using data to inform instruction. The courses addresses NCTM's principles and standards, as well as the content and process standards included in Indiana Academic Standards for Mathematics, and pedagogical strategies for teaching these in ways that serve the diverse population of mathematics learners. **Credits:** 3.00

EDCI 42600 - Teaching Of Secondary Mathematics - Methods II

Credit Hours: 3.00. This is the second of two methods courses designed for students who are planning to be secondary mathematics teachers. The course content is organized around principles of equity, mathematical task design, classroom discourse, classroom environment assessment and technology. It also focuses on the cycle of effective teaching, which includes justifying planning decisions, analyzing teaching, and using data to inform instruction. The courses addresses NCTM's Professional Standards as well as the content and process standards included in Indiana Academic Standards for Mathematics and pedagogical strategies for teaching in ways that serve the diverse population of mathematics learners.**Credits:** 3.00

EDCI 42700 - Teaching Of World Languages

Credit Hours: 3.00. This is one of the two methods courses required for World Language Teaching major. While LC 47500 is a theoretical course, this course is a practical course on world language teaching in secondary school.**Credits:** 3.00

EDCI 42800 - Teaching Science In The Middle And Junior High School

Credit Hours: 2.00. Designed to prepare preservice teachers to teach science in the middle and junior high school (grades 5-9). No undergraduate students may be enrolled in any of these undergraduate courses until they have been admitted to teacher education.**Credits:** 2.00

EDCI 43000 - The Teaching Of Foreign Languages In Junior High And Middle School

Credit Hours: 2.00. An examination of second language listening, reading, speaking, and writing skills, along with information on cultural problems. No undergraduate students may be enrolled in any of these undergraduate courses until they have been admitted to teacher education. **Credits:** 2.00

EDCI 43300 - Advanced Social Studies Methods

Credit Hours: 2.00. Foundations of social studies; methods, techniques, strategies of teaching, and activities - with special attention to skills of planning, questioning, and testing. Includes observation, participation, and microteaching in social studies classrooms. No undergraduate students may be enrolled in any of these undergraduate courses until they have been admitted to teacher education.**Credits:** 2.00

EDCI 43400 - Literacy Teaching And Learning In Secondary Schools

Credit Hours: 2.00. Exploration and development of various instructional methods and materials appropriate for supporting adolescent literacy in secondary English (i.e., middle and high school English Language Arts), including the teaching of reading. Content-area literacy methods and materials are also addressed. Includes a field experience of up to 20 hours in a secondary English school setting. **Credits:** 2.00

EDCI 44400 - Methods For Teaching Family And Consumer Sciences

Credit Hours: 4.00. The culminating on-campus teacher-education course for the Purdue University Family and Consumer Sciences program. The course builds and consolidates teacher-candidates' knowledge and skills for teaching family and consumer sciences. Emphasis placed on standards-based instructional planning and materials; instructional strategies, including laboratories, assessment of student learning, and classroom management. Course includes field experiences. Program content requirements should be completed previous to or concurrent with this course. **Credits:** 4.00

EDCI 44600 - Directed Observation For Family And Consumer Sciences

Credit Hours: 1.00 to 4.00. Field-based experience in a middle or high school, a Cooperative Extension setting, or other applicable career setting for family and consumer sciences educators. Build professional capacity through focused, participatory

experiences that include interactions with family and consumer sciences educators, other school/agency personnel, and students/clients. Thirty-five hours of documented experience in approved setting needed for one credit. **Credits:** 1.00 to 4.00

EDCI 45200 - Global Studies Seminar

Credit Hours: 1.00. (EDPS 45200) The course builds on students' international cross-cultural experiences, particularly Study Abroad. The course is required for those wishing to complete the Global Studies minor in the College of Education. Typically offered Fall Spring Summer.**Credits:** 1.00

EDCI 49000 - Individual Research And Teaching Experience

Credit Hours: 1.00 to 8.00. Primarily for teacher candidates requiring special, individualized experience in research or teaching. Permission of instructor required. **Credits:** 1.00 to 8.00

EDCI 49200 - Honors Scholarly Project Capstone

Credit Hours: 1.00 to 6.00. This course is designed to provide students with an introduction to designing and writing a proposal for the Honors Scholarly Project. **Credits:** 1.00 to 6.00

EDCI 49600 - Student Teaching In The Elementary School

Credit Hours: 8.00 to 16.00. Full time elementary classroom teaching experiences and a student teaching seminar under the mentorship of the classroom teacher and a University supervisor. **Credits:** 8.00 to 16.00

EDCI 49601 - Elementary Education Expanded Student Teaching

Credit Hours: 1.00 to 8.00. This course is the initial residency experience that precedes a full semester of student teaching. The seminar and field experience focus on induction into the broader elementary school context and building mentoring relationships as both a mentee and mentor. Students will develop their identity as a professional educator who advocates for the profession, themselves, and their students. Includes a field experience. Admission to Teacher Education required.**Credits:** 1.00 to 8.00

EDCI 49800 - Supervised Teaching

Credit Hours: 8.00 to 16.00. Teaching full time in a school classroom under the supervision of the teacher in charge of the class and a University supervisor. Completion of education methods courses and other Gate requirements for the major area and admittance to teacher education required. **Credits:** 8.00 to 16.00

EDCI 50000 - Foundations Of Literacy

Credit Hours: 3.00. Survey course in the acquisition of and instruction in reading, writing, and other aspects of language. **Credits:** 3.00

EDCI 50200 - Reading In Middle And Secondary Schools

Credit Hours: 3.00. A course designed for teachers and prospective teachers in subject matter areas of the junior and senior high school. Surveys of techniques and objectives of reading instruction in the schools with special attention to the opportunities and obligations to teach reading within content areas. Teaching experience helpful but not required. May be taken as part of the sequence leading to reading specialist or for the junior high school endorsement program. Typically offered Fall Spring.**Credits:** 3.00

EDCI 50600 - Environmental Education

Credit Hours: 3.00. Synthesis of philosophies, scientific principles and methods for environmental education programs in forests, camps, and schools. Students conduct and summarize literature research on scientific and educational principles. In interdisciplinary teams, they develop, implement, and evaluate curricula for schools, nature centers, interpretive and outdoor education programs. Typically offered Fall Spring.**Credits:** 3.00

EDCI 50900 - Writing In Middle And Secondary Schools

Credit Hours: 3.00. Focuses on understanding philosophical and theoretical approaches, such as the writing process model, current reading/writing research, and how various approaches fit into existing school curriculum. Typically offered Fall Spring Summer.**Credits:** 3.00

EDCI 51000 - Colloquium In Science And Mathematics Education

Credit Hours: 1.00. Weekly colloquia on individual research topics of interest to science and mathematics education faculty and graduate students. Colloquia will describe research programs in education. Course will be required of first-year graduate students. Typically offered Fall.**Credits:** 1.00

EDCI 51200 - Mathematics In The Secondary School

Credit Hours: 3.00. Models of mathematics learning, current curriculum trends and practices with emphasis on laboratory and individualized systems; designing instructional materials. Typically offered Fall Spring.**Credits:** 3.00

EDCI 51300 - Foundations Of Learning Design And Technology

Credit Hours: 3.00. Provides an historical overview of the field and delineates the foundational knowledge, skills, and attitudes needed by professionals in the field of educational technology and instructional design. Students explore the field by engaging in collaborative projects, along with thinking and writing about various aspects of educational technology and the underlying instructional design theories. Typically offered Summer Fall Spring.**Credits:** 3.00

EDCI 51600 - Seminar In Environmental Education

Credit Hours: 3.00. The seminar covers current research and literature in environmental education, focusing on teaching children and adults about the environment. Topics vary by semester and student interest. Typically offered Summer Fall Spring.**Credits:** 3.00

EDCI 51700 - Survey Of Science Education

Credit Hours: 3.00. Introduction to current issues and research in science education, broadly organized under themes of learning, teaching, and science curriculum. Typically offered Fall.**Credits:** 3.00

EDCI 51800 - The Nature Of Science In Science Teaching

Credit Hours: 3.00. Explores philosophical issues related to the scientific enterprise, such as the production and validation of scientific knowledge; the role of the scientific community; and the influence of gender and culture on doing science. Also examines the implications of these issues for science teaching and learning, as well as for research in science education. Typically offered Spring.**Credits:** 3.00

EDCI 51900 - Teaching English Language Learners

Credit Hours: 3.00. This course focuses on current issues and techniques in ESL instruction and assessment for students at the beginning or intermediate stages of English language acquisition Pre-K-12. Emphasis is on the design of materials and instruction that foster English language development in the content areas of the curriculum (i.e., Specially Designed Academic Instruction in English or SDAIE). Some familiarity with elementary and/or secondary teaching methods is assumed. Typically offered Fall Spring Summer.**Credits:** 3.00

EDCI 52001 - Curriculum And Instruction Online MS Seminar I

Credit Hours: 1.00. This boot camp is designed to help you to understand the knowledge and skills necessary for your successful online learning in the Curriculum and Instruction program. In this orientation, you will explore what online learning entails and reflect on how you can best set yourself up to succeed in your studies. You will also learn about various learning strategies and online resources that you can utilize in your courses. In this seminar, you will be responsible for completing all assignments on time over the course of the semester. Read the guidelines for each week and complete the assignments. NOTE: This course is a core course in the C&I online masters program. A grade of B- or better is required (if a lower grade is received, the course must be retaken). Permission of department required. Typically offered Fall Spring Summer.**Credits:** 1.00

EDCI 52002 - Curriculum And Instruction Online MS Seminar II

Credit Hours: 1.00. This seminar is designed to help you to understand the knowledge and skills necessary for your success throughout the Curriculum and Instruction program. In addition to providing you with information that will help you succeed in the program, you are also asked to think about ways to make yourself more marketable to current and future employers. Permission of department required. Typically offered Fall Spring Summer.**Credits:** 1.00

EDCI 52003 - Theories And Trends In Curriculum And Instruction

Credit Hours: 3.00. This course focuses on current theories and trends influencing curriculum and instruction. A theory is a plausible or scientifically acceptable general principle or body of principles offered to explain phenomena. It is a belief, policy, or procedure proposed or followed as the basis of action. A trend, on the other hand, is a pattern of gradual change in a condition, output, or process. It reflects a general tendency of a series of moves in a certain direction over time. We will focus on understanding sources of current theories and trends and how they may influence work in curriculum and instruction. Permission of department required. Typically offered Fall Spring Summer.**Credits:** 3.00

EDCI 52004 - Teachers As Leaders

Credit Hours: 3.00. This course focuses on teacher leadership in instruction. Participants will examine the history of teacher leadership. Instructional coaching models will be examined and compared. Students will identify the various theories that support each coaching model and examine what is most present in their school contexts. Permission of department required. Typically offered Fall Spring Summer.**Credits:** 3.00

EDCI 52301 - Foundations Of Bilingual Education

Credit Hours: 3.00. This course builds foundational and practical knowledge of children's bilingual development and the sociocultural, cognitive, philosophical, and educational basis for high-quality dual language and other bilingual education programs. It focuses on research and current issues related to the bilingual development of emergent bilinguals in K-12 contexts. It is designed for pre-service and in-service bilingual teachers and administrators, in addition to other teachers of English language learners and researchers interested in high-quality and equitable educational programs for bilingual students. Typically offered Fall Spring Summer.
Credits: 3.00

EDCI 52401 - Teaching Methods In Bilingual Education

Credit Hours: 3.00. Application of theory, research, and guiding principles to providing high-quality instruction in dual language and other bilingual education programs in K-12 education. This course includes a specific focus on both program-level design of effective dual language programs, and effective language and literacy instruction for emergent bilingual students leading to high levels of bilingualism, biliteracy, and academic achievement. This course is designed for pre-service and in-service bilingual teachers and administrators, in addition to other teachers of English language learners and researchers interested in high-quality and equitable educational programs for bilingual students. Typically offered Fall Spring Summer.**Credits:** 3.00

EDCI 52600 - Language Study For Educators

Credit Hours: 3.00. (ENGL 52900). Covers foundational knowledge in language and linguistics for teachers and educational researchers. Topics include structure and functions of language, language acquisition and development, language diversity, classroom discourse, language and media, and literacy-language arts curriculum. A foundation for work in Literacy and Language Education. Typically offered Spring.**Credits:** 3.00

EDCI 52700 - Science Methods In The Elementary School

Credit Hours: 3.00. The examination of learning theories, instructional methods, and curricular materials appropriate for teaching science concepts and skills in the elementary school setting. Students will apply, evaluate, and reflect upon elementary science teaching methods through class activities and field experience assignments. Acceptance into the Elementary Transition into Teaching (TTT) program. Typically offered Fall Spring.**Credits:** 3.00

EDCI 52800 - Human Performance Technology

Credit Hours: 3.00. This course provides an introduction to the field of human performance technology (HPT). It examines basic concepts and principles of human performance, the theoretical underpinnings of the field, research and application literature, and various approaches to solving human performance problems. A systematic approach to the analysis, design, development, implementation and evaluation of performance improvement interventions within organizations is emphasized. Typically offered Fall Spring Summer.**Credits:** 3.00

EDCI 53000 - English Language Development

Credit Hours: 3.00. Focuses on theoretical and practical knowledge for teachers about how second languages are learned, and on the educational and philosophical basis for second language teaching and learning. Links English language development to teaching and learning strategies and is designed for undergraduate and graduate students in education and practicing teachers. Typically offered Fall Spring Summer.**Credits:** 3.00

EDCI 53100 - Learning Theories And Instructional Design

Credit Hours: 3.00. This course has been designed to help you learn how theories of human learning and motivation can be applied to the instructional process in order to make the process more effective, efficient, and/or appealing. The focus of the course is on two areas: 1) the theoretical principles that have contributed to the field of Instructional Design (ID), and 2) how those principles can be applied within practical settings. Typically offered Fall Spring Summer.**Credits:** 3.00

EDCI 53300 - Teaching And Learning Number And Operations.

Credit Hours: 3.00. This course is designed to provide opportunities for mathematics educators to develop understanding of teaching and learning in the domain of number and operation. Central to this work is the construction of models of learners' understanding of number and operation and the use of those models to build and select curriculum. While curricular efforts have

historically taken as central a formal view of mathematics and its construction, more recently curriculum has been written to engage learners and to build from knowledge of learners' understanding. In this course we will develop models of learner's understandings of different facets of number and operation and then use those models and our emerging understanding of curriculum to explore challenges in teaching and learning. Typically offered Fall Spring Summer**Credits:** 3.00

EDCI 53400 - Teaching And Learning Geometry And Measurement

Credit Hours: 3.00. This course is designed to provide opportunities for mathematics educators to develop understanding of teaching and learning in the related domains of geometry and measurement. Central to this work is the construction of models of learners' understandings of geometry and measurement and the use of models to design instruction. Geometry, as a discipline in school mathematics, has historically and more currently been debated. In this course we will explore research in the teaching and learning of geometry and measurement. A synthesis of select literature will inform our efforts to develop models of learners' geometric reasoning and understanding of measurement. We will move past the development of models to the design of instruction meant to support understandings of concepts that utilizes technology. Typically offered Fall Spring Summer**Credits:** 3.00

EDCI 53500 - Teaching And Learning Algebra And Functions

Credit Hours: 3.00. This is a course for current or prospective mathematics teachers wishing to explore ways of teaching algebra with a focus on addressing concerns related to student performance in algebra and increasing algebraic reasoning skills in the classroom. The course includes experiences with inquiry-based learning by engaging participants in algebra activities from two secondary National Council of Teachers of Mathematics (NCTM) standards-based curricula. The course will provide opportunities for participants to collaborate on the development of algebraic thinking in mathematics classrooms and will address pedagogical approaches to students' learning of algebra. Typically offered Fall Spring Summer.**Credits:** 3.00

EDCI 53600 - Teaching And Learning Data Analysis And Probability

Credit Hours: 3.00. This course will provide opportunities for the growth of middle school mathematics teachers understanding of data analysis and probability as a means to help analyze and interpret experienced events. The course will address the following: selecting and using appropriate statistical methods to analyze data, developing and evaluating inferences and predictions that are based on data, and understanding and applying the basic concepts of probability. This course will also address pedagogical approaches to students' learning of data analysis and probability. Typically offered Fall Spring Summer**Credits:** 3.00

EDCI 53900 - Introduction To K-12 Integrated Science, Technology, Engineering And Mathematics (STEM) Education

Credit Hours: 3.00. This course will provide students with a conceptual understanding of integrated K-12 Science, Technology, Engineering and Mathematics (STEM) education and the nature of the disciplines of STEM. Students will explore implications for the teaching and learning of integrated STEM in a K-12 context through an evaluation of integrated approaches to STEM, national teaching standards and current research. Typically offered Fall Spring Summer.**Credits:** 3.00

EDCI 54100 - Contemporary Issues In Career And Technical Education

Credit Hours: 3.00. Identification, analysis, synthesis, and implications of current issues and problems in career and technical education at the elementary, secondary, postsecondary, and adult levels; policy and literature review; formulation of alternatives and solutions. Typically offered Fall Spring.**Credits:** 3.00

EDCI 54300 - Instruction In Career And Technical Education

Credit Hours: 3.00. Contemporary trends and methods in teaching career and technical programs, learning styles and teaching styles, and a variety of creative instructional strategies for different educational contexts will be identified and analyzed. Typically offered Fall Spring.**Credits:** 3.00

EDCI 54400 - Career And Technical Education For Special Needs Learners

Credit Hours: 3.00. Legislative initiatives; identification of special needs learners at the elementary, secondary, postsecondary, and adult levels; learning characteristics; assessment; individualized planning; instructional adaptations; school and community resources; exemplary program models; research, trends, and issues; and evaluation. Typically offered Summer.**Credits:** 3.00

EDCI 54500 - Planning In Career And Technical Education

Credit Hours: 3.00. Principles and strategies in planning new and improving existing career and technical education programs, strategic planning, needs assessment, community and workforce market research, information and data analysis, program improvement. Permission of Department required. Typically offered Fall Spring.**Credits:** 3.00

EDCI 54501 - Teaching STEM Through Agriculture, Food, And Natural Resources

Credit Hours: 3.00. The course focuses on the background and history of STEM movement and agricultural education, contemporary models, strategies, and justification for incorporation of science, technology, engineering and mathematics (STEM) concepts and practices into K-12 formal and non-formal agricultural education programs. Consider and develop the best practices for STEM teaching and learning and enhancement of STEM content in agriculture, food and natural resources (AFNR) context. The goal of the course is to help students develop knowledge about STEM integration and equip them with teaching knowledge and skills for designing K-12 lesson plans by using integrated STEM through AFNR. Students will learn strategies that promote engagement in integrated STEM through AFNR activities. At the end of the course, students should be able to design and implement research-based integrated STEM through AFNR lesson plans and assessment plans. Typically offered Spring.**Credits:** 3.00

EDCI 54800 - Teaching Mathematics To Diverse Learners

Credit Hours: 3.00. This course is designed to provide opportunities for in-service teachers to engage around issues of equity in mathematics education. Equity here is used as a broad construct intended to help us think about how to provide meaningful opportunities to learn for all the students in our mathematics classrooms. The notion of "diverse" here is also taken broadly. All students have special needs, but it is sometimes helpful to think about the needs of particular groups of students while at the same time avoiding reducing differences among students to stereotypes. Issues of diversity here include, but are not limited to race, culture, gender, disabilities, language, SES, and sexual orientation. Typically offered Fall Spring Summer**Credits:** 3.00

EDCI 54900 - Assessment In STEM Education

Credit Hours: 3.00. This course is designed to help teachers of STEM recognize the link between productive assessment and productive instruction, using the STEM education standards for teacher competence in educational assessment. This course is designed to help teachers meet those professional standards and understand the public pressure as well as instructional need for effective formative and summative assessment.**Credits:** 3.00

EDCI 55000 - Career Education

Credit Hours: 3.00. An overview of contemporary legislation, educational reform, trends, and issues; career education program models; vocational and technical education, technology prep, and school-to-work systems; partnerships; foundations of career education; career development; curriculum; career guidance and counseling; career assessment; career planning practices; learning styles and instructional strategies; career information sources and resources; exemplary programs; and special needs populations and practices. Typically offered Summer Fall Spring.**Credits:** 3.00

EDCI 55100 - Young Adult Literature

Credit Hours: 3.00. This course is a survey of classic and contemporary young adult texts. Students are introduced to the genre through reading notable young adult texts, applying relevant literary criticism, and investigating effective pedagogical strategies. Typically offered Fall Spring.**Credits:** 3.00

EDCI 55200 - Generalizable Skills Instruction In Career And Technical Education

Credit Hours: 3.00. Curriculum, assessment, planning, implementation, and evaluation relating to generalizable skills (also known as generic, transferable, or workplace skills) in career and technical education, other content areas, and special education programs; philosophical, historical, social, economic, political, and educational influencing factors; analysis and synthesis of current research and conceptual models; practical applications for programs; instructional strategies; resources and support services, interdisciplinary collaboration approaches; applications for special needs learners; learning styles and characteristics. Typically offered Summer Fall Spring.**Credits:** 3.00

EDCI 55300 - Leadership Development In Career And Technical Education

Credit Hours: 3.00. Design, development, implementation, and evaluation of systems and strategies for enhancing the skills and knowledge of personnel seeking to become leaders in the field of Career and Technical Education (CTE); research related to critical and emerging leadership issues, strategies, policies, and resources are examined and applied to program improvement initiatives in schools, the workplace, agencies, and other organizations that serve a wide variety of youth, adolescents, young adults, and adults. Typically offered Summer Fall Spring.**Credits:** 3.00

EDCI 55600 - Educational Video Game Design

Credit Hours: 3.00. Designed to provide an introduction to the design of educational video games. The focus of the course is on two areas: 1) the learning, instructional design, and game design theories which can inform the design of effective and engage in educational video games, and 2) how to apply those theories within practical settings. Typically offered Fall Spring Summer.**Credits:** 3.00

EDCI 55700 - Assessment Of Culturally And Linguistically Diverse Students

Credit Hours: 3.00. Critical review of research and practice in language proficiency and content-area assessment of culturally and linguistically diverse students in K-12 education, and the sociocultural dimensions of standardized testing, academic achievement, and accountability. Critical analysis of standardized language proficiency and literacy tests. Development of authentic alternative language, literacy and content-area assessments. Prerequisites: Background in K-12 education. Typically offered Summer.**Credits:** 3.00

EDCI 55800 - Integrated Science, Technology, Engineering And Mathematics (STEM) Education Methods-Secondary

Credit Hours: 3.00. Focuses on operationalizing the theoretical pedagogical approaches to integrated Science, Engineering, Mathematics and Agriculture (STEM) education. Collaboratively and cooperatively investigate, plan and deliver integrated learning experiences appropriate for secondary education. Course content will blend philosophical considerations with practical application. Permission of instructor required. Typically offered Fall Spring.**Credits:** 3.00

EDCI 55850 - Introduction To Teaching Engineering And Technology Design In The Context Of K-12 Integrated STEM

Credit Hours: 3.00. Engineering and technology design has gained considerable traction in many K-12 schools. In this course, we will examine principals of engineering design and technology as well as where and how engineering and technology design best fits in a K-12 integrated STEM curriculum. Course participants will engage in authentic engineering and technology design experiences. Course participants will also design, develop, deliver integrated lessons that help K-12 students develop the knowledge, skills, and practices of engineering and technology design.**Credits:** 3.00

EDCI 55900 - Academic Language And Content Area Learning

Credit Hours: 3.00. (ENGL 59900) Course focuses on theoretical and practical knowledge for teachers about how second languages are learned, and on the educational and philosophical basis for second language teaching and learning. The course links English language development to teaching and learning strategies and is designed for undergraduate and graduate students in education and practicing teachers. Typically offered Fall Spring Summer.**Credits:** 3.00

EDCI 55950 - Engineering And Technology Design Practicum

Credit Hours: 3.00. EPICS is a service-learning design course in which teams of students from across campus work together on long- term projects that benefit the community. Project work centers around the engineering, technology, and computing needs of a community partner, but interdisciplinary team interaction is an integral element for project success. Students may participate in EPICS multiple semesters and participation for multiple consecutive semesters on a project team is encouraged. Teams are composed of first year students through seniors.

Most EPICS projects last at least one-year, though partnership with the community organization continues for several years. Projects are intended to solve real problems, are defined in partnership with their community partners, and span the complete design process cycle [problem identification - specification development - conceptual design - detailed design - delivery - service/maintenance - retirement].

You receive academic credit for participating in EPICS. How academic credits are applied to your major depends on your degree program and is determined by your department and/or advisor. See https://engineering.purdue.edu/EPICS/purdue/epics-purdue/credit.**Credits:** 3.00

EDCI 56000 - Educational Technology For Teaching And Learning

Credit Hours: 3.00. This course addresses the fundamentals of educational/learning technologies within both the traditional classroom, as well as the corporate/business training environments. Students will explore and evaluate various tools/technologies and determine how, when, and why such technologies can/should be infused into normal, hybrid, or fully online learning situations. The goal of the course is to help the student plan, implement, and evaluate technology for teaching and learning. Typically offered Fall Spring Summer.**Credits:** 3.00

EDCI 56400 - Integration And Management Of Technology For Learning

Credit Hours: 3.00. This course focuses on techniques for and issues related to integrating technology in learning environments in a meaningful way. Topics covered stem from literature in the field and include (1) theoretical foundations of technology integration, including how technology can support a more personalized approach to learning, (2) instructional and learning issues with technology integration, (3) designing for the integration of technologies for in learning environments, and (4) emerging issues in research and practice with technology integration. Class activities are designed to model applications of learning technology, while class projects allow individuals to develop skills and knowledge in areas of your personal need or interest. The goal of the course is to help you develop an understanding of important issues associated with the integration and management of learning technology and to effectively plan, design, implement, and evaluate technology-based learning. **Credits:** 3.00

EDCI 56500 - Principles Of Adult Education

Credit Hours: 3.00. (ASEC 56500) Principles of adult education applied to helping adults learn, evaluating their performance, and determining their needs. Examines history, philosophy, and research of adult education. Explores techniques required in design and delivery of instruction for adults. Typically offered Spring.**Credits:** 3.00

EDCI 56600 - Educational Applications Of Multimedia

Credit Hours: 3.00. Examination of educational applications of hypermedia tools and related research. Creation of hypermedia instructional materials. Incorporation of digitized media (sound, photographs, and motion clips) in hypermedia is explored. Typically offered Fall Spring Summer.**Credits:** 3.00

EDCI 56700 - Action Research In Science Education

Credit Hours: 3.00. An introduction to various models and conceptions of teacher action research in science education. Students review literature on action research, participate in small research cohorts, and plan and conduct action research within their respective educational situations. Typically offered Fall Spring.**Credits:** 3.00

EDCI 56800 - Partnering With Web-Based Tools For Learner Centered Environments

Credit Hours: 3.00. Provides an in-depth look at Web-based digital tools for teaching and learning, with a focus on learner-centered activities and environments. Emphasis is given to applying the knowledge and skills necessary to create a Web-based, student-centered lesson/unit that provides diverse learners with opportunities for formal and informal learning. Course content is applicable to both independent and collaborative learning, as well as use of the Web as the sole educational delivery system or in combination with other approaches, including traditional classroom instruction. Typically offered Summer Fall Spring.**Credits:** 3.00

EDCI 56900 - Introduction To E-Learning

Credit Hours: 3.00. This course examines how the design and development of instruction are impacted by the use of the computer as delivery system. A primary focus is on effective learning design strategies for e-learning. Learners will identify and apply effective design practices with emphasis on project management, planning, and implementation. Education or training materials will be developed using appropriate authoring tools as determined by the instructional context. Learners will design an E-Learning module with end-to-end documentation of the design process (Project Plan, Design Document, Storyboard). Opportunities for collaborative feedback and evaluation will also be featured elements of the course experience. **Credits:** 3.00

EDCI 57200 - Introduction To Learning Systems Design

Credit Hours: 3.00. An introduction to the principles of designing instructional materials and to instructional communication theory and techniques. Topics include objectives, student characteristics, media selection, communication variables, message design, and systematic evaluation. Typically offered Fall Spring Summer.**Credits:** 3.00

EDCI 57300 - Instructional Development Practicum

Credit Hours: 2.00 or 3.00. Provides supervised field experience in programs involving instructional design development activities. Students participate in ongoing projects in the design, development, and evaluation of instructional materials and training programs in business and industry, medical facilities, or other settings deemed appropriate. Recommended prerequisites: EDCI 56900, EDCI 57200, and EDCI 67200. Permission of instructor required. Typically offered Fall Spring.**Credits:** 2.00 or 3.00

EDCI 57500 - Foundations Of Distance Learning

Credit Hours: 3.00. An introduction to the field of distance learning/education. Examination of basic concepts and principles of distance learning, the theoretical underpinnings of the field, research and application literature, and distance education delivery technologies. Focus is on integration of distance education technologies for learning and teaching. Typically offered Fall Spring Summer.**Credits:** 3.00

EDCI 57700 - Strategic Assessment And Evaluation

Credit Hours: 3.00. This course explores principles and techniques that can be used to carry out evaluations within an organization. The course also examines several aspects of conducting evaluations, including planning and designing an evaluation, developing appropriate instruments, using various methods to collect information, analyzing information obtained from those methods, and communicating results and recommendations. This course is designed to help learners understand the multiple ways that evaluation is used in instructional systems and provides opportunities to design various types of evaluation instruments. A portion of the course will examine the study of learner assessment as part of the evaluation of instructional programs; however, the course's focus is dedicated to the study of program evaluation. **Credits:** 3.00

EDCI 58000 - Foundations Of Curriculum

Credit Hours: 3.00. Introduction to the major historical and philosophical sources of curriculum ideas. Significant forces influencing curriculum decision making. Different theoretical approaches to the construction and analysis of curriculum. Typically offered Fall.**Credits:** 3.00

EDCI 58500 - Multicultural Education

Credit Hours: 3.00. The course aims to develop understanding of multicultural education as an on-going reform process that addresses social justice issues through an examination of race, class, gender, ethnicity, language, sexual orientation, etc. Typically offered Fall Spring Summer.**Credits:** 3.00

EDCI 58600 - Topics In Educational Reform

Credit Hours: 3.00. (EDFA 58600) Explore important and timely issues related to educational reform and restructuring. Topics include: school choice, curriculum reform, assessment, technology, and influences on the reform process. Typically offered Fall Spring.**Credits:** 3.00

EDCI 58700 - Leadership And Management In Educational Technology

Credit Hours: 3.00. This course addresses the fundamentals of leadership and management of educational technology in a K-12 setting. Students will explore and evaluate computer hardware, software, networks, and lab management, including how they fit into education. This course is designed to provide prospectives on organizational leadership of educational technology, as well as providing future teachers with the ability to troubleshoot basic problems often associated with computers and software in the classroom. Typically offered Fall Spring Summer.**Credits:** 3.00

EDCI 58800 - Motivation And Instructional Design

Credit Hours: 3.00. This course has been designed to provide an in-depth study of motivation as one of the fundamental variables underlying human learning, behavior, and instructional design. The focus of the course is on two areas: 1) theories of motivation and the general principles that have contributed to the field of instructional design, and 2) how those principles are applied within practical design settings. Typically offered Fall Spring Summer.**Credits:** 3.00

EDCI 58900 - Special Topics For Teachers

Credit Hours: 1.00 to 4.00. Consideration of appropriate professional problems of experienced educational personnel in workshops or in-service programs. Typically offered Fall Spring Summer.**Credits:** 1.00 to 4.00

EDCI 59000 - Individual Research Problems

Credit Hours: 1.00 to 6.00. Opportunities for students to study particular problems under the guidance of a member of the This plan of individualized instruction may be used in any field of education or vocational education. Does not include thesis work. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 1.00 to 6.00

EDCI 59100 - Special Topics In Education

Credit Hours: 1.00 to 4.00. Group study of a current problem or special topic of interest to professional educational personnel. Intensive study of research, theory, or practical aspects of a particular issue within the usual graduate class format. Typically offered Fall Spring Summer.**Credits:** 1.00 to 4.00

EDCI 59300 - Introductory Secondary Transition To Teaching Seminar

Credit Hours: 1.00. This seminar course offers an introduction to the TTT program, as well as an overview of general educational concerns and issues applicable to all content area instruction at the middle and high school levels. It is often the first course taken in the TTT program by program participants. The course centers on discussions of educational issues, theories, and approaches that the students who are seeking licensure in any of the secondary areas available at Purdue will find helpful. Additionally, the course provides general information about TTT program course sequences, the fee structure, application processes for student teaching placements, and the overriding philosophy of the TTT program at Purdue. Permission of instructor required. Typically offered Summer.**Credits:** 1.00

EDCI 59400 - Concluding Secondary Transition To Teaching Seminar

Credit Hours: 2.00. This seminar course offers a conclusion to the program, as well as a review of general educational concerns and issues applicable to all content area instruction at the middle and high school levels. It is often the last course taken in the TTT program by program participants. The course centers on discussions of educational issues, theories, and approaches that the students who are seeking licensure in any of the secondary areas available at Purdue will find helpful. Additionally, the course helps students prepare to obtain their teaching license and enter the teaching community as a secondary teacher. Permission of instructor required. Typically offered Summer.**Credits:** 2.00

EDCI 59500 - Advanced Studies In English Education

Credit Hours: 1.00 to 3.00. Advanced study of an English education topic, issue, problem and/or trend within the instructor's fields of specialization. Typically offered Fall Spring Summer.**Credits:** 1.00 to 3.00

EDCI 59600 - Pedagogy I: Introductory Methods For Secondary Education Transition To Teaching Program

Credit Hours: 3.00. This course is the introductory seminar for the secondary Transition to Teaching (TTT) programs across disciplines. Students who enroll in this course will be seeking teaching licensure in one of the secondary program areas available at Purdue University. Therefore, instruction in the course will revolve around general educational concerns and issues that are applicable to all content area instruction at the middle and high school levels. Admission to the Transition to Teaching program required. Permission of department required. Typically offered Fall Spring Summer.**Credits:** 3.00

EDCI 59700 - Pedagogy II: Advanced Methods For Secondary Education Transition To Teaching Program

Credit Hours: 3.00. This sixteen-week course is the capstone methods course for the online Transition to Teaching (TTT) program. Students who enroll in this course will be seeking teaching licensure in one of the secondary program areas available at Purdue University. Therefore, instruction in the course will revolve around general educational concerns and effective teaching approaches that are applicable to all content area instruction at the middle and high school levels. This course extends engagement with the pedagogical principles of practice introduced in *Transition to Teaching: Pedagogy I*. The course also includes a fifty-hour field experience component. Admission to Transition to Teaching program required. Permission of department required. Typically offered Fall Spring Summer.**Credits:** 3.00

EDCI 59900 - Research And Instructional Coaching

Credit Hours: 3.00. This independent study, field-based course is designed to teach you about field-based research, instruction, and coaching in teacher education and elementary schools. You will have the opportunity to apply what you learn by developing and executing a mini-inquiry project including research questions, data collection, analysis, and findings for publication and/or program materials development.**Credits:** 3.00

EDCI 60001 - Intro To Demonstrating Professional Competencies In LDT

Credit Hours: 1.00. This course is designed to help you to understand the knowledge and skills necessary for your successful online learning in the Learning Design and Technology program, with a focus on the process of earning digital badges aligned with professional competencies. In this orientation, you will explore what online learning entails and reflect on how you can best set yourself up to succeed in your studies. You will also learn and apply the process of both earning digital badges within the program and evaluating your peers' work as part of the badge earning process. Typically offered Fall Spring Summer.**Credits:** 1.00

EDCI 60002 - Demonstrating Professional Competencies In LDT

Credit Hours: 1.00. This course will primarily focus on the further earning of badges as part of demonstrating required program competencies. We will also further explore the purpose and process behind this. Additional resources and activities regarding a better understanding of the profession will also be available. Prerequisites: EDCI 60001. Typically offered Fall Spring Summer.**Credits:** 1.00

EDCI 60003 - LDT Professional Competencies Portfolio

Credit Hours: 1.00. This course will focus on completion of the competency portfolio reflecting on the depth and breadth of your educational growth since entering the Master's program. The purpose of the LDT competency portfolio is to demonstrate that you have mastered the graduate competencies. The portfolio will contain student evidence aligned with LDT competencies and will be reviewed by your committee. The completed competency portfolio is a requirement for graduation from the LDT Master's program. Prerequisites: EDCI 60001 and 60002. Typically offered Fall Spring Summer.**Credits:** 1.00

EDCI 60400 - Social Studies In The Elementary School

Credit Hours: 3.00. Social Studies-content and place in the modern elementary education curriculum. Materials, instruction techniques, evaluation procedures, and understanding the syntax of the structure of social studies. Prerequisite: EDCI 36100. Typically offered Fall Spring Summer.**Credits:** 3.00

EDCI 60500 - Teaching Integrated Science, Technology, Engineering And Math

Credit Hours: 3.00. Analysis of historical developments and present trends in science education; the designing, implementation, and evaluation of science programs; the role of research in present and future developments. Typically offered Fall Spring Summer.**Credits:** 3.00

EDCI 61200 - Seminar In Literacy

Credit Hours: 3.00. Recent trends and research in literacy. Topics provide in-depth study of literacy acquisition in educational settings. Typically offered Fall.**Credits:** 3.00

EDCI 61300 - Seminar In The English Language Arts

Credit Hours: 3.00. (ENGL 69100) Problems in the teaching of English: literature, language, rhetoric. Attention to recent scholarship and to its application in the public schools. Typically offered Fall Spring.**Credits:** 3.00

EDCI 61400 - Literacy And Development Of Young Children

Credit Hours: 3.00. Focuses on literacy development (reading, writing, other aspects of language) in pre-school and elementary age children. An emergent literacy model is contrasted with traditional models and school instruction. Particular experiences and materials that aid literacy acquisition are considered. Typically offered Fall.**Credits:** 3.00

EDCI 61450 - Seminar In Bilingualism And Multilingualism

Credit Hours: 3.00. This course examines theories, research and educational practices in bilingualism and multilingualism. Students will become familiar with major conceptual and methodological issues in research about the use and acquisition of two or more languages in bi/multilingual societal and educational contexts. Individual and societal dimensions will be considered through the examination of a wide range of approaches. Accordingly, the course is transdisciplinary in nature, bringing together work from anthropology, education, psychology, and (socio)linguistics. **Credits:** 3.00

EDCI 61500 - Qualitative Research Methods In Education

Credit Hours: 3.00. Focuses on expanding graduate students' research skills to include knowledge of the theories and methods associated with qualitative and qualitative-quantitative combined research. Prerequisite: EDPS 53300. Typically offered Spring.**Credits:** 3.00

EDCI 61600 - Qualitative Data Collection And Analysis In Educational Research

Credit Hours: 3.00. This course focuses on expanding and applying students' knowledge of qualitative data collection and analysis with an emphasis on multiple approaches to data collection, analysis, and interpretation. Prerequisite: EDCI 61500 or permission of instructor. Typically offered Fall.**Credits:** 3.00

EDCI 61800 - Gender And Culture In Science Education

Credit Hours: 3.00. An examination of the different perspectives on issues of gender, culture, and science. Major topics include feminist critiques of scientific theories and methods, the work of women and minorities in science, the role science has played in the construction of race and gender, and topics in science education, such as girls' learning in science and the potential of inclusive practices in the science classroom. Prerequisite: EDCI 51800 or EDCI 58500. Typically offered Summer Fall Spring.**Credits:** 3.00

EDCI 61900 - Learning Science

Credit Hours: 3.00. The course provides a holistic study of how children and adults learn science; how the learner's ideas, ways of thinking, abilities to do science, and their attitudes towards and beliefs about science learning influence how they learn science. Typically offered Fall Spring.**Credits:** 3.00

EDCI 62000 - Seminar In Mathematics Education

Credit Hours: 1.00 to 6.00. Selected topics in mathematics education. Typical topics considered are: (1) problem solving; (2) instructional strategies; (3) cognitive structure; (4) current curriculum; (5) current research. Permission of instructor required. Typically offered Spring.**Credits:** 1.00 to 6.00

EDCI 62100 - Technology For Qualitative Research

Credit Hours: 3.00. Exploration of the effective use of technology to facilitate data collection, organization, and analysis. Emphasis on application of theoretically-based methodologies for handling and analyzing qualitative data through the use of qualitative research software. Course also includes attention to other hardware or software relevant to the collection, organization and analysis of qualitative data. Prerequisites: EDCI 61500. Typically offered Summer.**Credits:** 3.00

EDCI 62200 - Seminar In Science Education

Credit Hours: 1.00 to 3.00. Current issues in science education. Typical topics considered are: (1) science curriculum; (2) concept learning; (3) teacher education; (4) intellectual developments; (5) current research. Prerequisite: EDCI 51700, EDCI 51800. Typically offered Spring.**Credits:** 1.00 to 3.00

EDCI 62400 - Seminar In Social Studies Education

Credit Hours: 3.00. An investigation of various aspects of the teaching of the social studies. One topic is dealt with in each enrollment. Master's candidates are expected to complete the first three topics. Areas include: (1) philosophic concepts used in the social studies; (2) curricular analysis and examination of new social studies materials; (3) methods of inquiry in the social studies; (4) research methodology in the social studies. Typically offered Fall Spring Summer.**Credits:** 3.00

EDCI 62500 - Individualized Competency Earning in Learning Design & Technology

Credit Hours: 1.00. This course is designed to facilitate your progression towards graduation from the Learning Design and Technology program, with a focus on the process of earning digital badges aligned with professional competencies. In this individualized course, you will work with an instructor to earn the appropriate number of challenges and digital badges needed in order to be on track for graduation. Typically offered Fall Spring Summer.**Credits:** 1.00

EDCI 62700 - Current Topics In Learning Design And Technology

Credit Hours: 3.00. A critical analysis of problems, trends, issues, and programs related to the area of learning design and technology. Prerequisite: EDCI 51300 . Typically offered Summer Fall Spring.**Credits:** 3.00

EDCI 62800 - Curriculum And Instruction Doctoral Seminar I

Credit Hours: 1.00. An examination of current issues and concerns related to doctoral study in Curriculum and Instruction. This course is intended for all new doctoral students in the Department of Curriculum and Instruction and should be taken within the first year of doctoral study. Typically offered Fall.**Credits:** 1.00

EDCI 63300 - Instructional Design Project Management

Credit Hours: 3.00. This course focuses on the application of project management ideas, concepts, and strategies in instructional design settings. Students will be asked to consider the relationship between instructional design and project management, tools that can assist with managing instructional design projects, and factors influencing the instructional design project management

process. Students will explore these topics by creating deliverables for instructional design cases and other interactive assignments. Typically offered Fall Spring Summer.**Credits:** 3.00

EDCI 63500 - Content And Goals In Mathematics Education

Credit Hours: 3.00. Examines conceptions of what mathematics is and how those conceptions have influenced the mathematics curriculum over the course of American history. Prerequisite: Master's student standing or higher and enrolled in Mathematics Education. Typically offered Fall.**Credits:** 3.00

EDCI 63600 - The Learning Of Mathematics: Insights And Issues

Credit Hours: 3.00. Examines research related to the learning of mathematics and to the relationships of social and cultural factors to the learning of mathematics. Prerequisite: Master's student standing or higher and enrolled in Mathematics Education. Typically offered Spring.**Credits:** 3.00

EDCI 63700 - The Teaching Of Mathematics: Insights And Issues

Credit Hours: 3.00. Examines research related to mathematics teaching, including research on characteristics of mathematics teachers, the features of effective mathematics teaching, and the professional preparation and development of mathematics teachers. Prerequisite: Master's student standing or higher and enrolled in Mathematics Education. Typically offered Spring.**Credits:** 3.00

EDCI 63800 - Curriculum And Instruction Doctoral Seminar II

Credit Hours: 1.00. This course consists of an examination of current educational research. EDCI and other faculty will present and lead discussions of their research. Students will be exposed to research within multiple paradigms and perspectives. This course is intended for all new doctoral students in the Department of Curriculum and Instruction and should be taken within the first year to doctoral study. Permission of instructor required. Typically offered Spring.**Credits:** 1.00

EDCI 64400 - Legal Issues In Career And Technical Education

Credit Hours: 3.00. Comprehensive examination of contemporary federal, state, and local legislation; rules, policy, regulations, provisions, guidelines, and initiatives affecting the nature, establishment, and implementation of state and local programs at the secondary and postsecondary levels in career and technical education; need for legislation and initiatives and the reauthorization of existing legislation; social, political, and economic aspects of legislation; advocacy for legislation; and public policy and policy development. Approval of Department required. Typically offered Fall Spring.**Credits:** 3.00

EDCI 64500 - Organization And Administration Of Career And Technical Education

Credit Hours: 3.00. Organizational structure and delivery systems at the national, regional, state, and local levels; program areas and services; legislative initiatives; federal, state, and local planning; administrative functions and practices; leadership development; trends; and issues. Typically offered Fall Spring.**Credits:** 3.00

EDCI 64600 - Supervision In Career And Technical Education

Credit Hours: 3.00. Purposes, principles, strategies, and procedures of supervision and management in career and technical education and related workforce education and development contexts: theory and practice: human resource development: environment, education, and management. Approval of Department required. Typically offered Fall Spring.**Credits:** 3.00

EDCI 64700 - Research In Career And Technical Education

Credit Hours: 3.00. Rationale for and history of research in career and technical education; analysis of the research process and research methods; examination of the environment and support required for research; proposal development, and strategies for dissemination and utilization of research. Offered in alternate years. Typically offered Fall.**Credits:** 3.00

EDCI 64800 - Curriculum In Career And Technical Education

Credit Hours: 3.00. Overview of curriculum in career and technical education programs; business and industry training programs; curriculum planning, development, implementation, and evaluation; review and analysis of curriculum models. Typically offered Fall Spring.**Credits:** 3.00

EDCI 64900 - Assessment In Career And Technical Education

Credit Hours: 3.00. Goals and rationale for evaluation in education and work training contexts; assessment and measurement methods, techniques, and procedures; reliability, validity, and accuracy; construction and selection of instruments; data and information collection, analysis, and interpretation; meta evaluation; adaptations and modifications for special needs populations; and using assessment data and information. Typically offered Fall Spring.**Credits:** 3.00

EDCI 65000 - Program Evaluation In Career And Technical Education

Credit Hours: 3.00. Goals and objectives of, and criteria for, program evaluation in career and technical education; evaluation models and methods; design and planning; issues; development and selection of instruments and procedures; data and information collection and analysis; preparing program evaluation reports; and using program evaluation results for program improvement. Typically offered Fall Spring.**Credits:** 3.00

EDCI 65200 - Seminar In Family And Consumer Sciences Education

Credit Hours: 2.00 to 6.00. A critical analysis of current problems, trends, issues, and programs in family and consumer sciences education. Prerequisite: 12 credit hours in Education or equivalent professional training. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 2.00 to 6.00

EDCI 65300 - Seminar In Career And Technical Education

Credit Hours: 1.00 to 9.00. Current trends, theory, and practices related to educational contexts and careers. Typically offered Fall Spring Summer.**Credits:** 1.00 to 9.00

EDCI 66000 - Learning Design And Technology Seminar

Credit Hours: 1.00. This course is an investigation of trends, developments, and issues in learning design and technology with a focus on current practices, problems, and research. This one-credit seminar is designed to help students learn about applications of instructional design and educational technology in various settings and to interact with faculty and guest speakers about topics related to the field and the LDT program.**Credits:** 1.00

EDCI 67000 - Learning Design And Technology Portfolio

Credit Hours: 1.00 to 2.00. This course was created to help guide LDT students near completion of their coursework to develop their competency portfolio. The competency portfolio is a requirement for graduation from the traditional LDT Master's program.**Credits:** 1.00 or 2.00

EDCI 67200 - Advanced Practices In Learning Systems Design

Credit Hours: 3.00. This course focuses on the application of learning systems design to real-world educational situations through the in-depth consideration of key instructional design processes (e.g., analysis, design, development, implementation, evaluation). Additionally, a key focus of the course is on the development of instructional design expertise. Prerequisite: EDCI 57200. **Credits:** 3.00

EDCI 67300 - Issues And Methods In Learning Systems Design Research

Credit Hours: 3.00. Provides preparation to conduct independent research in the field of learning design and technology through direct participation in the research process: critically reviewing research, designing and conducting a research study, synthesizing and presenting results in written and oral formats. Prerequisites: EDPS 53300, EDCI 67600, EDCI 67700.**Credits:** 3.00

EDCI 67400 - Advanced Instructional Design Theory

Credit Hours: 3.00. Examines the impact of both psychological learning theories and instructional applications upon the development of various instructional design theories. Emphasis is on theory construction, influence of learning and educational principles, and the current and future possibilities of instructional design theory. Prerequisite: EDCI 53100 and 57200. Typically offered Fall Spring Summer.**Credits:** 3.00

EDCI 67500 - Instructional Strategies

Credit Hours: 3.00. Examines and applies the cognitive strategies and tactics that can be used by an instructional designer to improve human learning. Applications of various instructional strategies for specific cognitive tasks (e.g., concepts, mental models, problem solving) will to be covered. Additionally, best practices for a diverse range of instructional methods will be considered, as well as, the strategies for the entire instructional experience. Prerequisite: EDCI 57200. Permission of instructor required.**Credits:** 3.00

EDCI 67600 - Unpacking Research: Writing Literature Reviews In Learning Design And Technology

Credit Hours: 2.00. This course is designed to introduce the learner to the process of analyzing and preparing literature reviews on topics relevant to the field of Learning Design and Technology. Emphasis is placed on helping the learner to understand, critique, and synthesize the research literature in order to apply it to their own personal research agenda. Course activities and assignments are designed to help the learner develop the knowledge, tools, and strategies needed to become thoughtful consumers and producers of research and to use this knowledge to inform their practice. Learning experiences revolve around two major themes: 1) the examination and thoughtful critique of current research and 2) preparation of a thorough literature review that provides a rationale for continued study. Permission of instructor required.**Credits:** 2.00

EDCI 67700 - Unpacking Research: Writing Research Proposals In Learning Design And Technology

Credit Hours: 2.00. This course is designed to introduce the novice researcher to the process of developing a research problem statement supported by literature resulting in a professional organization conference proposal and a proposal for a funding agency in the field of Learning Design and Technology. Permission of instructor required. Prerequisite: EDCI 67600. **Credits:** 2.00

EDCI 67800 - Unpacking Research: Writing For Scholarly Publications In Learning Design And Technology

Credit Hours: 2.00. This course is designed to introduce the novice researcher to the process of publishing research in the field of Learning Design and Technology. Emphasis is placed on practical aspects of the publishing process as well as familiarizing students with the role that editors and reviewers play in that process. Prerequisite courses include: EDCI 67600 Writing

Literature Reviews and EDCI 67700 Writing Research Proposals. Students must bring a draft manuscript completed through the methods portion into the course, and students must have completed research and collected data to facilitate completion of a research-based manuscript for publication during the course. Permission of instructor required.**Credits:** 2.00

EDCI 67900 - Capstone: Inquiry Into Practice

Credit Hours: 3.00. This course conceptually centers on the Ghanaian Sankofa symbol of a bird retrieving an egg from its back while facing forward. This metaphor represents the need to "go back to the past and bring forward that which is useful" (About the Sankofa [n.d.]. Retrieved from https://cola.siu.edu/africanastudies/about-us/sankofa.php). The twin aspect of looking back with the future in mind plays out in consonance with the Portfolio course generally taken in tandem with this course. In this course, students will reinforce and extend their learning of key concepts across the program and deepen their engagement with a topic of interest to them through an action research project. Permission of department required. **Credits:** 3.00

EDCI 68000 - Curriculum & Instruction MS Portfolio

Credit Hours: 1.00. This course was created to help guide C&I students near completion of their coursework to develop their competency portfolio. A competency portfolio reflects the depth and breadth of a student's educational growth since entering the graduate program. The purpose of the C&I competency portfolio is to demonstrate that students have mastered the graduate competencies for the C&I online Master's program. The portfolio will contain student projects aligned with C&I competencies and will be reviewed by committee members. The competencies are based on the Curriculum & Instruction departmental competencies and several program-specific competencies. The competency portfolio is a requirement for graduation from the C&I Master's program. (Multiple media are welcome.) Permission of department required.**Credits:** 1.00

EDCI 68200 - Contemporary Curriculum Theory

Credit Hours: 3.00. Critical examination of contemporary concepts of curriculum theory. Rational/technical curriculum, social needs/child centered curriculum. Socio-political curriculum theory; curriculum as existential, aesthetic, and phenomenological. Implications for current practice, school reform, and educational research. Typically offered Spring.**Credits:** 3.00

EDCI 68400 - Seminar In Curriculum Studies

Credit Hours: 3.00. A course designed to allow for the in-depth exploration of specialized and timely topics in curriculum theory, practice, and reform. Though all specialized topics address both theory and practice, some topics focus more heavily on practice, and others focus more heavily on theory. Typically offered Fall Spring Summer.**Credits:** 3.00

EDCI 68500 - Global Issues In Education

Credit Hours: 3.00. Critical examination of contemporary global issues in education. Historical, social economic, political, and cultural theories of globalization in international context. Analysis and synthesis of current research. Implications and application to current practice, school reform, policy, curriculum, and educational research. Resources for instruction; curriculum design strategies for implementing global education. Prerequisite: 12 credit hours in Education. Typically offered Summer Fall Spring.**Credits:** 3.00

EDCI 69400 - Elementary Transition To Teaching Student Teaching/Internship

Credit Hours: 0.00 to 6.00. A full-time elementary classroom teaching experience and internship seminars. Students teach for a period of 14 weeks under the mentorship of a master teacher and a University supervisor. In order to provide support for student teachers and ongoing interactions among students and their supervisors, students will attend scheduled student-teaching seminars. After the classroom experience has ended, students will spend two additional weeks completing a variety of assignments. The purpose of the internship semester is to provide a structured experience for learning and refining the theories and practices necessary to become an effective teacher of all children in the inclusive classroom. Prerequisite: EDCI 50100(Inactive at PWL),

EDCI 51100 , EDCI 58500, EDCI 60300(Inactive at PWL), EDCI 60400, EDCI 60500. Permission of instructor required. Typically offered Fall Spring.**Credits:** 0.00 to 6.00

EDCI 69500 - Internship In Education

Credit Hours: 1.00 to 10.00. Amount of credit to be determined by nature and extent of the assignment. A special course in selected areas of education, designed to provide practical field experience under professional supervision in selected situations related to the candidate's area of specialization. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 1.00 to 10.00

EDCI 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 1.00 to 18.00

EDCI 69900 - Research PhD Thesis

Credit Hours: 1.00 to 18.00. Research PhD Thesis. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 1.00 to 18.00

EDU 50000 - Topical Exploration In Education

Credit Hours: 1.00 to 6.00. Explores topics related to being an effective, professional educator. **Credits:** 1.00 to 6.00

EDU 50004 - Integrated Professional Seminar

Credit Hours: 0.00 to 6.00. This seminar is linked to courses and field experiences included in the Transition to Teaching (T2T) program. It will allow for collaboration among school-based mentors, university-based instructors and T2T candidates in offering academic content appropriate to the program. The seminar will provide a technology-rich and performance-based professional experience. This course has a fee attached.**Credits:** 0.00 to 6.00

EDU 51000 - School-Community Relations

Credit Hours: 2.00 or 3.00. For teachers and school administrators. Characteristics of the community-school, including the multicultural quality of the resources, adapting the educational program to community needs; use of community resources in instruction; planning school-community relations.**Credits:** 2.00 or 3.00

EDU 53900 - Seminar In Student Affairs Leadership

Credit Hours: 3.00. Integrative, project-based learning experience for student affairs professionals. Develop and implement real-world projects in coordination with higher education staff in a variety of institutional settings.**Credits:** 3.00

Educational and Psychological Studies

EDPS 10101 - Learning In Context-An Introduction To The Learning Sciences

Credit Hours: 3.00. This introductory course is designed to acquaint first year Learning Science students with the core concepts, principles, and research findings of the learning sciences as they apply to a wide range of formal and informal educational contexts. The course provides students with opportunities to interact with and learn about the scholarship of College of Education

faculty who conduct research within the framework of the learning sciences. Students will learn about faculty projects that exemplify key features of the Learning Sciences such as attention to the complexity of learning environments, the study of social and cultural as well as individual dimensions of learning, and the cross-disciplinary nature of the field. **Credits:** 3.00

EDPS 10500 - Academic And Career Planning

Credit Hours: 3.00. Builds understanding of career interests and personality characteristics related to academic and career decisions. Expands knowledge of Purdue academic programs and of the world of work. Introduces decision-making strategies. **Credits:** 3.00

EDPS 10600 - Mapping Your Career

Credit Hours: 1.00. A course designed to help students explore professional development and create an individualized career plan toward their career goals. Students can use this career plan while meeting educational goals at Purdue.**Credits:** 1.00

EDPS 17700 - Learning And Regulation Strategies For College Success

Credit Hours: 3.00. This course is designed to help students improve their college academic success by studying more efficiently and effectively, through strategic engagement, learning, and performance. We examine and apply evidence-based learning, motivation, and regulation strategies beneficial for college and lifelong learning. Educational psychology provides the theoretical framework for practical application of intentional and informed learning, cognition, motivation and behavior regulation.**Credits:** 3.00

EDPS 20001 - Special Populations Seminar: Focus On Students With Disabilities And Differentiation Approaches

Credit Hours: 1.00. (EDCI 2001) This seminar is focused on special populations of learners for teacher education majors with an emphasis on exceptional students and approaches to curricular differentiation. Students will engage in mentoring activities and ongoing support in their development as a professional. The goal of the seminar is to connect theory to practice by engaging in an immersive field experience that connects to content and courses taken concurrently. The seminar provides an environment conducive to fostering rich relationships with schools and communities, pursuing common inquiry, thinking critically about theory, content and practice and advocating for equitable schooling. This seminar includes a field experience targeting schools and classrooms including exceptional students. This seminar is intended to be taken concurrently with EDPS 24800 and EDPS 26501. Typically offered Fall Spring Summer.**Credits:** 1.00

EDPS 20002 - Special Populations Seminar: English Language Learners And Students With Gifts And Talents

Credit Hours: 1.00. This seminar is focused on special populations of learners for teacher education majors with an emphasis on students who are English learners and students with gifts, talents, and creativity. Students will engage in mentoring activities and ongoing support in their development as a professional. The goal of the seminar is to connect theory to practice by engaging in an immersive field experience that connects to content and courses taken concurrently. The seminar provides an environment conducive to fostering rich relationships with schools and communities, pursuing common inquiry, thinking critically about theory, content and practice and advocating for equitable schooling. This seminar includes a field experience targeting schools and classrooms with ELLs and students with gifts, creativity, and talents. This seminar is intended to be taken concurrently with EDPS 24000 and EDCI 37001. Typically offered Fall Spring Summer.**Credits:** 1.00

EDPS 21100 - Special Education Law, Policy, And Ethical Guidelines

Credit Hours: 3.00. This course provides opportunities for analysis and practical application of special education law and policy through discourse and advocacy. It is designed to provide students with a foundational understanding of special education, including the historical context for special education and the laws, policies, and ethical guidelines that have driven current special education legislation. Special education professionals hold multiple roles...teacher, case manager, general education consultant, instructional aid supervisor, researcher, and administrator to name a few. Moreover, there are numerous responsibilities required to successfully work in each of these roles and in this course we focus on law, policy, and ethical guidelines where they are relevant to special education pre-service teachers and support personnel. Typically offered Fall Spring Summer.**Credits:** 3.00

EDPS 21200 - Collaboration And Family Engagement To Support Students With Disabilities

Credit Hours: 3.00. Students will learn strategies for communicating and collaborating with a variety of team members. Finally culture will be explored. Strategies for collaborating with family members, administrators, paraprofessionals and related service personnel will be explored. This course includes a field experience.**Credits:** 3.00

EDPS 23500 - Learning And Motivation

Credit Hours: 2.00 or 3.00. Introduction to concepts of learning and motivation in educational contexts (i.e., Educational Psychology). Influence of development, culture, and individual differences on learning and motivation. Uses of assessment and technology in promoting learning and motivation. A field-based experiential component is included.**Credits:** 2.00 or 3.00

EDPS 24000 - Children With Gifts, Creativity, And Talents

Credit Hours: 1.00. This course is an introduction to the intellectual, social, and emotional characteristics of gifted children youth; philosophies of gifted education; and programmatic and classroom approaches for supporting gifted students generally and within different domains (e.g., intellectual, academic, creative, artistic, leadership). Cannot be taken concurrently with EDPS 24800. Typically offered Fall Spring.**Credits:** 1.00

EDPS 24800 - Differentiating Curriculum And Instruction

Credit Hours: 1.00. This course provides a solid foundation and set of principles for differentiating curriculum and instruction in any classroom at any grade level. Students will explore a variety of evidence-based strategies, tools, and curriculum models that effectively meet the diverse needs of all learners. Through readings, online class meetings and discussions, case studies, differentiated instruction examples, direct application, and reflection, students will deepen their understanding and need to differentiate. With an overarching goal of increasing achievement and developing student talents, this course includes the following major components:

- creating positive learning environments that support a) high-quality curriculum; b) diagnostic, formative, and summative assessments to inform instructional decision-making; and c) flexible grouping
- addressing student differences in readiness, interest, and learning profile (including learning preference, intelligence preference, gender, culture, language preference, locale, and opportunities to learn) and appreciating how these differences influence the ways in which students learn
- understanding that the process of differentiation involves modifying content, process, product, learning environment, and/or affect
- incorporating higher-order thinking skills, creative problem solving, project-based learning, authentic/respectful tasks, collaborative learning, and other evidence-based strategies to promote student achievement and talent development
- understanding how differentiation of curriculum and instruction fits within specific educational interventions and models, such as scaffolding, flexible grouping, Response to Intervention (RtI), and Multi-Tiered System of Support (MTSS)

Effective teachers do more than teach content; they teach unique individuals who enter classrooms with various levels of expertise, skills, abilities, social-emotional needs, and learning expectations. Effective teachers differentiate curriculum by personalizing content based on the particular needs and interests of their students. Effective teachers differentiate instruction by

applying various grouping strategies, technology applications, and thinking skills. *The goal of every effective teacher is that every child learns something new every day.* Cannot be taken concurrently with EDPS 24000. Typically offered Fall Spring.**Credits:** 1.00

EDPS 26500 - The Inclusive Classroom

Credit Hours: 3.00. Characteristics of students with special needs/talents; strategies for helping students learn and develop in general educational settings. Emphasis placed upon research evidence, case studies, problem-based learning, and development of a plan for an inclusive classroom. A field-based component is included. **Credits:** 3.00

EDPS 26501 - The Inclusive Classroom

Credit Hours: 2.00. This course is designed to provide an overview of the characteristics of children (birth through age 21) with disabilities, causes of disability, assessment techniques, and instructional strategies. Emphasis is placed upon the development of an inclusive lesson plan based on student needs in the field experience classroom. Characteristics addressed include learning, behavioral, social-emotional, and communicative abilities and needs for students with mild and intense support needs. Issues related to cultural differences and family impact will also be addressed. A field-based component is included. Typically offered Spring Summer Fall.**Credits:** 2.00

EDPS 27001 - Characteristics Of Individuals With Mild Disabilities

Credit Hours: 3.00. This course addresses the characteristics of students with mild disabilities and the social, legal, and ethical issues that surround their academic and social-emotional concerns, educational experiences, implications and life-long outcomes. This course has a shared field experience with EDPS 36201.**Credits:** 3.00

EDPS 30000 - Student Leadership Development

Credit Hours: 1.00 to 3.00. Leadership in students is developed through lectures and experiential activities. Topic areas include leadership styles; campus organizational structures; program planning; social and intellectual activities; human relations and cultural differences; motivation; team building; public relations. Permission of instructor required. **Credits:** 1.00 to 3.00

EDPS 30100 - Peer Counseling Training

Credit Hours: 1.00 to 3.00. Students are trained to help peers deal with their problems and concerns. Training modules are used to build knowledge and skills in the duties of peer helpers; student development, communication, goal setting, and use of community resources are stressed. (EDPS 30100 and 30100 are for Horizon students only.) Permission of instructor required. **Credits:** 1.00 to 3.00

EDPS 30101 - Motivation To Learn

Credit Hours: 3.00. This course introduces students to current social-cognitive and sociocultural theories of motivation for learning and academic achievement, and research framed by those theories. Both individual-level and contextual factors associated with motivation will be considered. The course will also address applications of theory in educational settings, including motivational interventions. **Credits:** 3.00

EDPS 30102 - Social-Emotional Aspects Of Learning In Diverse Environments

Credit Hours: 3.00. The course examines the role of social emotional competence in learning and builds understandings of the inter-relationships between theory, empirical evidence, and instructional practice. It takes the perspective that experiences across different learning contexts are interrelated and may influence each other in reciprocal ways. The course views social-emotional

dimensions of learning as: embedded in person-environment transactions; tied to specific instructional (formal and/or informal) contexts over time; co-evolving with cognition and language; critical to psychological, behavioral, and learning outcomes. The focus is on intersection of social-emotional competence, learning, and instruction. The course is intended to provide the foundations (theoretical and empirical) that can help those interested in formal and informal instructional environments make informed educational decisions by considering the social-emotional dimensions of learning. **Credits:** 3.00

EDPS 30200 - Adolescents Classroom Teacher

Credit Hours: 3.00. Students will develop understanding of physical, intellectual, emotional and social development of learners. Emphasis on individual differences and behavior patterns that influence the establishment of an orderly, healthy learning environment, and upon the teacher as an influence of the learning environment. **Credits:** 3.00

EDPS 30400 - Assessment And Transition (Data-Based Decision-Making)

Credit Hours: 3.00. This course addresses assessment techniques and transition planning in special education, with applications to curriculum. It includes norm-referenced and curriculum-based measurement, error analyses, observational ratings, data-based decision-making, and transition planning from early intervention to post-secondary settings. Typically offered Fall Spring Summer.**Credits:** 3.00

EDPS 30500 - Special Education Seminar: Perspectives On Disability

Credit Hours: 1.00. This course is designed to broaden student understanding of disability by exploring across related fields including disability studies, neurodiversity, speech language development, and behavioral characteristics. The goal of this seminar is for students to make connections between special education theory and practice and theories and views of disability beyond special education. Through lecture, discussion, and reflection, students will learn about the construct of disability and how individual strengths, needs, services, and supports extend across the lifespan and beyond the special education classroom.**Credits:** 1.00

EDPS 30900 - Systematic And Explicit Instruction

Credit Hours: 3.00. Students will learn evidence based instructional strategies for students with disabilities. The key components of systematic and explicit instruction will be explored. Students will learn how to use explicit instructional strategies to foster engagement and motivation. Methods for implementing systematic instruction across academic, functional, communication, social, and behavior goals will be addressed. Additionally, implementation in a variety of settings including 1:1, small group, and large group settings will be explored. Planning for generalization and maintenance of skills will also be addressed. Typically offered Fall Spring Summer.**Credits:** 3.00

EDPS 31001 - Characteristics Of Individuals With Disability Who Require Intense Intervention

Credit Hours: 3.00. This course addresses the characteristics of individuals who require intense intervention and how learning, behavioral, social-emotional, and communicative needs impact their lives. This course will also explore the cultural differences, legal and ethical guidelines, family impact, transition to adulthood, and wraparound services. A field experience will provide opportunities to observe and participate in a school setting (early childhood through age 21).**Credits:** 3.00

EDPS 31100 - Supporting Exceptional Learners: Foundations And Mathematics

Credit Hours: 3.00. Teaching students with special needs requires the ability to locate evidence-based interventions, implement those interventions with fidelity, and track student performance over time. Mathematics is a content area in which success or

failure yields major ramifications for postsecondary success. This course will cover the common math interventions employed for mild to severe disabilities across grade levels K-12. Typically offered Fall Spring Summer.**Credits:** 3.00

EDPS 31200 - Inclusive Practices In Cross-Content Curriculum

Credit Hours: 3.00. This course aims to teach best practices for cross-content integration in an inclusive or self-contained classroom. It develops pre-service teacher understanding of core curricula along with how to integrate the curricula across subject areas. This course will also cover curricula to implement a well-rounded education (e.g., visual arts, dance, theater, music, etc.), provide methods for inclusive practices within the content, and discuss the implementation of collaborative approaches to cross-content planning and delivery.**Credits:** 3.00

EDPS 31500 - Collaborative Leadership: Interpersonal Skills

Credit Hours: 3.00. The purpose of this course is to provide integrated study of listening as a collaborative leadership skill necessary for interpersonal and intrapersonal development. Focus is on the development of professional listening skills, and the understand of the role listening plays in collaborative leadership conflict resolution, interviewing, team building, and ethics.**Credits:** 3.00

EDPS 31600 - Collaborative Leadership: Cross-Cultural Settings

Credit Hours: 3.00. In this course, students will explore the cultural nuances of leadership in the United States as well as around the world. This course will include impact of globalism as a context for leadership, conflict resolution in a global environment, and other important factors that impact culturally diverse or global teams.**Credits:** 3.00

EDPS 31700 - Collaborative Leadership: Mentoring

Credit Hours: 3.00. The purpose of this course is to provide a theoretical and experiential overview of the basic elements of mentoring as a key aspect of effective collaborative leadership. The hallmark of this course is the inclusion of a service-learning component in which students will be paired with undergraduate mentees and required to participate in weekly mentoring meetings for the duration of the semester. This learning experience is designed to promote development of the knowledge, skills, and dispositions required for competent mentorship. Emphasis on peer mentoring. **Credits:** 3.00

EDPS 32000 - Happiness And Well-Being: Introduction To Positive Psychology

Credit Hours: 3.00. Happiness and Well-Being: An Introduction to Positive Psychology is an undergraduate course designed to provide students with an introduction to the field of positive psychology while also learning valuable, impactful life skills that can improve individual well-being, resilience, flow, happiness, and mindfulness for those enrolled. The course is designed in such a way time is devoted to both lecture and discussion based learning as well as experiential activities in the classroom designed to expose students to positive psychology constructs. Students will be exposed to strength oriented approaches to understanding human behavior, the instillation of hope and optimism, and multiple other positive psychology concepts that augment understanding of psychology. Students should be willing to participate in experiential exercises using positive psychology methods designed to promote self-awareness and growth. Though this course derives material from psychology, applications of the material can be made across fields and majors; thus, all students will benefit from better understanding human behavior, happiness, and well-being from an inclusive, positive psychology perspective.
This class introduces the student to the major topics of the growing area of positive psychology. Students will learn theories, techniques and research associated with methods that promote happiness and psychological well-being. This introductory class will begin the journey into positive psychology and provides a foundation for further study of applied psychology and counseling at the graduate level. Typically offered Fall Spring.**Credits:** 3.00

EDPS 32600 - Foundations Of Adapted Physical Education

Credit Hours: 3.00. Lecture and physical education practicum in teaching children with disabilities. An introduction to the basic concepts and techniques of adapted physical education. Laboratory experience in carrying out adapted physical education programs for children is provided. **Credits:** 3.00

EDPS 32700 - Classroom Assessment

Credit Hours: 1.00 to 3.00. Evaluating the impact of instruction on student performance is one of the most important skills for an educator. Effective teachers ask themselves, "How do I know if students are truly learning? Are they meeting educational objectives in the content area?" Using well-chosen assessment approaches, teachers can address these questions. In this course, students will acquire assessment literacy: the ability to gather accurate information about student achievement, and use that information to make instructional decisions that will improve learning. Course activities will focus on assessment tasks relevant to P- 12 classroom settings.**Credits:** 1.00 to 3.00

EDPS 33500 - Reading Instruction For Tier 1 And Tier 2

Credit Hours: 2.00. Given the needs of struggling/striving readers throughout the educational system, this class will focus on effective interventions from the primary grades through high school. Instructors will present a balance of theoretical and practitioner-oriented aspects of reading development and instruction. The course will also examine a number of reading models and instructional approaches designed to ensure all students have access to effective, research-based literacy instruction. The goal is to ensure students complete the semester with a range of essential tools for working with this population. Typically offered Fall Spring.**Credits:** 2.00

EDPS 34100 - Introduction To Philosophical Underpinnings And Concepts Of Applied Behavior Analysis

Credit Hours: 3.00. This course is the first of four courses in the Applied Behavior Analysis pathway for undergraduates in teacher licensure programs and is also part of the course content required to become a Board Certified Assistant Behavior Analyst (BCaBA). The course will provide an introduction into the primary concepts and principles of applied behavior analysis. Students will be introduce to the fundamental knowledge and experiences for understanding Applied Behavior Analysis principles, concepts, and techniques, including operant behavior, reinforcement, punishment, choice, antecedent stimulus control, and verbal behavior. Students learn concepts and principles to increase or decrease target behavior, to facilitate behavior maintenance and generalization, and to evaluate effectiveness of instruction. This course includes a field placement.**Credits:** 3.00

EDPS 34200 - Applied Behavior Analysis - Assessment And Intervention

Credit Hours: 3.00. This course is one of four courses in the Applied Behavior Analysis pathway for undergraduates in teacher licensure programs and is also part of the course content required to become a Board Certified Assistant Behavior Analyst (BCaBA). This course offers the interventionist with the techniques for designing, implementing, and evaluating instructional and behavioral interventions grounded in the theories of applied behavior analysis. Specifically, the learner will be exposed to techniques for measuring target academic, behavior, social and adaptive skills, as well as methods for displaying and interpreting data. Additionally, learners will design interventions, and monitor progress and will be exposed to the foundational concepts and methods of ABA including defining behaviors, collecting data, and understanding the three-term contingency of behavior. This course includes a field placement.**Credits:** 3.00

EDPS 36100 - Use Of Assessment Techniques In Special Education

Credit Hours: 3.00. Assessment techniques for the exceptional child, with applications to curriculum. Includes norm-referenced and curriculum-based measurement, error analyses, and observational ratings. Admission to Teacher Education Program, passage of Gate A. **Credits:** 3.00

EDPS 36201 - Positive Behavioral Supports

Credit Hours: 2.00 or 3.00. This course provides an overview of the theory, principles, and application of applied behavior analysis within positive behavior interventions and support. The course focuses on pre-service teacher preparation in designing and implementing group and individual behavior supports. Emphasis is on universal supports, targeted interventions, and data-driven decision-making.**Credits:** 2.00 or 3.00

EDPS 36300 - Psychoeducational, Medical, And Physical Aspects Of Individuals With Disabilities

Credit Hours: 3.00. Introduction to characteristics of individuals with mild and severe intellectual disabilities: defining characteristics, etiological factors, assessment, social, legal and educational issues, and basic physical or medical disability management issues and techniques. Admission to Teacher Education Program, passage of Gates A required.**Credits:** 3.00

EDPS 40099 - Topics In Design Based Research, Assessment And Evaluation

Credit Hours: 3.00. Design-Based Research (DBR) is inquiry that is driven by educational practice- the desire to understand and improve the practice of teaching and learning. Learning scientist employ DBR in order to implement innovative designs for teaching and learning in a variety of formal and informal educational settings (e.g., schools, museums, and extramural clubs) and to conduct research no teaching and learning that occurs in the context of their design innovations. The focus of this course is to help students develop a set of core competencies for systemically studying the teaching and learning of science in designed environments. **Credits:** 3.00

EDPS 40200 - K-12 Reading Methods For Exceptional Learners

Credit Hours: 2.00. This course is designed to meet the exceptions of CEC, NCTQ, and REPA 3 and prepare students in the science of reading for exceptional learners (including students with dyslexia and those with intensive needs) in Tiers 2 and 3. This course will provide implementation details on Response to Intervention (RTI) and Multi-tiered Systems of Support (MTSS). The course will present strategies and programs used in strategic and intensive intervention efforts for those learners needing additional, unique, and/or more focused remediation efforts. Topics will include understanding reading intervention research, the behavior analytic and learning sciences' contributions to understanding the reading process, the sequence of learning to read (systematic instruction), reading to learn, and the five components of reading instruction for both K-3 and 4-12 learners. This course will specifically address the REPA 3 Standard: Focused work using ("interventions that are direct, explicit, and multi-sensory) as a component of scientifically-based reading.**Credits:** 2.00

EDPS 40300 - Individual Social, Emotional, Behavioral Supports

Credit Hours: 3.00. This course is designed to prepare students with advanced knowledge and skills in designing and delivering individualized social-emotional and behavioral supports for learners. Emphasis will be placed on functional behavior assessment and function-based interventions and supports. Typically offered Fall Spring Summer.**Credits:** 3.00

EDPS 41001 - Collaboration And Transition Practices For Individuals With Disabilities

Credit Hours: 3.00. This course addresses the professional collaborative practices for special educators, who work with school age students with disabilities. The topics of this course include collaboration with professionals, ancillary personnel, agencies, and families, problem-solving and dealing with conflict, co-teaching, and transition planning from early intervention to post-secondary settings. The possible products from this course include community resources, transition plans, co-teaching plans, and family interviews. No undergraduate student may be enrolled in this undergraduate course until they have been admitted to the teacher education program and passed Gates A and B. Typically offered Spring.**Credits:** 3.00

EDPS 41700 - Special Education Knowledge And Skills For General Educators

Credit Hours: 3.00. This course is the capstone course for the Special Education certificate and pathway. This course is designed to expose students to innovative strategies and best practices for promoting inclusive education. Students in this course will develop the habits of ongoing training and professional development to support the variety of student needs in inclusive general education classes.**Credits:** 3.00

EDPS 42100 - Supporting Exceptional Learners: Social Studies And Science

Credit Hours: 3.00. Teaching students with special needs requires the ability to locate evidence-based interventions, implement those interventions with fidelity, and track student performance over time. Mathematics is a content area in which success or failure yields major ramifications for postsecondary success. This course will cover the common math interventions employed for mild to severe disabilities across grade levels K-12. This course includes assignments that will be linked to EDPS 46100 the Special Education Student Teaching Residency. Typically offered Fall Spring Summer.
Credits: 3.00

EDPS 43000 - Creating And Managing Learning Environments

Credit Hours: 2.00 or 3.00. The purpose of this course is to enable you to develop a supportive, challenging, and growth-enhancing classroom community for students in elementary grades. Teachers need insightful understanding and strong skills to create a classroom community that enhances achievement, welcomes diversity, makes effective use of technology, and provides appropriate educational experiences for students with diverse needs, backgrounds, and developmental levels.**Credits:** 2.00 or 3.00

EDPS 43010 - Secondary Creating And Managing Learning Environments

Credit Hours: 1.00 to 3.00. This course is designed to develop advanced pre-service teachers' skills in recognizing classroom processes and understanding how teachers' beliefs and practices affect secondary students' engagement, learning, and motivation. It focuses on Effective Teaching - what it is, what it looks like, and different ways to enact it in the classroom. Typically offered Fall Spring.**Credits:** 1.00 to 3.00

EDPS 44100 - Introduction To Ethics And Practice Of Applied Behavior Analysis

Credit Hours: 3.00. This course is the final course in the Applied Behavior Analysis pathway for undergraduates in teacher licensure programs and is also part of the course content required to become a Board Certified Assistant Behavior Analyst (BCaBA). This course will address the professional and ethical responsibilities of behavior analysts. Key issues of responsible conduct as it relates to areas such as confidentiality, consent, consultation, treatment planning, and research will be discussed and applied through case studies. Learners will be able to consider ABA techniques within the bounds of both legal and ethical frameworks.**Credits:** 3.00

EDPS 44200 - Advanced Intervention In Applied Behavior Analysis

Credit Hours: 3.00. This course is one of four courses in the Applied Behavior Analysis pathway for undergraduates in teacher licensure programs and is also part of the course content required to become a Board certified Assistant Behavior Analyst (BCaBA). This course will provide fundamental knowledge and experiences for understanding instructional and behavior interventions grounded in the principles of Applied behavior Analysis including a pivotal response training, functional communication training, video modeling, self-management, social skills training, and augmentative and alternative communication (AAC). Students learn procedures to increase or decrease target behavior, to facilitate behavior maintenance and generalization, and to evaluate effectiveness of instruction. Students will also learn strategies for consultation with other service providers as well as practices for effective supervision of others such as paraeducators.**Credits:** 3.00

EDPS 45200 - Global Studies Seminar

Credit Hours: 1.00. (EDCI 45200) The course builds on students' international cross-cultural experiences, particularly Study Abroad. The course is required for those wishing to complete the Global Studies minor in the College of Education. Typically offered Fall Spring Summer.**Credits:** 1.00

EDPS 45901 - Assistive Technology

Credit Hours: 1.00. This course explores the use of Universal Design for Learning as a framework for Differentiated Instruction. Additionally, this course addresses the use of Augmentative and Alternative Communication and Assistive Technology by individuals with disability requiring mild, moderate, and intense intervention.**Credits:** 1.00

EDPS 46000 - Strategies For Teaching Individuals With Mild And Moderate Disabilities Primary & Elementary Grades

Credit Hours: 3.00. This course is designed to prepare future special educators to plan and provide content area instruction in the core content areas to primary and elementary students with mild and moderate disabilities. Course content will include information on assessment, instructional design, and development of individualized education programs, research-based practices for promoting academic and behavioral growth, and content area literacy and numeracy, and your professional role as a teacher of students with mild disabilities. This course has a required concurrent enrollment in EDPS 46100.**Credits:** 3.00

EDPS 46100 - Practicum In Strategies For Teaching Individuals With Disabilities

Credit Hours: 1.00 to 6.00. Practicum experience in assessment and teaching of individuals with disabilities. Experience in design, delivery, implementation, and evaluation of instruction. No undergraduate students may be enrolled in any of these undergraduate courses until they have been admitted to teacher education. Admission to Teacher Education Program, passage of Gates A and B. **Credits:** 1.00 to 6.00

EDPS 46200 - Strategies For Teaching Individuals With Mild And Moderate Disabilities (Middle And High School)

Credit Hours: 3.00. This course is designed to prepare future special educators to plan and provide content area instruction in the areas of mathematics, science, and social studies to elementary and secondary students with mild disabilities. Course content will include information on assessment, instructional design, development of individualized education programs, research-based practices for promoting academic and behavioral growth, and content area literacy, and the professional role as a teacher of students with mild disabilities. **Credits:** 3.00

EDPS 46300 - Teaching Individuals With Severe Disabilities

Credit Hours: 3.00. Education of individuals with severe or multiple disabilities. Application of innovative technology, design of individual educational programs, strategies and methods for instruction, evaluation of instruction, community-based instruction, generalization and maintenance of skills. Admission to Teacher Education Program, passage of Gate A required.**Credits:** 3.00

EDPS 49000 - Individual Research And Teaching Experience

Credit Hours: 1.00 to 8.00. Primarily for teacher candidates requiring special, individualized experience in research or teaching. Permission of instructor required. **Credits:** 1.00 to 8.00

EDPS 49100 - Topics And Issues In Education

Credit Hours: 1.00 to 3.00. Provides student with opportunity to strengthen preparation through study of selected educational topics and issues based upon individual needs and interests. One topic is considered in each enrollment. **Credits:** 1.00 to 3.00

EDPS 49500 - Practicum In Gifted, Creative, And Talented Education

Credit Hours: 3.00. The Practicum in Gifted, Creative, and Talented (GCT) Education is designed to be the culminating experience for those who are pursuing the GCT pathway as part of their teacher education undergraduate licensure program, with or without Indiana licensure. The overall goal of the course is derived from Standard 6 of the NAGC-CEC Teacher Preparation Standards in Gifted and Talented Education. Includes experiential learning. Required for those seeking GCT pathway in teacher education.**Credits:** 3.00

EDPS 49800 - Supervised Teaching- Special Education

Credit Hours: 1.00 to 16.00. A student planning to enroll in EDCI 49600, EDCI 49800, EDCI 49900; EDPS 49800, EDPS 49900, EDPS 56100, or EDPS 56600 in the spring or fall semester of any academic year must secure, complete, and submit a student teaching application form between the middle of September and November 1 preceding the academic year during which he or she will be enrolled in the course. Failure to file the application during or prior to this time will make it virtually impossible for the student to receive a student teaching assignment for that year. Application forms may be obtained in and submitted to Room 3241, Liberal Arts and Education Building. Teaching full time in a school classroom under the supervision of the teacher in charge of the class and a University supervisor. No undergraduate students may be enrolled in any of these undergraduate courses until they have been admitted to teacher education. Admission to Teacher Education Program, passage of Gates A, B, and C. **Credits:** 1.00 to 16.00

EDPS 49900 - Supervised Teaching Or Practicum In Endorsement Area

Credit Hours: 3.00 to 9.00. A student planning to enroll in EDCI 49600, EDCI 49800, EDCI 49900; EDPS 49800, EDPS 49900, EDPS 56100, or EDPS 56600 in the spring or fall semester of any academic year must secure, complete, and submit a student teaching application form between the middle of September and November 1 preceding the academic year during which he or she will be enrolled in the course. Failure to file the application during or prior to this time will make it virtually impossible for the student to receive a student teaching assignment for that year. Application forms may be obtained in and submitted to Room 3241, Liberal Arts and Education Building. Teaching full time in an endorsement area in a school classroom under the supervision of the teacher in charge of the class and a University supervisor. No undergraduate students may be enrolled in any of these undergraduate courses until they have been admitted to teacher education. completion of education courses required for the endorsement area and admittance to teacher education program. **Credits:** 3.00 to 9.00

EDPS 50000 - Group Counseling Theories And Techniques

Credit Hours: 3.00. Theoretical and experiential overview of fundamental elements of group work and group counseling processes. Broad topics include purposes and types of groups, therapeutic factors and stages of leadership skills, and multicultural, ethical, and legal aspects of group counseling. **Credits:** 3.00

EDPS 50001 - Foundations Of Online Learning

Credit Hours: 1.00. This course is designed to help you to understand the knowledge and skills necessary for your successful online learning in the Online MSEd in Special Education program, with a focus on the process of completing University and Program specific requirements. In this orientation, you will explore what online learning entails and reflect on how you can best set yourself up to succeed in your studies. Typically offered Fall Spring Summer. **Credits:** 1.00

EDPS 50002 - Foundations Of Licensure

Credit Hours: 1.00. This course is designed to guide candidates to complete required documents needed to determine appropriate clinical practice placement(s) for candidates within unique employment situations. This course includes two process applications required of all employed candidates: 1) Clinical Practice Pre-Application Process and 2) Clinical Practice Application Process. Typically offered Fall Spring Summer.**Credits:** 1.00

EDPS 50100 - Introduction To School Counseling

Credit Hours: 3.00. Presents an overview of counseling in elementary, middle, and secondary schools. Treats the history of school counseling, developmental characteristics and problems of students, and counseling program elements and issues. Typically offered Summer Fall Spring.**Credits:** 3.00

EDPS 50500 - Foundations Of Career Development And Assessment

Credit Hours: 3.00. Treats career development theories which emphasize aspects of the self in decision making, occupational classification systems, and educational and vocational information with applications to individual and group counseling. Typically offered Summer Fall Spring.**Credits:** 3.00

EDPS 50700 - Counseling Multicultural And Diverse Populations

Credit Hours: 3.00. Counseling strategies for multicultural and diverse populations encountered by helping professionals. Among the populations considered are ethnic and cultural minorities, older persons, the gifted, and the disabled. Typically offered Spring Summer.**Credits:** 3.00

EDPS 50701 - Foundational Techniques For Telemental Health Providers

Credit Hours: 3.00. The purpose of this course is to provide a broad overview of individual therapy with adults via telemental health using a videoconferencing platform. Within this course, students will develop general, foundational knowledge related to pre-screening adults for individual therapy, conducting intakes with adult clients, engaging in individual therapy sessions with adult clients, terminating with adult clients, and managing risk with adult clients. Additionally, this course offers a brief overview of telemental health therapy with children, couples, families, and groups. This course is taught in an asynchronous manner and uses various strategies to facilitate student learning, which include: discussion boards, case studies, role plays, self-assessment papers, and pre-recorded lectures with associated PowerPoint slides. Access to necessary technology resources which includes but is not limited to: stable internet access, Brightspace, a telemental health or associated platform, and a computer, is required to complete the course.**Credits:** 3.00

EDPS 50702 - Addressing Demographic Health Disparities In Telehealth

Credit Hours: 3.00. The practice of tele-mental health is expanding rapidly. This expansion reflects both increased opportunities afforded by technological advances within the healthcare field, as well as pressing needs to resolve persistent healthcare disparities associated with in-person services. As part of the Certificate in Telemental Health Counseling, this course will prepare students to take a systematic view of the challenges and opportunities of transitioning live practices to telehealth, by preparing students to Identify demographic telemental health disparities at local, national, and international levels; describe key barriers that produce demographic telemental health disparities; generate a telemental health access toolkit to address demographic disparities within a specific practice and/or field. **Credits:** 3.00

EDPS 50703 - Introduction To Telemental Health Assessment And Intervention

Credit Hours: 3.00. As part of the Certificate in Telemental Health, this course will prepare students to take a systematic view of the challenges and opportunities of transitioning live practices to telehealth, by preparing students to apply intervention skills within a telehealth framework; identify key differences in telehealth procedures compared to in-person practice; apply skills for working with individuals, groups and families via telemental health processes and practices.**Credits:** 3.00

EDPS 50800 - Cultural And Linguistic Diversity In Special Education Programs

Credit Hours: 3.00. Living in a diverse society provides special education teachers and support personnel the opportunity to encounter a wide array of cultures in their educational settings. The course, designed for special education stakeholders (i.e., teachers, staff, support personnel, administrators), considers issues of human diversity, broadly defined to include ability, ethnicity, culture, gender identity, linguistic background, race, religion, socioeconomic status, and sexual orientation. This course challenges biased assumptions that influence the provision of educational services, and examines issues related to promoting equal learning opportunities in the classroom and other educational settings. It is designed to facilitate student examination of how diversity and diverse experiences shape systems that affect individuals, families, communities, and society. It allows students to explore their own cultures and the biases and internalized messages about those who are different from themselves. Students will be introduced to specific approaches to practice, and frameworks for equity, advocacy, and empowerment to support students who receive special education and/or applied behavior analysis (ABA) service, as well as their families. The course also includes information and discussion topics pertaining to the culturo-behavior science (CBS) specialization of the Association for Behavior Analysis International (ABAI) and to interpersonal communication skills - to include speaking, listening, reading, and writing - and their effect on students and families. Permission of instructor required.**Credits:** 3.00

EDPS 51500 - Foundations Of Applied Behavioral Analysis In School Settings

Credit Hours: 3.00. Application of learning theory, measurement procedures, verification of functional relationships, and developing knowledge of current significant research in applied behavior analysis. Typically offered Fall Spring Summer.**Credits:** 3.00

EDPS 52000 - Characteristics Of Students With Intense Intervention Needs

Credit Hours: 3.00. EDPS 52000 will explore typical and atypical human development, characteristics and etiologies, as well as the influence of cultural, linguistic, and socioeconomic factors of students with intense intervention needs. Candidates will study medical conditions, physical and health needs, common medications, and the importance of transition plans, health-care plans, and behavioral and academic intervention plans designed to help students with intense intervention needs achieve desired positive learning outcomes. Candidates will be introduced to AAC systems, technology, materials, and other resources to support and enhance the communication skills of students with intense intervention and English learning needs. This course will also explore strategies for using digital tools and resources to communicate and collaborate with students, families, general education teachers, related service providers, paraprofessionals, community agencies, and other stakeholders to help students with mild disabilities achieve desired positive learning outcomes. In addition, candidates will analyze relationships across theory and practice, multiple perspectives and trends, and the application of these relationships within educational settings. Candidates will explore major theories and concepts related to online learning, virtual instruction, twenty-first-century skills, information literacy skills, and the diverse perspectives of online students and develop strategies for effectively integrating technologies into teaching and learning, discuss the benefits and challenges of technologies as educational tools, and apply technologies to meet a variety of learning purposes and needs.**Credits:** 3.00

EDPS 52400 - Effective Instruction For Students With Significant Reading Difficulties

Credit Hours: 3.00. This course will explore significant reading difficulties, such as dyslexia, and essential components of effective reading instruction. This course will investigate scientifically-based reading research (SBRR), evidence-based and developmentally appropriate reading instruction and interventions to support students with exceptionalities.**Credits:** 3.00

EDPS 52700 - Literacy Curricula For Learners With Exceptionalities

Credit Hours: 3.00. This course will explore research-supported general and specialized literacy curricula to prepare candidates to design and/or adapt instructional lessons and materials to meet the needs of students with exceptionalities.**Credits:** 3.00

EDPS 53000 - Cognition And Learning In Context

Credit Hours: 3.00. Theories of learning and development, research on instruction and learning, and principles of measurement applied to educational problems.**Credits:** 3.00

EDPS 53100 - Introduction To Measurement And Instrument Design

Credit Hours: 3.00. An application-oriented introduction to constructing educational and psychological tests and surveys. Class sessions include guided practice with the process of instrument development, from trait and test task domain definition, item writing and revision, and item analysis, to score interpretation and validation. Typically offered Fall Spring Summer.**Credits:** 3.00

EDPS 53300 - Introduction To Educational Research I: Methodology

Credit Hours: 3.00. This course presents a sequence of journal articles and exercises that help introduce the foundational concepts of the course, including: research design, reliability and validity, various methodologies commonly used in educational research, and basic quantitative and qualitative data analyses. In addition, contrasting research conclusions are shown in the articles to help students learn why careful analysis of articles and their theoretical framing is critical to evaluating their conclusions. Typically offered Fall Spring Summer.**Credits:** 3.00

EDPS 53400 - Introduction To Educational Research II: Measurement Consideration

Credit Hours: 3.00. This course is designed to provide an overview of introductory quantitative data analysis methods in education. The course in specially designed to enhance students' quantitative reasoning and skills through discussions of issues in educational data and authentic data analysis experiences of a variety of education data. The topics to be covered in this course include data collection and description, sampling distributions, methods of quantitative data analysis often used in education research. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 3.00

EDPS 53600 - Achievement Motivation And Performance

Credit Hours: 3.00. Study of current theory and research on the nature and development of achievement motivation. Motivation for intellectual and academic performance will be emphasized. Applications of theory in educational settings will be considered. Typically offered Fall.**Credits:** 3.00

EDPS 54000 - Gifted, Creative And Talented Children

Credit Hours: 3.00. This course is an introduction to the intellectual, social, and emotional characteristics of gifted youth; philosophies of gifted education; and programmatic and classroom approaches for supporting gifted students generally and within different domains (e.g., intellectual, academic, creative, artistic, leadership). Typically offered Fall Spring Summer.**Credits:** 3.00

EDPS 54100 - Identification And Evaluation In Gifted Education

Credit Hours: 3.00. This course provides an introduction to the instruments and procedures for identifying gifted, creative, and talented students, as well as the issues and procedures for evaluating gifted programs and individual student progress. Typically offered Fall Spring Summer.**Credits:** 3.00

EDPS 54200 - Curriculum And Program Development In Gifted Education

Credit Hours: 3.00. This course is an introduction to the curriculum development and program design for meeting the needs of gifted, creative, and talented students. Students will be exposed to established program and curriculum models, as well as the nuts and bolts of developing curricular plans, materials, and specialized programs that support the advanced learning needs of gifted students. Typically offered Fall Spring Summer.**Credits:** 3.00

EDPS 54500 - Social And Affective Development Of Gifted Students

Credit Hours: 3.00. This course focuses on the social and emotional development of gifted and talented students. An overview of the characteristics and needs of gifted subpopulations, diversity issues, and family/parenting concerns along with an introduction to current educational approaches and counseling interventions are provided. The course is designed to complement EDPS 54000. Typically offered Summer.**Credits:** 3.00

EDPS 54700 - Foundations And Principles Of Applied Behavior Analysis

Credit Hours: 3.00. This course will provide a historical perspective of Applied Behavior Analysis as well as the core principles of ABA. The learner will be exposed to the foundational concepts and methods of ABA including defining behaviors, collecting data, and understanding the three-term contingency of behavior. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 3.00

EDPS 54800 - Ethics And Professional Practice Of Applied Behavior Analysis

Credit Hours: 3.00. This course will address the professional and ethical responsibilities of behavior analysts. Key issues of responsible conduct as it relates to areas such as confidentiality, consent, consultation, treatment planning, and research will be discussed and applied through case studies. Learners will be able to apply ABA techniques within the bounds of both legal and ethical frameworks. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 3.00

EDPS 54900 - Verbal Behavior And Social Communication

Credit Hours: 3.00. This course will explore the development of verbal and social behavior as explained through tenets of applied behavior analysis. Students will identify the similarities and differences between verbal operants as well as appropriate function-based interventions to develop each including augmentative communication systems and functional communication training. Measurement and intervention for more complex social-communication skills will also be addressed. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 3.00

EDPS 55000 - Behavioral Consultation And Systems Change

Credit Hours: 3.00. This course will address the provision of behavioral analytic services through consultation within an implementation science framework. Application of ABA principles to evaluate and address system change will be explored including application of behavioral skills training. Techniques for program evaluation, collaborative planning, and progress monitoring will be discussed. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 3.00

EDPS 55100 - Practicum In Applied Behavior Analysis

Credit Hours: 3.00. University-supervised fieldwork in applied behavior analysis. This practicum will facilitate development and fluency of essential professional and ethical skills necessary for the delivery of high-quality ABA services. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 3.00

EDPS 55200 - Basic Concepts Of Applied Behavior Analysis

Credit Hours: 3.00. This course is the first in a sequence of courses for the Applied Behavior Analysis Certificate Program. This course, in combination with the other courses, will provide fundamental knowledge and experiences for understanding Applied Behavior Analysis principles, concepts, and techniques, including observational analysis, data-based instruction, and social validity to increase students' social and task related behavior. Students learn procedures to increase or decrease target behavior, to facilitate behavior maintenance and generalization, and to evaluate effectiveness of instruction. Permissoin of instructor required. Typically offered Fall Spring Summer.

Credits: 3.00

EDPS 55300 - Application Of Applied Behavior Analysis To Manage And Support Personnel

Credit Hours: 3.00. This course will teach students how to use applied behavior analysis to maximize the potential of an organization. Students will learn the role of a Behavior Analyst in implementing principles of applied behavior analysis to motivate employees, intervene with challenges in the organization, evaluate the program, and collect and deliver ongoing performance feedback. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 3.00

EDPS 55400 - Positive Learning Environments And Classroom Management

Credit Hours: 3.00. This course will focus on classroom PBIS practices to create positive learning environments (online and face-to-face), establish classroom expectations, and develop academic and behavioral routines to meet the social, emotional, and behavioral needs of students with exceptionalities. EDPS 55400 will support candidates as they develop classroom practices that are positive and preventative in nature and align to larger school and district positive behavioral supports.**Credits:** 3.00

EDPS 55500 - Differentiating Curriculum & Instruction

Credit Hours: 3.00. This course provides a solid foundation and set of principles for differentiating curriculum and instruction in any classroom at any grade level. Students will explore a variety of evidence-based strategies, tools, and curriculum models that effectively meet the diverse needs of all learners. Through readings, online class meetings and discussions, case studies, differentiated instruction examples, direct application, and reflection, students will deepen their understanding and need to differentiate. With an overarching goal of increasing achievement and developing student talents, this course includes the following major components: creating positive learning environments that support a) high-quality curriculum; b) diagnostic, formative, and summative assessments to inform instructional decision-making; and c) flexible grouping; addressing student differences in readiness, interest, and learning profile (including learning preference, intelligence preference, gender, culture, language preference, locale, and opportunities to learn) and appreciating how these differences influence the ways in which students learn and are motivated; understanding that the process of differentiation involves modifying content, process, product, learning environment, and/or affect; incorporating higher-order thinking skills, creative problem solving, project-based learning, authentic/respectful tasks, collaborative learning, and other evidence-based strategies to promote student achievement and talent development; understanding how differentiation of curriculum and instruction fits within specific educational interventions and models, such as scaffolding, flexible grouping, Response to Intervention (RTI), and Multi-Tiered System of Support (MTSS). **Credits:** 3.00

EDPS 55600 - Introduction To Quantitative Data Analysis Methods In Education I

Credit Hours: 3.00. This online course is designed to provide an overview of introductory quantitative data analysis methods in education. The course is specially designed to enhance students' quantitative reasoning and skills through discussions of issues in educational data and authentic data analysis experiences of a variety of education data. The topics to be covered in this course include data collection and description, sampling distributions, methods of quantitative data analysis often used in education research. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 3.00

EDPS 55700 - Introduction To Quantitative Data Analysis Methods In Education II

Credit Hours: 3.00. This online course is the second quantitative data analysis methods sequences within the college of education. This course is specially designed to enhance students' quantitative reasoning and skills through discussions of issues in educational data and authentic data analysis experiences of a variety of education data. The topics to be covered in this course include simple/multiple linear regression, different types of group comparison methods (including n-way ANOVA, ANCOVA, Repeated-measures ANOVA, and Mixed ANOVA). The course is specifically designed: 1) to understand how the quantitative methods covered in the course can be used appropriately to address proposed research questions in education, and 2) to interpret

quantitative results meaningfully for a given context. It is expected that all students who enroll in this course have completed at least one semester of introductory statistics course (e.g. STAT 50100 or equivalent.) Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 3.00

EDPS 55800 - Transition Education And Services

Credit Hours: 3.00. This course will explore a variety of resources, strategies, and techniques for promoting successful life transitions for students with mild and intense intervention needs before and throughout the school years and into postsecondary and adult settings.**Credits:** 3.00

EDPS 56010 - Clinical Practice I Experience: Practicum

Credit Hours: 1.00 to 6.00. This is a supervised clinical practice experience across two (2) special education settings, one at the elementary level (K-6) and a second experience at the secondary level (5-12) serving students with Mild and/or Intense Intervention Needs. These experiences take place over the course of 8-16 weeks depending upon availability and individual agreements with our partner district. These experiences are a coordinated effort between the Clinical Practice Coordinator, University Supervisor, and highly qualified, practicing Cooperating Teachers from both the elementary and secondary placements. Candidates assess, design and deliver lessons, manage student needs and behaviors, develop IEPs, integrate technology to support learning outcomes, collaborate with families and colleagues, and analyze the experience of facilitation a classroom and caseload of students. In addition, candidates will analyze relationships across theory and practice, multiple perspectives and trends, and the application of these relationships within educational settings. Candidates will explore major theories and concepts related to online learning, virtual instruction, twenty-first-century skills, informative literacy skills, and the diverse perspectives of online students and develop strategies for effectively integrating technologies into teaching and learning, discuss the benefits and challenges of technologies as educational tools, and apply technologies to meet a variety of learning purposes and needs.**Credits:** 1.00 to 6.00

EDPS 56300 - Data-Based Decision Making For Learners With Exceptionalities

Credit Hours: 3.00. Advanced procedures for educational assessment of exceptional individuals: norm-referenced and curriculum-based measurement, error analyses, and observational ratings. Adaptations and selections of tests for sensory impairments, behavioral styles, different intelligence levels and ages. Typically offered Fall Spring Summer.**Credits:** 3.00

EDPS 56400 - Mild Mental Handicaps: Historical Perspectives, Etiology, And Characteristics

Credit Hours: 3.00. Advanced study of persons with varying disabilities. Topics include: historical development; theoretical models; etiological factors; characteristics; assessment and intervention. Typically offered Fall.**Credits:** 3.00

EDPS 56500 - Math Curricula For Learners With Exceptionalities

Credit Hours: 3.00. This course will explore research-supported general and specialized math curricula to prepare candidates to design and/or adapt math lessons and instructional materials to meet the math needs of students with exceptionalities.**Credits:** 3.00

EDPS 56510 - Collaboration And Transition Practices In Special Education

Credit Hours: 3.00. Three modules related to collaboration and transition practices in special education are addressed. Included are theoretical frameworks and assessment for consultation and collaboration involving paraeducators and families. Typically offered Fall Spring Summer.**Credits:** 3.00

EDPS 56600 - Graduate Supervised Teaching Special Education

Credit Hours: 1.00 to 16.00. Demonstration of ability to function independently in special education setting by appropriately planning for student needs, implementing and evaluating plans, establishing appropriate classroom discipline, and interacting professionally with staff and parents. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 1.00 to 16.00

EDPS 56601 - Clinical Practice Experience II (Student Teaching)

Credit Hours: 1.00 to 6.00. This course is a supervised 16-week teaching experience in special education. Candidates assess, design and deliver lessons, manage student needs and behaviors, develop IEPs, integrate technology to enhance learning outcomes and communication, collaborate with families and colleagues, and analyze the experience of facilitating a classroom and caseload of students.**Credits:** 1.00 to 6.00

EDPS 56800 - Social, Legal, And Ethical Issues Across The Lifespan

Credit Hours: 3.00. Survey of difference and similarities of children with exceptionality, including their nature and characteristics related to their developmental and educational needs. Analysis and practical application of social, legal, and ethical issues in the field of special education. Typically offered Fall Spring Summer.**Credits:** 3.00

EDPS 57100 - Advanced Assistive Technology

Credit Hours: 3.00. Introduction and overview of assistive technology for communication, education, employment, recreation, and daily living activities. Typically offered Spring.**Credits:** 3.00

EDPS 57300 - Medical And Physical Management Of Learners With Disability Or Chronic Illness

Credit Hours: 3.00. This course will explore instructional programs, interventions, services, and implications specific to independent living, career, education, and medical self-management procedures that support students with intense medical, physical, or chronic health care needs.**Credits:** 3.00

EDPS 57600 - Curricula For Learners With Intense Intervention Needs

Credit Hours: 3.00. This course will explore research-supported general and specialized content-area (reading, Math, Writing, Science, Social Studies) curricula as well as functional and independent skill curricula to prepare candidates to design and/or adapt instructional lessons and materials to meet the needs of students with intense intervention needs.**Credits:** 3.00

EDPS 57701 - Development Of Learners With Mild Intervention Needs

Credit Hours: 3.00. This course will explore the 4 areas of child development and the milestones associated with Cognitive, Social/Emotional, Language and Communication, and Movement and Physical development. This foundation in typical development will allow candidates to better understand atypical development in relation to characteristics and etiologies of mild disabilities. Candidates will investigate the multiple impacts systems have on individuals with mild disabilities and their families.**Credits:** 3.00

EDPS 58900 - Special Topics For Teachers

Credit Hours: 1.00 to 4.00. Consideration of appropriate professional problems of experienced educational personnel in workshops or in-service programs. Typically offered Fall Spring Summer.**Credits:** 1.00 to 4.00

EDPS 59000 - Individual Research Problems

Credit Hours: 1.00 to 6.00. Opportunities for students to study particular problems under the guidance of a member of the This plan of individualized instruction may be used in any field of education or vocational education. Does not include thesis work. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 1.00 to 6.00

EDPS 59100 - Special Topics In Education

Credit Hours: 1.00 to 4.00. Group study of a current problem or special topic of interest to professional educational personnel. Intensive study of research, theory, or practical aspects of a particular issue within the usual graduate class format. Typically offered Fall Spring Summer.**Credits:** 1.00 to 4.00

EDPS 60000 - Counseling Theories And Techniques

Credit Hours: 3.00. Examination of major counseling theories and counseling techniques, professional and ethical issues. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 3.00

EDPS 60100 - Counseling Theories And Techniques Laboratory

Credit Hours: 3.00. Use of counseling techniques in a supervised laboratory; application of theories and techniques within varying employment settings. Concurrent Prerequisite: EDPS 60000. Typically offered Fall Spring Summer.**Credits:** 3.00

EDPS 60400 - Advanced Counseling Theories And Techniques

Credit Hours: 3.00. Integration of counseling theory, practice, and research. Emphasis on integrating counseling knowledge and skills with major counseling theories and interventions. Prerequisite: EDPS 60000. Permission of instructor required. Typically offered Spring.**Credits:** 3.00

EDPS 60700 - Mixed Methods Research Designs And Applications

Credit Hours: 3.00. This course provides an overview of mixed methods research designs within social science and educational research. The focus of the course will emphasize the philosophical pragmatism embedded in enacting mixed methods research. Further, the course will demonstrate the utility and plausibility of integrating quantitative and qualitative data into a single study. This demonstration will be accomplished through reviewing the historical context of qualitative and quantitative research in social sciences and students' application of mixed methods research within their respective fields of study. Prerequisites: EDPS 53300, EDPS 55600, and EDPS 55700 and an introductory qualitative methods course (one of COM 58500, EDCI 61500, SOC 68600). Typically offered Fall Spring Summer.**Credits:** 3.00

EDPS 61000 - School Counseling Practicum

Credit Hours: 3.00. EDPS 61000 is a field experience for first year master's students in school counseling, consisting of a minimum of 100 hours in a school, under the supervision of both a site supervisor and a campus supervisor. Permission of instructor required. Prerequisites: EDPS 60000 and EDPS 60100 . Permission of instructor required. Typically offered Spring.**Credits:** 3.00

EDPS 61100 - School Counseling Seminar

Credit Hours: 3.00. Attention given to current topics, such as special education, gifted education, data management, grant writing, crisis intervention, service learning, K-12 career development, and systemic change. Prerequisite: EDPS 50100 . Permission of instructor required. Typically offered Fall.**Credits:** 3.00

EDPS 61200 - Advanced Applied Behavior Analysis

Credit Hours: 3.00. The purpose of this course is to expand knowledge and understanding of advanced applied behavior analytic theories and interventions. Specifically, this course will focus on interventions aimed at developing new skills as well as increasing and decreasing behaviors. Procedures for identifying and designing function based interventions will be addressed. Prerequisite: EDPS 36200 or 51500 and EDPS 58800. Typically offered Fall Spring.**Credits:** 3.00

EDPS 61400 - Advanced Counseling Practicum

Credit Hours: 3.00. Supervised use of personal and career counseling techniques applied to complex and difficult client situations. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 3.00

EDPS 61500 - Theories Of Counseling Supervision

Credit Hours: 3.00. Critical analysis of the theories and counseling supervision. Experiential exercises may be included. Prerequisite: EDPS 61400. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 3.00

EDPS 61700 - Professional Issues, Ethics, And History Of Counseling Psychology

Credit Hours: 3.00. Three primary areas in counseling psychology: 1) historical development within psychology; 2) American Psychological Association ethics, professional, and legal issues; and 3) the scientist-practitioner training model in counseling psychology identity. Permission of instructor required. Typically offered Fall Spring.**Credits:** 3.00

EDPS 61801 - Intellectual & Neuropsychological Assessment

Credit Hours: 4.00. This course is designed to expose students to the theory and practice of intellectual and neuropsychological assessment. Students will receive instruction on the theoretical, psychometric, and best practice foundations of these types of assessment in the context of a lecture component, which will be followed by laboratory time in which students will gain experience in administering and scoring relevant tests. Although the WAIS-IV and WISC-IV will be the primary foci of this course, other tests of achievement, cognitive ability, and neuropsychological functioning will be covered. Students will also (a) gain experience in preparing written reports of their interpretations of assessment results, (b) develop an understanding of the history and development of cognitive ability and neuropsychological tests, and (c) explore implications for intellectual and neuropsychological assessment with diverse populations. Permission of instructor required. Prerequisite: EDPS 53300, B-. Typically offered Fall Spring Summer.**Credits:** 4.00

EDPS 61900 - Counseling Psychology Research Practicum

Credit Hours: 3.00. Application of qualitative and quantitative research designs in counseling psychology. Concurrent prerequisite: EDPS 61800(Inactive at PWL) and (PSY 60100 or STAT 50200) and Doctoral student standing enrolled in the Counseling Psychology Program. Typically offered Fall Spring.**Credits:** 3.00

EDPS 62000 - Counseling Seminar

Credit Hours: 1.00 to 4.00. Recent investigation and research in (1) counselor supervision; (2) professional issues; (3) counseling theories; (4) education of counselors and student personnel workers; (5) counseling methodology; (6) vocational development; (7) elementary school counseling; (8) counselor consultation; and (9) other relevant topics. One topic is dealt with in each

enrollment. Prerequisite: Open to graduate students who have successfully completed 12 credit hours of previous counseling personnel services courses. Typically offered Fall Spring Summer.**Credits:** 1.00 to 4.00

EDPS 62100 - Advanced Multicultural Counseling Theory And Practice

Credit Hours: 3.00. Advanced study and clinical application of racial and cultural theories in counseling. Knowledge and practicum components are integrated to facilitate development of awareness and skill competencies central to "Guidelines on Multicultural Education, Training, Research, Practice and Organizational Change for Psychologists" of the American Psychological Association. Prerequisite: EDPS 50700 . Permission of instructor required. Typically offered Fall.**Credits:** 3.00

EDPS 62200 - Systems Concepts In Counseling And Development

Credit Hours: 3.00. Introduction to the use of systems concepts in the counseling professions. Individuals' development within relationships and family matrix, contemporary person-environment issues, and constructs for research and preventive, developmental, and remedial practice. Prerequisite: EDPS 61700. Typically offered Summer Fall Spring.**Credits:** 3.00

EDPS 62300 - Personality Assessment

Credit Hours: 3.00. Applied introduction to methods of administration, scoring, and interpretation of primarily objective personality assessments. Emphasis is placed on assessment of normative population with attention given to personal strengths, developmental factors, and issues of diversity. Typically offered Summer Fall Spring.**Credits:** 3.00

EDPS 62400 - Advanced Off-Site Counseling Practicum And Supervision Theory

Credit Hours: 3.00. Supervised use of personal and/or career counseling and assessment applied to complex and difficult client situations. Critical analysis of counseling supervision theories. Prerequisite: EDPS 61400. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 3.00

EDPS 62500 - Human Growth And Development

Credit Hours: 3.00. An overview of lifespan development. Study of major development theories of childhood, adolescence, and adulthood. Prerequisite: EDPS 60000. Typically offered Fall Spring Summer.**Credits:** 3.00

EDPS 62800 - The Behavior Analyst As Supervisor

Credit Hours: 3.00. This course will address the provision of supervision of behavior analysis trainees and technicians utilizing principles and procedures of applied behavior analysis. Application of goal development, behavioral skills training, and progress monitoring within a behavioral analytic framework will be explored. Must be enrolled in ABA Certificate or Masters Program. Pre-requisite: EDPS 61200. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 3.00

EDPS 63000 - Research Procedures In Education

Credit Hours: 3.00. Development of a philosophy of educational research and consideration of the methods for the selection and evaluation of techniques used in educational research. Techniques discussed are methods to control variables, sampling procedures, data collection procedures, statistical procedures, and research proposal development and writing. Prerequisite: EDPS 53300, (PSY 60100 or EDPS 53300), STAT 50200. Typically offered Fall Spring.**Credits:** 3.00

EDPS 63100 - Applied Educational Research Design Seminar

Credit Hours: 1.00 to 3.00. This seminar seeks to promote professionalism, research and scholarly productivity and collegial support among graduate students in gifted, creative (GCT), and talented studies, associated graduate students, visiting scholars, and interested others. A secondary purpose involves assisting GCT students, COE students, and associates with successful study and career preparation by focusing on research, grants, thesis preparation, graduate writing, proposal development, professional development, and degree completion. Finally, seminar offers students the opportunity to discuss, learn and "mess" around with current issues in the field and of personal interest. Seminar creates time and incentive for students to become more productive with their scholarship efforts, and offers students credit for work completed and formal support for the professional development and scholarship processes. In this course students should expect to attend, contribute, and participate. A variety of formats will be used, including, but not limited to: discussion, simulations, group work, lecture, guest speakers, and peer feedback. Prerequisite: EDPS 63000 and one graduate course in Statistics. Typically offered Fall.**Credits:** 1.00 to 3.00

EDPS 63200 - Seminar In Research Procedures In Education

Credit Hours: 1.00 to 3.00. Experimental, field study, scientific survey, and prediction study methods in education. Internal and external validity, identification and development of research problems, criteria development, common methodological errors, strategies of analysis, and sources of acceptable educational research literature will be reviewed. Critical analyses of the research methodology of educational research reports in the student's field. Prerequisite: EDPS 63000 or EDPS 53300 and course work in Statistics. Typically offered Spring.**Credits:** 1.00 to 3.00

EDPS 63300 - Seminar In Educational Psychology

Credit Hours: 1.00 to 3.00. Recent investigations and research in educational psychology. One topic is dealt with in each enrollment. The topics provide an in-depth study of those areas of psychological investigation in educational settings and problems. These areas include: (1) instructional technology and design; (2) individual differences and educational growth; (3) school learning: theory and research; (4) classroom behavior and social processes; (5) educational assessment; and (6) other relevant topics. Prerequisite: EDPS 53000. Typically offered Fall Spring.**Credits:** 1.00 to 3.00

EDPS 63500 - Psychometric Theory And Application

Credit Hours: 3.00. Advanced classical test theory and application of psychometric methods to study technical properties of tests. Prerequisite: (EDPS 53100 and STAT 50200), or (PSY 60100 or PSY 51200) or consent of Instructor. Typically offered Fall Spring Summer.**Credits:** 3.00

EDPS 63600 - Item Response Theory

Credit Hours: 3.00. Models and model-data fit, estimation of ability and item parameters, item and test information, test construction, obtaining evidence of test reliability and validity, differential item functioning, norming, and equating. Prerequisite: EDPS 53100, (PSY 60100 or STAT 50200 or STAT 51200). Typically offered Summer Fall Spring.**Credits:** 3.00

EDPS 63800 - Factor Analytic Procedures

Credit Hours: 3.00. Introduction to exploratory and confirmatory factor analysis techniques and examination of the use of factor analysis in social sciences. Emphasis on application of methods. Students will develop skills to conduct factor analytic research and critically review use of factor analysis in research. Prerequisite: STAT 51200, STAT 52400. Typically offered Spring.**Credits:** 3.00

EDPS 65000 - Critical Issues In Special Education

Credit Hours: 3.00. This course is designed for advanced graduate students in special education and related disciplines. The goals of this course are: (a) to familiarize students with current topics and critical controversies in special education, (b) to help

students gain skills in critical analyses of issues, and (c) to provide students with opportunities to develop skills that are linked to the professorate (e.g., researching, writing, and speaking about contemporary issues). Typically offered Fall Spring.**Credits:** 3.00

EDPS 65300 - Collaborative Learning

Credit Hours: 3.00. Techniques for fostering productive collaboration in classrooms will be discussed along with the evidence for their educational effectiveness. The course will be research focused. Truth-wins, most -competent-member, and average-member models for comparing group performance to individual performance will be described. The goal will be to have students learn how to implement successful collaborative activities in classrooms while also developing the ability to further research in the field. In addition to course readings and class participation, students will be expected to propose a research study related to collaborative learning with emphasis on the literature review. Typically offered Fall Spring Summer.**Credits:** 3.00

EDPS 66100 - Review And Implications Of Research In Special Education

Credit Hours: 3.00. Investigation and research in (1) special issues; (2) mental retardation; (3) learning disabilities; (4) emotional disturbance; (5) early education for exceptional children; (6) curriculum development; (7) career education; (8) parent education; and (9) other relevant topics. One or more topics are dealt with in each enrollment period. Prerequisite: Must have post-master's status. Typically offered Fall Spring Summer.**Credits:** 3.00

EDPS 66300 - Organization And Administration Of Special Education

Credit Hours: 3.00. (EDST 66300) A comprehensive course in the organization and administration of special education including the organizational arrangements, identification, placement and service delivery, tests and assessments, program evaluation, personnel, and school/community relations. Typically offered Spring.**Credits:** 3.00

EDPS 66400 - Seminar In Special Education

Credit Hours: 1.00 to 4.00. A critical analysis of or special assignments related to research, practice, and selected problems in special education or in specific disability areas. One topic is considered in each enrollment. For advanced graduate students. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 1.00 to 4.00

EDPS 68800 - Single Subject Research Design

Credit Hours: 2.00 or 3.00. Designed to introduce advanced level students to single subject research methodology in context of a science of human behavior, including design theory and application, measurement, experimental validity, applied behavior analysis, and data analysis procedures.**Credits:** 2.00 or 3.00

EDPS 69500 - Internship In Education

Credit Hours: 1.00 to 10.00. Amount of credit to be determined by nature and extent of the assignment. A special course in selected areas of education, designed to provide practical field experience under professional supervision in selected situations related to the candidate's area of specialization. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 1.00 to 10.00

EDPS 69600 - Internship In Counseling Psychology

Credit Hours: 0.00. A special course in the practice activities of counseling psychology. Provides field experience under the supervision of a licensed psychologist. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 0.00

EDPS 69700 - Education Specialist Project-Research

Credit Hours: 0.00 to 18.00. Educational Specialist project research. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 0.00 to 18.00

EDPS 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 1.00 to 18.00

EDPS 69900 - Research PhD Thesis

Credit Hours: 1.00 to 18.00. Research PhD Thesis. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 1.00 to 18.00

EDST 64500 - Higher Education Leadership And Management

Credit Hours: 3.00. This is the second in the series of courses on the Higher Education Organization. The aim of this course is to provide an overview of leadership and management of higher education institutions in the U.S. from relationship-rich and cultural lenses. The scope of the course seeks to create an appreciation for the complexity of the higher education system, specifically of colleges and universities as ecosystems, through exploration of the leadership and management types, systems and structures both horizontally across institutions and institutional types and vertically within the individual, single institution. The course will examine leadership and management from the presidency to managers at all levels in both academic and administrative units. Permission of instructor required. Prerequisite: EDST 64000. **Credits:** 3.00

Educational Leadership and Cultural Foundations

EDST 20010 - Educational Policies And Laws

Credit Hours: 1.00 to 3.00. The interactive course will provide an understanding of the history of schooling in the United States. A special emphasis will be placed on reviewing historical and contemporary educational policies and educational laws as each subject is critical to understanding social, historical, and cultural issues in the United States. Focus will also be on contemporary applications of historical ideas in the classroom and in school systems. Typically offered Fall Spring.**Credits:** 1.00 to 3.00

EDST 49000 - Individual Research And Teaching Experience

Credit Hours: 1.00 to 8.00. Primarily for teacher candidates requiring special, individualized experience in research or teaching. Permission of instructor required. **Credits:** 1.00 to 8.00

EDST 49100 - Topics And Issues In Education

Credit Hours: 1.00. Provides student with opportunity to strengthen preparation through study of selected educational topics and issues based upon individual needs and interests. One topic is considered in each enrollment. **Credits:** 1.00

EDST 51200 - Foundations Of Educational Policy

Credit Hours: 3.00. (EDFA 51200) An examination of the relationship between policy, values, and social change in education, including the roles of local, state, and federal government in educational policymaking and the effects of educational policies on societal issues such as equity, cultural diversity, and opportunity. Typically offered Summer Fall Spring.**Credits:** 3.00

EDST 51300 - Educational Facilities Planning

Credit Hours: 3.00. (EDFA 51300) The course utilizes a systems approach as a basis for planning, construction, and utilization of school facilities. The primary audience for which the course is designed is aspiring school superintendents and central office leaders. Emphasis is placed on gaining the performances, dispositions, and knowledge necessary for successfully providing facilities to enhance the teaching/learning processes in meeting the educational needs of diverse learners. It is intended as a practical course oriented toward "tools" and school facilities in the state of Indiana. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 3.00

EDST 51400 - Economics Of Education

Credit Hours: 3.00. A general course in financing education, including current economic theories, sources of revenues, and trends in fiscal structure and operations in education. **Credits:** 3.00

EDST 51600 - School-Community Relations

Credit Hours: 3.00. (EDFA 51600) This course will stress concepts and principles relevant to school-community interaction. It will focus on the new roles of the public in education and will deal with problems encountered by educators in communicating with the public. Typically offered Fall.**Credits:** 3.00

EDST 52000 - Educational Leadership, Governance, And Policy

Credit Hours: 3.00. The aim of this course is to explore and examine the complexities of contemporary PK-22 education leadership, administration, and governance. This course will cover the foundational administrative knowledge and skills necessary for transformational leadership at the modern primary, secondary, and post-secondary educational settings. The scope of this course seeks to cultivate an understanding of the functionality of educational systems as organizations within the context of a technologically, socially, and culturally changing world. **Credits:** 3.00

EDST 52100 - Foundations In PK-XXII Educational Systems

Credit Hours: 3.00. This survey course broadly explores the complex foundations of U.S. educational systems from pre-kindergarten (PK) through the doctoral level of education (PK-22). Through the lenses of culture, history, politics, and society, this course seeks to examine factors that impact the policies and practices of PK-22 educational systems. From theoretical knowledge to philosophical orientations, the course interrogates the ways schools transform society and ways society transforms schools. The course incorporates a variety of engaged learning activities including discussion prompts, reflective journaling of course readings, and literature review and research writing. As such, this course challenges students to: 1. Describe and analyze the cultural, historical, political, and social foundations of PK-22 education systems; 2. Examine the interrelationships of culture, politics, and social structures related to educational systems; 3. Analyze and evaluate current issues in PK-22 education systems; 4. Construct connections between and among course topics, specifically drawing from educational models and philosophies.**Credits:** 3.00

EDST 52200 - Culture And Social Issues In PK-XXII Education

Credit Hours: 3.00. The aim of this course is to engage students in the critical examination of cultural and social issues impacting PK-22 education at the local, state, and federal levels. This course will review the evolving functional role of PK-22 education in a diversifying global society. By way of critical intercultural and intracultural examination and reflection, this course seeks to cultivate a deeper understanding of the ways that education influences and is influenced by issues related to cultural and social change and conflict. **Credits:** 3.00

EDST 58900 - Special Topics For Teachers

Credit Hours: 1.00 to 4.00. (EDFA 58900) Consideration of appropriate professional problems of experienced educational personnel in workshops or in-service programs. Typically offered Fall Spring Summer.**Credits:** 1.00 to 4.00

EDST 59000 - Individual Research Problems

Credit Hours: 1.00 to 6.00. (EDFA 59000) Opportunities for students to study particular problems under the guidance of a member of the This plan of individualized instruction may be used in any field of education or vocational education. Does not include thesis work. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 1.00 to 6.00

EDST 59100 - Special Topics In Education

Credit Hours: 1.00 to 4.00. (EDFA 59100) Group study of a current problem or special topic of interest to professional educational personnel. Intensive study of research, theory, or practical aspects of a particular issue within the usual graduate class format. Typically offered Fall Spring Summer.**Credits:** 1.00 to 4.00

EDST 60000 - Seminar In The Foundations Of Education

Credit Hours: 3.00. Recommended for those who have had a prior foundations course. Specialized studies in such areas as educational history, educational philosophy, educational sociology, religion and public education, current educational issues, and classical literature of education. Typically offered Fall, Spring, Summer.**Credits:** 3.00

EDST 60200 - Seminar: The School Principalship

Credit Hours: 3.00. Individual exploration in depth of selected aspects of the school principalship and critical analysis of related issues. Prerequisite: EDST 51200. Typically offered Summer Fall Spring.**Credits:** 3.00

EDST 60700 - Administration Of Educational Systems

Credit Hours: 3.00. An examination of administrative function, process, structure, and practice. Special emphasis given to theory development in administration. Exploration of system analysis applications to educational administration. Prerequisite: EDST 51200.**Credits:** 3.00

EDST 60800 - Business Management In Education

Credit Hours: 3.00. (EDFA 60800) This course explores the management and operation of the school business environment, the critical trends and issues in the field, and the internal and external determinants of school fiscal policy. As applicable, selected core and supplemental content and skills from the district level educator standards of the Indiana Standards for School Leaders are addressed in this course. Emphasis is on the integration of theory and practice. Prerequisite: EDST 51400 . Typically offered Fall Spring Summer.**Credits:** 3.00

EDST 60900 - Legal Aspects Of American Education

Credit Hours: 3.00. (EDFA 60900) Legal foundations of education as established by constitutional provisions, court decisions, opinions of attorney generals, administrative rulings, and executive directives. Emphasis on legal theory and principles currently in state of change. Stress of case study method of investigation into educational law. Prerequisite: 9 credit hours in Education. Typically offered Fall Spring Summer.**Credits:** 3.00

EDST 61000 - Supervision Of Instruction And Instructional Personnel

Credit Hours: 3.00. (EDFA 61000) A comprehensive approach to supervision and instruction that develops the knowledge, interpersonal, and leadership skills, which are then applied in a school setting for the purpose of instructional improvement. Models of supervision, leadership and evaluation will be examined to gain knowledge in order to apply effective strategies for diverse situations. The study of transformational change in today's schools will guide leadership knowledge to the task of direct

assistance, collegiality, collaboration, culture of trust, professional development, dialectic inquiry, curriculum development and action research. Prerequisite: EDST 51200 . **Credits:** 3.00

EDST 61200 - Seminar In Educational Administration And Curriculum

Credit Hours: 3.00. An analysis of current research and theory related to selected topics in educational administration and curriculum. One topic is studied in each enrollment. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 3.00

EDST 61300 - Clinic For Educational Leaders

Credit Hours: 1.00 to 6.00. (EDFA 61300) Clinic for educational leaders. Typically offered Summer.**Credits:** 1.00 to 6.00

EDST 61400 - Leadership For Community Collaboration And Development

Credit Hours: 3.00. In this course, we will consider how school leaders can help develop and strengthen relationships between districts/corporations and their publics, for the mutual benefit of students, schools, families, and communities. Throughout selected core and supplemental district level educator standards of the Indiana Standards for School Leaders and the National Policy Board for Educational Administration are addressed. Emphasis is on the integration of theory and practice. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 3.00

EDST 61500 - Educational Policy And Decision Making

Credit Hours: 3.00. This course explores a variety of current legal, political, social, cultural and economic issues as they relate to educational policy and decision making. As applicable, selected core and supplemental content and skills from the district level educator standards of the Indiana Standards for School Leaders and ELCC/NPBEA standards are addressed in this course. Emphasis is on the integration of theory and practice. Prerequisite: EDST 51200 . Typically offered Fall Spring Summer.**Credits:** 3.00

EDST 61600 - Analytical Techniques In Educational Management

Credit Hours: 3.00. This course is a mix of theory and practice concerning planning and implementation of the fiscal responsibilities that a superintendent of schools would engage in at the district level. The course exposes students to some of the key processes and activities related to planning for and implementing the school budget and related activities. The course examines such planning concepts as goal definition, decision-making, and evaluation of planning as it relates to the fiscal issues of a school corporation. A feature of the course is an emphasis on the process of dealing with the elements of change and planning for such as it relates to fiscal issues in educational organizations. Prerequisite: EDST 51400 or EDST 60800 . **Credits:** 3.00

EDST 64000 - Higher Education Law

Credit Hours: 3.00. This course explores the legal framework within which institutions of higher education operate. Course materials, activities, and assignments will give students a deep understanding of how state and federal legislative bodies and courts operate. Students will read statutory materials and case law on legal issues related to higher education, including: free speech, religion, academic freedom, searches and seizures, due process rights, equal protection issues, individuals with disabilities, contracts and employment, torts and university liability. Permission of instructor required. **Credits:** 3.00

EDST 64100 - Organization And Adminstration In Higher Education

Credit Hours: 3.00. The aim of this course is to explore and examine the complexities of organization and administration in higher education. To do so, the course will have a dual focus: organization, which includes forms, structures, systems, roles, and functions; and administration, including the three "Ps" - processes, products, and "players." The scope of the course seeks to create an appreciation for the complexity of the higher education system, specifically of colleges and universities as ecosystems, through exploration of these systems both horizontally across institutions and institutional types and vertically within the individual, single institution. Throughout the semester students will engage in a variety of analytic and critical perspectives through course readings, discussions, and assignments that encourage a multifaceted perspective. The course intends to provide an organizational framework and serve as the foundation for the courses in the Higher Education program of study. **Credits:** 3.00

EDST 64200 - Cultural Engagment In Higher Education Communities

Credit Hours: 3.00. The influence of culture is of particular import with issues facing the world today and Higher Education institutions (HEIs) are not immune to this reality. HEIs often serve as an institutional base for communities and have a vested interest in meaningful engagement with the communities that surround their campuses. This course is designed to enable learners to confidently communicate, build relationships, and work effectively in culturally diverse communities. Through exploration of a variety of intercultural theories, students will become aware of and be able to navigate the cultural influences in local, state, regional, national, and international higher education communities. As part of the course, students will engage in their communities through experiential, real-world, case study, and project management methods. Permission of instructor required. **Credits:** 3.00

EDST 64300 - Higher Education Economics And Finance

Credit Hours: 3.00. This course provides students with an overview of financial issues related to higher education. Students will discuss and evaluate topics such as the public versus private financial benefits of higher education, the financial relationship between institutions of higher education and both state and federal governments, and issues related to labor economics. Permission of instructor required. **Credits:** 3.00

EDST 64400 - Policy And Politics In Higher Education

Credit Hours: 3.00. In this course, focused on historic and contemporary issues, research, and theories that shape public policy in higher education, students will critically examine the policy issues facing higher education today. The course will interrogate the ways politics and policy are leveraged to address issues of access and college success for all, dismantle systemic oppression, and improve upon higher education's ability to carry out its mission, vision, and purpose. Three main foci will be reviewed and applied throughout the course: The policymaking process: Students will gain a foundational knowledge of policy formation and implementation process at the federal, state, tribal/local levels; Methods of policy analysis: methods of analyzing, interpreting, and evaluating policy/policy issues; Policy research: multiple theoretical lenses and research trends focused on continued improvement and development of higher education institutions, programs, and services. Permission of instructor required. **Credits:** 3.00

EDST 64600 - Assessment And Evaluation In Higher Education

Credit Hours: 3.00. The aim of this course is to explore and examine the complexities of assessment and evaluation within higher education systems, including but not limited to student learning, academic programs, student support services, and administrative services. The scope of the course seeks to create a practical understanding of assessment and evaluation, whereby we examine the foundations of assessment planning and development, explore various assessment techniques, explicate and develop a comprehensive assessment plan, and explain how approaches to data collection work in concert and separately to assess both student learning outcomes and program effectiveness. **Credits:** 3.00

EDST 64700 - History Of American Higher Education

Credit Hours: 3.00. This course engages students to better understand the history of higher education in the United States from the Colonial era to the present. Upon completion, students will have an appreciation for how higher education institutions (HEIs) were (and continue to be) developed, as well as an understanding of who had access to these institutions over the past 200+ years, and who did not, from a social justice perspective. **Credits:** 3.00

EDST 64800 - International And Intercultural Higher Education

Credit Hours: 3.00. This doctoral-level course critically examines the interconnected and interdependent world of international higher education through an intercultural lens. The course will employ a variety of critical theoretical perspectives (post-development, feminist, & equity frameworks as well as organizational/institutional models) to examine both the historical and contemporary developments in higher education throughout the globe. Topics will vary based on current issues but will center on the influences cultural, economic, political, & social factors have had on national and international higher education development. Permission of instructor required.**Credits:** 3.00

EDST 66300 - Organization And Administration Of Special Education

Credit Hours: 3.00. (EDPS 66300) A comprehensive course in the organization and administration of special education including the organizational arrangements, identification, placement and service delivery, tests and assessments, program evaluation, personnel, and school/community relations. Typically offered Spring.**Credits:** 3.00

EDST 69400 - Intern In Educational Administration: Building Administrator

Credit Hours: 1.00 to 3.00. (EDFA 69400) Field experience in educational administration under university supervision in selected situations related to school building administration. Amount of credit to be determined by nature and extent of assignment. Permission of instructor required.**Credits:** 1.00 to 3.00

EDST 69500 - Internship In Education

Credit Hours: 1.00 to 10.00. (EDFA 69500) Amount of credit to be determined by nature and extent of the assignment. A special course in selected areas of education, designed to provide practical field experience under professional supervision in selected situations related to the candidate's area of specialization. Typically offered Fall Spring Summer.**Credits:** 1.00 to 10.00

EDST 69700 - EdS Project-Research

Credit Hours: 0.00 to 18.00. Educational Specialist project in research. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 0.00 to 18.00

EDST 69900 - Research PhD Thesis

Credit Hours: 1.00 to 18.00. Research PhD Thesis. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 1.00 to 18.00

Electrical and Computer Engineering

ECE 19595 - Selected Topics In Electrical And Computer Engineering

Credit Hours: 1.00 to 5.00. Topics vary. Permission of department required. **Credits:** 1.00 to 5.00

ECE 20001 - Electrical Engineering Fundamentals I

Credit Hours: 3.00. This course covers fundamental concepts and applications for electrical and computer engineers as well as for engineers who need to gain a broad understanding of these disciplines. The course starts by the basic concepts of charge, current, and voltage as well as their expressions with regards to resistors and resistive circuits. Essential concepts, devices, theorems, and applications of direct-current (DC), 1st order, and alternating-current (AC) circuits are subsequently discussed. Besides electrical devices and circuits, basic electronic components including diodes and transistors as well as their primary applications are also discussed. Typically offered Fall Spring Summer.**Credits:** 3.00

ECE 20002 - Electrical Engineering Fundamentals II

Credit Hours: 3.00. Continuation of Electrical and Computer Engineering Fundamentals I. The course addresses mathematical and computational foundations of circuit analysis (differential equations, Laplace Transform techniques) with a focus on application to linear circuits having variable behavior as a function of frequency, with emphasis on filtering. Variable frequency behavior is further considered for applications of electronic components through single-transistor and operational amplifiers. The course ends with consideration of how circuits behave and may be modeled for analysis at high frequencies. Permission of Department required. Typically offered Fall Spring Summer.**Credits:** 3.00

ECE 20007 - Electrical Engineering Fundamentals I Lab

Credit Hours: 1.00. This is an introduction course in electronic measurement and circuit modeling, simulation and design techniques. These skills are developed through a variety of laboratory experiments ranging from voltage, current, and frequency, to resistors, inductors, capacitors, and operational amplifiers. When possible, the experiments develop practical skills through small design and soldering tasks. Finally, the course culminates in a
two week group design project. In many ways this course is the laboratory of the co-requisite lecture course ECE 20001: Electrical Engineering Fundamentals I; however, we remind students that this is a standalone course that expects students will learn and demonstrate material not taught in ECE 20001. Typically offered Fall Spring Summer.**Credits:** 1.00

ECE 20008 - Electrical Engineering Fundamentals II Lab

Credit Hours: 1.00. This is a course in electronic measurement, circuit modeling, simulation and design techniques. These skills are developed through a variety of laboratory experiments including discrete semiconductor measurement, transistor amplifiers, motor control, and operational amplifier internals. The experiments develop practical skills through small design and soldering tasks. Finally, the course culminates in a two week group design project. In many ways this course is the laboratory of the co-requisite lecture course ECE 20002 Electrical Engineering Fundamentals II; however, we remind students that this is a standalone course that expects students will learn and demonstrate material not taught in other courses. Typically offered Fall Spring Summer.**Credits:** 1.00

ECE 20100 - Linear Circuit Analysis I

Credit Hours: 3.00. Volt-ampere characteristics for circuit elements; independent and dependent sources; Kirchhoff's laws and circuit equations. Source transformations; Thevenin's and Norton's theorems; superposition, step response of 1st order (RC, RL) and 2nd order (RLC) circuits. Phasor analysis, impedance calculations, and computation of sinusoidal steady state responses. Instantaneous and average power, complex power, power factor correction, and maximum power transfer. Instantaneous and average power.**Credits:** 3.00

ECE 20200 - Linear Circuit Analysis II

Credit Hours: 3.00. Continuation of ECE 20100. Use of Laplace Transform techniques to analyze linear circuits with and without initial conditions. Characterization of circuits based upon impedance, admittance, and transfer function parameters. Determination of frequency response via analysis of poles and zeros in the complex plane. Relationship between the transfer function and the impulse response of a circuit. Use of continuous time convolution to determine time domain responses.

Properties and practical uses of resonant circuits and transformers. Input - output characterization of a circuit as a two-port. Low and high-pass filter design.**Credits:** 3.00

ECE 20700 - Electronic Measurement Techniques

Credit Hours: 1.00. Experimental exercises in the use of laboratory instruments. Voltage, current, impedance, frequency, and wave form measurements. Frequency and transient response. Elements of circuit modeling and design. **Credits:** 1.00

ECE 20800 - Electronic Devices And Design Laboratory

Credit Hours: 1.00. Laboratory experiments in the measurement of electronic device characteristics. Design of biasing networks, small signal amplifiers, and switching circuits. **Credits:** 1.00

ECE 20875 - Python For Data Science

Credit Hours: 3.00. This course will introduce Python programming to students through data science problems. Students will learn Python concepts as well as introductory data science topics, and will use their knowledge of Python (and prior programming experience) to implement data analyses. Typically offered Fall Spring.**Credits:** 3.00

ECE 25500 - Introduction To Electronic Analysis And Design

Credit Hours: 3.00. Diode, bipolar transistor, and FET circuit models for the design and analysis of electronic circuits. Single and multistage analysis and design; introduction to digital circuits. Computer-aided design calculations, amplifier operating point design, and frequency response of single and multistage amplifiers. High-frequency and low-frequency designs are emphasized.**Credits:** 3.00

ECE 26400 - Advanced C Programming

Credit Hours: 3.00. Continuation of a first programming course. Topics include files, structures, pointers, and the proper use of dynamic data structures. A basic knowledge of the UNIX operating system and an introductory C programming course; C programming knowledge should include basic syntax, control structures, and file I/O, as well as experience in declaring and using functions. **Credits:** 3.00

ECE 27000 - Introduction To Digital System Design

Credit Hours: 4.00. An introduction to digital system design and hardware engineering, with an emphasis on practical design techniques and circuit implementation.**Credits:** 4.00

ECE 27900 - Sophomore Participation In Vertically Integrated Projects In Electrical And Computer Engineering

Credit Hours: 1.00 or 2.00. This course provides an opportunity for undergraduate students to explore and develop comprehensive applications of electrical and computer engineering technologies, especially as they relate to active research areas of Purdue faculty members. Students will learn about the underlying research, and will work on teams to formulate applications of the research that address real-world needs. Students will attend a weekly lecture that provides an introduction to a broad range of applicable technologies and development tools - some associated with the activities of specific teams, and some addressing topics of more general value to students enrolled in the course. **Credits:** 1.00 or 2.00

ECE 29101 - Internship Experience

Credit Hours: 0.00 to 3.00. A supervised internship experience linking academic studies with relevant work experience. Part-time employment concurrent with full-time study. Permission of instructor required. **Credits:** 0.00 to 3.00

ECE 29199 - Cooperative Experience I

Credit Hours: 0.00. Professional experience in electrical and/or computer engineering. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

ECE 29299 - Cooperative Experience II

Credit Hours: 0.00. Professional experience in electrical and/or computer engineering. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

ECE 29401 - Electrical And Computer Engineering Sophomore Seminar

Credit Hours: 1.00. An introduction to the School of Electrical and Computer Engineering, the program's objectives, and outcomes, BSEE and BSCmpE degree requirements, professional writing and multicultural and professional development. Typically offered Fall Spring.**Credits:** 1.00

ECE 29595 - Selected Topics In Electrical And Computer Engineering

Credit Hours: 1.00 to 5.00. Topics vary. Permission of department required. **Credits:** 1.00 to 5.00

ECE 29600 - Electrical And Computer Engineering Projects

Credit Hours: 0.00 to 18.00. Projects in Electrical and Computer Engineering. Permission of Department required. **Credits:** 0.00 to 18.00

ECE 30010 - Introduction To Machine Learning And Pattern Recognition

Credit Hours: 3.00. Intelligent information processing, search and retrieval, classification, recognition, prediction and optimization with machine learning and pattern recognition algorithms such as neural networks, support vector machines, decision trees and data mining methods, current models and architectures, implementation topics especially in software, applications in areas such as information processing, search and retrieval of internet data, forecasting (prediction), classification, signal/image processing, pattern recognition, optimization, simulation, system identification, communications, control, management and finance. Topics covered will also be illustrated with the software package MATLAB and related toolboxes. Permission of instructor required. **Credits:** 3.00

ECE 30100 - Signals And Systems

Credit Hours: 3.00. Classification, analysis and design of systems in both the time- and frequency-domains. Continuous-time linear systems: Fourier Series, Fourier Transform, bilateral Laplace Transform. Discrete-time linear systems: difference equations, Discrete-Time Fourier Transform, bilateral Z-Transform. Sampling, quantization, and discrete-time processing of continuous-time signals. Discrete-time nonlinear systems: median-type filters, threshold decomposition. System design examples such as the compact disc player and AM radio.**Credits:** 3.00

ECE 30200 - Probabilistic Methods In Electrical And Computer Engineering

Credit Hours: 3.00. An introductory treatment including probability of events, discrete and continuous random variables, multiple random variables, sums of random variables and long-term averages, and elementary random processes. Applications involving uniform, Gaussian, exponential, geometric and related random variables. Introduction to parameter estimation and hypothesis testing. Discussion of wide-sense stationary random processes, including correlation functions, spectral densities and the response of linear time invariant systems. Course examples are drawn from signal processing, wireless communications, system reliability, and data science.**Credits:** 3.00

ECE 30411 - Electromagnetics I

Credit Hours: 3.00. This course is a continued study of vector calculus, electrostatics, magnetostatics, and Maxwell's Equations. It serves as an introduction to electromagnetic waves and transmission lines, which is continued in ECE 30412.**Credits:** 3.00

ECE 30412 - Electromagnetics II

Credit Hours: 3.00. Electromagnetics II builds on Electromagnetics I (ECE 31100) and emphasizes time-varying electromagnetic fields. Both fundamental understanding and an appreciation for applications that span all technologies related to electrical and computer engineering are emphasized. The topics covered include: Maxwell's equations, plane waves, transmission lines, waveguides and cavities, and antennas and radiation. Applications addressed relate to photonics, communications, and imaging and sensing. More generally, illustrations cover the basic principles on which devices and systems used every day operate.**Credits:** 3.00

ECE 30414 - Elements Of Fiber Optics, Lasers And Optoelectronics

Credit Hours: 3.00. Fundamental of photonics, guided-wave optics, optical fibers, lasers, photon detectors, integrated optical components, optical information processing, devices in communication and sensor applications. Topics include generation, transformation, modulation and detection of laser beams and their applications.**Credits:** 3.00

ECE 30415 - Fiber Optics And Lasers Laboratory

Credit Hours: 1.00. This laboratory course exercises in lasers, modulation of laser beams, fiber components and systems. It covers some simple optical measurements like Power and beam spot measurement of Gaussian beams. Students learn about lens-pinhole spatial filters and beam expanders. Fourier transform, convolution and correlation are covered. Characteristics of LEDs and ILDs are shown. Students become familiar with optical fibers related experiments like Fiber-optic microbend intensity sensors, Electrooptic modulation, Fiber optic Mach-Zehnder interferometer etc. Students also learn how to build laser systems based on the knowledge acquired from previous labs and with some simple set up. Finally there is a final project where students can design a practical optical instrument based on their knowledge from the lab.**Credits:** 1.00

ECE 30416 - Basics Of Engineering Optics

Credit Hours: 3.00. Fundamental of photonics, guided-wave optics, optical fibers, lasers, photon detectors, integrated optical components, optical information processing, devices in communication and sensor applications. Topics include generation, transformation, modulation and detection of laser beams and their applications.**Credits:** 3.00

ECE 30417 - Engineering Optics Laboratory

Credit Hours: 1.00. A set of laboratory experiments dealing with fundamentals and basic applications of geometrical optics, beams, polarization optics, wave optics and Fourier optics. Permission of instructor required.**Credits:** 1.00

ECE 30500 - Semiconductor Devices

Credit Hours: 3.00. Introduces and explains terminology, models, properties, and concepts associated with semiconductor devices. Provides detailed insight into the internal workings of the "building-block" device structures such as the pn-junction diode, Schottky diode, BJT, and MOSFET. Presents information about a wide variety of other devices including solar cells, LEDs, HBTs, and modern field-effect devices. Systematically develops the analytical tools needed to solve practical device problems.**Credits:** 3.00

ECE 30600 - Electronic Circuits And Systems Laboratory

Credit Hours: 1.00. Experiments in electronic circuits and systems, including spectral analysis techniques, sampling, distortion measurements, random signals, signal-to-noise ratio and correlation.**Credits:** 1.00

ECE 30653 - Introduction To Nanotechnology And Quantum Science & Technology

Credit Hours: 3.00. This interdisciplinary course offers an introduction to nanotechnology and quantum science and technology for undergraduate students in science and engineering. The students will develop understanding of interdisciplinary nature of these fields and utilize concepts in physics, chemistry and mechanics to describe and analyze unique properties of quantum and nanoscale objects. The course will provide the opportunity to get exposed to highly interdisciplinary nature of today's most active and rapidly expanding fields of research and technologies. **Credits:** 3.00

ECE 30700 - Electromagnetic Fields And Waves Laboratory

Credit Hours: 1.00. Experimental exercises illustrating concepts in electric and magnetic fields, transmission lines, electromagnetic fields, simple waveguides, and antennas.**Credits:** 1.00

ECE 30800 - Systems Simulation And Control Laboratory

Credit Hours: 1.00. Instruction and laboratory exercises in the solution of differential equations that arise in the modeling of physical systems. Instruction in the principles of operation and design of linear control systems.**Credits:** 1.00

ECE 30834 - Fundamentals Of Computer Graphics

Credit Hours: 3.00. Fundamental principles and techniques of computer graphics. The course covers the basics of going from a scene representation to a raster image using OpenGL. Specific topics include coordinate manipulations, perspective, basics of illumination and shading, color models, texture maps, clipping and basic raster algorithms, fundamentals of scene constructions. Permission of department required. **Credits:** 3.00

ECE 30862 - Object-Oriented Programming In C++ And Java

Credit Hours: 3.00. C++ and Java programming languages, including classes, inheritance, encapsulation, polymorphism, class derivation, abstract classes, interfaces, static class members, object construction and destruction, namespaces, exception handling, function, overloading and overriding, function name overload resolution, container classes, and template classes. **Credits:** 3.00

ECE 30864 - Software Engineering Tools

Credit Hours: 1.00. This course will acquaint students with the toolkit of the modern software engineer. Students will learn the tools surrounding the software application itself, e.g., tools for software process, software construction, and software deployment. Examples include: integrated development editors (IDEs), version control systems, project management, bug tracking, scripting languages, testing aids, deployment technologies. **Credits:** 1.00

ECE 31032 - Power Systems Engineering

Credit Hours: 3.00. Introduction to the economic operation of power systems, three-phase circuit analysis, modeling of transformers and transmission lines, steady-state network analysis using a power flow, analysis during faults and state estimation.**Credits:** 3.00

ECE 31033 - Power Electronics

Credit Hours: 3.00. Introduction to the fundamental operating principles of power conditioning circuits that are currently being used to effect power flow from AC to DC and vice versa. Emphasis is on the relationship between form and function of these circuits. Circuits discussed will include AC/DC line-commutated converters, DC/DC converters, DC/variable frequency converters, resonant converters, and AC/AC converters. Computer simulations will be used as a part of the coursework.**Credits:** 3.00

ECE 31100 - Electric And Magnetic Fields

Credit Hours: 3.00. Continued study of vector calculus, electrostatics, and magnetostatics, and Maxwell's equations. Introduction to electromagnetic waves, transmission lines, and radiation from antennas.**Credits:** 3.00

ECE 32100 - Electromechanical Motion Devices

Credit Hours: 3.00. The general theory of electromechanical motion devices relating electric variables and electromagnetic forces. The basic concepts and operational behavior of DC, induction, brushless DC, and stepper motors used in control applications are presented.**Credits:** 3.00

ECE 32300 - Electromechanical Motion Devices and Systems Laboratory

Credit Hours: 1.00. Experiments closely coordinated with ECE 32100 involving measurement of fundamental parameters of various electromechanical devices using modern instrumentation techniques. Computer simulation is used to predict steady-state and dynamic operating characteristics. Comparison of predicted and measured performance is emphasized.**Credits:** 1.00

ECE 32600 - Engineering Project Management

Credit Hours: 3.00. (ME 32600) Project management is an important skill that is needed in the private and public sectors as well as specialty businesses. This course will explore the challenges facing today's project managers and will provide a broad understanding of the project management environment focused on multiple aspects of the project.**Credits:** 3.00

ECE 32700 - Engineering Economics

Credit Hours: 3.00. (ME 32700) Engineering Economics is designed as an overview of economics with a focus on how it relates to the practice of engineering. Topics include interest formulas, rate of return, life cost analysis, depreciation, taxes, and cash flow.**Credits:** 3.00

ECE 33700 - ASIC Design Laboratory

Credit Hours: 2.00. Introduction to standard cell design of Application Specific Integrated Circuits (ASICs) using modern hardware description languages (HDLs). Emphasis on how to write HDL code that will map readily to hardware. Laboratory experiments using commercial grade computer-aided design (CAD) tools for HDL based design, logic simulation, automatic placement and routing, timing analysis and verification.**Credits:** 2.00

ECE 34000 - Simulation, Modeling, and Identification

Credit Hours: 3.00. Investigation and evaluation of design problems through simulation of systems described by ordinary differential and difference equations. Development of simulation models from physical parameters and from experimental data. Topics include continuous, discrete, and hybrid models of electrical, mechanical, and biological systems. Laboratory experiences demonstrate concepts studied in text and lecture.**Credits:** 3.00

ECE 36200 - Microprocessor Systems And Interfacing

Credit Hours: 4.00. An introduction to basic computer organization, microprocessor instruction sets, assembly language programming, and microcontroller peripherals. Typically offered Fall Spring.**Credits:** 4.00

ECE 36800 - Data Structures

Credit Hours: 3.00. Provides insight into the use of data structures. Topics include stacks, queues and lists, trees, graphs, sorting, searching, and hashing.**Credits:** 3.00

ECE 36900 - Discrete Mathematics For Computer Engineering

Credit Hours: 3.00. This course introduces discrete mathematical structures and finite-state machines. Students will learn how to use logical and mathematical formalisms to formulate and solve problems in computer engineering. Topics include formal logic, proof techniques, recurrence relations, sets, combinatorics, relations, functions, algebraic structures, and finite-state machines. **Credits:** 3.00

ECE 37900 - Junior Participation In Vertically Integrated Projects (VIP) In Electrical And Computer Engineering

Credit Hours: 1.00 or 2.00. This course provides an opportunity for undergraduate students to explore and develop comprehensive applications of electrical and computer engineering technologies, especially as they relate to active research areas of Purdue faculty members. Students will learn about the underlying research, and will work on teams to formulate applications of the research that address real-world needs. Students will attend a weekly lecture that provides an introduction to a broad range of applicable technologies and development tools - some associated with the activities of specific teams, and some addressing topics of more general value to students enrolled in the course.**Credits:** 1.00 or 2.00

ECE 38199 - Professional Practice Co-Op I

Credit Hours: 0.00. To obtain professional practice with qualified employers within industry, government, or small business. Permission of department required. **Credits:** 0.00

ECE 38200 - Feedback System Analysis And Design

Credit Hours: 3.00. In this course, classical concepts of feedback system analysis and associated compensation techniques are presented. In particular, the root locus, Bode diagram, and Nyquist criterion are used as determinants of stability. **Credits:** 3.00

ECE 38299 - Professional Practice Co-Op II

Credit Hours: 0.00. To obtain professional practice with qualified employers within industry, government, or small business. Permission of department required. **Credits:** 0.00

ECE 38399 - Professional Practice Co-Op III

Credit Hours: 0.00. To obtain professional practice with qualified employers within industry, government, or small business. Permission of department required. **Credits:** 0.00

ECE 39399 - Cooperative Experience III

Credit Hours: 0.00. Professional experience in electrical and/or computer engineering. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

ECE 39401 - Professional Communications And Diversity

Credit Hours: 1.00. This course provides ECE students with practice in relevant aspects of communication. Topics include: successfully seeking employment, working effectively in teams, delivering engaging presentations, and leveraging the advantages and challenges of diversity and inclusion. Typically offered Fall Spring.**Credits:** 1.00

ECE 39499 - Extensive Cooperative Experience IV

Credit Hours: 0.00. Professional experience in electrical and/or computer engineering. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

ECE 39595 - Selected Topics In Electrical And Computer Engineering

Credit Hours: 1.00 to 5.00. Topics vary. Permission of department required. **Credits:** 1.00 to 5.00

ECE 39599 - Extensive Cooperative Experience V

Credit Hours: 0.00. Professional experience in electrical and/or computer engineering. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

ECE 39600 - Industrial Practice Seminar I

Credit Hours: 1.00. A special seminar for cooperative education and curricular practical training students. Permission of instructor required.**Credits:** 1.00

ECE 39699 - Professional Practice Internship

Credit Hours: 0.00. To obtain professional practice with qualified employers within industry, government, or small business. Permission of department required. **Credits:** 0.00

ECE 40020 - Sound Reinforcement System Design

Credit Hours: 3.00. An introduction to computational tools used in the measurement and analysis of electro-acoustic systems, and their application to sound reinforcement system engineering. Service learning based projects, serving the needs of community clients, provide the context for application of sound reinforcement system design principles and practices. **Credits:** 3.00

ECE 40100 - Engineering Ethics and Professionalism

Credit Hours: 1.00. Some ethical, social, political, legal, and ecological issues that practicing engineers may encounter. (ECE 401 and ME 401 are cross-listed courses; students may not get credit for both ECE 401 and ME 401.)**Credits:** 1.00

ECE 40400 - Introduction To Computer Security

Credit Hours: 3.00. Introduction to security issues related to the operation of computers and the workings of computer networks. Topics covered include introduction to cryptography, authentication protocols, digital signature algorithms, internet vulnerabilities, worms and virus propagation, denial of service attacks, etc. The students will also learn how to design firewalls to protect a system against unwanted intrusions. Permission of department required. **Credits:** 3.00

ECE 40862 - Software For Embedded Systems

Credit Hours: 3.00. This course provides an introduction to software design for embedded computing systems. Major topics covered include the importance of time and timing in embedded systems, embedded software organization (FSM-based program design, polled loop systems, foreground-background systems, event driven architectures, multi-tasking, etc.), real-time scheduling and real-time operating systems, wired/wireless networked embedded systems, debugging techniques for embedded software, and advanced topics such as memory-safe programming, implementing reentrant functions, and minimizing code space, memory usage, and power consumption. The course features a series of integrated assignments using state-of-the-art embedded hardware platforms, embedded software design tools, and real-time operating systems that reinforce the concepts taught in the lectures. Typically offered Fall Spring.**Credits:** 3.00

ECE 40875 - Data Mining Basic Concepts And Techniques

Credit Hours: 3.00. This course introduces fundamental techniques in data mining, such as the techniques that extract useful knowledge from a large amount of data. Topics include data preprocessing, exploratory data analysis, association rule mining, clustering, classification, anomaly detection, recommendation and graph analysis. The applications of these techniques in real-world decision making in various domains, such as science, business, biology, health care, transportation, will be discussed. **Credits:** 3.00

ECE 41023 - Electromechanical Motion Control

Credit Hours: 3.00. The operation, analysis, and control of electromechanical systems are covered, including a treatment of electromechanical devices, power electronics, and control systems. Sample applications include servo-systems, propulsion drives, and variable-speed rotational equipment.**Credits:** 3.00

ECE 41200 - Introduction To Engineering Optics

Credit Hours: 3.00. The control and characteristics of optical radiation are covered. Applications to optical instrumentation, thin films, holography, and polarizing optics are discussed.**Credits:** 3.00

ECE 41300 - Introduction To Optics Laboratory

Credit Hours: 1.00. A set of laboratory experiments dealing with fundamentals and applications of geometrical optics, polarization optics, wave optics, and Fourier optics.**Credits:** 1.00

ECE 41400 - Elements Of Electro And Fiber Optics

Credit Hours: 3.00. Introduction to the use of lasers, fiber and integrated optical components and devices in communication and sensory applications. Topics include generation, transformation, modulation, deflection, and detection of laser beams, and their applications in fiber communication sensory systems.**Credits:** 3.00

ECE 41500 - Electro- And Fiber Optics Laboratory

Credit Hours: 1.00. Laboratory exercises in lasers, hologram, modulation and deflection of laser beams, fiber components, and systems.**Credits:** 1.00

ECE 43200 - Elements Of Power System Engineering

Credit Hours: 3.00. Fundamental concepts of power system analysis, transmission line parameters, basic system models, steady-state performance, network calculations, power flow solutions, fault studies, symmetrical components, operating strategies, and control. **Credits:** 3.00

ECE 43201 - Elementary Power Systems Engineering

Credit Hours: 3.00. Fundamental concepts of power systems analysis, transmission line parameters, basic system models, steady state performance, network calculations, power flow solutions, fault studies, symmetrical components, operating strategies and control.**Credits:** 3.00

ECE 43500 - Object-Oriented Design Using C++ And Java

Credit Hours: 3.00. Review of OO design with C++ and Java. Difficulties caused by multiple inheritances in C++. Taking advantage of Run-Time Identification in C++. Multi-threading, AWT, and Network Programming in Java. Discussion of Java applets, beans, and servlets. Unified modeling language. Use-case analysis. Constructing conceptual models. System sequence diagrams. "Gang of Four" design patterns. Case studies. Permission of instructor required. **Credits:** 3.00

ECE 43700 - Computer Design And Prototyping

Credit Hours: 4.00. An introduction to computer organization and design, including instruction set selection, arithmetic logic unit design, datapath design, control strategies, pipelining, memory hierarchy, and I/O interface design. **Credits:** 4.00

ECE 43800 - Digital Signal Processing With Applications

Credit Hours: 4.00. The course is presented in five units. Foundations: the review of continuous-time and discrete-time signals and spectral analysis; design of finite impulse response and infinite impulse response digital filters; processing of random signals. Speech processing; vocal tract models and characteristics of the speech waveform; short-time spectral analysis and synthesis; linear predictive coding. Image processing: two-dimensional signals, systems and spectral analysis; image enhancement; image coding; and image reconstruction. The laboratory experiments are closely coordinated with each unit. Throughout the course, the integration of digital signal processing concepts in a design environment is emphasized.**Credits:** 4.00

ECE 44000 - Transmission Of Information

Credit Hours: 4.00. Analysis and design of analog and digital communication systems. Emphasis on engineering applications of theory to communication system design. The laboratory introduces the use of advanced engineering workstations in the design and testing of communication systems.**Credits:** 4.00

ECE 44100 - Distributed Parameter Systems

Credit Hours: 3.00. Transient and steady-state behavior of transmission lines, wave guides, antennas, propagation, noise, microwave sources, and system design.**Credits:** 3.00

ECE 45300 - Fundamentals Of Nanoelectronics

Credit Hours: 3.00. Nanoelectronic devices are an integral part of our life, including the billion-plus transistors in every smartphone, each of which has an active region that is only a few hundred atoms long. This course is designed to convey the key concepts developed in the last 25 years which constitute the fundamentals of nanoelectronics and mesoscopic physics, assuming a minimal set of prerequisites. Topics covered include the new Ohm's law, conductance quantization, the nanotransistor, spin valves, thermoelectricity, quantum systems and the non-equilibrium Green's function (NEGF) method. **Credits:** 3.00

ECE 45500 - Integrated Circuit Engineering

Credit Hours: 3.00. Analysis, design, and fabrication of silicon bipolar and MOSFET monolithic integrated circuits. Consideration of amplifier circuit design and fabrication techniques with circuit simulation using Spice-2. Integrated operational amplifiers with difference amplifiers, current sources, active loads, and voltage references. Design of IC analog circuit building blocks.**Credits:** 3.00

ECE 45600 - Digital Integrated Circuit Analysis And Design

Credit Hours: 3.00. As applied t digital integrated circuits, the MDs transistor is studied in depth-from its fabrication to its electrical characteristics. Combinational, sequential, and dynamic logic circuits are considered. While the focus of the course is on CMOS technology, bipolar, nMOS, and BiCMOS circuits are introduced as well. SPICE is used as both an analysis and design tool. Semiconductor memory circuits are also discussed.**Credits:** 3.00

ECE 45700 - Electronic Design Laboratory

Credit Hours: 1.00. Laboratory exercises illustrating the design and application of electronic circuits. Case studies of circuits presently in existing instruments, such as the color television receiver sampling oscilloscope, are used as a basis for the circuits investigated or designed. Pulse and analog circuits studied, as well as high voltage and power supplies. Signal processing, modulation, and sampling are used to demonstrate the circuits as interconnected into a complete system.**Credits:** 1.00

ECE 46100 - Software Engineering

Credit Hours: 3.00. Introduction to software engineering principles, with special emphasis on the process, methods, and tools needed to develop and test quality software products and systems. **Credits:** 3.00

ECE 46300 - Introduction To Computer Communication Networks

Credit Hours: 3.00. An introduction to the design and implementation of computer communication networks. The focus is on the concepts and the fundamental design principles that have contributed to the global Internet success. Topics include: digital transmission and multiplexing, protocols, MAC layer design (Ethernet/802.11), LAN interconnects and switching, congestion/flow/error control, routing, addressing, performance evaluation, internetworking (Internet) including TCP/IP, HTTP, DNS etc. This course will include one or more programming projects.**Credits:** 3.00

ECE 46800 - Introduction To Compilers And Translation Engineering

Credit Hours: 4.00. The design and construction of compilers and other translators. Topics include compilation goals, organization of a translator, grammars and languages, symbol tables, lexical analysis, syntax analysis (parsing), error handling, intermediate and final code generation, assemblers, interpreters, and an introduction to optimization. Emphasis is on engineering a compiler or interpreter for a small programming language - typically a C or Pascal subset. Projects involve the stepwise implementation (and documentation) of such a system. Department permission required.**Credits:** 4.00

ECE 46900 - Operating Systems Engineering

Credit Hours: 4.00. The design and construction of operating systems for both individual computers and distributed (networked) systems. Basic concepts and methods for managing processor, main memory, block-structured storage, and network resources are covered. Detailed examples are taken from a number of operating systems, emphasizing the techniques used in networked versions of UNIX. These techniques are applied to design improvements of portions of a simplified, networked, UNIX-based operating system; the improvements are implemented and their performance is evaluated in laboratory experiments.**Credits:** 4.00

ECE 47000 - Curricular Practical Training

Credit Hours: 0.00. An electrical and/or computer engineering work experience. This internship experience is intended to complement the student's academic plan of study and help prepare him/her for his/her future role as a practicing engineer. A letter from the prospective employer stating the period of employment, hours per week, job title, job qualifications, and job minimum period of employment is required. This course may not be taken in successive semesters. Permission of department required. **Credits:** 0.00

ECE 47001 - Part-Time Curricular Practical Training

Credit Hours: 0.00. A part-time electrical and/or computer engineering work experience. This internship experience is intended to complement the student's academic plan of study and help prepare him/her for his/her future role as a practicing engineer. Permission of department required.**Credits:** 0.00

ECE 47300 - Introduction To Artificial Intelligence

Credit Hours: 3.00. The course introduces fundamental areas of artificial intelligence: knowledge representation and reasoning; machine learning; planning; game playing; natural language processing; and vision. **Credits:** 3.00

ECE 47301 - Machine Learning

Credit Hours: 3.00. This course introduces the fundamental concepts and algorithms of machine learning (ML) with their implementations and applications to practical problems consisting of modeling and prediction. Students will gain knowledge on the formulation of learning representation, over-fitting, generalization, clustering, classification, regression, and probabilistic modeling. Topics include linear regression, supervised and unsupervised learning, dimensionality reduction, Naïve Bayes, feedforward neural networks, deep convolutional neural networks, and the state-of-the-art machine learning libraries.**Credits:** 3.00

ECE 47700 - Digital Systems Senior Project

Credit Hours: 4.00. A structured approach to the development and integration of embedded microcontroller hardware and software that provides senior-level students with significant design experience applying microcontrollers to a wide range of embedded systems (e.g., instrumentation, process control, telecommunications, and intelligent devices). The primary objective is to provide practical experience developing integrated hardware and software for embedded microcontroller systems in an environment that models one which students will most likely encounter in industry. Permission of instructor required.**Credits:** 4.00

ECE 47900 - Senior Participation In Vertically Integrated Projects (VIP) In Electrical And Computer Engineering

Credit Hours: 1.00 or 2.00. This course provides an opportunity for undergraduate students to explore and develop comprehensive applications of electrical and computer engineering technologies, especially as they relate to active research areas

of Purdue faculty members. Students will learn about the underlying research, and will work on teams to formulate applications of the research that address real-world needs. Students will attend a weekly lecture that provides an introduction to a broad range of applicable technologies and development tools - some associated with the activities of specific teams, and some addressing topics of more general value to students enrolled in the course. **Credits:** 1.00 or 2.00

ECE 48300 - Digital Control Systems Analysis And Design

Credit Hours: 3.00. The course introduces feedback computer controlled systems, the components of digital control systems, and system models on the z-domain (z-transfer functions) and on the time domain (state variable representations.) The objectives for system design and evaluation of system performance are considered. Various discrete-time controllers are designed including PID-controllers, state and output feedback controllers, and reconstruction of states using observers. The systems with the designated controllers are tested by simulations. **Credits:** 3.00

ECE 49022 - Electrical Engineering Senior Design Projects

Credit Hours: 4.00. Lecture sessions provide the student with background information on the design and management of projects. Formal lectures cover, for example, design for manufacturability, design for quality, test and evaluation, reliability and ethics, patents and copyrights, plus case studies. During the laboratory sessions, the students work in teams on challenging open-ended electrical engineering project that draws on previous coursework. Projects routinely involve standard design facets (such as consideration of alternative solutions, feasibility considerations, and detailed system descriptions) and include a number of realistic constraints (such as cost, safety, reliability, and aesthetics). Lectures require use of the I-Clicker system.**Credits:** 4.00

ECE 49401 - Professional Communication Capstone

Credit Hours: 1.00. This course provides ECE students an opportunity to refine their professional communication skills before launching into the workplace or graduate school. Topics include: ethics in ECE, workplace communication (written and verbal), and plans for professional growth. Typically offered Fall Spring.**Credits:** 1.00

ECE 49500 - Selected Topics In Electrical And Computer Engineering

Credit Hours: 1.00 to 4.00. Topics vary. Permission of department required. **Credits:** 1.00 to 4.00

ECE 49595 - Selected Topics In Electrical And Computer Engineering

Credit Hours: 1.00 to 5.00. Topics vary. Permission of department required. **Credits:** 1.00 to 5.00

ECE 49600 - Electrical And Computer Engineering Projects

Credit Hours: 0.00 to 18.00. Arrange Hours and Credit. Topics vary. Permission of department required.**Credits:** 0.00 to 18.00

ECE 50024 - Machine Learning

Credit Hours: 3.00. An introductory course to machine learning, with a focus on supervised learning using linear models. The course will have four parts: (1) mathematical background on linear algebra, probability, and optimization. (2) classification methods including Bayesian decision, linear regression, logistic, regression,
and support vector machine. (3) robustness of classifier and adversarial examples. (4) learning theory on the feasibility of learning, VC dimension, complexity analysis, bias-variance analysis. Suitable for senior undergraduates and graduates with a background in probability, linear algebra, and programming.**Credits:** 3.00

ECE 50616 - Physics And Manufacturing Of Solar Cells

Credit Hours: 3.00. This course introduces the electronic, optical and material properties and the manufacturing of photovoltaic devices. Topics include electronic charge separation, transportation and recombination; optical concentration, trapping and confinement; material preparations in photovoltaic systems; bulk crystal, thin-film and organic photovoltaic device configurations; energy storage; as well as emerging concepts in photovoltaics. Discussions also involve the process and equipment for the manufacturing of various photovoltaic modules, with special emphasis on driving down the cost of photovoltaic systems. Typically offered Fall.**Credits:** 3.00

ECE 50631 - Fundamentals Of Current Flow

Credit Hours: 1.00. Traditional description of electronic motion through a solid is based on diffusive transport which means that the electron takes a random walk from the source to the drain. However, modern nanoelectronic devices often have channel lengths comparable to a mean free path so that electrons travel ballistically, or "like a bullet." This course provides a unified conceptual framework for ballistic and diffusive transport of both electrons and phonons, that is very different from what is taught in standard courses, but indispensable to understanding nanolectronic devices.**Credits:** 1.00

ECE 50632 - Introduction To Quantum Transport

Credit Hours: 1.00. This course introduces the Schrödinger equation, uses the tight-binding method to discuss the concept of bandstructure and E(k) relations, along with simple quantum transport problems. No prior background in quantum mechanics or statistical mechanics is assumed.**Credits:** 1.00

ECE 50633 - Boltzmann Law: Physics To Computing

Credit Hours: 1.00. This course introduces the key concepts of equilibrium statistical mechanics leading to the celebrated Boltzmann law and how it leads to Boltzmann machines and related concepts in modern machine learning. No prior background in statistical mechanics is assumed.**Credits:** 1.00

ECE 50635 - An Introduction To Data Analysis, Design Of Experiment, And Machine Learning

Credit Hours: 1.00. This course will provide the conceptual foundation so that a student can use modern statistical concepts and tools to analyze data generated by experiments or numerical simulations. We will also discuss the principles of the design of experiments so that the data generated by experiments/simulations are statistically relevant and useful. We will conclude with a discussion of analytical tools for machine learning and principal component analysis. At the end of the course, a student will be able to use a broad range of tools embedded in MATLAB and Excel to analyze and interpret their data.**Credits:** 1.00

ECE 50653 - Fundamentals Of Nanoelectronics

Credit Hours: 3.00. The modern smartphone is enabled by a billion-plus nano-transistors, each having an active region that is barely a few hundred atoms long. Interestingly the same amazing technology has also led to a deeper understanding of the nature of current flow on an atomic scale. The aim of this course is to make the fundamentals of nanoelectronics accessible to anyone in any branch of science or engineering, assuming very little background beyond linear algebra and differential equations, although we will be discussing advanced concepts in non-equilibrium statistical mechanics that should be of interest even to specialists. We first introduce a new perspective connecting the quantized conductance of short ballistic conductors to the familiar Ohm's law of long diffusive conductors, along with a brief description of the modern nano-transistor. We then address fundamental conceptual issues related to the meaning of resistance on an atomic scale, the interconversion of electricity and heat, the second law of thermodynamics and the fuel value of information. Finally we introduce the concepts of quantum transport as applied to modern nanoscale electronic devices. Typically offered Fall.**Credits:** 3.00

ECE 50836 - Introduction To Data Mining

Credit Hours: 3.00. This course introduces fundamental techniques in data mining, i.e., the techniques that extract useful knowledge from a large amount of data. Topics include data preprocessing, exploratory data analysis, association rule mining, clustering, classification, anomaly detection, recommendation and graph analysis. Students are expected to gain the skills to formulate data mining problems, solve the problems using data mining techniques and interpret the output. **Credits:** 3.00

ECE 50863 - Computer Network Systems

Credit Hours: 3.00. The goal of this course is to provide students with a proper grounding in the basic concepts and seminal work in computer network protocols and systems, and to introduce students to research in the field. The course will cover classical concepts such as network architecture, switching, routing, congestion control, and quality-of-service, and discuss recent developments in these areas. The course will also cover new developments in networking such as network measurements, network management, overlay networking and peer-to-peer systems, network security, and new network architectures. The course will emphasize a system-oriented and empirical view of internet architecture. Graduate standing or consent of instructor. Typically offered Spring.**Credits:** 3.00

ECE 51000 - Introduction To Biometrics

Credit Hours: 3.00. Biometrics is an emerging technology for automatic human identification and verification using unique biological traits. Compared to traditional identification and verification methods, biometrics is more convenient for users, reduces fraud, and is more secure. It is becoming an important ally of security, intelligence, law enforcement, and e-commerce. The principle of various biometric technologies and systems is introduced. Especially, students analyze and design fingerprint recognition, face recognition, iris recognition, voice recognition, and multimodal biometric systems. Students have hands-on experience in designing and analyzing biometric systems.**Credits:** 3.00

ECE 51012 - Electromechanics

Credit Hours: 3.00. The general theory of electromechanical motion devices relating electric variables and electromagnetic forces. The basic concepts and operational behavior of dc, induction, brushless dc, and stepper motors used in control applications are presented. Prerequisite by Topic: Basic circuit analysis; Elementary electromagnetics; Elementary mechanics. Typically offered Spring.**Credits:** 3.00

ECE 51018 - Hybrid Electric Vehicles

Credit Hours: 3.00. Introduction to architectures and technologies associated with electric and hybrid electric vehicles including their constituent components. Specific topics include electric and hybrid electric drive trains, energy storage (batteries/ultracapacitors, fuel cells), electromechanical energy conversion (induction and permanent magnet motors and generators), power electronics, vehicle-level modeling and control, and optimization. Prerequisite by Topic: Energy conversion and power electronics. Typically offered Spring.**Credits:** 3.00

ECE 51032 - Computational Methods For Power System Analysis

Credit Hours: 3.00. System modeling of power networks. Description of modern electricity markets. Analysis of the economic dispatch problem using optimality conditions. Planning of distributed energy resources. Smart grid applications. Machine learning applications to power systems (forecasting, demand-side management, and fault detection). Assigned projects will involve implementing some of the methods using realistic power system models.**Credits:** 3.00

ECE 51100 - Psychophysics

Credit Hours: 3.00. (PSY 51100) An examination of the relationship between physical stimuli and perception (visual, auditory, haptics, etc.). Includes a review of various methods for studying this relationship and of the mathematical and computational tools used in modeling perceptual mechanisms. Permission of department required. Typically offered Fall.**Credits:** 3.00

ECE 51214 - CMOS Analog IC Design

Credit Hours: 3.00. The course covers general topics in CMOS analog IC design; biasing, noise, single stage amplifiers, differential amplifiers, OP-Amp, OTA, frequency domain analysis, and active filters. While the focus of the course is on CMOS IC design, design in bipolar andBi CMOS technologies are introduced as well. A design project is a key component of the course. The students conduct group or individual design projects. Process Design *Kit* and EDA tools are provided for the design projects.**Credits:** 3.00

ECE 51216 - Digital Systems Design Automation

Credit Hours: 3.00. This course will provide an introduction to the tools used to design and analyze circuits at the logic level of abstraction (where circuits are composed of gates and flip-flops). Most digital chips used in computing and electronic systems (including microprocessors, graphics processors, chips used in network routers, cell phones, digital audio/video appliances, automotive electronics) are entirely or largely designed using EDA tools. This course will focus on the foundations of logic-level EDA tools, including the design of exact and heuristic algorithms that form the basis for VLSI Computer-Aided Design. Topics covered include an overview of the IC design flow and levels of abstraction, synthesis of two-level (AND-OR / PLA) circuits, multi-level logic synthesis and technology mapping, sequential circuit synthesis, Logic-level verification using Boolean Satisfiability and BDDs, Timing Analysis, Power analysis and Reduction, and design techniques for emerging nanoscale technologies.**Credits:** 3.00

ECE 51220 - Applied Algorithms

Credit Hours: 3.00. Solving large-scale problems typically rely on many clever data structures and algorithms. This course aims to cover many such useful algorithms for solving large-scale problems. These algorithms include greedy algorithms, dynamic programming and more advanced graph algorithms. The course also aims to demonstrate how such algorithms can be applied to solve optimization problems encountered in engineering applications. In particular, applications in the design of VLSI (very large scale integration) at circuit, layout, or system level will be used to demonstrate how an engineering problem can be formulated as a tree/graph problem and solved using established tree/graph algorithms.**Credits:** 3.00

ECE 51300 - Diffraction, Fourier Optics, And Imaging

Credit Hours: 3.00. Modern theories of diffraction and Fourier optics for imaging, optical communications, and networking. Imaging techniques involving diffraction and/or Fourier analysis with application to tomography, magnetic resonance imaging, synthetic aperture radar, and confocal microscopy. Additional topics in optical communications and networking, including wave propagation in free space, fiber, integrated optics, and related design issues. Simulation studies, using Matlab and other software packages for analysis and design. Offered odd years. Typically offered Fall.**Credits:** 3.00

ECE 51500 - Software Engineering For Embedded Systems

Credit Hours: 3.00. This course teaches the object-oriented system analysis and design for embedded systems. Unified modeling language and Shlaer/Mellor methodology are studied. Assigned project will lead students through the cycles of information gathering, problem analysis, model design, and model implementation for software development.**Credits:** 3.00

ECE 51501 - Smart Grid

Credit Hours: 3.00. The course analyzes the history of the U.S. power grid and to the basic concepts on the current electric power system. The main challenges on the transition of the traditional power system with unidirectional power flow to the new and complex system connected to renewable sources and bidirectional power flow capability is also presented in this course. In addition, the impact of distributed generation and electric vehicles is discussed along with cybersecurity and information privacy issues inherent in this new power grid.**Credits:** 3.00

ECE 52301 - Nanosystems Principles

Credit Hours: 3.00. (ME 52301) This is the introductory course in the nanosystems area. It introduces students to the principles and applications of nanosystems. The course begins with an introduction to the nanometer scale phenomena. It then introduces students to the basic elements resulting in nanosystems: nanoscale materials, processes, and devices. It also provides students with a basic understanding of the tools and approaches that are used for the measurement and characterization of nanosystems, and their modeling and simulation. Moreover, the course covers the applications of nanosystems in a wide range of industries, including information technology, energy, medicine, and consumer goods. The course concludes with a discussion of the societal and economical significance of these applications, including benefits and potential risks.**Credits:** 3.00

ECE 52600 - Fundamentals Of MEMS And Micro-Integrated Systems

Credit Hours: 3.00. (BME 58100) Key topics in micro-electro-mechanical systems (MEMS) and biological micro-integrated systems; properties of materials for MEMS; microelectronic process modules for design and fabrication. Students will prepare a project report on the design of a biomedical MEMS-based micro-integrated system. Offered in alternate years. Permission of department required. Typically offered Fall.**Credits:** 3.00

ECE 52601 - Integrated Nanosystems Processes And Devices

Credit Hours: 3.00. (ME 52601) This course covers processes and devices associated with integrated nanosystems. Integrated nanosystems refer to systems which consist of integrated micro-, meso-, and/or macro-scale parts, and their core components are realized by nano-scale materials, processes, and devices. The course, while covering processes which result in integrated nanosystems, will focus on the theory and operation of select electronic, electromechanical, and biomedical devices which are used for information technology, sensing, medical, and other applications. The lectures will be complemented by hands-on laboratory experience. Permission of instructor required.**Credits:** 3.00

ECE 52702 - Advanced Power Electronics Converters

Credit Hours: 3.00. The course introduces students to advanced power electronics converters dealing with ac voltage. The power electronics topologies considered in this course are sorted into two groups: multilevel configurations and back-to-back converters. The multilevel configurations presented are: a) neutral-point-clamped, b) cascade, c) flying capacitor, and d) non-conventional multilevel configurations. The back-to-back converters presented are: a) three-phase to three-phase, b) single-phase to three-phase, c) single-phase to single-phase ac-dc-ac converters. A new methodology will be employed to present comprehensively multilevel and back-to-back converters topologies. The main applications of those converters are in renewable energy systems, active power filters, energy efficiency devices and motor drive systems. Permission of instructor required.**Credits:** 3.00

ECE 52800 - Measurement And Stimulation Of The Nervous System

Credit Hours: 3.00. (BME 52800) Engineering principles addressing questions of clinical significance in the nervous system: neuroanatomy, fundamental properties of excitable tissues, hearing, vision, motor function, electrical and magnetic stimulation, functional neuroimaging, disorders of the nervous system, development and refinement of sensory prostheses. Typically offered Spring.**Credits:** 3.00

ECE 53301 - Wireless And Multimedia Computing

Credit Hours: 3.00. A treatment of Voice and Video over IP and wireless communication algorithms, protocols, standards, and implementation using multicore digital signal processors and communications processor modules. Discussion of voice over IP and wireless communication algorithms, protocols and standards, and advanced wireless and voice over IP applications.**Credits:** 3.00

ECE 53401 - Embedded Autonomous Systems In Automotive Platforms

Credit Hours: 3.00. A treatment of Embedded and Autonomous Systems: Motor Control, Image Vision, Sensors, Security, Neural Networks, SLAM, Machine and Deep Learning, Protocols, Standards and Implementation using Multiprocessors, Multicores, ISP, Bluebox and APEX.**Credits:** 3.00

ECE 53600 - Introduction To Computational Intelligence

Credit Hours: 3.00. Basic concepts in theory and paradigms for neural networks, evolutionary computation, and fuzzy logic; algorithms and applications for hybrids of these tools known as computational intelligence are explored. Topics include artificial neural networks, fuzzy systems, and evolutionary computation. Implementations of a number of paradigms are presented, including particle swarm optimization. Applications to various areas, such as biomedical engineering and nonlinear control, are examined.**Credits:** 3.00

ECE 53700 - Multimedia Applications

Credit Hours: 3.00. Treatment of multimedia algorithms and implementation using high-speed multimedia processors. Detailed discussion of entropy coding, transform coding, speech compression, image compression, video compression, and architecture, addressing modes, and instruction set of multimedia processors.**Credits:** 3.00

ECE 53800 - Digital Signal Processing I

Credit Hours: 3.00. Theory and algorithms for processing of deterministic and stochastic signals. Topics include discrete signals, systems, and transforms, linear filtering, fast Fourier transform, nonlinear filtering, spectrum estimation, linear prediction, adaptive filtering, and array signal processing. Typically offered Fall.**Credits:** 3.00

ECE 53801 - Discreet Event Dynamic Systems

Credit Hours: 3.00. This course introduces discrete event dynamic systems with their applications in system modeling, analysis, and control. Models such as automata, Petri nets, Markov chain, and queueing systems are introduced, along with analysis of their dynamics. Discrete event simulation methods are included. Examples from various engineering applications are given. Permission of instructor required.**Credits:** 3.00

ECE 53900 - Foundations Of Advanced Engineering I

Credit Hours: 3.00. Several mathematical tools applied in the engineering discipline are discussed. Statistical methods, including construction of confidence interval and hypothesis testing, as well as regression and regression analysis, are discussed. Discrete tools are discussed; these include logic and mathematical reasoning, combinatorics, groups and finite fields. Applications of some of these tools in engineering problems are introduced. Decision Theory including Bayes Theorem and applying Bayes Theorem to form decision problems. Permission of instructor required.**Credits:** 3.00

ECE 54400 - Digital Communications

Credit Hours: 3.00. Introduction to digital communication systems and spread spectrum communications. Topics include analog message digitization, signal space representation of digital signals, binary and M-ary signaling methods, detection of binary and M-ary signals, comparison of digital communication systems in terms of signal energy and signal bandwidth requirements. The principal types of spread spectrum systems are analyzed and compared. Application of spread spectrum to multiple access systems and to secure communication systems is discussed. Typically offered Fall.**Credits:** 3.00

ECE 54700 - Introduction To Computer Communication Networks

Credit Hours: 3.00. A qualitative and quantitative study of the issues in design, analysis, and operation of computer communication and telecommunication networks as they evolve toward the integrated networks of the future, employing both packet and circuit switching technology. The course covers packet and circuit switching, the OSI standards architecture and protocols, elementary queuing theory for performance evaluation, random access techniques, local area networks, reliability and error recovery, and integrated networks. Typically offered Fall.**Credits:** 3.00

ECE 54800 - Introduction To 2D And 3D Digital Image Processing

Credit Hours: 3.00. An introduction to 2D and 3D image processing. Lecture and projects covering a wide range of topics including 2D and 3D image analysis, image segmentation; color image processing, image sharpening, linear and filtering, image restoration, and image registration. Permission of instructor required.**Credits:** 3.00

ECE 55200 - Introduction To Lasers

Credit Hours: 3.00. An introduction to lasers and laser applications which does not require a knowledge of quantum mechanics as a prerequisite. Topics include: the theory of laser operation; some specific laser systems; nonlinear optics; optical detection; and applications to optical communications, holography, laser-driven fusion, and integrated optics. Typically offered Spring.**Credits:** 3.00

ECE 55400 - Electronic Instrumentation And Control Circuits

Credit Hours: 3.00. Analysis and design of special amplifiers, pulse circuits, operational circuits, DC amplifiers, and transducers used in instrumentation, control, and computation.**Credits:** 3.00

ECE 55700 - Integrated Circuit Fabrication Laboratory

Credit Hours: 3.00. Laboratory exercises in the fabrication and testing of silicon integrated circuits. Both bipolar and MOS integrated circuit test chips are fabricated and tested. Laboratory technique, the technology of integrated circuit fabrication, and electrical characterization are emphasized. Permission of department required. Typically offered Fall Spring.**Credits:** 3.00

ECE 55801 - Advanced Systems On A Chip (SoC) Designs For Image Processing Using FPGAs

Credit Hours: 3.00. This class covers advanced concepts in using Field Programmable Gate Arrays (FGPAs) designed with and HDL (VHDL for example: Very High Speed IC Hardware Description Language). The students will learn complex interface design, advanced hardware and embedded system design and parallel processing. Projects and lessons will focus on application in Digital Imaging Systems. Lecture and projects covering topics including: VHDL mapped to FPGA for state machine design, hardware and software VGA control, image filtering, data transfer to bus, and embedded controller integration. Permission of instructor required.**Credits:** 3.00

ECE 55900 - MOS VLSI Design

Credit Hours: 3.00. An introduction to most aspects of large-scale MOS integrated circuit design including: device fabrication and modeling; inverter characteristics; designing CMOS combinational and sequential circuits; designing arithmetic building blocks and memory structures; interconnect and timing issues; testing and verification; and system design considerations. Term projects involve the complete design of a functional logic block or system using CAD tools. Typically offered Fall.**Credits:** 3.00

ECE 56200 - Introduction To Data Management

Credit Hours: 3.00. Emphasis is on the design of systems that can manipulate and retrieve data from large databases using high level formal languages. Topics covered are: data models and data independence, normalization in relational databases, development of high level query languages for relational and hierarchical models, pictorial query languages, object oriented systems, and object oriented databases. The course includes a project that accounts for about 20 percent of the grade for the course. Offered odd years. Permission of department required. Typically offered Fall.**Credits:** 3.00

ECE 56300 - Programming Parallel Machines

Credit Hours: 3.00. This course presents methods and techniques for programming parallel computers, such as multicore and high-end parallel architectures. Various parallel algorithms will be presented to demonstrate different techniques for identifying parallel tasks and mapping them onto parallel machines. Realistic science/engineering applications and their characteristics will be discussed. Parallel architectures to be considered are shared-memory and distributed-memory multiprocessor systems. Programming paradigms for these machines will be compared, including directive-based (OpenMP), message passing (MPI) and thread-based (Posix threads) methods. Methodologies for analyzing and improving the performance of parallel programs will be discussed. There will be a class project in which each student parallelizes and tunes the performance of a large computation application or develops/improves a tool that helps this process. Each student will prepare one lecture for a selected topic. Offered during odd years. Typically offered Spring.**Credits:** 3.00

ECE 56401 - Computer Security

Credit Hours: 3.00. In this course the discussion will include the following topics: (not necessarily in this order) security policies, confidential policies, integrity policies, security models, security design, access control, cryptography, key management, authentication, program and software, security, malicious logic, intrusion detection, network security, security attacks and countermeasures, operation system security, smartcard tamper-resistant devices, phishing, legal and ethical issues in computer security, and selected topics.**Credits:** 3.00

ECE 56500 - Computer Architecture

Credit Hours: 3.00. An introduction to the problems involved in designing and analyzing current machine architectures. Major topics include performance and cost analysis, pipeline processing, vector machines and numerical applications, hierarchical memory design, and multiprocessor architectures. A quantitative approach allowing a computer system designer to determine the extent to which a design meets design goals is emphasized. Typically offered Fall.**Credits:** 3.00

ECE 56601 - Real-Time Operating Systems And Applications

Credit Hours: 3.00. This course introduces students to the principles of modern operation systems focusing on real-time operation systems and embedded operation systems and their applications. Permission of instructor required.**Credits:** 3.00

ECE 56800 - Embedded Systems

Credit Hours: 3.00. This course provides an introduction to the design of embedded and ubiquitous computing systems including their hardware and software architectures, design methodologies and tools, and communication protocols. The lectures are organized into three parts namely, (a) basic design principles including specification and modeling, hardware components and platforms, software organization, embedded and real-time operating systems, interfacing with external environments using sensors and actuators, and communication in distributed embedded systems, (b) advanced topics such as energy management, safety and reliability, and security, and (c) case-studies of real-world systems from a variety of embedded application domains such as biomedical devices, smart cards and RFID, networked sensors, personal computing devices, home appliances and electronics, mobile robotics, etc. In addition to hands-on programming assignments using off-the-shelf embedded system development kits, the course will feature a comprehensive project where students will design, implement, and evaluate a prototype embedded system. Typically offered Spring.**Credits:** 3.00

ECE 56810 - Design With Embedded Systems

Credit Hours: 3.00. This course provides an overview of the architectures, design considerations, features and applications of embedded processors with digital signal processing capabilities. The course emphasizes design consideration for embedded systems. Different applications such as Internet of Things, Voiceover IP, Machine to Machine, Wearable Devices, Smart Homes, Medical Devices, Drones and Wireless Systems, are considered.**Credits:** 3.00

ECE 56900 - Introduction To Robotic Systems

Credit Hours: 3.00. (CS 56900) The topics to be covered include: basic components of robotic systems; selection of coordinate frames; homogeneous transformations; solutions to kinematic equations; velocity and force/torque relations; manipulator dynamics in Lagrange's formulation; digital simulation of manipulator motion; motion planning; obstacle avoidance; controller design using the computed torque method; and classical controllers for manipulators. Basic knowledge of vector-matrix manipulations required. Typically offered Fall.**Credits:** 3.00

ECE 57000 - Artificial Intelligence

Credit Hours: 3.00. Introduction to the basic concepts and various approaches of artificial intelligence. The first part of the course deals with heuristic search and shows how problems involving search can be solved more efficiently by the use of heuristics and how, in some cases, it is possible to discover heuristics automatically. The next part of the course presents ways to represent knowledge about the world and how to reason logically with that knowledge. The third part of the course introduces the student to advanced topics of AI drawn from machine learning, natural language understanding, computer vision, and reasoning under uncertainty. The emphasis of this part is to illustrate that representation and search are fundamental issues in all aspects of artificial intelligence. Typically offered Fall.**Credits:** 3.00

ECE 57101 - System Modeling And Design For Smart Devices

Credit Hours: 3.00. Introduction to the mobile computing and the principles to design and implement application system for a smart device, including mobile computing architecture, mobile and pervasive computing environments, applications and services, context-aware computing, and human-computer interaction. Permission of instructor required.**Credits:** 3.00

ECE 57300 - Compilers And Translator Writing Systems

Credit Hours: 3.00. This course presents the concepts needed to efficiently design and implement translators. Basic compiler/translation theory and technology are briefly reviewed, after which the course focuses on software tools for the automatic construction of translators, as well as more complex concepts involving the construction of compiler symbol tables, etc. Using C on ECN UNIX, each student will construct a simple lexical-recognizer generator, parser generator, and code-generator generator. Basic understanding of compilers and proficiency in C language required. Typically offered Fall.**Credits:** 3.00

ECE 57700 - Engineering Aspects Of Remote Sensing

Credit Hours: 3.00. Introduction to the concepts of multispectral image data generation and analysis. Basic principles of optical radiation, reflection, and measurement in natural scenes. Fundamentals of multispectral sensor design and data analysis for complex scenes. Application of signal processing and signal design principles and of statistical pattern recognition to these problems. Spatial image processing methods and algorithms as appropriate to land scene data. Practice with analysis of actual aircraft and spacecraft data in a cross-disciplinary environment. Offered even years. Typically offered Spring.**Credits:** 3.00

ECE 58000 - Optimization Methods For Systems And Control

Credit Hours: 3.00. Introduction to optimization theory and methods, with applications in systems and control. Nonlinear unconstrained optimization, linear programming, nonlinear constrained optimization, various algorithms and search methods for optimization, and their analysis. Examples from various engineering applications are given. Elements of linear algebra and calculus of several variables and some experience with MATLAB helpful. Typically offered Spring.**Credits:** 3.00

ECE 58500 - Automotive Control

Credit Hours: 3.00. Basic engine operation; Air-Fuel Ratio control, Idle Speed control, Knock control,Fuel injection timing control, Ignition control of SI engines; Engine fault diagnosis; Driveline modeling and control, Clutch phasing control; Hybrid Electric Vehicle and its control; Wheel model and complete vehicle model; Observers, Friction coefficient estimators, Tire contact patch force estimators; Anti-lock brake control, Traction control, Yaw stability control, Drive-By-Wire systems.**Credits:** 3.00

ECE 58900 - State Estimation And Parameter Identification Of Stochastic Systems

Credit Hours: 3.00. Introduction to point estimation, least squares, Bayes risk, and maximum likelihood. Optimum mean-square recursive estimation for nondynamic stochastic systems. State estimation for discrete-time and continuous-time dynamic systems. Parameter identification of stochastic systems using maximum likelihood. Stochastic approximation, least squares, and random search algorithms. Offered in alternate years.**Credits:** 3.00

ECE 59500 - Selected Topics In Electrical Engineering

Credit Hours: 1.00 to 3.00. Formal classroom or individualized instruction on topics of current interest. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 1.00 to 3.00

ECE 60000 - Random Variables And Signals

Credit Hours: 3.00. Engineering applications of probability theory. Problems on events, independence, random variables, distribution and density functions, expectations, and characteristic functions. Dependence, correlation, and regression; multivariate Gaussian distribution. Stochastic processes, stationarity, ergodicity, correlation functions, spectral densities, random inputs to linear systems; Gaussian processes. Prerequisite: Master's student standing or higher. Typically offered Fall Spring Summer.**Credits:** 3.00

ECE 60004 - Communication For Engineering Leaders

Credit Hours: 1.00. The goal of this course is to upskill talented engineers' communication abilities. By the end of the course, you should have new adeptness at creating and delivering powerful presentations on a short deadline, as well as strategies for leading others effectively.**Credits:** 1.00

ECE 60022 - Wireless Communication Networks

Credit Hours: 3.00. This course will cover fundamental concepts in mobile wireless systems such as propagation and fading, cellular systems, channel assignment, power control, handoff, mobility management. It will also cover system and standards issues including second-generation circuit switched and third-generation packet switched networks, wireless LANs, mobile IP, and ad hoc networks. Besides providing an overview of current technologies, the emphasis on the course will be to identify the challenges that face the engineers of wireless communications networks. Prerequisites: ECE 54700. Prerequisite by Topic: Students are expected to enter the course with an introductory graduate-level understanding of networking, as well as a basic understanding of probability obtained from a typical undergraduate EE program. Permission of instructor required. Typically offered Spring.**Credits:** 3.00

ECE 60146 - Deep Learning - Theory And Practice Of Deep Neural Networks

Credit Hours: 3.00. This course teaches the theory and practice of deep neural networks from basic principles through state-of-the-art methods. The class blends hands-on programming, using a variety of state-of-the-art programming frameworks, with theoretical treatment based on current literature. Implementation will emphasize the use of the Pytorch language and the use of dynamic computational graphs. Some previous experience with optimization techniques is important for success in the course.**Credits:** 3.00

ECE 60200 - Lumped System Theory

Credit Hours: 3.00. An investigation of the basic theory and techniques of modern system theory, emphasizing linear state model formulations of continuous and discrete time systems in the time domain and frequency domain. Coverage includes notions of linearity, time invariance, discrete and continuous time state models, canonical forms, associated transfer functions and impulse response models, the state transition matrix, the Jordan form, controllability, observability, and stability. Prerequisite: Master's student standing or higher and concurrent prerequisite: MA 51100. Typically offered Fall Spring Summer.**Credits:** 3.00

ECE 60270 - Structure And Dynamics Of Large-Scale Networks

Credit Hours: 3.00. Large-scale networks are prevalent in both engineered systems (e.g., the Internet, the power grid, industrial control networks, large robotic swarms and sensor networks) and in natural systems (e.g., genetic networks, ecological networks, social and economic networks). While the specific details of such networks will depend on the application, the last few decades have seen the emergence of an underlying "science" of networks, comprised of a common language (graph theory) for representing large-scale networks, along with mathematical models and analytical techniques for studying structure and dynamics. This course will provide a detailed introduction to the field of network science. It will develop common mathematical representations of networks, metrics for identifying important features of networks, generative mechanisms for networks (including both random-graph and strategic network formation perspectives), and tools for studying dynamical processes on networks (such as information cascades, opinion dynamics and interconnected dynamical systems). This is an introductory course that establishes several of the fundamental tools and concepts in network science, and requires only an undergraduate background in probability and linear algebra.**Credits:** 3.00

ECE 60281 - Intro To Mathematical Fundamentals For Systems And Control

Credit Hours: 1.00. This course serves as background for ECE 60200 Lumped System Theory, ECE 69500 Epidemic Processes over Networks, and ECE 69500 Structure and Dynamics of Large-Scale Networks, and other similar courses. The course will make the necessary mathematical background for the aforementioned courses accessible by decomposing and illustrating difficult concepts with a number of real-world examples and problems for students to work out. Namely, the course consists of five modules: 1) Linear Algebra, 2) Basic Graph Theory, 3) Basic Control Theory, 4) Probability, and 5) Optimization. Prerequisite: Linear Algebra (MA 26500 or MA 26200) or equivalent, ECE 30200 or equivalent. **Credits:** 1.00

ECE 60282 - Epidemic Processes

Credit Hours: 1.00. This course provides a control theory and data science approach to traditional epidemic models. Traditional epidemiological ideas will be explored and combined with probability theory and systems theoretic ideas to be able to capture spread behavior, learn from data, and design mitigation techniques. Namely, the course consists of four modules: 1) Virus Models, 2) Limiting Behavior, 3) Parameter Identification, and 4) Mitigation Algorithms. Prerequisite: ECE 60281. **Credits:** 1.00

ECE 60283 - Epidemic Processes Over Networks

Credit Hours: 1.00. This course presents a class of epidemic models from a network science, control theoretic, and data science perspective. Networked epidemiological ideas will be explored combined with probability theory and systems theoretic ideas to

be able to capture spread behavior, learn the behavior from data, and design mitigation techniques. Namely, the course consists of three modules: 1) Networked Virus Models, 2) Limiting Behavior of Networked Virus Models, and 3) Parameter Identification & Mitigation Algorithms. Prerequisites: ECE 60281 and ECE 60282. **Credits:** 1.00

ECE 60400 - Electromagnetic Field Theory

Credit Hours: 3.00. Review of general concepts (Maxwell's equations, materials interaction, boundary conditions, energy flow); statics (Laplace's equation, Poisson's equation); distributed parameter systems (classification of solutions, transmission lines, and wave-guides); radiation and antennas (arrays, reciprocity, Huygen's principle); a selected special topic (e.g., magnetostatics, waves in anisotropic media and optical fibers). Offered in alternate years. Prerequisite: Master's student standing or higher. Typically offered Fall Spring.**Credits:** 3.00

ECE 60419 - Numerical Simulations Of Electro-Optic Energy Systems

Credit Hours: 3.00. Introduction to computational techniques employed in research on energy systems involving quantum electronics and electromagnetics. You will learn the strengths and weaknesses of each approach; what types of problem call for which one; and how your simulation will perform. Techniques include eigenvalue problems, fast Fourier transforms, band structure calculations, rigorous-coupled wave analysis, beam-propagation methods, finite-difference time-domain, and finite element methods. Applications include nanophotonics, photovoltaics, thermal management, radiative control, and nonlinear optics. Prerequisite by Topic: Elect/Magn Interactions (ECE 60400 or equivalent); Programming For Engineers (C, MATLAB, or similar); Linear Algebra; Ordinary Differ. Equatn; and Signals and Systems. Typically offered Spring.**Credits:** 3.00

ECE 60420 - Radio Frequency Integrated Circuits

Credit Hours: 3.00. This course aims at analysis and design of CMOS integrated radio frequency (RF), microwave and mm-wave circuits. Various modules of an RF transceiver are discussed including low noise amplifiers, mixers, oscillators, frequency synthesizers and power amplifiers. A term project on design of an RF to mm-wave module is also required. Typically offered Fall.**Credits:** 3.00

ECE 60421 - Nanophotonics And Metamaterials

Credit Hours: 3.00. The course will cover nanoscale processes and devices and their applications for manipulating light on the nanoscale. The following topics will be covered: Fundamentals, Maxwell's equations, light-matter interaction, dispersion, EM properties of nanostructures; Photonic crystals and photonic crystal fibers; Photonic and plasmonic nanocircuits; Silicon nanophotonics; Metal optics; Manipulating light with plasmonic nanostructures; Plasmonic nano-sensors; Near-field optics; Metamaterials: artificial magnetism and negative refractive index; Metamaterials: superlens and hyperlens; Transformation optics and cloaking; Nanolasers; Tunable and active plasmonic materials; Refractory plasmonics; Plasmonics for energy conversion, data storage and biomed applications; Metasurfaces; Intro to quantum photonics. Prerequisites by Topic: Basic knowledge of electromagnetism and solid state materials, Maxwell equations and band structure of solids. Typically offered Spring.**Credits:** 3.00

ECE 60422 - Primer On RF Design

Credit Hours: 1.00. This course covers the fundamentals of RF design. It is designed as a first course for students or engineers with limited background in high-frequency electronics. Engineers that need to understand the 'RF language' and gain working knowledge of critical RF concepts will benefit from taking this course. Students in this class will learn the basic RF tools and design principles. By the end of this class students will be able to understand important RF concepts and how these are related to the design of practical RF blocks. Typically offered Fall Spring Summer.**Credits:** 1.00

ECE 60423 - RF System Design

Credit Hours: 1.00. Following the 'Primer on RF Design' course, this class focuses on system-level issues. We discuss several important design considerations including noise, non-linearity, distortion, sensitivity and dynamic range and their impact in selecting the appropriate system architecture. The course also covers common receiver architectures including superheterodyne and direct-conversion receivers. **Credits:** 1.00

ECE 60424 - RF Design: Passive And Active Components

Credit Hours: 1.00. Following the 'Primer on RF Design' course, this class focuses on passive and active components. We use the techniques learnt in the previous course, to design advanced RF devices including couplers, filters and amplifiers. Current research topics are discussed as appropriate. **Credits:** 1.00

ECE 60432 - Nanophotonic Modeling

Credit Hours: 1.00. This course is an introduction to photonic materials and devices structured on the wavelength scale. Generally, these systems will be characterized as having critical dimensions at the nanometer scale. These can include nanophotonic, plasmonic, and metamaterials components and systems. Co-requisite: ECE 60400 or equivalent. **Credits:** 1.00

ECE 60600 - Solid State Devices

Credit Hours: 3.00. A relatively-broad, moderate-depth coverage of semiconductor devices and related topics. The first portion of the course presents and examines semiconductor fundamentals required in the operational analysis of solid state devices. A detailed examination of the PN junction diode and PN junction devices follows. The final portion of the course treats heterojunction surface devices including the Schottky diode, the MOS capacitor and the MOSFET. Offered in alternate years. Prerequisite: Master's student standing or higher. Typically offered Fall Spring.**Credits:** 3.00

ECE 60614 - Reliability Physics Of Nanoelectronic Transistors

Credit Hours: 3.00. This course will focus on the physics of reliability of small semiconductor devices. In traditional courses on device physics, the students learn how to compute current through a device in response to applied voltage. However, as transistors are turned on and off trillions of times during the years of operation, gradually defects accumulate within the device so that at some point the transistor does not work anymore. The course will explore the physics and mathematics regarding how and when things break a topic of great interest to semiconductor device engineers. Prerequisites: ECE 60600 required; ECE 61200 and ECE 55800 are recommended. Typically offered Spring.**Credits:** 3.00

ECE 60645 - High-speed Semiconductor Devices

Credit Hours: 3.00. As semiconductor device geometry miniaturizes, the device becomes faster and some devices move into the quantum-effect region. These high-speed devices are the key components for future electronic systems in communications, computers, control, and consumer applications. This course covers the physics and operational principles of these devices to meet the needs of microelectronics in the 21st century. This course emphasizes the integration of the state-of-the-art technologies such as high-k dielectrics, SiGe, SiC and GaN devices. This course is intended for graduate students in science and engineering who are either i) interested in pursuing research in semiconductor materials, structures or devices, or ii) seeking the broad device background on the state-of-the-art technologies for a future R&D career in the microelectronic industry. Co-requisite: ECE 60600. **Credits:** 3.00

ECE 60800 - Computational Models And Methods

Credit Hours: 3.00. Computation models and techniques for the analysis of algorithm complexity. The design and complexity analysis of recursive and nonrecursive algorithms for searching, sorting, set operations, graph algorithms, matrix multiplication, polynomial evaluation and FFT calculations. NP-complete problems. Prerequisite: Master's student standing or higher. Typically offered Fall Spring.**Credits:** 3.00

ECE 60827 - Programmable Accelerator Architectures

Credit Hours: 3.00. Programmable hardware accelerators seek to fulfill the promise of continued performance and energy-efficiency gains in the era of a slowing Moore's law, larger problem sizes and an increased focused on energy-efficiency. These factors have caused hardware acceleration to become ubiquitous in today's computing world and critically important in computing's future. This class will introduce students to the architectures of programmable accelerators. We will delve deeply into the architectures of modern massively parallel accelerators like GPUs, culminating in a course project. General topics in hardware acceleration will be discussed, including but not limited to GPGPU and massively parallel computing, approximate accelerators, reconfigurable hardware and programmable hardware for machine learning. Pre-requisite: ECE 43700 or equivalent and ECE 56500. **Credits:** 3.00

ECE 60872 - Fault Tolerant Computer System Design

Credit Hours: 3.00. The course provides an introduction to the hardware and software methodologies for specifying, modeling and designing fault-tolerant systems supported by case studies of real systems. The material presents a broad spectrum of hardware and software error detection and recovery techniques that can be used to build reliable networked systems. The lectures discuss how the hardware and software techniques interplay, what techniques can be provided in COTS hardware, what can be embedded into operating system and network communication layers, and what can be provided via a distributed software layer and in the application itself. Prerequisite by Topic: Any one high level programming language experience; A basic background in probability. Typically offered Fall.**Credits:** 3.00

ECE 60874 - Mobile Computing Systems

Credit Hours: 3.00. This course will introduce the technologies of mobile computing systems for various applications, including multimedia, cloud services, location-based services, data collections and privacy. This course will include both hands-on assignments writing mobile applications as well as reading recently published papers on the technologies. The students will design mobile services and present their projects. Typically offered Spring.**Credits:** 3.00

ECE 61000 - Energy Conversion

Credit Hours: 3.00. Basic principles of static and electromechanical energy conversion. Control of static power converters. Reference frame theory applied to the analysis of rotating devices. Analysis and dynamic characteristics of induction and synchronous machines. State variable analysis of electromechanical devices and converter supplied electromechanical drive systems. Prerequisite: Master's student standing or higher. Typically offered Fall.**Credits:** 3.00

ECE 61010 - Time Domain Simulation And Optimization For Design

Credit Hours: 1.00. This is a skills course that teaches time domain simulation and multi-objective design optimization. This course will serve the needs of students in power
and energy system and component design, but is widely applicable to all areas of engineering and does not require domain specific knowledge.**Credits:** 1.00

ECE 61014 - Electromagnetic And Electromechanical Component Design

Credit Hours: 3.00. This course focuses on the design of electromagnetic and electromechanical systems, with power applications. The course includes optimization methods, modeling techniques for design (as opposed to for simulation), and the formulation of design problems as optimization problems. Prerequisite by Topic: Knowledge of the use of field and co-energy techniques to calculate force/torque, Understanding of theory of operation of permanent magnet ac machines (brushless dc machines), basic knowledge of electromagnetic fields. Typically offered Fall.**Credits:** 3.00

ECE 61016 - Power Electronic Converters And Systems

Credit Hours: 3.00. The objective of this course is to educate students in the operation, detailed modeling, average-value modeling, and control design of power electronics converters and systems of converters. Prerequisite by Topic: Basic knowledge of ordinary differential equations, solution of ODEs using numerical methods, state-space system representation, basic feedback control design with frequency domain methods, reference frame theory, some knowledge of rotating electric machinery. Permission of instructor required. Prerequisites: ECE 61010. Concurrent prerequisites: ECE 61000 and ECE 38200. Concurrent prerequisites by topic: synchronous machines (wound rotor and permanent magnet), reference frame theory, three-phase inverters, basic frequency domain control techniques, state-space representation of systems. **Credits:** 3.00

ECE 61020 - Operation Of Modern Power Systems

Credit Hours: 3.00. Overview of modern power system operations. Economic dispatch of assets as a constrained optimization problem, and solution methods. The unit commitment problem formulation, and solution methods. Power flow solution methods. Security-constrained economic dispatch and unit commitment. The optimal power flow. Automatic generation control. Operation of power markets. Prerequisites: ECE 43200. Co-Requisites: ECE 58000. Typically offered Spring.**Credits:** 3.00

ECE 61025 - Finite Element Analysis Of Electric Machines

Credit Hours: 3.00. Application of advanced numerical methods for the characterization of the steady-state and dynamic characteristics of electromechanical energy conversion devices including solenoids, synchronous, induction, and permanent-magnet machines. **Credits:** 3.00

ECE 61200 - Advanced VLSI Devices

Credit Hours: 3.00. Device physics of advanced transistors. Process, device, circuit, and systems considerations affecting development of new integrated circuit technologies. Review of metal oxide semiconductor (MOS) fundamentals along with key process and circuit concepts. Short channel effects in sub-micron channel length metal oxide semiconductor field-effect transistors (MOSFETs) including device scaling considerations. Device physics and technology issues for sub-100 nm (nanoscale) MOSFETs. Limits of silicon device technology and key issues in the continuing miniaturization of devices. Alternative device structures to replace bulk MOSFET. Computer simulation employed throughout the course to examine device issues and prototype new device technologies. Offered in alternate years. Prerequisite: ECE 60600. Typically offered Spring.**Credits:** 3.00

ECE 61220 - Advanced VLSI Design

Credit Hours: 3.00. The objective of this course is to train the students with advanced digital circuit design techniques that can be instrumental in achieving higher energy efficiency and resilience to process variations in scaled technologies. Prerequisite: ECE 55900 or equivalent. **Credits:** 3.00

ECE 61500 - Nonlinear Optics

Credit Hours: 3.00. An in-depth study of nonlinear optics. After a review of linear effects, several nonlinear optical processes and applications are discussed. These include electro-optic switches and modulators, harmonic light generators, sum and difference frequency mixing, parametric amplifiers and oscillators, and phase conjugate mirrors. Discussions of nonlinear spectroscopy include topics such as two-photon absorption, saturation spectroscopy, Raman spectroscopy and double-optical resonance measurements. Photonechoes and other transient effects, and surface effects are also discussed. Offered in alternate years. Prerequisite: ECE 55200, ECE 60400. Typically offered Fall.**Credits:** 3.00

ECE 61600 - Ultrafast Optics

Credit Hours: 3.00. A study of the physics, technology, and applications of ultrashort laser pulses. Topics covered include the following: methods for generating and measuring ultrafast laser pulses; basic physical processes affecting ultrashort pulses; devices for manipulating ultrashort pulses; ultrafast nonlinear optics, including nonlinear optics in fibers, nonlinear refractive index effects, pulse compression, solitons, and all-optical switching; time-resolved spectroscopy of ultrafast materials processes; and applications to ultrafast optoelectronics. In addition, each student will select a specific topic for in-depth study. Offered in alternate years. Prerequisite: ECE 55200. Typically offered Fall.**Credits:** 3.00

ECE 61700 - Antennas: Design And Applications

Credit Hours: 3.00. Electrically small antennas; arrays; wire antennas and feeding arrangements; aperture antennas such as slots, horns, and parabolic reflectors; antennas for multiple frequencies including log-periodic and other frequency independent types; receiving antennas and the concept of antenna temperature; antenna measurements and evaluation. Prerequisite: ECE 44100 and concurrent prerequisite: ECE 60400. Typically offered Fall Spring.**Credits:** 3.00

ECE 61800 - Numerical Electromagnetics

Credit Hours: 3.00. The numerical solution of Maxwell's equations is studied. Numerical methods such as the Finite Element Method and the Finite Difference Method are presented for the solution of both differential and integral equations. Applications studied include: waveguides (microstrip, VLSI interconnects, optical, discontinuities), scattering (frequency selective surfaces, arbitrary scatterers), antennas, magnetics, semiconductor devices, and inverse scattering. Papers in the current literature are used. Offered every third semester. Prerequisite: ECE 60400. Typically offered Fall Spring.**Credits:** 3.00

ECE 62000 - Introduction To Biomedical Imaging Systems

Credit Hours: 3.00. (BME 63000) Overview of biomedical imaging systems and analysis. Examination of various imaging modalities, including X-ray, ultrasound, nuclear, and MRI. Microscopy including how images are formed and what types of information they provide. Image analysis techniques, including analysis of cardiac ultrasound, mammography, and MRI functional imagery. Offered in alternate years. Concurrent prerequisite: ECE 63700. Typically offered Spring.**Credits:** 3.00

ECE 62400 - Multimedia Systems

Credit Hours: 3.00. Provides a general coverage of three major areas that include multimedia data management (logical and physical modeling), broadband network architectures and protocols for distributed multimedia communication, and user interface environments. Various models and specification methodologies in these areas are introduced. The discussion is augmented with various case studies. Prerequisite: ECE 54700, ECE 56200. Typically offered Fall.**Credits:** 3.00

ECE 62500 - Analysis Of Electromechanical Systems II

Credit Hours: 3.00. Extension of ECE 525. Electric propulsion systems including presentation of cycloconverter and rectifier-inverter drive systems. Dynamic and steady-state analysis of machine performance with series controlled rectifiers in the stator or rotor phases. MMF space harmonic analysis. Prerequisite: ECE 62500. Typically offered Spring.**Credits:** 3.00

ECE 62700 - Introduction To Cryptography And Secure Communication

Credit Hours: 3.00. Introduces the basic concepts of cryptography. Various cipher systems are presented, including transposition and substitution systems, Block ciphers, RSA, and Knapsack. Methods used to attack ciphers are discussed with emphasis on complexity. Case studies of the use of cryptographic methods in communication systems are presented with some consideration given to privacy issues. Offered in alternate years. Prerequisite: ECE 60000. Typically offered Spring.**Credits:** 3.00

ECE 62900 - Introduction To Neural Networks

Credit Hours: 3.00. Information processing with neural networks, biological and engineering implications, learning algorithms, current neural network models and architectures, implementational topics, applications in areas such as signal/image processing, pattern recognition, optimization, simulation, system identification, nonlinear prediction, communications, and control. Concurrent prerequisite: ECE 60000. Typically offered Fall.**Credits:** 3.00

ECE 63300 - Modeling And Simulation Of Power System Components

Credit Hours: 3.00. Recommended for those interested in learning to use computer simulation to investigate the dynamic and controlled behavior of electrical power components. Beginning with an introduction to MATLAB/SIMULINK, the course goes through the key steps of modeling, implementing and verifying the simulation of single and three-phase transformers, single and three-phase induction machines, three-phase wound field synchronous machines and permanent magnet machines useful in power applications, each case amply illustrated in projects around some interesting topics. Students are expected to implement and verify about 10 simulation projects and also discuss observed behaviors on topics such as inrush current in transformers, motoring, generating and braking operation of machines, and pulsating torque from subsynchronous resonance. Prerequisite: ECE 43200. Typically offered Fall.**Credits:** 3.00

ECE 63400 - Digital Video Systems

Credit Hours: 3.00. Digital video systems. Characteristics of basic analog video systems, including bandwidth constraints, color encoding, and composite signal formation. Digital video concepts with emphasis on processing of time-varying images. Topics include: filtering, enhancement, restoration, and motion estimation and prediction. Digital video compression techniques, including intraframe coding approaches, with particular emphasis on JPEG. MPEG1 and MPEG2 video compression standards. Low bit rate approaches, including H.261, H.263, and MPEG4. Applications include: video servers, transmission systems, high definition television, multimedia systems, and videoconferencing systems. Offered in alternate years. Concurrent prerequisite: ECE 60000. Typically offered Spring.**Credits:** 3.00

ECE 63700 - Digital Image Processing I

Credit Hours: 3.00. Introduction to digital image processing techniques for enhancement, compression, restoration, reconstruction, and analysis. Lecture and experiments covering a wide range of topics. 2-D signals and systems, image analysis, and image segmentation. Achromatic vision, color image processing, color imaging systems, image sharpening, interpolation, decimation, linear and nonlinear filtering, printing and display of images. Image compression, image restoration, and tomography. Offered every third semester. Typically offered Spring.**Credits:** 3.00

ECE 63800 - Principles Of Digital Color Imaging Systems

Credit Hours: 3.00. Basic principles of color science: physiology of the human eye, trichromatic and color opponent models for color, and uniform color spaces. Color reproduction in electronic imaging systems: color models for input and output devices, color imaging system calibration, color quantization and halftoning, and color printing. Color appearance and computational color: color appearance models, models for color constancy, and physics-based models for color. Offered in alternate years. Prerequisite: 51100 and Master's student standing or higher. Typically offered Fall.**Credits:** 3.00

ECE 63900 - Error Control Coding

Credit Hours: 3.00. The theory and practice of error control coding is examined. The study includes the arithmetic of Galois fields as well as linear block, cyclic, and convolutional codes. Some applications of codes in digital communication systems and in computer systems are presented. Offered every third semester. Concurrent prerequisite: ECE 60000. Typically offered Fall Spring.**Credits:** 3.00

ECE 63901 - Error Correction Coding And Secret Sharing

Credit Hours: 3.00. The theory and practice of error control coding is examined. The study includes the arithmetic of Galois fields as well as linear block, cyclic, and convolution codes. Some applications of codes in digital communication systems and in computer systems are presented. The dual of error coding, secret sharing is also discussed. Several secret sharing schemes will be presented. Applications of secret sharing are discussed. Permission of instructor required.**Credits:** 3.00

ECE 64100 - Model Based Image And Signal Processing

Credit Hours: 3.00. An advanced treatment of the methods in model-based signal and image processing including stochastic modeling of multidimensional signals, Bayesian estimation, inverse methods, doubly stochastic models, regularized inversion, the EM algorithm, Bayesian networks, Markov chains, optimization, convexity, majorization techniques, and stochastic simulation. The underlying theory is presented in the context of applications including image restoration, tomographic reconstruction, clustering, classification, and segmentation. Prerequisite: ECE 60000, 63700. **Credits:** 3.00

ECE 64200 - Information Theory And Source Coding

Credit Hours: 3.00. A treatment of the basic concepts of information theory. Determination of channel capacity and its relation to actual communication systems. Rate distortion theory is introduced, and the performance of various source codes is presented. Offered in alternate years. Prerequisite: ECE 60000. Typically offered Fall.**Credits:** 3.00

ECE 64500 - Estimation Theory

Credit Hours: 3.00. This course presents the basics of estimation and detection theory that are commonly applied in communications and signal processing systems. Applications in communications and signal processing will be considered throughout. Prerequisite: ECE 60000. Typically offered Spring.**Credits:** 3.00

ECE 64700 - Performance Modeling Of Computer Communication Networks

Credit Hours: 3.00. The mathematical background needed for the performance and stability analysis of computer communication networks is developed. Point processes, Markov processes, and queuing processes are used in the modeling and analysis of queues, interconnected queues such as ARPANET, and random multiple access networks such as Xerox's ETHERNET. Distributed control of random access networks and centralized control of queuing networks is considered. The techniques developed are useful in the design of computer systems as well as computer networks. Offered in alternate years. Prerequisite: ECE 60000. Typically offered Spring.**Credits:** 3.00

ECE 64800 - Wavelet, Time-Frequency, And Multirate Signal Processing

Credit Hours: 3.00. Advanced topics in signal processing, including time-frequency analysis, multiscale edge detection, wavelet bases and filter banks, and techniques for approximation, estimation, and compression using wavelets. Offered in alternate years. Prerequisite: ECE 53800. Typically offered Spring.**Credits:** 3.00

ECE 65000 - Topics In Solid-State Devices And Materials

Credit Hours: 1.00 to 3.00. An introductory treatment of selected device and materials related topics. Topics will change from semester to semester and will be announced in advance. The list of possible topics includes solid state microwave devices, optoelectronics, laser-quantum electronics, magnetics, noise in semiconductor devices, acoustic wave devices, energy conversion, device fabrication, electroceramics, MOS devices, thin-film devices, and memory devices. Typically offered Fall Spring.**Credits:** 1.00 to 3.00

ECE 65400 - Solid State Devices II

Credit Hours: 3.00. Introduction to advanced concepts in semiconductor devices as an extension and continuation of ECE 60600. Topics include charge storage and transfer in deep depletion MOS devices (CCDs and DRAMs); negative differential mobility and transit time effects in microwave oscillators (Gunn and IMPATT diodes); spontaneous and stimulated emission, quantum efficiency, and charge confinement in photonic devices (LEDs and double heterojunction lasers); and quantum efficiency and spectral response in conventional and avalanche photodiodes. Prerequisite: ECE 60600. Typically offered Spring.**Credits:** 3.00

ECE 65600 - Electronic Transport In Semiconductors

Credit Hours: 3.00. A treatment of the microscopic and phenomenological physics of carrier transport in bulk semiconductors and in semiconductor devices. The Boltzmann transport equation is introduced as are techniques for solving it analytically and numerically. The physics of carrier scattering in common semiconductors is explored. Theoretical treatments of low and high field transport are compared with measured results. Balance equations are derived as moments of the Boltzmann Transport Equation and are applied to the analysis of sub-micron semiconductor devices. Students are expected to be able to apply elementary concepts of quantum mechanics and solid state physics. Offered every third semester. Prerequisite: ECE 60600. Typically offered Fall Spring.**Credits:** 3.00

ECE 65800 - Semiconductor Material And Device Characterization

Credit Hours: 3.00. A comprehensive survey of modern characterization techniques routinely used to determine solid-state material and device parameters. Concepts and theory underlying the techniques are examined, and sample experimental results are presented. The coverage includes electrical, optical, chemical, and physical characterization methods. Offered in alternate years. Prerequisite: ECE 60600. Typically offered Spring.**Credits:** 3.00

ECE 65900 - Quantum Phenomena In Semiconductors

Credit Hours: 3.00. This course is designed for graduate students familiar with semiconductor fundamentals, with engineering electromagnetics and with linear algebra, but having no significant acquaintance with either quantum mechanics or statistical mechanics. The purpose of the course is to introduce the relevant concepts of quantum mechanics and nonequilibrium statistical mechanics as possible using device-related examples. Topics include: preliminary concepts, equilibrium, restoration of equilibrium, transport, effective mass equation, optical properties, advanced concepts. Offered every third semester. Prerequisite: ECE 60600, MA 51100. Typically offered Fall Spring.**Credits:** 3.00

ECE 66100 - Computer Vision

Credit Hours: 3.00. This course deals with how an autonomous or a semi-autonomous system can be endowed with visual perception. The issues discussed include: sampling from a topological standpoint; grouping processes; data structures, especially hierarchical types such as pyramids, quadtrees, octrees, etc.; graphic theoretic methods for structural description and consistent labeling; issues in 3-D vision such as object representation by Gaussian spheres, generalized cylinders, etc. Prerequisite: ECE 57000. Typically offered Spring.**Credits:** 3.00

ECE 66200 - Pattern Recognition And Decision-Making Processes

Credit Hours: 3.00. (CS 66200) Introduction to the basic concepts and various approaches of pattern recognition and decision-making processes. The topics include various classifier designs, evaluation of classifiability, learning machines, feature extraction and modeling. Prerequisite: ECE 30200. Typically offered Spring.**Credits:** 3.00

ECE 66300 - Advanced Compilation And Automatic Programming

Credit Hours: 3.00. This course presents the concepts needed to design and implement production quality code generators for any of the more popular languages and families of computer architecture (including various pipelined, superscalar, and macro-parallel machines). Flow analysis and concurrency detection, as well as optimizations and loop and irregular code

parallelizations, are covered in detail. Using C on ECN UNIX, each student will complete a project implementing a simple optimizer/parallelizer. Prerequisite: ECE 56500, CS 50200 or ECE 46800 or ECE 57300. Typically offered Spring.**Credits:** 3.00

ECE 66400 - Formal Languages, Computability, And Complexity

Credit Hours: 3.00. Topics in computability theory and formal languages include recursive function theory, the equivalence of various generic programming languages for numeric calculations and string manipulations, regular languages and finite state automata, and context-free and context-sensitive languages. In complexity theory, emphasis is on the theory of NP-completeness, including proof methods, the distinctions between strong- and weak-sense NP-completeness, NP-hardness, and performance-guaranteed approximation algorithms. Offered in alternate years. Prerequisite: ECE 60800. Typically offered Fall.**Credits:** 3.00

ECE 66600 - Advanced Computer Systems

Credit Hours: 3.00. The study of theoretical aspects of advanced computer systems where multiprocessing is used. Topics include the design, architecture, and performance evaluation of multiprocessor memories, interconnection networks, and computational pipelines. Also included are the topics of scheduling, synchronization, resource allocation, load-balancing, partitioning and deadlock avoidance in multiprocessors. Also covered are the design and analysis of parallel algorithms, programming languages and automatic approaches to parallelism detection/exploitation for concurrent computation. Prerequisite: ECE 56500, ECE 60800. Typically offered Spring.**Credits:** 3.00

ECE 67000 - Modeling And Optimization Of High-Performance Interconnects

Credit Hours: 3.00. RLC extraction of VLSI interconnects. Modeling of interconnects as RLC trees or networks. Elmore delay model. Reduced-order modeling: moment matching, Pade approximation, and Krylov-subspace methods. Device modeling with consideration of resistive shielding in the interconnection load. Delay calculation with consideration of devices and interconnects. Repeater insertion and planning at floorplanning. Timing-driven placement: zero-slack algorithm for delay budgeting, net-based placement, and path-based placement. High-performance clock synthesis: zero-skew routing, bounded-skew routing, and useful-skew routing. Term projects investigating interconnect-related issues are assigned. Prerequisite: ECE 55900. Typically offered Fall (even years).**Credits:** 3.00

ECE 67300 - Distributed Computing Systems

Credit Hours: 3.00. Discussions of the design issues of distributed computing systems (DCS). The general theory of distributed transaction management, reliability, and resource management is discussed. Various algorithms and specification methodologies for DCS are introduced. A general coverage of the three major areas of DCS, namely: distributed operating systems, distributed databases, and distributed AI is provided. The discussion is augmented with various case studies. Prerequisite: ECE 46900 or introductory course in operating systems. Typically offered Spring.**Credits:** 3.00

ECE 67500 - Introduction To Analysis Of Nonlinear Systems

Credit Hours: 3.00. An introduction to modeling of dynamic control systems. State plane and numerical methods for solving modeling equations. Linearization and describing function techniques. Stability concepts. Controller and state estimator design for nonlinear systems. Variable structure sliding mode control. Vector field techniques. Introduction to chaos. Offered in alternate years. Prerequisite: ECE 60200. Typically offered Fall.**Credits:** 3.00

ECE 67600 - Academic Oral Communication For International Research Students

Credit Hours: 0.00. Discussions of and activities related to such topics as appropriate nonverbal communication; learning styles; strategies for effective speech and listening; and speech acts for the classroom, office, and laboratory. Individual weekly tutoring sessions to improve speech comprehension. Prerequisite: Master's student standing or higher and Electrical & Computer Engineering majors only. Permission of department required. Typically offered Fall Spring.**Credits:** 0.00

ECE 67700 - Communication Aspects Of Academic Research

Credit Hours: 0.00. Topics relevant to oral and written communication needs of Ph.D. students. Three papers are written: a journal article review, a literature review, and the choice of a thesis proposal, conference paper, or a journal article. Library and Internet research strategies and resources; research/writing ethics; citing sources; citation styles; and academic language. Oral presentations based on the written projects. Extensive peer revision and editing and out-of-class writing conferences with the instructor. Prerequisite: Master's student standing or higher and Electrical & Computer Engineering majors only. Permission of department required. Typically offered Fall Spring.**Credits:** 0.00

ECE 67800 - Radar Engineering

Credit Hours: 3.00. An introduction to the system aspects of modern radar engineering. The theoretical basis for radar performance analysis is developed and applied to radars designed for a variety of different applications. Consideration is given to system parameters such as receiver noise, antenna characteristics, operating frequency, target characteristics, transmitted signal modulation, and methods of detection. Attention is given to radars for special purposes, such as automatic range and angle tracking, moving target indication, and resolution enhancement through synthetic aperture techniques. Offered in alternate years. Prerequisite: ECE 60000. Typically offered Fall.**Credits:** 3.00

ECE 67900 - Advanced Digital Communications

Credit Hours: 3.00. Provides a detailed examination of optimum digital communication principles and introduces three advanced topics critical to the design of digital communication systems: system synchronization; techniques for communication in nonideal channels (equalization); and communication over fading/multipath channels. Theoretical principles and practical implementations are considered. Prerequisite: ECE 54400, ECE 60000. Typically offered Spring.**Credits:** 3.00

ECE 68000 - Modern Automatic Control

Credit Hours: 3.00. Theoretical methods in optimal control theory. Topics include the calculus of variations and the Pontryagin minimum principle with applications to minimum energy problems. Geometric methods will be applied to the solution of minimum time problems. Computational methods, singular problems, observer theory, and sufficient conditions for existence of solutions are also discussed. Offered in alternate years. Prerequisite: ECE 60200. Typically offered Fall.**Credits:** 3.00

ECE 68400 - Linear Multivariable Control

Credit Hours: 3.00. A state space investigation of multi-input, multi-output control design problems from the geometric perspective. The course will detail the theory and design algorithms needed for a solution to the state feedback eigenvalue assignment problem, the disturbance decoupling problem with and without internal stability, the output stabilization problem, and the tracking (or regulator) problem with internal stability. Offered in alternate years.**Credits:** 3.00

ECE 68800 - VLSI Testing And Verification

Credit Hours: 3.00. Discusses different aspects of VLSI testing and formal verification of designs. Design and manufacturing defect models are introduced along with test generation and fault simulation algorithms targeting the different fault models. Both combinational and sequential logic testing are covered, and different synthesis for testability schemes such as BIST (Built-In-Self-Test), scan path design, etc., are introduced. Other new and emerging test and verification techniques also are discussed. Offered every third semester. Prerequisite: ECE 55900. Typically offered Fall Spring.**Credits:** 3.00

ECE 69200 - Introduction To Graduate Research

Credit Hours: 1.00 to 3.00. Research-related activities supervised by an ECE faculty member to introduce newly admitted ECE graduate students to the methods and culture of doing research. Possible activities might include, but are not limited to, participation in group research meetings, association with an advanced graduate student, and individualized reading or project work. A description of the activity, approved by the faculty supervisor, must be filed with the ECE Graduate Office. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 1.00 to 3.00

ECE 69300 - Advanced Intern Project

Credit Hours: 1.00. Graduate-level project course in ECE based on off-campus intern position. Individual research projects are approved by the supervising Purdue ECE faculty member before registering for the course. An approved written report must be filed before credit is accepted. This course cannot be used to satisfy the minimum course requirements for the master's or Ph.D. degrees. Permission of instructor required. Typically offered Summer Fall Spring.**Credits:** 1.00

ECE 69311 - Advanced Internship

Credit Hours: 1.00 to 3.00. Graduate-level Internship based course, in an off-campus internship position. Internship must be in the area of Electrical & Computer Engineering. Individual Internship must be preapproved by the supervising ECE faculty member before the student can register for the course. A written report must be submitted and approved by the faculty before credit is accepted. This course cannot be used to satisfy the minimum course requirements for the Master's or Ph.D. degrees. Permission of instructor required.**Credits:** 1.00 to 3.00

ECE 69400 - Electrical And Computer Engineering Seminar

Credit Hours: 0.00. Seminar presentations by representatives from industry, members of the faculty of the School of Electrical and Computer Engineering, and other staff and faculty of Purdue University. The presentations introduce the student to a wide variety of current topics relevant to the technical and career aspects of electrical and computer engineering. Technical topics span the entire spectrum of electrical and computer engineering. Career topics include the importance of interpersonal communications, opportunities beyond graduate school, interviewing techniques, and descriptions of non-typical jobs. Required of electrical and computer engineering graduate students at Purdue during one of their first two semesters in residence. Typically offered Fall Spring.**Credits:** 0.00

ECE 69401 - Electrical And Computer Engineering Graduate Seminar

Credit Hours: 0.00. Seminar presentations by members of the faculty of the Department of Electrical and Computer Engineering, staff and other faculty of IUPUI, researchers from academia, and representatives from industry. The presentations introduce the student to a wide variety of current topics relevant to the technical, educational and career aspects of electrical and computer engineering. This course cannot be used to satisfy the PhD seminar requirement. Permission of department required.**Credits:** 0.00

ECE 69409 - Electrical And Computer Engineering PhD Student IUPUI Residency Course

Credit Hours: 1.00. This course is for ECE PhD students who are required to be enrolled at Purdue West Lafayette for their PhD program although research instruction and all related activities occur at the IUPUI Campus.**Credits:** 1.00

ECE 69500 - Advanced Topics In Electrical And Computer Engineering

Credit Hours: 1.00 to 3.00. Formal classroom or individualized instruction on advanced topics of current interest. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 1.00 to 3.00

ECE 69600 - Advanced Electrical Engineering Projects

Credit Hours: 0.00 to 18.00. Individual research projects to be approved by the supervising faculty member before registering for the course. An approved written report must be filed before credit is accepted. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 0.00 to 18.00

ECE 69700 - Directed Reading In Electrical Engineering

Credit Hours: 1.00 to 3.00. Individualized reading course supervised by an appropriate faculty member and pertaining to a topic not intended for a subsequent project or thesis done by that student. Approval for each reading course must be obtained from the department prior to registration. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 1.00 to 3.00

ECE 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 1.00 to 18.00

ECE 69900 - Research PhD Thesis

Credit Hours: 1.00 to 18.00. Research PhD Thesis. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 1.00 to 18.00

ECE 533001 - Wireless And Multimedia Computing

Credit Hours: 3.00. A treatment of Voice and Video over IP and wireless communication algorithms, protocols, standards, and implementation using multicore digital signal processors and communications processor modules. Discussion of voice over IP and wireless communication algorithms, protocols and standards, and advanced wireless and voice over IP applications.**Credits:** 3.00

Electrical and Computer Engineering Technology

ECET 10300 - Topics In Electrical Technology

Credit Hours: 1.00 to 4.00. This course includes specialized topics and skills associated with electrical technology. The level of coverage varies according to the audience. Since various electrical/electronics topics may be offered under this title. Does not carry credit toward degree requirements in Electrical Engineering Technology. Typically offered Fall Spring Summer.**Credits:** 1.00 to 4.00

ECET 12000 - Gateway To Electrical Engineering Technology

Credit Hours: 3.00. This course introduces students to the academic and professional field of electrical and computer engineering technology. Familiar applications of technology that impact today's and tomorrow's society are blended with foundational electrical and electronics principles. Practical systems are examined to illustrate the diverse knowledge required to design, analyze, and solve problems in multifaceted systems. Skills needed to explore electronic systems using standard laboratory instrumentation and methods of measurement are introduced. Typically offered Fall Spring Summer.**Credits:** 3.00

ECET 15700 - Electronics Circuit Analysis

Credit Hours: 4.00. Capacitors, inductors, switching circuits, transformers, rectifiers, linear regulators, dependent sources, operational amplifiers, BJT- & MOSFET-based small-signal amplifiers, waveform generation, and programmable analog devices

are studied. Circuit fundamentals such as Kirchhoff's laws are utilized in analysis and design of circuits. Computer simulation is used.**Credits:** 4.00

ECET 16400 - Applied Object-Oriented Programming

Credit Hours: 3.00. Problem solving and computing with emphasis on electrical engineering technology applications. Introduction to an object programming language as applied to solving electrical technology problems.**Credits:** 3.00

ECET 17700 - Data Acquisition And Systems Control

Credit Hours: 3.00. Fundamental electrical parameters and measurement techniques are introduced. These are then applied to implementing power interfaces, actuators and sensors. Modules that provide signal conditioning, data conversion, filtering and controllers are evaluated. A full, closed loop control system is built and evaluated.**Credits:** 3.00

ECET 17900 - Introduction To Digital Systems

Credit Hours: 3.00. This course introduces computing systems and defines the major classes of computing devices. Sequential and concurrent operations, along with logic and control structures, are covered. Knowledge of fundamental computing principles is discovered. Common software tools are used to create, test, and debug systems. Systems are constructed from standard blocks with a focus on subsystem operation and performance, troubleshooting/debugging and testing. Common applications of embedded systems are introduced.**Credits:** 3.00

ECET 20900 - Introduction To Microcontrollers

Credit Hours: 4.00. This course is an introduction to microcontroller hardware and software, focusing on embedded control applications. Interconnections of components, peripheral devices, bus timing relationships, structured C-language programming, debugging, input/output techniques, and use of PC based software development tools are studied.**Credits:** 4.00

ECET 22000 - Professional Career Development

Credit Hours: 1.00. This course expands the student's knowledge about the EET program. Included are topics such as: options and electives in the EET curriculum; the EET plan of study; student activities, including professional practice and organizations; international opportunities; employment and career opportunities; plant tours; and guest lectures, featuring EET alumni. Typically offered Fall Spring Summer.**Credits:** 1.00

ECET 22400 - Electronic Systems

Credit Hours: 3.00. This course is a survey of key electrical and electronics systems, their basic performance and applications. DC fundamentals include sources, resistance, Ohm's and Kirchhoff's Laws with simple circuits. AC systems include transformers and reactive elements, power production and distribution, filtering, motors and relays. Computer systems are presented with a microprocessor and provide the ability to write and read both digital and analog data. Analog systems include diodes, transistors, IC amplifiers, and analog-digital and digital to analog conversions. The semester closes by combining all of the topics presented in the control of motor speed. Typically offered Fall Spring Summer.**Credits:** 3.00

ECET 22700 - DC And Pulse Electronics

Credit Hours: 3.00. Capacitors, inductors, oscillators, rectifiers, bipolar and MOSFET power switches, switching power supplies, half-and full-H bridges, switching audio power amplifiers, and linear regulators are studied. Computer-aided analysis of circuits is utilized. Typically offered Fall Spring Summer.**Credits:** 3.00

ECET 22900 - Concurrent Digital Systems

Credit Hours: 3.00. This course establishes a foundation for concurrent digital systems. Common methods of describing digital circuit operation are studied along with the techniques for translation between any two methods. Basic building blocks of digital systems are defined and applied. Analysis techniques for combinational and sequential logic circuits or subsystems are covered. Computer-based development tools, programmable logic devices, and technical reference sources are used to build, test, and evaluate digital systems. **Credits:** 3.00

ECET 23120 - Industrial Controls

Credit Hours: 3.00. An introduction to Industrial Controls with a focus on relay logic and PLC logic. Design and optimization of control systems based on National Electrical Code guidelines and methods for development of schematics and coding for industrial controls. Laboratory experiments in the design, coding, operation, and documentation of industrial control systems.**Credits:** 3.00

ECET 27000 - Electronics Prototype Development And Construction

Credit Hours: 3.00. This course introduces project planning and basic concepts in electronic design automation (EDA). The student develops a portion of an electronic system by utilization of EDA, design for testing, design for manufacturability (DFM), and component selection techniques. New construction methods and testing techniques are introduced. Typically offered Fall Spring Summer.**Credits:** 3.00

ECET 27300 - Modern Energy Systems

Credit Hours: 3.00. This course is an introduction to modern energy system technologies. Topics include energy conversion fundamentals, efficiency, and renewable energy technologies such as wind, solar, and geothermal. Other topics include central and distributed generation, and power plant fundamentals. Typically offered Fall Spring Summer.**Credits:** 3.00

ECET 27400 - Wireless Communications

Credit Hours: 3.00. The theory and techniques of wirelessly sending information (voice, music, data) from one location to another is studies from a systems point of view. This includes a signal analysis, modulation techniques, transmitters, receivers, low noise amplifiers, and filters in the RF frequency spectrum. In addition, special topics of current interest are introduced. This course incorporated a student-based communication design and analysis laboratory. Typically offered Fall Spring Summer.**Credits:** 3.00

ECET 27700 - AC And Power Electronics

Credit Hours: 3.00. AC Circuits including the j operator, phasors, reactance and impedance are studies. Circuit laws, network theorems, and the application of circuit analysis techniques to amplifiers used in power electronics, including power MOS devices, thyristors, and other appropriate applications. Computer-aided analysis of circuits is used. Typically offered Fall Spring Summer.**Credits:** 3.00

ECET 27900 - Embedded Digital Systems

Credit Hours: 3.00. A course emphasizing the advanced applications of embedded digital systems. Topics include embedded system architecture, use of advanced programmable counter/timer arrays, analog interfaces, serial communication, and interrupts. Typically offered Fall Spring Summer.**Credits:** 3.00

ECET 29000 - International Experience

Credit Hours: 1.00 to 3.00. This variable-title, variable-credit course establishes student credit for ECET department approved international activities such as study abroad or industrial internships in foreign countries. Permission of department is required. Typically offered Fall Spring Summer.**Credits:** 1.00 to 3.00

ECET 29801 - Laboratory Teaching Aide In Electrical Engineering Technology

Credit Hours: 1.00 to 3.00. This course allows a student to serve as an undergraduate teaching aide in the laboratory. The student will work with and support a course instructor in the undergraduate teaching labs. Hours, subject matter, and credit to be arranged by faculty. Course content applies toward the EET Professional Experience requirement. Department and Instructor permission required. Typically offered Fall Spring Summer.**Credits:** 1.00 to 3.00

ECET 29900 - Selected Electrical Engineering Technology Subjects

Credit Hours: 0.00 to 6.00. Hours and subject matter to be arranged by staff. Permission of instructor required. Typically offered Summer Fall Spring.**Credits:** 0.00 to 6.00

ECET 30201 - Introduction To Industrial Controls

Credit Hours: 3.00. This course examines the concepts, devices and common practices associated with control systems with a primary focus on industrial implementations. Additionally, the course provides a hierarchical examination of the implantation of control theory. Programmable logic controllers serve as the primary platform for presenting applications in interfacing and control of electromechanical and pneumatic devices. Electrical industrial safety standards are presented and emphasized throughout the course. Typically offered Fall Spring Summer.**Credits:** 3.00

ECET 31800 - Foundations Of Audio Electronics

Credit Hours: 3.00. The design, fabrication, and testing of the electronics that comprise audio signal transduction, transmission, processing, amplification and delivery to a loudspeaker are studied at an introductory level. Computer-aided analysis of circuits is used.**Credits:** 3.00

ECET 32100 - Introduction To Nanotechnology

Credit Hours: 3.00. This course explores the downsizing of electronic and mechanical devices and introduces the field of nanotechnology. Properties of nanomaterials and the tools of nanotechnology are studied. Interdisciplinary research and commercial applications are reviewed. The course involves participation in research seminars and hands-on laboratory experiences with nanotechnology instrumentation.**Credits:** 3.00

ECET 32300 - Introduction To Electric Vehicle Systems

Credit Hours: 3.00. The course is an introduction to electric vehicle (EV) technology analysis and configuration. The course explores the integrated mechanical and electrical power and control systems including the management of integrated power and control systems within an electric vehicle. Students perform detailed analysis of and develop design approaches for electrically powered vehicles. Typically offered Fall Spring Summer.**Credits:** 3.00

ECET 32700 - Instrumentation And Data Acquisition Design

Credit Hours: 3.00. This course builds upon the prerequisite knowledge and covers implementation of electric systems to measure and record mechanical, electrical, and biological parameters. Signal characteristics, transducer specification and selection, signal conditioning and transmission design, data conversion, software, and an overall system error budget are developed. Typically offered Fall Spring Summer.**Credits:** 3.00

ECET 32900 - Advanced Embedded Digital Systems

Credit Hours: 3.00. This course focuses on the study and application of real-time embedded systems. Real-time operating systems (RTOS) are introduced and applied. Students learn and use programming and scripting languages to discover the advantages and limitations of RTOS application in the lab. Typically offered Fall Spring Summer.**Credits:** 3.00

ECET 33300 - Power Electronics In Energy Systems

Credit Hours: 3.00. A study of fundamentals and applications of switch-mode DC-DC and DC-AC power electronic converters. The emphasis is given to hardware development aspects. Students will learn how to safely work with high power and high voltage circuits. Typically offered Fall Spring Summer.**Credits:** 3.00

ECET 33400 - Embedded Cross-Platform Interface And Communication

Credit Hours: 3.00. Project-oriented, hands-on study of embedded communication protocols, advanced OOP targeted for hand-held devices and low power embedded systems interface. A PC based OS with cross-platform development environments designing system solutions targeted for device platforms and interfacing with microcontroller systems. Topics include microcontrollers, SoC, various OS platforms, RTOS, embedded IoT protocols.**Credits:** 3.00

ECET 33500 - Computer Architecture And Performance Evaluation

Credit Hours: 3.00. The course focuses on the application and evaluation of computers. The architecture of modern computer CPUs and their peripheral subsystems are presented. Analytic performance evaluation techniques are introduced and developed. Common benchmarking tools for quantifying performance are used. Students also apply performance evaluation algorithms of their own creation to evaluate CPU and subsystem performance. Typically offered Fall Spring Summer.**Credits:** 3.00

ECET 33700 - Continuous Systems Analysis And Design

Credit Hours: 3.00. This is an advanced course in continuous systems analysis and design. Systems may include RCL circuits, op amp circuits, and DC permanent magnet motors. Systems analyses using differential equations and Laplace Transform techniques are developed, culminating in active filter and closed loop PID system design. Software tools, circuit simulation, and advance calculators are used to solve differential, integral, and differential equation problems. **Credits:** 3.00

ECET 33900 - Digital Signal Processing

Credit Hours: 3.00. The course introduces students to the fundamental principles associated with processing discrete time signals. The architecture, instruction set and hardware and software development tools associated with a fixed point general purpose VLSI digital signal processor are examined. Some common real-time applications are implemented such as digital filters and DFT-based spectral estimation on a typical fixed point digital signal processor. **Credits:** 3.00

ECET 34900 - Advanced Digital Systems

Credit Hours: 3.00. This course investigates complex digital systems that are implemented with field programmable gate arrays (FPGAs) using concurrent and sequential digital design techniques. Applications will include interfacing with analog signals and memory systems. Typically offered Fall Spring Summer.**Credits:** 3.00

ECET 35100 - Instrumentation Applications For Technology

Credit Hours: 3.00 or 4.00. Introduction to the basic concepts and terminology of instruments. This course covers the procedures and techniques essential to measurement of physical quantities (such as pressure, flow, temperature, and level measurements) and

analysis of that data. Students will use data acquisition systems and computer control software to complete laboratory exercises.**Credits:** 3.00 to 4.00

ECET 35901 - Computer Based Data Acquisition Applications

Credit Hours: 3.00. This course focuses on the study and application of computer based data acquisition (DAQ) systems. Concepts of high resolution and high throughput data acquisition are introduced and applied. Students learn and use programming and scripting languages to discover the interfacing, advantages and limitations of computer based (DAQ) systems. Typically offered Fall Spring Summer.**Credits:** 3.00

ECET 36400 - Fundamentals Of Electromagnetics

Credit Hours: 3.00. This course introduces the fundamentals of electromagnetics in both theory and application. Wave propagation, transmission lines, port parameters, antenna theory, and antenna design are studied. Other topics include Maxwell's equations, propagation losses, RF signal measurement, impedance matching, and Smith chart applications. Typically offered Fall Spring Summer.**Credits:** 3.00

ECET 36900 - Applied Computer Vision For Sensing And Automation

Credit Hours: 3.00. This course provides fundamental knowledge of integrated computer imaging or vision systems for sensing, quality control and automation applications. Fundamental basis of optics, illumination, camera types with associated technologies, and image acquisition to develop a customized computer imaging or vision systems will be covered. Algorithms for image processing, image analysis and pattern recognition will also be covered. Emerging technologies-based integrated computer vision or imaging system for sensor system, inspection, quality control and automation in different sectors (medical, manufacturing, security, construction etc.) will be examined. Parallel laboratory hands-on experience will allow the students to apply and validate the concepts learned in the lecture.**Credits:** 3.00

ECET 37100 - Automation, Instrumentation, and Process Control

Credit Hours: 3.00 or 4.00. A project-oriented course combining key areas of automation, instrumentation and process control. The course covers automatic testing, computer interfacing, data collection, robotic controls, programmable logic controllers, and graphical process control software. A final project is an integrated system.**Credits:** 3.00 to 4.00

ECET 37201 - Continuous Control Electronics

Credit Hours: 3.00. A study of the electronic design of the elements of closed-loop analog and digital systems. Topics include characteristics of process and servo systems, analysis and design of the electronics used to acquire the process variable; condition, transmit, and receive the signal; implement a single loop control algorithm, and provide proportional power. Several sensor types and interpretation of their static and dynamic specifications are included. Controllers employed include student designed analog, and embedded microprocessor, and commercial single loop controllers. Software is used to model components and analyze open and closed-loop systems. Typically offered Fall Spring Summer.**Credits:** 3.00

ECET 37300 - Applied Electronic Drives

Credit Hours: 3.00. This course covers operational principles and application development consideration of all subsystems that make up electric drives: electric machines, power-electric based converters, mechanical system requirements, feedback controller design, and the interaction of drives with the utility grid. State of the art drive development tools are introduced through hands-on activities. Typically offered Fall Spring Summer.**Credits:** 3.00

ECET 37600 - Electrical Energy Systems

Credit Hours: 3.00. This course is an introduction to a wide range of electrical energy systems technologies. Topics include fundamentals of energy conversion, which includes large- and small-scale generation, energy storage, and end-use. Processes include coal, nuclear, solar, wind, hydro, and biomass and their application in central and distributed power systems. The power grid, micro-grids, and smart grid technologies are also explored. The goal is to introduce students to the breadth of technology in the rapidly growing and changing field of energy systems.**Credits:** 3.00

ECET 38001 - Global Professional Issues In Engineering Technology

Credit Hours: 3.00. This course addresses professional ethics, legal issues, professional development, technology transfer, and corporate culture as they relate to EET graduates and our global society. Information relating to personal job and career choices, resumes, and interviews are included. Typically offered Fall Spring Summer.**Credits:** 3.00

ECET 38100 - Electrical Distribution Systems

Credit Hours: 4.00. A study of the design and operation of electric distribution systems including estimated demand, demand calculations, energy conservation, faults on power systems, power quality, power factor improvement, electric rates, voltage drops, protective devices, illumination, and the applicable portions of the National Electric Code (NEC). Both new facilities and additions to existing facilities are included.**Credits:** 4.00

ECET 38404 - Fundamentals Of Contemporary Signal Of Processing

Credit Hours: 4.00. Fundamentals of processing techniques applied to signals and systems in both time and frequency domains are studies. Both continuous-time and discrete-time linear systems are introduced. Analysis methods such as: Fourier series, Fourier transform, bilateral Laplace transform, difference equations, discrete-Time Fourier transform, bilateral 7-Transform are introduced. Common applications such as waveform generation, FIR and IIR digital filtering, DFT and FFT based spectral analysis and filtering are covered. Use of software tools is emphasized throughout the course. Department permission required.**Credits:** 4.00

ECET 38600 - Building Electrical Codes And Standard Practices

Credit Hours: 3.00. A course in the design of building wiring, machine wiring and electrical control systems using relevant codes and standards to layout commercial and industrial facilities and manufacturing processes. Typically offered Fall Spring Summer.**Credits:** 3.00

ECET 38800 - Analog IC Applications

Credit Hours: 3.00. This course is a study of the applications of analog integrated circuits. Topics include linear amplifiers, IC specifications, linear regulators, waveform generation, linear and switched-capacitor active filters, and nonlinear circuit applications. Computer aided analysis of these circuits is also presented. Typically offered Fall Spring Summer.**Credits:** 3.00

ECET 39000 - Lab Assistant In Electrical Engineering Technology

Credit Hours: 0.00 to 3.00. This course allows a student to serve like an employee as an undergraduate teaching assistant in the laboratory, lab exercise/apparatus developer, or undergraduate researcher. Hours, subject matter, and credit to be arranged by faculty. Course content applies toward the EET Professional Experience requirement. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 0.00 to 3.00

ECET 41500 - Digital Hardware Modeling Using Hardware Description Languages (HDL)

Credit Hours: 3.00. This course introduces students to various contemporary Hardware Description Languages (HDL) for modern digital logic systems. The course will emphasize on Verilog HDL. It covers logic-synthesis and high-level-synthesis in the context of HDL coding constructs for platform-independent and dependent technologies applicable to modern semiconductor industry testing. Students are also exposed to the subset of HDL that may be used for synthesis of custom logic for edge devices. HDL simulation and synthesis labs and projects are performed using commercial and/or academic VLSI CAD tools.**Credits:** 3.00

ECET 42301 - Electrical Vehicle Integration And Fabrication

Credit Hours: 3.00. This course requires students to develop a detailed design, develop a time/action plan, perform research on existing electronic vehicle systems, develop a procurement plan for electronic vehicle components, design and fabricate custom electric vehicle components, and construct an electric vehicle. The completed electric vehicle is extensively tested for safety, performance, and energy efficiency. Typically offered Fall Spring Summer.**Credits:** 3.00

ECET 42800 - Audio Electronics-Selected Topics

Credit Hours: 3.00. Define, implement, and evaluate the performance of the electronic elements in a professional audio system such as preamplifiers, signal encoding and transmission, signal reception and decoding, mixers, post processors, power amplifiers, limiting and protection, and intelligent power supplies. Both analog and digital signal processing may be implemented in each of the electronic elements. Typically offered Fall Spring Summer.**Credits:** 3.00

ECET 42801 - Advanced Acoustics And Audio Engineering Technologies

Credit Hours: 3.00. This course introduces topics on acoustics and audio features/elements from hardware and/or software perspectives. Topics covered include the preparation and augmentation of audio data and designing, implementing, and evaluating the audio data using AI machine learning. This course also investigates electro-acoustic applications, their hardware element details, and their contributions to the system. This will pave students' understanding of the state-of-the-art technology in the acoustic and audio engineering technology field.**Credits:** 3.00

ECET 43000 - Electrical And Electronic Product And Program Management

Credit Hours: 3.00. This course deals with the planning of electrical and electronic products and projects. Research methods are studied to support new product development including customer needs and the development of engineering requirements. Formal techniques such as functional decomposition, top-down and bottom-up design techniques are studied. Planning and design alternatives to meet cost, performance, and user-interface foals are emphasized. Technical topics are revisited with emphasis on new applications. The various types and levels of new product system tests are studied. New product planning, scheduling, and management techniques are studied, along with the usage of software tools for project scheduling and management. Creativity is stressed, and the different approaches taken by the designers are compared and discussed. Typically offered Fall Spring Summer.**Credits:** 3.00

ECET 43100 - International Capstone Project Planning And Design

Credit Hours: 3.00. The course deals with the planning and execution of an industry sponsored senior capstone project carried out jointly with students from a foreign academic institution. Project management and systems engineering methods are studied to support the development of solutions to open-ended problems proposed by industry. Formal techniques such as functional decomposition, top-down and bottom-up, requirement matrix, analysis of alternatives are studied and applied to the projects. Project planning techniques including work breakdown structures, Gantt charts and resource planning are studied and applied to meet cost, performance and project goals. The various types and levels of new system tests are studied and applied. Electronic and internet communication tools shall be used to maintain team and project progress. Foreign travel shall be required for at least one face to face team meeting during the execution of the project. Permission of Instructor required. Typically offered Fall Spring Summer.**Credits:** 3.00

ECET 43600 - Electrical Power Transmissions, Distribution, And Smart Control

Credit Hours: 3.00. A course on the simple modeling and simulation of the power grid systems, power flow analysis, and advanced meter infrastructure (AMI). The fundamentals learned in this course will be useful in the study of the effects of distributed energy resources and storage in Smart Grid environment. Typically offered Fall Spring Summer.**Credits:** 3.00

ECET 43900 - Advanced Digital Signal Processing

Credit Hours: 3.00. The course builds on the basic principles and applications of Digital Signal Processing with a view to implementing advanced DSP techniques. These techniques are chosen to form some of the building blocks that are used in specialization areas such as the biomedical, communications and energy management fields. Typically offered Fall Spring Summer.**Credits:** 3.00

ECET 44200 - Programming Robots With ROS

Credit Hours: 3.00. Robot Operating Systems (ROS) will be used as a programming platform to explore the topics of computer vision, SLAM (Simultaneous Localization and Mapping), path planning, grasping, and social interaction in robotic systems, as well as programming large systems for physical interaction with the world. Self-contained implementation projects are core to the class. Student knowledge of a procedural programming language, familiarity with robotics, and a rudimentary understanding of matrices is assumed. **Credits:** 3.00

ECET 44400 - Wireless Systems: Design And Measurement

Credit Hours: 3.00. In this course wireless RF signals and microwave circuit designs are studied. Topics include signal analysis, RF signal measurement, microstrip design and analysis, Smith chart applications, RF circuit design, s-parameters, power dividers and couplers, filter design, and advanced RF PCB layout. Typically offered Fall Spring Summer.**Credits:** 3.00

ECET 46000 - Project Design And Development

Credit Hours: 3.00. An extensive individual or small group design project is carried out with guidance from a faculty advisor. This course includes determining customer requirements, considering design alternatives, prototyping, project integration, and testing. The project is completed as a robust prototype. The course concludes with a formal written report and a presentation of the project to faculty and invited industrial guests. Typically offered Fall Spring Summer.**Credits:** 3.00

ECET 46100 - International Capstone Project Execution

Credit Hours: 3.00. This course completes the development and execution of an international industry sponsored senior capstone project carried out jointly with students from a foreign academic institution. Project management and systems engineering methods are applied in the development of solutions to open-ended problems proposed by industry. Design tools including failure mode and effects analysis and configuration management are studied and applied. A manufacturing plan supported by both in process and validation test plans are developed and applied to demonstrate compliance to project requirements. The project is completed with the generation of a proof of concept demonstration that satisfies project requirements. The course concludes with a formal written report and presentation. Electronic and internet communication tools shall be used to maintain team and project progress. Foreign travel shall be required for at least one face to face team meeting during the execution of the project. Permission of Instructor required. Typically offered Fall Spring Summer.**Credits:** 3.00

ECET 47600 - Smart Grid Technology And Applications

Credit Hours: 3.00. This smart-grid (SG) technology and applications is designed to introduce new topics related to distributed generation, micro-grids, renewable energy sources, and smart home applications. Topics covered include design, modeling,

control, and analysis of smart-grid systems. Concepts dealing with computational intelligence, decision support systems, smart metering, optimization, and energy storage are addressed. The laboratory component will provide students with hands-on experience in the utilization of smart-grid technologies and applications.**Credits:** 3.00

ECET 49000 - Senior Design Project Phase I

Credit Hours: 1.00 or 2.00. An extensive individual design and/or analytical project performed in consultation with one or more faculty advisors. Collaboration with representatives of industry, government agency, or community institutions is encouraged. Evidence of extensive and thorough laboratory performance is required. PHASE I includes, but is not limited to, faculty acceptance of project proposal, defining and limiting project objectives, initial research and source contacts, procurement of materials, and periodic progress reports.**Credits:** 1.00 or 2.00

ECET 49500 - Intensive Project Design/Development

Credit Hours: 3.00. Credit will not be granted for both ECET 495 and ECET 49700. This course is an intensive conclusion to the senior design process begun in ECET 496. The course concludes with a formal demonstration and oral presentation on the finished product and a written report on the final design. Typically offered Summer Fall Spring.**Credits:** 3.00

ECET 49700 - Project Design And Development, Phase II

Credit Hours: 1.00 or 2.00. This conclusion of the design project begun in ECET 49600 [Inactive] emphasizes system integration and testing. The course concludes with a formal demonstration of and oral presentation on the finished product and a written report on the final design. Typically offered Fall Spring Summer.**Credits:** 1.00 or 2.00

ECET 49900 - Electrical Engineering Technology

Credit Hours: 1.00 to 9.00. Hours and subject matter to be arranged by staff. Cannot be used to replace EET 48000, 49600, or 49700. Permission of instructor required. Typically offered Fall Spring Summer.**Credits:** 1.00 to 9.00

ECET 52500 - Applications In Forensic Engineering Technology

Credit Hours: 3.00. An interdisciplinary consideration of the applications of forensics in the American jurisprudence system. Topics include: failure analysis of electrical and mechanical systems, accident reconstruction, product liability, codes and standards, ethics, and expert witness testimony. Typically offered Spring.**Credits:** 3.00

ECET 53500 - Energy Sustainability

Credit Hours: 3.00. A study of energy auditing, energy saving opportunities of commercial and industrial systems, utility rate structures, economic evaluation of investments, potential energy saving retrofits, maintenance considerations, and cogeneration opportunities. Data analysis and report writing are practiced using data from a real world energy audit. Typically offered Fall.**Credits:** 3.00

ECET 53600 - Embedded Systems Security

Credit Hours: 3.00. This course focuses on the implementation and application of cryptographic algorithms and protocols in embedded systems. An overview of the security problem and the science of cryptography and cryptanalysis is presented. The notion of the security perimeter in terms of physical access to assets in embedded hardware subsystems is studied. Students implement and apply various ciphers on 8-bit to 32-bit embedded platforms, comparing and contrasting computational and data throughout performance. Permission of instructor required. Typically offered Fall Spring.**Credits:** 3.00

ECET 54100 - Robotics And Cyber-Physical Systems Seminar

Credit Hours: 0.00 to 1.00. This course is a series of lectures from eminent local, national, and international researchers in the field of robotics, cyber-physical systems, and related areas (such as computer vision, autonomy, wearables, etc.).**Credits:** 0.00 to 1.00

ECET 54400 - Real-Time And Embedded Systems

Credit Hours: 3.00. Real-time systems are hardware/software systems in which a timely response by a computer to external stimuli is vital to the performance of the system's objectives. This is the study of temporal determinism. Embedded systems are those with special-purpose microcomputers designed into the system for explicit purposes. Examples of such are the computers on your car's engine that control fuel injection, fly-by-wire attitude controls in modern jet aircraft, even the microcontroller inside a cellular phone. In these examples, the computer has a specific, limited task that is part of the functionality of the device and specifying average performance of that computer is insufficient for successful completion of the task at hand. Imagine if the flight controls of a Boeing 787 on final landing approach experienced a "network lag" similar to that which occurs occasionally while you're reading e-mail. If the controls stop responding at a critical time, a horrific crash could occur. Even if the system doesn't freeze up 99.999% of the time, it can still result in disaster.**Credits:** 3.00

ECET 54900 - Advanced Computer Vision For Sensing And Automation

Credit Hours: 3.00. This course focuses on advanced issues related to an integrated computer vision system for sensing, quality control and automation applications.**Credits:** 3.00

ECET 58100 - Workshop In Electrical And Computer Engineering Technology

Credit Hours: 0.00 to 8.00. Advanced study of technical and professional topics. Emphasis is on new developments relating to technical, operational, and training aspects of industry and technology education. Typically offered Summer Fall Spring.**Credits:** 0.00 to 8.00

ECET 59000 - Special Problems In Electrical And Computer Engineering Technology

Credit Hours: 1.00 to 6.00. Independent study of a special problem under the guidance of a member of the staff. Does not substitute for either M.S. thesis or M.S. project credit. Permission of instructor required. Typically offered Summer Fall Spring.**Credits:** 1.00 to 6.00

ECET 59800 - Directed MS Project

Credit Hours: 1.00 to 3.00. A formal investigation of a particular problem under the guidance of the advisory committee. Not applicable to a thesis option plan of study. Enrollment during at least two consecutive terms for a total of three credits is required. Permission of instructor required. Typically offered Summer Fall Spring.**Credits:** 1.00 to 3.00

ECET 63800 - Selected Topics In Sensor Networks

Credit Hours: 3.00. This course examines general sensor network concepts, with a focus on a particular area of research and development. Current applications are studied, culminating with the analysis, characterization and/or examination of a sensor network. Permission of instructor required. Typically offered Fall Spring.**Credits:** 3.00

ECET 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. Research MS Thesis. Permission of instructor required. Typically offered Summer Fall Spring.**Credits:** 1.00 to 18.00

Engineering

ENGR 10000 - First-Year Engineering Lectures

Credit Hours: 0.00 or 1.00. An introduction to the engineering profession. **Credits:** 0.00 or 1.00

ENGR 10300 - Introduction To Engineering In Practice

Credit Hours: 1.00. Weekly small group seminars led by faculty designed to introduce a specific topic, problem, or discipline of engineering to First-Year Engineering students. Seminars are designed to help students explore a single area of engineering and/or to assist in their decision of an engineering degree program. **Credits:** 1.00

ENGR 10301 - Introduction To Engineering In Practice

Credit Hours: 1.00. Weekly small seminars led by faculty designed to introduce a specific topic, problem or discipline of engineering to First-Year Engineering students. Seminars are designed to help students explore a single area of engineering and/or assist in their decision of an engineering degree. Permission of department required. **Credits:** 1.00

ENGR 10400 - Introduction To Engineering And Purdue

Credit Hours: 1.00. Weekly small group seminars led by upper-class engineering students, enabling a broader understanding of engineering disciplines at Purdue, covering skills and techniques for academic success, and offering instruction and practice in career preparation and employment-finding skills. **Credits:** 1.00

ENGR 10500 - First-Year Engineering Seminar

Credit Hours: 1.00. A selection of invited lectures, participation exercises, and lab tours designed to acquaint exceptionally well-motivated students with opportunities to enhance their undergraduate engineering education through independent study, special research projects, overseas study, and other opportunities that may be available for students who are inclined to seek extraordinary challenges. **Credits:** 1.00

ENGR 11700 - First-Year Engineering Honors Seminar

Credit Hours: 3.00. A course in computer programming, covering fundamentals of the C programming language. Other language(s) or materials will be covered to prepare Honors students to do the best possible work in their professional school courses. Students will be introduced to structured problem-solving and top-down programming techniques. Laboratory exercises will accelerate learning of fundamental materials through supervised repetitive practice, while more traditional individual and team projects will provide practice in the decomposition and solution of larger problems. **Credits:** 3.00

ENGR 12600 - Engineering Problem Solving And Computer Tools

Credit Hours: 3.00. Introduction to the solving of open-ended engineering problems and the use and of computer software, including UNIXTM, computer communications, spreadsheets, and MATLAB. Explicit model-development activities are utilized, and students are expected to develop skill at working in teams. This is emphasized both in laboratories and on projects. **Credits:** 3.00

ENGR 13000 - Transforming Ideas To Innovation, EPICS/VIP

Credit Hours: 4.00. This introductory course to engineering teaches skills in managing complex problems related to design, systems analysis with computational tools, and academic professional development. Through multiple experiences, students will learn effective methods to design and analyze behaviors of complex engineering systems with an eye for innovation. These experiences will develop their skills in teaming, project management, logical reasoning, sustainability, coupled with oral, written and visual communication for multiple audiences. This course also develops students ability to build computational tools (e.g., Python, MATLAB and Excel) to analyze the performance of systems using fundamental concepts associated with physical science and data science (e.g., mathematical modeling, data processing, numerical modeling, statistics). Professional identify development is critical to preparing students for making an informed decision in their choice of major and the development of professional skills to succeed in that major. Therefore, the course includes learning experiences to help them gather and process information about all the engineering academic pathways they could choose at Purdue. Permission of instructor required.**Credits:** 4.00

ENGR 13100 - Transforming Ideas To Innovation I

Credit Hours: 2.00. A partnership between Schools and Programs within the College of Engineering, introduces students to the engineering professions using multidisciplinary, societally relevant content. Developing engineering approaches to systems, generating and exploring creative ideas, and use of quantitative methods to support design decisions. Explicit model-development activities (engineering eliciting activities, EEAs) engage students in innovative thinking across the engineering disciplines at Purdue. Experiencing the process of design and analysis in engineering including how to work effectively in teams. Developing skills in project management, engineering fundamentals, oral and graphical communication, logical thinking, and modern engineering tools (e.g., Excel and MATLAB). **Credits:** 2.00

ENGR 13200 - Transforming Ideas To Innovation II

Credit Hours: 2.00. A partnership between Schools and Programs within the College of Engineering continues building on the foundation developed in ENGR 13100. Students take a more in-depth and holistic approach to integrating multiple disciplines perspectives while constructing innovative engineering solutions to open-ended problems. Extending skills in project management engineering fundamentals, oral and graphical communication, logical thinking, teamwork, and modern engineering tools (e.g., Excel and MATLAB). **Credits:** 2.00

ENGR 13300 - Transforming Ideas To Innovation, EPICS/VIP

Credit Hours: 2.00. Introduces students to the engineering professions using multidisciplinary, societally relevant content. Students will develop engineering approaches to systems, generate and explore creative ideas, and use quantitative methods to support design decisions. Students will experience the process of design and analysis in engineering including how to work effectively in teams, and will develop skills in project management, engineering fundamentals, oral and graphical communication, logical thinking, and modern engineering tools (e.g., Excel and MATLAB). An emphasis will be placed on computing logic development and builds upon the co-requisite experience of the students in the EPICS class.**Credits:** 2.00

ENGR 14100 - Honors Creativity And Innovation In Engineering Design I

Credit Hours: 3.50. This course introduces students to the engineering professions using multidisciplinary, societally relevant content. Students develop engineering approaches to systems, generate and explore creative and innovative ideas, and use of computational methods to support design decisions. Design challenges and projects engage students in innovative thinking across the engineering disciplines at Purdue. Students experience the process of design and analysis in engineering including how to work effectively in teams. Students also develop skills in project management, engineering fundamentals, oral and graphical communication, logical thinking, and modern engineering tools (e.g., Excel®, LabView®, MATLAB®, and Python). **Credits:** 3.50

ENGR 14200 - Honors Creativity And Innovation In Engineering Design II

Credit Hours: 3.50. This course continues building on the foundation developed in ENGR 14100. Students take a more in-depth and holistic approach to integrating multiple disciplines perspectives while constructing innovative engineering solutions to open-ended problems. The students extend and continue to develop skills in project management, engineering fundamentals, oral and graphical communication, logical thinking, teamwork, and modern engineering tools (e.g., C, Excel®, LabView®, MATLAB®, and Python). **Credits:** 3.50

ENGR 16100 - Honors Introduction To Innovation And The Physical Science Of Engineering Design I

Credit Hours: 4.00. This course introduces students to the engineering profession using physics-based, multidisciplinary, societally relevant content. Students develop engineering approaches to systems, generate and explore creative and innovative ideas, and use of computational methods to support design decisions. In particular, the students will develop the ability to model and investigate physical systems at the microscopic and macroscopic levels with a focus on vectors analysis, linear momentum, angular momentum, work-energy, and solid material interactions. Design challenges and projects will explore a wide range of natural phenomena experimentally and computationally (utilizing MATLAB and Python) and engage students in innovative thinking across the engineering disciplines at Purdue. They will learn the basics of descriptive statistics, data analysis, sensitivity analysis, and decision-making. Students experience the process of design and analysis in engineering including how to work effectively in teams. Students also develop skills in project management, engineering fundamentals, oral and graphical communication, logical thinking, and modern engineering tools. **Credits:** 4.00

ENGR 16200 - Honors Introduction To Innovation And The Physical Science Of Engineering Design II

Credit Hours: 4.00. Students will take an in-depth and holistic approach to integrating multiple disciplines perspectives while constructing innovative engineering solutions to open-ended problems. The students continue to explore more complicated models of physical systems, especially internal energy, entropy, models of gases and fluids, and statistical thermodynamics. The students will extend the concepts learned in ENGR 16100 and continue to develop skills in project management, engineering fundamentals, oral and graphical communication, logical thinking, teamwork, and modern engineering tools (e.g. MATLAB and Python). In addition, students will learn how to use hypothesis testing to make informed, quantitative decisions. Finally, they will build systems that incorporate feedback control in an effort to identify and characterize physical material systems. **Credits:** 4.00

ENGR 17600 - Professional Internship I

Credit Hours: 0.00. Professional experience in engineering. Program coordinated by department with cooperation of participating employers. Students submit a summary report. **Credits:** 0.00

ENGR 18000 - Minorities In Engineering Seminar

Credit Hours: 1.00. Explores the challenges that minority engineering students have in making a smooth and informed transition to college from high school. The content and activities may be of particular interest to engineering students from underrepresented groups as they adjust to the University's environment. The course provides a setting for entering students to explore career opportunities in the various fields of engineering. Open to all entering engineering students. **Credits:** 1.00

ENGR 18500 - Engineering Career Planning

Credit Hours: 1.00. An engineering-oriented course designed to assist students in planning for their educational, career, and personal development. Individual and group projects, computer-aided guidance. Course will incorporate autobiographies, resumes, and academic and career planning exercises. Interest inventories and personal appraisal surveys will be utilized.

Computer-based guidance systems will be utilized, including ESCAPE (Engineering Specific Career Advisory Problem-solving Environment). (Eight-week session) **Credits:** 1.00

ENGR 19400 - Women In Engineering Seminar

Credit Hours: 1.00. An overview of the career opportunities for women in engineering. The content and activities of the course may be of particular interest to women. Speakers from a variety of engineering organizations discuss their career paths and share their strategies for success. Students also meet weekly in small groups led by engineering seniors for additional information, interaction, and support from their peers in engineering. Open to all entering engineering students. **Credits:** 1.00

ENGR 19500 - First-Year Engineering Projects

Credit Hours: 1.00 to 6.00. Topics vary. Permission of instructor required. **Credits:** 1.00 to 6.00

ENGR 19700 - Introduction To Programming Concepts

Credit Hours: 2.00. Basic concepts and applications of software programming for solving engineering problems. Topics include techniques for developing structured algorithms, data input and output, conditional statements, loops, recursion, functions, arrays, and elementary concepts in mathematical programming. Examples, homework, and applications of programming concepts make extensive use of the C programming language.**Credits:** 2.00

ENGR 20000 - Cooperative Education Practice I

Credit Hours: 1.00. A semester or summer of external, full time, related career experiences designed to enhance the student's preparedness for an intended career with business, industry or government agency. A comprehensive written report on the internship practice is required. A minimum of 10 weeks and 200 hours are required for credit. Typically offered Fall Spring Summer.**Credits:** 1.00

ENGR 20010 - Engineering Career Enrichment Internship I

Credit Hours: 1.00. Semester of external career related experiences designed to enhance the student's preparedness for entering an initial or second career. A minimum of 10 weeks and 200 hours are required for credit. Typically offered Fall Spring Summer.**Credits:** 1.00

ENGR 23099 - Cooperative Education Seminar I

Credit Hours: 1.00 or 2.00. (PSY 23099) This seminar course is optional for Co-Op students when they are on campus. In this course, students share their work experiences, receive feedback from the instructor and seminar participants, and continue their professional development. Prerequisite: Student must have completed at least one Co-Op work term. May be repeated once after the second work term. Can be taken for two credits subsequent to completing two back-to-back work terms. Instructor permission required. **Credits:** 1.00 or 2.00

ENGR 25000 - Cooperative Education Practice II

Credit Hours: 1.00. A semester or summer of external, full time, related career experiences designed to enhance the student's preparedness for an intended career with business, industry or government agency. A comprehensive written report on the internship practice is required. A minimum of 10 weeks and 200 hours are required for credit. Typically offered Fall Spring Summer.**Credits:** 1.00

ENGR 25010 - Engineering Career Enrichment Internship II

Credit Hours: 1.00. Semester of external career related experiences designed to enhance the student's preparedness for entering and initial or second career. Typically offered Fall Spring Summer.**Credits:** 1.00

ENGR 26099 - Learning While Working Full-Time Co-Op I

Credit Hours: 0.00. Co-Op is an academic program with oversight by assigned Faculty Coordinators who serve as the instructor for participating students. Learning While Working participants are undergraduate students who work part-time (10-20 hours per week) in paid computer science, engineering, polytechnic, or management positions during the academic year terms (fall and spring semesters) for an employer with a local operations or offering a remote work opportunity. During the summer term, Learning While Working students work in full-time positions at any location offered by the employer. During the academic year, Learning While Working students register for a full-time course load, and also for this zero-credit hour Learning While Working course. During the summer term, Learning While Working students register for a zero-credit hour Co-Op course. This course will help students set goals for their work experiences and reflect on skill growth and receive feedback from their employer supervisor and Purdue Co-Op supervisor. Prerequisite: Student must be eligible to participate in the Cooperative Education (Co-Op) program and have written documentation of valid work session with approved Co-Op employer. Permission of instructor required. **Credits:** 0.00

ENGR 27199 - Professional Practice Flex Co-Op I

Credit Hours: 0.00. Co-Op is an academic program with oversight provided by assigned Faculty Coordinators who serve as the Instructor for participating students. In the Flex Co-Op program, students must work for their first employer for a minimum of two work sessions, and then have the option to continue for one-to-three additional work sessions; or, after completing two work sessions with the first employer, the student may elect to start with a second employer. If the student elects to change employers, they must notify their first employer and their Faculty Coordinator in writing at the conclusion of the second work session. The student must commit to work for the second Co-Op employer for a minimum of two work sessions. Permission of instructor required. **Credits:** 0.00

ENGR 27299 - Professional Practice Flex Co-Op II

Credit Hours: 0.00. Co-Op is an academic program with oversight provided by assigned Faculty Coordinators who serve as the Instructor for participating students. In the Flex Co-Op program, students must work for their first employer for a minimum of two work sessions, and then have the option to continue for one-to-three additional work sessions; or, after completing two work sessions with the first employer, the student may elect to start with a second employer. If the student elects to change employers, they must notify their first employer and their Faculty Coordinator in writing at the conclusion of the second work session. The student must commit to work for the second Co-Op employer for a minimum of two work sessions. Permission of Instructor required. **Credits:** 0.00

ENGR 29199 - Cooperative Experience I

Credit Hours: 0.00. Professional experience in engineering. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

ENGR 29299 - Cooperative Experience II

Credit Hours: 0.00. Professional experience in engineering. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

ENGR 29600 - Experimental Courses

Credit Hours: 0.00 to 6.00. Experimental classes offered at the freshmen/sophomore level on a temporary basis to test the viability of offering the course on a permanent basis. **Credits:** 0.00 to 6.00

ENGR 29701 - Global Engineering Orientation

Credit Hours: 1.00. Forum in preparation of study and work abroad. Understanding of cultural differences and collaborating across cultural boundaries, professionalism and ethics in foreign work and academic environments, leadership and teamwork options in foreign environments. Permission of instructor required. **Credits:** 1.00

ENGR 30500 - Fundamentals Of Innovation Theory And Practice

Credit Hours: 3.00. This course is designed to provide students with initial exposure to the fundamental patterns, mindsets, behaviors, attributes, tools, and methods employed in the innovative activity of individuals and organizations. Emphasis is placed on understanding and effectively utilizing techniques to systematically drive innovation that are drawn from the fields of business, design, problem-solving, engineering, and the social sciences. Lecture, in-class small group activities, and individual and team assignments are employed across an array of contemporary socio-technical challenges to provide students with the opportunity to apply conveyed theory and methods to rigorously structure problems, understand involved stakeholders, utilize innovation motifs and analogical reasoning to develop robust views of potential solutions spaces, tailor solution design to stakeholder context, consider the full suite of functional, social, and emotional dimensions that could influence solution prioritization, and document and systematically assess underlying solution assumptions to iterate toward a viable and sustainable forward-looking plan that could achieve target outcomes. This course counts toward, serves as a required entry course for, the College of Engineering Minor in Innovation and Transformational Change. **Credits:** 3.00

ENGR 31000 - Engineering In Global Context

Credit Hours: 3.00. This course provides students with opportunities to study how engineering is intertwined with larger economic, social, cultural, and technological dynamics in an era of intensified globalization. Its major goals are to help students understand and appreciate what engineering is, how engineers are trained, what engineers do, and how engineering and society interact. The course approaches these themes through discussion of: the relation and interaction of engineering, science, technology, and society; the historical origins and development of engineering as a profession; diversity issues in engineering and other STEM fields; engineering in cross-national/cultural contexts; and contemporary challenges related to globalization, ethics, and sustainability. In summary, the course is designed to help students understand what it means to identify as, and/or work with, engineers. Recitation sections and/or independent projects (at the instructor's discretion) provide further opportunities for students to expand their knowledge and improve their skills in relation to course themes. **Credits:** 3.00

ENGR 33099 - Cooperative Education Seminar II

Credit Hours: 1.00 or 2.00. This seminar is optional for Co-Op students when they are on campus. In this course, students share their work experiences, receive feedback from the instructor and seminar participants, and continue their professional development. Prerequisite: Student must have completed at least two Co-Op work terms. May be repeated once after the fourth work term. Can be taken for two credits subsequent to completing two back-to-back work terms. Instructor permission required. **Credits:** 1.00 or 2.00

ENGR 35000 - Cooperative Education Practice IV

Credit Hours: 1.00. A semester or summer of external, full time, related career experiences designed to enhance the student's preparedness for an intended career with business, industry or government agency. A comprehensive written report on the internship practice is required. Typically offered Fall Spring Summer.**Credits:** 1.00

ENGR 36099 - Learning While Working Full-Time Co-Op II

Credit Hours: 0.00. Co-Op is an academic program with oversight by assigned Faculty Coordinators who serve as the instructor for participating students. Learning While Working participants are undergraduate students who work part-time (10-20 hours per week) in paid computer science, engineering, polytechnic, or management positions during the academic year terms (fall and spring semesters) for an employer with a local operations or offering a remote work opportunity. During the summer term, Learning While Working students work in full-time positions at any location offered by the employer. During the academic year, Learning While Working students register for a full-time course load, and also for this zero-credit hour Learning While Working course. During the summer term, Learning While Working students register for a zero-credit hour Co-Op course. This course will help students set goals for their work experiences and reflect on skill growth and receive feedback from their employer supervisor and Purdue Co-Op supervisor. Prerequisite: Student must be eligible to participate in the Cooperative Education (Co-Op) program and have written documentation of valid work session with approved Co-Op employer. Permission of instructor required. **Credits:** 0.00

ENGR 36199 - Learning While Working Part-Time Co-Op I

Credit Hours: 0.00. Co-Op is an academic program with oversight by assigned Faculty Coordinators who serve as the instructor for participating students. Learning While Working participants are undergraduate students who work part-time (10-20 hours per week) in paid computer science, engineering, polytechnic, or management positions during the academic year terms (fall and spring semesters) for an employer with a local operations or offering a remote work opportunity. During the summer term, Learning While Working students work in full-time positions at any location offered by the employer. During the academic year, Learning While Working students register for a full-time course load, and also for this zero-credit hour Learning While Working course. During the summer term, Learning While Working students register for a zero-credit hour Co-Op course. This course will help students set goals for their work experiences and reflect on skill growth and receive feedback from their employer supervisor and Purdue Co-Op supervisor. Prerequisite: Student must be eligible to participate in the Cooperative Education (Co-Op) program and have written documentation of valid work session with approved Co-Op employer. Permission of instructor required. **Credits:** 0.00

ENGR 36299 - Learning While Working Part-Time Co-Op II

Credit Hours: 0.00. Co-Op is an academic program with oversight by assigned Faculty Coordinators who serve as the instructor for participating students. Learning While Working participants are undergraduate students who work part-time (10-20 hours per week) in paid computer science, engineering, polytechnic, or management positions during the academic year terms (fall and spring semesters) for an employer with a local operations or offering a remote work opportunity. During the summer term, Learning While Working students work in full-time positions at any location offered by the employer. During the academic year, Learning While Working students register for a full-time course load, and also for this zero-credit hour Learning While Working course. During the summer term, Learning While Working students register for a zero-credit hour Co-Op course. This course will help students set goals for their work experiences and reflect on skill growth and receive feedback from their employer supervisor and Purdue Co-Op supervisor. Prerequisite: Student must be eligible to participate in the Cooperative Education (Co-Op) program and have written documentation of valid work session with approved Co-Op employer. Permission of instructor required. **Credits:** 0.00

ENGR 37399 - Professional Practice Flex Co-Op III

Credit Hours: 0.00. Co-Op is an academic program with oversight provided by assigned Faculty Coordinators who serve as the Instructor for participating students. In the Flex Co-Op program, students must work for their first employer for a minimum of two work sessions, and then have the option to continue for one-to-three additional work sessions; or, after completing two work sessions with the first employer, the student may elect to start with a second employer. If the student elects to change employers, they must notify their first employer and their Faculty Coordinator in writing at the conclusion of the second work session. The student must commit to work for the second Co-Op employer for a minimum of two work sessions. Permission of Instructor required. **Credits:** 0.00

ENGR 37499 - Professional Practice Flex Co-Op IV

Credit Hours: 0.00. Co-Op is an academic program with oversight provided by assigned Faculty Coordinators who serve as the Instructor for participating students. In the Flex Co-Op program, students must work for their first employer for a minimum of two work sessions, and then have the option to continue for one-to-three additional work sessions; or, after completing two work sessions with the first employer, the student may elect to start with a second employer. If the student elects to change employers, they must notify their first employer and their Faculty Coordinator in writing at the conclusion of the second work session. The student must commit to work for the second Co-Op employer for a minimum of two work sessions. Permission of Instructor required. **Credits:** 0.00

ENGR 37599 - Professional Practice Flex Co-Op V

Credit Hours: 0.00. Co-Op is an academic program with oversight provided by assigned Faculty Coordinators who serve as the Instructor for participating students. In the Flex Co-Op program, students must work for their first employer for a minimum of two work sessions, and then have the option to continue for one-to-three additional work sessions; or, after completing two work sessions with the first employer, the student may elect to start with a second employer. If the student elects to change employers, they must notify their first employer and their Faculty Coordinator in writing at the conclusion of the second work session. The student must commit to work for the second Co-Op employer for a minimum of two work sessions. Permission of Instructor required. **Credits:** 0.00

ENGR 38199 - Professional Practice Co-Op I

Credit Hours: 0.00. Professional experience in engineering. Program coordinated by Office of Professional Practice with cooperation of participating employers. Students submit a summary report and company evaluation. Permission of Instructor required. **Credits:** 0.00

ENGR 38299 - Professional Practice Co-Op II

Credit Hours: 0.00. Professional experience in engineering. Program coordinated by Office of Professional Practice with cooperation of participating employers. Students submit a summary report and company evaluation. Permission of Instructor required. **Credits:** 0.00

ENGR 38399 - Professional Practice Co-Op III

Credit Hours: 0.00. Professional experience in Engineering. Program coordinated by Office of Professional Practice with cooperation of participating employers. Students submit a summary report and company evaluation. Permission of Instructor required. **Credits:** 0.00

ENGR 39399 - Cooperative Experience III

Credit Hours: 0.00. Professional experience in engineering. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

ENGR 39499 - Extensive Cooperative Experience IV

Credit Hours: 0.00. Professional experience in engineering. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

ENGR 39501 - Breakthrough Thinking Complex Challenges

Credit Hours: 3.00. This course is intended to help students understand and effectively employ the principles underlying breakthrough thinking. Students will participate in cross-disciplinary teams to design solutions to a complex societal challenge in conjunction with a partner organization, in an experiential learning setting. Case discussions of historical breakthroughs will be used to introduce techniques for the identification of opportunities, the design of solutions, and the launch, test, and iteration of such solutions. Emphasis will be placed on the effective use of techniques from various fields, such as business, design, problem-solving, engineering, and the social sciences. **Credits:** 3.00

ENGR 39599 - Extensive Cooperative Experience V

Credit Hours: 0.00. Professional experience in engineering. Program coordinated by school with cooperation of participating employers. Students submit summary report and company evaluation. Professional Practice students only. Permission of department required. **Credits:** 0.00

ENGR 39600 - Experimental Courses

Credit Hours: 0.00 to 6.00. Experimental classes offered at the junior level on a temporary basis to test the viability of offering the course on a permanent basis. **Credits:** 0.00 to 6.00

ENGR 39602 - Undergraduate Experiential Training - Research

Credit Hours: 0.00. This course is meant to promote meaningful reflection on the different experiential learning research environments a student may participate in such as Summer Undergraduate Research Fellowship and Research for Pay internship. Additional data will be collected on each student's experience regarding pay, project, position, etc. Assignments will include goal setting, goal evaluation, reflection, and resume writing. Guidance will be provided within the Brightspace page and throughout the pre/post-experience survey assignments. Permission of instructor required.**Credits:** 0.00

ENGR 39603 - Undergraduate Experiential Training - Semiconductors

Credit Hours: 0.00. This course is meant to promote meaningful reflection on the different experiential learning environments a student may participate in which focus on workforce development and the acquisition and practice of technical skills. This course will supplement the Summer Training Awareness & Readiness for Semiconductions (STARS) program. Additional data will be collected on each student's experience regarding pay, project, position, etc. Assignments will include goal setting, goal evaluation, reflection, public speaking as it relates to the workforce domain, and resume writing in addition to industry/sector-specific technical training. Guidance will be provided within the Brightspace page and throughout the pre/post-experience survey assignments. Permission of instructor required.**Credits:** 0.00

ENGR 39697 - Global Engineering Projects

Credit Hours: 1.00 to 3.00. Students will work in teams to formulate solutions to engineering problems. Project topics will focus on a problem outside the U.S. and/or incorporate teammates from international universities. International teams may work remotely with the possibility for international travel and in-person collaboration. Permission of instructor required. **Credits:** 1.00 to 3.00

ENGR 39699 - Professional Practice Internship

Credit Hours: 0.00. Professional experience in engineering. Program coordinated by Office of Professional Practice with cooperation of participating employers. Students submit a summary report and company evaluation. Permission of Instructor required. **Credits:** 0.00

ENGR 39700 - Global Engineering Experience

Credit Hours: 1.00. Forum for students participating in an international internship or study abroad experience. Students will complete weekly guided writing assignments during the first 15 weeks of their international experience. Assignments will aid students with integration into the host community. Students will demonstrate increased awareness of the nature and complexities of intercultural communication by applying various theories to their lived experiences. To be taken concurrently with international internship/study abroad experience. Permission of instructor is required. **Credits:** 1.00

ENGR 39799 - GEARE Domestic Internship

Credit Hours: 0.00. Domestic internship experience for GEARE program. Program coordinated by Office of Professional Practice with cooperation of participating employers. Students to obtain professional practice with domestic employers within industry, government or small business. Permission of instructor required. **Credits:** 0.00

ENGR 39899 - GEARE Global Internship

Credit Hours: 0.00. Global internship experience for GEARE program. Program coordinated by Office of Professional Practice with cooperation of participating employers. Students to obtain professional practice with global employers within industry, government or small business. Permission of instructor required. **Credits:** 0.00

ENGR 40400 - Instruction, Mentorship And Leadership

Credit Hours: 1.00. This course provides students with valuable mentorship, leadership, and instructional opportunities through participation in the College of Engineering mentorship programs. The weekly seminar will feature a combination of student-led discussions, guest speakers, and practical team-building skills. **Credits:** 1.00

ENGR 40600 - Engineering Ambassador Leadership Seminar

Credit Hours: 1.00. Students will engage in a weekly seminar that includes topics such as leadership, professional skills, teamwork, and Purdue culture. Students will utilize these skills while representing Purdue College of Engineering to current and prospective students, alumni, donors, legislators, and other supporters of Purdue College of Engineering. Student must be selected as a College of Engineering Ambassador; be currently enrolled full-time in the College of Engineering; have completed no less than three academic semesters at Purdue; have a cumulative GPA of 2.8 or higher. Permission of department required. **Credits:** 1.00

ENGR 43099 - Cooperative Education Seminar III

Credit Hours: 1.00 or 2.00. This seminar course is optional for Co-Op students when they are on-campus. In this course, students share their work experiences, receive feedback from the instructor and seminar participants, and continue their professional development. Prerequisite: Student must have completed at least three Co-Op work terms. Can be taken for two credits subsequent to completing two back-to-back work terms. Instructor permission required. **Credits:** 1.00 or 2.00

ENGR 46099 - Learning While Working Full-Time Co-Op III

Credit Hours: 0.00. Co-Op is an academic program with oversight by assigned Faculty Coordinators who serve as the instructor for participating students. Learning While Working participants are undergraduate students who work part-time (10-20 hours per week) in paid computer science, engineering, polytechnic, or management positions during the academic year terms (fall and spring semesters) for an employer with a local operations or offering a remote work opportunity. During the summer term, Learning While Working students work in full-time positions at any location offered by the employer. During the academic year, Learning While Working students register for a full-time course load, and also for this zero-credit hour Learning While Working course. During the summer term, Learning While Working students register for a zero-credit hour Co-Op course. This course will help students set goals for their work experiences and reflect on skill growth and receive feedback from their employer supervisor and Purdue Co-Op supervisor. Prerequisite: Student must be eligible to participate in the Cooperative Education (Co-Op)

program and have written documentation of valid work session with approved Co-Op employer. Permission of instructor required. **Credits:** 0.00

ENGR 46399 - Learning While Working Part-Time Co-Op III

Credit Hours: 0.00. Co-Op is an academic program with oversight by assigned Faculty Coordinators who serve as the instructor for participating students. Learning While Working participants are undergraduate students who work part-time (10-20 hours per week) in paid computer science, engineering, polytechnic, or management positions during the academic year terms (fall and spring semesters) for an employer with a local operations or offering a remote work opportunity. During the summer term, Learning While Working students work in full-time positions at any location offered by the employer. During the academic year, Learning While Working students register for a full-time course load, and also for this zero-credit hour Learning While Working course. During the summer term, Learning While Working students register for a zero-credit hour Co-Op course. This course will help students set goals for their work experiences and reflect on skill growth and receive feedback from their employer supervisor and Purdue Co-Op supervisor. Prerequisite: Student must be eligible to participate in the Cooperative Education (Co-Op) program and have written documentation of valid work session with approved Co-Op employer. Permission of instructor required. **Credits:** 0.00

ENGR 46499 - Learning While Working Part-Time Co-Op IV

Credit Hours: 0.00. Co-Op is an academic program with oversight by assigned Faculty Coordinators who serve as the instructor for participating students. Learning While Working participants are undergraduate students who work part-time (10-20 hours per week) in paid computer science, engineering, polytechnic, or management positions during the academic year terms (fall and spring semesters) for an employer with a local operations or offering a remote work opportunity. During the summer term, Learning While Working students work in full-time positions at any location offered by the employer. During the academic year, Learning While Working students register for a full-time course load, and also for this zero-credit hour Learning While Working course. During the summer term, Learning While Working students register for a zero-credit hour Co-Op course. This course will help students set goals for their work experiences and reflect on skill growth and receive feedback from their employer supervisor and Purdue Co-Op supervisor. Prerequisite: Student must be eligible to participate in the Cooperative Education (Co-Op) program and have written documentation of valid work session with approved Co-Op employer. Permission of instructor required. **Credits:** 0.00

ENGR 49001 - Breakthrough Thinking For Complex Challenges

Credit Hours: 3.00. This course helps students learn and effectively employ high-impact design principles and structured problem solving methods to address complex multi-stakeholder socio-technical challenges. Case discussions of historical and contemporary high impact solutions to complex challenges are used to introduce techniques to frame problems, structure ambiguity, intentionally design non-incremental solutions, and communicate, trial, and iterate solutions to drive adoption and multifaceted sustainability. Techniques are drawn from multiple schools of thought such as business, design, engineering, and the social sciences. Over the course of the term, multi-disciplinary student teams directly apply cumulative learning to address selected parts of a real-world complex societal challenge in close collaboration with a partner organization, in an experiential learning format. This course can be counted toward the College of Engineering Minor in Innovation and Transformational Change and the Burton D. Morgan Center for Entrepreneurship (BDMCE) Certificate in Entrepreneurship and Innovation. Permission of instructor required. **Credits:** 3.00

ENGR 49400 - Women In Engineering Senior Seminar: Gender In The Workplace

Credit Hours: 1.00. This course provides junior and senior engineering students an opportunity to maximize their earning potential, promotion opportunities, and retention within engineering or related fields. Enrolled students will 1) become aware of and discuss solutions for internal and external barriers which can prevent women from reaching their greatest potential in the workforce; 2) enhance professional development and transition skills required to move successfully from an academic to professional environment; and 3) acquire skills and knowledge to serve as engineering role models/ambassadors for diverse

populations. The content and activities of the course may be of particular interest to women. Permission by instructor required. **Credits:** 1.00

ENGR 49600 - Experimental Courses

Credit Hours: 0.00 to 6.00. Experimental classes offered at the senior level on a temporary basis to test the viability of offering the course on a permanent basis. **Credits:** 0.00 to 6.00

ENGR 49700 - Global Engineering Capstone

Credit Hours: 1.00. Forum for students returning from international internship and/or study abroad experience. Students will explore personal development resulting from the international experience as it relates to changes in world-view, understanding of culture, interpersonal skills and career aspirations. They will learn to highlight international experiences on resumes and in interviews. Students will apply and share their cultural knowledge through structured activities and summarize their entire global experience through a poster presentation. To be taken in semester following international internship/study abroad experience. Permission of instructor is required. **Credits:** 1.00

ENGR 50000 - Global Design Team V

Credit Hours: 0.00 to 3.00. Global Design Team brings together undergraduate and graduate students from different disciplines, inside and outside of the College of Engineering to design solutions to solve real-world problems over the course of one academic semester. Depending on the size and scope of the project, teams may range from one to twenty students under the advisement of a faculty member. GDTs partner student teams with non-governmental organizations, businesses and/or other research institutions in international development projects. Approval for registration is granted based on an application process that takes into consideration previous design experience, level of interest in the topic and GPA. Permission of department required. **Credits:** 0.00 to 3.00

ENGR 50100 - Engineering Management Graduate Program Seminar

Credit Hours: 1.00. Seminar focused on graduate-level development for Interdisciplinary Engineering (IDE) professional master's students in key professional skill areas including technical management, engineering industry awareness, networking, and methods for obtaining a professional position after graduation. Permission of instructor required. **Credits:** 1.00

ENGR 50200 - Engineering Leadership

Credit Hours: 3.00. Engineering leadership is the ability to inspire and guide engineering and technology-focused teams and organizations to achieve strategic outcomes. The successful engineering leader creates value at the intersection of technical systems and human systems. This course introduces students to evidence-based, practice-proven frameworks and tools related to (1) leadership presence, (2) cognitive diversity and psychological safety in teams, and (3) designing and transforming organizations and ecosystems. **Credits:** 3.00

ENGR 59600 - Special Topics

Credit Hours: 0.00 to 6.00. Special topic courses for projects or special interest in Engineering.**Credits:** 0.00 to 6.00

ENGR 60100 - Doctor Of Engineering Fundamentals

Credit Hours: 1.00. This course is designed to guide students in creating individual development plans tailored to their academic and professional aspirations as part of the Doctor of Engineering (D.Eng.) program. Students will learn to assess their skills, interests, and values, aligning them with potential research and academic paths. The course will cover setting realistic goals,

identifying resources, and developing strategies for personal and academic growth. The course will also detail the differences between a professional doctorate (D.Eng) and a PhD program. Students will engage in workshops and activities that foster self-reflection and practical planning skills. By the end of the course, students will have a personalized roadmap that outlines the steps necessary to achieve their graduate school objectives. As the foundational course for the Doctor of Engineering program, students are expected to take this course during their first year of the program. **Credits:** 1.00

ENGR 69199 - Professional Practice Graduate Co-Op I

Credit Hours: 0.00. Graduate cooperative education experience. Program coordinated by the Office of Professional Practice with cooperation from academic disciplines and participating employers. Students submit technical report and company evaluation. Permission of Instructor required. **Credits:** 0.00

ENGR 69299 - Professional Practice Graduate Co-Op II

Credit Hours: 0.00. Graduate cooperative education experience. Program coordinated by the Office of Professional Practice with cooperation from academic disciplines and participating employers. Students submit technical report and company evaluation. Permission of Instructor required. Prerequisite: ENGR 69199. **Credits:** 0.00

ENGR 69399 - Professional Practice Graduate Co-Op III

Credit Hours: 0.00. Graduate cooperative education experience. Program coordinated by the Office of Professional Practice with cooperation from academic disciplines and participating employers. Students submit technical report and company evaluation. Permission of Instructor required. Prerequisite: ENGR 69299. **Credits:** 0.00

ENGR 69499 - Professional Practice Graduate Co-Op IV

Credit Hours: 0.00. Graduate cooperative education experience. Program coordinated by the Office of Professional Practice with cooperation from academic disciplines and participating employers. Students submit technical report and company evaluation. Permission of Instructor required. Prerequisite: ENGR 69399. **Credits:** 0.00

ENGR 69699 - Professional Practice Graduate Internship

Credit Hours: 0.00. Graduate internship experience. Program coordinated by the Office of Professional Practice with cooperation from academic disciplines and participating employers. Students submit technical report and company evaluation. Permission of Instructor required. **Credits:** 0.00

ENGR 69810 - Engineering Research

Credit Hours: 1.00 to 18.00. Designed for online engineering graduate students to participate in a mentored research experience. Permission of instructor required. **Credits:** 1.00 to 18.00

Engineering Education

ENE 49800 - Undergraduate Research In Engineering Education

Credit Hours: 1.00 to 3.00. Individual research projects for students with the approval of their academic advisors. Requires prior approval of, and arrangement with, a faculty research advisor in the Department of Engineering Education. Written and oral final reports are required. Permission of instructor required. **Credits:** 1.00 to 3.00

ENE 50100 - Professional Development In Engineering Education

Credit Hours: 1.00. This course provides beginning engineering education graduate students opportunities to define themselves with the engineering education department and within the field of engineering education. Students, faculty, and outside speakers present research topics, academic opportunities, and other information that will enhance students' graduate experiences. Permission of instructor required. Typically offered Fall.**Credits:** 1.00

ENE 50101 - Foundations Of Engineering Education

Credit Hours: 3.00. In this course, new doctoral students in engineering education explore their roles within the field of engineering education, create a learning plan that maps to program requirements, and develop habits of mind to support their ongoing professional development. Students learn to write clearly and coherently in an academic context. Students examine research trends and faculty interests so they can make informed choices about advising and program opportunities. Permission of instructor required. **Credits:** 3.00

ENE 50200 - History And Philosophy Of Engineering Education

Credit Hours: 3.00. Examines the history and philosophy of engineering education by: (1) exploring the history of engineering education through archival research and historical documents (critical moments, tensions, issues); (2) investigating philosophies of education and the philosophies that have guided engineering as a profession; and (3) critiquing the evolution of engineering education, identifying alternative scenarios, and imagining a future role in engineering education. This course introduces students to the field of engineering education while broadening their views of the roles of interrelationships between teaching and research. Open to students in Engineering Education. Permission of instructor required. Typically offered Fall.**Credits:** 3.00

ENE 50300 - Engineering Education Inquiry

Credit Hours: 3.00. This course is conceived as a bridge between beginning graduate students' knowledge of technical research and modes of inquiry appropriate to the new field of engineering education. It is designed as the entryway to required research method courses taken as part of the students' plan of study. By the end of this survey course, students will be able to critique research in terms of the quality of the authors' argument based on their chain of reasoning, and will recognize that the articulation of a research question, the significance of the question, the choice of methods in regards to the research goals, and the transparency of the explanation of the methodology are all the parts of the chain of reasoning. Permission of instructor required. Typically offered Fall.**Credits:** 3.00

ENE 50400 - Leadership, Policy, And Change In Science, Technology, Engineering, And Mathematics (STEM) Education

Credit Hours: 3.00. This course provides a foundation for examining historical and current perspectives of STEM education programs and policy at the secondary and postsecondary levels. Focusing on the relationships among education policy, leadership theories, and models of systemic change, this course will enable students to situate and envision their potential role in shaping engineering education within the context of the larger education landscape. Students will synthesize course readings, examine education policy, and reflect on leadership theories and change, as well as explore how they can influence leadership, policy, and /or organizational change in STEM education through a semester project. Typically offered Spring.**Credits:** 3.00

ENE 50500 - Theories Of Development And Engineering Thinking

Credit Hours: 3.00. This course examines theories of human development, learning and epistemology in the context of Engineering Education. A broad survey of readings guides an in-depth study of fundamental theories of development and knowledge generation as it relates to pedagogy and research. A rich body of theoretical literature will be studied in order to explore its relation to engineering education. Work in the course aims to construct answers to the following three questions: (1) How do theories of human learning, development, and epistemology help us think about engineering? (2) How do they relate to

engineering education? (3) How do they inform research method and practice in engineering education? No restrictions. It is helpful, however, for students to have engaged in prior reading-and writing- intensive courses that required them to synthesize large amounts of information. For this reason, it is recommended that students are enrolled currently in a graduate program at Purdue University. Permission of department required. Typically offered Spring.**Credits:** 3.00

ENE 50600 - Content, Assessment And Pedagogy: An Integrated Engineering Design Approach

Credit Hours: 3.00. The course is explicitly identified in the ENE-PhD requirements as a "foundation course" required for all students. This course is intended to be taken early in a graduate student's curriculum and therefore is designed to be a bridge between the student's previous experience with engineering (education, work, and teaching) and new engineering education research-based approaches. It is intended as an entryway to help students apply an engineering design approach to the design of instruction. To meet this aim, the course involves an iterative project-based approach in a context (design site) that is chosen by the student for its relevance, interest and potential application. Typically offered Spring.**Credits:** 3.00

ENE 55400 - Globalization And Engineering

Credit Hours: 3.00. The focus is on the multifaceted dynamics of globalization, and its impact on engineering practice and the lives and education of engineers. The course emphasizes engineering and globalization from the perspectives of the emerging Asian economies and Europe, as well as the United States. This course is designed for practicing engineers and engineering educators. It is taught within a learner-centric, highly interactive, collaborative learning environment in which students are expected to learn from the experiences and thinking of each other, as well as from the instructor, and other course resources. The course places emphasis on reading, writing, web-based research, and discussion. Students are recommended (but not required) to have a minimum of two years work experience as a practicing engineer and strong communication skills (self-assessed). Permission of instructor is required. Typically offered Fall.**Credits:** 3.00

ENE 58600 - Exploring Alternative Career Paths As An Engineering Educator

Credit Hours: 3.00. This course is designed for graduate students in engineering or closely related fields who want to be involved in educating current or future engineering students or practicing engineers or in communicating technical material to others, including teachers, the public, or policymakers - but are not currently interested in a tenure-track faculty position. It explores a wide range of positions in formal education, informal education (e.g., museums, foundations), industry, and government and offers an opportunity to learn and practice some skills typically required for success in those positions.**Credits:** 3.00

ENE 59000 - Special Problems In Engineering Education

Credit Hours: 1.00 to 6.00. Project or special topics of contemporary importance or of special interest that are outside the scope of the standard graduate curriculum. Interested students should seek a faculty advisor by meeting individual faculty members who work in their area of special interest and prepare a brief description of the work to be undertaken and expected outcomes and deliverables. An individual project must be approved by the faculty member supervising the project and the student's advisor before registering for the course. An approved written report is required. Permission of instructor required.**Credits:** 1.00 to 6.00

ENE 59500 - Special Topics In Engineering Education

Credit Hours: 0.00 to 6.00. Primarily designed for specialized topic areas for which there is no specific course, workshop, or individual study plan, but having enough student interest to justify the formalized teaching of a course. Permission of instructor required.**Credits:** 0.00 to 6.00

ENE 62000 - Design, Cognition And Learning

Credit Hours: 3.00. Design is central to engineering: it is an integral part of the engineering profession and how we educate future professionals. Design cognition and learning is an area of engineering education research that seeks to understand what designers know and how they learn, and what tools best support design activity (e.g., collaboration, innovation, etc.). This research draws from many perspectives including cognitive psychology and the learning sciences, organizational learning, engineering and product design, architecture, human-centered interaction, and creativity and innovation. Themes in the course include (1) design knowledge, (2) what theories help understand design knowing and learning, (3) what are ways to study designers and design activity, and (4) how may design research inform design education and practice? Permission of instructor required. Typically offered Fall.**Credits:** 3.00

ENE 63000 - Cognitive Devices In Science, Technology, Engineering And Mathematics Learning Environments

Credit Hours: 3.00. This course explores the nature of technologies we use to assist in thinking, learning and teaching. Specific focus is on cognitive tools associated with engineering activities and how to blend these tools with science and mathematical knowledge. These will range from representational tools, computational tools and cognitive tools for supporting individual and group thinking and learning. Participants in this course will be able to evaluate various learning technologies relative to specific learning goals and outcomes and will design a technological tool to support thinking, learning and/or teaching about concepts in science, engineering, mathematics and technology. Participants will also be able to identify assessment methods that indicate cognitive change in learners as a measure of the effectiveness of a device/tool in context of an activity. **Credits:** 3.00

ENE 68500 - Educational Methods In Engineering

Credit Hours: 3.00. (CHE 68500) Students will learn how to teach in an engineering environment where both classroom and laboratory instruction is intertwined. Classroom techniques, such as lectures, cooperative groups, mastery and PSI, TV and video, and guided design will be studied, in addition to class preparation issues, such as ABET accreditation and design content. Students will study motivation, learning theories and cycles, and personality types. Includes teaching practice and group projects. Student must be admitted into a Ph.D. program in Engineering or other technical discipline (Finished with MS or MS-bypass). Not open to students who have taken PSY 69500/EDPS 63400. Permission of Instructor required. Typically offered Fall Spring.**Credits:** 3.00

ENE 68700 - Mentored Teaching In Engineering

Credit Hours: 1.00 or 3.00. Mentored experience in the teaching of engineering, with structured opportunities for individual reflection. All students create a scholarly teaching portfolio. Students who register for three credits conduct a scholarship of teaching and learning project. Prerequisites: Significant concurrent responsibility for teaching an engineering course. Registration in or completion of ENE 50600 (Content, Assessment And Pedagogy) or ENE 68500 (Educational Methods In Engineering); or instructor permission required. Typically offered Fall Spring.**Credits:** 1.00 or 3.00

ENE 69000 - Seminar In Engineering Education

Credit Hours: 0.00. Seminar course covering a broad range of current discovery, learning, and engagement topics in Engineering Education. Seminar presentations by representatives from academia, industry, other external institutions, and members of the Purdue University community. This is a required course for the graduate program in the Department of Engineering Education. Typically offered Fall Spring.**Credits:** 0.00

ENE 69500 - Advanced Topics In Engineering Education

Credit Hours: 0.00 to 6.00. Primarily designed for specialized topic areas for which there is no specific course, workshop, or individual study plan, but having enough student interest to justify the formalized teaching of a course. Permission of instructor required. Typically offered Summer Fall Spring.**Credits:** 0.00 to 6.00

ENE 69800 - Research MS Thesis

Credit Hours: 1.00 to 18.00. MS Thesis. Permission of instructor required. Typically offered Summer Fall Spring.**Credits:** 1.00 to 18.00

ENE 69900 - Research PhD Thesis

Credit Hours: 1.00 to 18.00. PhD Thesis. Permission of instructor required. Typically offered Summer Fall Spring.**Credits:** 1.00 to 18.00

Engineering Projects in Community Service

EPCS 10100 - First Year Participation In EPICS

Credit Hours: 1.00. Together, Engineering Projects in Community Service (EPICS) courses create a vertical project track under which students work in multidisciplinary teams on long-term engineering-based design projects. Projects of at least one year in duration are intended to solve real problems that are defined in consultation with "customers" from not-for-profit community and education organizations. EPCS courses are open to students from all disciplines; each student contributes expertise in his/her academic discipline. Each team consists of a mix of first-year, sophomores, juniors, and seniors. Students are encouraged to participate in an EPICS project team for two or more semesters. First-year students participating in EPCS 10100 gain insight into the specific project, and more generally, into the design and development process. They attend planning and reporting meetings with the customer and are expected attend all team meetings. Under the mentorship of the team's sophomores, juniors and seniors they perform and report upon tasks consistent with their level of discipline expertise. May be repeated for credit. **Credits:** 1.00

EPCS 10200 - First Year Participation In EPICS

Credit Hours: 2.00. Continuation of EPCS courses (see EPCS 10100). Participants in EPCS 10200 gain insight into the specific project, and more generally, into the design and development process. They attend planning and reporting meetings with the customer and are expected to attend all team meetings. Working with team's sophomores, juniors and seniors they perform and report upon tasks consistent with their level of discipline expertise. EPCS 10200 is offered for two credits and is intended for students who have exhibited significant achievement in EPCS 10100 and desire the level of responsibility that is appropriate for two credits. May be repeated for credit. Permission of department required. **Credits:** 2.00

EPCS 11100 - First Year Participation In EPICS I

Credit Hours: 1.00. Together, Engineering Projects in Community Service (EPICS) courses create a vertical project track under which students work in multidisciplinary teams on long-term engineering-based design projects. Projects of at least one-year in duration are intended to solve real problems that are defined in consultation with "customers" from not-for-profit community and education organizations. EPCS courses are open to students from all disciplines; each student contributes expertise in his/her academic discipline. Each team consists of a mix of first-year, sophomores, juniors, and seniors. Students are encouraged to participate in an EPICS project team for two or more semesters. First-year students participating in EPCS gain insight into the specific project, and more generally, into the design and development process. They attend planning and reporting meetings with the customer and are expected to attend all team meetings. Under mentorship from upper-level students and instructors, they perform and report upon design tasks consistent with their level of discipline expertise. **Credits:** 1.00

EPCS 12100 - First Year Participation In EPICS II

Credit Hours: 1.00. Together, Engineering Projects in Community Service (EPICS) courses create a vertical project track under which students work in multidisciplinary teams on long-term engineering-based design projects. Projects of at least one year in duration are intended to solve real problems that are defined in consultation with "customers" from not-for-profit community and

educational organizations. EPCS courses are open to students from all disciplines; each student contributes expertise in his/her academic discipline. Each team consists of a mix of first-year, sophomores, juniors, and seniors. Students are encouraged to participate in an EPICS project for two or more semesters. First-year students participating in EPICS gain insight into the specific project, and more generally, into the design and development process. Under mentorship from upper-level students and instructors, they perform and report upon design tasks consistent with their level of discipline expertise. **Credits:** 1.00

EPCS 20100 - Sophomore Participation In EPICS

Credit Hours: 1.00. Continuation of EPCS courses (see EPCS 10100). Sophomores participating in EPCS 20100 gain insight into the specific project, and, more generally, into the design and development process. They attend planning and reporting meetings with the customer and are expected attend all team meetings. Under the mentorship of the team's juniors and seniors they perform and report upon tasks consistent with their level of discipline expertise. EPCS 20100 is offered for one credit. **Credits:** 1.00

EPCS 20200 - Sophomore Participation In EPICS

Credit Hours: 2.00. Continuation of EPCS courses (see EPCS 10100). Sophomores participating in EPCS 20100 gain insight into the specific project, and, more generally, into the design and development process. They attend planning and reporting meetings with the customer and are expected attend all team meetings. Under the mentorship of the team's juniors and seniors they perform and report upon tasks consistent with their level of discipline expertise. EPCS 20200 is offered for two credits. Permission of instructor required. **Credits:** 2.00

EPCS 30100 - Junior Participation In EPICS

Credit Hours: 1.00. Continuation of EPCS courses (see EPCS 10100). The responsibilities of juniors include working with the seniors in the planning and organization of the project, contributing to the design process, problem-solving by contributing expertise from their discipline, meeting with the customer, and the mentorship of sophomores and freshmen. EPCS 30100 is offered for 1 credit. The EPICS procedures manual provides information on expected relative workload for EPCS 30100 and EPCS 30200 students. May not be taken concurrently with EPCS 30200. **Credits:** 1.00

EPCS 30200 - Junior Participation In EPICS

Credit Hours: 2.00. Continuation of EPCS courses (see EPCS 10100). The responsibilities of juniors include working with the seniors in the planning and organization of the project, contributing to the design process, problem-solving by contributing expertise from their discipline, meeting with the customer, and the mentorship of sophomores and freshmen. EPCS 30200 is offered for two credits. The EPICS procedures manual provides information on expected relative workload for EPCS 30100 and EPCS 30200 students. May not be taken concurrently with EPCS 30100. **Credits:** 2.00

EPCS 40100 - Senior Participation In EPICS

Credit Hours: 1.00. Continuation of EPCS courses (see EPCS 10100). Seniors are responsible for the management tasks of planning and organizing their team project activity. They are expected to contribute expertise from their discipline to the design of the team's projects throughout most of the design process phases of problem identification, specification development, design, production, and deployment. Seniors will also meet with the customer and mentor the freshman, sophomores and juniors. Seniors using EPCS 40100/EPCS 40200 to fulfill capstone or design requirements where approved for their major may be required to satisfy additional course requirements specified by their degree program. EPCS 40100 is offered for 1 credit. The EPICS procedures manual provides information on expected relative workload for EPCS 40100 and EPCS 40200 students. May not be taken concurrently with EPCS 40200. **Credits:** 1.00

EPCS 40200 - Senior Participation In EPICS

Credit Hours: 2.00. Continuation of EPCS courses (see EPCS 10100). Seniors are responsible for the management tasks of planning and organizing their team project activity. They are expected to contribute expertise from their discipline to the design of the team's projects throughout most of the design process phases of problem identification, specification development, design, production, and deployment. Seniors will also meet with the customer and mentor the freshman, sophomores and juniors. Seniors using EPCS 40100/40200 to fulfill capstone or design requirements where approved for their major may be required to satisfy additional course requirements specified by their degree program. EPCS 40200 is offered for 2 credits. The EPICS procedures manual provides information on expected relative workload for EPCS 40100 and EPCS 40200 students. May not be taken concurrently with EPCS 40100. **Credits:** 2.00

EPCS 41100 - Senior Design Participation In EPICS

Credit Hours: 1.00. Continuation of EPICS courses. Seniors using EPCS 41100 to fulfill capstone or design requirements where approved for their major may be required to satisfy additional course requirements specified by their degree program. EPCS 41100 is offered for 1 credit. The EPICS procedures manual provides information on expected relative workload for EPCS 41100 and EPCS 41200 students. Seniors are responsible for the management tasks of planning and organizing their team project activity. They are expected to contribute expertise from their discipline to the design of the team's projects throughout most of the design process phases of problem identification, specification development, design, production, and deployment. Seniors will also meet with the customer and mentor the first year, sophomores and juniors. May not be taken concurrently with EPCS 41200. **Credits:** 1.00

EPCS 41200 - Senior Design Participation In EPICS

Credit Hours: 2.00. Continuation of EPICS courses. Seniors using EPCS 41200 to fulfill capstone or design requirements where approved for their major may be required to satisfy additional course requirements specified by their degree program. EPCS 41200 is offered for 2 credits. The EPICS procedures manual provides information on expected relative workload for EPCS 41100 and EPCS 41200 students. Seniors are responsible for the management tasks of planning and organizing their team project activity. They are expected to contribute expertise from their discipline to the design of the team's projects throughout most of the design process phases of problem identification, specification development, design, production, and deployment. Seniors will also meet with the customer and mentor the first year, sophomores and juniors. May not be taken concurrently with EPCS 41100. **Credits:** 2.00

EPCS 49000 - EPICS Special Topics Course

Credit Hours: 1.00 to 3.00. Projects of special interest outside the scope and structure of the standard EPICS courses. Interested students seek a faculty advisor in their area of special interest and together prepare a brief description of the work to be undertaken. Permission of instructor required. **Credits:** 1.00 to 3.00

Engineering Technology

ECET 52400 - Applied Electromagnetics

Credit Hours: 1.00 or 3.00. This course provides an advanced treatment of electromagnetics and applications at the graduate level for engineering technology students. Electric and magnetic field theory is presented, including Maxwell's equations. Topics include vector analysis, electric and magnetic fields, Maxwell's equations, electromagnetic wave radiation, and propagation. A semester-long project based on applied electromagnetics is required for each student. Knowledge of RF measurement equipment, such as spectrum analyzers and vector network analyzers is required.**Credits:** 1.00 or 3.00

ENGT 10100 - Industrial Technology Biotechnical Studies

Credit Hours: 3.00. Students are introduced to the fields of biotechnology, bioengineering, biomedical engineering, and bio-molecular engineering. Students design, fabricate and evaluate devices that solve biotechnical problems. **Credits:** 3.00

ENGT 10200 - Industrial Technology Aerospace Studies

Credit Hours: 3.00. This course introduces students to the world of aeronautics, flight, and engineering. Students apply scientific and engineering concepts to design materials and processes that measure, repair, improves, and extend aeronautical systems. **Credits:** 3.00

ENGT 10300 - Industrial Technology Exploring Civil Engineering And Architecture

Credit Hours: 3.00. Students learn various aspects of civil engineering and architecture, apply their knowledge to designing and development of a commercial property. Students learn about documenting their project, problem-solving, and communications in the civil engineering community. **Credits:** 3.00

ENGT 10500 - Industrial Technology Introduction To Design

Credit Hours: 3.00. This course develops students' problem-solving skills, with emphasis placed upon the concept of developing a three-dimensional model of an object. Students focus on the application of visualization processes and tools currently used in the design and manufacturing environments. **Credits:** 3.00

ENGT 10600 - Industrial Technology Digital Electronics

Credit Hours: 3.00. This course is the study of applied digital logic. Students will study the application of electronic logic circuits and apply Boolean logic to the solution of problems. Students will design circuits, export their design to a printed program that generates printed circuit boards, and construct the design using electronic components. **Credits:** 3.00

ENGT 10700 - Industrial Technology Principles Of Engineering

Credit Hours: 3.00. This course explores various engineering systems and manufacturing processes. Students examine how the field of engineering technology addresses social and political consequences of technological change. **Credits:** 3.00

ENGT 10800 - Industrial Technology Computer-Integrated Manufacturing

Credit Hours: 3.00. This course builds on students' solid modeling skills to develop manufactured products. Students evaluate products using mass property analysis, make appropriate modifications, and use prototyping equipment to produce three-dimensional models of the solutions. **Credits:** 3.00

ENGT 10900 - Industrial Technology Engineering Design And Development

Credit Hours: 3.00. In this capstone course students work in teams to design and construct a solution to an engineering problem, applying the knowledge and skills previously developed. Students maintain a portfolio of their design and development activities. Teams are responsible for making final presentations of the solution to an engineering review panel. **Credits:** 3.00

ENGT 18000 - Engineering Technology Foundations

Credit Hours: 3.00. This course introduces School of Engineering Technology students to resources and skills that will help them to be successful in their studies and ultimately in their careers. The skills needed to define and solve technical problems in engineering technology are developed. Instruction is given in analytical and computational problem-solving techniques.

Application of software for analysis and communication is emphasized. Teamwork, global and societal concerns, and professional ethics are integrated into course projects. **Credits:** 3.00

ENGT 18100 - Engineering Technology Applications

Credit Hours: 1.00. Basic electrical, electronics, mechanical, and process laboratory skills are introduced, including simple troubleshooting techniques and safety practice. Relevant engineering technology projects are emphasized. **Credits:** 1.00

ENGT 18200 - Gateway To Engineering Technology

Credit Hours: 4.00. This course introduces School of Engineering Technology students to the resources and skills needed to define and solve technical problems, which will help them be successful in their studies and ultimately in their careers. Instruction is given in analytical and computational problem-solving techniques. The application of software for analysis and problem-solving is emphasized. Foundational principles for electrical, industrial, manufacturing, and mechanical engineering technology are studied. Teamwork, global and societal concerns, and professional ethics are integrated into course. **Credits:** 4.00

ENGT 22670 - Sustainable Energy Technologies: An International Perspective

Credit Hours: 3.00. This course is a survey of sustainable energy technologies taught at Ostfalia University in Wolfenbuttel, Germany during the two-week International Summer University Program. Wind, Solar, Hydro-electric, Hydrogen Fuel Cell, Biomass, and other technologies are studied along with the future of Nuclear and Coal powered generation. The economic aspects of shifting to renewable energy sources by Germany are presented. Field trips to energy-related industries and historic cities occur nearly every day. Permission of instructor required. **Credits:** 3.00

ENGT 29000 - Special Topics In ENGT

Credit Hours: 1.00 to 3.00. Group instruction in new or specialty areas of engineering technology is provided by SOET faculty, subject to SOET curriculum subcommittee approval. Hours, subject matter, and credit to be arranged by faculty. Permission of department required. **Credits:** 1.00 to 3.00

ENGT 29900 - Engineering Technology Project

Credit Hours: 1.00 to 3.00. Independent project or study of a special topics is conducted under the supervision of appropriate SOET faculty. Hours and subject matter must be arranged with the instructor and approved by the SOET curriculum subcommittee before enrolling in the course. Permission of department required. **Credits:** 1.00 to 3.00

ENGT 39000 - Special Topics In Engineering Technology

Credit Hours: 1.00 to 3.00. Group instruction in new or specialty areas of engineering technology is provided by SOET faculty, subject to SOET curriculum subcommittee approval. Hours, subject matter, and credit to be arranged by faculty. Permission of department required. **Credits:** 1.00 to 3.00

ENGT 39900 - Engineering Technology Project

Credit Hours: 1.00 to 6.00. Independent project or study of a special topic is conducted under the supervision of appropriate SOET faculty. Hours and subject matter must be arranged with the instructor and approved by the SOET curriculum subcommittee before enrolling in the course. Permission of department required. **Credits:** 1.00 to 6.00

ENGT 48000 - Engineering Technology Capstone I

Credit Hours: 3.00. This is the first course of a two-term senior capstone sequence. The skills needed to define, design and develop engineering technology solutions are introduced and developed. Planning and designing alternatives that meet cost, performance, and user-interface goals are emphasized. Project planning, scheduling, and management techniques are studied. Different design approaches are compared. Teamwork, global and societal concerns, and professional ethics are integrated into course projects.**Credits:** 3.00

ENGT 48100 - Engineering Technology Capstone II

Credit Hours: 3.00. This is the second course of two-term capstone sequence, addressing an industry-based problem. The focus of the course is on designing and implementing an acceptable solution. **Credits:** 3.00

ENGT 49000 - Special Topics In Engineering Technology

Credit Hours: 1.00 to 3.00. Group instruction in new or specialty areas of engineering technology is provided by SOET faculty, subject to SOET curriculum subcommittee approval. Hours, subject, matter, and credit to be arranged by faculty. Permission of department required. **Credits:** 1.00 to 3.00

ENGT 49900 - Engineering Technology Project

Credit Hours: 1.00 to 6.00. Independent project or study of a special topic is conducted under the supervision of appropriate SOET faculty. Hours and subject matter must be arranged with the instructor and approved by the SOET curriculum subcommittee before enrolling in the course. Permission of department required. **Credits:** 1.00 to 6.00

ENGT 50100 - Graduate Research Seminar

Credit Hours: 0.00 or 1.00. This course is intended to orient new graduate students to the Engineering Technology (ET) program and faculty. This includes PhD students and students pursuing a Master's degree through a thesis or directed project option. This does not include students pursuing a Master's degree with coursework only. Research activities within ET and throughout Purdue University are discussed. Student resources and opportunities are reviewed to give the students the tools they need to be successful. In addition, this course provides a way to develop a natural cohort of graduate students. This course is a graduate seminar course focused on the ET program. Graduate status or upper-division undergraduate. Permission of department required. **Credits:** 0.00 or 1.00

ENGT 50200 - Developmental Testing And Innovation Seminar

Credit Hours: 1.00. The course introduces Engineering Technology and the requirements to fulfill the master's and/or PhD Technology degrees. The seminar can include graduate faculty from the SoET, the NAVY, and other Engineering and Technology related disciplines from the Purdue Polytechnic, College of Engineering, and other STEM related disciplines across campus. **Credits:** 1.00

ENGT 50700 - Fundamentals Of Collaborative Leadership And Agile Strategy For Engineering Technology

Credit Hours: 3.00. This course will provide students with a foundation in collaborative leadership and agile strategy. The course brings together theories and insights from a variety of disciplines including engineering, management, psychology, and social science. Increasingly manufacturing management is being called upon to apply their technical skills in collaborative environments that cut across organizational units and inter-organizational boundaries. Understanding how to design and guide collaborations and apply agile approaches for meeting strategic objectives is an important skill set and knowledge base in the 21st-century economy, defined more by open networks than the ridged hierarchies of the past. **Credits:** 3.00

ENGT 50900 - Applied Computational Methods

Credit Hours: 1.00 to 3.00. This class covers the mathematics typically needed for research in engineering technology and is especially suited to the needs of ENGT student. The class includes basic calculus, introductory numerical methods, implemented in MATLAB, and elementary linear algebra. It uses relevant, practical problems to teach concepts and provides the students with actionable information. The starting point is graphical and numerical solutions of systems of non-linear algebraic equations. The class progresses to simple ordinary differential equations. Prerequisite: Six credits of undergraduate classes in technical mathematics, focusing on calculus.**Credits:** 1.00 to 3.00

ENGT 54000 - Change Management For Enterprise Sustainability

Credit Hours: 3.00. Change management is at the core of an engineering organization's processes and data, and it affects every member of the enterprise. Change management provides a method for identifying, analyzing, preparing, implementing, validating, and documenting engineering changes throughout a product's lifecycle, to ensure everyone in the organization is working from the same product record and changes are communicated in real-time. In this course, the core elements, data structures, stakeholders, and workflows of change management and their role as enablers of the digital thread and the digital enterprise are discussed. The application of the industry standard CM2 methodology is emphasized as a strategy to provide control, maintain data integrity, and improve visibility and traceability of changes.**Credits:** 3.00

ENGT 54200 - Cyber-Animal Systems I: Technology-Enhanced Animal Welfare

Credit Hours: 3.00. Cyber-Animal Systems is an interdisciplinary course involving hardware science, software science, and animal science students, who will study the interaction of animals and computer-controlled systems. The course addresses recent advances in robotics, data science, and animal husbandry that combine to create collaborative robots, wearable devices, and biological and environmental sensing systems that improve the practice of precision animal agriculture. Topics include case studies of technology adoption in animal agriculture, impacts of animal welfare on farm production and climate, and the importance of animal societies, confounding variables in animal studies, and animal anxiety on the design of experiments for technology integration. All students will learn mentoring techniques for tutoring other students from different disciplines so they develop skills in "lifelong teaching". **Credits:** 3.00

ENGT 55000 - Manufacturing System Design For Sustainability

Credit Hours: 3.00. This course prepares manufacturing and information technology leaders to design and analyze manufacturing processes to achieve manufacturing system objectives that meet internal and external customers quality, cost and delivery requirements within a safe environment. The course project covers major aspects of manufacturing system design and Industry 4.0 in the context of meeting customer needs. Technology leaders and entrepreneurs learn how to work with others to develop the design of manufacturing systems that are sustainable (business, ecological, social, technological) for the long term. When to use lean and six-sigma techniques in the context of the manufacturing enterprise system design to meet customer needs will be assessed from a system design perspective, through analytical and computer simulation techniques, and through the use of physical modeling tools. **Credits:** 3.00

ENGT 56100 - Metrology Concepts And Applications

Credit Hours: 3.00. Metrology is a fundamental concept required for obtaining scientific data and understanding instrumentation. This course introduces the concepts of metrology associated with measurement systems: sensors, signal conditioning, data acquisition and analysis, as well as the error propagation. System and environmental noise are investigated along with methods to mitigate influences of noise. Standards and calibration of instrumentation are also studied. Concepts of metrology for the seven basic units of measurements are described from the macro to nano-scale. **Credits:** 3.00

ENGT 57100 - Applied Nanotechnology

Credit Hours: 3.00. The emerging field of nanotechnology introduces new challenges and opportunities in a variety of career fields. This course introduces students to the concepts of nanotechnology including electronics/mechanics, materials, tools and applications. The experience allows students to move beyond the boundaries of standard application of mechanical and electrical systems into the next generation or dimension of their chosen fields. The course incorporates experiential instruction to reinforce the concepts learned in the lecture. Permission of department required. **Credits:** 3.00

ENGT 58100 - Workshop In Engineering Technology

Credit Hours: 1.00 to 21.00. This course number is used to pilot and develop new graduate-level courses. Each 58100 course number is followed by either a unique alphabetic suffix (e.g., ABC) or numeric suffix (e.g., 123) and is given a unique title and course description. These courses can be included in a graduate plan of study with the usual condition that they must be approved by the student's graduate committee. Accordingly, it is important to discuss these courses with your faculty advisor and committee prior to registration. Permission of instructor required. **Credits:** 1.00 to 21.00

ENGT 58300 - Applied Engineering Statistics For Industry

Credit Hours: 3.00. The purpose of this course is to teach the practitioner how to use and make better-informed decisions as a manager for making optimum process, business, or personnel decisions. Emphasis will be placed on Verification, Validation in R&D, Manufacturing, QA/QC, basic probability, Summarizing Data, Basic Tools (flowcharts, fishbone diagrams, Pareto charts), Process Capability - Cp/Cpk. Upper and lower control limits/charts, Use of Control Charts for Continual Improvement, Six Sigma, Design of Experiments, Taguchi Methodology and Data Analytics will also be covered. **Credits:** 3.00

ENGT 59000 - Special Problems In Engineering Technology

Credit Hours: 1.00 to 3.00. The ENGT 59000 course code is intended primarily for students to undertake targeted study or projects to develop depth in an area related to their area of research, where no other comparable course is available at Purdue or conveniently elsewhere. You may take up to 9 credits of ENGT 59000 as part of your Plan of Study. Requests to extend the number of credits must be decided within your graduate committee and documented with the Graduate Chair. Permission of instructor required. **Credits:** 1.00 to 3.00

ENGT 60500 - Engineering Technology Research Writing Strategies

Credit Hours: 3.00. The stated Master of Science in Engineering Technology graduate course teaches research literature mining and analysis found in Purdue licensed databases. Focuses on detail, a measurable topic, literature review, reporting, citation, data visualization using APA. Requires research paper writing aligned with ARWE specifications for in-depth research preparation and reporting. Students will research a topic relevant to a workplace problem in their industry. For example, a new technology, a process (Giga Casting for example), a material, supply chain, digitization, industry 4/5.0, sustainability, workforce diversity, aging workforce, ethics in the workplace, offshoring vs. onshoring, direct part marking, inventory/project management, cybersecurity risks, facility management, energy management, patents/intellectual property or environmental compliance. Keep in mind, Before You Start, that whichever topic you choose, the problem must be measurable. Measurable either from a quantitative or qualitative statistic perspective. Your topic will have to be tied to a global grand engineering challenge we face as a society and/or industry.**Credits:** 3.00

MET 37900 - Introduction To Aerospace Technology

Credit Hours: 3.00. An overview of flight vehicle design is introduced through designing and making radio controlled model flight vehicles. Aerodynamic forces, dynamics and longitudinal stability are studied. Students will make airframes, integrate the controls, and test fly the resulting vehicles.**Credits:** 3.00

English

ENGL 1080N - Reading, Writing, And Inquiry I

Credit Hours: 2.00 to 4.00. This course teaches skills of critical reading, thinking, and writing to help students meaningfully engage artifacts, events, and issues in our world. The course builds students' abilities to read written and cultural texts critically; to analyze those texts in ways that engage both students' own experiences and the perspectives of others; and to write about those texts for a range of audiences and purposes as a means of participating in broader conversations. Assignments emphasize the analysis and synthesis of sources in making and developing claims.**Credits:** 2.00 to 4.00

ENGL 10400 - English Composition I

Credit Hours: 3.00. Emphasis on the organization of the expository theme. Directed writings of themes based on personal experience, on the relationship between experience and language, and on the relationship between experience and ideas.**Credits:** 3.00

ENGL 10500 - English Composition II

Credit Hours: 3.00. The second half of the basic composition sequence. Extensive practice in writing clear and effective prose. Instruction in logic, structure, and style.**Credits:** 3.00

ENGL 10600 - First Year Composition With Conferences

Credit Hours: 4.00. This 4-credit hour composition course includes student-teacher conferences. Students in this course produce between 7,500-11,500 words of polished writing (or 15,000-22,000 total words, including drafts or the equivalent). Within the course, students will learn to write with a rhetorical awareness of diverse audiences, situations, and contexts; critically think about writing and rhetoric through reading, analysis, and reflection; provide constructive feedback and incorporate feedback into their own writing; perform research and evaluate sources to support claims; and engage multiple digital technologies for different purposes.**Credits:** 4.00

ENGL 10800 - First Year Composition

Credit Hours: 3.00. In this 3-credit hour composition course students should expect an emphasis on self-guided work. Students in this course produce between 7,500-11,500 words of polished writing (or 15,000-22,000 total words, including drafts or the equivalent). Within the course, students will learn to write with a rhetorical awareness of diverse audiences, situations, and contexts; critically think about writing and rhetoric through reading, analysis, and reflection; provide constructive feedback and incorporate feedback into their own writing; perform research and evaluate sources to support claims; and engage multiple digital technologies for different purposes.**Credits:** 3.00

ENGL 11000 - SHOULD BE SCLA

Credit Hours: 3.00. The course takes a social science-based approach to investigating the American university by examining contemporary college life, the history of the American academy, social and environmental issues on campus, and opportunities for engagement with the wider community. Students will improve their speaking, listening, reading, writing skills in English so that they can actively participate in social and academic communication. **Credits:** 3.00

ENGL 11100 - SHOULD BE SCLA

Credit Hours: 3.00. Students will continue to develop the foundational language skills and knowledge that they need to succeed in their other classes at Purdue and to prepare for further academic and professional opportunities. Students will also deepen their understanding of American culture and improve their ability to think about cultural differences in positive ways. In a sense, this class will be a bridge to help you transition to other language-intensive courses at Purdue where you need to read, write, and

speak frequently and/or work in groups (such as business, engineering, literature, public speaking, and social sciences). **Credits:** 3.00

ENGL 19500 - Introducing English

Credit Hours: 1.00. This introductory seminar familiarizes students with the different majors in English as well as potential career opportunities, introduces them to departmental and College of Liberal Arts resources, and promotes community through participation in English Department activities. These include visits to the Writing Lab (English) and the Career Center (CLA); common read book discussions; & more. **Credits:** 1.00

ENGL 20102 - Introduction To Digital Humanities

Credit Hours: 3.00. This is an interdisciplinary foundational course that combines theory and practice to teach students in and about digitally mediated culture. Accordingly, this course fosters a critical understanding of the digital and its implication for the development of a technologically driven society. Students will be introduced to digital inquiry and critical practice and explore the ways that the digital transforms knowledge acquisition and production across the humanities, social sciences and sciences. Students will engage in readings and activities that help them form substantive perspectives on the digital formulations and practice through digital technologies and tools. Students will also experiment with digital methods and tools by building a digital project. This course places an emphasis on engaged learning through online and in-class discussion, digital activities, and collaborative work.**Credits:** 3.00

ENGL 20200 - Engaging English

Credit Hours: 3.00. This theme-based course introduces students to the field of English, and provides foundational liberal arts skills. It teaches, for instance, critical and creative thinking, reading, and writing using a variety of genres, texts, and media. **Credits:** 3.00

ENGL 20300 - Introduction To Research For Professional Writers

Credit Hours: 3.00. Introduction to research sources and methods useful for professional writers, including electronic resources. Focus on collecting print and online information, interviewing, surveying, and conducting observations; and on evaluating, summarizing, analyzing, and reporting research. Typically offered Summer Fall Spring.**Credits:** 3.00

ENGL 20400 - Special Topics In Writing

Credit Hours: 3.00. A course in writing, with the special topic selected by the instructor. Typically offered Fall Spring.**Credits:** 3.00

ENGL 20500 - Introduction To Creative Writing

Credit Hours: 3.00. Practice in writing short prose narratives and poetry for students who have finished composition and wish to develop their skills further. Workshop criticism. CTL:IEL 1230 Introduction To Creative Writing**Credits:** 3.00

ENGL 21500 - Inventing Languages

Credit Hours: 3.00. "Invented languages" include linguistic systems created for fictional worlds, such as Dothraki (Game of Thrones), Na'vi (Avatar), Elvish (Lord of the Rings) and Klingon (Star Trek), as well as languages invented for international communication by real speakers, such as Esperanto. In this course, you will study these systems, learn the major properties of natural human languages, and construct your own rudimentary languages. **Credits:** 3.00

ENGL 21700 - Figures Of Myth And Legend I: Monsters

Credit Hours: 3.00. This course traces specific monster case studies across a variety of genres and media from the ancient to the modern period. It explores the way monsters define and police the boundaries of what it means to be human, and provide a common language for crystallizing specific social, ethnic, and national practices. **Credits:** 3.00

ENGL 21800 - Figures Of Myth And Legends II: Heroes And Villains

Credit Hours: 3.00. This class offers in-depth explorations of the larger-than-life leaders (on the side of good, and sometimes evil, too) who have become models for how we think of heroism, charisma, and what it means to seek and wield power over others. From the chivalric Knights of the Round Table to the frightening energy of the Viking comitatus bands, it will show that no models of mythic leadership come without their complications--or admirable qualities. **Credits:** 3.00

ENGL 21900 - Figures Of Myth And Legend III: Magic And Marvels

Credit Hours: 3.00. This course surveys stories of elves, fairies, wizards, witches, etc., and explores the allure of all things marvelous, strange, and magical. It considers how language itself constitutes a kind of magic; examines magic as technology and vice versa, since, as Arthur C. Clarke famously declared: "Any sufficiently advanced technology is indistinguishable from magic"; and seeks to understand how people across history have used stories of magic to reinforce (mystify) or upend (defamiliarize) the status quo. **Credits:** 3.00

ENGL 22002 - Technology And Play

Credit Hours: 3.00. This course introduces students to games, as well as investigating innovations and controversies in the gaming industry. It will explore theories of play, how technological innovations and business practices in both digital and analog gaming (through board games, video games, tabletop games, and esports) mediate or structure the experience of play. It will also survey the rise of myriad gaming subcultures, including celebrity streamers and esports.**Credits:** 3.00

ENGL 22300 - Literature And Technology

Credit Hours: 3.00. This class uses literature to explore how technological innovation both enables and constrains creativity. It also explores how technology has been represented in literature, and examines the relationship between literature and new media. **Credits:** 3.00

ENGL 22400 - Literature, Money, And Markets

Credit Hours: 3.00. This course explores the interconnections among markets, business and its management, and literature. It examines representations of traditional markets (industry, finance, and global trade) as well as alternative markets (the market in bodies, the black market, and the digital marketplace economy). The course will present a wide-ranging survey of canonical texts, orienting the reader as to how classics from Chaucer to Dickens are engaged in the business of thinking about business. But it will also engage with alternative viewpoints and contemporary concerns about business practices, literature, and individual consciousness in the techno-digital age. **Credits:** 3.00

ENGL 22500 - Literature, Inequality, And Injustice

Credit Hours: 3.00. This course introduces students to literature addressing inequality and social justice. Questions will include: What is social justice? How do literary works reproduce or resist dominant ideologies? How does literature provide tools to map social and economic formations? What role have literary works played in emancipatory and egalitarian political movements? Readings and comparison of these texts will help examine how literature maintains a variety of communities.**Credits:** 3.00

ENGL 22600 - Narrative Medicine

Credit Hours: 3.00. "Narrative Medicine" encompasses stories about the interior lives of doctors and medical professionals, the complexities of medicine past and present, and health-care for patients and their families. Ultimately, this course emphasizes the essential role of rhetoric and storytelling in the face of medical crisis and uses stories about illness and disability to explore the human condition. **Credits:** 3.00

ENGL 22700 - Elements Of Linguistics

Credit Hours: 3.00. A summary of what is known about human language, its structure, its universality, and its diversity; language in its social setting; language in relation to other aspects of human inquiry and knowledge. Typically offered Fall Spring Summer. CTL:IEL 1260 Introduction To Linguistics**Credits:** 3.00

ENGL 22800 - Language And Social Identity

Credit Hours: 3.00. This course introduces linguistic diversity, including regional, cultural, and stylistic variation within a single language, code-switching in bilingual communities, and colonial, immigrant, Creole, indigenous, and sign languages. It also explores the role of language in supporting various types of social identity (e.g., age, gender, social class, race, ethnicity) as well as power structures that enable discrimination against less powerful groups. **Credits:** 3.00

ENGL 22900 - Creole Languages And Cultures

Credit Hours: 3.00. This course introduces the concept of pidgin and creole languages across the world, with a focus on English-based pidgins and creoles. It addresses their geographical distribution and some of their cultural manifestations such as music, food and literature on both sides of the Atlantic. The course presents a general view of the historical events that led to the formation of creole languages and to the development of the African diaspora. We will consider different varieties of creole languages and (their) cultures including English-based creoles in West Africa such as Kru (Liberia and Sierra Leone), Nigerian Pidgin and Cameroonian Pidgin; in the Caribbean such as Jamaican, San Andreas, Nicaraguan and Limonense, contrasting them with the Spanish-based creole Palenquero; and the three most predominant creoles in the U.S. Louisiana Creole, Gullah and Hawaii Creole, to understand their characteristics and their history. We will explore the ways in which the languages manifest in the music and literature of the contexts where they are spoken. Finally, we will consider the African diaspora as a fundamental thread that ties (English-based) creole languages and peoples together. In exploring these issues, the course will draw on a variety of theoretical concepts and traditions from sociolinguistics, creole studies and African American studies. **Credits:** 3.00

ENGL 23000 - Great Narrative Works

Credit Hours: 3.00. Reading and discussion of great narratives from Homer's Odyssey to the present, considering works from a variety of cultures and time periods in order to develop an understanding of their ideas, structures, styles, and cultural values. Typically offered Fall Spring Summer.**Credits:** 3.00

ENGL 23100 - Introduction To Literature

Credit Hours: 3.00. Reading and discussion of great works of various types to develop an understanding of their ideas, structures, and styles. Includes poetry, drama, biography, essay, and prose fiction. Typically offered Fall Spring Summer. CTL:IEL 1270 Appreciation Of Literature**Credits:** 3.00

ENGL 23200 - Thematic Studies In Literature

Credit Hours: 3.00. Examination of a particular theme, such as the hero, death, or the city, and the techniques by which it is treated in various literary works, usually in more than one genre. Current offerings available from counselors. Typically offered Fall Spring Summer.**Credits:** 3.00

ENGL 23400 - Literature And The Environment

Credit Hours: 3.00. Literary study of nature writing; writing from the natural sciences; and canonical poetry, fiction, and essays through an ecological lens. Introduces students to ecocritical thought and environmental literary history. Typically offered Fall Spring Summer.**Credits:** 3.00

ENGL 23700 - Introduction To Poetry

Credit Hours: 3.00. Reading and discussion of poetry from different periods aimed at enhancing the student's understanding of genre, form, and style; how poetry grows out of and speaks to its historical moment; and how poetry addresses pressing social issues.**Credits:** 3.00

ENGL 23800 - Introduction To Fiction

Credit Hours: 3.00. Reading and discussion of fiction from different periods aimed at enhancing the student's understanding of genre, form, and style; how fiction grows out of and speaks to its historical moment; and how fiction addresses pressing social issues. **Credits:** 3.00

ENGL 24000 - British Literature Before 1789

Credit Hours: 3.00. A historically oriented survey of genres, authors, and texts from the medieval to the Romantic period. Typically offered Fall Spring Summer.**Credits:** 3.00

ENGL 24100 - British Literature After 1789

Credit Hours: 3.00. A historically oriented survey of genres, authors, and texts from the Romantic period on. Typically offered Fall Spring Summer.**Credits:** 3.00

ENGL 24900 - Great British Books

Credit Hours: 3.00. Why are British books so compelling? This course examines the dynamic history of British literature and explores how canonical and contemporary texts shaped the cultural landscape of Britain, the British Empire, and the world. **Credits:** 3.00

ENGL 25000 - Great American Books

Credit Hours: 3.00. What makes great American books so compelling? This course examines the dynamic history of American literature and explores how canonical and contemporary books have shaped the cultural landscape of the U.S. and the world. Typically offered Fall Spring Summer.**Credits:** 3.00

ENGL 25700 - Literature Of Black America

Credit Hours: 3.00. A survey of literature written by black American authors. Close attention is paid to the history of black literature and to the historical context in which it was written, as well as to the texts of major works by black writers. Typically offered Summer Fall Spring.**Credits:** 3.00

ENGL 26200 - Greek And Roman Classics In Translation

Credit Hours: 3.00. Study of important works of Greek and Roman literature, their intrinsic literary values, and their influence on later European and American writing and thinking. Typically offered Summer Fall Spring.**Credits:** 3.00

ENGL 26400 - The Bible As Literature

Credit Hours: 3.00. A literary study of selections from the Old and New Testaments as examples of Hebrew and early Christian literature.**Credits:** 3.00

ENGL 26600 - World Literature: From The Beginnings To 1700 A.D.

Credit Hours: 3.00. (CMPL 26600) World literature in translation. A comparative and chronological survey of the masterpieces of Eastern and Western literature. Typically offered Fall Spring Summer. CCN: IEL 1250 World Literature 1**Credits:** 3.00

ENGL 26700 - World Literature: From 1700 A.D. To The Present

Credit Hours: 3.00. (CMPL 26700) World literature in translation. A comparative and chronological survey of the masterpieces of Eastern and Western literature. Typically offered Summer Fall Spring. CCN: IEL 1251 World Literature 2**Credits:** 3.00

ENGL 27600 - Shakespeare On Film

Credit Hours: 3.00. Considers the relation of the written text of five or six Shakespeare plays to multiple film versions from a wide variety of times and cultures, e.g., the United States, England, France, Italy, Japan, Denmark, India, and Russia. Typically offered Fall Spring Summer.**Credits:** 3.00

ENGL 27900 - The American Short Story In Print And Film

Credit Hours: 3.00. Analysis of American short stories of the nineteenth and twentieth centuries, their filmed versions, their printed scenarios, and critical writings about the tales and their adaptations. Typically offered Summer Fall Spring.**Credits:** 3.00

ENGL 28000 - Games, Narrative, Culture

Credit Hours: 3.00. This is an introduction to the field of game studies, and to games as narrative and cultural media. We will look at the stories games tell; the way their narrative elements or plot devices intersect with the culture around the games and gaming itself; and how all these things come together to affect game design, meaning, and play. **Credits:** 3.00

ENGL 28600 - The Movies

Credit Hours: 3.00. Introduction to the movies from classic to contemporary films. Typically offered Fall Spring.**Credits:** 3.00

ENGL 30100 - Ways Of Reading

Credit Hours: 3.00. Introduction to literary theory and practice. Close reading of and significant writing about selected literary texts informed by a variety of critical and/or theoretical perspectives.**Credits:** 3.00

ENGL 30400 - Advanced Composition

Credit Hours: 3.00. Designed for students who wish additional training in composition beyond the basic requirements. Extensive practice in the writing of mature expository, critical, and argumentative prose. (The course satisfies the Indiana certification requirement of three hours of advanced composition.). Typically offered Fall Spring Summer.**Credits:** 3.00

ENGL 30600 - Introduction To Professional Writing

Credit Hours: 3.00. Development of skill in analyzing rhetorical situations in the workplace. Practice in planning, writing, evaluating, and revising a variety of documents typical of those used in the arts and industry. Typically offered Fall Spring Summer.**Credits:** 3.00

ENGL 30900 - Digital Design And Production

Credit Hours: 3.00. The development of the ability to write and design documents using electronic publishing technologies. Students will receive instruction in writing, graphics, and publishing software and will write, design, produce, and critique a number of publications.**Credits:** 3.00

ENGL 31600 - Craft Of Fiction From A Writer's Perspective

Credit Hours: 3.00. This course focuses on the craft of fiction with some consideration of its underlying principles from a writer's perspective. Topics of study may include works of fiction, statements of aesthetics and craft, and various fictional forms. Typically offered Fall Spring.**Credits:** 3.00

ENGL 31700 - Craft Of Poetry From A Writer's Perspective

Credit Hours: 3.00. This course focuses on the craft of poetry with some consideration of its underlying principles from a writer's perspective. Topics of study may include works of poetry, statements of aesthetics and craft, and various poetic forms.**Credits:** 3.00

ENGL 32200 - Word, Image, Media

Credit Hours: 3.00. This course introduces students to the study of images, their relationship to language, and their functions in media. From decoding advertising messages to analyzing digital journalism, students will learn how images and their viewers make meaning in a variety of media contexts. **Credits:** 3.00

ENGL 32700 - English Language I: History And Development

Credit Hours: 3.00. Introduction to the history of the English language, its sounds, inflections, words, and sentence structures. Cultural and historical events affecting this history, and the interplay between language and literature. Typically offered Fall Spring.**Credits:** 3.00

ENGL 32800 - English Language II: Structure And Meaning

Credit Hours: 3.00. The structure of American English and its dialects, with emphasis on syntax and semantics, including parts of speech, sentence structure, and meaning. Implications of recent theory for the teaching of English. Credit will not be given for both ENGL 32800 and LING 32100. Typically offered Fall Spring.**Credits:** 3.00

ENGL 32900 - English Language III: Sound And Form

Credit Hours: 3.00. The structure of American English and its dialects, with emphasis on phonology and morphology. Implications of recent theory to the teaching of English. Typically offered Fall Spring.**Credits:** 3.00

ENGL 33000 - Games And Diversity

Credit Hours: 3.00. This course looks critically at diversity in games, game development, and in the larger mainstream games community. Students will analyze and play games that related to women, minorities, members of the LGBTQ community, and/or those who lack access because of disability. **Credits:** 3.00

ENGL 33100 - Medieval English Literature

Credit Hours: 3.00. A survey of Saxon and Medieval English literature (700-1500 A.D.) through intensive reading of Old English heroic, elegiac, and religious poetry and Middle English romance, allegory, lyric, and drama, exclusive of Chaucer. **Credits:** 3.00

ENGL 33200 - Games And User Experience (UX)

Credit Hours: 3.00. This course connects gamers and their experiences with games by developing ways to harvest gaming experiences for the improvement of games. We aim to prepare you to better understand gaming experiences, use those understandings to improve games in development, and be able to think and write critically about those experiences. **Credits:** 3.00

ENGL 34100 - Topics In Science, Literature, And Culture

Credit Hours: 3.00. This course focuses on issues in and representation of science and technology in various texts, including literature, film, science, and theory. May be repeated for credit only under a different topic. Typically offered Fall Spring.**Credits:** 3.00

ENGL 34200 - Legal Fictions

Credit Hours: 3.00. This course explores legal conflicts through literature. It uses the narratives created by the cat-and-mouse of procedural dramas, emotionally charged trial scenes, and dramatic courtroom struggles, to introduce different schools of jurisprudence, and to critically examine the decisions made by those with social and legal governing power. **Credits:** 3.00

ENGL 34300 - Labor And Literature

Credit Hours: 3.00. This course introduces its students to the transformative synergy between the labor of literature and labor within literature. In contrast to accepting the marketplace as a societal monolith, the readings illustrate the role of labor in creation. This course will examine labor taken in its broadest sense, from the labor of self-fashioning to the labor of industries; the labor of life and the labor of destruction and the implications of the laboring body from market creation to market collapse. Diverse readings range from traditional literary staples to modern representations of the labor market. **Credits:** 3.00

ENGL 34400 - Environmental Ethics, Policy, And Sustainability

Credit Hours: 3.00. Environmental Ethics, Policy and Sustainability is an interdisciplinary course designed to open new pathways into ethical and eco-critical inquiry in the Anthropocene age. The course analyzes disciplinary differences in approaching the ethical, the human, and environmental problems such as sustainability, development, biodiversity, global security, and climate change. Students will explore what it means to be ethical in and through an interrogation of our contemporary conceptions of what it means to be human. These interrogations in turn will prompt us to reconsider human creations such as knowledge, culture, and technology, which will push us to genuinely think how humans as a species situate

their creations within the realm of what they call Nature. Students will be introduced to the history of environmental studies in the discipline, to the rise of what is now known as "postcolonial ecocriticism" to theoretical inquiry into modern technology, and to other recent developments in the fields of environmental studies. **Credits:** 3.00

ENGL 34500 - Games And World Building

Credit Hours: 3.00. Every game designer and gamer knows that there is more to narrative than just words on a page and more to worldbuilding than images on a screen. This course looks at the ways that narrative worlds get built-in games. We will begin by looking at the narrative elements in analog games that have been the foundation of many digital games and move on to look at the elements in digital games that come together to form the worlds. **Credits:** 3.00

ENGL 35000 - American Literature Before 1865

Credit Hours: 3.00. A historically oriented survey of genres, authors, and texts from European colonization to the U.S. Civil War. Typically offered Fall Spring Summer. CTL:IEL 1210 American Literature I**Credits:** 3.00

ENGL 35100 - American Literature After 1865

Credit Hours: 3.00. A survey of American literature from the Civil War to the present.Typically offered Spring Summer Fall. CTL:IEL 1211 American Literature II**Credits:** 3.00

ENGL 35200 - Native American Literature

Credit Hours: 3.00. Study of literature by Native American authors in a variety of genres-novels, short stories, poetry, autobiography--using literary analysis, as well as historical, legal, and ethnographic materials. Typically offered Spring Fall.**Credits:** 3.00

ENGL 35400 - Asian American Literature

Credit Hours: 3.00. Study of Asian American Literature covering issues such as immigration, identity, class, and gender. Typically offered Spring.**Credits:** 3.00

ENGL 35800 - Black Drama

Credit Hours: 3.00. A critical analysis and discussion of selected representative works by African American dramatists - from William Wells Brown to the moderns. Typically offered Summer Fall Spring.**Credits:** 3.00

ENGL 35900 - Black Women Writers

Credit Hours: 3.00. (AAS 35900) This course introduces students to the rich and varied literary texts produced by black women writers. Literary analysis, along with a consideration of historical, cultural, gender, and racial contexts will be emphasized. Typically offered Summer Fall Spring.**Credits:** 3.00

ENGL 36000 - Gender And Literature

Credit Hours: 3.00. An introduction to feminist approaches to the study of literature, including poetry, drama, fiction, and/or autobiography. Examines how gender intersects with race, ethnicity, sexual orientation, and class in shaping authorship, reading, and representation. Typically offered Summer Fall Spring.**Credits:** 3.00

ENGL 36500 - Literature And Imperialism

Credit Hours: 3.00. A study through cultural and theoretical works of the impact of imperialism on the ruling nations.**Credits:** 3.00

ENGL 36600 - Postcolonial Literatures

Credit Hours: 3.00. A study of Third World Literature, film, and theory that emerged during and after Western rule.**Credits:** 3.00

ENGL 36700 - Mystery And Detective Fiction

Credit Hours: 3.00. An introduction to the detective genre, examining its origins, its characteristics, and its intersections with empiricism, forensic science, race, class, gender, sex, and empire. **Credits:** 3.00

ENGL 37300 - Science Fiction And Fantasy

Credit Hours: 3.00. Representative works of science fiction and fantasy examined in relation to both mainstream and popular literature. Emphasis is on technique, theme, and form. Typically offered Summer Fall Spring.**Credits:** 3.00

ENGL 37401 - Studies In British Literary History

Credit Hours: 3.00. This class focuses on one of several important British literary-historical periods, ranging from medieval English to modern British literature. In it, students will examine individual authors and texts while also gaining a wider understanding of their historical context. Students will also engage with a variety of genres and practice numerous critical approaches to literature. **Credits:** 3.00

ENGL 37700 - Modern And Contemporary Poetry

Credit Hours: 3.00. A study of poetry in English from the twentieth century to the present. Typically offered Summer Fall Spring.**Credits:** 3.00

ENGL 37800 - Studies In American Literary History

Credit Hours: 3.00. This class focuses on one of several important American literary-historical periods: colonial, nineteenth-, or twentieth- and twenty-first-century literature. In it, students examine individual authors and texts while also gaining a wider understanding of their historical context. Students also will engage with a variety of genres and practice numerous critical approaches to literature. **Credits:** 3.00

ENGL 37900 - The Short Story

Credit Hours: 3.00. A study of the development and features of the short story genre. Typically offered Summer Fall Spring.**Credits:** 3.00

ENGL 38000 - Issues In Rhetoric And Public Life

Credit Hours: 3.00. Study of how language and media create belief and change. Examines ancient and contemporary rhetorical theory as it applies to public discourse, media, and technology. **Credits:** 3.00

ENGL 38100 - The British Novel

Credit Hours: 3.00. Survey of British novels ranging from the eighteenth- to the twenty-first centuries. Typically offered Fall Spring.**Credits:** 3.00

ENGL 38200 - The American Novel

Credit Hours: 3.00. A survey of American novels ranging from the eighteenth century to the twenty-first-centuries. Typically offered Fall Spring.**Credits:** 3.00

ENGL 38600 - History Of Film To 1950

Credit Hours: 3.00. This survey crosses the divide between the silent film era and the "talkies" to explore narrative, experimental, and documentary styles of feature films from the 1890s to 1950. Typically offered Fall Spring.**Credits:** 3.00

ENGL 38700 - History Of Film Since 1950

Credit Hours: 3.00. A survey of narrative, experimental, and documentary styles of feature films from the mid-twentieth century to the present. Typically offered Fall Spring.**Credits:** 3.00

ENGL 38900 - Literature For Children

Credit Hours: 3.00. This course surveys eighteenth, nineteenth-century, and early-twentieth-century literature for children, including the so-called "golden age" of children's myth, fairy tales, and fantasy, as well as domestic fiction for girls and adventure books for boys. **Credits:** 3.00

ENGL 39000 - Practicum In Tutoring Writing

Credit Hours: 1.00 to 3.00. A practicum to teach undergraduates to teach writing in the one-to-one setting of a writing lab. **Credits:** 1.00 to 3.00

ENGL 39100 - Composition For English Teachers

Credit Hours: 3.00. Exploration of the theory, research, and pedagogy of teaching writing at the secondary level. Topics include the development of writing assignments and related activities, the study of writing process models, and the evaluation of student work in a variety of genres. Typically offered Fall Spring.**Credits:** 3.00

ENGL 39200 - Young Adult Literature

Credit Hours: 3.00. This course examines the construct of Young Adult Literature as a genre crafted specifically for adolescents. Using both classic and contemporary novels, as well as relevant theoretical and research texts, this course explores how YA literature is defined, what it offers to adolescent readers, and how it is situated in the literary landscape. **Credits:** 3.00

ENGL 39300 - Interdisciplinary Approaches To Environmental And Sustainability Studies

Credit Hours: 3.00. (ANTH 39300) This course is the lynchpin of the undergraduate Certificate in Environmental and Sustainability Studies. It will present a series of case studies, core concepts, and problem questions that integrate the following three academic approaches: 1) Human Dimensions and Environment/Sustainability, 2) Engineering and Environment/Sustainability, and 3) Environmental/Sustainability Sciences. **Credits:** 3.00

ENGL 39600 - Studies In Literature And Language

Credit Hours: 1.00 to 3.00. A course in the study of a special topic directed by an instructor in whose particular field of specialization the content of the course falls. Typically offered Fall Spring Summer.**Credits:** 1.00 to 3.00

ENGL 39900 - Beyond English

Credit Hours: 3.00. This class is designed for third- and fourth-year English majors. It will help students translate the worth of English and the humanities to the world beyond the university, providing them with tools to articulate their achievements and prepare for their professional and adult lives. **Credits:** 3.00

ENGL 40600 - Review Writing

Credit Hours: 3.00. Intensive practice in the writing of book, film, and theatre criticism, as well as reviews of musical programs and art exhibits. Readings in critics to serve as possible models. Audience analysis of newspapers and periodicals that would be potential markets. Typically offered Fall Spring.**Credits:** 3.00

ENGL 40700 - Intermediate Poetry Writing

Credit Hours: 3.00. Study and practice of methods of composing poetry, with primary emphasis on the student's own work. Workshop criticism and discussion of published writing. Typically offered Summer Fall Spring.**Credits:** 3.00

ENGL 40800 - Creative Writing Capstone

Credit Hours: 3.00. This course will focus on the writing and revision of the capstone thesis in Creative Writing, consisting of a substantial portfolio of either fiction or poetry with an introductory essay. Workshop, discussion of published writing, and individual conferences will form the center of the course with readings, lecture, and discussion of various literary topics. Permission of instructor required. Typically offered Fall Spring.**Credits:** 3.00

ENGL 40900 - Intermediate Fiction Writing

Credit Hours: 3.00. Study and practice of methods of composing fiction, with a primary emphasis on the student's own work. Workshop criticism and discussion of published fiction. Typically offered Summer Fall Spring.**Credits:** 3.00

ENGL 41100 - Studies In Major Authors

Credit Hours: 3.00. A study of the literary, critical, or cinematic works of one or two influential authors or directors. A project-based capstone seminar containing a significant research component. May be repeated for credit only with a different topic.**Credits:** 3.00

ENGL 41200 - Studies In Genre

Credit Hours: 3.00. A study of literary or cinematic works that share distinctive formal features. A project-based capstone seminar containing a significant research component. May be repeated for credit only with a different topic.**Credits:** 3.00

ENGL 41300 - Studies In Literature And History

Credit Hours: 3.00. A study of literature or film produced during a well-defined historical period from the view of its social, political, religious, and economic contexts. A project-based capstone seminar containing a significant research component. May be repeated for credit only with a different topic.**Credits:** 3.00

ENGL 41400 - Studies In Literature And Culture

Credit Hours: 3.00. A study of literature or film from the perspective of the cultural norms and values it expresses, celebrates, and challenges. A project-based capstone seminar containing a significant research component. May be repeated for credit only with a different topic.**Credits:** 3.00

ENGL 41900 - Multimedia Writing

Credit Hours: 3.00. Multimedia writing for networked contexts. Emphasizes principles, and practices of multimedia design, implementation, and publishing. Typical genres include Web sites, interactive media, digital video, visual presentations, visual argument, and user documentation. **Credits:** 3.00

ENGL 42000 - Business Writing

Credit Hours: 3.00. Workplace writing in networked environments for management contexts. Emphasizes organizational context, project planning, document management, ethics, research, team writing. Typical genres include management memos, reports, letters, e-mail, resumes (print and online), oral presentations.**Credits:** 3.00

ENGL 42100 - Technical Writing

Credit Hours: 3.00. Workplace writing in networked environments for technical contexts. Emphasizes context and user analysis, data analysis/display, project planning, document management, usability, ethics, research, team writing. Typical genres include technical reports, memos, documentation, Web sites.**Credits:** 3.00

ENGL 42201 - Writing For The Health And Human Sciences

Credit Hours: 3.00. This course applies rhetorical principles to writing in health, hospitality, nutrition, nursing and related fields in the Health and Human Sciences. **Credits:** 3.00

ENGL 42400 - Writing For High Technology Industries

Credit Hours: 3.00. Applies principles of effective professional writing to the planning, production, and evaluation of computer user manuals and other writing tasks. **Credits:** 3.00

ENGL 43201 - Editing And Publishing

Credit Hours: 3.00. Editing and Publishing is a professional writing workshop that teaches students how to proofread, copyedit, substantive edit, and global edit documents. Students will learn how to navigate the publishing industry and work with authors on print, electronic, online, and multimedia documents. **Credits:** 3.00

ENGL 43300 - Writing Proposals And Grants

Credit Hours: 3.00. Writing Proposals and Grants is a professional writing workshop that teaches students to write workplace proposals and grants in for-profit and not-for-profit companies and organizations. Students will also learn how to write business plans, a specialized form of proposal.**Credits:** 3.00

ENGL 43400 - Science And Medical Writing

Credit Hours: 3.00. Science and Medical Writing is a professional writing workshop that teaches students how to write in medical and scientific fields. Students will learn the genres and conventions that are used by medical writers and science writers, as well as editors in these fields. **Credits:** 3.00

ENGL 43900 - Topics In Disability Studies

Credit Hours: 3.00. Explores cultural, social, and political meanings and effects of disability in relation to literature and/or rhetoric. Specific topics will vary. **Credits:** 3.00

ENGL 44100 - Chaucer's Canterbury Tales

Credit Hours: 3.00. Critical reading of The Canterbury Tales in Middle English, with attention to the literary and cultural background. **Credits:** 3.00

ENGL 44200 - Shakespeare

Credit Hours: 3.00. Shakespeare's dramatic craftsmanship, poetry, humor, characterization, psychology, and modern pertinence illustrated in representative tragedies, comedies, and history plays. **Credits:** 3.00

ENGL 46000 - Studies In Women's Literature

Credit Hours: 3.00. A study of literary works by women according to a specific theme, historical period, genre, or culture, e.g., Nineteenth-Century Women Novelists, Madness in Women's Writing, Caribbean Women Writers. May be repeated only with different topic. **Credits:** 3.00

ENGL 46200 - The Bible As Literature: The Old Testament

Credit Hours: 3.00. A study of the Old Testament - Pentateuch, Prophets, and other books such as Psalms, Proverbs, Job, and Ecclesiastes - with emphasis on its unique literary characteristics. **Credits:** 3.00

ENGL 46300 - The Bible As Literature: The New Testament

Credit Hours: 3.00. A study of the New Testament, with emphasis on its unique literary characteristics. **Credits:** 3.00

ENGL 47000 - Advanced Topics In Rhetorical Studies

Credit Hours: 3.00. Study of rhetorical theories and practices past and present. Includes readings in primary texts in the history and theory of rhetoric. May be repeated for credit with a different topic. **Credits:** 3.00

ENGL 48800 - Internship In Professional Writing

Credit Hours: 3.00 to 6.00. This course provides on-the-job experience in various kinds of professional writing, combined with a seminar in applied rhetoric. Students work in selected internship settings, participate in seminar discussions of their work, and read selections appropriate to their internship. Permission of instructor required. **Credits:** 3.00 to 6.00

ENGL 49000 - Worksite Internship Practicum

Credit Hours: 1.00 to 3.00. Course facilitates the transition between an English undergraduate degree and the workplace or professional life. The course has two components: a professor-guided component and a practicum component in a chosen area. Permission of instructor required. **Credits:** 1.00 to 3.00

ENGL 49200 - Literature In The Secondary Schools

Credit Hours: 3.00. Exploration of the theory, research and pedagogy supporting the teaching of literature at the secondary level. Topics include text selection, instructional strategies, adolescent literacy, student engagement and the use of alternative texts. **Credits:** 3.00

ENGL 49400 - Research Practicum For Undergraduates

Credit Hours: 2.00 or 3.00. This course introduces students to research techniques and trains them to participate in a research laboratory or a professor-sponsored research project. Permission of instructor required. **Credits:** 2.00 or 3.00

ENGL 50100 - Introduction To English Studies

Credit Hours: 3.00. Introduction to graduate studies in English with special emphasis on research and reference tools, methods of bibliography, and the writing of scholarly papers. Prerequisite: Fulfillment of the basic composition requirement and 6 credit hours in English. **Credits:** 3.00

ENGL 50200 - Practicum In Teaching College Composition

Credit Hours: 1.00. Reading professional literature, preparing syllabi; evaluating student papers, leading discussions. Required of all teaching assistants in their initial semesters. **Credits:** 1.00

ENGL 50500 - Approaches To Teaching College English

Credit Hours: 3.00. Reading professional literature on the teaching of writing, linguistics, and ESL. Studies of methodologies, issues of assessment, and the relationship between theory and pedagogy. This course is not part of the degree requirement. Open only to teaching assistants in the Department of English. Permission of instructor required. **Credits:** 3.00

ENGL 50600 - Introduction To English And General Linguistics

Credit Hours: 3.00. General study of language and linguistic theory with emphasis on English. Problems and methods in phonology, morphology, syntax, and semantics. Current techniques of linguistics analysis. **Credits:** 3.00

ENGL 50700 - Advanced Poetry Writing

Credit Hours: 3.00. Study and practice of advanced methods of composing poetry, with primary emphasis on the student's own work. Workshop criticism and discussion of published writing.**Credits:** 3.00

ENGL 50900 - Advanced Fiction Writing

Credit Hours: 3.00. Study and practice of advanced methods of composing fiction, with the primary emphasis on the student's own work. Workshop criticism and discussion of published writing. **Credits:** 3.00

ENGL 51000 - History Of The English Language

Credit Hours: 3.00. Introduction to theories of linguistic change and their application to the historical development of English from its beginnings. **Credits:** 3.00

ENGL 51100 - Semantics

Credit Hours: 3.00. An introduction to and survey of current semantic theories and methods with an emphasis on English. Basic concepts of linguistic semantics and its relation to the other semantics. Compositional (transformational), model-theoretical (truth-conditional), pragmatic, and contextual semantics. **Credits:** 3.00

ENGL 51200 - English Syntax And Syntactic Theory

Credit Hours: 3.00. Introduction to English syntactic structure, syntactic argumentation, and syntactic theory. Emphasis on one current theory as the primary theoretical framework, with other theories considered.**Credits:** 3.00

ENGL 51300 - English Phonology

Credit Hours: 3.00. Introduction to current phonological theory, with applications to descriptions of American and British English. Articulatory description of English phonological structure and contrastive analysis of phonetic variation across dialects. Evolution of the stress system of English and its utilization by poets writing metrical verse. **Credits:** 3.00

ENGL 51500 - Advanced Professional Writing

Credit Hours: 3.00. Production of documents and coordination of publishing projects for clients and users; application of advanced principles of document design, rhetoric, collaboration, and project management; and team writing in a computer-networked environment. **Credits:** 3.00

ENGL 51600 - Teaching English As A Second Language: Theoretical Foundations

Credit Hours: 3.00. Survey of theories of learning and teaching English as a second/foreign/international language. Focus is on current theories and their implications for practice. **Credits:** 3.00

ENGL 51800 - Teaching English As A Second Language: Principles And Practices

Credit Hours: 3.00. Studies of issues and principles in ESL/EFL program development. Emphasis is on practical application of theory in a variety of English learning and teaching contexts in the U.S. and abroad. **Credits:** 3.00

ENGL 52800 - Medieval English Literature

Credit Hours: 3.00. A survey of selected works of Medieval English literature (700-1500 C.E.), exclusive of Chaucer's writings. **Credits:** 3.00

ENGL 53100 - The Rise Of The Novel

Credit Hours: 3.00. A study of the history and theory of the emergent novel genre as it developed in 18th-century Britain and/or America. **Credits:** 3.00

ENGL 53200 - The English Novel In The Nineteenth Century

Credit Hours: 3.00. A survey of fiction up to about 1880, including such novelists as Scott, Dickens, Thackeray, the Brontes, Eliot, and Meredith. **Credits:** 3.00

ENGL 53400 - Seventeenth-Century Literature

Credit Hours: 3.00. Nondramatic literature from 1603 to 1660. Particular emphasis upon such figures as Jonson, Donne, Marvell, and Herbert, with representative prose from Bacon, Browne, Burton, and others. **Credits:** 3.00

ENGL 53500 - Restoration And Early Eighteenth-Century Literature

Credit Hours: 3.00. A survey of nondramatic literature from 1660 to 1744, from Clarendon through Thomson. Emphasizes Bunyan, Dryden, Pope, and Swift. **Credits:** 3.00

ENGL 53800 - English Drama From The Restoration To The Modern Period

Credit Hours: 3.00. A survey of English drama from Dryden and Wycherley through Robertson and Pinero. **Credits:** 3.00

ENGL 54100 - Studies In Chaucer's Canterbury Tales

Credit Hours: 3.00. Critical reading of The Canterbury Tales and related works in Middle English, with attention to the literary and cultural background and to secondary studies. **Credits:** 3.00

ENGL 54300 - Shakespeare In Critical Perspective

Credit Hours: 3.00. Shakespeare's plays read in context of historical and contemporary literary theory and criticism, considering such issues and approaches as structuralism, Marxism, deconstruction, new historicism, colonialism, sexuality, race, and gender. **Credits:** 3.00

ENGL 54400 - Milton

Credit Hours: 3.00. A study of Milton's poetry and prose, with particular emphasis on Paradise Lost, and some attention to the social, political, and literary background. **Credits:** 3.00

ENGL 54700 - British Romanticism

Credit Hours: 3.00. Readings from among the works of the High Romantics and other figures; discussion of historical, philosophical, cultural debates of the era, with attention to current critical and theoretical developments in the field. **Credits:** 3.00

ENGL 54800 - Victorian Literature

Credit Hours: 3.00. A study of selected English poetry and prose, largely nonfiction, from circa 1830-1900. Includes readings from such figures as Arnold, Barrett, Bronte, Browning, Carlyle, Mill, Rosetti, Ruskin, and Tennyson. **Credits:** 3.00

ENGL 55200 - Studies In Major American Authors

Credit Hours: 3.00. A study of the works of one or two influential American authors. **Credits:** 3.00

ENGL 55300 - Colonial And Early American Literature

Credit Hours: 3.00. A survey of American literature to about 1820. Texts of major and minor authors, such as Bradford, Bradstreet, Rowlandson, and Cooper, are viewed within their cultural context. **Credits:** 3.00

ENGL 55400 - American Literary Culture 1820-1860

Credit Hours: 3.00. Emphasizes cultural inventory, definition, and production in early nineteenth-century literary culture. The approach is intertextual, moving back and forth between the emerging culture and literary productions, and between one author and other authors. **Credits:** 3.00

ENGL 55700 - Nineteenth-Century African-American Narrative

Credit Hours: 3.00. This course focuses on both fiction and nonfiction by a range of African American authors dating from the pre-Civil War years through the turn of the twentieth century. Appropriate for M.A. students seeking to fulfill 19th-century breadth requirements and/or build a foundation for future study in the field. Appropriate for Ph.D. students preparing for qualifying exams and/or preparing to write a dissertation in the field. **Credits:** 3.00

ENGL 55800 - American Literature In The Later Nineteenth Century

Credit Hours: 3.00. Study of American literature from about 1865 to 1900. Addresses realism, regionalism, naturalism, and other related movements. Focuses on such writers as Whitman, Dickinson, Stowe, Davis, Stoddard, Alcott, Twain, Howells, James, Jewett, Chopin, Crane, Chesnutt, and Norris. **Credits:** 3.00

ENGL 56000 - Modern American Poetry

Credit Hours: 3.00. A survey of modern American poetry. Emphasis will be on major writers such as Eliot, Pound, Frost, Stevens, and Lowell, but attention will be paid to lesser figures. **Credits:** 3.00

ENGL 56100 - Modern British Poetry

Credit Hours: 3.00. Surveys modern British poetry from Hardy to Auden; relates it to the main currents of modern thought and feeling; introduces critical principles. **Credits:** 3.00

ENGL 56300 - Historical Linguistics

Credit Hours: 3.00. (ANTH 56300, LC 56300) A survey of mechanisms and motivations of linguistic change. Topics include: phonological, morphological, semantic and syntactic change, comparative and internal reconstruction, linguistic variation, language contact, and linguistic typology. **Credits:** 3.00

ENGL 56500 - Sociolinguistics

Credit Hours: 3.00. (ANTH 56500, COM 56500, LC 56500, LING 56500) An introduction to language in its social context, focusing on uses and users of language. Topics include social class, ethnic group, gender, language attitudes, and bilingualism. **Credits:** 3.00

ENGL 56900 - Contemporary Criticism And Theory

Credit Hours: 3.00. Study of contemporary criticism and theory generally focused on such schools and movements as structuralism, psychoanalysis, poststructuralism, feminism, new historicism, cultural studies, and gay and lesbian studies. **Credits:** 3.00

ENGL 57000 - Introduction To Semiotics

Credit Hours: 3.00. The study of languages, literatures, and other systems of human communication. Includes a wide range of phenomena which can be brought together by means of a general theory of signs. The course deals with three fundamental areas: 1) verbal communication, 2) nonverbal communication (iconic systems, gestures, body language, etc.), and 3) communication through art forms. **Credits:** 3.00

ENGL 57300 - Tragedy
